The QuickPatch you create using this method can be used to patch an existing .msi file or an existing QuickPatch.

Tip • *You can use the Create New QuickPatch Wizard to create a QuickPatch project for an existing QuickPatch. As an alternative, you can open the latest QuickPatch project in InstallShield and specify that you want to create a QuickPatch project for the current QuickPatch. For more information, see Creating a QuickPatch Project for an Existing QuickPatch.*

Welcome Panel

Project • *This information applies to QuickPatch projects.*

A QuickPatch project is recommended for installation authors who want to ship small, single updates to their users. QuickPatch authoring provides an alternative to creating a patch in the Patch Design view, even though it provides less customization. Fundamentally, both patch creation methods produce the same deliverable types: .msp and .exe files.

To create a QuickPatch project for an existing .msi file or an existing QuickPatch, use the Create New QuickPatch Wizard.

Note • *If you click Cancel or Exit in the wizard, QuickPatch project creation will be incomplete, and the QuickPatch project will not open in InstallShield.*

QuickPatch Project Base Panel

Project • *This information applies to QuickPatch projects.*

The QuickPatch Project Base panel is where you specify whether you would like to base your new QuickPatch project on an existing .msi file or on an existing QuickPatch project.

Panel Options

Table 12-21 • QuickPatch Project Base Panel Options

Option	Description
Based on an MSI package	Select this option to build a QuickPatch project for an existing .msi file. Select this option if this is the first QuickPatch created for the application.
Based an existing QuickPatch project	Select this option to build a QuickPatch project for an existing QuickPatch. This option creates a project that can patch existing QuickPatch projects as well as the original .msi file.  ***Note*** • *Attempting to create a QuickPatch of an already existing QuickPatch project without first building the existing QuickPatch causes unexpected behavior.*

If you select the Based on an MSI package option and click Next, the Original Setup Package panel opens. If you select the Based an existing QuickPatch project option and click Next, the Location of Existing QuickPatch panel opens.

Original Setup Package Panel

Project • *This information applies to QuickPatch projects.*

If you are building a QuickPatch project for an existing Windows Installer installation, use the Original Setup Package panel to specify the location of the .msi file. The original installation is the base installation for the new patch. The Create New QuickPatch Wizard creates a patch that can update this installation.

If the original installation is compressed, InstallShield creates an uncompressed image of that installation. The Original Setup Package panel enables you to specify the path for the uncompressed base image.

Note • *Once your project has been created and opened in InstallShield, there is no way to change the path to the base installation. Therefore, if you want to patch a different installation, you must run through the Create New QuickPatch Wizard again to create a new QuickPatch project.*

Panel Options

Table 12-22 • Original Setup Package Panel Options

Option	Description
Original Setup	Specify the location of the original/base installation or click the Browse button. The Create New QuickPatch Wizard creates a project that can validate this installation. If your original installation is uncompressed, click Finish to open your QuickPatch project in InstallShield.
Decompress Path	***Note*** • *This option is not available if the original installation is uncompressed.Specify a path that should contain the decompressed image. If you do not specify a path, the following location is used as the default: <ISProjectDataFolder>\BaseImage.*

Click Finish to close the Create New QuickPatch Wizard and open your new QuickPatch project in InstallShield.

Caution • *You cannot decompress installations that span multiple disks from a local or network drive. You will need to find an alternate method of decompressing the installation.*

Location of Existing QuickPatch Panel

Project • *This information applies to QuickPatch projects.*

If you are building a QuickPatch project for an existing QuickPatch, use the Location of Existing QuickPatch panel to specify its location. The QuickPatch that is created can be used to update the original installation, the existing QuickPatch project that you specified, and any selected intermediate QuickPatch projects.

Note • *Once your project has been created and opened in InstallShield, there is no way to change the path to the existing QuickPatch project. Therefore, if you want to patch a different QuickPatch project, you must run through the Create New QuickPatch Wizard again to create a new QuickPatch project.*

Panel Options

Existing QuickPatch Project

Specify the location of the QuickPatch project (.ism file) that you would like to patch or click the Browse button.

Create Table Wizard

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

The Create Table Wizard is launched when you are adding a table through the Direct Editor. This wizard collects information about your custom table, and then adds it to the table list.

Task: ***To launch the Create Table Wizard:***

1. In the View List under **Additional Tools**, click **Direct Editor**.
2. Right-click the **Table** explorer and click **Add Table**.

The Create Table Wizard consists of the following panels:

- Welcome
- Column Properties
- Summary

Welcome Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

The Welcome panel provides an introduction to the Create Table Wizard.

Task: ***To begin creating a table:***

1. In the table name box, enter a name.

   

   Windows Logo Guideline • *The Windows logo program requires that you avoid naming a custom table with the **MSI** (in uppercase, lowercase, or mixed-case letters). The MSI prefix is reserved for future use in new standard properties and tables.*

2. Click the **Add Column** button to proceed to next panel in the wizard.

Column Properties Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

On the Column Properties panel, you configure information for your custom table columns. The following properties are configurable:

Table 12-23 • Column Properties Panel Options

Property	Description
Column Name	Provide a name for the column.
Column Description	Type a description for the column.
Column Type	The available types are Binary, Long, Short, and String.
Nullable Check Box	Select this check box if this column's values are nullable.
Primary Key Check Box	Select this check box to make this column the table's primary key.
Localizable String Check Box	Select this check box if the string is localizable.

Table 12-23 • Column Properties Panel Options (cont.)

Property	Description
String Length	Provide a maximum length for string columns. Enter 0 if the string can be any length.
Min Value	For numeric columns, specify a minimum value.
Max Value	For numeric columns, specify a maximum value.
External Key Table	If this column references an external table, select it from this list
External Key Column	Select the column referenced in an external table.

Click Add Another Column to define additional columns, or click Done with Columns to proceed to the Summary panel.

Summary Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

In the Summary panel, you can review your new table's settings before you add it to your project. If you need to change any of the settings, click Back until you see the appropriate panel, and make the necessary changes.

Click Finish to add the custom table.

Custom Action Wizard

Project • *The Custom Action Wizard is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*

- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Custom Action Wizard enables you to add custom actions to your installation. These actions can call a .dll file function; launch an executable file (.exe); call a public method in a managed assembly; run VBScript, JScript, or InstallScript code; display an error message; set a directory or a property; and more.

Task: ***To launch the Custom Action Wizard:***

1. In the View List under **Behavior and Logic**, click **Custom Actions and Sequences** (in Basic MSI, InstallScript MSI, MSI Database, and Transform projects) or **Custom Actions** (in DIM, Merge Module, and MSM Database projects).
2. Right-click the **Custom Actions** explorer and click **Custom Action Wizard**.

The Custom Action Wizard consists of the following panels:

- Welcome
- Basic Information
- Action Type
- Function Definition
- Action Parameters
- Managed Method Definition
- In-Sequence Scripts
- Additional Options
- Respond Options
- Insert into Sequence
- Summary

Windows Logo • *If you are applying for the Windows logo, any custom actions in your installation must follow best practices guidelines for custom action creation. You can use the InstallShield validation suites and the Full MSI Validation Suite to verify whether your installation package meets most of the custom action–related logo requirements. However, some of the requirements cannot be verified through the validation suite. To learn more, see Guidelines for Creating Custom Actions that Meet Requirements of the Windows Logo Program.*

Welcome Panel

Project • *The Custom Action Wizard is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Welcome panel provides a brief introduction to the Custom Action Wizard. The wizard helps you build a custom action that will perform tasks not inherently supported by Windows Installer.

Windows Logo • *If you are applying for the Windows logo, any custom actions in your installation must follow best practices guidelines for custom action creation. You can use the InstallShield validation suites and the Full MSI Validation Suite to verify whether your installation package meets most of the custom action–related logo requirements. However, some of the requirements cannot be verified through the validation suite. To learn more, see Guidelines for Creating Custom Actions that Meet Requirements of the Windows Logo Program.*

Basic Information Panel

Project • *The Custom Action Wizard is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Basic Information panel lets you enter the name of your custom action and a description. This information is used only for your reference and is not displayed to the end user. The following settings are available on this panel.

Table 12-24 • Basic Information Panel Settings

Setting	Description
Name	Enter the name of your custom action. The name can contain only letters, numbers, underscores, or periods, and it must begin with a letter or an underscore.
Comment	Optionally enter comments about your action in this box. This information is for your reference only and is not displayed to the end user.

Action Type Panel

Project • *The Custom Action Wizard is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Action Type panel lets you specify the type of custom action that you want to create and where the code for that action is stored.

Panel Options

Type

The Type list provides options for several different ways of executing your custom action. For example, your custom action can call an executable file, run VBScript code, or call a function from a .dll file. The following options are available in this list:

Table 12-25 • Available Types of Custom Actions

Type	Project Type	Description
Call a function in a standard dynamic-link library	Basic MSI, InstallScript MSI	This custom action calls a function in a .dll file. Specify the function name, parameters, and return value in the Function Definition panel. ***Note*** • *If you call a function in a standard .dll file that is stored in the **Binary** table, you cannot use deferred or rollback execution for the action's In-Script Execution setting.* *If you call a function in a standard .dll file that is installed with the product and the action is scheduled as deferred (for the In-Script Execution setting), the .dll file that you are calling must be the component's key file.*
Call a function in a Windows Installer dynamic-link library	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action calls a function from a .dll file written specifically for Windows Installer. The .dll file's entry point must have a predefined parameter and return value.
Call a public method in a managed assembly	Basic MSI, DIM, InstallScript MSI, Merge Module	This custom action calls a public method in a managed assembly that is written in managed code such as Visual Basic .NET or C#. For more information, see Calling a Public Method in a Managed Assembly.
Display error message and abort	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action displays a specified error message, returns failure, and ends the installation.

Table 12-25 • Available Types of Custom Actions (cont.)

Type	Project Type	Description
Launch an executable	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action launches an executable file.
Launch another .msi package	Basic MSI, InstallScript MSI, MSI Database, Transform	Also known as a nested installation, this type of custom action launches a second .msi package during your installation.  ***Important*** • *Nested installations is a deprecated feature of the Windows Installer. Applications installed with nested installations sometimes fail because they are difficult for end users to service correctly. Microsoft Corporation recommends that you avoid using nested installations and nested-installation custom actions to install products that are intended to be released to the public. To learn more, see Concurrent Installations on the MSDN Web site.*
Run 64-bit JScript code	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs 64-bit JScript code instead of a compiled language such as C or Visual Basic.
Run PowerShell code	Basic MSI, InstallScript MSI	This custom action runs a PowerShell script (.ps1). For target system requirements, as well as other information about this type of custom action, see Calling a PowerShell Custom Action.
Run 64-bit VBScript code	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs 64-bit VBScript code instead of a compiled language such as C or Visual Basic.
Run InstallScript code	Basic MSI, InstallScript MSI, Merge Module	This custom action calls a function from your InstallScript code.

Table 12-25 • Available Types of Custom Actions (cont.)

Type	Project Type	Description
Run JScript code	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs JScript code instead of a compiled language such as C or Visual Basic.
Run VBScript code	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs VBScript code instead of a compiled language such as C or Visual Basic.
Set a property	Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action sets a property in the **Property** table. This is useful if you need to get information from the end user and store it so that it can be used later in your installation.
Set a directory	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action sets a directory in the **Directory** table at run time. For example, if you want to create a temp directory that is a subdirectory of the installation directory selected by the end user, you can use this option to set that new temp directory for use later in the installation.
Terminate a process by identifier	Basic MSI, InstallScript MSI	This custom action kills a process that has a specific process identifier (PID). ***Important*** • *When you create this type of custom action, you also need to define a property that identifies the PID that you want to stop. To learn more see Calling a Kill-Process Custom Action.*

Table 12-25 • Available Types of Custom Actions (cont.)

Type	Project Type	Description
Terminate a process by name	Basic MSI, InstallScript MSI	This custom action kills a process that has a specific executable file name.  ***Important*** • *When you create this type of custom action, you also need to define a property that identifies the name of the process that you want to stop. To learn more see Calling a Kill-Process Custom Action.*

Location

The code that your custom action calls can be stored in one of several places. Select the location where the installer should look for that code. Note that some custom action types do not support some of the locations. In addition, the Location setting is not applicable for the error custom action.

Table 12-26 • Possible Locations for Storing Custom Actions

Location	Custom Action Type	Description
An application that is advertised or already installed	Launch another .msi package	Select this location to uninstall any Windows Installer applications that are currently installed on the target system—for example, applications that you previously installed with a custom action. You should have this custom action launch only on uninstallation of your main installation.
Destination machine search path	Standard DLL	When you call a function in a standard .dll file, the file can be present in the target system's search path.
Included within your main setup	Launch another .msi package	Select this location if the .msi file that you want to launch is stored within your main installation package.
Installed with the product	Standard DLL, MSI DLL, Managed code, Executable file, PowerShell code, VBScript, 64-bit VBScript, JScript, 64-bit JScript	Select this location to call code from a file or executable file that is going to be installed on the target system.

Table 12-26 • Possible Locations for Storing Custom Actions (cont.)

Location	Custom Action Type	Description
Stored directly in the custom action	VBScript, 64-bit VBScript, JScript, 64-bit JScript	Select this location to enter code directly into the wizard, without having to associate a file.
Stored in the Binary table	Standard DLL, MSI DLL, Managed code, Executable file, PowerShell code, VBScript, 64-bit VBScript, JScript, 64-bit JScript	Select this location to have your code base stored in the **Binary** table. This option is useful if you do not want the file to be installed on the target system. ***Note*** • *For the managed-code type of custom action, InstallShield creates a C++ Windows Installer wrapper DLL for your .NET assembly at build time. The wrapper DLL includes your assembly, as well as the information that is required to mediate, load, and run the assembly. InstallShield stores the wrapper DLL in the **Binary** table.*
Stored in the Directory table	Executable file	Select this location to reference a path—without the file name—that is stored in the **Directory** table.
Stored in the Property table	Managed code, Executable file, VBScript, 64-bit VBScript, JScript, 64-bit JScript	Select this location to reference a full path to the executable that you want to launch. The path is stored in the **Property** table.
Stored on the source media	Launch another .msi package	Select this location if the .msi file that you want to launch is stored on the same media as your main installation package.

Function Definition Panel

The Function Definition panel is where you specify the parameters for the entry-point function in your standard .dll file.

This panel is displayed only if you selected **Call a function in a standard dynamic-link library** in the Action Type panel of the Custom Action Wizard.

Note • *The function must use the __stdcall calling convention. Functions with more than one parameter will not work properly if this convention is not used.*

Panel Options

Name

Specify the name of the function that you want to call. The .dll file can have a single entry point for each custom action.

Arguments

Build the list of arguments—in order—that you want to pass to the function.

First, click the last row of the Arguments list to add a new argument. Next, complete the Type, Source, and Value columns for each argument.

Type

In this list, select the data type of the parameter. Note that there are two special cases for argument types, and these cases are identified below.

Task: ***To initialize a pointer to null:***

1. In the **Type** list, select **POINTER**.
2. In the **Source** list, select **Constant**.
3. In the **Value** list, select **NULL**. Do not enter 0 (zero) instead of NULL, because it is interpreted as a pointer pointing to the number 0.

Task: ***To set a handle to the .msi database or the Windows Installer window:***

1. In the **Type** list, select **HANDLE**.
2. In the **Source** list, select **Constant**.
3. In the **Value** list, select **MsiHandle** or **MsiWindowHandle**, depending whether you want a handle to the .msi database or the Windows Installer window.

Source

Indicate how you want to pass the data to the function. The following options are available in this list.

Table 12-27 • Options for Passing Data to a Function

Option	Description
Constant	The value that you want to pass is stored as a literal in your installation project. After you select Constant for the argument's source, enter its definition in the Value column. This "constant" does not require a name or identifier. Do not enclose string literals in quotation marks.
in Property	Select in Property for the source to specify the name of a Windows Installer property whose value will be passed to the function. This type of argument is suitable for a ByVal parameter.
inout Property	This source type is similar to a ByRef parameter. Select inout Property for the source to specify the name of a Windows Installer property whose value will be passed to the function and can be modified by the function.
out Property	An out property serves as a placeholder for a value that can be set by the function. No value is passed to the function, but the function requires the name of a property whose value it can modify.

When you select a property for the argument's source, you must specify the name of the property in the Value column.

Value

The value can be one of two types:

- A number or string literal that you enter when the argument's source is a constant
- A Windows Installer property when the argument's source is a property

Note • *When you set the Type list to HANDLE and the Source list to Constant, the Value column contains two options: MsiHandle and MsiWindowHandle. These constants can be used to get a handle to either the .msi database or the Windows Installer window.*

When the source is a property, the Value list provides the name of every property in the Property Manager. You can select an existing property or enter a new name, in which case the new property is added to the Property Manager.

Remember that a property is merely a container for a value. If your parameter stores its value in an in property or inout property, ensure that you specify a value for the property in the Property Manager.

(Context Menu)

The context menu provides you with options for working with your arguments. To access the context menu, right-click an argument in the Arguments grid. The context menu options are described below.

Table 12-28 • Context Menu Options

Option	Description
Add	Click Add to add an argument to the Arguments grid.
Remove	Click Remove to delete the argument.
Move Up	The arguments must be in the precise order in which the function expects to receive them. Click Move Up to place the argument higher in the list.
Move Down	Click Move Down to place the argument lower in the list.

Return Type

Select the data type of the function's return value. If you do not need to check the return value, you can accept void.

Return Property

Select the name of a property whose value will be set to the function's return value. If you are going to check the return value elsewhere in your installation, you may want to initialize the return property's value.

Note • *The property cannot be set to the function's return value unless the action is configured for immediate execution. Thus, if the action is scheduled for deferred, rollback, or commit execution, the Return Property setting is ignored at run time.*

Silent mode

If you want the installation to suppress a warning message whenever the custom action fails to load the .dll file and call the function, select this check box.

Action Parameters Panel

The Action Parameters panel is where you specify the actual file that you call in your custom action. For example, if you call an executable file, you can browse to that file and add any command-line options.

This panel is not displayed if your custom action is running JScript or VBScript code that is stored directly within the action.

Panel Options

Source

This box behaves differently depending on the options you selected for the Type and Location lists on the Action Type panel. The following table shows the source values that you can use, depending on the type and location of each custom action.

Table 12-29 • Source Values for Custom Actions

Custom Action Type	Instructions for Setting the Source
Call a function in a standard DLL	Set the source for this custom action type according to its location. • **Destination machine search path**—Browse to the location of the .dll file. The wizard uses only the file name and not the path. • **Installed with the product**—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .dll file is located. Then, in the list of files, select the standard .dll file. • **Stored in the Binary table**—Browse to the location of the .dll file.
Call a function in a Windows Installer DLL	Set the source for this custom action type according to its location. • **Installed with the product**—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .dll file is located. Then, in the list of files, select the Windows Installer .dll file. • **Stored in the Binary table**—Browse to the location of the .dll file.
Call a public method in a managed assembly	Set the source for this custom action type according to its location. • **Installed with the product**—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .NET assembly is located. Then, in the list of files, select the assembly. • **Stored in the Binary table**—Browse to the location of the .NET assembly. • **Path referencing a Property**—Select a Windows Installer property in the list, type the name of a new property, or type the name of a directory in the **Directory** table. The property or directory name must be enclosed within square brackets ([]). You can add a string after the property if appropriate. The resulting path should indicate the location of the .NET assembly.
Display error message and abort	The Source setting is disabled for the error custom action, since it is not applicable to this type of custom action.

Table 12-29 • Source Values for Custom Actions (cont.)

Custom Action Type	Instructions for Setting the Source
Launch an executable	Set the source for this custom action type according to its location. • **Installed with the product**—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the executable file is located. Then, in the list of files, select the executable file. • **Stored in the Binary table**—Browse to the location of the .exe file. • **Stored in the Property table**—Select a Windows Installer property in the list. If you specify the name of a new property, you must later open the Property Manager, enter the property, and specify a value that points to the .exe file. • **Stored in the Directory table**—Select one of the standard folders in the list, or enter the name of a new entry into the **Directory** table—which you can later edit in the Direct Editor. The directory that you specify is the working directory for the target that you specify in the Target box.
Launch another .msi package	Set the source for this custom action type according to its location. (For more information about custom actions that launch another .msi package, see Nested Installations.) • **Included within your main setup**—Browse to the location of the "child" .msi file. The Custom Action Wizard automatically creates the appropriate entries in the Binary table. • **Stored on the source media**—Browse to the location of the "child" .msi file. The Custom Action Wizard automatically adds this file to the Disk1 folder in the Support Files view. • When you build a release, InstallShield copies the .msi file (but not its uncompressed application and support files) to the release location. • **An application that is advertised or already installed**—Browse to the location of the "child" .msi file. The Custom Action Wizard extracts the product code from the .msi package that you select.
Run InstallScript code	You cannot change the location of the InstallScript file. For an InstallScript custom action, you must select the name of the entry-point function in the list.

Table 12-29 • Source Values for Custom Actions (cont.)

Custom Action Type	Instructions for Setting the Source
Run JScript or 64-bit JScript code	Set the source for this custom action type according to its location. • **Installed with the product**—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .js file is located. Then, in the list of files, select the .js file. • **Stored in the Binary table**—Browse to the location of the JScript source file. • **Stored in the Property table**—Select one of the properties in the list. If you specify a new property, you must later open the Property Manager, enter the property name, and add the JScript code as the value of the property. • **Stored directly in the custom action**—You can use the In-Sequence Scripts panel, which provides a text editor for your JScript code.  ***Note*** • *The In-Sequence Scripts panel is provided for backward compatibility only. A superior script editor is available in the Script tab of the Custom Actions and Sequences view (and the Custom Actions view).*
Run PowerShell code	Set the source for this custom action type according to its location. • **Installed with the product**—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .ps1 file is located. Then, in the list of files, select the .ps1 file. • **Stored in the Binary table**—Browse to the location of the PowerShell file (.ps1).

Table 12-29 • Source Values for Custom Actions (cont.)

Custom Action Type	Instructions for Setting the Source
Run VBScript or 64-bit VBScript code	Set the source for this custom action type according to its location. • **Installed with the product**—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .vbs file is located. Then, in the list of files, select the .vbs file. • **Stored in the Binary table**—Browse to the location of the VBScript source file. • **Stored in the Property table**—Select one of the properties in the list. If you specify a new property, you must later open the Property Manager, enter the property name, and add the VBScript code as the value of the property. • **Stored directly in the custom action**—You can use the In-Sequence Scripts panel, which provides a text editor for your VBScript code.  ***Note*** • *The In-Sequence Scripts panel is provided for backward compatibility only. A superior script editor is available in the Script tab of the Custom Actions and Sequences view (and the Custom Actions view).*
Set a directory	You cannot set the location when setting a Directory. You must select the name of a folder in the list, or enter a new name and specify it in the **Directory** table (available in the Direct Editor).
Set a property	You cannot set the location when setting a property. You must select the name of the property in the list, or enter a new name and specify it in the Property Manager.

Target

The value for the target depends on the custom action type.

Table 12-30 • Target Options

Custom Action Type	Instructions for Setting the Target
Call a function in a standard DLL	For the standard DLL type of custom action, the Target box is read-only. It displays the function definition that is specified on the Function Definition panel.

Table 12-30 • Target Options (cont.)

Custom Action Type	Instructions for Setting the Target
Call a function in a Windows Installer DLL	Use this box to enter the name of the function that you want to call. You do not need brackets or any other special formatting, but note that the function name is case-sensitive. A Windows Installer .dll function has a predefined parameter and return type. For more information, see Passing Parameters to a DLL File Function in a Custom Action.
Call a public method in a managed assembly	For a managed assembly type of custom action, the Target box is not applicable. The Managed Method Definition panel, which is the next panel in the wizard for this type of custom action, is where you identify the method that you want to be invoked.
Display error message and abort	Type the error message text that should be displayed when the custom action's conditions are met on the target system. As an alternative, you can type a property name whose value contains the error text. The property name must be enclosed within square brackets ([]).
Launch an executable	If you are launching an executable file, you can enter command-line arguments in this box. For example, if you want to launch a readme file that is installed with you installation, you should enter Notepad.exe [INSTALLDIR]Readme.txt.
Launch another .msi package	Specify any public properties that you would like to pass to the .msi package.
Run InstallScript code	The target value is not applicable for InstallScript custom actions.
Run PowerShell code	The target value is not applicable for PowerShell custom actions.
Run JScript/64-bit JScript or VBScript/64-bit VBScript code	Enter the function name that you want to call.
Set a property or directory	Enter a formatted text string that evaluates to the new value of the property that you selected or created. See the Windows Installer Library for more information on formatted text strings.

Managed Method Definition Panel

The Managed Method Definition panel is where you specify the public class method in the managed assembly. The Custom Action Wizard displays this panel only if you selected **Call a public method in a managed assembly** in the Action Type panel.

The Managed Method Definition panel has the following settings.

Table 12-31 • Settings on the Managed Method Definition Panel

Setting	Description
Class	Enter the public class with which the method is associated. As an alternative, click the Browse button to display the Method Browser dialog box. This dialog box lets you select the public method from the list of public classes that are available in the managed assembly that you selected on the Action Parameters panel.  ***Note*** • *The browse functionality is available only if the .NET Framework is installed. In addition, it is available only if the location of the managed assembly is set to the* ***Binary*** *table or installed with the product—not if the assembly's path references a property or a directory in the* ***Directory*** *table.* *Also note that the browse functionality is available for only 32-bit assemblies and for Microsoft intermediate language (MSIL) files. It is not available for 64-bit assemblies.*
Method	Enter the public method that you want your installation to call. As an alternative, click the Browse button to display the Method Browser dialog box. This dialog box lets you select the public method from the list of public classes that are available in the managed assembly that you selected on the Action Parameters panel.  ***Note*** • *The browse functionality is available only if the .NET Framework is installed. In addition, it is available only if the location of the managed assembly is set to the* ***Binary*** *table or installed with the product—not if the assembly's path references a property or a directory in the* ***Directory*** *table.* *Also note that the browse functionality is available for only 32-bit assemblies and for Microsoft intermediate language (MSIL) files. It is not available for 64-bit assemblies.*
Use custom method signature	To use the default method signature, clear this check box. For the default method signature, the installation calls the method with an MsiHandle parameter if the signature has one or more void parameters, or if it has a single MsiHandle parameter. To use a custom method signature, select this check box. Then specify the arguments and return property as needed. If you specified a class and a method by clicking the Browse button, InstallShield automatically adds any associated parameters. Specify the value for each parameter that you want to pass to the method. For detailed information about specifying the method's signature, see Specifying the Signature for a Managed Method in an Assembly Custom Action.

Table 12-31 • Settings on the Managed Method Definition Panel (cont.)

Setting	Description
Arguments	If you are using a custom method signature, specify the list of arguments that you want to pass to the selected method. If you specified a class and a method by clicking the Browse button, InstallShield automatically adds any associated parameters to the grid in this area. To use a property as an argument, click the value field for the parameter, and then select the property from the list. The context menu provides you with options for working with arguments. To access the context menu, right-click an argument in the Arguments grid. The available context menu commands are: • **Add**—Add an argument to the grid. • **Remove**—Delete an argument from the grid. This grid is available only if the **Use custom method signature check box** is selected. For more information about specifying the arguments, see Specifying the Signature for a Managed Method in an Assembly Custom Action.
Return Property	Select the name of the property whose value will be set to the method's return value. This list is available only if the **Use custom method signature check box** is selected. For more information about specifying the return property, see Specifying the Signature for a Managed Method in an Assembly Custom Action.

In-Sequence Scripts Panel

Note • *The In-Sequence Scripts panel is provided for backward compatibility only. A superior script editor is available in the Script tab of the Custom Action and Sequences view (and the Custom Actions view).*

If your custom action calls JScript or VBScript code that is stored directly in the custom action, you can enter the script in the box that is displayed. Type your code into the text box and click Next to continue. No validation is performed on your code to check syntax.

Additional Options Panel

The Additional Options panel lets you specify how the custom action thread should be processed and whether the custom action should be run only during patch uninstallation.

The Additional Options panel has the following settings.

Table 12-32 • Settings on the Additional Options Panel

Setting	Description
Return Processing	Specify how the custom action thread should be processed. Valid options for the Return Processing list are: • Asynchronous (No wait for completion) • Asynchronous (Wait for exit code) • Synchronous (Check exit code) • Synchronous (Ignores exit code) These flags are used to specify that the main and custom action threads run synchronously (the installer waits for the custom action thread to complete before resuming the main installation thread) or asynchronously (the installer runs the custom action simultaneously as the main installation continues). Note that some options are not applicable to some types of custom actions. Only options that pertain to the selected type of custom action are available in this list.
Run During Patch Uninstall	 ***Project*** • *If you are working on a project in Direct Edit mode, this setting is not applicable unless the database schema is a minimum of 405 (for Windows Installer 4.5 or later).* This check box lets you specify whether Windows Installer should run the custom action only when a patch is being uninstalled. You can select this check box for a custom action in an .msi package. You can also select this check box for a new custom action that is added by a patch. However, this check box should not be selected for a custom action that is being added or removed by a patch to an existing custom action. This check box is cleared by default. When Windows Installer 4.5 runs the patch uninstall custom action, it uses the custom action in the patch that is being uninstalled.  ***Note*** • *Windows Installer 4.5 includes support for this setting, but Windows Installer 4.0 and earlier do not. Therefore, if you select Yes for this setting and some target systems may have Windows Installer 4.0 or earlier, add a condition to this custom action to prevent Windows Installer 4.0 and earlier from running it. Otherwise, Windows Installer 4.0 and earlier would call the custom action during the installation, repair, or update of the package.* For the condition, use the **MSIPATCHREMOVE** property. For more information, see MSIPATCHREMOVE in the Windows Installer Help Library.

Respond Options Panel

The Respond Options panel lets you specify how your custom action will respond to the rest of the installation.

Table 12-33 • Respond Options Panel Options

Option	Description
In-Script Execution	Specify when you would like your action to execute. • **Immediate execution**—Select this option to have the action execute when it is encountered in the sequence. • **Immediate execution (Terminal Server Aware)**—Select this option to have the action execute when it is encountered in the sequence. The custom action impersonates the user during per-machine installations on terminal server machines. • **Deferred execution**—Select this option to have your action wait until the script begins to run. • **Rollback execution**—Select this option to set your action to execute only during rollback. If you changed something to the system during the execute sequence using a custom action, you need to undo that change with a rollback custom action. • **Rollback execution (Terminal Server Aware)**—Select this option to set your action to execute only during rollback. If you changed something to the system during the execute sequence using a custom action, you need to undo that change with a rollback custom action. The custom action impersonates the user during per-machine installations on terminal server machines. • **Commit execution**—Select this option to have your action delayed until the installation has successfully completed the installation script. • **Commit execution (Terminal Server Aware)**—Select this option to have your action delayed until the installation has successfully completed the installation script. The custom action impersonates the user during per-machine installations on terminal server machines. • **Deferred execution in system context**—Select this option if your action needs elevated system privileges for performing tasks such as editing the registry. The action is deferred until the script begins to run. When the action does run, it runs with elevated system privileges. For more information on this property, see In-Script Execution.  ***Note*** • *If you are calling a function in a standard dynamic-link library that is stored in the* ***Binary*** *table, you cannot use deferred or rollback execution for the action's In-Script Execution property.*

Table 12-33 • Respond Options Panel Options (cont.)

Option	Description
Execution Scheduling	Specify how many times you want the action to run. For example, if an action is listed in both the user interface and execute sequences, it can be set to run both times, or it can run only once. Available options are: • **Always execute**—The action runs every time it is encountered. Therefore, it could run in the user interface sequence and again in the execute sequence. • **Execute only once**—The action runs only once—even if it exists in both the user interface and Execute sequences. The action is skipped in the execute sequence if the user interface sequence has run.  ***Note*** • *The **Execute only once** option does not work for InstallScript MSI projects. If your custom action exists in both the user interface and execute sequences, it is executed twice. This is because—in an InstallScript MSI project—the InstallScript engine executes the user interface sequence and Windows Installer executes the execute sequence.* • **Execute only once per process**—The user interface sequence and the execute sequence run in separate processes. Select this option to force your custom action to launch at least once in the user interface sequence and once in the execute sequence. • **Always execute at least once on the client**—This action executes at least one time on the client. If you selected anything other than Immediate execution in the In-Script Execution setting, the Execution Scheduling setting is not available and is set to Always execute.

Insert into Sequence Panel

In the Insert into Sequence panel, you specify where in the installation sequence you want to insert the custom action that the wizard is creating. You can insert your custom action into one sequence or into multiple sequences.

Panel Options

Sequences

Select where in the Installation User Interface or Installation Execute sequence you want to insert your custom action.

Conditions

Click the Browse button to launch the Condition Builder dialog box, where you can create a condition that will be used to determine whether your custom action is launched.

Summary Panel

In the Summary panel, you can review your custom action's settings before you add it to your installation. If you need to change any of the settings, click Back until you see the appropriate panel, and make the necessary changes.

When your action is complete, click Finish.

You can now insert this custom action into a sequence or specify it as the argument for a dialog's control event.

Database Import Wizard

***Note** • The import database functionality applies to the Microsoft SQL Server Database. Oracle users should refer to the Oracle Web page on Oracle Database Utilities for information on utilities that may work in conjunction with InstallShield.*

The Database Import Wizard helps you import your Microsoft SQL Server Database and generate a SQL script file from the database based on options you, the installation author, determine. The wizard can be launched from the following nodes of the SQL Scripts explorer when you right-click in the SQL Scripts view:

- SQL Servers
- New Connection
- New Script

***Note** • InstallShield supports SQL Server 7.0 and later.*

The following wizard panels are associated with the Database Import Wizard:

- Welcome
- SQL Server
- SQL Database
- Database Tables
- Objects to Script
- Scripting Options
- Advanced Scripting Options
- Summary

Welcome Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

The Database Import Wizard helps you import your Microsoft SQL Server Database and generate a SQL script file from the database based on options you, the installation author, determine.

The second paragraph of this wizard panel indicates what the wizard will create.

SQL Server Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

Server Name

Specify a SQL Server from the list of servers below or click Browse to select the location of a server on your network.

Note • *InstallShield supports SQL Server 7.0 and later.*

Importing a database and browsing for a SQL Server requires ODBC driver version 3.80 or later.

With Windows NT authentication using the network login ID

This is the recommended authentication method. SQL Servers must be set up to work with this method. The currently logged in user and the user's credentials will be used.

With Server authentication using the login ID and password below

If you select this option, you will have to enter the login ID and set the password for a particular SQL Server.

SQL Database Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

Database Name

Choose a database found on the SQL Server you selected in the SQL Server panel. A script file will be generated for the database you select in the Database Name drop down list.

Script Display Name

Type a valid identifier for the script file which will be generated from the SQL database you selected in the Database Name drop down list. The script display name is what is displayed in the explorer in the SQL Scripts view.

Note • *When the generated script is executed on a target machine, this database will be automatically created if not found on the target server.*

Database Tables Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

In this panel, determine which tables in the database you want to include or exclude in the generated script file. If you choose to include or exclude certain tables, then from the Available Tables list, click the table(s) you want, and then click the “>” button to mark the tables.

Note • *Selecting the Include All Tables option guarantees that new tables added to the database are imported every time you reimport the database.*

Objects to Script Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

The Objects to Script panel is where you select the objects that you want to import from the database.

Objects

Determine which objects to import from your SQL Database. Many of these objects represent and expose attributes of a single Microsoft SQL Server database object.

Note • *The Records option is unavailable if no tables are selected to be imported in the Database Tables wizard panel.*

Scripting Options Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

The Scripting Options panel in the Database Import Wizard is where you specify whether your script should be compatible with Microsoft SQL Server version 7.0. Other options on this panel let you specify whether descriptive headers, extended properties, and other information should be included in your script. Transact-SQL statements are generated as needed.

General Options

Table 12-34 • General Options

Option	Description
Create Only If Missing	To generate a Transact-SQL statement that creates a component prefixed by a check for existence, select this check box. When the script is executed, a component is created only if a copy of the named component does not exist. ***Note*** • *Currently, this option applies only to tables.*
Drop First If Exists	To generate a Transact-SQL statement that removes a referenced component, select this check box. The script tests for the existence of the component prior to an attempt to remove the component.
Include Descriptive Headers	To include explanatory header text before each Transact-SQL statement in the script, select this check box.
Include Extended Properties	To include extended stored procedures in the SQL scripts that are created, select this check box.
Only Script 7.0 Compatible	To generate a script that is compatible with Microsoft SQL Server version 7.0, select this check box. If you select this check box, the following SQL Server 2000 options are ignored: • Column level collation • User-defined functions • Extended property • INSTEAD OF trigger on tables and views • Indexes on views (indexed views) • Indexes on computed columns • Reference permissions on views • Descending indexes

Table Scripting Options

Table 12-35 • Table Scripting Options

Setting	Description
Script Indexes	To generate a Transact-SQL statement that creates indexes that currently exist for any selected tables, select this check box. ***Note*** • *Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.*
Script Full-Text Indexes	To generate a Transact-SQL statement that creates full-text indexes, select this check box. Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.
Script Triggers	To generate a Transact-SQL statement that creates triggers that exist for any selected tables, select this check box. ***Note*** • *Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.*
Script Check Constraints	To generate a Transact-SQL statement that creates check constraints that exist for any selected tables, select this check box. ***Note*** • *Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.*
Script Foreign Keys	To generate a Transact-SQL statement that creates FOREIGN keys that exist for any selected tables, select this check box. ***Note*** • *Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.*
Script Primary Keys	To generate a Transact-SQL statement that creates PRIMARY keys that exist for any selected tables, select this check box. ***Note*** • *Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.*

Table 12-35 • Table Scripting Options (cont.)

Setting	Description
Script Defaults	To generate a Transact-SQL statement that creates defaults that exist for any selected tables, select this check box. ***Note*** • *Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.*

Advanced Scripting Options Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

The Advanced Scripting Options panel lets you specify security scripting options, as well as the file format.

Security Scripting Options

Table 12-36 • Security Scripting Options

Setting	Description
Script database	Generate a Transact-SQL statement to create a script of the existing database schema.
Script database users and database roles	Generate a Transact-SQL statement to create all users and roles that have access to the database.
Script SQL Server logins (Windows NT and SQL Server logins)	Generate a Transact-SQL statement to create all logins that currently have access to the server.
Script object-level permissions	Generate a Transact-SQL statement to create all grant, revoke, and deny permissions that currently exist for each object selected on the Objects to Script panel.

File Format

Table 12-37 • File Format Options

Option	Description
Windows Text (ANSI)	This is the default option. If you want the script to be in ANSI format, select this option.
International Text (Unicode)	International databases can use the Unicode file format for the script, if necessary. If you select this option, Unicode BOM encoding for your SQL script.

Note • *Consult your SQL-DMO help reference for more detailed information about script formatting and file formats.*

Summary Panel

Note • *The import database functionality applies to the Microsoft SQL Server Database.*

The Summary panel provides a summary of all the wizard settings.

Check the Regenerate Script at Build option if you want to regenerate the script file each time you build your installation project.

Note • *The Regenerate Script at Build option will slow down your build since a connection to the server needs to be established, and the database needs to be reimported every time you rebuild your project.*

Click Finish to generate the script file (.sql). Once the script is generated, you can edit it from the script's Script tab in the SQL Scripts view.

Device Driver Wizard

Project • *The Device Driver Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*

The Device Driver Wizard simplifies the process of installing device drivers from a Windows Installer–based installation using the Driver Installation Frameworks for Applications (DIFxApp) from Microsoft. The wizard creates the necessary table and entries, custom actions, feature, and components.

For the latest available information on the Driver Installation Frameworks, visit Windows Hardware and Driver Central at http://www.microsoft.com/whdc/.

Task: ***To open the Device Driver Wizard, do one of the following:***

- In the **Setup Design** view, right-click a feature and then click **Device Driver Wizard**. The feature that the wizard creates will be a subfeature of the selected feature.
- On the **Project** menu, click **Device Driver Wizard**. The feature that the wizard creates will be a root-level feature.

The following panels are associated with the Device Driver Wizard:

- Welcome
- Device Driver Package
- Device Driver Files
- Device Driver Information
- Project-Wide Device Driver Information
- Summary

Welcome Panel

The Device Driver Wizard simplifies the process of installing device drivers from a Windows Installer–based installation using Microsoft's Driver Install Frameworks for Applications (DIFxApp). The wizard creates the necessary table and entries, custom actions, feature, and components.

Tip *• You can disable the Welcome panel by choosing the Tools menu's Options command and clearing the Options dialog box's* ***User Interface tab's Show Welcome panel in IDE wizards*** *option.*

Device Driver Package Panel

In the Device Driver Package panel, specify the package file (.inf file) for the device driver that you want to add. Type the fully qualified file name of the package, or click the Browse button to navigate to the file.

Note *• Clicking Next displays a warning message if the specified package file does not specify a security catalog, if the specified security catalog is missing, or if the package file has been modified or corrupted since it was signed. For more information, visit http://www.microsoft.com/whdc/winlogo/drvsign/drvsign.mspx.*

Device Driver Files Panel

The Device Driver Files panel displays the files that the wizard has detected as belonging to the device driver.

Device Driver Information Panel

In the Device Driver Information panel, you can view the device driver type that is specified in your .inf file, and optionally select any of the following runtime options:

Always overwrite any existing device driver

Replace any existing driver for the device with this driver. If this check box is cleared and a driver already exists for the device, your driver is not installed.

Do not show Connect Device to Computer dialog

To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, select this option.

Do not create Add or Remove Programs entry for device driver

If you select this check box, the installation does not create an Add or Remove Programs entry for the device driver. If you clear this check box, the installation does create an Add or Remove Programs entry.

DIFxApp does not support this feature on Windows Vista and later.

Install unsigned driver files and drivers with missing files

By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, select this check box. Selecting this check box enables you to fully test drivers more easily before shipping final signed versions.

Remove binary files associated with driver during uninstall

By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, select this check box.

If you select this check box, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.

Caution • *Select the* ***Remove binary files associated with driver during uninstall*** *check box only if you can verify that the driver's binary files are not required by any other driver package or application.*

Device Driver Type

The Device Driver Information panel displays a device driver type, which is determined in the following way:

- If the [Version] section of the package file (.inf file) has a DriverPackageType entry whose value is one of those in the following table, the corresponding driver type is displayed.
- Otherwise, the displayed device driver type is Plug and Play driver.

Table 12-38 • DriverPackageType Values and Corresponding Driver Types

DriverPackageType Value	Corresponding Driver Type
ClassFilter	Class filter driver
FileSystem	File system driver
FileSystemFilter	File-system filter driver
KernelModule	Export driver
KernelService	Kernel service driver
Network	Network driver
PlugAndPlay	Plug and Play driver

InstallShield uses Microsoft Windows Driver Install Framework (DIFx) to install drivers. When your device driver is installed, DIFx treats it as being a device driver of the type that is displayed in the Device Driver Information panel.

To change the device driver type, change the value of the DriverPackageType entry in the package file's [Version] section to the desired value from the preceding table, and then re-sign the package file. (For more information on signing package files, visit http://www.microsoft.com/whdc/winlogo/drvsign/drvsign.mspx.)

Project-Wide Device Driver Information Panel

The settings that you configure on the Device Driver Information panel are applied to all device drivers in this project. The settings are:

Include all localized installation runtime dialogs

When this check box is selected, the installation uses a custom action runtime .dll that includes dialogs and text for the following languages:

- Arabic (Saudi Arabia)
- Chinese (People's ROC)
- Chinese (Taiwan)
- Czech (Czech Republic)
- Danish (Denmark)
- Dutch (Netherlands)
- English (United States)
- Finnish (Finland)
- French (France)
- German (Germany)
- Greek (Greece)
- Hebrew (Israel)
- Hungarian (Hungary)
- Italian (Italy)
- Japanese (Japan)
- Korean (Korea)
- Norwegian (Bokmål) (Norway)
- Polish (Poland)
- Portuguese (Brazil)
- Portuguese (Portugal)
- Russian (Russia)
- Spanish - Modern Sort (Spain)

- Swedish (Sweden)
- Turkish (Turkey)

If you clear this check box, the installation uses runtime dialogs for English only. The English runtime .dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, clear this check box.

Device driver machine architecture

This area has several options. Select the appropriate option.

- Device driver targets 32 bit machines
- Device driver targets Itanium 64 bit machines
- Device driver targets AMD 64 bit machines

Summary Panel

The Summary panel displays the options that you have specified in the wizard. Click the Finish button to complete the wizard.

Dialog Wizard

InstallShield provides a Dialog Wizard that enables you to add a new dialog to your installation and configure it by stepping through the wizard panels.

Task: ***To launch the Dialog Wizard:***

1. Open the **Dialogs** view.
2. In the **Dialogs** explorer, right-click **All Dialogs** and then click **New Dialog**. The Dialog Wizard launches.
3. Follow the wizard panels.

The following panels are associated with the Dialog Wizard:

- Welcome
- Dialog Template
- User Interface Sequence
- Dialog Position and Condition

Welcome Panel

The Welcome panel welcomes you to the wizard and briefly describes the Dialog Wizard's function. Click Next to begin using the wizard.

Dialog Template Panel

Use the Dialog Template panel to select a default template or an existing dialog on which to base your new dialog.

Panel Options

List of Dialogs

The box in the Dialog Template panel lists dialogs that are in the directory specified in the Dialog Location box on the File Locations tab of the Options dialog box. It may also include dialogs that are stored in a repository. In addition, several default dialog templates are listed:

Table 12-39 • Dialog Template Options

Dialog Template	Description
Blank Dialog	Creates a blank dialog with no dialog controls. ***Project*** *• In InstallScript and InstallScript MSI projects, this dialog template does not have a hidden control that has a Control Identifier value of 2; the NewScriptBasedDialog and NewSkinnableDialog templates do include this control. To enable end users to cancel the installation by clicking the close button in the upper-right corner of the InstallScript dialog, a custom dialog must have a button control whose Control Identifier property is set to this value. For more information, see Using InstallScript to Implement Custom Dialogs.*
Exterior Wizard Panel	***Project*** *• This dialog template is available for Basic MSI projects.* Creates a dialog with a large bitmap along the left side of the dialog—similar to the formatting of the Welcome dialog.
Interior Wizard Panel	***Project*** *• This dialog template is available for Basic MSI projects.* Creates a dialog with a small bitmap at the top of the dialog.
Logon Information Panel and Associated Child Dialogs	***Project*** *• This dialog template is available for Basic MSI projects.* *For information on adding the Login Information dialogs to Basic MSI, InstallScript, or InstallScript MSI projects, see Adding the Ability to Create or Set an Existing User Account.* Creates a set of dialogs that enable the end user to create or browse for an existing user account in order to access resources that are restricted to others.

Table 12-39 • Dialog Template Options (cont.)

Dialog Template	Description
NewScriptBasedDialog	***Project*** *• This dialog template is available for the following project types:* • *InstallScript* • *InstallScript MSI* Creates a new script-based dialog that contains the same controls as those contained in an internal dialog. This dialog contains basic controls, including Back, Next, Cancel, Title, and Subtitle.
NewSkinnableDialog	***Project*** *• This dialog template is available for the following project types:* • *InstallScript* • *InstallScript MSI* Creates a new script-based, *skinnable* dialog that contains some of the same controls as those contained in an internal dialog. This dialog contains basic controls—including Back, Next, and Cancel. You should select this option if you plan to use dialog skins. ***Caution*** *• If you add any controls to this dialog, do not set the control ID to 52. If you do, the dialog skins will not work.*

Show Dialogs in Repository

To display dialogs that are stored in a repository, select the Show Dialogs in Repository check box.

Browse

Click the Browse button if you want to select to a dialog (.isd) file that is not listed.

Let me Insert this dialog into a sequence

Select this check box to automatically insert the new dialog in a user interface sequence. This check box is available only for Basic MSI projects and only for Interior and Exterior dialogs. In InstallScript MSI projects, you need to use InstallScript to schedule the dialog's appearance in the user interface and to process the dialog's controls.

Note *• If this option is not selected in a Basic MSI project, the wizard process ends and the new dialog is added to your project. You need to manually add the dialog to a sequence to display it during installation.*

Basic MSI Projects

If you selected an exterior, interior, or login dialog, click Next to move to the next panel. If you selected a blank dialog, a dialog in your repository, or a dialog in a different location, click Finish to add the dialog to your project.

Note • *You need to manually insert a blank dialog into a sequence in order to display it during installation.*

InstallScript and InstallScript MSI Projects

Click Finish to add the new dialog. In order for the new dialog to appear in the user interface, you need to add it to your script and use InstallScript to process the dialog controls. You can edit the dialog controls if necessary.

User Interface Sequence Panel

The User Interface panel lets you select the user interface sequence into which you want to insert the new dialog. You can also see which dialogs are currently in the selected sequence and insert the new dialog after a particular existing dialog.

Panel Options

Table 12-40 • User Interface Sequence Panel Options

Option	Description
User Interface Sequence	From the menu, select the sequence into which you want to insert the new dialog.
Dialogs currently in this sequence	Displays the dialogs that occur in the selected sequence. Select the dialog that you want to appear immediately before your new dialog in the sequence.

Dialog Position and Condition Panel

Use the Dialog Position and Condition panel to indicate where you want the dialog to appear in the sequence. This panel also lets you specify any conditions that you want placed on the dialog.

Panel Options

Table 12-41 • Dialog Position and Condition Panel Options

Option	Description
Dialog Position	This pane displays the new dialog's place in the sequence selected in the User Interface Sequence panel. To move the new dialog within the sequence, select it and click Move Up or Move Down.
Condition	Set a condition for the new dialog in this field. Click Build to launch the Condition Builder dialog box.

Click Finish to exit the wizard. InstallShield adds the new dialog to your project and inserts it in the specified sequence.

DirectX Object Wizard

Project • *The DirectX Object Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The DirectX Object Wizard enables you to include the Microsoft DirectX 9c redistributable files in your installation project and to set several options.

Note • *For information about which files are included with the DirectX object, see Including the DirectX 9.0 Object.*

The optional ManagedDX component of DirectX 9c requires that the .NET Framework version 1.1 or later be installed on the system.

The following wizard panels are associated with the DirectX Object Wizard:

- Welcome
- Object Settings
- Summary

For more information about DirectX, visit http://msdn.microsoft.com/directx.

Welcome Panel

Project • *The DirectX Object Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The DirectX Object Wizard enables you to include the Microsoft DirectX 9c redistributable files in your installation project and to set several options.

Note • *For information about which files are included with the DirectX object, see Including the DirectX 9.0 Object.*

The optional ManagedDX component of DirectX 9c requires that the .NET Framework version 1.1 or later be installed on the system.

For more information about DirectX, visit http://msdn.microsoft.com/directx.

Object Settings Panel

Project • *The DirectX Object Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Object Settings panel enables you to set the following options:

Table 12-42 • Object Settings Panel Options

Option	Description
Place DirectX files in a folder in Disk1	If you select this check box, InstallShield creates a DirectX folder for your installation at build time and places it in the Disk1 folder of your release. If you clear this check box, InstallShield streams the DirectX redistributable files into the .msi file. If you are creating a single-file executable installation, clear this check box so that the files are included in the .msi file. For information on the DirectX files that are included in the object, see Including the DirectX 9.0 Object.
Show the Microsoft DirectX EULA before starting the DirectX 9 installation	By default, the Microsoft DirectX EULA is displayed to the end user before the DirectX 9 installation begins. To prevent the EULA from being displayed, clear this check box.

For more information about DirectX, visit http://msdn.microsoft.com/directx.

Summary Panel

Project • *The DirectX Object Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Summary panel enables you to review the options that you configured on the Object Settings panel. Click Finish to accept the settings and add the DirectX 9 redistributable files to your project.

Dynamic Scanning Wizard

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Dynamic Scanning Wizard is an easy-to-use tool that monitors your system while an executable file runs. The wizard displays a list of .dll and .ocx files that may be required by the executable file, and it lets you specify whether you want to include each one in your project. The wizard can scan for an executable file that is already included in your project, or you can use the Specify the Executable panel in the wizard to select a new executable file that you want to scan and add to your project prior to the scanning process.

Task: ***To launch the Dynamic Scanning Wizard:***

1. In the View List under **Additional Tools**, click **Dependency Scanners**.
2. Click the **Perform Dynamic Scanning** button.

The following panels are associated with the Dynamic Scanning Wizard:

- Welcome
- Filter Files
- Specify the Executable
- Specify Application File
- Launch the Application
- Your Application is Running
- File Selection
- Scan Results

- Completing the Dynamic Scanning Wizard

Welcome Panel

Project *• This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Dynamic Scanning Wizard provides you with an easy path to add your application's dependency files to your project. Before you begin using the scanner, it is recommended that you add the target executable file to your project.

Click Next to begin using this wizard.

Filter Files Panel

Project *• This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Dynamic Scanning Wizard may list as dependencies certain files that you do not want to add to your installation. For example, common system files that are already present on target machines usually do not need to be reinstalled. To avoid having these files added to your project when you run the scanner, select the **Filter files** check box on the Filter Files panel.

To learn how to customize the list of files that are excluded from scans, see Filtering Files in Dependency Scanners.

Specify the Executable Panel

Project *• This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Specify the Executable panel is where you specify whether you want to scan an executable file that is already included in your project, or one that has not yet been added.

Table 12-43 • Specify the Executable Panel Settings

Setting	Description
I would like to select an executable file from my project (recommended)	If the executable file that you would like to scan has already been added to your project, select this option.
I would like to select a new executable	If the executable you want to scan is not currently included in your project, select this option.

Specify Application File Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Specify Application File panel is where you to select the specific executable file (.exe) that you would like to scan. Additionally, you can specify command-line parameters for the file and a working folder.

Table 12-44 • Specify Application File Panel Settings

Setting	Description
Application	Specify which executable file you would like to scan. If you choose to scan a file that is already included in your project, select it from the list of executable files that present in your project. If you choose to scan a file that is not yet a part of your project, enter the path to that file or click the Browse button to navigate to it.
Command Line	Enter the command-line parameters that you would like to pass to the executable file. These parameters are used only during the scanning process; they are not used after the wizard has been dismissed.
Working Folder	Enter the path to the working folder for this application, or click the Browse button to navigate to the directory. By default, this directory is set to the same folder in which the application you choose to scan resides.

Launch the Application

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

Before the Dynamic Scanning Wizard begins scanning your application, it must launch the application. After your application is launched by the wizard, you should use as many of the application's menu items and features as you can. This helps to identify where dependency files are located so that they can be added to your project.

Click Next to launch your application and begin scanning for dependencies.

Your Application is Running Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Your Application is Running panel is displayed while your application is running. When you have finished using your application, click the Done button to view the results of the scan. No files are added until you have confirmed the findings of the scan.

File Selection Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The File Selection panel displays a list of possible files and merge modules that you may need to add to your project. Use this panel to select the ones that you want to include in your installation. For more information, see Reviewing Dependency Scanner Results.

Table 12-45 • File Selection Panel Settings

Setting	Description
File	Indicate which files and merge modules you want to add to your project by selecting the appropriate check boxes.
Deselect All	If you want to clear all of the check boxes, click this button. You can then manually select each check box that corresponds with a file or merge module that you would like to add to your project.
Select All	If you want to select all of the check boxes, click this button. You can then manually clear each check box that corresponds with a file or merge module that you do not want to add to your project.

Scan Results Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Scan Results panel shows the dependencies that the wizard identified and that you selected to be added to your project.

To add these dependencies to your project, click the Next button. To exit the wizard without adding the dependencies, click the Cancel button. To review the list of potential dependencies again and add or remove any of them, click the Back button.

Completing the Dynamic Scanning Wizard Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

When the Dynamic Scanning Wizard shows the Completing the Dynamic Scanning Wizard panel, the wizard has added the executable file's dependencies to your project. If you chose to scan an executable file that was not already included in your project, that .exe file has been added as well.

Click Finish to close the wizard and return to InstallShield.

Export Components Wizard

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Export Components Wizard simplifies the process of exporting a component from certain file types (.ism, .msi, .msm) to any existing project or a new one altogether. A common use of this wizard includes exporting components to merge modules.

Note • *The Export Components Wizard does not let you export components from an .msi or .msm file to an .ism file. It also does not let you export from an .ism file to an .msi or .msm file.*

When you export components to other projects, a copy of this component is added to the specified project file, along with all of the component's data, such as its files, shortcuts, registry entries, and advanced settings.

Task: ***To launch the Export Components Wizard:***

1. In the View List under **Organization**, click **Setup Design** (in installation projects only) or **Components**.
2. Do one of the following:
   - To export a specific component, right-click the component that you want to export, and then click **Export Component Wizard**.
   - To export more than one component, right-click the main node in this view, and then click **Export Component Wizard**.

Note • *You can also launch the Export Components Wizard from the Project menu.*

The following panels are associated with the Export Components Wizard:

- Welcome
- Select Components
- Select Target File Info
- Summary

Welcome Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Export Components Wizard simplifies the process of exporting components from a file type (.ism, .msi, .msm) to any existing project or a new one altogether. A common use of this wizard includes exporting components to merge modules.

Note • *The Export Components Wizard does not let you export components from an .msi or .msm file to an .ism file. It also does not let you export from an .ism file to an .msi or .msm file.*

Select Components Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Select Components panel lists all of the components in your open project. Select the components that you want to export. You can filter the components list in this panel by feature or component destination.

If you launch the Export Components Wizard by right-clicking a specific component and then clicking Export Components Wizard, the wizard skips the Select Components panel.

Note • *When you are exporting from a merge module, the feature filter is not available because there are no features in merge modules.*

Select Target File Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

On the Select Target File panel, specify whether you want to export the component to an existing or new project. In either case, browse for the file location.

Note • *When the wizard is exporting the component to the target project, the wizard checks for conflicts. If the target project already has a component of the same name with different settings, the Resolve Conflict dialog box opens to offer you options for resolving the conflicts.*

There is also an option to export as a Merge Module project. Select this option to export the component to this specific project type.

Target File Info Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

On the Target File panel, specify information, including the product name, version, and language, for the new project. Indicate whether you want to replace exported components in the current project with the generated merge module. Replacing the component with the exported merge module option removes the component from the currently open project.

Summary Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Summary panel displays the results of the export process. The summary also lists any errors from exporting. Click Finish to complete the process.

Note • *After you have arrived at the Summary panel, you cannot click Back to return to previous panels.*

Function Wizard

The Function Wizard automates the process of adding function calls to your scripts. After you complete two brief wizard panels, your function call is inserted into your script at the caret location.

Launching the Function Wizard

Task: ***To launch the Function Wizard, do one of the following:***

- From the **Script Editor**, press Ctrl+I.
- Click the toolbar's **Insert InstallScript Function** button ().
- On the **Edit** menu, point to Insert and select **InstallScript Function**.

Function Name Panel

Lets you select an InstallScript function to paste into the active script editor window.

The Function Wizard lets you select from an alphabetic list of all functions or from lists of specific function categories. You can view the description for each function you highlight. Press the Help button to see the complete function description for any highlighted function.

Panel Options

Function Category (list box)

Select a function category. The InstallScript functions belonging to the selected category are displayed in the Function Name list box. Select "All" to display the names of all available InstallScript functions.

Function Name (list box)

Select a function name to display the function parameters and a brief description of the selected function in the bottom portion of this panel.

Click Next to display the Function Parameters panel of the Function Wizard.

Function Parameters Panel

Displays the name of the function selected in the Function Name panel and the parameters for that function. Next to each parameter is either an edit box in which you can enter a variable name or a value, or a drop-down menu from which you can select a parameter value.

Task: ***To specify function parameters and insert the function into your script:***

1. Complete the arguments for each function. When you place the cursor in an edit field, the parameter description appears at the bottom of the panel. If there are predefined options available for a parameter, the edit field contains a drop-down menu. Note that you can select only one option from a drop-down menu, even when the options are not exclusive.

   

   Note • *You can enter strings (or string identifiers) and numbers directly in the edit fields, but you must pay careful attention to the purpose of the parameters. One clue is the InstallScript Hungarian notation in the variable name.*

   You must declare all variable names that you use in all function calls. The Function Wizard does not declare them for you.

2. Click **Finish** to insert the function call into your setup script. If you need further help, place the cursor in the function name and press the **F1** key.

Import DIM Wizard

Project • *This information applies to Basic MSI projects.*

Use the Import DIM Wizard to identify a DIM that you want to statically import into a Basic MSI project. When you complete the wizard, InstallShield incorporates the project data of the DIM into the open Basic MSI project.

Note that statically importing a DIM is a design-time task. If you statically import a DIM into a project, its data becomes part of the Basic MSI project at the time of the import. If you later update the DIM project, the Basic MSI project is not updated with the latest changes in the DIM. In order to remove a statically imported DIM from a Basic MSI project, it would be necessary to identify each file, component, and other element from the DIM and manually remove it from the Basic MSI project.

Task: ***To launch the Import DIM Wizard:***

1. In the View List under **Organization**, click **Setup Design**.
2. In the **Setup Design** explorer, right-click the feature that you want to contain the DIM, and then click **Import DIM Wizard**.

The Import DIM Wizard consists of the following panels:

- Welcome
- Select Source File
- Import

Welcome Panel

Project • *This information applies to Basic MSI projects.*

Use the Import DIM Wizard to identify a DIM that you want to statically import into a Basic MSI project. When you complete the wizard, InstallShield incorporates the project data of the DIM into the open Basic MSI project.

Select Source File Panel

Project • *This information applies to Basic MSI projects.*

On the Select Source File panel, specify the path and file name for the DIM that you want to statically import into your Basic MSI project. To navigate to the file without having to manually enter the path and file name, click the Browse button.

If you want to back up your Basic MSI project file (.ism) before statically importing the DIM, specify the path and file name for the backup project file. If you specify a path and file name, the wizard saves the backup file when you click the Next button on this panel.

Import Panel

Project • *This information applies to Basic MSI projects.*

The Import panel shows the location and name of the DIM project file that you are importing. If you specified to create a backup copy of your Basic MSI project file (.ism) before statically importing the DIM, the path and file name are also displayed.

To complete the import process, click the Finish button.

Import REG File Wizard

InstallShield enables you to import existing registry (.reg) files that you have created in other installation projects or outside InstallShield.

Task: ***To launch the Import REG File Wizard:***

1. In the View List under **System Configuration**, click **Registry**.
2. *Windows Installer projects only*: In the **View Filter** list, click the component that should have the .reg file that you are importing.

   

   Note • *If All Application Data is selected, the Registry view is read-only.InstallScript projects only: In the Destination computer's Registry view pane, open the registry set that should have the .reg file that you are importing.*
3. In the **Destination computer's Registry** view pane, right-click the registry key to which you would like your registry data added, and then click **Import REG File**. The Import Reg File Wizard opens.

When you import an .reg file into a component or registry set, that registry data is added to the component's or registry set's registry data and written to the end user's system if the component or registry set is installed.

The Import REG File Wizard consists of the following panels:

- Welcome
- Import Registry File
- Import Conflict Options
- Progress

Welcome Panel

The Import REG File Wizard allows you to import existing registry data (.reg) into your InstallShield project. This registry data is added to the target system's registry during the setup project.

Click Next to continue to the next wizard panel to begin importing your REG file.

Note • *Before you begin importing REG data be sure that you selected the proper feature to which you would like this data added. To specify a feature, cancel the wizard and select the appropriate feature from the Feature list at the top of the Registry view.*

Import Registry File Panel

In this panel you can specify the REG file you would like to import.

Panel Options

Registry File

Enter the path to the REG file you would like to import, or click the Browse button to navigate to this file.

Import Conflict Options Panel

Because your setup may already contain registry data that could conflict with information stored within the REG file you are importing, you can select how you would like to handle any conflicts.

Panel Options

Overwrite the registry data

Select this option if you would like data stored within the REG file you are importing to overwrite any conflicting data already present in your setup project.

Do not overwrite the registry data

Select this option if you would like to retain the data already present in your setup project when a conflict arises during the import progress. All nonconflicting registry data are still imported.

Log all registry conflicts to a file

Select this option if you want to keep a record of all registry conflicts found by the wizard. You can type a path and folder name in the field or click the folder button to browse to a file.

Import Progress Panel

This panel displays the import progress of the REG file. Click Cancel to stop the import or wait until the wizard finishes importing your REG file and click Finish to return to the IDE.

Import XML Settings Wizard

The Import XML Settings Wizard enables you to add a reference for an XML file to the XML File Changes view, where you can configure the changes that you want to be made to the XML file at run time.

Important • *The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:*

- *If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.*
- *If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.*

Therefore, when you use the Import XML Settings Wizard, import only the nodes in the XML file that you want to modify at run time.

Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.

The wizard consists of the following panels:

- Welcome
- XML File
- XML Element
- XML Import Progress
- XML Import Results

Welcome Panel

The Import XML Settings Wizard enables you to add a reference for an XML file to the XML File Changes view, where you can configure the changes that you want to be made to the XML file at run time.

The Welcome panel is the first panel of the Import XML Settings Wizard.

Important • *The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:*

- *If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.*
- *If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.*

Therefore, when you use the Import XML Settings Wizard, import only the nodes in the XML file that you want to modify at run time.

Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.

XML File Panel

On the XML File panel, specify the XML file that you want to import by clicking Browse to locate it and populate the field. Then click Next to continue.

XML Element Panel

On the XML Element panel, specify which elements in the XML file should be imported into the XML File Changes view. Then click Import to begin the process or click Back to return to the previous panel.

Important *• The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:*

- *If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.*
- *If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.*

Therefore, on the XML Element panel of the Import XML Settings Wizard, select only the nodes in the XML file that you want to modify at run time.

Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.

XML Progress Panel

The XML Progress panel appears after you click Import in the Import XML Element panel. It displays the progress of the file import.

XML Results Panel

The XML Results panel displays a summary of the imported .xml file and all of its elements. Click Finish to complete the import process and exit the wizard.

Once you click Finish, InstallShield adds a new node for the XML file that you imported. The XML file node contains each of the nodes that you selected in the wizard. Each node represents an XPath query that occurs at run time. InstallShield also adds a new component for the XML file that you have imported through the XML File Changes view. Once you are done importing, you can use the XML File Changes view to configure the XML file's settings and specify any element, attribute, and content changes for it.

For examples of how to create some basic XPath expressions, see Using XPath Expressions to Find XML Data in an XML File.

Microsoft .NET Framework Object Wizard

Project • *The Microsoft .NET Framework Object Wizard is available in InstallScript projects.*

The Microsoft .NET Framework Object Wizard opens when you add the Microsoft .NET Framework Object to a feature in the Objects view of an InstallScript project. This wizard lets you specify which versions of the .NET Framework and language packs should be included in your project. The language packs contain translated text, such as error messages, for languages other than English.

The Microsoft .NET Framework Object Wizard consists of the following panels:

- Step 1
- Step 2

Tip • *This object is not installed with InstallShield; you need to download it. For more information, see Obtaining Updates for InstallShield.*

Step 1 Panel

Project • *The Microsoft .NET Framework Object Wizard is available in InstallScript projects.*

The Step 1 panel of the Microsoft .NET Framework Object Wizard lets you specify which versions of the .NET Framework and language packs should be included in your project.

Table 12-46 • Step 1 Panel Settings

Setting	Description
Select the version of .NET to include and install	Select which versions of the .NET Framework should be included in the object.
Use Web downloader version of .NET redistributable	If a Web downloader redistributable and a full package redistributable are available for the selected version of .NET, this check box is enabled. Select this check box if you want to use the Web downloader redistributable. The Web downloader redistributable is smaller than the full package redistributable, but it requires that the target system have an Internet connection at run time.
Platforms	Select which platform-specific versions of the .NET Framework should be included in the object.
Languages	Specify whether the object should include language packs. • **Don't include any language packs**—If no language packs should be included, select this option. • **Include all appropriate language packs**—If the object should include all of the available language packs that are supported by the project, select this option.

For more information about this object, see the help pane that is displayed when you click the Microsoft .NET Framework Object in the Objects view.

Tip • *This object is not installed with InstallShield; you need to download it. For more information, see Obtaining Updates for InstallShield.*

Step 2 Panel

Project • *The Microsoft .NET Framework Object Wizard is available in InstallScript projects.*

If you select the **Include multiple versions of the .NET Framework** option on the Step 1 panel of the Microsoft .NET Framework Object Wizard, the Step 2 panel is displayed.

Table 12-47 • Step 2 Panel Settings

Setting	Description
Select the .NET redists to include in the object	Select the check box for each version of the .NET Framework that should be included in the project. Note that the object can install only one version of the .NET Framework at run time.
Allow the object to install a .NET language pack without installing the corresponding .NET Framework.	To allow a language pack to be installed without first installing the corresponding version of the .NET Framework, select this check box. InstallShield uses this setting to configure the **InstallLangPackOnly** property for the object. This read-write numeric property indicates whether the object should allow the installation of the language pack without first installing the corresponding version of the .NET Framework, which may occur if the framework is not being included in the object. By default, if the object is set to install a particular version of the framework and that version of the framework is not included in the object, the object sets a status of DOTNET_STATUS_VERSION_NOT_IN_MEDIA. However, if the **InstallLangPackOnly** property is set, the object does not set the failure status, which allows the object to install the language pack, if appropriate, without first installing the framework. This property is typically set in the object wizard.

For more information about this object, see the help pane that is displayed when you click the Microsoft .NET Framework Object in the Objects view.

Tip • *This object is not installed with InstallShield; you need to download it. For more information, see Obtaining Updates for InstallShield.*

New Language Wizard

Edition • *The New Language Wizard is available in the Premier edition of InstallShield.*

Project • *The New Language Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Suite/Advanced UI*

The InstallShield Premier edition lets you add unsupported languages, beyond the built-in 35 languages, to projects through the New Language Wizard. An unsupported language is one in which none of the default run-time strings are translated. When you add an unsupported language to a project, that language is made available in various language-related settings throughout InstallShield. In addition, InstallShield uses the strings from your project's default language as placeholders for the strings in that newly added unsupported language; you can use the String Editor view to provide translated strings for the unsupported languages.

When you use the New Language Wizard to add an unsupported language, InstallShield adds to your machine several files that contain English strings as placeholders:

- *LanguageID*.ini

  LanguageID is the language identifier for the new language. InstallShield adds this file to the following directory:

  InstallShield Program Files Folder\Support

- _isres_*LanguageID*.dll

  LanguageID is the language identifier for the new language. InstallShield adds this file to the following directories:

  InstallShield Program Files Folder\Redist\Language Independent\i386

  InstallShield Program Files Folder\Redist\Language Independent\i386\Skins

If you want to add the unsupported language in InstallScript or InstallScript MSI projects, you will need to translate the strings in those files. You can open the .dll file in a resource editor to replace the English strings with the appropriate translated strings.

Task: ***To launch the New Language Wizard:***

On the **Tools** menu, click **Add New Language**.

Welcome Panel

Edition • *The New Language Wizard is available in the Premier edition of InstallShield.*

Project • *The New Language Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Suite/Advanced UI*

The InstallShield Premier edition lets you add unsupported languages, beyond the built-in 35 languages, to projects through the New Language Wizard. An unsupported language is one in which none of the default run-time strings are translated. When you add an unsupported language to a project, that language is made available in various language-related settings throughout InstallShield. In addition, InstallShield uses the strings from your project's default language as placeholders for the strings in that newly added unsupported language; you can use the String Editor view to provide translated strings for the unsupported languages.

Project Language Panel

Edition • *The New Language Wizard is available in the Premier edition of InstallShield.*

Project • *The New Language Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Suite/Advanced UI*

The Project Language panel lets you specify the languages that you would like to add to your project. Select the box next to each language that you want to add.

Project Files Panel

Edition • *The New Language Wizard is available in the Premier edition of InstallShield.*

Project • *The New Language Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Suite/Advanced UI*

The Project Files panel is where you specify which existing projects should contain the ability to add the new languages. (That is, InstallShield will add the new languages to the list of languages that you can select for the Setup Languages setting in the General Information view.)

This panel also enables you to specify whether you want to be able to include the languages in every new project that you create.

For information on adding a language to a project, see Selecting the Installation Languages.

Panel Settings

Table 12-1 • Project Files Panel Settings

Setting	Description
Project Name	Select the projects that should enable you to select the new languages for the Setup Languages setting in the General Information view. If your project is not stored in the default project location, navigate to it by clicking the Browse button.
Update InstallShield	Select this check box if you would like any new project that you create to have optional support for these languages. Selecting this check box does not automatically include the new languages in future projects. Instead, it adds the new languages to the list of languages that you can select for the Setup Languages setting in the General Information view.

Summary Panel

Edition • *The New Language Wizard is available in the Premier edition of InstallShield.*

Project • *The New Language Wizard is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Suite/Advanced UI*

The Summary panel lists the new languages that will be added to the specified projects. It also indicates whether you want InstallShield to add the new languages to all new projects that you create. Click the Finish button to accept the settings and begin updating projects with the new languages.

When you use the New Language Wizard to add an unsupported language, InstallShield adds to your machine several files that contain English strings as placeholders:

- *LanguageID*.ini

  LanguageID is the language identifier for the new language. InstallShield adds this file to the following directory:

  InstallShield Program Files Folder\Support

- _isres_*LanguageID*.dll

  LanguageID is the language identifier for the new language. InstallShield adds this file to the following directories:

  InstallShield Program Files Folder\Redist\Language Independent\i386

  InstallShield Program Files Folder\Redist\Language Independent\i386\Skins

If you want to add the unsupported language in InstallScript or InstallScript MSI projects, you will need to translate the strings in those files. You can open the .dll file in a resource editor to replace the English strings with the appropriate translated strings.

Open MSI/MSM Wizard

The Open MSI/MSM Wizard is a tool that converts existing installation projects (.msi files) and merge modules (.msm files) to InstallShield installation projects (.ism files) that you can modify and build in the InstallShield user interface.

Task: ***To launch the Open MSI/MSM Wizard:***

1. On the **File** menu, click **Open**. The **Open** dialog box opens.
2. In the **Files of Type** list, select either **Windows Installer Packages (*.msi)** or **Windows Installer Modules (*.msm)**.
3. Browse to the Windows Installer package or merge module that you want to convert and click the **Open** button.

Once you select a package, the Open MSI/MSM Wizard presents options for converting the file, converts the project, and then opens the converted project.

Note • *Any errors encountered by the wizard are displayed in the Output window when the converted project is opened. To solve any problems, see MSI/MSM Conversion Errors.*

Welcome Panel

The Open MSI/MSM Wizard allows you to import setup packages (.msi) and merge modules (.msm) into InstallShield. This functionality is useful for network administrators who need to build custom setups for their users.

Panel Options

Open MSI/MSM in Direct Edit Mode

Select this option to view and edit the database directly, without creating a project file. If you select this option, the selected database will open in the IDE, where you can view and edit its contents with the Direct Editor.

Click Next to open the database in the Direct Editor.

Convert MSI/MSM to an InstallShield Project

Select this option to convert the selected database into an InstallShield project, which you can then edit within the IDE.

Click Next to continue using the wizard for this option.

File Locations Panel

In the File Locations panel, specify the name of the project that the wizard will create and the location of its data files.

Panel Options

Project Name

Type a name for the setup project that will be created when the wizard converts the existing .msi or .msm project to an InstallShield (.ism) project. The .ism project is saved in the default location.

Note • *Because the project name determines the name of the .ism file and the root for the project's folder structure, use only legal characters for a Windows file name.*

Data File Location

If the imported application's files are stored in .cab files, those files are automatically extracted and stored in the location specified here.

After specifying the project name and data file location, click Finish to convert the project and open it in the InstallShield IDE.

Note • *The wizard alerts you of any errors it encountered while creating the project. To resolve any problems, see MSI/MSM Conversion Errors.*

Open MSP Wizard

Before InstallShield can open a patch or MSP file for editing or create a new patch project, it needs the base MSI to which the MSP should be applied. When you first open a patch (.msp) project in InstallShield, the Open MSP Wizard appears.

The Open MSP Wizard gathers the necessary file information, applies the patch to the base MSI, and opens the patch project in the IDE in Direct MSP mode (which is similar to the Direct Edit mode). The data you specify in the Open MSP Wizard is saved so the next time you open the MSP file, the patch project opens in the IDE.

Welcome Panel

This panel welcomes you to the wizard and briefly describes the Open MSP Wizard's function. Click Next to begin using the wizard.

Base MSI Package Panel

In the Base MSI Package panel, you specify the base MSI file to which you want to apply this patch.

Panel Options

MSP File Name

Read-only field that provides the path and file name of the MSP file.

Base MSI File Name

Specify the name of the base MSI file to which this patch (indicated in the MSP File Name edit box) will be applied. Click the browse (ellipsis) button to browse to an .msi file.

Click Finish to close the Open MSP Wizard and create your patch project. The patch is applied to the MSI project that is specified in the Base MSI File Name edit box, and the patch project (.msp file) opens in Direct MSP mode in the IDE.

Open Transform Wizard

Before InstallShield can open a transform (.mst) file for editing or create a new Transform project, it needs the base .msi file to which the .mst should be applied and any additional .mst files that should be applied to the base .msi file.

The first time that you open an .mst file in InstallShield, the Open Transform Wizard launches. This wizard enables you to specify the .mst file, the base .msi file, and any additional transforms to apply before editing. The last panel of this wizard—the Create a Response Transform panel—lets you specify whether or not your transform should be a response transform. A response transform includes default responses for the user interface portion of the installation. If you specify that you want to create a response transform, the user interface elements of the installation are executed, enabling you to customize the options available in each panel of the installation wizard.

When the Open Transform Wizard is finished, the transforms are applied and the .mst file opens in the InstallShield in Direct MST mode (which is similar to Direct Edit mode). The data specified in the wizard is saved so that the next time that you open the .mst file, the transform project opens directly in InstallShield.

Task: ***To launch the Open Transform Wizard when opening a transform for editing:***

1. On the **File** menu, click **Open**. The **Open** dialog box opens.
2. Select the .mst file that you would like to open.
3. In the **Open as** box, select **Wizard**.
4. Click **Open**. The Open Transform Wizard opens.

Task: ***To launch the Open Transform Wizard when creating a new transform:***

1. On the **File** menu, click **New**. The **New Project** dialog box opens.
2. On the **Windows Installer** tab, click **Transform**.
3. In the **Project Name** box, type a name for your transform project.
4. In the **Location** box, type the path where your transform project should be stored or click the browse button to find the location.
5. Click **OK**. The Open Transform Wizard opens.

The following panels are associated with the Open Transform Wizard:

- Welcome
- Transform Information
- Additional Transforms
- Create a Response Transform

Welcome Panel

This panel welcomes you to the Open Transform Wizard and briefly describes the wizard's function. Click Next to begin using the wizard.

Transform Information Panel

In the Transform Information panel, you specify the base .msi file to which you want to apply this transform.

Panel Options

MST File Name

Read-only field that provides the path and file name of the .mst file.

Base MSI File Name

Specify the name of the base .msi file to which this transform (indicated in the MST File Name box) will be applied. Click the ellipsis (...) button to browse to an .msi file.

Click Next to move to the next panel.

Additional Transforms Panel

In this panel, you can supply the names of one or more additional transforms that you want applied prior to applying the transform that the Open Transform Wizard is currently creating. For example, you may want to include previous customization or transforms containing language-specific information. The transforms are applied in the order in which they are listed.

Adding a Transform

Task: ***To add a transform to the list:***

1. Click New (Insert) or press Insert.
2. Type the full path and name of the .mst file or click the ellipsis (...) button to browse to it.

Deleting a Transform from the List

Task: ***To delete a transform from the list:***

1. Select the transform in the list that you would like to remove.
2. Click Delete or press Delete.

Changing the Transform Order

Task: ***To change the order in which the transforms are applied:***

Select a transform in the list and click the move up button or the move down button.

The transform that the Open Transform Wizard is creating is applied last.

Caution • *When you are using multiple transforms, keep in mind that the order in which they are applied is critical. For example, if you create a transform for a Windows Installer package that creates a new value for a property, and then you create a second transform that changes the value created in the first transform, everything works correctly. However, if you apply the second transform first, that transform is attempting to modify the property's value, instead of creating it. That will result in an error.*

One simple example of where this may be a problem is with the default company name. If the value is not set by default, and you set it in the first transform, a new value for the property is created. If you create a second transform that modifies the combined original package and first transform, and the second transform changes the default company name, it is only changing the property. However, if you try to apply the second transform without the first one, Windows Installer interprets this as trying to change a null value to another value, which will result in an error.

Click Next to move to the next panel.

Create a Response Transform Panel

In this panel, you can specify that you want to create a response transform.

Panel Options

Table 12-2 • Create a Response Transform Panel Options

Option	Description
Create response transform	If you want to create a response transform, select this check box. If you select this option, the user interface elements of the installation are executed when you click Finish. No file transfer takes place, and no changes to your machine occur. Complete this simulated installation, customizing the options available in each panel of the installation wizard as needed. When you reach the end of the installation sequence and click Install, the simulated installation exits. InstallShield saves all of the changes that you made during the simulated installation as default installation values in the response transform.
Command line properties (optional)	If you are using a response transform, you can specify additional command-line properties (in property name/value pairs separated by semicolons) to pass to the response transform. These must be public properties, and they control only how the dialog boxes are displayed during creation of the response transform. They are not persisted outside of the user interface sequence during creation. For example, you can pass the property/value pair ARPHELPTELEPHONE=1-111-111-1111 to set the value of the Help Telephone field of Add or Remove Programs in Control Panel. You might pass a property/value pair during the creation of a response transform to display all dialog boxes during an installation that may not be displayed based on your system configuration (for example, to show Windows 9x–only dialog boxes on a Windows NT platform). You can then make appropriate responses and have them included in your transform.

Click Finish to exit the Open Transform Wizard and create your transform project. The transforms are applied to the .msi file specified in the Transform Information panel, and the transform project (.mst file) opens in Direct MST mode in InstallShield.

Publish Wizard

Use the Publish Wizard to save the selected installation element to a repository.

The following panels are associated with the Publish Wizard:

- Welcome

- Repository
- Publishing Information
- Summary

Welcome Panel

This panel welcomes you to the Publish Wizard. Click Next to begin using the wizard.

Repository Panel

The Repository panel of the Publish Wizard is where you specify the repository to which your installation element should be published.

Publishing Information Panel

The Publishing Information panel of the Publish Wizard is where you specify information that identifies the item that you are publishing to the repository. If you are publishing a dialog to the repository, for example, the information that you provide in the Publishing Information panel will be displayed for your dialog when you or other users browse the repository of dialogs.

Panel Options

Name

Specify a name for the dialog, template, script file, or other installation element that you are publishing.

Publisher

Type your name.

Description

Type the description that should be displayed for this installation element.

Summary Panel

Use the Summary panel of the Publish Wizard to review the settings for the item that you are publishing to the repository. If you need to change anything, click Back until you reach the appropriate panel, and then make the necessary changes.

When you are done, click Finish. The Output window opens to inform you whether the installation element was successfully published to the selected repository.

Redistributable Downloader Wizard

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Redistributable Downloader Wizard allows you to quickly download third-party redistributables, merge modules, and other files to your local machine. You can launch the Redistributable Downloader Wizard from the Release Wizard's .NET Run-Time Options panel and from the Releases view (.NET 1.1/2.0 Core Language and .NET 1.1/2.0 Language Packs settings).

Task: ***To use the Redistributable Downloader Wizard:***

1. In the **Select Files to Download** panel, select the redistributables that you want to download and click **Next** to move to the **Progress** panel.
2. When the progress bars complete, click **Next**.
3. The final panel displays the list of redistributables that the wizard downloaded to your machine. Click **Finish** to exit the wizard.

Reg-Free COM Wizard

Use the Reg-Free COM Wizard to create and modify Reg-Free COM manifest files to be included in your installation.

Note • *Before you use the Reg-Free COM Wizard, you should add the COM libraries (.dll and .ocx files) and the executable file that uses them to your InstallShield project. Note that the Reg-Free COM manifest file, the executable file, and the COM libraries should all be installed to the same folder on the target machine.*

Task: ***To launch the Reg-Free COM Wizard:***

On the **Project** menu, click **Reg-Free COM Wizard**.

The following panels are associated with the Reg-Free COM Wizard:

- Welcome
- Select an EXE File
- Select the Manifest File
- Select Files

- Summary

Welcome Panel

The Welcome panel provides a brief introduction to the Reg-Free COM Wizard. Click Next to begin using the wizard.

Note • *Select the* ***Don't show the welcome panel again*** *check box if you do not want this panel to appear the next time you open the wizard.*

Select an EXE File Panel

The Select an EXE File panel is where you specify the executable file that uses the manifest file that you are creating or modifying.

Panel Options

Executable FileKey

Select an executable file from the Executable FileKey list and click Next. Note that the file must already be included in your installation project.

Select the Manifest File Panel

The Select the Manifest File panel is where you either specify that you are creating a new manifest (.manifest) file or that you are modifying an existing one. If you are modifying a manifest file, you need to specify where it is located.

Panel Options

Create a new manifest file that will be added to the project

To create a new manifest file, select this option.

Pre-existing file that will be added to the project

To specify a manifest file that already exists but has not been included in the project yet, select this option, and then click the Browse button to locate the file.

A manifest file that already exists in the project

To specify a manifest file that has already been added to the project, select this option and then select the file from the list.

Select Files Panel

The Select Files panel is where you specify the required COM library files (.dll or .ocx) that are used by the executable file. You can additionally specify to extract the COM information during each build by selecting the **Refresh COM Info during Build** check box. If you clear this check box, the COM information is injected into the manifest only once, when you have completed the wizard.

Summary Panel

Use the Summary panel of the Reg-Free COM Wizard to review the options that you selected. If you need to change anything, click Back until you reach the appropriate panel, and then make the necessary changes.

When you are done, click Finish. The wizard creates a new component with the manifest file set as the key file. The manifest component has the same destination and condition as the associated executable-file component. The following file naming convention is used for manifest files:

```
ExecutableFileName.exe.manifest
```

For example, **MyFile.exe**.manifest is created for an executable file called **MyFile.exe**.

You can specify additional COM servers by running the wizard again and specifying the existing manifest file.

Release Wizard

The Release Wizard provides an easy way for you to build a release for your product and specify the settings particular to that release.

Task: ***To launch the Release Wizard and build your setup package, do one of the following:***

- Click the **Release Wizard** button on the toolbar.
- Select **Release Wizard** from the **Build** menu.
- Double-click the **Release Wizard** item in the **Release** view.
- Right-click on a product name or a release name in the tree control in the **Release** view, and select **Release Wizard**.

Task: ***You can launch an abbreviated version of the Release Wizard by doing one of the following:***

- Click the **Build** button on the toolbar.
- Select **Build** from the **Build** menu.
- Right-click on a release name in the Release explorer, and select **Build**.

The Build option rebuilds the release that has focus in the Release view or builds the product's first release with default settings. The build feedback—and any build errors—appears in the Output window.

Another alternative to the Release Wizard is building a release at the command line.

Welcome Panel

This panel provides a brief introduction to the Release Wizard. This wizard walks you through all the necessary steps required to build a distributable release of your product.

Click Next to begin using the wizard.

Product Configuration Panel

Project • *This topic does not apply to InstallScript projects.*

A product configuration is the highest level of organization in the Release view. By grouping related releases together under a common product configuration, you can change specific settings for each release by editing the properties of the product configuration.

Panel Options

New product configuration

Select this option if you want to build this release under a new product configuration. Specify a name for the new configuration.

Existing product configuration

Select this option to build this release under an existing product configuration. Choosing this option overwrites any existing release.

Specify a Release Panel

This panel gives you the option of creating a new release or rebuilding an existing release.

Panel Options

New Release Name

If you would like to build a new release, select the New Release Name option and then enter a new name in the field.

Existing Release Name

If you choose to build an existing release, click the Existing Release Name option and then select a release name from the drop-down list.

Filtering Settings Panel

Project • *The Filtering Settings panel is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The Filtering Settings panel prompts you to select which features, components, InstallShield prerequisites, and chained .msi packages to include in your release.

Table 12-3 • Filtering Settings Panel Options

Setting	Description
Release Flags	To filter features, InstallShield prerequisites, and chained .msi packages, enter the release flags that you would like to include in this release. If you are including more than one flag, separate them with commas. You have the option of including a subfeature but not its parent feature. In such a case, the subfeature is built into the release as a top-level feature, and its parent is excluded from the release. The release flags that you enter here are combined with the product configuration flags. For more information on the relationship between the two, see Product Configuration Flags vs. Release Flags.  ***Project*** • *The Release Flags option is not available for merge module projects.*
Filter application data based on the following languages	To filter application data based on each component's language, select this option, and then select or clear the appropriate language check boxes. If you select one or more language check boxes, InstallShield includes in the release all of the components that are marked with a matching language, as well as all of the components that are marked as language independent; InstallShield excludes any components whose languages do not match.

Merge Module Options Panel

The Merge Module Options panel provides the option to make your new module immediately available to other InstallShield packages by copying it to your local merge module gallery.

Panel Options

Add to local merge module catalog

Select this option if you would like your new module to be immediately available to other projects. The Merge Modules Locations field is located on the Merge Modules tab of the Options dialog.

Setup Languages Panel

Project • *The functionality for the Setup Languages panel varies, depending on which project type you are using.*

The Setup Languages panel lets you specify language-related settings for your installation's run time.

Table 12-4 • Setup Languages Panel Settings

Setting	Description
Included Release Languages	The functionality for this box varies, depending on which project type you are using: • In a Basic MSI or InstallScript MSI project, this setting lets you specify which user interface languages you want to include in a release. Note that if a language is not selected in the Setup Languages setting in the General Information view of the project, it is not listed as one of the available languages in this box. • In an InstallScript or InstallScript Object project, use this setting if you want to include certain components and exclude others based on the language that is selected for each component. This setting also lets you specify which user interface languages you want to include in a release. If the language specified for a component does not match one of the languages that is selected in this box, InstallShield does not include the component in the release. In addition, if a UI language that is included in the project does not match one of the languages that is selected in this box, InstallShield does not include the UI strings in the release. By default, releases are language independent; that is, none of the project's components or UI strings are excluded from the release. Note that if a language is not selected in the General Information view of a project, it is not listed as one of the available languages in this box.
Make Default	To override the release's default project language that is configured in the General Information view or the String Editor view, select the appropriate default user interface language for your installation, and then click this button. For more information, see Setting the Default Project Language.
Display the Setup Languages Dialog	If you want your installation to display the Choose Setup Languages dialog when it is run with a full user interface, select this check box.  ***Tip*** • *A `Setup.exe` setup launcher is required if you want the language selection dialog to be displayed. To learn more, see Creating a Setup Launcher.*

Project • *In Basic MSI and InstallScript MSI projects, the Setup Languages panel affects only the user interface elements that you include in your project. To include components based on the language of the application data, see the Release Filtering panel.*

For information on adding a language to a project, see Selecting the Installation Languages.

Media Type Panel

This panel prompts you to select the type of distribution media for which you want to create a release.

Panel Options

Media type

Choose the type of media on which you will be distributing your setup program. You can select from the following options:

Table 12-5 • Media Type Panel Options

Option	Description
CD-ROM	Select this option if you will be distributing your setup on a CD. The maximum size for this type of media is 650 MB.
Custom	Select this option if the media that you are distributing is not in the list of media types. For example, you may be distributing your setup on floppy disks or Zip disks. You will need to set the format size and cluster size for this media, as it will change depending on the media type you are using.
DVD-5	This option allows you to ship your release on a 4.38 GB DVD-ROM.
DVD-9	Choose this option if you plan on shipping your setup on a 7.95 GB DVD-ROM.
DVD-10	This option allows you to ship your release on an 8.75 GB DVD-ROM.
DVD-18	If you have an enormous setup, you can ship your release on 15.83 GB DVD-ROM media.
Network image	If your setup is going to be placed on a network, you can choose this option. There is no size limit for this media type.
Web	(Windows Installer based projects only) If you want to distribute your release over the Web, choose this option. There is no size limit for this media type.

Project • *If your installation requires more than one disk, InstallShield automatically splits it across as many disks as needed. In a Windows Installer–based project, the wizard prompts you for more information about disk spanning later in the sequence.*

Format size

If you chose the Custom media type, you will need to specify the capacity of the media in this field. For example, if you are shipping your installation program on a Zip disk, you will want to set the media size to 100 MB. If you chose any other media type, the maximum size allowed for that media is displayed in this field.

Cluster size in bytes (Windows Installer based projects only)

This option defines the minimum amount of space that each file requires. For bigger disks, the cluster size will be larger due to the formatting constraints.

Disk Spanning Options Panel

Project • *This panel is not available for InstallScript projects.*

If your setup is larger than one disk, you have the option to split the setup into pieces so it can be distributed on multiple disks.

Panel Options

Automatic

Select this option to have the wizard automatically split your setup across as many disks as are necessary. This option is the recommended way to span your setup across disks.

Custom

Select this option to manually define how many disks your setup requires, and set the breakpoints yourself. This option requires you to specify which features will be stored on each disk in the Disk Spanning Advanced Settings panel.

Caution • *Multi-disk setups cannot be run from a non-removable media (for example, from a hard drive). If you want to run test a setup that spans disks, you need to put the setup on your target media. If you do not, the setup will fail due to a limitation of the Windows Installer service.*

Enforce disk size

Select this option if you want the wizard to verify that none of your disk images exceeds the media size that you selected. If any of the disks exceeds the specified size limit, Build Error -1531 appears when you try to build the project.

Disk Spanning Advanced Settings Panel

Project • *This panel is not available for InstallScript projects.*

This panel prompts you to specify the number of disks that your setup requires. In addition, you can choose which features are on each disk. This panel is displayed only if you selected the Custom Disk Spanning option on the Disk Spanning Options panel.

Panel Options

Disk Mapping

This dialog lists all the features included in the release when it was first built. Because a release is designed to be a snapshot of your build settings, features created after a release will not be available for disk mapping nor built into the current release. You must start a new release in order to map the new features.

All features are on Disk 1 by default. To change the name of this disk, click the Rename Disk button and type in the new name of the disk. To add a new disk, click the New Disk button.

Task: ***To transfer some of your features from one disk to another:***

1. Select the feature that you want to move.
2. Click the **Move Up** or **Move Down** button. The feature will move through the hierarchy of the current disk until there is nowhere left to go, at which time it will skip to the next disk, provided there is another disk for it to move to.

Tip • *Note the following when spanning your setup across multiple disks:*

- *A single feature cannot be spanned across multiple disks. If you have a feature that is too big to fit on one disk, you need to divide it into smaller features or subfeatures.*
- *Any merge modules that are included in your setup must be on the first disk, because these files must be available when Windows Installer first processes the database (.msi file).*

If you add features to your setup after you have defined how you would like your setup to span across multiple disks, those features are automatically added to the last disk of your setup. You can add new disks to your setup at any time by using the Release Wizard.

Disk Prompt

Task: ***To indicate the prompt you want displayed to end users when the next disk needs to be inserted:***

1. Select a disk in the **Disk Mapping** section.
2. Do one of the following in the **Disk Prompt** field.
   - Type the prompt that you want to display to end users.
   - Click the ellipsis button (**...**) to display the Select String dialog and select a string to use as the prompt.

Repeat for each disk except the last. The Release Wizard automatically creates a string-table entry for the Disk Prompt value, so you can provide a translated string for each language your setup program supports.

The string that is displayed comes from a number of sources throughout your project, as described below:

1. The complete prompt originates in the Error table (exposed in the Direct Editor) as Error record 1302.
2. This value in turn comes from your project's string entries, and the default value for English reads "Please insert the disk: [2]."
3. Windows Installer resolves *[2]* with the value of the property DiskPrompt, which is set to *[1]* in the Property Manager.
4. Finally, Windows Installer evaluates *[1]* to the string you enter into the Disk Prompt field.

In most cases you should enter the same name as the disk volume (below). For example, assuming the defaults are unchanged, a Disk Prompt entry of *Disk8* would cause the user to be prompted with "Please enter the disk: Disk8."

Disk Volume

Select a disk and then enter the name for the resulting disk image folder. Repeat for each disk.

When you are building your release image for removable media (such as CD-ROM), be sure to create the media with the same volume names specified here.

If you leave the names as DISK?, the Release Wizard numbers the disks sequentially (for example, DISK1, DISK2, and so on).

Tip • *Notice that the default name of the volume is in all uppercase letters. It is a good idea to keep the names as uppercase to accommodate media types, such as CD-ROM, which require volume names in that format.*

Web Type Panel

Project • *This panel is not available for InstallScript projects.*

The Web Type panel prompts you to select the configuration of your Web installation package.

Panel Options

One Executable

Select this option if you want to build this release as a single self-extracting `Setup.exe`. This Web type is ideal for a package that is to be downloaded from multiple Web or FTP sites, since the installation package is self-contained, and it does not contain any configuration information that ties it to a specific location.

Note, however, that the entire installation package will be downloaded, so the download size and time will be greater than the Install from the Web type described below.

Downloader

Select this option to build this release as a combination of `Setup.exe` and your .msi database. With this option, you can specify where your product's data files should be stored: they can be streamed into the .msi database or stored externally in cabinet (.cab) files. Any .mst and .ini files are embedded in the `Setup.exe` file.

With the Downloader option, the end user downloads and runs `Setup.exe`, which in turn downloads and runs the .msi database. If the .cab files are stored externally, only the .cab files that are required, based on the end user's setup type and feature selections, are downloaded and installed. This minimizes download size and time.

The URL that you specify in the Downloader Options panel of the Release Wizard is used during product maintenance and repair mode.

Install from the Web

Select this option to build this release as a combination of `Setup.exe`, your .msi database, and external cabinet (.cab) files. Any .mst and .ini files are embedded in the `Setup.exe` file.

With the Install from the Web option, the end user downloads and runs `Setup.exe`, which in turn downloads and runs the .msi database; based on the end user's setup type and feature selections, only the requested .cab files are downloaded and installed, which minimizes download size and time.

The URL that you specify in the Install from the Web Options panel of the Release Wizard is used during product maintenance and repair mode.

Downloader Options Panel

Project • *This panel is not available for InstallScript projects.*

The Downloader Options panel is where you specify the URL for your installation package. It is also where you specify the location for your product's data files.

Table 12-6 • Downloader Options Panel Settings

Setting	Description
URL for your package	Type the URL for your installation package—for example, **http://www.yourcompany.com/downloads**. (The file name is not necessary.)

Table 12-6 • Downloader Options Panel Settings (cont.)

Setting	Description
Create external .cab files	To stream your product's data files into the .msi package, clear this check box. To store your product's data files outside the .msi package (in external .cab files), select this check box and then select the appropriate **.cab Files** option.
.cab Files	If you select the **Create external .cab files** check box, specify how the (.cab files should be created. Available options are: • **One .cab per component**—Builds a separate cabinet file for each component. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded. • **One .cab per feature**—Builds a separate cabinet file for each feature. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded. • **Multiple .cab files based on size**—Enter a specific size, in kilobytes, for each cabinet file.

Install From The Web Options Panel

Project • *This panel is not available for InstallScript projects.*

The Install From The Web Options panel is where you specify the URL for your installation package. It is also where you specify how the .cab files should be created.

Table 12-7 • Install From The Web Options Panel Settings

Setting	Description
URL to install files from the Web	Type the URL for your installation package—for example, **http://www.yourcompany.com/downloads**. The URL must begin with `http://` or `ftp://`.

Table 12-7 • Install From The Web Options Panel Settings (cont.)

Setting	Description
.cab Files	Specify how the (.cab files should be created. Available options are: • **One .cab per component**—Builds a separate cabinet file for each component. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded. • **One .cab per feature**—Builds a separate cabinet file for each feature. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded. • **Multiple .cab files based on size**—Enter a specific size, in kilobytes, for each cabinet file.

One-Click Install Panel

Project • *This panel is not available for InstallScript projects.*

The One-Click Install panel is where you specify whether to generate an HTML page and cabinet file from which an end user can begin installing your project.

Panel Options

Generate a One-Click Install

Select this option if you would like to create a One-Click Install, which is an installation program whose initial user interface is an HTML page. When an end user visits your Web page and clicks a button on it, the installation files are downloaded to the target system and then launched. The files that are downloaded to the user's system depends on your setting for the Web Type property for the current release.

HTML base file name

Type in the base name of the HTML file to generate, as in *install*. The ".htm" extension will be added to the base name you specify.

CAB base file name

Type in the base name of the cabinet (.cab) file to generate, as in `install`.

Local Machine Panel

Project • *This panel is not available for InstallScript projects.*

The Local Machine panel prompts you to specify whether and where your installation files should be cached on the target system.

Panel Options

Cache installation on local machine

Check this box if you would like your installation files to be cached on the target system. When the user performs maintenance operations on your product, the cached location you specify here will be used as the default installation source.

Note • *Files cached on the target system using this option will not be automatically removed when the user uninstalls your product.*

Path

Specify the directory in which files should be cached on the target system. You can enter a hard-coded path, as in `C:\Cached Files`, but it is recommended you include a destination variable from the drop-down list in the path, as in `[LocalAppDataFolder]Downloaded Installations`.

Note • *Only the destination variables included in the Path list are available for use as download locations.*

Release Configuration Panel

Project • *This panel is not available for InstallScript projects.*

The Release Configuration panel enables you to specify the type of compression, if any, that you would like to use in your release.

If you are rebuilding an existing release, the wizard remembers your previous build settings.

Table 12-8 • Settings on the Release Configuration Panel

Setting	Description
Compress all files	Select this option to compress all of your product's files into either a single executable file (`Setup.exe`) or a single Windows Installer package (.msi file).
Leave files uncompressed and separate from the installation package	Select this option if your product's files should not be compressed, and if they should be in a subfolder of the folder that contains your installation package.

Table 12-8 • Settings on the Release Configuration Panel (cont.)

Setting	Description
Custom	Specify whether the release should be compressed: • **Compress all files**—Select this option to compress all of your product's files into either a single executable file (`Setup.exe`) or a single Windows Installer package (.msi file). • **Leave files uncompressed and separate from the installation package**—Select this option if your product's files should not be compressed, and if they should be separate from your installation package. • **Custom**—Select this option to compress only the files that are associated with one or more features into .cab files. If you select this option, the Release Wizard displays the Custom Compression Settings panel when you click Next to enable you to configure how the compression should be done.  ***Tip*** • *The output of the build process depends on your media type, compression, and spanning settings.*

Note • *The output of the build process depends on your media type, compression, and spanning settings.*

- *If you choose a Network Image media type and the **Compress all files** option, all your data files are compressed into `Setup.exe` or your .msi database, depending on whether you include the `Setup.exe` installation launcher.*
- *If you choose a CD-ROM, DVD-ROM, or Custom media type, along with the **Compress all files** option, each disk image contains a `DataN.cab` file that contains your data files.*
- *If you choose a CD-ROM, DVD-ROM, or Custom media type, along with the Custom option compression, the data files that you choose to compress are placed in cabinet files named `ComponentName.cab`.*
- *If you choose a Web media type, the build output is described on the Web Type panel of the Release Wizard.*

Custom Compression Settings Panel

Project • *This panel is not available for InstallScript projects.*

This panel prompts you to choose which features you would like to compress.

Panel Options

Features to Compress

All of the features included in this release are displayed here. Select the features that you would like to compress by selecting the check box next to each one.

A component or merge module can be associated with more than one feature. In such a case, the Release Wizard applies the compression settings of the *first* feature with which the component or module is associated. For example, if ComponentA belongs to both Feature1 (whose files are compressed) and Feature2 (whose files are uncompressed), the compression settings are applied as follows. If Feature1 is the first feature to be built into the release, ComponentA's files will be compressed into the Windows Installer package or `Setup.exe`.

Select All

Click this button to select all features for compression.

Clear All

Click this button to deselect all features, meaning that none of the features will be compressed into the installation.

Setup Launcher Panel

Project • *The Setup Launcher panel is available for the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Setup Launcher panel lets you specify whether you want to create a `Setup.exe` setup launcher. It also lets you specify whether you want to include the redistributable for Windows Installer 3.1 or earlier with your installation. For information about Windows Installer redistributables, see Adding Windows Installer Redistributables to Projects.

Table 12-9 • Settings on the Setup Launcher Panel

Setting	Description
Create installation launcher (Setup.exe)	Use this option to specify whether to create a `Setup.exe` setup launcher for the current release. The `Setup.exe` setup launcher is required in some cases. For example, if you want to install the Windows Installer engine on a target system, your release must include a setup launcher. It is also required if you selected the option to display the Language dialog in the Setup Languages panel. To learn more about scenarios that require a setup launcher, see Creating a Setup Launcher. The entire setup package and all of your application's files are compressed into `Setup.exe` if you selected the **Compressed and included within the installation package** option on the Release Configuration panel for a Network Image or Web—One Executable media type.
Include MSI 3.1 Engine	If you want to include the Windows Installer engine installation so that it can be installed or upgraded on a target system if necessary, select this check box. As an alternative, you can add an InstallShield prerequisite for the Windows Installer to your project. For more information, see Adding Windows Installer Redistributables to Projects.
Suppress warning if the Windows Installer service cannot be upgraded	To suppress the warning dialog that is displayed if the Windows Installer service cannot be installed or upgraded on the target system, select this check box.
Delay engine reboot until after your setup installation completes	Select the **Delay engine reboot until after your setup installation completes** option to delay any reboot that may be required by the Windows Installer engine installation until your setup program has completed. Clear this option to allow the system to reboot immediately after installing or updating the Windows Installer engine, if necessary.

Windows Installer Location Panel

Project • *This panel is not available for InstallScript projects.*

This panel specifies where the Windows Installer engine installers (`InstMsiA.exe` and `InstMsiW.exe`) are located.

Panel Options

Download engine from the Web

Select this option to download the Windows Installer engine installers (if necessary) from the URL that is specified on the Setup Launcher panel.

Tip • *This option is recommended if your installation will be downloaded from the Internet and you want to minimize the package size and download time. The engine will not be downloaded if the correct version is already present on the target machine.*

Extract engine from Setup.exe

Select this option to compress the selected Windows Installer engine installers into `Setup.exe`, to be extracted at run time, if necessary.

Tip • *Use this option if the entire installation must be self-contained in `Setup.exe`. Note that the Download engine from the Web option results in smaller installations and shorter download time; however, this option provides for a completely self-contained installation.*

Copy from source media

Select this option to leave the Windows Installer engine installers on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into `Setup.exe`.

Tip • *Use this option if the installation will be run uncompressed from fixed media—CD, DVD, or local network.*

InstallShield Prerequisites Panel

The InstallShield Prerequisites panel is displayed if your project contains one or more InstallShield prerequisites.

Use this panel to specify where the InstallShield prerequisites are located. Available options are as follows.

Tip • *If you want to use the locations that are specified for each individual InstallShield prerequisite, you must select the Following Individual Selections option for the InstallShield Prerequisites Locations setting on the Setup.exe tab*

in the Releases view. For more information, see Specifying a Run-Time Location for a Specific InstallShield Prerequisite.

Table 12-10 • Available Options on the InstallShield Prerequisites Panel

Option	Description
Download prerequisites from the Web	Download all of the InstallShield prerequisite files included in your project (if necessary) from the URL specified in the InstallShield prerequisite (.prq) file for each prerequisite.  ***Tip*** • *This option is recommended if your installation will be downloaded from the Internet and you want to minimize the package size and download time. An InstallShield prerequisite will not be downloaded if the correct version is already present on the target machine.*
Extract prerequisites from Setup.exe	Compress the InstallShield prerequisite files into `Setup.exe`, to be extracted at run time, if necessary.  ***Tip*** • *Select this option if the entire installation must be self-contained in `Setup.exe`. Note that the **Download prerequisites from the Web** option results in smaller installations and shorter download time; however, the **Extract engine from Setup.exe** option provides for a completely self-contained installation.*
Copy prerequisites from source media	Store the InstallShield prerequisite files on the source media.  ***Tip*** • *Use this option if the installation will be run uncompressed from fixed media—CD, DVD, or local network.*
Follow individual selections	Use the locations that are specified for each individual setup prerequisite's properties in the Redistributables or Prerequisites view. For more information, see Specifying a Run-Time Location for a Specific InstallShield Prerequisite.

Note • *If an InstallShield prerequisite is added to a project as a dependency of another prerequisite, the location for the prerequisite dependency follows the location setting of the prerequisite that requires it.*

Digital Signature Panel

The Digital Signature panel enables you to specify digital signature information for your package and the files in your package. Digitally signing your application assures your end users that the code within your application has not been modified or corrupted since publication.

Table 12-11 • Settings on the Digital Signature Panel

Setting	Description
Certificate URL	Type a fully qualified URL—for example, **http://www.mydomain.com**. This URL is used in your digital certificate to link to a location you would like end users to visit in order to learn more about your product, organization, or company.
Digital certificate file (SPC or PFX)	Specify the location of your digital certificate file (.spc or .pfx) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location. If you specify an .spc file, you must also specify a .pvk file.
Private key file (PVK)	If you are using an .spc file, you must also specify the location of your private key file (.pvk) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location.
Certificate password	If you would like to pass the password for the .pvk file or the .pfx file to `ISCmdBld.exe` to digitally sign your application while building the release from the command line, type the password in this box. InstallShield encrypts this password and stores it in your project (.ism) file. If you do not specify a password in this box but you are digitally signing the release while building it from the command line, you will need to manually enter the password when you are prompted each time that you build the release from the command line.

Digital Signature Options Panel

The Release Wizard includes the Digital Signature Options panel if you enter digital signature information on the Digital Signature panel.

Use the Digital Signature Options panel to specify which files in your installation should be digitally signed at build time.

Tip • *You can also configure digital signature information for a release on the Signing tab in the Releases view.*

Table 12-12 • Settings on the Digital Signature Options Dialog Box

Setting	Project Type	Description
Sign Windows Installer Package	Basic MSI, InstallScript MSI, Merge Module	If you want to sign your Windows Installer package (.msi file), select this check box. This check box is enabled only if .spc and .pvk files are specified, or if a .pfx file is specified.  ***Note*** • *You can sign the Windows Installer package only if version 2.0 or later is selected for the MSI Engine Version setting on the Setup.exe tab.*
Sign Media (requires .spc and .pvk)	InstallScript	If you want to digitally sign the media header file (`Data1.hdr`), select this check box. This check box is enabled only if .spc and .pvk files are specified, or if a .pfx file is specified.  ***Project*** • *InstallShield does not support using .pfx files to sign media header files (.hdr files), which are used for the One-Click Install type of installation for InstallScript projects. For this type of installation, consider one of the following alternatives:* • *Use .spc and .pvk files instead of a .pfx file for your digital signature.* • *Build a compressed installation, which would enable you to sign with a .pfx file.*
Sign Setup.exe	Basic MSI, InstallScript, InstallScript MSI	If you want to sign your `Setup.exe` file, select this check box. This check box is enabled only if .spc and .pvk files are specified, or if a .pfx file is specified. In addition, this setting is applicable only to releases that meet the following criteria: • Single-file `Setup.exe` • Compressed files • Network image media type

Table 12-12 • Settings on the Digital Signature Options Dialog Box (cont.)

Setting	Project Type	Description
Sign files in package	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If you want to sign any of the files in your release, select this check box and then use the **Include patterns and files** and **Exclude patterns and files** boxes to indicate which files should be signed.  ***Windows Logo*** • *All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.*
Include patterns and files	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify the files and file patterns that you want to be digitally signed at build time. Note the following guidelines: • You can type directly in the box. As an alternative, you can click the Files button, which launches the Browse for file dialog box. This dialog box lists all of the static files that are currently in your project. It also lists file patterns such as *.dll, which you can select. • To indicate a wild-card character, use an asterisk (*). For example, if you want to sign all .exe files, specify the following: ***.exe** Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern. • Put each file and each file pattern on its own line, with each separated by a carriage return. • Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.exe in the **Include patterns and files** box and in the **Exclude patterns and files** box, InstallShield does not sign any .exe files.

Table 12-12 • Settings on the Digital Signature Options Dialog Box (cont.)

Setting	Project Type	Description
Exclude patterns and files	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify any files and file patterns that you do not want to be digitally signed at build time. Note the following guidelines: • You can type directly in the box. As an alternative, you can click the Files button, which launches the Browse for file dialog box. This dialog box lists all of the static files that are currently in your project. It also lists file patterns such as *.dll, which you can select. • To indicate a wild-card character, use an asterisk (*). For example, if you do not want to sign any .drv files, specify the following: ***.drv** Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to avoid signing any files that match a certain pattern. • Put each file and each file pattern on its own line, with each separated by a carriage return. • Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.exe in the **Include patterns and files** box and in the **Exclude patterns and files** box, InstallShield does not sign any .exe files.
Sign files that are already signed	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If any of the files in your project are already digitally signed, determine whether you want InstallShield to replace those existing digital signatures with the digital signature that you specify on the Digital Signature panel. Note that this affects only files that meet the requirements that are specified in the **Include patterns and files** and **Exclude patterns and files** boxes. • To use the digital signature information that you provided on the Digital Signature panel to sign a file instead of any existing digital signature information that is already included with the file, select this check box. • To leave the existing digital signature information intact for any files that are already signed, clear this check box. This check box is cleared by default.

Table 12-12 • Settings on the Digital Signature Options Dialog Box (cont.)

Setting	Project Type	Description
Sign files in their original location	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Determine whether you want InstallShield to sign your original files or just the files that are built into the release: • If you want InstallShield to sign a temporary copy of each file and then use that signed temporary copy to build a release, clear this check box. Note that if you clear this check box, InstallShield will not modify or sign your original files. • If you want InstallShield to sign your original files, select this check box. This check box is cleared by default.  ***Tip*** • *The benefit of selecting this check box for a Basic MSI or InstallScript MSI project is that it helps create one patch that updates both compressed and uncompressed versions of a release that contains originally unsigned files.*

Password & Copyright Panel

The Password & Copyright panel prompts you to activate password protection for your installation. It also lets you specify whether you want to use default information or custom information for the Version tab on the Properties dialog box, which is displayed when end users right-click `Setup.exe` and then click Properties.

Table 12-13 • Password & Copyright Panel Settings

Setting	Description
Password Protect Setup.exe	If you want to require that end users enter a password in order for `Setup.exe` to run, select this check box, and then enter the password in the Password box.
Password	Enter the password that end users must enter in order to run the installation.
Show Password Dialog Box During Setup Initialization	 ***Project*** • *This setting is available in InstallScript projects.* If you want to launch the password-checking code in the **OnCheckMediaPassword** event handler function's default code, select this check box. If you clear this check box, you must enter your own code in the script to request the password from end users and check it by calling **FeatureValidate**.

Table 12-13 • Password & Copyright Panel Settings

Setting	Description
Use Custom Version Properties	 ***Project*** • *This setting is available in the following project types:* • *Basic MSI* • *InstallScript MSI* To override the default information and display your company's copyright information, as well as other information, select this check box. The information is shown on the Properties dialog box, which is displayed when end users right-click `Setup.exe` and then click Properties.
Copyright Notice	 ***Project*** • *This setting is available in the following project types:* • *Basic MSI* • *InstallScript MSI* Enter the copyright information that you want to be displayed on the Properties dialog box, which is displayed when end users right-click `Setup.exe` and then click Properties.

.NET Framework Panel

Project • *This panel is available in the following project types.*

- *Basic MSI*
- *InstallScript MSI*

To include one or more versions of the .NET Framework in an InstallScript or InstallScript Object project, use the Objects view to add the Microsoft .NET Framework object to your installation.

The .NET Framework panel is where you add support for the 32-bit versions of the .NET Framework 1.0, 1.1, or 2.0.

Note • *To include .NET Framework 3.5, 3.0 SP1, 3.0, 2.0 SP1 (x86, x64, IA64), or 2.0 (only x64, IA64) redistributables in your project, use the Redistributables view to add the appropriate InstallShield prerequisite for the Microsoft .NET Framework to your project.*

For more information, see Adding .NET Framework Redistributables to Projects.

Table 12-14 • .NET Framework Panel Settings

Setting	Description
Include or set up .NET Framework	Select this check box to include the .NET Framework with your installation. If it is not available on the target system, you can indicate the location where to find it and specify installation details.
.NET Version	Select the version of .NET Framework that you want to install to the target system. ***Note*** *• To include .NET Framework 3.5, 3.0 SP1, 3.0, 2.0 SP1 (x86, x64, IA64), or 2.0 (only x64, IA64) redistributables in your project, use the Redistributables view to add the appropriate InstallShield prerequisite for the Microsoft .NET Framework to your project.* *For more information, see Adding .NET Framework Redistributables to Projects.*
Download from the Web	Select this option to download .NET Framework support from the URL that is specified in the Release property sheet's .NET and J# Framework URL property.
Extract from Setup.exe	Select this option to extract the .NET Framework from Setup.exe and install it to the target system.
Copy from source media	Select this option to leave the .NET Framework on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into Setup.exe.
Show full user interface when installing .NET Framework	If you select this check box, the Microsoft .NET Framework (English) Setup wizard appears when dotnetfx.exe installs the .NET Framework on the target system. This wizard shows the progress of the .NET Framework installation. If you clear this check box, the InstallShield Wizard appears when dotnetfx.exe installs the .NET Framework on the target system. This InstallShield Wizard shows the progress of the .NET Framework installation.
Delay requested .NET reboots until after your installation	Select this check box to delay any prompts to reboot until after the installation is finished. The .NET Framework may not function until after this reboot. Therefore, it is strongly recommended that you not select this check box if the .NET Framework is used during the installation.

.NET Run-Time Options Panel

Project • *This panel is not available for InstallScript projects.*

Use this panel to specify additional command line parameters to `DotNetFx.exe` and select the .NET core language.

Panel Options

Command line to pass to DotNetFx.exe

In the edit field, type a command line that you want to pass to `DotNetFx.exe`.

.NET Core Language

If you selected .NET version 1.1 in the .NET Framework panel, you can specify one .NET core language you want to distribute. This is the language that is used while the .NET 1.1 core redistributable is installed. If you selected version 2.0, the language options are disabled since they are all included with this version of the redistributable. To launch the Redistributable Downloader Wizard, click **Download more Languages**.

.NET Language Pack Run-Time Options Panel

Project • *This panel is not available for InstallScript projects.*

Use this panel to select the .NET language packs you want to include with your setup. In addition, you can provide a command line to be used with `LangPack.exe`.

Panel Options

Command line to pass to LangPack.exe

Type a command line to pass to `LangPack.exe`.

.NET 1.1 Language Packs to Distribute

Select the check boxes next to the language packs that you want to distribute with your setup. The options available depend on the Microsoft language pack redistributables you have on your system. To download more, click **Download more languages** to launch the Redistributable Downloader Wizard.

Visual J# Run-Time Options Panel

Project • *This panel is not available for InstallScript projects.*

Use this panel to select Visual J# options that will be used if the Visual J# run-time components are not installed on the target system.

Note • *The version of Visual J# installed at runtime aligns with the version of the .NET Framework you selected in the .NET Framework panel.*

Panel Options

Include Visual J# run-time components

Select this option to include the Visual J# run-time components you select below

Download from the Web

Select this option to have the setup download the components from the URL that is specified in the Release property sheet's .NET and J# Framework URL property.

Extract from Setup.exe

Select this option to extract the J# run-time components from Setup.exe during the installation process.

Copy from source media

The components are copied from the installation's source media.

Command line to pass to redist

Type a command line to pass to the J# redistributable. Consult Microsoft for valid command-line parameters.

Make the installation of J# optional

Presents the option to the end user while the installation is running—via a dialog.

If it is optional, and the setup is silent, install J#

If you elect to make J# installation optional and the installation is run silently, the option cannot be presented to the end user. In this case, the J# run-time components are installed without requiring the end user to make a choice.

Advanced Settings Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The Advanced Settings panel enables you to set the release location and file name format. For installation projects, you can also specify whether you want to create Autorun and package definition files along with your release. You can optionally specify an earlier release build to optimize patch creation.

If you are rebuilding an existing release, the wizard remembers the build settings you last specified.

Panel Options

Release Settings

Table 12-15 • Release Settings Area on the Advanced Settings Panel

Setting	Description
Location	Enter the directory where you would like your release to be saved. You may navigate to this directory by clicking the Browse button. Alternatively, you may enter a path variable for your release location. To use a path variable in this field, you can either navigate to the directory your path variable points to, or you can enter the name of the path variable you would like to use, enclosed in angle brackets—for example, <MyVariable>.
Use long file names	If your release will be stored on media that supports long file names, select this check box. If long file names are not supported, or if you are uncertain what file name format your media supports, clear this check box.
Optimize size	If you want InstallShield to use the LZX method of compression when building this release's cabinet files, select this check box. To use MSZIP compression, clear this check box. The Cab Optimization Type setting on the Build tab for a release in the Releases view also lets you select LZX or MSZIP compression for the .cab files; in addition, this setting also lets you specify that you do not want to use any compression for the .cab files.  ***Important*** • *Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select this check box, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.* This setting is used only if your release is configured to compress some or all of its files into .cab files.
Use path variable test values	If you used test values for any of your path variables, you can set those variables to their actual values at this time.

Table 12-15 • Release Settings Area on the Advanced Settings Panel (cont.)

Setting	Description
Generate Autorun.inf	Choose this option if you are distributing your installation on a CD-ROM and want to support the AutoPlay feature, a Windows logo requirement. A text file called Autorun.inf containing the instructions to autoplay your installation will be created in the root of your disk images folder. You can edit this file to add additional AutoPlay options or to pass command-line parameters to `MsiExec.exe` or `Setup.exe`. AutoPlay will not work in the disk image folders on your development system, because it is enabled only in root drives. Note also that users can turn off AutoPlay on their own systems.
Generate Package Definition File	To create a package definition file (.pdf) that enables end users to run your installation as an SMS job, select this check box. If you select this check box, InstallShield creates a version 2.0 .pdf.
Build UTF-8 Database	If you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding, select this check box. The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system. However, some scenarios result in user interface issues. For example, if an end user specifies the `/qb` command-line option or uninstalls the product from Add or Remove Programs, Windows Installer uses very small fonts to display the user interface text in a UTF-8 database. If you clear this check box, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages. This check box is cleared by default.

Patch optimization (Optional) Area

To make the smallest possible patches, file keys in the **File** table should be identical in the earlier and later .msi databases. The patch-creation process uses the **File** table keys to determine if two files are the same file. (The actual file names cannot reliably be used, since a package might contain more than one file with the same name, installed under different conditions.) If the previous package is specified here, InstallShield uses identical **File** table keys for identical files.

For more information, see Upgrade Considerations.

Previous Windows Installer package

Browse for the earlier release version of the .msi file.

Release Settings Summary Panel

If you want to change any settings, click the Back button until you come to the panel that you would like to change. You can then return to the Release Settings Summary panel and start your build.

Panel Options

Build the Release

Select this option to build this release when you click Finish. Progress information for the build is displayed in the Output window.

Note • *The Build your Release option does not appear on the Summary panel if the Release Wizard was launched from Microsoft Visual Studio.*

General Options Panel

Project • *The General Options panel is available in the following project types:*

- *InstallScript*
- *InstallScript Object*

The General Options panel enables you to do the following:

- Create a self-extracting executable file for distributing your installation.
- Pass command-line options to `Setup.exe`.
- Pass preprocessor variable definitions to the compiler.
- Select whether to place the compiled script file (.inx file) in a cabinet file.

Project • *In an InstallScript object project, the Compiler Preprocessor Defines list and the Advanced button are available; none of the other options on this panel are available.*

Create a single file executable

Select this check box to create a self-extracting executable file. The File Name and Icon lists are enabled only if this check box is selected.

File Name

Type a file name for the self-extracting executable file or select a path variable whose value defines the password.

Icon

Optionally specify the fully qualified name of the file from which the executable file's icon is taken at build time; if no file is specified, a default icon is used. To specify a file, type an explicit path, select and append to a path variable, or click the browse button to open the Change Icon dialog box, in which you can click the Browse button to select a file. By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, **C:\Temp\MyLibrary.dll,2** indicates the icon with an index of 2, and **C:\Temp\MyLibrary.dll,-100** indicates the icon with a resource ID of 100.

Compress compiled script (.inx) file into media

If the compiled script file (.inx file) should be placed in a cabinet file, select this check box. If the file should be placed uncompressed in the Disk1 disk image folder, clear this check box.

Setup Command Line

Optionally specify any command-line parameters you want to pass to `Setup.exe` when the installation is launched; type a command line or select a path variable.

Compiler Preprocessor Defines

Optionally specify any preprocessor variable definitions; type the definitions or select a user-created build variable. Preprocessor variable definitions that are specified here apply only to the current release; they are not used when compiling the script for other releases. Use the following format, with no spaces before or after equals signs or commas:

```
MYVARIABLE1=123,MYVARIABLE2
```

Such variables can be tested in the script by #if and #ifdef statements that control the flow of the script. When you are creating an InstallScript object, enter IFX_OBJECTS.

Entering the name of a preprocessor variable in this box defines the variable. For example, if you enter MYVARIABLE in this box, the script commands in the following #ifdef loop are executed:

```
#ifdef MYVARIABLE
   // Commands
#endif
```

After you add or change a preprocessor variable definition in this box, you must compile your installation project for the addition or change to take effect. To learn how, see Compiling Scripts.

Other Disk Files

This button is enabled only if there are files in the Other folder under Advanced Files in the Support Files/Billboards view and you selected a media format that produces multiple disk images—which is true for all formats other than Network Image.

When you click this button, the General Options - Other Disk Files dialog box opens. This dialog box lets you specify a location in the disk image folders for each file that is in the Other folder.

Advanced

When you click this button, the General Options - Advanced dialog box opens. This dialog box lets you specify a custom location for the built files, the space that is reserved in the disk images folders, and whether the installation performs MD5 checking.

Features Panel

Project • *This panel is not available for the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Features panel allows you to specify which features are included in the built release.

Panel Options

Use the "Include in Build" property

If this option is selected, each feature whose Include in Build property is set to Yes is included in the built release and each feature whose "Include in Build" property is set to No is not included.

Specify the features

Lets you specify for each feature whether the feature is included in the built release. To toggle a feature's inclusion, click the check box next to the feature. A checked box indicates that a feature is included in the built release; an unchecked box indicates that a feature is not included.

You cannot toggle the inclusion status of InstallScript objects. Objects will always have the same inclusion status as their parent feature.

A disabled checked box indicates that the feature cannot be excluded because it is required by a feature that is included.

If you toggle a feature to included, all its parent, child, and required features will also become included, as well as all child features of its required features. If you toggle the feature to excluded, then its child features will become excluded as well. If this feature's parent has no more included features, then the parent will become excluded as well; a parent feature must have at least one child feature included for it to be included. If you exclude all but one of the visible child features of a required feature, the remaining visible child feature of the required feature is automatically included and disabled so that at least one child feature remains included.

Visible features (features whose Visible property is set to Yes) are displayed with a filled icon (); invisible features are displayed with an unfilled icon ().

Media Layout Panel

Project • *This panel is not available for Windows Installer–based or InstallScript MSI projects.*

This panel allows you to specify, for individual features or for all features, whether the features' files are stored in cabinet files or placed uncompressed in the disk image.

Panel Options

Cabinet File(s)

Store all features' files in cabinet files.

Note • *You can specify in a component's Compressed property whether the component's files are compressed or uncompressed when stored in a cabinet file.*

CD-ROM Folder(s)

Place all features' files uncompressed in the disk image. Files associated with a given feature are placed in the disk image in the folder specified in the feature's CD-ROM Folder property. If no folder is specified, that feature's files are placed in the root of the disk image.

Custom

If this option is selected, clicking the panel's Next button displays the Custom Media Layout panel, which lets you specify for individual features whether the feature's files are stored in cabinet files or placed uncompressed in the disk image.

Custom Media Layout Panel

Project • *This panel is not available for the following project types:*

- *Basic MSI*
- *InstallScript MSI*

This panel allows you to specify, for individual features or for all features, whether the features' files are stored in cabinet files or placed uncompressed in the disk image.

Panel Options

Features in cabinets

Lets you specify for individual components whether the component's files are stored in cabinet files or placed uncompressed in the disk image. To toggle a component's storage mode, click the check box next to the component. A checked box signifies that a component's files are stored in cabinet files. An unchecked box signifies that a component's files are placed in the disk image in the folder specified by the component's CD-ROM Folder property. If no folder is specified, that component's files are placed in the root of the disk image.

Select All

Selects all features in the **Features in cabinets** box.

Clear All

Deselects all features in the **Features in cabinets** box.

User Interface Panel

Project • *This panel is not available for the following project types:*

- *Basic MSI*
- *InstallScript MSI*

This panel allows you to specify the look and feel of your setup's end user dialog boxes.

Panel Options

Use project's default

If this option is selected, the end user dialog boxes are displayed with the skin that is selected in the Dialogs view's Skins folder, as shown in the Dialog Preview graphic.

Do not use any skin

If this option is selected, the end user dialog boxes are displayed in standard Windows style, as shown in the Dialog Preview graphic.

Use skin specified below

If this option is selected, the end user dialog boxes are displayed with the skin that you select in the list box, as shown in the Dialog Preview graphic. Note that the BlueTC skin uses GIF files and so under a 16-bit color setting does not look as good as the Blue skin, which uses bitmaps (and so is much larger).

Dialog Preview

Displays a sample of how the end user dialog boxes will appear as a result of the selections you made with the option buttons and list box.

- *The dialog boxes that are displayed by the following functions cannot be displayed with a skin; they appear the same regardless of whether you have specified a skin.*
  - *AskYesNo*
  - *EnterDisk*
  - *MessageBox*
  - *MessageBoxEx*
  - *RebootDialog*
  - *SdComponentDialog—the Available Disk Space dialog box*
  - *SdComponentDialog2—the Select Subcomponents dialog box*
  - *SdComponentDialogAdv—the Available Disk Space dialog box*
  - *SdConfirmNewDir*
  - *SdConfirmRegistration*
  - *SdExceptions*
  - *SdShowMsg*
  - *SelectDir*
  - *SelectDirEx*
  - *SprintfBox*

Display small initialization dialog

If checked, the setup initialization dialog box is the small box that was shown by setups created with InstallShield Professional version 6.31 and earlier—unless the setup displays a security, Save And/or Run Setup, Choose Setup Language, or Qualifying Product(s) Detected dialog box, in which case the setup initialization dialog box is larger and is consistent with the rest of the end user dialog boxes, regardless of the state of this check box. If unchecked, the setup initialization dialog box is larger and is consistent with the rest of the end user dialog boxes.

If this check box is unchecked, the setup initialization dialog box (and the Choose Setup Language dialog box, if any) are not displayed until the startup graphic closes. To specify the length of time for which the startup graphic displays, set Setup.ini's [Startup] section's SplashTime value.

Internet Options Panel

Project • *This panel is available in InstallScript projects.*

The Internet Options panel enables you to specify various Internet-related options.

Note • *Any release can be run over the Internet, regardless of its media type.*

Table 12-16 • Settings on the Internet Options Panel

Setting	Description
Generate One-Click Install	To create a One-Click Install installation that end users can download from the Internet and install, select this check box. If you select this check box, InstallShield includes with your installation an external setup player (`Setup.ocx` file) that downloads and then launches the `Setup.exe` file with the appropriate command line. If you select this check box, the other settings on this panel are enabled. To learn more, see One-Click Install Installations in InstallScript Projects.
Create a default Web page for the setup	Select this check box to indicate that you want InstallShield to create a default Web page (.htm file) in the Disk1 folder.
Enter the URL to launch	Do one of the following to indicate what URL should be launched if you click the Run From Web command on the Build menu: • To launch the `Setup.htm` file that InstallShield creates at build time and places in the Disk1 folder, leave this box blank. • To launch a different Web page, type the URL in this box or click the browse button to select the Web file. ***Tip*** • *If you enter a URL, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the `Setup.htm` file is **http://www.mypages.com/setup/Setup.htm**, enter the following as the URL to launch: **`http://www.mypages.com/setup`**.* *When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (http://www.mypages.com/setup/Setup.htm, in the aforementioned example).*

Update Panel

Project • *This panel is not available for the following project types:*

- *Basic MSI*
- *InstallScript MSI*

This panel allows you to specify the release format and the existing releases for which the current release can be run as an update.

Tip • *To create a setup that can be run on a system on which no version of your product is currently installed, select the Full option and the Non-version specific option.*

Panel Options

Full

Specifies that the current release is a full release.

Non-version specific

Enabled only if the Full option button is selected. Specifies that the current release can update any existing version of your application (as long as it was installed by a setup that was created with InstallShield Professional version 6.0 or later), or can install your application on a system on which no version of your product is currently installed.

Version specific

Enabled only if the Full option button is selected. Specifies that the current release can update only the versions of your application that are specified in the combo box.

combo box

Enabled only if the Version specific option is selected. Lets you specify the versions of your product to which the update can be applied. Type a semicolon-delimited list of version numbers (for example, 1.2.3;1.2.4) or select a list of version numbers from the list box. If you leave this field blank, the update can be applied to all earlier versions of your product.

Differential

Specifies that the current release is a differential release.

list box

Enabled only if the Differential option button is selected. Displays the existing releases to which the current project is compared when creating the new differential release. A file in the current project is excluded from the differential release if the same file (with the same date and time, size, and attributes) exists in each of the specified releases; otherwise the file is included in the differential release. (Files in a component whose Difference property is set to No are always included in the differential release.) You specify these releases by clicking the Import and Add buttons.

Also displays the version information for each release.

Note • *If the setup is unable to determine a specified release's version information, that version of your product cannot be updated by the setup. If no version information is displayed for a release, select the release, click the Modify button, then select the* ***Specify the version information below*** *option and type or select a version number.*

Add

Enabled only if the Differential option is selected. Opens the Existing Media dialog box, in which you can specify a release that is in the current project.

Import

Enabled only if the Differential option is selected. Opens the Media File Properties dialog box, in which you can specify a release that is not in the current project.

Modify

Enabled only if the Differential option is selected and a single release is selected in the list box. Opens the Media File Properties dialog box, in which you can change the release selection and the version information that is associated with the release.

Remove

Enabled only if the Differential option is selected and one or more releases are selected in the list box. Removes the selected release from the list.

Objects

Enabled only if the Differential option is selected. Opens the Object Difference dialog box, in which you select the conditions for including InstallScript objects in your differential release.

Object Difference Dialog Box

This dialog box opens when you click the Objects button in the Release Wizard's Update panel. This dialog box allows you to you specify the conditions for including InstallScript objects in your differential media.

Dialog Options

Include All

Specifies that the differential build will include all objects that would have been included in a full (non-differential) build. (This excludes, for example, objects that are associated with a feature whose Include In Build property is set to No or that is deselected in the Release Wizard's Features panel.)

Include If Changed

Specifies that the differential build will include only those objects that would have been included in a full build and are absent from, or have an earlier version number in, all the specified comparison media.

Note • *If the current project and all specified comparison media include the InstallShield Object Installer object, the media builder compares the files packaged by the InstallShield Object Installer in the current project to the packaged files in the specified media. The media builder includes in the InstallShield Object Installer only those files*

that are absent from—or have an earlier date and time, different size, or different attributes in—all the specified comparison media.

Exclude All

Specifies that the differential build will include no objects.

Postbuild Options Panel

Project • *The Postbuild Options panel is not available for the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Postbuild Options panel enables you to copy disk image folders to a folder or FTP site, or execute a batch file, after the release build is complete.

Table 12-17 • Settings on the Postbuild Options Panel

Setting	Description
Upload release files to the FTP site specified below	To automatically distribute your release to an FTP site, select this check box and enter the FTP location. Also enter the user name and password, if applicable. • **FTP Location**—Specify the FTP URL for the location. If you need to distribute your release to a path outside the FTP default folder, use a double slash (//). For example, to distribute your release to a root-level folder called **myproduct**, where the URL of the FTP server is **ftp://ftp.mydomain.com**, enter `ftp://ftp.mydomain.com//myproduct` for the FTP location. • **User Name**—If a user name is required to upload to the FTP location, enter the user name. • **Password**—If a password is required to upload to the FTP location, enter the password.
Copy the built media files to the folder specified below	If you want to be able to automatically distribute your release to a folder, select this check box and specify the FTP URL for the location. Existing folders with the same names as copied folders are overwritten, but no folders are deleted. Specify the folder path by typing the path in the box, or click the browse button to browse to the location. If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.

Table 12-17 • Settings on the Postbuild Options Panel (cont.)

Setting	Description
Execute the batch or executable file specified below after building the media files	To launch a batch file (.bat) or executable file (.exe) after the release has been built, select this check box and specify the path in the box. You can either type the path or click the browse button to browse to the file. In addition, you can select a path variable in the list and then type the rest of the path. If you select this check box, InstallShield sets environment variables with the same names (including the angle brackets) and values as the project's build variables. InstallShield also sets the environment variable <ISMEDIADIR>, whose value is the path to the folder in which the release's Disk Images, Log Files, and Report Files folders are created. You can refer to the value of an environment variable in a batch file by surrounding the variable name with percent signs (%); for example: set PATH = %<ISPROJECTDIR>%;%PATH% When the file is finished, InstallShield deletes the environment variables that it set.

Setup Best Practices Wizard

This wizard is invoked whenever you violate Setup Best Practices while adding files to a component. The wizard tells you which Best Practices you are not following and gives you the option to correct the action.

The wizard appears only if you have enabled active monitoring of Best Practices in the Options dialog.

Welcome Panel

The wizard is informing you that by adding files to a component you have violated one of the following Setup Best Practices:

Table 12-18 • Setup Best Practices Violations

Best Practice	Description
Components Should Not Contain Multiple EXEs, DLLs, OCXs, CHMs, or HLPs	Each component should contain only one "portable executable" file (an EXE, DLL, or OCX) or help file (CHM or HLP). Windows Installer components are designed such that all of the advanced settings and component properties, such as the code GUID, refer ideally to a single portable executable or help file. Place other EXEs, DLLs, OCXs, CHMs, or HLPs into new components.
A File Cannot Be Associated with More than One Component	This Best Practice is extremely important for shipping reusable components and facilitating resiliency. Microsoft recommends that no file be shipped in more than one component, "even across products, product versions, and companies."

Table 12-18 • Setup Best Practices Violations (cont.)

Best Practice	Description
Use Merge Modules	Merge modules contain all of the files, registry entries, and logic necessary to install a distinct piece of functionality. You should not distribute a file for which a merge module is available. Using merge modules also helps you comply with two related requirements—the Best Practice to avoid associating a file with more than one component and the Windows logo guideline not to ship any core components. If the Best Practices monitoring option is enabled, the Setup Best Practices Wizard alerts you whenever you try adding to a component any file that is part of the merge modules that InstallShield provides.

Panel Options

Please do not warn me of other Setup Best Practice conflicts

Selecting this option if you do not want the Setup Best Practices Wizard to notify you of Best Practices violations. You can reverse this action later in the Tools | Options panel.

Compliance Panel

This panel tells you which files violate the Setup Best Practices listed in the Welcome panel by placing a warning icon next to the file and citing the specific Best Practice rule violated.

Panel Options

Files

The list contains all of the files you added to the component and tells you which of them violates Best Practices. You can ignore the wizard's recommendations by clicking Finish (or Cancel to exit the wizard altogether), or you can correct the Best Practices conflict by clicking the Remove button.

Remove

Select a file and click the Remove button to prevent the file from being added to this component.

Static Scanning Wizard

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

In Basic MSI and InstallScript MSI projects, the value that is selected for a component's.NET Scan at Build setting affects how the Static Scanning Wizard scans the files in that component. To learn more, see Static Scanning.

The Static Scanning Wizard enables you to scan the files that are in your project for potential dependencies that they may require. This wizard scans all .exe, .dll, .ocx, .sys, .com, .drv, .scr, and .cpl files in your project and lets you add any detected dependencies to your installation.

The new files that added to your project are added to the same feature as the file that depends on them, thereby ensuring they get installed when needed.

Task: ***To launch the Static Scanning Wizard:***

1. In the View List under **Additional Tools**, click **Dependency Scanners**.
2. Click the **Perform Static Scanning** button.

The following panels are associated with the Static Scanning Wizard:

- Welcome
- Filter Files
- Scanning Progress
- File Selection
- Scan Results
- Completing the Static Scanning Wizard

Welcome Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Static Scanning Wizard enables you to scan the files that are in your project for potential dependencies that they may require. This wizard scans all .exe, .dll, .ocx, .sys, .com, .drv, .scr, and .cpl files in your project and lets you add any detected dependencies to your installation.

Click the Next button to begin scanning your project's files for dependencies.

Filter Files Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Static Scanning Wizard may list as dependencies certain files that you do not want added to your installation. For example, common system files that are already present on target machines usually do not need to be reinstalled. To avoid having these files added to your installation when you run the scanner, select the **Filter files** check box on the Filter Files panel.

To learn how to customize the list of files that are excluded from scans, see Filtering Files in Dependency Scanners.

Scanning Progress Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Scanning Progress panel is displayed when the Static Scanning Wizard is scanning all .exe, .dll, .ocx, .sys, .com, .drv, scr, and .cpl files in your project for dependencies. No files are added until you have confirmed the findings of the scan.

File Selection Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The File Selection panel displays a list of possible files and merge modules that you may need to add to your project. Use this panel to select the ones that you want to include in your installation. For more information, see Reviewing Dependency Scanner Results.

Table 12-19 • File Selection Panel Settings

Setting	Description
File	Indicate which files you want added to your installation by selecting the appropriate check boxes. The meaning of each type of icon is as follows: •  : This icon indicates that the file is a system or driver files. They are normally not redistributed as part of an installation, and they can potentially cause target systems to become inoperable. Ensure that these files are necessary before including them. •  : This icon indicates a non-system file. To include the file in your project, select the corresponding check box. •  : This icon indicates a merge module. To include the merge module in your project, select the corresponding check box. •  : This is the icon for a .NET assembly in your project. •  : This icon indicates a file that the Static Scanning Wizard has detected but is already in the project.
Deselect All	If you want to clear all of the check boxes, click this button. You can then manually select each check box that corresponds with a file or merge module that you would like to add to your project.
Select All	If you want to select all of the check boxes, click this button. You can then manually clear each check box that corresponds with a file or merge module that you do not want to add to your project.

Scan Results Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Scan Results panel shows the dependencies that the wizard identified and that you selected to be added to your project.

To add these dependencies to your project, click the Next button. To exit the wizard without adding the dependencies, click the Cancel button. To review the list of potential dependencies again and add or remove any of them, click the Back button.

Completing the Static Scanning Wizard Panel

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

When the Static Scanning Wizard shows the Completing the Static Scanning Wizard panel, the wizard has added the selected dependencies to your project.

Click Finish to close the wizard and return to InstallShield.

System Search Wizard

Project • *The System Search Wizard is not available in the following project types:*

- *InstallScript*
- *InstallScript Object*

The System Search Wizard provides the Windows Installer capability to search for a particular file, folder, Registry Key, .xml file or .ini value on a target system prior to installation. To access the wizard, click System Search in the view list under Behavior and Logic.

The System Search Wizard consists of the following panels:

- Welcome
- What do you want to find?
- How do you want to look for it?
- What do you want to do with the value?

Welcome Panel

The Welcome panel is the first panel displayed in the System Search Wizard, which allows you to add or modify a system search in your setup project. Click Next to add or modify a system search.

What do you want to find? Panel

Task: ***In this panel, specify the item you want to search for on the target system and the location of that item. To do so:***

1. Choose the appropriate item/search method combination from the drop-down list in the dialog.

   This indicates what type of item you are searching for and where to conduct that search on the target system.

2. Click **Next** to continue.

Note • *If you are searching for a registry entry that contains a file path or folder, then the file or folder must exist on your system in order for the search to be successful. Otherwise, the value from the search will not be set to a property.*

If you are searching for a file or folder, the full path to that item is stored in the property. If you are searching for a registry value, the data of that value will be stored in the property. The same holds true for .ini files. For components, the key path to the component will be in the property.
To get the property using script, see MsiGetProperty in the Windows Installer Help Library.

How Do You Want to Look for It? (Defining Your System Search Method)

Provide information to customize your search in this wizard panel. The information you provide in this panel will vary depending on your search methodology.

How do you want to look for it?

In this panel, you need to provide the following information:

Table 12-20 • System Search Wizard Panel Options

Option	Description
File Name	Enter the full name and extension of the file or application you want to locate.  ***Note*** • *Once you have entered a file name, the Details button is enabled. To modify your search to include any particular version, date, size or language, click Details to display the File Details dialog box.*
Look In	The information in this field references where your setup will look for items on the target system.

Table 12-20 • System Search Wizard Panel Options (cont.)

Option	Description
Number of subfolder levels to search	Specify the number of subdirectory levels to search for the file on the target system.

Click Next to continue to the next panel.

How do you want to look for it?

In this panel, you need to provide the following information:

Table 12-21 • System Search Wizard Panel Options

Option	Description
File Name	Enter the full name and extension of the file or application you want to locate.  ***Note*** • *Once you have enter a file name, the Details button next to that field is enabled. If you want to modify your search to include any particular version, date, size or language, click the Details button to enhance your search.*
Look In	In this section, you can either specify a full path or choose a path found in a previous search. When your are specifying a full path, the browse button next to the text box is enabled. Click the browse button to display the Browse for Directory dialog box in which you can select an existing directory or create a new one. If you want to specify a path from a previous search, select it from the list.
Number of subfolder levels to search	In this field, specify the number of subdirectory levels to search for the file on the target system.

Click Next to continue to the next panel.

How do you want to look for it?

In this panel, you need to provide the following information:

Table 12-22 • System Search Wizard Panel Options

Option	Description
Folder Name	Enter the full name of the folder you want to locate. Once you have entered a folder name, the Details button next to that field is enabled. If you want to modify your search to include any particular version, date, size or language, click the Details button to enhance your search.
Look In	The information in this field references where your setup will look for items on the target system.
Number of subfolder levels to search	In this field, specify the number of subdirectory levels to search for the file on the target system.

Click Next to continue to the next panel.

How do you want to look for it?

In this panel, you need to provide the following information:

Table 12-23 • System Search Wizard Panel Options

Option	Description
Folder Name	Enter the full name and extension of the folder you want to locate.  ***Note*** • *Once you have entered a folder name, the Details button next to that field is enabled. If you want to modify your search to include any particular version, date, size or language, click the Details button to enhance your search.*
Look In:	In this section, you can either specify a full path or choose a path found in a previous search. When specifying a full path, the browse button next to the edit field is enabled. Clicking the browse button launches the "Browse for Directory" dialog, in which you can select an existing directory or create a new one. When specifying a path from a previous search, select from the drop-down list.
Number of subfolder levels to search	Specify the number of subdirectory levels to search for the file on the target system.

Click Next to continue to the next panel.

How do you want to look for it?

The following settings are available on this panel:

Table 12-24 • How do you want to look for it? Panel Settings

Setting	Description
Registry Root	Choose the appropriate registry root on the target system to locate the search item. For example, the registry key for Adobe Acrobat on a system would be similar to the following: HKEY_LOCAL_MACHINE\SOFTWARE\Adobe\Acrobat. In this case, you would select HKEY_LOCAL_MACHINE in the Registry Root list.
Registry Key	Enter the exact registry key that is associated with the item that you are locating. To locate `HKEY_LOCAL_MACHINE\SOFTWARE\Adobe\Acrobat` on the target system, you would type `SOFTWARE\Adobe\Acrobat` in this setting. ***Tip*** • *Ensure that the syntax is correct by copying the correct key name from the Windows Registry Editor.*
Registry Value (Optional)	To search for a specific registry value, enter the registry value exactly as it appears in the Windows Registry Editor. ***Note*** • *If this setting is blank, the system search looks for the registry key's default value.*
Search the 64-bit portion of the Registry	Select this check box if you want your installation to check the 64-bit portion of the registry on the target system.

How do you want to look for it?

In this panel, you need to provide the following information:

Table 12-25 • System Search Wizard Panel Options

Option	Description
Field	Description
INI File Name	Specify the INI file name as it should appear on the target system.
INI Section Name	Obtain this information from the INI file. If you need to add a section to an INI file, refer to INI File Changes view.
INI Key Name	Enter the INI file key that can be found within the section.

Table 12-25 • System Search Wizard Panel Options (cont.)

Option	Description
Read entire line checkbox	This option will search for data in the field column of an INI file's IniLocator Table if it is null or 0.

Specify the Data That You wish to Find in the XML File

This wizard panel is where you specify which .xml element you want to search for in an .xml file on the target system. The settings in this panel allow you to search by attribute value, contents, or existence of the element you specify.

How do you want to look for it?

Enter the component ID of the component whose key path is to be used for the search. The component ID must be enclosed in curly braces {}.

What do you want to do with the value?

In this panel, you can choose from a list of properties to which you will set an existing value or enter a new property. This stores your search value in a property.

To store your value in a non-predefined, type the name of the property directly in the property edit field. The property must be a public property and therefore have an identifier that consists of uppercase letters.

Note • *You can add a new property to your setup project via the Property Manager. Any new properties you create must be public properties and have an identifier that consists of all uppercase letters. Save changes to your project after you add a new property, so you can access that new property in your project. For example, the new property is listed in the System Search Wizard.*

You also have the option to use the property in an Install Condition by choosing the option in the Additional Options section of the panel. Click Finish when you are done making your selections. InstallShield automatically launches the Condition Builder if you have chosen to use the property in an Install Condition.

What do you want to do with the value?

In this panel, you can choose from a list of properties to which you can set an existing value. This stores your search value in a property.

Store the value in this property

Select a property from the drop-down list.

To store your value in a non-predefined, type the name of the property directly in the property edit field. The property must be a public property and therefore have an identifier that consists of uppercase letters.

Note • *You can add a new property to your project via the Property Manager. Any new properties you create must be public properties and have an identifier that consists of all uppercase letters. Save changes to your project after you add a new property, so you can access that new property in your project. For example, the new property is listed in the System Search Wizard.*

Additional Options

Select from the options listed below.

Table 12-26 • System Search Wizard Panel Options

Option	Description
Just store the value in the property	Stores the value in the property you select in this dialog.
Use the property in an Install Condition	This will trigger the condition builder after you click Finish.
Use the property as the destination for a component	Selecting this option enables the component list. You can then choose a component with which to associate the property. ***Note*** • *This option is available only when you are searching for a folder path, a registry entry that contains a folder, an INI file that contains a folder, or a component whose key path is a folder.*

Transform Wizard

The Transform Wizard walks you through the steps of creating and applying transforms for your installation projects. Transforms represent the difference between two similar installation projects. When you apply a transform to one project, you are updating or changing it to incorporate the changes between the two projects.

Task: ***To launch the Transform Wizard:***

On the **Tools** menu, click **Create/Apply Transform**. It is not necessary to have a project open in InstallShield.

The following panels are associated with the Transform Wizard:

- Welcome
- Specify Files

Welcome Panel

The Transform Wizard walks you through the steps of creating and applying transforms to your setup project. A transform represents the differences between two setup projects. For example, network administrators may want to distribute different configurations of a product to the various departments in the company. As a result, you can create a transform for every configuration of the product, then apply the appropriate transform as needed.

Panel Options

Create a transform

Select this option to compare two similar setup projects and create a transform that represents the differences between them. This transform can then be applied at run time or before the final setup is built.

Apply a transform

Select this option to apply a transform to an existing Windows Installer setup. This may be useful for network administrators who will be customizing a product for everyone.

Specify Files Panel

If you are creating a transform, select the two MSI files that you would like to compare. If you are applying a transform, select the MSI file that you would like the transform applied to and the transform that will be applied.

Panel Options

Base package

This field will contains the path to the project that is currently open. If you want to change this value, enter the path to a different project or click the Browse button to navigate to one. If you are applying a transform, this field should contain the path to the file that you would like the transform applied to.

Target Package

This option is only available if you are creating a transform. Enter the path to the MSI file that you would like to compare to your base file, or click the Browse button to navigate to this file. The differences between these two files will be compared and a transform will be created that will update the base package to the target package.

Transform

This option is only available if you chose to apply a transform. Enter the path to the transform (*.mst) file that you would like to apply, or click the Browse button to navigate to that file.

Validation Settings Panel

The Validation Settings panel is displayed if you selected the Create a transform option on the Welcome panel of this wizard.

The Validation Settings panel prompts you for information on how you would like to validate your transform. These validation items must be met in order for the transform to execute.

Panel Options

Do not perform validation prior to applying the transform to the base package

Select this option if you do not want to perform any validation prior to applying the transform.

Validate the following prior to applying the transform to the base package

Select this option to check for certain conditions before the transform is applied. If these conditions are not met, the transform will not be applied.

Table 12-27 • Conditions for Applying a Transform to a Base Package

Option	Description
Default language must match base package	Select this option if the language of the transform should match the language of the package to which the transform is being applied.
Product must match base package	Select this option if you want your transform to be applied only to .msi files that have the same product code as the base package.
Platform must match base package	Select this option if the platform for which the base package is intended should match the target platform of the transform.
Upgrade Code must match base package	Select this option if you want the transform to be applied only if the upgrade code of the .msi file matches that of the transform.
Product Version	Select the version type that you would like to validate against. You can choose between a combination of major version, minor version, or upgrade version. You can also choose to not validate against the product version.

Table 12-27 • Conditions for Applying a Transform to a Base Package (cont.)

Option	Description
Version Relationship	Specify how you would like to validate the product version. The choices are outlined below: • **None**—Do not validate against the product version. • **Applied Version < Base Version**—Apply the transform only if the product version of the .msi file to which the transform is being applied is less than the version number of the base .msi file. • **Applied Version <= Base Version**—Apply the transform if the product version of the .msi file to which the transform is being applied is less than or equal to the version number of the base .msi file. • **Applied Version = Base Version**—Apply the transform only if the product version of the .msi file to which the transform is being applied is equal to the version number of the base .msi file. • **Applied Version >= Base Version**—Apply the transform only if the product version of the .msi file to which the transform is being applied is greater than or equal to the version number of the base .msi file. • **Applied Version > Base Version**—Apply the transform only if the product version of the .msi file to which the transform is being applied is greater than the version number of the base .msi file.

Suppress Error Conditions Panel

As your transform is being applied to the target MSI file, certain error codes may be generated. This panel gives you the option of suppressing those error codes so the end user will not see them.

Panel Options

Do not suppress error conditions when the transform is applied to the base package

Select this option if you do not want to hide the errors reported during the application of the transform.

Suppress the following error conditions when the transform is applied to the base package

Select this option to hide certain error codes from your end users. You can choose to suppress the following errors:

Table 12-28 • Suppressible Error Conditions

Error	Description
Adding an existing row	If your transform tries to add a row to the MSI database that already exists, an error is generated. Select this option to suppress that error.

Table 12-28 • Suppressible Error Conditions (cont.)

Error	Description
Deleting a row that does not exist	Select this option to suppress any errors that occur as a result of your transform trying to delete a row from the MSI database that does not exist.
Adding an existing table	Select this option to suppress errors caused by your transform trying to add a table to the MSI database that already exists.
Deleting a table that does not exist	Select this option to suppress any errors that occur as a result of your transform trying to delete a table from the MSI database that does not exist.
Updating a row that does not exist	If your transform tries to update a row to the MSI database that does not exist, an error will be generated. Select this option to suppress that error.
Transform and database code pages do not match	Select this option to suppress error codes caused by code pages in the transform not matching those in the target database.

Specify Output File Name Panel

This panel prompts you for the location and name of the transform (*.mst) file that will be created as a result of the comparison of your two MSI files.

Panel Options

Folder location and file name

If you are creating a transform, enter the path and file name of the transform file that you would like to create. If you are applying a transform, enter the path and file name of the new MSI package that you are creating as a result of applying the transform.

Summary Panel

The Summary panel displays all of the settings you selected throughout the Transform Wizard. If you need to change any of these settings, click the Back button until you reach the appropriate panel.

Completing the Transform Wizard Panel

The last panel of the Transform Wizard notifies you of the wizard's success. When you click the Finish button, you will be taken back to the IDE.

For more information on transforms, see Creating Transforms. This page provides an overview of transforms and links to pages that discuss how to create a transform and the different ways that transforms can be applied.

Tip • *For more information about the errors that can occur when a transform is being applied to an .msi database, see the MsiDatabaseApplyTransform topic in the Windows Installer Help Library.*

Upgrade Validation Wizard

The Upgrade Validation Wizard performs a set of tests to determine if your installation will properly upgrade older versions of your installation.

Project • *This wizard does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Task: ***To launch the Upgrade Validation Wizard:***

On the **Build** menu, point to **Validate**, and then click **Upgrade Validation Wizard**.

The following panels are associated with this wizard:

- Welcome
- Settings
- Summary

Welcome Panel

The Upgrade Validation Wizard performs a set of tests to determine if your setup will properly upgrade older versions of your setup.

Click Next to continue.

Settings Panel

Specify the following basic configurations for the upgrade validation:

Table 12-29 • Settings Panel

Configuration	Description
Specify the latest version of your setup	Click the browse button to locate the file.  ***Tip*** • *Think of the latest setup as the new image or version that you want to place on the target machine, and think of the previous setup as the existing image or version on the target machine before an upgrade.*
Specify any previous versions of your setup you want to validate against	Click Add to append to the existing list. You can add *.msi or *.exe Windows Installer Setup files. You can also specify multiple previous versions of your setup. To remove an item from the previous versions list, you must first select it in the list control and then click Remove.

When you click Next, validation begins.

Summary Panel

The Summary panel allows you to view the results from validation. You can also view the results externally by opening the corresponding log file stored in `<ISProjectDataFolder>\Upgrade Validation Log\Results.log`.

Note • *You can run validation again with different settings by clicking the Back button and changing your settings.*

The following table describes the icons next to each log file entry.

Table 12-30 • Icons

Button	Description
	This is the information notice icon.
	This is the error notice icon.
	This is the warning notice icon.

User Interface Wizard

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The User Interface Wizard enables you to add various predefined wizard pages to your Advanced UI or Suite/Advanced UI project. Examples include:

- A page that allows end users choose the installation directory for an .msi package
- A page that lets end users enter customer information and serial numbers
- A page that shows a feature tree, as well as feature descriptions and sizes, and allows end users to select which features to install

Task: ***To launch the User Interface Wizard:***

1. In the View List under **User Interface**, click **Wizard Interface**.
2. In the **Wizard Interface** explorer, right-click **Wizard Pages** and then click **Add Predefined Page**.

The User Interface Wizard consists of the following panels:

- Predefined Task Pages Panel
- Task Configuration Panel

Predefined Task Pages Panel

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The Predefined Task Pages panel is where you select the type of predefined wizard page that you want to add to your Advanced UI or Suite/Advanced UI project. This panel also lets you specify where in the sequence of wizard pages you want to schedule the new predefined page. You can resequence the wizard page later after adding it to your project.

The following table describes each of the types of available predefined wizard pages:

Table 12-31 • Types of Predefined Task Pages

Type of Wizard Page	Description
Browse for installation folder	This BrowseFolder wizard page lets end users select the installation directory for an .msi package. The Advanced UI or Suite/Advanced UI installation passes the path to the .msi package through the Windows Installer property **INSTALLDIR** when launching the package. This type of page is usually sequenced before an InstallationType or InstallationProgress wizard page.
Enter customer information for an MSI package	This CustomerInformation wizard page lets end users enter customer information and serial numbers for an .msi package, and pass the values to the package through the Windows Installer properties **USERNAME**, **COMPANYNAME**, and **SERIALNUMBER**. This type of page is usually sequenced after the LicenseAgreement wizard page.
Enter installation's password	This Password wizard page is where end users enter the installation's password. If an end user does not enter the correct password, the installation exits. This type of page is usually sequenced at the beginning of an installation.  ***Note*** • *When you add this type of wizard page to your project, InstallShield adds a placeholder image control to it so that you can add a lock image to the page. Ensure that you either configure the control's Resource setting to indicate the file that you want to display with this control, or, to exclude an image, delete the image control.*
View and accept supplemental license agreement	This LicenseAgreement wizard page requires end users to accept a supplemental end-user license agreement (EULA). The name of each EULA file must be unique; otherwise, the text and properties are linked. This type of page is usually sequenced after another LicenseAgreement wizard page.

Table 12-31 • Types of Predefined Task Pages (cont.)

Type of Wizard Page	Description
View and accept supplemental license agreement (Scrolling required)	This LicenseAgreement wizard page requires end users to scroll through and accept a supplemental end-user license agreement (EULA). The name of each EULA file must be unique; otherwise, the text and properties are linked. This type of page is usually sequenced after another LicenseAgreement wizard page.
View features and their size	This wizard page shows a feature tree, as well as feature descriptions and sizes that you have specified in your project. It allows end users to select which features to install. Note that this wizard page requires that you enter values in the Description and Cost settings of each feature in your Advanced UI or Suite/Advanced UI project. This type of page usually replaces the built-in InstallationFeatures wizard page.

Task Configuration Panel

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The Task Configuration panel in the User Interface Wizard is where you specify additional information for the predefined wizard page that you are adding to your project. This panel is displayed for only some of the predefined wizard page types.

Table 12-32 • Required Information for the Task Configuration Panel

Type of Wizard Page	Description of the Required Information
Browse for installation folder	Select the package in the Advanced UI or Suite/Advanced UI project for which you want to allow end users to specify the path.
Enter customer information for an MSI package	Select the package in the Advanced UI or Suite/Advanced UI project for which you want to allow end users to specify customer information.

Table 12-32 • Required Information for the Task Configuration Panel (cont.)

Type of Wizard Page	Description of the Required Information
Enter installation's password	If you add this type of wizard page to your Advanced UI or Suite/Advanced UI project, the Task Configuration panel is not displayed.
View and accept supplemental license agreement	Specify the EULA file (.rtf) that you want to be displayed on the supplemental LicenseAgreement wizard page.
View and accept supplemental license agreement (Scrolling required)	Specify the EULA file (.rtf) that you want to be displayed on the supplemental LicenseAgreement wizard page.
View features and their size	If you add this type of wizard page to your Advanced UI or Suite/Advanced UI project, the Task Configuration panel is not displayed.

Visual Studio .NET Wizard for Visual Basic .NET, C# .NET, and Visual C++ .NET

The Visual Studio .NET Wizard for Visual Basic .NET, C# .NET, and Visual C++ .NET creates a new InstallShield installation project and adds it to a Microsoft Visual Studio solution.

Note • *The Visual Studio .NET Wizard is available only if Microsoft Visual Studio is installed on your system.*

When you are creating the InstallShield installation project, the Visual Studio .NET Wizard does the following:

- Creates a new InstallShield project (with the file name specified on the New Project dialog box) and adds it to the solution (.sln file).
- If you have the Scan at Build option set to Dependencies and Properties (on the .NET tab of the Options dialog box), the wizard adds all dependencies to your project at build time.
- Adds the primary outputs from every project in the solution to the InstallShield project.
- Updates the release settings to deploy the appropriate version of the .NET Framework via download.

To launch the wizard, select the appropriate project type in the New Project dialog box.

The following panels are associated with this wizard:

- Welcome Panel

  Solution Panel

Welcome Panel

The Visual Studio .NET Wizard enables you to add an InstallShield installation project to a Microsoft Visual Studio .NET solution.

Note • *The Visual Studio .NET Wizard is available only if Microsoft Visual Studio is installed on your system.*

Click Next to select a solution.

Solution Panel

In this panel, type the path or browse to the Visual Studio solution to which you want to add the InstallShield installation project.

Click Finish to create a new InstallShield project and add it to the selected solution.

Visual Studio Deployment Project Import Wizard

The Visual Studio Deployment Project Import Wizard enables you to import a Visual Studio setup or merge module project (.vdproj) into an InstallShield project (.ism). You can reuse this wizard if you want to import multiple Visual Studio projects into your InstallShield project.

Important • *If the Visual Studio setup or merge module project that you want to import into an InstallShield project contains one or more project outputs, the InstallShield project must be in the same Visual Studio solution that contains the Visual Studio setup or merge module project and all of its project dependencies.*

Task: ***To launch the Visual Studio Deployment Project Import Wizard, do one of the following:***

- If you are using InstallShield by itself (without integration with Visual Studio): On the **Project** menu, click **Visual Studio Deployment Project Import Wizard**.
- If you are using InstallShield from within Visual Studio: On InstallShield toolbar, click the **Visual Studio Deployment Project Import Wizard** button.

This wizard consists of the following panels:

- Welcome
- Project File
- Options
- Summary

Welcome Panel

The Visual Studio Deployment Project Import Wizard enables you to import a Visual Studio setup or merge module project (.vdproj) into an InstallShield project (.ism). You can reuse this wizard if you want to import multiple Visual Studio projects into your InstallShield project.

Important • *If the Visual Studio setup or merge module project that you want to import into an InstallShield project contains one or more project outputs, the InstallShield project must be in the same Visual Studio solution that contains the Visual Studio setup or merge module project and all of its project dependencies.*

Click Next to begin using the wizard.

Project File Panel

The Project File panel is where you specify the Visual Studio project (.vdproj) that you want to import. The project can be a setup project or a merge module project.

Options Panel

The Visual Studio Deployment Project Import Wizard imports the project outputs, files, registry keys, file extensions, custom actions, target system searches, launch conditions, and prerequisites from your Visual Studio project into your InstallShield project. The Options panel is where you select which, if any, properties you also want InstallShield to import from the Visual Studio project into your InstallShield project.

Note • *If you select the check box for an option, InstallShield overwrites the existing value in your InstallShield project with the value that is configured in the Visual Studio project. For example, if you select the Product Name check box, InstallShield overwrites the value of the Product Name setting of your InstallShield project with the value that is set in the Visual Studio project.*

Table 12-33 • Available Options for Importing

Option	Description
Product Name	If you want your InstallShield project to use the ProductName property that is configured in the Visual Studio project that you are importing, select this check box. The product name is configured in the General Information view of InstallShield.  ***Project*** • *This option does not apply to merge module projects.*

Table 12-33 • Available Options for Importing (cont.)

Option	Description
Product Version	If you want your InstallShield project to use the value of the ProductVersion property that is configured in the Visual Studio project that you are importing, select this check box. The product version is configured in the General Information view of InstallShield.
INSTALLDIR	If you want your InstallShield project to use the value of the DefaultLocation property that is configured for the application folder in the Visual Studio project that you are importing, select this check box. If you select this check box, InstallShield updates the value of the INSTALLDIR setting in the General Information view with the path that is configured in the Visual Studio project.  ***Note*** • *Visual Studio lets you specify a directory path that contains multiple formatted properties, such as [ProgramFilesFolder][Manufacturer]\[ProductName], for the application folder. Visual Studio projects use a directory custom action to resolve the path at run time. However, InstallShield does not support this type of directory path. Therefore, InstallShield resolves the path during the conversion process and uses the* ***INSTALLDIR*** *property for the path.*

Table 12-33 • Available Options for Importing (cont.)

Option	Description
Add or Remove Programs Properties	If you want your InstallShield project to use the Add or Remove Program properties (AddRemoveProgramsIcon, Manufacturer, Description, ManufacturerUrl, Author, SupportUrl, and SupportPhone) that are configured in the Visual Studio project that you are importing, select this check box. If you select this check box, InstallShield updates the values of the following settings in the General Information view with the values that are configured in the Visual Studio project: • Display Icon (In the Visual Studio project, this is the AddRemoveProgramsIcon property.) • Publisher (In the Visual Studio project, this is the Manufacturer property.) • Add or Remove Programs Comments (In the Visual Studio project, this is the Description property.) • Publisher/Product URL (In the Visual Studio project, this is the ManufacturerUrl property.) • Support Contact (In the Visual Studio project, this is the Author property.) • Support URL • Support Phone Number  ***Project*** • *This option does not apply to merge module projects.*
Summary Information Stream Properties	If you want your InstallShield project to use the Summary Information Stream properties (Title, Subject, Keywords, and TargetPlatform) that are configured in the Visual Studio project that you are importing, select this check box. If you select this check box, InstallShield updates the values of the following settings in the General Information view with the values that are configured in the Visual Studio project: • Title • Subject • Keywords • Processor type in the Template Summary setting (In the Visual Studio project, this is the TargetPlatform property.)  ***Project*** • *This option does not apply to merge module projects.*

Table 12-33 • Available Options for Importing (cont.)

Option	Description
Product Code	If you want your InstallShield project to use the value of the ProductCode property that is configured in the Visual Studio project that you are importing, select this check box. The product code is configured in the General Information view of InstallShield.  ***Project*** • *This option does not apply to merge module projects.*
Upgrade Code	If you want your InstallShield project to use the value of the UpgradeCode property that is configured in the Visual Studio project that you are importing, select this check box. The upgrade code is configured in the General Information view of InstallShield.  ***Project*** • *This option does not apply to merge module projects.*
All Users	If you want your InstallShield project to use the value of the InstallAllUsers property that is configured in the Visual Studio project that you are importing, select this check box. If you select this check box, InstallShield updates the value of the **ALLUSERS** property in the Property Manager view based on the value that is set in the InstallAllUsers property in the Visual Studio project.  ***Project*** • *This option does not apply to merge module projects.*

Table 12-33 • Available Options for Importing (cont.)

Option	Description
Project Language	If you want your InstallShield project to use the language that is selected in the Localization property of the Visual Studio project that you are importing, select this check box. If you are importing a Visual Studio project into an InstallShield project and the following conditions exist, InstallShield replaces the existing string entry values in your project with default string entry values for the language of your Visual Studio project: • You select this Project Language check box in the Visual Studio Deployment Project Wizard. • The language of your Visual Studio project does not match the default language in your InstallShield project. (In Visual Studio, the Localization property indicates the project's language. In InstallShield, the Default Language setting in the String Editor view indicates the project's default language.) • InstallShield has support for the language that is used in your Visual Studio project. (If you are using the Professional edition of InstallShield, you may not have support for the language that is used in your Visual Studio project.) For example, if you select this Project Language check box, if the language of your InstallShield project is Spanish, if the language of your Visual Studio project is German, and if you are using the Premier edition of InstallShield, InstallShield replaces the Spanish run-time strings in your project with the default German translations. Thus, if you edit a string entry value by revising a setting such as the Publisher setting in the General Information view, and then you indicate in the wizard that you want to import the language of a Visual Studio project, InstallShield overwrites the value of the Publisher setting—as well as values for other settings—with the default German string entry values. Therefore, if the project language is changed while you are importing your Visual Studio project, review the settings in the General Information view and the String Editor view after the import, and modify the string entry values if appropriate.  ***Project*** • *This option does not apply to merge module projects.*

Summary Panel

The Summary panel lets you review the settings that you specified in the Visual Studio Deployment Project Import Wizard. To change any of the settings, click the Back button until you reach the appropriate panel. To import the project, click the Finish button.

View Reference

The InstallShield installation development environment (IDE) is organized into views that incorporate various areas of functionality. The View Reference section describes each of those views in the InstallShield interface.

Installation Information View

Project • *The Installation Information view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

The Installation Information view contains links to other views that you can use to configure general settings about your installation.

General Information

Project • *The General Information view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

The General Information view contains basic information about your project, your company, and your product. Some of the information that you enter in this view is for your reference only, some (in Basic MSI, DIM, InstallScript MSI, and Merge Module projects) is necessary to comply with Windows logo requirements, and the rest is for setting basic project settings.

Update Notifications

Project • *The Update Notifications view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

For information on adding FlexNet Connect support to an InstallScript project, consult the Knowledge Base.

In the Update Notifications view, you can add FlexNet Connect to your installation project. FlexNet Connect enables you to provide automatic application updates to your end users.

Trialware

Project • *The Trialware view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

In the Trialware view, you can protect your product from piracy by including a license with it. The license enables you to create a fully functional trial version of your product that expires after a predetermined number of days or uses. No changes to your product's source code are required.

Edition • *Trialware functionality is available in the Premier edition of InstallShield.*

General Information View

Project • *The General Information view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

The General Information view contains basic information about your project, your company, and your product. Some of the information that you enter in this view is for your reference only, some is necessary to comply with Windows logo requirements, and the rest is for setting basic project settings.

When you create a new installation project, you must configure its General Information view settings. InstallShield creates new projects with default settings, but you should set your own values so that your project includes data that is specific to your needs.

The General Information view consists of the following elements:

- A row of buttons
- A grid of settings

The following table describes the buttons that are displayed in the General Information view.

Table 12-1 • Controls in the General Information View

Name of Control	Icon	Description
Categorized		Sorts the settings according to categories.
Alphabetical		Sorts the settings alphabetically.

For descriptions of each of the settings in the General Information view, see General Information View Settings.

General Information View Settings

Project • *The General Information view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

The General Information view settings are organized into the following main categories:

- General
- Summary Information Stream
- Add or Remove Programs
- Software Identification Tag

General Settings

Use the General area of the General Information view to specify details such as product name and product version. The following settings are available in this area.

Table 12-2 • General Settings

Setting	Project Type	Description
Project File Name	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	This read-only setting displays the path and name of the InstallShield project file. It also shows the type of project. The extension of the project file varies, depending on the project type: • **.ism project file**—InstallShield uses this extension for most project types, including Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, and Merge Module. • **.dim project file**—InstallShield uses this extension for DIM projects. • **.issuite project file**—InstallShield uses this extension for Advanced UI and Suite/Advanced UI projects. To learn more, see Project Types.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Project File Format	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Select the file format that you want to use for your project file (.ism or .dim). Available options are: • **Binary**—To save the .ism file as a database file, select this option. This format is best for the speed of opening and saving the project file. This is the default format for Basic MSI, DIM, InstallScript MSI, and Merge Module projects. If you select this project file format for these project types, you can modify the .ism file in a Windows Installer database editor. You can also modify the .ism file by using the Windows Installer API or its automation interface. • **XML**—To save the .ism file as a hierarchical text-based format, select this option. This project file format is best for use with source code control systems. It enables you to modify the project file using XML tools. This is the default format for InstallScript and InstallScript Object projects.  ***Note*** • *Both project file formats let you build releases from the command line.*
Suite GUID	Advanced UI, Suite/Advanced UI	Enter a GUID that uniquely identifies the Advanced UI or Suite/Advanced UI installation. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting. Since this code uniquely identifies your Advanced UI or Suite/Advanced UI installation, changing the Suite GUID after you have already distributed your release is not recommended.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Setup Languages	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	 ***Project*** • *The behavior of this setting varies, depending on the project type.* In Basic MSI, InstallScript MSI, Merge Module, and Suite/ Advanced UI projects, the Setup Languages setting lets you specify the languages that you want to be listed in the UI Languages setting in the Releases view. If a language is not listed for this Setup Languages setting at the project level, you cannot include that particular UI language in your project's releases. Advanced UI projects, which are available in the Professional edition of InstallShield, have support for only one language. Therefore, the Setup Languages setting in this project type is read-only. In InstallScript and InstallScript Object projects, the Setup Languages setting lets you specify the languages that you want to be listed in the Languages setting in the Components and Releases views in your project. In general, if a language is not listed for this setting at the project level, you cannot designate that a particular component in your project is targeted for that language; in addition, you cannot designate that the components and UI strings for a particular language are included in your project's releases. When you add a supported language to an Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, or Suite/Advanced UI project through this setting, InstallShield adds string entries for that language to your project. The string entries include the built-in user-interface string resources that are already translated. In DIM projects, the Setup Languages setting lets you specify the languages that you want the project to support. When you add a language to your project through this setting, InstallShield adds string entries for that language to your project. The string entries include string resources that you would need to have translated. For more information, see Selecting the Installation Languages.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Default Language	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	Select the default language for your project. The localizable strings that you specify throughout various views in InstallShield—such as the Display Name setting for a feature or the Description setting for a shortcut—are all from the default language's string entries. For more information, see Setting the Default Project Language.
Platform Filtering	InstallScript, InstallScript Object	This setting lets you specify the platforms that you want to be available when you select operating system requirements for components or releases in your project. In general, if a platform is not listed for this setting at the project level, you cannot designate that a particular component or release in your project is targeted for that platform. To change the platforms for your project, click the ellipsis button (...) in this setting. The Platforms dialog box opens, enabling you to select the platforms for your project.  ***Note*** • *Specifying platforms at the project level does not create target system requirements for running the installation. If you want to create target system requirements in an InstallScript or InstallScript Object project, use the SYSINFO structure to identify the operating platform of the target system.*

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Maintenance Experience	InstallScript	Select the behavior that occurs when a target machine already has your product installed and the end user reruns your installation. Valid options are: • **Standard**—If the maintenance user interface should be displayed when a target machine already has your product installed and the end user reruns your installation, select this option. Only one entry for the product is listed in Add or Remove Programs. • **Multi-Instance**—If end users should be able to rerun an installation multiple times as a first-time installation rather than as a maintenance installation, select this option. Each time that an end user runs the installation, a separate entry is added to Add or Remove Programs. By default, this option lets end users install the product to a different location each time that they run the installation. This is useful for a product that an end user may want to install to different locations in order to experiment with different product configurations and then later remove only specific instances. The maintenance user interface is displayed only if an end user reruns the installation from Add or Remove Programs. • **No uninstall or maintenance**—If end users should not be able to uninstall the product or run it in maintenance mode, select this option. No entry is created for the product in Add or Remove Programs. To learn more, see Running an InstallScript Installation Multiple Times.
Enable Maintenance	InstallScript MSI	Indicate whether you want to display the full maintenance user interface (UI) or the uninstallation UI when end users rerun the installation on a system on which the product is already present. Available options are: • **Yes**—Unless the `/removeonly` command-line parameter is passed to `Setup.exe`, the system variable REMOVEONLY is set to FALSE when an end user reruns the installation, and the standard maintenance UI is displayed. • **No**—The system variable REMOVEONLY is set to TRUE when an end user reruns the installation, and the uninstallation UI is displayed. To learn more, see Configuring the Enable Maintenance Setting.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
InstallScript User Interface Type	InstallScript MSI	Specify the type of InstallScript user interface (UI) that you want to use for your installation. Valid options are: • **Traditional Style (Requires Setup.exe)**—If you want to use the InstallScript engine as an external UI handler for your InstallScript MSI installation, select this option. With this style, your installation must include a `Setup.exe` setup launcher. The setup launcher serves as a bootstrap application that initiates the InstallScript engine to display the UI and run the InstallScript code, and the Windows Installer to run the Execute sequence of the .msi package. This is the default option for this setting. • **New Style (Requires Windows Installer 4.5)**—If you want to use the InstallScript engine as an embedded UI handler for your InstallScript MSI installation, select this option. With this style, InstallShield embeds the InstallScript engine within the .msi package. The Windows Installer calls the InstallScript engine to display the UI. The Windows Installer also runs the Execute sequence of the .msi package. This option requires Windows Installer 4.5 on the target machine. This option also has some limitations that require careful planning if you decide to use this style. For detailed information about these two styles, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.
Product Name	**Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Suite/Advanced UI, Transform**	Enter the name of the product, DIM, merge module, or object. For information on how the product name is used, see Specifying a Product Name.  ***Project*** • *For InstallScript and InstallScript Object projects—Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)* *The product name is stored in the InstallScript system variable IFX_PRODUCT_NAME.* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying different versions of the project.*

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Product Version	**Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Suite/Advanced UI, Transform**	Enter the version number for your product. The version must contain only numbers. It is typically in the format *aaa.bbb.ccccc* or *aaa.bbb.ccccc.ddddd*, where *aaa* represents the major version number, *bbb* represents the minor version number, *ccccc* represents the build number, and *ddddd* represents the revision number. The maximum value for the *aaa* and *bbb* portions is 255. The maximum value for *ccccc* and *ddddd* is 65,535. Note that although you can include the fourth field (*ddddd*), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see Specifying the Product Version.  ***Project*** • *For Basic MSI, InstallScript, and InstallScript MSI projects—If your release includes a `Setup.exe` file, the product version that you specify is displayed on the Properties dialog box for `Setup.exe`. For more information, see Customizing File Properties for the Setup Launcher.* *For InstallScript and InstallScript Object projects—Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying different versions of the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.*
Product Code	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Transform	Enter a GUID that uniquely identifies this product. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting. Since this code uniquely identifies your product, changing the product code after you have already distributed your release is not recommended. For more information, see Setting the Product Code in a Windows Installer–Based Project or Setting the Product Code in an InstallScript-Based Project.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Upgrade Code	Basic MSI, InstallScript MSI, MSI Database, Transform	Enter a GUID that can be used for your product's upgrade code. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting. The upgrade code is a GUID that identifies a related set of products. The Windows Installer uses a product's upgrade code when performing major upgrades of an installed product. The upgrade code, stored in the **UpgradeCode** property, should remain the same for all versions of a product. For more information, see Setting the Upgrade Code.
Install Condition	Basic MSI, InstallScript MSI, MSI Database, Transform	This setting lets you specify one or more conditions that must be true in order for your installation to run. For example, you can test for a specific operating system or minimum system requirements. If the conditions do not evaluate to True at run time, an error message is displayed and the product is not installed. To specify one or more conditions, click the ellipsis button (...) in this setting. For more information, see Setting Product Conditions. When you add a condition, InstallShield adds two new settings under the Install Condition setting: • **Condition**—This setting displays the conditional statement that you added. To edit the conditional statement, click the ellipsis button (...) in this setting. To delete the condition and its message, click the **Delete this condition** button in this setting. • **Message**—This setting displays the run-time error message that is configured to be displayed at run time if the corresponding condition is not met on the target system. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (**...**) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Exit Conditions	Advanced UI, Suite/Advanced UI	This setting lets you specify one or more exit error messages that you want the Advanced UI or Suite/Advanced UI installation to display under various conditions before ending the installation. For example, if your Advanced UI or Suite/Advanced UI installation requires Windows Vista or later, you could use the Exit Condition setting and its subsettings to specify an error message that you want to be displayed when end users launch your Advanced UI or Suite/Advanced UI installation on earlier versions of Windows. When end users dismiss the error message, the Advanced UI or Suite/Advanced UI installation ends. To specify an error message and one or more conditions, click the ellipsis button (...) in this setting. When you add a condition, InstallShield adds two new settings under the Exit Conditions setting: • **Exit Message**—Use this setting to enter the error message that you want the Advanced UI or Suite/Advanced UI installation to display at run time if the conditions that are defined under this message are true. To delete the message and its conditions, click the **Delete this condition** button in this setting. • **Any/All/None**—This setting displays the conditional statement that you are defining. For more information, see Defining Exit Conditions for an Advanced UI or Suite/Advanced UI Installation.
Module Language	DIM, Merge Module, MSM Database	Select the language of the DIM or merge module, or select Language Independent.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
INSTALLDIR	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify the value of the Windows Installer property **INSTALLDIR**, which indicates the destination directory where most of the files of the product, DIM, or merge module will be installed at run time. Instead of hard-coding a path, you can enter a directory property as part of the path. To select a directory property, click the ellipsis button (...) in this setting. This enables you to select the appropriate directory from a list, or to create a new directory within a predefined directory. Separate further levels of subdirectories with a backslash—for example, `[ProgramFilesFolder]MyApp\Bin`.  ***Windows Logo*** • *To comply with the Windows logo program, your product's default destination should be a subfolder of the Program Files folder (**[ProgramFilesFolder]**), which can vary depending on the system's locale and user settings.*  ***Project*** • *In Basic MSI, InstallScript MSI, MSI Database, and Transform projects, the default value is as follows:* `[ProgramFilesFolder]My Company Name\My Product Name` *The value that you enter in this setting is assigned to the property **INSTALLDIR**, which is the default destination folder for all of your product's features and components. For more information, see Setting the Default Product Destination Folder (INSTALLDIR).* *In DIM, Merge Module, and MSM Database projects, the default value is as follows:* `[TARGETDIR]` *In DIM, Merge Module, and MSM Database projects, if you would like to let the users of this DIM or module override the default destination directory, leave that default value in this setting. For more information, see Specifying the Default Destination Folder for a Merge Module.*
TARGETDIR	InstallScript, InstallScript Object	Specify the default value for the main target directory for your product. Typically this value is set to a value such as the following one: `<FOLDER_APPLICATIONS>\<IFX_COMPANY_NAME>\<IFX_PRODUCT_NAME>` For more information, see TARGETDIR.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Module ID GUID	Merge Module, MSM Database	This read-only setting displays a GUID that uniquely identifies the merge module. Whenever you create a new merge module, InstallShield generates a new GUID for it. The module ID GUID is appended to all merge module GUID foreign keys. For example, if you create a component in a merge module project, that component is listed in the Direct Editor and in the built .msm file as **ComponentName.MergeModuleGUID**. If you want to change this GUID, you can use the Direct Editor view to edit the ModuleID field of the **ModuleSignature** table. Note that if you change this value, you must also update the value in all of the tables in your project; you can do this from within the Direct Editor view.
Module Dependencies	Merge Module, MSM Database	This setting lets you specify one or more merge modules that are required for your merge module. To add one or more dependencies that are available in your redistributables gallery, click the ellipsis button (...) in this setting. The Module Dependencies dialog box opens, enabling you to select the modules that your merge module requires. To add a dependency that is not present on your machine, click the **Add a new module dependency** button, and then specify its version, language, and module GUID.
Name	Merge Module, MSM Database	This read-only setting shows one of the following values: • If you selected a dependency that is available in your redistributables gallery, this setting shows the name of that dependency. • If you chose to add a dependency that is not present on your machine, this setting indicates **[Merge Module Added by Setup Author]**. This setting is displayed only if you have added a merge module dependency to your project. If you want to remove this dependency from your project, you can click the **Delete this module dependency** button in this setting.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Version	Merge Module, MSM Database	If the merge module that you are creating requires a particular version of the dependency, specify the version number. If any version of the dependency is acceptable, you can leave the Version setting blank. This setting is displayed only if you have added a merge module dependency to your project.
Language	Merge Module, MSM Database	If the merge module that you are creating requires a dependency of a particular language, specify the language. If any language of the dependency is acceptable, select Language Independent. This setting is displayed only if you have added a merge module dependency to your project.
Module ID	Merge Module, MSM Database	If you selected a dependency that is available in your redistributables gallery, this setting indicates the module ID of that dependency. If you chose to add a dependency that is not present on your machine, enter the module ID of the dependency. The module ID must be in the following format: `ModuleName.ModuleGUID` For example, if the name of the merge module is **MyDependency** and the GUID is **{2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9}**, enter the following in this setting: `MyDependency.2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9` This setting is displayed only if you have added a merge module dependency to your project.
Module Exclusions	Merge Module, MSM Database	This setting lets you specify one or more merge modules that are incompatible with the merge module that you are creating. This may be necessary, for example, if an earlier version of your merge module is not compatible with your new module. To add one or more exclusions that are available in your redistributables gallery, click the ellipsis button (...) in this setting. The Module Exclusions dialog box opens, enabling you to select the modules that are incompatible with your merge module. To add an exclusion that is not present on your machine, click the **Add a new module exclusion** button, and then specify the requirements for the version, language, and module GUID.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Name	Merge Module, MSM Database	This read-only setting shows one of the following values: • If you selected an exclusion that is available in your redistributables gallery, this setting shows the name of that exclusion. • If you chose to add an exclusion that is not present on your machine, this setting indicates **[Merge Module Added by Setup Author]**. This setting is displayed only if you have added a merge module exclusion to your project. If you want to remove this exclusion from your project, you can click the **Delete this module exclusion** button in this setting.
Max. Version	Merge Module, MSM Database	Specify the maximum version number of the merge module that should be excluded. If you leave this setting blank, all versions after the value that you specify in the Min. Version setting are excluded. If you leave both the Max. Version and Min. Version settings blank, there is no exclusion based on version. This setting is displayed only if you have added a merge module exclusion to your project.
Min. Version	Merge Module, MSM Database	Specify the minimum version number of the merge module that should be excluded. If you leave this setting blank, all versions before the value that you specify in the Max. Version setting are excluded. If you leave both the Max. Version and Min. Version settings blank, there is no exclusion based on version. This setting is displayed only if you have added a merge module exclusion to your project.
Language	Merge Module, MSM Database	If you want to exclude merge modules that have a specific language or change the current value of this setting, click the ellipsis button (...) in this setting. The Exclusion Languages dialog box opens, enabling you to specify whether you want to exclude a particular language or all of the languages except a particular language. This dialog box also lets you select Language Independent, which indicates that the language should not be used to exclude a merge module. This setting is displayed only if you have added a merge module exclusion to your project.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Module ID	Merge Module, MSM Database	If you selected an exclusion that is available in your redistributables gallery, this setting indicates the module ID of that exclusion. If you chose to add an exclusion that is not present on your machine, enter the module ID of the exclusion. The module ID must be in the following format: `ModuleName.ModuleGUID` For example, if the name of the merge module is **MyExclusion** and the GUID is **{2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9}**, enter the following in this setting: `MyExclusion.2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9` This setting is displayed only if you have added a merge module exclusion to your project.
DIM GUID	DIM	This read-only setting displays a GUID that uniquely identifies the DIM. Whenever you create a new DIM, InstallShield generates a new GUID for it. The DIM GUID is appended to all DIM GUID foreign keys. For example, if you create a component in a DIM project, that component is listed in the Direct Editor as **ComponentName.DIM_GUID**. If you want to change this GUID, you can use the Direct Editor view to edit the ModuleID field of the **ModuleSignature** table. Note that if you change this value, you must also update the value in all of the tables in your project; you can do this from within the Direct Editor view.
Build Instructions	DIM	Enter any special instructions or comments about this project that may be helpful for the release engineers who are responsible for including this DIM in installation projects. These instructions are displayed in the DIM References view of the project that contains this DIM. The build instructions are not displayed to the end user.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Locked-Down Permissions	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Select the type of permissions that you want to use for securing files, folders, and registry keys for end users who run your product in a locked-down environment. Available options are: • **Custom InstallShield handling**—InstallShield uses a custom **ISLockPermissions** table and adds custom actions to your project to set permissions on the target system. This option is the default value. • **Traditional Windows Installer handling**—InstallShield uses the **LockPermissions** table in the .msi database to store permission information for your product. It is often more advantageous to use the custom InstallShield handling than the traditional Windows Installer handling. For example: • The custom option includes support for many well-known security identifiers (SIDs) that are not supported by the traditional option. • The custom option supports the use of localized user names for many well-known SIDs, unlike the traditional option. With the traditional option, if you try to use a localized name to set permissions on a non-English system, the installation may fail. • The custom option lets you specify that you want to deny a user or group from having the permissions that you are specifying. The traditional handling does not allow you to do this. That is, with the traditional handling, you can only set specific permissions; you cannot deny permissions. This is a project-wide setting that affects all new permissions that you set for files, folders, and registry keys in your project. If you have already configured some permissions in your project and then you change the value of this setting, InstallShield lets you specify whether you want to use the alternate handling method for those already-existing permissions. For more information about configuring this setting, as well as information about InstallScript support for setting permissions, see Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Show Per-User Option	Basic MSI	Specify whether you want to give end users the option of installing your product for all users or for only the current user. This run-time option is available only on Windows 7 and later systems, and on Windows Server 2008 R2 and later systems. Available options are: • **No**—Do not include the buttons that let end users specify how they want to install the product. • **Yes**—If the target system has Windows 7 or Windows Server 2008 R2, InstallShield adds buttons to the ReadyToInstall dialog. The buttons let end users specify how they want to install the product. If elevated privileges are required, the shield icon is included on the all-users button. If an end user selects the per-user button, the **ALLUSERS** property is set to 2, and the **MSIINSTALLPERUSER** property is set to 1. If an end user selects the all-users button, the **ALLUSERS** property is set to 1, and the **MSIINSTALLPERUSER** property is not set. If the target system has Windows Vista or earlier, or Windows Server 2008 or earlier, the ReadyToInstall dialog does not show the buttons that let end users specify how they want to install the product. The default value is No.  ***Note*** • *Selecting No does not prevent end users from setting **MSIINSTALLPERUSER** from the command line when they run your installation. If your installation does not support this, you may want to add a launch condition or other run-time check to prevent this from occurring.* To learn more, see Per-User vs. Per-Machine Installations.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Create MSI Logs	Basic MSI, InstallScript MSI, MSI Database, Transform	To specify whether Windows Installer 4.0 or later should log your installation, click the ellipsis button (...) in this setting, which launches the Logging Options for Windows Installer 4.0 and Later dialog box. This dialog box is where you specify whether Windows Installer should log your installation. You can also use this dialog box to customize the types of messages that are logged. There are three possible values for this setting: • **No**—Installations are not logged. This is the default value. • **Yes**—InstallShield populates the **MsiLogging** property with the default value of **voicewarmupx**. • **Custom**—InstallShield populates the **MsiLogging** property with the value that you specified on the Logging Options for Windows Installer 4 and Later dialog box. If the value of this setting is Yes or Custom, and if the installation is run with Windows Installer 4.0 or later, as well as Windows Vista or later or Windows Server 2008 or later, the following occurs: • The installer creates a log file according to the appropriate logging mode: either **voicewarmupx** (if the Create MSI Logs value is Yes) or whatever custom value you specified on the Logging Options for Windows Installer 4.0 and Later dialog box. • The installer populates the **MsiLogFileLocation** property with the log file's path. • A **Show the Windows Installer log** check box is added to the SetupCompleteSuccess, SetupCompleteError, and SetupInterrupted dialogs. If the end user selects that check box and then clicks Finish, the log file is opened in a text file viewer or editor.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Create MSI Logs (continued)		The Create MSI Logs setting applies to installations that are run with Windows Installer 4.0 or later on Windows Vista and later systems or Windows Server 2008 and later systems. The **Show the Windows Installer log** check box is not visible in run-time dialogs that are displayed on earlier systems that are running earlier versions of Windows Installer. ***Note*** • *If the value of this setting is Custom and you change it to Yes, any custom parameters that you defined for the **MsiLogging** property in the Property Manager will be overwritten with the default value. If you change it to No, InstallShield deletes any custom parameters from the **MsiLogging** property.* For more information, including details on how to customize the types of messages that are logged, see Specifying Whether Windows Installer Installations Should Be Logged.
Fast Install	Basic MSI, InstallScript MSI, MSI Database, Transform	If you want to reduce the time that is required to install a large Windows Installer package, consider selecting the check boxes for one or more of the following options: • No system restore point is saved for this installation • Perform only File Costing and skip checking other costs • Reduce the frequency of progress messages This setting configures the Windows Installer property **MSIFASTINSTALL**, which can be set at the command line. Windows Installer 5 includes support for this setting. Earlier versions of Windows Installer ignore it.
Company Name	InstallScript, InstallScript Object	Enter the name of your company. This value is used in the default script to set TARGETDIR (if the string entry COMPANY_NAME does not exist); it can be retrieved at run time by calling the **MediaGetData** function. ***Tip*** • *Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)*

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Executable File	InstallScript, InstallScript Object	Enter the name of the application's main executable file. This value can be retrieved at run time by calling the **MediaGetData** function. ***Tip*** • *Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)*
URL	InstallScript, InstallScript Object	Enter a product URL. This information is stored in the project file and is for your reference only. It is never displayed to the end user. ***Tip*** • *Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)*

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Server Locations	Transform	If you are storing the installation package and its related files for the product on a network server or Web site, click the ellipsis button (...) in this setting to specify the server or Web site locations. The locations should have the .msi package, as well as all of the files that might be required to, for example, repair the product or advertise a feature. The validity of the server location that you specify is determined when the installation needs to access the server remotely. That is, if a server is not available, or if you added an invalid server, the entry will be ignored if the resource is needed, and errors might be generated. Each location that is specified must have the complete source for the installation. The entire directory tree at each source location must be the same and must include all of the required source files, including any .cab files. Each location must have an .msi file with the same file name and product code.  ***Tip*** • *Server paths can contain environment variables that are identified with a percent sign (%). For example, the following path uses the Home environment variable:* `\\Server1\%Home%\Office` The paths that you specify are stored in the **SOURCELIST** property. Windows Installer appends this list to the end of an end user's existing source list for the product at run time.
Register Object	InstallScript Object	Specify whether you want the InstallScript object to be registered on your machine when you build a release for it. Registering an object on your development machine enables you to include the object in InstallScript projects that you create on that machine.  ***Tip*** • *If the object is not registered when you build it, you can register it from within an InstallScript project. To learn more, see Registering Objects in InstallScript Projects.*

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
Object Wizard	InstallScript Object	Select the type of wizard, if any, that you would like to use for your object's default language. Available options are: • **No Wizard**—If your object does not require a wizard, select this option. • **Use InstallShield Object Stock Wizard**—If you want InstallShield to create a wizard based on the properties that you are creating for your object, select this option. With the stock wizard, all read-only properties are displayed but are not editable. All read/write properties can be changeable by the user. Write-only properties are not displayed. As an alternative, you can click the ellipsis button (...) in this setting if you want to select a custom wizard that you created for your object. To learn more about creating a custom wizard and using the InstallShield stock wizard, see Designing an Object's Wizard.
Register Custom Wizard	InstallScript Object	Specify whether you want InstallShield to register the custom object wizard for this object when you build a release for the object. ***Note*** • *This setting is applicable only if you specify a custom wizard in the Object Wizard setting.*
Font Registration	InstallScript, InstallScript Object	If you want all of the font files in your project to be registered on the target system at run time, select Enabled. Static file links have an individual setting for font registration as well. This setting must be used to set the behavior for dynamically linked font files.
DIFx Support (for 32-bit platforms)	InstallScript, InstallScript Object	To enable DIFx support in your project for installing device drivers on 32-bit systems, select Enabled. If you select Enabled, InstallShield adds the DIFxAPI libraries to your project when you build a release. For more information, see Installing Device Drivers.
DIFx Support (for 64-bit Itanium platforms)	InstallScript, InstallScript Object	To enable DIFx support in your project for installing device drivers on 64-bit Itanium systems, select Enabled. If you select Enabled, InstallShield adds the DIFxAPI libraries to your project when you build a release. For more information, see Installing Device Drivers.

Table 12-2 • General Settings (cont.)

Setting	Project Type	Description
DIFx Support (for 64-bit AMD platforms)	InstallScript, InstallScript Object	To enable DIFx support in your project for installing device drivers on 64-bit AMD systems, select Enabled. If you select Enabled, InstallShield adds the DIFxAPI libraries to your project when you build a release. For more information, see Installing Device Drivers.

Summary Information Stream

Windows Installer databases are implemented as COM structured storage, and COM structured storage files usually contain a Summary Information Stream. The Summary Information Stream contains information about your company and the product that is being installed.

The following settings are available in the Summary Information Stream area in the General Information view.

Table 12-3 • Summary Information Stream Settings

Setting	Project Type	Description
Title	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify the type of database that you are creating. For a product installation, the default value is **Installation Database**, which is the recommended value.  ***Project*** • *Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project.* When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-3 • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
Subject	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter the name of the product.  ***Project*** • *In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.* When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Author	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify your company name.  ***Project*** • *In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.* When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-3 • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
Keywords	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify keywords that describe the Windows Installer database for your product.  ***Project*** *• In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project.*
Package Code	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database	This setting identifies the package code, which is the GUID for your installation package, DIM, or merge module. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting.  ***Project*** *• In Basic MSI, InstallScript MSI, Merge Module, MSI Database, and MSM Database projects—Because Windows Installer requires that any two .msi databases with identical package codes to have identical contents, you should change the package code before releasing a modified package. In the Releases view, you can use the Generate Package Code setting for a product configuration to specify whether you want InstallShield to generate a new package code every time that you build a release. The default value for this setting is Yes.* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.*

Table 12-3 • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
Template Summary	Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify the processor type and default language that your installation supports. List the processor type first, followed by your installation's default language, and separate them with a semicolon. If you have multiple entries in the language category, separate them with a comma. For example, if your installation runs only on Intel processors and English-based systems, enter `Intel;1033`. If your product runs on x64 processors and supports English and German, enter `x64;1033,1031`. For the language portion of this setting, use the number 0 if your installation is language neutral. Valid processor values include: • Alpha (Alpha is supported by Windows Installer 1.0 only.) • Intel • Intel64 (Intel64 is supported by Windows Installer 2.0 only.) • x64 Note that you can specify only one processor value. For more information, see Using the Template Summary Property. If the target machine does not meet the requirements that you specify for this setting, an error message is displayed and the installation exits.
Summary Information Stream Comments	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter any comments about your product. A typical value for this setting is as follows: `This installer database contains the logic and data required to install MyProduct.`  ***Project*** • *In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.* *For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project.* When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-3 • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
Schema	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting lets you specify the integer that identifies the minimum Windows Installer version that is required for your installation package or DIM. For a minimum of Windows Installer 2.0, enter **200**. For a minimum of Windows Installer 3.0, enter **300**. For a minimum of Windows Installer 3.1, enter **301**. For a minimum of Windows Installer 4.5, enter **405**. If the end user's system has a Windows Installer version earlier than the minimum requirement that you specify for the Schema setting—for example, if you specify a schema value of 405 because your installation uses Windows Installer 4.5 features, but an end user has Windows Installer 3.1—the installation displays an error message and exits. The value that you enter for the Schema setting is used for the Page Count Summary property of your Windows Installer database.  ***Note*** • *You can override this value for all of the releases that are associated with a particular product configuration in your project by setting the Schema setting for the product configuration in the Releases view.*

Table 12-3 • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
Require Administrative Privileges	Basic MSI, MSI Database	Specify whether your .msi package requires administrative privileges for the execute sequence of your installation. The default is Yes. If you set this to No, InstallShield sets bit 3 in the Word Count Summary property to indicate that elevated privileges are not required to install the .msi package. Note that if you select No but your .msi package tries to perform a task for which it does not have adequate privileges, Windows Installer may display a run-time error. This setting applies to installations that are run with Windows Installer 4.0 or later on Windows Vista and later systems or Windows Server 2008 and later systems. Earlier versions of Windows Installer and Windows ignore this setting. Note that an end user's installation experience is more secure when installations are run with only the permissions that they need. Unless an application is designed to be run only by system administrators, it should be run with the least privilege. To learn how this setting and other InstallShield settings affect whether Windows Vista and later display a User Account Control prompt to elevate privileges, see Minimizing the Number of User Account Control Prompts During Installation.

Add or Remove Programs

Add or Remove Programs (which is called Programs in the latest versions of Windows) in the Control Panel provides end users with technical support links and telephone numbers, product update information, and information about a product's manufacturer. Depending on how the installation is configured, the end user may have the option of removing, repairing, or changing the installation with the click of a button. You can specify this information in your project by configuring the Add or Remove Programs settings in the General Information view.

Project • *In a Basic MSI project—To prevent your product from appearing in Add or Remove Programs, you can set the Windows Installer property* ***ARPSYSTEMCOMPONENT*** *to 1 in the Property Manager. Note that setting this property simply suppresses the display of your product in Add or Remove Programs. An end user can still remove your product by running the installation in maintenance mode or from the command line.*

In an InstallScript MSI project—To prevent your product from appearing in the Add or Remove Programs, select Yes for the Hide Add/Remove Panel Entry setting in the Releases view.

Table 12-4 • Add or Remove Programs Settings

Setting	Project Type	Description
Show Add or Remove Programs Entry	Advanced UI, Suite/Advanced UI	Indicate whether you want to show your Advanced UI or Suite/Advanced UI product's entry in Add or Remove Programs in the Control Panel. Available options are: • **Yes**—Your Advanced UI or Suite/Advanced UI product's entry is displayed on the target system in Add or Remove Programs. This is the default value. • **No**—Your Advanced UI or Suite/Advanced UI product's entry is not displayed on the target system in Add or Remove Programs. The end user cannot use Add or Remove Programs to remove the product, perform maintenance, or view support information. If you select this option, InstallShield disables the other Add or Remove Programs settings.

Table 12-4 • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
Display Icon	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	 ***Project*** • *The value that you should enter for this setting depends on what project type you are using.* **In Basic MSI, InstallScript MSI, MSI Database, and Transform projects:** Enter the path on your development system to the .ico, .exe or .dll file that contains the icon resource that you want to be used for your product's entry in Add or Remove Programs. Instead of manually typing the path and file name, you can click the ellipsis button (...) in this setting to browse to the file. **For InstallScript and InstallScript Object projects:** Enter the path on the target system to the .ico or .exe file that contains the icon resource that you want to be used for your product's entry in Add or Remove Programs. You can specify a path relative to a system variable that is enclosed by angle brackets—for example: `<TARGETDIR>\icon.ico` **In Advanced UI and Suite/Advanced UI projects:** Enter the path on your development system to the .ico, .exe or .dll file that contains the icon resource that you want to be used for your product's entry in Add or Remove Programs. Instead of manually typing the path and file name, you can click the ellipsis button (...) in this setting to browse to the file. If you want to use the icon in a file that is present on target systems (for example, in a file that is installed by one of the packages in the Advanced UI or Suite/ Advanced UI installation), select a directory property from the list in this setting, and then enter the rest of the path for the icon file. If you leave this setting blank, InstallShield uses the icon that is specified in the Setup.exe Icon File setting on the Setup.exe tab in the Releases view.
Display Icon Index	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Suite/ Advanced UI	If the icon file that you specify contains more than one icon resource, specify the index in this setting. • A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon. • Use a negative number to refer to a specific resource ID. For example, the icon index -12 refers to the icon with a resource ID of 12.

Table 12-4 • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
Disable Change Button	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Specify whether you want to disable the Change button for your product's entry in Add or Remove Programs. The Change button enables end users to change installation options after the product has been installed. End users can remove or add features as needed.  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.* *Also in an InstallScript project, you can specify a combined Change/ Remove button by setting the Disable Change Button and Disable Remove Button settings to Yes and setting the system variable ADDREMOVE_COMBINEDBUTTON to TRUE in your script before the* ***MaintenanceStart*** *function is called. (****MaintenanceStart*** *is called by the default code for the* ***OnMoveData*** *event handler.)*
Disable Remove Button	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Specify whether you want to disable the Remove button for your product's entry in Add or Remove Programs. The Remove button enables end users to remove the product by clicking one button, which runs your uninstaller with a reduced user interface.  ***Project*** • *For Basic MSI, InstallScript MSI, MSI Database, and Transform projects—If the end user clicks the Remove button to remove your product, actions in the User Interface sequence of the project are executed.* *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*
Disable Repair Button	Basic MSI, MSI Database, Transform	Specify whether you want to disable the Repair button for your product's entry in Add or Remove Programs. The Repair button enables end users to run the Windows Installer repair option if any files have been deleted or corrupted.

Table 12-4 • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
Publisher	Advanced UI, Basic MSI, InstallScript MSI, MSI Database, Suite/Advanced UI, Transform	Specify the name of the company that created the product. This information is displayed for your product's entry in Add or Remove Programs. The value that you enter is stored in the Windows Installer Manufacturer property. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Windows Logo*** • *If you want to meet the requirements of the Windows logo program, you must specify the publisher.*
Publisher/Product URL	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/Advanced UI, Transform	Enter a general URL for your company or product—for example, **http://www.installshield.com**. On some versions of Windows, the publisher name on the Support Info dialog box is a hyperlink to this URL. The Support Info dialog box is displayed when an end user clicks the support information hyperlink for your product's entry in Add or Remove Programs. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*

Table 12-4 • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
Support Contact	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Transform	Enter the name of the person or department that end users should contact for technical support. On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*
Support URL	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Transform	Enter the URL that you would like end users to visit for technical support information for your product. This URL is displayed for your product's entry in Add or Remove Programs. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Windows Logo*** • *If you want to meet the requirements of the Windows logo program, you must enter a valid URL.*  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*

Table 12-4 • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
Support Phone Number	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Enter the technical support phone number for your product. On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*
Read Me	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Enter the name or path of the Readme file for your product. As an alternative, you can link to a Readme file located on the Internet by specifying a valid URL. For more information, see Specifying a Readme File. On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*

Table 12-4 • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
Product Update URL	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Specify a URL where end users can get information about product updates or download the latest version. On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*
Add or Remove Programs Comments	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Enter comments about your product. This information is displayed for your product's entry in Add or Remove Programs. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** • *In an InstallScript project, the* ***OnMoveData*** *event handler writes the data for this setting to the target system's registry.*
English or Japanese IDE Settings	InstallScript Object	These areas—English IDE Settings and Japanese IDE Settings—let you specify information that should be available to InstallShield users when they view your object in the Objects view of the English and Japanese versions of InstallShield.
Use Default	InstallScript Object	If this setting is for a language other than the default language, specify whether you want to use the default language settings' values for this language. If you select Yes, the other settings under the Use Default setting become disabled. If you select No, the other settings under the Use Default setting become enabled so that you can specify language-specific values. This setting is disabled for the default language.

Table 12-4 • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
Display Name	InstallScript Object	Enter the name of your object as you would like it to appear in the Objects view.
Short Name	InstallScript Object	Enter a shortened version of your object's name, if desired. You can enter the same name that you entered for the Display Name setting.
HTML Help	InstallScript Object	Specify the object's help file, which must consist of a single Web file; this file is displayed in the right pane when the object is selected in the Objects view. Type an explicit path or path variable.
Icon File	InstallScript Object	The icon is displayed next to your object in the Objects view. The icon must be 16 pixels by 16 pixels with a maximum of 16 colors. The icon can be loaded from a DLL, .exe, or .ico file. When the file is a DLL or .exe, the icon index or resource ID can be specified after the path and file name separated by a comma. If a resource ID is specified rather than an index, it must be preceded by a dash (-). If no index is specified, the number 0 is assumed.

Software Identification Tag

Use the Software Identification Tag area of the General Information view to specify whether you want to include an ISO/IEC 19770-2 software identification tag in your installation. If a tag is included, this area also lets you specify the identification information that is not already specified in other areas of the General Information view. For more information, see Including a Software Identification Tag for Your Product.

If you include a software identification tag, you can include application model data for Microsoft System Center Configuration Manager in the tag. For more information, see Including Microsoft System Center Configuration Manager Application Model Data About Your Product.

Table 12-5 • Software Identification Tag Settings

Setting	Project Type	Description
Use Software Identification Tag	Basic MSI	Specify whether you want to include an ISO/IEC 19770-2 software identification tag in your installation. If you select Yes, use the other tag-related settings in this area of the General Information view to specify the identification information that is not already specified in other areas of the General Information view.

Table 12-5 • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
Require Software Entitlement	Basic MSI	Specify whether you want to require your product to have a corresponding software entitlement in order for software reconciliation to be considered successful. In general, if the software must be purchased, Yes should be selected for this setting; if the software is free, No should be selected for this setting.
Unique ID	Basic MSI	Enter a unique ID that identifies the specific version of this specific product. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button (...) in this setting. Note that InstallShield uses the value that you enter as part of the name of the tag file (*TagCreatorID_UniqueID*.swidtag). Therefore, the ID that you enter must not contain any characters that are invalid for file names.
Tag Creator	Basic MSI	Enter the name of the organization that created the tag.

Table 12-5 • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
Tag Creator ID	Basic MSI	Enter the registration ID of the organization that created the tag. This ID helps to differentiate between different legal organizations that have the same creator name but are in different countries. The convention for the registration ID is as follows: **regid.YYYY-MM.ReversedDomainName,division** The registration ID consists of the following parts: • **regid.**—The string *regid* indicates that the XML portion is a registration ID for a software identification tag. A period (.) must be included after this string. • **YYYY-MM.**—This part of the registration ID identifies the first full month (MM) and the year (YYYY) in which the domain name was owned by the tag creator. For example, if you are creating the tag and you purchased the domain name February 15, 1999, you would use **1999-03** in this part of the registration ID, since the first full month the domain name was owned was March (03), and the year was 1999. The year and month must be separated by a dash. • **ReversedDomainName**—This part identifies the reversed domain name of the organization that is creating the software identification tag. For example, for the flexerasoftware.com domain name, the reversed domain name is: **com.flexerasoftware** • **,division**—This optional part starts with a comma (,), and is followed by an additional string. You can enter a string that helps to distinguish between different divisions or areas of the organization. If you do not want to use this optional distinguishing part of the registration ID, do not include the comma or an additional string in your entry. Note that InstallShield uses the value that you enter as part of the name of the tag file (*TagCreatorID_UniqueID*.swidtag). Therefore, the ID that you enter must not contain any characters that are invalid for file names.
Software Creator	Basic MSI	Enter the name of the organization that created the software. This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator setting for the name of the software creator.

Table 12-5 • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
Software Creator ID	Basic MSI	Enter the registration ID of the organization that created the software. This ID helps to differentiate between different legal organizations that have the same creator name but are in different countries. This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator ID setting for the software creator ID. The convention for the registration ID is as follows: **regid.YYYY-MM.ReversedDomainName,division** The registration ID consists of the following parts: • **regid.**—The string *regid* indicates that the XML portion is a registration ID for a software identification tag. A period (.) must be included after this string. • **YYYY-MM.**—This part of the registration ID identifies the first full month (MM) and the year (YYYY) in which the domain name was owned by the tag creator. For example, if you are creating the tag and you purchased the domain name February 15, 1999, you would use **1999-03** in this part of the registration ID, since the first full month the domain name was owned was March (03), and the year was 1999. The year and month must be separated by a dash. • **ReversedDomainName**—This part identifies the reversed domain name of the organization that is creating the software identification tag. For example, for the flexerasoftware.com domain name, the reversed domain name is: **com.flexerasoftware** • **,division**—This optional part starts with a comma (,), and is followed by an additional string. You can enter a string that helps to distinguish between different divisions or areas of the organization. If you do not want to use this optional distinguishing part of the registration ID, do not include the comma or an additional string in your entry.
Software Licensor	Basic MSI	Enter the name of the organization that owns the copyright for the software. This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator setting for the name of the software licensor.

Table 12-5 • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
Software Licensor ID	Basic MSI	Enter the registration ID of the organization that owns the copyright for the software. This ID helps to differentiate between different legal organizations that have the same licensor name but are in different countries. This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator ID setting for the software licensor ID. The convention for the registration ID is as follows: **regid.YYYY-MM.ReversedDomainName,division** The registration ID consists of the following parts: • **regid.**—The string *regid* indicates that the XML portion is a registration ID for a software identification tag. A period (.) must be included after this string. • **YYYY-MM.**—This part of the registration ID identifies the first full month (MM) and the year (YYYY) in which the domain name was owned by the tag creator. For example, if you are creating the tag and you purchased the domain name February 15, 1999, you would use **1999-03** in this part of the registration ID, since the first full month the domain name was owned was March (03), and the year was 1999. The year and month must be separated by a dash. • **ReversedDomainName**—This part identifies the reversed domain name of the organization that is creating the software identification tag. For example, for the flexerasoftware.com domain name, the reversed domain name is: **com.flexerasoftware** • **,division**—This optional part starts with a comma (,), and is followed by an additional string. You can enter a string that helps to distinguish between different divisions or areas of the organization. If you do not want to use this optional distinguishing part of the registration ID, do not include the comma or an additional string in your entry.
Add SCCM App Model Data	Basic MSI	Specify whether you want to include application model data for Microsoft System Center Configuration Manager in the software identification tag in your installation. If you select Yes, configure this setting's subsettings as needed. For more information, see Including Microsoft System Center Configuration Manager Application Model Data About Your Product.

Table 12-5 • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
Application Type	Basic MSI	Select the type of application that your installation installs.
Supersedence	Basic MSI	If you want the installation that you are creating to supersede other installations, click the ellipsis button (...) in this setting. The Supersedence dialog box opens, enabling you to browse to the Windows Installer packages (.msi) that you want to be superseded.
Uninstall Superseded Applications	Basic MSI	Specify whether the applications that are being superseded should be uninstalled before installing the application via the current installation.

Update Notifications View

Project • *The Update Notifications view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

For information on adding FlexNet Connect support to an InstallScript project, consult the Knowledge Base.

FlexNet Connect provides a mechanism that enables you to automatically notify your Web-connected end users when patches, updates, and product information for your application are ready for release.

Using FlexNet Connect is simple. When you enable FlexNet Connect, InstallShield includes the Software Manager in your installation. This desktop tool ships with your application and provides a tool for your end users to view available updates. To publish updates to your end users, you need to use a Web-based management portal called the FlexNet Connect Publisher site.

FlexNet Connect includes a variety of options that can be purchased together for a complete solution, or separately for a customized solution. To learn more, visit the Flexera Software Web site.

Trialware View

Project • *The Trialware view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

Edition • *Trialware functionality is available in the Premier edition of InstallShield.*

With the Trialware view, you can configure a license for trialware. InstallShield uses the license to wrap a trialware shell around your product's executable file (.exe, .dll, .ocx, or .scr file). The file can be unwrapped and used only according to the license settings that you configure, such as the trial limit (a specified number of days or a specified number of uses).

To obtain a license for an executable file in your project, you begin by right-clicking the Trialware Files explorer in the Trialware view and then clicking **New File Configured for Trial Usage**.

Two tabs are associated with the file selected in the Trialware Files explorer:

- General
- Advanced

Two different types of icons are available for files in the Trialware Files explorer:

Table 12-6 • Icon Types in Trialware Files Explorer

Icon	Description
	InstallShield displays this icon for a file in the Trialware Files explorer if a corresponding executable file (.exe, .dll, .ocx, or .scr file), trialware type, and license have been specified on the General tab.
	InstallShield displays this warning icon for a file in the Trialware Files explorer if the file still needs to be configured: a corresponding executable file (.exe, .dll, .ocx, or .scr), trialware type, or license needs to be specified on the General tab. If you build your project when this warning icon is displayed, a build error occurs (unless you have chosen to exclude trialware protection from the release).

General Tab

Project • *The Trialware view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

Edition • *Trialware functionality is available in the Premier edition of InstallShield.*

The Trialware view has a General tab. InstallShield displays this tab when an item is selected in the Trialware Files explorer.

The General tab is where you select an executable file (.exe, .dll, .ocx, or .scr file), a trialware type, and a corresponding license for your trialware.

Table 12-7 • Trialware View General Tab Settings

Setting	Description
Trialware File (.exe, .dll, .ocx, or .scr)	Select the .exe, .dll, .ocx, or .scr file in your project that you would like to protect. InstallShield will wrap a trialware shell around this file. The file can be unwrapped and used only according to the license settings that you configure on the Advanced tab.
Trialware Type	Select the type of trialware. For detailed information about the different types, see Types of Trialware.
License(s)	Select the license that should be used to protect the selected executable file. If you do not have a license, click the Acquire button to obtain one.

Once you have configured the above settings for a trialware file, the icon in the Trialware Files explorer changes from a warning icon () to a protected trialware icon (). If you build your project when the warning icon is displayed, a build error occurs (unless you have chosen to exclude trialware protection from the release).

Advanced Tab

Project • *The Trialware view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

Edition • *Trialware functionality is available in the Premier edition of InstallShield.*

The Trialware view has an Advanced tab. InstallShield displays this tab when an item is selected in the Trialware Files explorer.

The Advanced tab is where you configure settings such as the trial limit (number of trial days or number of uses) for your trialware. It is also where you set the hyperlinks for the trialware run-time dialogs.

Note • *The default values for the URL-related settings listed below are for pages on the InstallShield Web site. You must change these default values or delete them before releasing your trialware. Otherwise, hyperlinks to the InstallShield Web site will be included in your trialware run-time dialogs.*

Table 12-8 • Trialware View Advanced Tab Settings

Property	Description
Manage Licenses Online	Double-click the Manage Licenses Online property to access the Publisher Web Site for the InstallShield Activation Service. You can set up an account on this Web site in order to acquire licenses for your Try and Die products.
Product Name	Specify the name that you want to be displayed for your product in the trialware run-time dialogs. If you leave this setting blank, the name that is specified in the Product Name setting in the General Information view is used in the trialware run-time dialogs.
Type of Trial Limit	Select the type of trialware limit: either number of days or number of uses. The type of trial limit that you select here is used as the unit of measure for the Trial Limit Quantity and Extension Limit Quantity settings. Note that it is impossible to have an extension trial limit type that does not match the standard trial limit type. For example, if you set the trial limit to a specific number of days, you cannot set the extension trial limit to a specific number of uses. For the Try and Die type of trialware, end users can continue using the product only if trial extensions are allowed and they enter the correct extension serial number.

Table 12-8 • Trialware View Advanced Tab Settings (cont.)

Property	Description
Trial Limit Quantity	Specify the number of days or the number of uses (depending on the value of the Type of Trial Limit property) for the trial limit: • If the Type of Trial Limit property is set to Days, the trial period starts on the day that the end user launches your trialware product for the first time. The trial period starts on that first day even if the end user clicks the Cancel button on one of the trialware run-time dialogs and does not start using the product. • If the Type of Trial Limit property is set to Uses, the countdown for the number of trial uses starts with the first time that the end user launches your product. If an end user clicks the Cancel button on one of the trialware run-time dialogs and does not start using the product, the number of uses does not change.  ***Note*** • *Note that it is impossible to have an extension trial limit type that does not match the standard trial limit type. For example, if you set the trial limit to a specific number of days, you cannot set the extension trial limit to a specific number of uses.*
Serial Number Format	Specify the format for your product's trialware serial number and—if trial extensions are allowed—the extension serial number: • Type a question mark (?) to represent each character in your product's trialware serial number. For example, if a serial number consists of seven characters, type seven question marks in this field. • To split the serial number into groups of characters, type a dash (-) between each group of question marks. The dash indicates a break in the serial number, where one group of characters ends and another begins. For a serial number format of **???-????**, the serial number field on the trialware run-time dialog would consist of two boxes; end users would be able to type only three characters in the first box and only four characters in the second box. If you allow trial extensions, the serial number that you specify for the Extension Serial Number property must fit the format specified in the Serial Number Format property.
Allow Trial Extension	Specify whether end users are allowed to extend the trial for your product. If you select Yes, enter values for the Extension Limit Quantity and Extension Serial Number settings.  ***Note*** • *Note that if you allow trial extensions, end users can extend the trial only once. They cannot continually extend the trial.*

Table 12-8 • Trialware View Advanced Tab Settings (cont.)

Property	Description
Extension Limit Quantity	Specify the number of days or the number of uses (depending on the value of the Type of Trial Limit property) that an end user is allowed to extend the trial if they enter the correct extension serial number. If the Type of Trial Limit property is set to Days, the countdown for the number of days in the trial extension period starts the day after the initial trial period ends. This occurs even if the end user does not immediately extend the trial, but instead waits several days after the trial period is over to extend it. For more details, see Trial Limits and Extensions.  ***Note*** • *Note that it is impossible to have an extension trial limit type that does not match the standard trial limit type. For example, if you set the trial limit to a specific number of days, you cannot set the extension trial limit to a specific number of uses.*
Extension Serial Number	Specify the serial number that end users need to enter if they want to extend the trial. Use a dash (-) to indicate a break in the serial number, where one group of characters starts and another begins. The serial number that you specify must fit the format specified in the Serial Number Format property.
Expiration Date	You can set an expiration date to prevent evaluations or activations of your product after a certain date. To specify an expiration date, double-click this property, select the **I want my trial to expire on this date** option, and then select the appropriate date. If you do not want the trialware version of your product to expire after a predetermined date when end users have not yet activated it, leave the default value of **(Does not expire)** for this field. Expiration dates are often used for beta versions of a product. For example, you may want to set the expiration date to the last day of the beta trial period. When the beta trial period is over, end users can no longer use the trialware version of your product, even if they have additional days or uses remaining in their trial.
Product Purchase URL	Specify the URL for a page on your Web site that end users can visit to find information about purchasing your product. Note that the default value for this property is a page on the InstallShield Web site. You must change this default value or delete it before releasing your trialware. When an end user clicks the hyperlink for more information on purchasing your product on one of the trialware run-time dialogs, this Web page is opened in a Web browser. If you delete the URL in this box, the purchasing link is not displayed in the trialware run-time dialogs.

Table 12-8 • Trialware View Advanced Tab Settings (cont.)

Property	Description
Feedback URL	Specify the URL for a page on your Web site that end users can visit to submit feedback to you. Note that the default value for this property is a page on the InstallShield Web site. You must change this default value or delete it before releasing your trialware. When an end user clicks the Feedback hyperlink on one of the trialware run-time dialogs, this Web page is opened in a Web browser. If you leave this box empty, the Feedback link is not displayed in the trialware run-time dialogs. If you want end users to submit feedback through email messages instead of through your Web site, you can configure this property with a mailto URL. If an end user clicks a mailto URL hyperlink in one of the trialware run-time dialogs, a new email message is opened in the end user's email application, and the destination address is populated in the To field. For example, if you type the following text in this property, an email message will open with feedback@mycompany.com in the To field. `mailto:feedback@mycompany.com` You can also specify the text for the Subject line with the following code, using `%20` in place of spaces: `mailto:feedback@mycompany.com?Subject=My%20Subject`
Serial Number Information URL	This setting does not apply to the Try and Die type of trialware.
Help URL	Specify the URL for a page on your Web site that end users can visit to learn more about the trial of your product. Note that the default value for this property is a page on the InstallShield Web site. You must change this default value or delete it before releasing your trialware. When an end user clicks the Help hyperlink on one of the trialware run-time dialogs, this Web page is opened in a Web browser. If you delete the URL in this box, the Help link is not displayed in the trialware run-time dialogs.
Privacy Policy URL	Specify the URL for a page on your Web site that end users can visit to learn more about your company's privacy policy. Note that the default value for this property is a page on the InstallShield Web site. You must change this default value or delete it before releasing your trialware. When an end user clicks the Privacy Policy hyperlink on one of the trialware run-time dialogs, this Web page is opened in a Web browser. If you delete the URL in this box, the Privacy Policy link is not displayed in the trialware run-time dialogs.
Offline Activation Email	This setting does not apply to the Try and Die type of trialware.

Table 12-8 • Trialware View Advanced Tab Settings (cont.)

Property	Description
Offline Activation Phone	This setting does not apply to the Try and Die type of trialware.

Organization View

Project • *The Organization view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

The first step in building anything is to lay a solid foundation. The base of your project is formed by specifying application information through the General Information view and—for installation projects—creating features in the Features view.

Setup Design

Project • *The Setup Design view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *MSI Database*
- *Transform*

The most important step in designing any setup is to lay out the various elements, the “building blocks” of the installation. You need to think both from your user’s perspective as well as your own. The Setup Design view gives you a full look at your setup and all the features, components, and redistributables associated with it.

Features

Project • *The Features view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *MSI Database*
- *Suite/Advanced UI*
- *Transform*

Features are the building blocks of your installation. They represent a distinct piece of your application—such as program files, help files, or clip art—to your end users. You can create features and subfeatures in the Features view.

Components

Project • *The Components view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Components are setup-authoring tools that help you organize similar application data, such as files, registry entries, and shortcuts, into logical groups. Unlike features, they constitute the developer's view of a project.

Setup Types

Project • *The Setup Types view is available in the following project types:*

- *InstallScript*
- *InstallScript MSI*

Setup types offer your customers multiple configurations of your applications. Generally, these configurations include Complete and Custom. Setup types allows your users to choose the best configuration for their needs. This view is available only for InstallScript and InstallScript MSI setup projects.

Packages

Project • *The Packages view is available in the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

Use the Packages view to add packages and InstallShield prerequisites that you want to include in your Advanced UI or Suite/Advanced UI installation. This view is also where you define conditions for each package, associate each package with one or more Advanced UI or Suite/Advanced UI features, and configure other settings for each package.

DIM References

Project • *The DIM References view is available in Basic MSI projects.*

Use the DIM References view to manage all of the DIM references in your project, view any specific instructions that are required for the referenced DIMs, and associate each referenced DIM with one or more features. This view also lets you schedule the DIM's custom actions and dialogs in the Basic MSI installation's sequences.

Setup Design View

Project • *The Setup Design view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *MSI Database*
- *Transform*

The most important step in designing any installation is to lay out the various elements, the building blocks of the installation. You need to think both from the end user's perspective, as well as your own.

You can design the entire installation hierarchy for your application visually under the Setup Design view. This is the only view in which you can associate components with features and subfeatures.

Features

Features are the building blocks of your application from the end user's perspective. They can be installed or uninstalled based on the end user's selections. Your entire application should be divided into discrete features that perform a specific purpose. Features can be created in both the Setup Design view and the Features view.

Components

Components enable you to group your application data together. Unlike features, components constitute the developer's view of a project—containing data such as files, registry entries, and shortcuts. Components are associated with features in the Setup Design view, and a component may belong to more than one feature. Components can be created in both the Setup Design view and the Components view.

Tip • *The Components section contains the Files, Registry Entries, and Shortcuts nodes, in addition to the Advanced Settings for the component. If you do not want to see the subordinate nodes when they do not contain data, right-click Setup Design and select* ***Show Only Nodes with Data****. When this option is selected, only the nodes that contain data are displayed.*

DIMs

Developer installation manifest (DIMs) are separate pieces of an installation project that can be incorporated into a Basic MSI project to create a complete product installation. You can divide your product into separate, logical units to foster collaboration, enable distributed installation development, and enable reuse.

Redistributables

Redistributables enable you to install distinct, pre-existing pieces of functionality. For example, if your application requires Visual Basic run-time .dll files, you can include the Visual Basic Virtual Machine merge module, rather than add a file to your installation project and trying to determine its installation requirements.

Note • *You can add redistributables—including InstallShield prerequisites, merge modules, and objects—to your installation in the Redistributables view (or the Prerequisites view in InstallScript projects and the Objects view in InstallScript and InstallScript Object projects).*

Files, Registry Data, and Shortcuts

Files, registry data, and shortcuts are elements that are added to a component to complete the hierarchy.

Advanced Settings

Advanced Component Settings let you handle installation of components with special requirements. By specifying the advanced settings, you can publish your component and register COM servers, file extension servers, MIME types, and so on. You can also use the component's advanced settings to create an application paths entry in the registry.

Features View

Project • *The Features view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *MSI Database*
- *Suite/Advanced UI*
- *Transform*

A feature is the smallest installable part of a product, from the end user's perspective. It represents a specific capability of your product—such as its help files or a part of a product suite that can be installed or uninstalled based on the end user's selections. Your entire installation should be divided into features, each of which performs a specific purpose.

Subfeatures are further divisions of a feature. Because features should be self-contained elements of a product or product suite that an end user can selectively install, it might make sense for you to organize portions of your installation as subfeatures of a parent feature.

Tip • *Although you can create many levels of subfeatures, you should keep the design as simple as possible for organizational purposes.*

Feature Settings

Project • *Feature settings are available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

- *MSI Database*
- *Suite/Advanced UI*
- *Transform*

The settings in the Features view (and the feature settings in the Setup Design view) are organized into the following main categories:

- General
- Feature Events
- Run-Time Settings

General

When you select a feature in the Features view or the Setup Design view, the following settings are available in the General area:

Table 12-9 • General Settings for a Feature

Setting	Project Type	Description
Display Name	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Enter the name that you want to be displayed for this feature on the CustomSetup dialog (or in Advanced UI or Suite/ Advanced UI projects, on the InstallationFeatures wizard page). When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Description	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	Enter a brief description of the feature. A feature's description is displayed on the CustomSetup dialog (or, in Advanced UI and Suite/Advanced UI installations, on the InstallationFeatures wizard page) when the end user clicks a feature or subfeature. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
Remote Installation	Basic MSI, InstallScript MSI, MSI Database, Transform	Indicate the default install state for the feature. Valid options are: • **Favor Source**—The files in this feature are set to be run directly from the source medium, such as a CD-ROM or a network location, by default. • **Favor Local**—The files in this feature are set to be installed on the target system by default. • **Favor Parent**—The subfeature has the same default state as its parent feature. This option is available only if the feature is a subfeature. For more information, see Setting a Feature's Remote Installation Setting.  ***Caution*** • *If any of the feature's components contain a Windows service, select Favor Local. Although an end user could change the installation state through the CustomSetup dialog, the Windows Installer cannot install a service remotely.*
Destination	Basic MSI, InstallScript MSI, MSI Database, Transform	Select the folder on the target system into which the feature's files should be installed, or click the ellipsis button (...) to select or create a directory.  ***Note*** • *If you want the destination to be configurable at run time, the destination folder that you select must be a public property (containing all uppercase letters).* For more information, see Setting a Feature's Destination.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
Install Level	Basic MSI, InstallScript MSI, MSI Database, Transform	Enter an integer for this feature's install level. Unless the end user deselects features in the CustomSetup dialog, all features with an install level less than or equal to the value of the package's INSTALLLEVEL property are installed. You can change the INSTALLLEVEL property for the entire project in the Property Manager. The Install Level setting for a feature is compared against the **INSTALLLEVEL** property at run time to determine which features are available for installation. You can use this setting to create specific feature configurations.  ***Project*** • *For InstallScript MSI installations, this setting is used only if no setup types are defined for the project.*
Display	Basic MSI, InstallScript MSI, MSI Database, Transform	Indicate how you want the feature presented to the end user in the CustomSetup dialog (in Basic MSI, MSI Database, and Transform projects) or the feature selection dialog (in InstallScript MSI projects). • **Visible and Collapsed**—The feature is displayed in the run-time dialog with its subfeatures collapsed by default. • **Visible and Expanded**—The feature is displayed in the run-time dialog with its subfeatures expanded by default. • **Not Visible**—The feature and subfeatures are not displayed in the run-time dialog. This setting does not have any direct impact on whether a feature is installed. A feature is not automatically installed if it is not visible—it just cannot be deselected if it would otherwise be installed, or selected if it should not be installed. For more information, see Displaying Features to End Users.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
Visible	Advanced UI, InstallScript, Suite/Advanced UI	Specify whether the feature should be visible on the feature selection dialog in InstallScript installations or the InstallationFeatures wizard page in Advanced UI and Suite/Advanced UI installations. This setting does not have any direct impact on whether a feature is installed. A feature is not automatically installed if it is not visible—it just cannot be deselected if it would otherwise be installed, or selected if it should not be installed.  ***Note*** • *Since the only way for end users to change the selection status of an invisible feature is by selecting or deselecting a visible feature that requires the invisible feature, you should make every invisible feature a required feature for one or more visible features. Otherwise, end users will not be able to select or install features that are initially deselected.*
Advertised	Basic MSI, MSI Database, Transform	Select the appropriate advertisement option for this feature. Available options are: • **Allow Advertise**—End users have the ability to select the advertisement option for this feature in the CustomSetup dialog. Although advertisement is allowed, it is not the default option when the installation is run. • **Favor Advertise**—The feature is advertised by default. End users can change the advertisement option for a feature in the CustomSetup dialog. • **Disallow Advertise**—Advertising is not allowed for this feature. End users cannot elect to have the feature advertised in the CustomSetup dialog. • **Disable Advertise if Not Supported**—Advertisement works only on systems with Internet Explorer 4.01 or later. If the target system does not meet this criterion, advertising is not allowed. If the target system can support advertisement, advertising is allowed. For more information, see Advertising Features.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
Required	Basic MSI, InstallScript MSI, MSI Database, Transform	Indicate whether the feature is required on the target system; if the feature is required, end users cannot deselect it in the CustomSetup dialog (in Basic MSI, MSI Database, and Transform projects) or the feature selection dialog (in InstallScript MSI projects).  ***Project*** • *In InstallScript MSI projects, this setting is applicable to root-level features during a first-time installation. It is also applicable to subfeatures in an upgrade or patch. This setting is ignored for subfeatures during a first-time installation.*
Condition	Advanced UI, Suite/Advanced UI	This setting lets you specify one or more conditions that the Advanced UI or Suite/Advanced UI installation should use to evaluate whether the feature should be selected for installation by default on the InstallationFeatures wizard page. For example, if you want a particular feature to be selected by default on target systems that have a particular version of Windows, you can create a condition that specifies that version of Windows. Depending on how you configure the condition, you can have that Advanced UI or Suite/Advanced UI feature selected by default on the InstallationFeatures wizard page when an end user runs the Advanced UI or Suite/Advanced UI installation on that platform. Unless the end users deselects the feature, the Advanced UI or Suite/Advanced UI installation installs it. To add one or more new feature conditions, click the New Condition button in this setting. InstallShield adds a new row under the Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement. If one or more conditional statements are configured, the Condition setting says **(Condition)**. If none are configured, the Condition setting says **(Empty)**. For descriptions of each of the condition settings, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
Release Flags	Advanced UI, Basic MSI, InstallScript MSI, Suite/Advanced UI	If you want to use release flags to be able to selectively include and exclude this feature from different builds of your installation, enter one or more release flags to identify this feature. Separate multiple flags with a comma. For more information, see Assigning Release Flags to Features.
Condition	Basic MSI, InstallScript MSI, MSI Database, Transform	This setting lets you specify one or more conditional install levels. If a condition is true on the target system, the feature is given the corresponding install level. At run time, the feature's install level value is compared to the value of the global public property **INSTALLLEVEL** to determine whether the feature should be selected for installation by default. To specify one or more conditions, click the ellipsis button (...) in this setting. For more information, see Setting Feature Conditions. When you add a condition, InstallShield adds a new row to the grid of feature settings. The new row shows the install level for the feature, as well as the corresponding conditional statement that you added.
Comments	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Enter comments to help you track the changes you make to a feature, or for any future reference. The feature's comments are stored only in the project file and are not used in the installation at any time.
Required Features	InstallScript, InstallScript MSI, InstallScript Object	If one or more other features must be installed whenever the selected feature is installed, click the ellipsis button (...) and specify the other required features. For more information, see Using the Required Features Setting.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
Status Text	InstallScript, InstallScript Object	Specify the status text for the feature. Your end users will see this text in the uppermost line of the progress indicator during the transfer of this feature. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
File Need	InstallScript, InstallScript Object	Indicate the severity of allowing end users to deselect the feature in a Custom setup type. Available options are: • **Standard**—End users should be allowed to deselect the feature; no error messages are displayed. • **Highly Recommended**—End users should be advised that the feature is highly recommended. • **Critical**—End users should be warned that the feature should not be deselected. Your script can read this setting using the InstallScript function **FeatureGetData** with the FEATURE_FIELD_FILENEED constant. Depending on the return value, your script can display a message to alert the end user if a critical or highly recommended feature is deselected.
Include in Build	InstallScript, InstallScript Object	Specify whether the feature should be included in your release when you build it. Note that in the Features panel of the Release Wizard, you can override this setting for any of the features in your project.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
Password	InstallScript	If you want to password-protect the feature, enter a password. You can specify a different password for each feature. You can also specify a password for the entire installation (in the Media Password setting on the Setup.exe tab in the Releases view). Note that the default script does not automatically validate a feature's password. You must modify the script to validate the password by inserting a dialog function (such as **AskText**) that prompts the end user to enter a password, and then calling the **FeatureValidate** function from within the script.  ***Caution*** • *Experienced hackers may be able to extract this password from your release. If security is a critical issue, it is recommended that you not depend solely on this password protection functionality.*
Encryption	InstallScript	Specify whether the files for the feature should be encrypted. Encrypted files can be read only by the InstallScript engine (or by an experienced hacker). If you plan to offer end users the option of running your product directly from the distribution media, do not encrypt the relevant files. InstallShield decrypts files only during installation to the end user's hard drive. Encryption is not the same as password protection. Encrypting a file scrambles it so that if someone opens it in a text editor, they cannot read strings and other data to get confidential information about your product. Password-protecting a feature prevents it from being installed by someone who does not know the password. You can encrypt a feature's files or you can password-protect the feature—or, for maximum security, you can do both. If a feature's files are encrypted but neither the feature nor the release is password-protected, the feature can be installed by anyone who obtains your distribution media (or a copy). If a feature is password-protected but its files are not encrypted, someone can open the files in a text editor and read confidential information—possibly including the feature's password.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
CD-ROM Folder	InstallScript, InstallScript Object	Specify the folder in the disk image in which the feature's files should be placed if the CD_ROM Folder(s) option is selected in the Media Layout panel of the Release Wizard, or if the feature's check box is selected on the Custom Media Layout panel of the Release Wizard. If either of these conditions are met but no folder is specified, the feature is placed in the root of the disk image or, if it is a subfeature, in the same folder as its parent feature. Folder names on CD-ROMs should conform to ISO 9660 (Level 1) standards. That is, folder names should be no more than eight characters long (with no extensions), and use only the characters A-Z, 0-9, and _ (underscore). By putting a folder structure on your CD-ROM, you can allow your product to be run from the CD-ROM. The folder structure on the CD-ROM does not need to mirror the folder structure that would be installed to a hard drive. All that is necessary is that your product be able to work with either folder structure. This functionality is typically used only for CD-ROM distribution; for other distribution media, you usually want to compress all features into .cab files.  ***Project*** • *For InstallScript Object projects, the value of this setting has no effect on where the object's files are placed when the object is included in an installation project.*
Included Components	InstallScript, InstallScript Object	This read-only setting lists the components that are associated with the feature. It is essential to an installation that components be associated with features; otherwise, no files will be installed. Use the Setup Design view to associate components with features. For more information, see Component-Feature Associations.

Table 12-9 • General Settings for a Feature (cont.)

Setting	Project Type	Description
GUID	InstallScript, InstallScript Object	Enter a GUID that uniquely identifies this feature. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting. The feature GUID identifies the feature in the installation's log file; if you change a feature's GUID in an upgrade, the InstallScript engine treats it as a new feature rather than an update to an existing feature.

Feature Events

When you select a feature in the Features view or the Setup Design view of an InstallScript, InstallScript MSI, or InstallScript Object project, the following settings are available in the Feature Events area:

Table 12-10 • Feature Event Settings for a Feature

Setting	Project Type	Description
OnInstalling	InstallScript, InstallScript MSI, InstallScript Object	This setting lets you specify an InstallScript function to be called before this feature is installed. Select the desired function from the list. Only exported functions appear in the list. Exported functions have this prototype: `export prototype FunctionName( );`
OnInstalled	InstallScript, InstallScript MSI, InstallScript Object	This setting lets you specify an InstallScript function to be called after this feature is installed. Select the desired function from the list. Only exported functions appear in the list. Exported functions have this prototype: `export prototype FunctionName( );`
OnUninstalling	InstallScript, InstallScript MSI, InstallScript Object	This setting lets you specify an InstallScript function to be called before this feature is uninstalled. Select the desired function from the list. Only exported functions appear in the list. Exported functions have this prototype: `export prototype FunctionName( );`

Table 12-10 • Feature Event Settings for a Feature (cont.)

Setting	Project Type	Description
OnUninstalled	InstallScript, InstallScript MSI, InstallScript Object	This setting lets you specify an InstallScript function to be called after this feature is uninstalled. Select the desired function from the list. Only exported functions appear in the list. Exported functions have this prototype: `export prototype FunctionName( );`

Run-Time Settings

When you select a feature in the Features view or the Setup Design view of an InstallScript, InstallScript MSI, or InstallScript Object project, the following settings are available in the Run-Time Settings area:

Table 12-11 • Run-Time Settings for a Feature

Setting	Project Type	Description
FTP Location	InstallScript, InstallScript MSI, InstallScript Object	If you want to associate an FTP location with the feature, enter the FTP address in the following format: `ftp.domain.com` The address that you enter can be accessed from within the script using the **FeatureGetData** function with the FEATURE_FIELD_FTPLOCATION constant.
HTTP Location	InstallScript, InstallScript MSI, InstallScript Object	If you want to associate an HTTP address with the feature, enter the HTTP address in the following format: `http://www.domain.com` The address that you enter can be accessed from within the script using the **FeatureGetData** function with the FEATURE_FIELD_HTTPLOCATION constant.
Miscellaneous	InstallScript, InstallScript MSI, InstallScript Object	If you want to associate a text string with the feature, enter the text string. The text string that you enter can be accessed from within the script using the **FeatureGetData** function with the FEATURE_FIELD_MISC constant.

Components View

Project • *The Components view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Components are installation-authoring elements that help you organize similar application data, such as files, registry entries, and shortcuts, into logical groups. Unlike features, components constitute the developer's view of a project.

You can create and modify components in the Setup Design view (for installation projects) or the Components view.

Tip • *The Components explorer contains nodes for the files, registry data, and so on for each component. If you do not want to see the subordinate nodes when they do not contain data, right-click the top-level explorer and then click Show Only Nodes with Data. When this command is selected, only the nodes that contain data are displayed.*

Note • *To improve performance, the list displayed in the Files view truncates when there are more than a predefined number of files in a dynamically linked file with subfolders. **List Truncated** appears as the first item in the file list when this occurs. All files contained in the subfolders are built into your project.*

Component-Feature Relationships

Components are associated with features in the Setup Design view. For more information, see Associating New Components with Features.

Component Settings

For descriptions of each of the settings that are displayed when you click a component, see Component Settings.

Advanced Settings for a Component

For information about advanced settings that you can configure for a component, see Advanced Settings for a Component.

Component Settings

Project • *Component settings are available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The settings in the Components view (and the component settings in the Setup Design view) are organized into the following main categories:

- General
- Target Machine
- .NET Settings
- Run-Time Settings

General

When you select a component in the Components view or the Setup Design view, the following settings are available in the General area:

Table 12-12 • Component Settings in the General Area

Setting	Project Type	Description
Destination	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Transform	Select the folder on the target system into which the component's files should be installed, or click the ellipsis button (...) to select or create a directory. To install the files to the product's default destination folder, select the appropriate location, depending on which project type you are using: • **[INSTALLDIR]**—in a Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project • **<TARGETDIR>**—in an InstallScript or InstallScript Object project  ***Project*** • *In Basic MSI, InstallScript MSI, MSI Database, and Transform projects, if you want the destination to be configurable at run time, the destination folder that you select must be a public property (containing all uppercase letters).* *Note that in some project types (Basic MSI, InstallScript MSI, MSI Database, and Transform), you can also set the destination folder of a component's feature. For information on the effects of setting the destination for a feature as well as its components, see Component Destination vs. Feature Destination.* *In InstallScript and InstallScript Object projects, if you are installing files to WINSYSDIR64, you may need to select Yes for the component's 64-Bit Component setting. Otherwise, files being installed to WINSYSDIR64 may be redirected to SysWOW64, the 32-bit Windows system folder. For more information, see Targeting 64-Bit Operating Systems with InstallScript Installations.*
Destination Permissions	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	To set permissions for the component's destination folder, click the ellipsis button (...) in this setting.  ***Note*** • *Unless you need to designate specific permissions, it is recommended that you leave this setting undefined so that normal user permissions can apply to the destination folder.*

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Component Code	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a GUID that uniquely identifies this component. To have InstallShield generate a different GUID for you, click the Generate a new GUID button ({...}) in this setting.
Shared	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Transform	 ***Project*** • *The behavior of this setting varies slightly, depending on whether the project type is Windows Installer based (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project) or InstallScript based (InstallScript or InstallScript Object project).* • **For a Windows Installer–based project**—Specify whether you want to mark this component's key file as shared. If the installation installs the key file and Yes is selected for its component's Shared setting, a reference count is created in the registry—if it does not already exist—and incremented. • **For an InstallScript-based project**—Specify whether you want to mark this component as shared. If the installation installs the component's files and Yes is selected for the component's Shared setting, a reference count for each of the component's files is created in the registry—if it does not already exist—and incremented. Note that the installation increments any existing reference count for any file in a component regardless of whether you mark the component as shared. However, if no reference count exists, the installation does not create one unless you select Yes for this Shared setting. For more information, see Managing Reference Counts for Shared Files.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Permanent	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify whether you want to mark this component as permanent. If you select Yes, none of the component's data (such as files, registry entries, and shortcuts) are removed from the target system when the component's feature is uninstalled. Validation rules require that you select Yes for any component being installed to **[SystemFolder]**.  ***Note*** • *If you are installing a font, it is recommended that you select Yes.*
Uninstall	InstallScript, InstallScript Object	Specify whether the component's files, registry entries, and other data should be uninstalled when the component's feature is uninstalled. This setting is useful for preventing the uninstallation of files that may be used by other products. If the component's files are not used by other products, the Uninstall setting should typically be set to Yes.
Condition	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting lets you enter a statement that the installation must evaluate before setting up your component's data on the target system. The component is not installed if its condition evaluates to false. However, the component is installed or advertised if its condition evaluates to true, assuming that its feature is selected for installation. To create a condition for the component, click the ellipsis button (...) in this setting. For more information, see Configuring Component Conditions.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Remote Installation	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Indicate the default install state for the component. Valid options are: • **Favor Source**—The files in this component are set to be run directly from the source medium, such as a CD-ROM or a network location, by default. • **Favor Local**—The files in this component are set to be installed on the target system by default. • **Optional**—The component uses the Remote Installation setting of its feature. For more information, see Setting a Component's Remote Installation Setting.  ***Caution*** • *If the component contains a Windows service, select the Favor Local option. Although an end user could change the feature's installation state through the CustomSetup dialog, the Windows Installer cannot install a service remotely.*

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
COM Extract at Build	Basic MSI, DIM, InstallScript MSI, Merge Module	Specify whether you want InstallShield to extract COM data from this component's key file at build time. Available options are: • **No**—InstallShield does not extract the COM information at build time. • **Yes**—InstallShield extracts the COM information every time that you build a release. If your COM server's interfaces are subject to change, this option is preferable to maintaining statically acquired or provided data in the COM Registration area under the component's Advanced Setting area. Select the No option if you want InstallShield to register the file according to the information that is statically contained in the COM Registration area under the component's Advanced Setting area. This advanced setting stores information about the file's COM classes, ProgIDs, and so on, that were either extracted in the Component Wizard or entered manually in the Advanced Setting area.  ***Best Practice*** • *If you have marked a file for this component as self-registering, you should select No for the COM Extract at Build setting. Note, however, that calling self-registration functions is a violation of setup best practices.* To learn more about COM registration, see Extracting COM Registration Data at Build Time.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Languages	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	The Languages setting for a component enables you to specify the languages for which the component is intended, for use in build-time filtering. By default, components are language independent, meaning that none of the component's data (such as files and registry entries) are specific to a particular language.  ***Project*** • *In InstallScript and InstallScript Object projects, if a language is not selected in the General Information view of a project, it is not listed as one of the available languages for the project's components.* To designate that the component is intended for only certain languages, click the ellipsis button (...) in this setting. The Languages dialog box opens, enabling you to select the appropriate languages for the component. For more information, see Marking Components as Language Dependent.  ***Tip*** • *To learn how to specify which language-dependent components are installed at run time, see Installing Components Based on Language.*
Reevaluate Condition	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify whether you want the Windows Installer to reevaluate the component's condition when the product is reinstalled. This setting is useful for authoring transitive components—components that can replace each other when a product is reinstalled, for example, after an operating system upgrade. For more information, see Reevaluating Component Conditions During Reinstallation.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Never Overwrite	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify whether you want your installation to avoid overwriting a file if it already exists on the target system: • If you select Yes, the file—if it exists on the target system—is never overwritten, regardless of the file version. Selecting Yes for this setting overrides file versioning rules. • If you select No and the file version on the target system is newer than the version being installed, the file on the target system is not overwritten. However, if the version being installed is newer, the file on the target system is overwritten.  ***Important*** • *The Windows Installer checks for the existence of the component's key file when determining if it should install the component. If the component's key file does not exist on the target system, Windows Installer installs the component as if No were selected for the Never Overwrite setting. For more information on how the Windows Installer determines whether a component should be installed, see Overwriting Files and Components on the Target System.*
64-Bit Component	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Transform	 ***Project*** • *The use of this setting varies, depending on whether the project type is Windows Installer based (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project) or InstallScript based (InstallScript or InstallScript Object project).*

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
64-Bit Component (cont.)		**For Windows Installer–Based Projects** Specify whether you want to mark this component as 64 bit. The component should be marked as 64 bit if any of the following are true: • The component contains files that need to be installed to a 64-bit location. • The component contains registry data that needs to be installed to a 64-bit area of the registry. • The component contains a 64-bit COM server and it needs to be self-registered. Note the following details: • If you include a 64-bit component in your installation, the installation cannot be run on 32-bit machines, and the Template Summary property must specify a 64-bit value. • If the component is 64 bit and it is replacing a 32-bit component, be sure to specify a new GUID for the component in the Component Code setting. For more information about 64-bit support, see Targeting 64-Bit Operating Systems with Basic MSI and InstallScript MSI Installations. **For InstallScript-Based Projects** Specify whether you want to mark this component as 64 bit. If you want your installation to install the files and registry data in this component to 64-bit locations on 64-bit systems and 32-bit locations on 32-bit systems, you can mark the component as 64 bit. For more information about 64-bit support, see Targeting 64-Bit Operating Systems with InstallScript Installations.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Source Location	Basic MSI, DIM, InstallScript MSI, Merge Module	Specify the name of a subfolder where the component's files should be stored in the source disk images if the component's files are not compressed. When you build a release, InstallShield copies the component's files to this subfolder in your disk image. This setting enables you to create unique folders for each component's files, which is necessary if you have different files with the same name in more than one component. If you do not specify a value for Source Location setting, you run the risk of overwriting files with the same name when you build an uncompressed release. This setting does not require a value, and in most cases, may be left blank. If you do enter a value, it must be a valid Windows folder name. For more information, see Installing Files of the Same Name.
Disable Registry Reflection	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Registry reflection keeps the 32-bit registry view and the 64-bit registry view in sync on the target machine. To enable registry reflection for all existing and new registry keys that are affected by the selected component, select No, which is the default value. To disable registry reflection on all existing and new registry keys that are affected by this component, select Yes. Windows Installer calls the **RegDisableReflectionKey** function on each key being accessed by the component. This function disables registry reflection for the specified key. Disabling reflection for a key does not affect reflection of any subkeys.  ***Note*** • *Only 64-bit systems with Windows Installer 4 or later support this setting. In addition, only Windows Vista and later and Windows Server 2008 and later support it. Other systems ignore this setting.* For more information about registry reflection, see Registry Reflection in the MSDN Library.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Multiple Package Shared Component	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	To enable shared component patching for the selected component, select Yes; otherwise, select No, which is the default value. If this multiple-package sharing feature were enabled in at least one package that is installed on the target system, Windows Installer 4.5 treats the component as shared among all of those packages. If a patch that shares this component is uninstalled, Windows Installer can continue to share the highest version of the component's files on the system. The purpose of this multiple-package component sharing is to prevent files from being downgraded during the uninstallation of a patch that contains a component that is shared with one or more other installed packages. The intent is to keep the highest version of the component's files present on the machine after uninstallation of that patch. The following scenario helps to illustrate the behavior: • Install product A with shared file 1.0.0.0. • Install product B with shared file 1.1.0.0. • Apply an uninstallable patch for product A with shared file 1.2.0.0. • Uninstall the patch for product A.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Multiple Package Shared Component (cont.)		Either of the following results may occur: • If the value of the Multiple Package Shared Component setting is Yes for either product A or product B and if Windows Installer 4.5 is present, uninstalling the patch from product A could restore version 1.1.0.0 to the target system. • If the value of this setting is No for product A and product B, the file would be downgraded to version 1.0.0.0, even though product B used 1.1.0.0. As a result, if product B requires version 1.1.0.0, product B may no longer work properly.  ***Note*** • *If the DisableSharedComponent policy is set to 1 on a target system, Windows Installer ignores this setting for all packages. Windows Installer 4.0 and earlier ignore this setting.* To learn more about this setting, see Specifying Whether Shared Component Patching Should Be Enabled for a Component.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Uninstall Superseded Component	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting determines how Windows Installer handles the selected component during installation of a superseding patch under certain conditions. It is designed to prevent the component's feature from being changed to an advertised state if a patch that is installed or uninstalled changes the component count for the feature. If the feature state changes to advertised, none of the feature's remaining components can be maintained. To specify that this component in the current patch should be flagged for uninstallation in order to avoid leaving this component orphaned on the target system after a superseding patch is applied, select Yes. If a subsequent patch is installed and it is flagged to supersede the first patch (that is, if Yes is selected in the Supersede column for the patch's family on the Sequence tab for the patch configuration in the Patch Design view), Windows Installer can unregister and uninstall this component if appropriate. If you select No, the superseding patch can leave an orphaned component on the target system. The default value for this setting is No. If you select No and the superseded patch installs a component for the product but the superseding patch removes that component, the component's feature state is changed to advertised, and it is not reinstalled. In addition, none of the remaining components associated with that feature can be maintained. If you select Yes, Windows Installer unregisters and uninstalls the component when the superseding patch is applied.  ***Note*** • *Windows Installer 4.5 includes support for this Uninstall Superseded Component setting. Earlier versions of Windows Installer ignore it.*  ***Tip*** • *Setting the* ***MSIUNINSTALLSUPERSEDEDCOMPONENTS*** *property has the same effect as selecting Yes for the Uninstall Superseded Component setting of all components in the patch.*
REG File to Merge at Build	Basic MSI, DIM, InstallScript MSI, Merge Module	If you want to merge a .reg file with the component's registry entries at build time, enter the complete path for the .reg file. As an alternative, you can click the ellipsis button (...) in this setting to browse to the .reg file.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Self-Register	InstallScript, InstallScript Object	Specify whether the component's files are self-registering. (A self-registering file is an OLE server that can place information about itself in the registry so that it is seen by other OLE applications. Such a file can also remove this information from the registry when it is uninstalled.)  ***Important*** • *If you select Yes but one or more files in the component are not self-registering, an error occurs when the installation runs.*  ***Project*** • *InstallScript and InstallScript Object projects support self-registration of .dll files, .exe files, and type libraries—that is, .tlb and .olb files.* *In Basic MSI and InstallScript MSI projects, self-registration is set at the file level, rather than the component level.*
Potentially Locked	InstallScript, InstallScript Object	Specify whether already-installed versions of the component's files may be locked—that is, in use by another product—during installation. If a file is locked during installation or uninstallation, and that file is in a component whose Potentially Locked setting is set to Yes, the file operation is automatically performed after restart. If a file is locked during installation or uninstallation, and that file is in a component whose Potentially Locked setting is set to No, the **OnFileLocked** event handler function is called. (The default code for this function automatically performs the file operation after restart.) Note that InstallShield always treats shared files as potentially locked files.
Compressed	InstallScript, InstallScript Object	Specify whether you want to compress the files in the component if its files are built into a .cab file at build time. This setting has no effect if you select the check box for the component's feature in the Custom Media Layout panel of the Release Wizard.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Overwrite	InstallScript, InstallScript Object	This setting indicates the installation's behavior when it encounters an existing file with the same name as the one being installed; you can selectively replace each file in a component based on its version number or modification date. To change the behavior, click the ellipsis button (...) in this setting. The Overwrite dialog box opens, enabling you to specify the appropriate run-time behavior.  ***Tip*** • *If the component consists of files—such as data and configuration files—that end users may have updated, consider selecting the Never Overwrite option.* Files that are associated with a component that has the Never Overwrite option selected for the Overwrite setting are logged for uninstallation; that is, even if such a file is not copied to the target system, because a file with the same name already exists there, that file is removed when the application is uninstalled. To prevent an already existing file from being uninstalled, select Yes for the Shared setting of the file's component.
Difference	InstallScript, InstallScript Object	Specify whether you want InstallShield to include the component's files in a release when you are building a differential release. (When you define a differential release, you specify one or more existing releases to which the current project should be compared when the new differential release is built.) Available options are: • **Include If Appropriate**—InstallShield excludes a file in this component from the differential release if the same file (with the same date, time, size, and attributes) exists in each of the specified comparison releases. This is the default option. • **Include Always**—InstallShield includes all of the component's files in the differential release, even if the same file (with the same date, time, size, and attributes) exists in each of the specified comparison releases.
Link Type	InstallScript, InstallScript Object	Specify whether the component's file links are static or dynamic and, if the latter, how the links are determined at the time of the release build.

Table 12-12 • Component Settings in the General Area (cont.)

Setting	Project Type	Description
Comments	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Enter comments about this component. Your comments are saved in the project file for your reference and are not used in the installation at any time.

Target Machine

When you select a component in the Components view or the Setup Design view of an InstallScript, InstallScript MSI, or InstallScript Object project, the following settings are available in the Target Machine area:

Table 12-13 • Component Settings in the Target Machine Area

Setting	Project Type	Description
Operating Systems	InstallScript, InstallScript MSI, InstallScript Object	If a component is specific to one or more operating systems, use this setting to indicate those operating systems. If the target machine's operating system does not match one of the operating systems that are specified for this setting, the component is not installed. By default, components are operating system independent, meaning that none of the component's data are specific to certain operating systems. To change the value of this setting, click the ellipsis button (...) in this setting.

Table 12-13 • Component Settings in the Target Machine Area (cont.)

Setting	Project Type	Description
Platform Suite(s)	InstallScript, InstallScript Object	If a component is specific to one or more platform suites, use this setting to indicate the suites. If you specify more than suite, you can indicate whether all or any of the suites must be present on the target machine in order for the component to be installed. By default, components are platform suite independent, meaning that none of the component's data are specific to a particular platform suite.  ***Tip*** • *This setting provides an additional layer of filtering beyond the Operating Systems setting. Select platform suites for the Platform Suite(s) setting only if necessary, and be sure to select only those platform suites that are required for the proper functioning of your application. For example, if a component should be installed on both the Home and Professional editions of Windows XP, you can leave Suite Independent as the value for this setting; selecting Windows XP for the Operating Systems setting encompasses both editions.* You can control the platform suites that your installation supports at run time by calling the **FeatureFilterOS** function. In the **OnFilterComponents** event handler, the framework typically calls this function with the platform suites that match the target system so that only the appropriate components are installed. By calling **FeatureFilterOS**, you can override this default behavior to install or prevent the installation of components based on any platform suite criteria that you specify.

.NET Settings

When you select a component in the Components view or the Setup Design view, the following settings are available in the .NET Settings area:

Table 12-14 • Component Settings in the .NET Settings Area

Setting	Project Type	Description
.NET COM Interop	Basic MSI, DIM, InstallScript MSI, Merge Module	Specify whether you want to use COM interoperation (the ability to call .NET objects from COM) for the component. For example, if you have a Visual Basic .NET class library that defines the ComClass attribute and contains at least one public (COM-callable) function, you can select Yes for this setting; InstallShield extracts the COM Interop information at build time and adds it to the **Registry** table of your .msi database. At run time, registry entries that allow COM objects to call your .NET assembly are created on the target system.  ***Note*** • *This setting is applicable only if the component's key file is a .NET assembly.*
.NET Precompile Assembly	Basic MSI, DIM, InstallScript MSI, Merge Module	Specify whether you want the installation to create a native image from the .NET assembly at run time and install it to the native image cache on the target system. This allows the assembly to load and execute faster, because it restores code and data structures from the native image cache rather than from just-in-time (JIT) compilation.
.NET Assembly	InstallScript, InstallScript Object	Specify whether the component's files should be installed as local .NET assemblies. Available options are: • **Local Assembly**—The component contains a .NET assembly. In addition, the installation performs COM interop registration and configures .NET installer class information for the component at run time. • **Not a .NET Assembly**—The component does not contain a .NET assembly. This is the default option. If you want InstallShield to scan the assembly in this component for .NET dependencies at run time, Local Assembly must be selected for this setting. To learn more, see Identifying Properties and Dependencies of .NET Assemblies.

Table 12-14 • Component Settings in the .NET Settings Area (cont.)

Setting	Project Type	Description
.NET Scan at Build	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	***Project*** *• The functionality for this setting depends on whether the project type is Windows Installer based (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project) or InstallScript based (InstallScript or InstallScript Object project).* • **For a Windows Installer–based project**—Indicate whether you want the key file of this component to be scanned for .NET dependencies, properties, or both at build time. • **For an InstallScript-based project**—Indicate whether you want the files of this component to be scanned for .NET dependencies at build time. For more information, see Identifying Properties and Dependencies of .NET Assemblies.
.NET Application File	Basic MSI, DIM, InstallScript MSI, Merge Module	This setting is used when this component is scanned at build time (based on the .NET Scan at Build setting) or by the Static Scanning Wizard. The scanner uses this setting—along with the component destination—to determine the value of the File Application setting for the assembly. For optimal advertising and repair, select the .NET executable file that uses the assembly in this component. The key file of the component is displayed in this setting if the .NET Scan at Build setting is set to Dependencies and Properties or Properties. You can select any other key or portable executable file in the project. ***Note*** *• This setting is applicable only if the component's key file is a .NET assembly.* *The value for this setting is ignored if the file that is selected is not a .NET assembly file.*
.NET Installer Class	Basic MSI, DIM, InstallScript MSI, Merge Module	***Note*** *• This setting is applicable only if the component's key file is a .NET assembly that contains a class that is derived from System.Configuration.Install.Installer.* If the assembly's Install, Commit, Rollback, and Uninstall methods should be called at the appropriate times at run time, select Yes.

Table 12-14 • Component Settings in the .NET Settings Area (cont.)

Setting	Project Type	Description
.NET Installer Class Arguments	Basic MSI, DIM, InstallScript MSI, Merge Module	To specify arguments that should be passed to the .NET installer class, click the ellipsis button (...) in this setting. The .NET Installer Class Arguments dialog box opens, enabling you to specify arguments for the Install, Commit, Rollback, and Uninstall methods. For sample code, see Reading Properties Passed to the .NET Installer Class.  ***Note*** • *This setting is applicable only if the component's key file is a .NET assembly.*

Run-Time Settings

When you select a component in the Components view or the Setup Design view of an InstallScript or InstallScript Object project, the following settings are available in the Run-Time Settings area:

Table 12-15 • Component Settings in the Run-Time Settings Area

Setting	Project Type	Description
FTP Location	InstallScript, InstallScript Object	If you want to associate an FTP location with the component, enter the FTP address. The location that you enter cannot be accessed from within a script. Note that this same setting is also available for features; however, the location that you specify for the feature setting can be accessed from within a script.
HTTP Location	InstallScript, InstallScript Object	If you want to associate an HTTP address with the component, enter the HTTP address. The location that you enter cannot be accessed from within a script. Note that this same setting is also available for features; however, the location that you specify for the feature setting can be accessed from within a script.
Miscellaneous	InstallScript, InstallScript Object	If you want to associate a text string with the component, enter the text string. The location that you enter cannot be accessed from within a script. Note that this same setting is also available for features; however, the location that you specify for the feature setting can be accessed from within a script.

Advanced Settings for a Component

Project • *The Advanced Settings area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Advanced Settings area under a component in the Components view (and in the Setup Design view) enables you to fulfill installation requirements for special component types. For example, when you copy an .ocx file to the target system, you must register its classes, ProgIDs, and type libraries so that the file's methods can be properly accessed. Advanced settings use Windows Installer's built-in functionality for registering COM servers; setting up ODBC drivers, data sources, and translators; installing or controlling Windows services; and registering a file association.

By specifying the advanced settings, you can publish your component and register COM servers, file extension servers, and MIME types. If the component is selected, an advanced setting is made on the target system when the component is installed or advertised. That way, the file is ready to execute once it is installed. Publishing components—a type of advertising—is accomplished through the Publishing advanced setting.

Categories of Advanced Settings

The Advanced Settings area under a component in the Components view (and in the Setup Design view) is organized into the following main categories:

Table 12-16 • Categories for the Advanced Settings of a Component

Category	Description
Application Paths	Use this advanced setting to specify the paths to your component's files and folders. When you run your installation, it will create an App Paths key for your component under the following registry key: HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\App Paths\ProgramName.exe.
Assembly	Use this advanced setting to install a Win32 or .NET assembly when its component is installed.

Table 12-16 • Categories for the Advanced Settings of a Component (cont.)

Category	Description
COM Registration	In the COM Registration area, you can enter or modify registration information for the COM server that you have set as your component's key file. The COM Registration advanced setting is intended to replace self-registration, which is a violation of Setup Best Practices. The recommended way to specify file registration is to use the Component Wizard and have it automatically extract the necessary information for you. Use the COM Registration explorer only if you need to make advanced modifications.
File Types	This advanced setting registers information about a file type on the target system when the component is installed or advertised.
Services	Use the Services area to install, configure, start, stop, and uninstall Windows services during installation and uninstallation. As an alternative, you can use the Services view to install, configure, start, stop, and uninstall Windows services. If you configure service information in either of these areas, the other area is automatically updated accordingly.
Publishing	Use this advanced setting to publish your component. Publishing is a type of advertising (just-in-time installation) in which no user-interface elements are created for the component during installation, but the component can be installed through the Add or Remove Programs or when an installed component requests the published component from the installer.
Device Driver	The Device Driver advanced setting enables you to specify whether the current component includes a device driver, the type of driver, and the order in which the project's device drivers (not just the current component's device drivers) should be installed.
Other Data	The Other Data advanced setting lists various Windows Installer tables that are related to the component.

Application Path Settings

Project • *The Application Paths area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*

- *Transform*

The following columns are available in the Application Paths area under the Advanced Settings node of the Components view and the Setup Design view:

Table 12-17 • Assembly Settings

Column	Description
Check Box	To add an application path for the component, select the check box for the executable file whose application path you want to define.
File	This read-only column shows the executable files that are in the selected component.
Application Path	Enter a sequence of directories that the executable file should use as a search path for its DLLs (whether linked to the executable at build time, or loaded with the **LoadLibrary** API). Separate multiple directories with a semicolon (;). Do not use hard-coded paths, such as **C:\MyDir**, for one of your paths. Instead, use Windows Installer folder properties in square brackets, as in **[INSTALLDIR]MyDir** and **[CommonFilesFolder]MyProgram**, or the name of the component after a dollar sign, such as **[$ComponentName]**. The Windows Installer resolves these values and writes the resulting locations to the application path key.

Assembly Settings

Project • *The Assembly area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The following settings are available in the Assembly area under the Advanced Settings node of the Components view and the Setup Design view:

Table 12-18 • Assembly Settings

Setting	Description
Manifest	For a .NET assembly, this setting is automatically set to the first .exe or DLL file in the component. For a Win32 assembly, this setting is automatically set to the first file in the component with the .manifest extension. The file name of the manifest is the application executable name, followed by the .manifest extension. This setting should be left blank if Global Assembly Cache is selected for the assembly's File Application setting. The Manifest setting cannot be deleted.
File Application	For a .NET assembly, this setting lets you specify whether to install the assembly in the global assembly cache. Select the appropriate file to install the assembly in your application's private cache, or select Global Assembly Cache to install the assembly in the global assembly cache. For a Win32 assembly, this setting lets you specify whether to install the assembly privately for the selected .exe or to install the assembly to the global assembly cache. If you select Global Assembly Cache, the assembly can be used by any .NET application on the target system. The File Application setting cannot be deleted. The value of this setting affects the component's Destination setting. If the File Application setting is set to Global Assembly Cache, the component's Destination setting is also set to Global Assembly Cache. For optimal advertising and repair, select the executable file that uses the assembly in this component.  ***Note*** • *To install a .NET assembly to the global assembly cache, the assembly must meet certain criteria. For details, consult Microsoft's .NET documentation.* *To install a Win32 assembly to the global assembly cache, your files must be signed and have catalog (.cat) files. For details, see "Creating Signed Files and Catalogs" in the Platform SDK help.*

Table 12-18 • Assembly Settings (cont.)

Setting	Description
Properties	Enter the property names and values. To create a new entry, right-click in the grid and click New. For a Win32 assembly, you must enter values for the following properties: type, name, version, language, publicKeyToken, and processorArchitecture. For a private .NET assembly, you must enter values for the following properties: Name, Version, and Culture. For a global .NET assembly, you must enter values for the following properties: Name, Version, Culture, and PublicKeyToken. InstallShield adds the property name and value that you enter to the **MsiAssemblyName** table of your Windows Installer database. You can view the records in this table using the Direct Editor. ***Note*** • *The property and values that you enter for your assembly must match the information in the assembly's manifest file. If they do not match, the assembly might be left on the target system when your product is uninstalled.*

COM Registration Settings

Project • *The COM Registration area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The COM Registration area under the Advanced Settings node of the Components view and the Setup Design view is organized into the following categories:

- COM Classes
- ProgIDs
- Type Libraries

COM Classes

When you select a COM class in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

Table 12-19 • COM Class Settings

Setting	Description
ProgID	Select a ProgID for this COM class from the list of ProgIDs created for this COM server. You can also create a ProgID by typing a new name; if you do this, InstallShield adds the new ProgID under the ProgIDs node.
File Type Mask	Enter the file type mask in the following format: **offset, cb, mask, value** • **offset**—The position, in bytes, from the beginning of the file, indicating where the byte range begins. Number of bytes from the end of the file if the offset value is a negative integer. • **cb**—The number of bytes in the file, starting from the offset value, that will be used to perform a logical AND operation with the mask. • **mask**—A value that is used to perform a logical AND operation with the bits in the file so that the result can be compared with a specified value (the next entry). If you leave this value empty, it is assumed to be all ones. • **value**—The bytes that will be compared with the result of a logical AND operation between the mask and the byte range in a file in order to determine the file's class ID. A file type mask is part of a pattern registered under HKEY_CLASSES_ROOT\FileType*CLSID**pattern*. Windows APIs such as **OleCreateFromFile** and **GetClassFile** can retrieve a class ID for a file by comparing information in this key to the bytes in the file. For example, **0,4,FFFFFFFF,AABBCCDD** would mean that the first four bytes in the file must be AA BB CC DD for the system to use this component's class ID for a specified file. You can specify more than one mask that the file has to match. Separate multiple patterns with a semicolon (;). When the installation creates these keys, the subkeys for each pattern are automatically numbered sequentially starting with the number 0.

Table 12-19 • COM Class Settings (cont.)

Setting	Description
Icon File	Enter the fully qualified path to the file that contains the icon associated with this COM class, or click the ellipsis button (...) in this setting to browse to the path. You can specify an .ico, .exe, or .dll file. An icon will be extracted from the file for you if you browse for an executable file or DLL and select a specific icon.
Icon Index	If there is more than one icon resource in the file, enter the index for the appropriate icon. A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 is for the first icon in the file, 1 for the second, 2 for the third, and so on. Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.
AppID	Select an AppID for this DCOM or COM+ class from the list of AppID names that you have already created for this file's registration. An AppID is a GUID that is registered under HKEY_CLASSES_ROOT\AppID used for grouping all of the security and configuration options of distributed COM objects. To create a new AppID, you need to use the Direct Editor: Navigate to the AppID table and enter the information for your new AppID. Once you have created an AppID, you can select it from the list in this setting. To permanently delete an AppID, delete its row in the AppID from within the Direct Editor.
Description	Enter a description for this COM class. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-19 • COM Class Settings (cont.)

Setting	Description
Relative Path	Specify whether you want to register a relative path to the file under its class ID. Available options are: • **No**—The installation registers the fully qualified path to the file under its class ID. Then, when any client application instantiates an object from this class, the system always points to the registered COM server. This is the default option. • **Yes**—The installation registers only the name of the file without any path. Doing so allows you to install side-by-side components, meaning that the operating system uses the copy of the COM server in the current directory and that other applications can maintain separate copies of the file in their respective folders.  ***Note*** • *If the path is relative and the file is not in the system's path, the operating system will not be able to find the class when a client attempts to create an object outside of the server's current directory.*

When you select a LocalServer32, LocalServer, or InprocServer32 context type under a COM class in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

Table 12-20 • COM Class Context Settings

Setting	Description
Default Inproc Handler	Select the InprocHandler value for this LocalServer or LocalServer32 context type.
Argument	Enter the argument that OLE will use when calling this COM server.

ProgIDs

When you select a ProgID in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

Table 12-21 • ProgID Settings

Setting	Description
COM Class	Select the COM class, if any, to which this ProgID refers. If you later change the class ID (CLSID) for the COM class, you will need to select it again from the list to restore the association.

Table 12-21 • ProgID Settings (cont.)

Setting	Description
Description	Enter a description of this ProgID. The description is registered as the default value for the ProgID under the registry key HKEY_CLASSES_ROOT*class.object* when this component is installed. When the user right-clicks a file associated with your file extension and then clicks Properties, the General tab displays the description that you enter here. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Icon File	Enter the fully qualified path to the file that contains the icon associated with this ProgID, or click the ellipsis button (...) in this setting to browse to the path. You can specify an .ico, .exe, or .dll file. An icon will be extracted from the file for you if you browse for an executable file or DLL and select a specific icon.
Icon Index	If there is more than one icon resource in the file, enter the index for the appropriate icon. A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 is for the first icon in the file, 1 for the second, 2 for the third, and so on. Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.

When you select a version-independent ProgID in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

Table 12-22 • Version-Independent ProgID Settings

Setting	Description
Description	Enter a description of this version-independent ProgID. The description is registered as the default value for the version-independent ProgID under its root key (HKEY_CLASSES_ROOT*version-independent ProgID*) when this component is installed. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Type Libraries

When you select a type library in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

Table 12-23 • Type Library Settings

Setting	Description
Locale ID	Enter the decimal value of the type library's locale ID. Since type libraries are usually language-neutral, the number zero is the most common language of type libraries.
Version	Provide the version number of the type library. If this setting is left blank, Windows Installer automatically determines the version of the type library at run time. Windows Installer requires the type library version to be in the format *x.y*, where *x* and *y* are decimal (base-10) integers.
Cost	Enter the cost that is associated with registering this type library. Use non-negative numbers only. Enter the number 1 if no specific value is available.
Help Path	Select the destination folder where the help file for this type library will be installed, or click the ellipsis button (...) to select or create a directory. To use the component's default destination directory, select [INSTALLDIR].

Table 12-23 • Type Library Settings (cont.)

Setting	Description
Description	Enter a description of this type library. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

File Type Settings

Project • *The File Types area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The File Types area under the Advanced Settings node of the Components view and the Setup Design view is organized into the following categories:

- Extension
- Verbs
- MIME Type
- ProgIDs

Extension

When you select an extension in the File Types area of the Components view or the Setup Design view, the following settings are available:

Table 12-24 • Extension Settings

Setting	Description
ProgID	Select the ProgID that should be registered for this file extension. You can also create a ProgID by typing a new name; if you do this, InstallShield adds the new ProgID under the ProgIDs node. A file type's ProgID is an arbitrary string, but it should be unique on the target system. One ProgID naming convention is to append the word *file* to your extension without a dot—the *.ext* extension might use the ProgID *extfile*. Another convention is to name a file-type ProgID after the application used to open the file type, as in **SampleApp.Document**.
MIME Type	Select the MIME type, if any, that is associated with this file extension. To create a new MIME type for your extension, right-click its icon and click New MIME Type.

Verbs

When you select a verb under a file extension in the File Types area of the Components view or the Setup Design view, the following settings are available:

Table 12-25 • Verb Settings

Setting	Description
Command Sequence	Enter a sequence number for the command verb. If this file extension has more than one verb associated with it, the sequence numbers determine the order in which the verbs are displayed on the context menu (also known as a right-click menu or pop-up menu). If you do not specify a sequence number, or if more than one verb has the same sequence number, the verbs are listed alphabetically. The first verb in the command sequence is displayed in bold as the default option on the file type's context menu.

Table 12-25 • Verb Settings (cont.)

Setting	Description
Display Name	Enter the text that you want to display for this verb on the context menu that Windows Explorer displays when an end user right-clicks a file with the current extension. For example, to display **Open with SampleApp** (with an underlined letter *O*) on the context menu for this file extension, enter `&Open with SampleApp`. This setting is optional. If you do not specify a display name, the name of the verb as it appears in the Extensions tree is used on the file-type's context menu on the target system. Note that if you use one of the canonical verbs—such as *open*, *print*, or *find*, and you do not specify a display name, Windows automatically localizes the verb on each system. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Argument	Enter the command-line arguments for this verb. Use `%1` in the argument in place of the selected file name. For example, suppose an end user right-clicks C:\File.ext and **-p %1** is the argument for the verb, the command-line argument becomes **-p C:\File.ext**. In some cases, it may be necessary to place quotation marks around the %1 argument—that is, enter `"%1"` as the argument—to correctly handle file names that contain spaces.

MIME Types

When you select a verb under a file extension in the File Types area of the Components view or the Setup Design view, the following settings are available:

Table 12-26 • Mime Type Settings

Setting	Description
Class ID	Enter the class ID that is associated with this MIME type.

ProgIDs

When you select a ProgID in the File Types area of the Components view or the Setup Design view, several settings are available. For descriptions of each setting, see ProgIDs.

Services Settings

Project • *The Services area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Note • *A service must be a single executable file (.exe), since the Windows Installer does not support driver services.*

The service executable file must be the key file of its component. For more information, see Component Key Files.

For information about the Services settings, see Services View.

Publishing Settings

Project • *The Publishing area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

You can add the following types of items to the Publishing explorer in the Publishing area under the Advanced Settings node of the Components view and the Setup Design view:

Table 12-27 • Publishing Settings

Setting	Description
ComponentID	The componentID, a GUID, is a category identifier that represents the category of components that are being grouped together as a qualified component. Each componentID must have at least one qualifier. ***Note*** • *Do not confuse the componentID with the GUID that is entered in the Component Code setting for the component; they must be unique values.*
Qualifier	The qualifier is a string that you can use to distinguish this language or version of the component from any other (for example, to specify a language). It must be unique for the component.

The following settings are available when you select a qualifier in the Publishing area:

Table 12-28 • Qualifier Settings

Setting	Description
Application Data	Enter the application data that corresponds with its qualifier. The application data is a text string that may be displayed to end users. This setting is optional. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Device Driver Settings

Project • *The Device Driver area for a component is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

The following tabs are available in the Device Driver area under the Advanced Settings node of the Components view and the Setup Design view:

- Common tab
- Sequence tab

Common Tab

The Common tab contains the following run-time settings for device drivers:

Table 12-29 • Device Driver Settings on the Common Tab

Options	Description
Always overwrite any existing device driver	Replace any existing driver for the device with this driver. If this check box is cleared and a driver already exists for the device, your driver is not installed.
Do not show Connect Device to Computer dialog	To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, select this option.
Do not create Add or Remove Programs entry for device driver	If you select this check box, the installation does not create an Add or Remove Programs entry for the device driver. If you clear this check box, the installation does create an Add or Remove Programs entry. DIFxApp does not support this feature on Windows Vista and later.
Install unsigned driver files and drivers with missing files	By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, select this check box. Selecting this check box enables you to fully test drivers more easily before shipping final signed versions.
Remove binary files associated with driver during uninstall	By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, select this check box. If you select this check box, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.  ***Caution*** • *Select the **Remove binary files associated with driver during uninstall** check box only if you can verify that the driver's binary files are not required by any other driver package or application.*

Table 12-29 • Device Driver Settings on the Common Tab (cont.)

Options	Description
Include all localized installation runtime dialogs	When this check box is selected, the installation uses a custom action runtime .dll that includes dialogs and text for the following languages: • Arabic (Saudi Arabia) • Chinese (People's ROC) • Chinese (Taiwan) • Czech (Czech Republic) • Danish (Denmark) • Dutch (Netherlands) • English (United States) • Finnish (Finland) • French (France) • German (Germany) • Greek (Greece) • Hebrew (Israel) • Hungarian (Hungary) • Italian (Italy) • Japanese (Japan) • Korean (Korea) • Norwegian (Bokmål) (Norway) • Polish (Poland) • Portuguese (Brazil) • Portuguese (Portugal) • Russian (Russia) • Spanish - Modern Sort (Spain) • Swedish (Sweden) • Turkish (Turkey) If you clear this check box, the installation uses runtime dialogs for English only. The English runtime .dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, clear this check box. This check box applies to all of the components in the project that contain device drivers.

Table 12-29 • Device Driver Settings on the Common Tab (cont.)

Options	Description
Device driver machine architecture	This area has several options. Select the appropriate option. • Device driver targets 32 bit machines • Device driver targets Itanium 64 bit machines • Device driver targets AMD 64 bit machines This setting applies to all of the components in the project that contain device drivers.

Sequence Tab

The Sequence tab enables you to specify the order in which the project's device drivers (not just the current component's device drivers) should be installed.

Other Data Settings

Project • *The Other Data area for a component is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Other Data area for a component is available in the Components view and the Setup Design view.

Task: ***Using the Other Data node:***

- Click the Other Data node to view a list of Windows Installer tables that are related to the component. The list also includes the name of any SQL script files associated with a component. In addition, the Other Data node lists the number of records found in the **Complus**, **DuplicateFile**, **Environment**, **IniFile**, **MoveFile**, **RemoveIniFile**, **RemoveRegistry**, and **ReserveCost** tables.
- To go to a table in the Direct Editor, click the table name.

Setup Types View

Project • *The Setup Types view is available in the following project types:*

- *InstallScript*
- *InstallScript MSI*

To create setup types for a Basic MSI project, use the feature's Install Level property.

Setup types enable you to provide different versions of your product to your end users. For example, the default setup types are Complete and Custom. The Complete setup type installs all of the files included in your installation. The Custom setup type lets the end user select which features are installed.

Setup types are based on features. You select the features that you would like to associate with each setup type. Then, when an end user selects a certain setup type, only those features that you associated with that setup type are installed.

By default, each project that you create contains predefined setup types. In the Setup Types view, you can add or remove setup types, rename existing setup types, and change which features are associated with each one.

Default Setup Types

Table 12-30 • Default Setup Types

Setup Type	Project Type	Description
Complete	InstallScript, InstallScript MSI	The Complete setup type includes all of your installation program's features.
Custom	InstallScript, InstallScript MSI	The Custom setup type lets end users select which features they would like to install. Required features should be marked as such, so that they are always installed. However, features such as the online help may not need to be installed. In these cases, the end user can select which of the optional features to install.

Additional Setup Types

You can create additional setup types in this view. To learn how to add setup types to your project, see Working with Setup Types.

Setup Type Settings

When you select a setup type in the Setup Types view, the following settings are available:

Table 12-31 • Setup Type Settings

Setting	Description
Display Name	Enter the name of the setup type. This is the name that is displayed to end users when they run your installation. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Description	Type a description for the setup type.  ***Note*** • *This description is displayed to end users during the installation process only if you call SdSetupTypeEx in your script.* When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Comment	Type comments about the setup type. The comments are for your use only and do not appear in the installation. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Packages View

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Project-specific differences are noted where appropriate.

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

Use the Packages view to add one package to an Advanced UI project, or one or more packages to a Suite/Advanced UI project. For information on how to determine which type of package format to include, see Guidelines for Adding Packages to an Advanced UI or Suite/Advanced UI Project.

This view also lets you import one or more InstallShield prerequisites into your project as .msi packages, .msp packages, or .exe packages, depending on the type of file that is configured to run for the prerequisites.

Use this view to define conditions for each package, associate each package with one or more Advanced UI or Suite/Advanced UI features, and configure other settings for each package.

At run time, the `Setup.exe` file launches each package based on the conditions that you have defined and the order in which you listed the packages in the Packages view.

When you select a package in the Packages view, the following tabs are available:

- Common
- Features

When you select a dynamically linked folder in the Packages view, two settings are available. For more information, see Dynamic Link Settings.

Common Tab

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Project-specific differences are noted where appropriate.

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The Common tab in the Packages view is organized into the following main categories:

- General
- Operation
- Events (This is available in Suite/Advanced UI projects.)

General Settings

Use a package's General settings to specify details such as the display name and the conditions under which the Advanced UI or Suite/Advanced UI installation should launch the package.

Note that some settings are not applicable to all types of Advanced UI or Suite/Advanced UI package files.

Table 12-32 • General Settings on the Common Tab

Setting	Type of Package File	Description
Package GUID	.appx, .exe, .msi, .msp, InstallScript	Enter a GUID that uniquely identifies this package. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting.
Display Name	.appx, .exe, .msi, .msp, InstallScript	Enter the name that you want to be displayed for this package at run time.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Location	.appx, .exe, .msi, .msp, InstallScript	Specify where the package should be located. Available options are: • **Copy From Source Media**—Store the package and its files on the source media. If the Advanced UI or Suite/Advanced UI installation will be run uncompressed from fixed media—such as CD, DVD, or local network—use this option. • **Extract From Setup.exe**—Compress the package and its files into `Setup.exe`, to be extracted at run time, if necessary. If the entire Advanced UI or Suite/Advanced UI installation must be self-contained in `Setup.exe`, select this option. Note that the Download From The Web option results in smaller installations and shorter download time; however, the Extract From Setup.exe option provides for a completely self-contained installation. • **Download From The Web**—Download the package and its files (if necessary) from the URL that is specified for the package. This option is recommended if your installation will be downloaded from the Internet and you want to minimize the Advanced UI or Suite/Advanced UI package size and download time. An Advanced UI or Suite/Advanced UI package is not downloaded if the correct version is already present on the target system. Note that the option that you select in the Location setting may be overridden in the Releases view.
URL	.appx, .exe, .msi, .msp, InstallScript	Enter the URL for the root folder that will contain the selected package and its folders and files. The package and any accompanying files are downloaded from this location to target systems at run time if the package needs to be launched. This setting is applicable if Download From The Web is selected in the Location setting.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Package Type	.appx, .exe, .msi, .msp, InstallScript	 ***Project*** *• In Suite/Advanced UI projects, this setting is available for edit. In Advanced UI projects, this setting is read-only, since an Advanced UI project has support for only one primary package.* In a Suite/Advanced UI project: Select the type of package that identifies whether the presence of this package on the target system should influence whether the Suite/Advanced UI installation runs in first-time-installation mode or maintenance mode. Available options for this setting are: • **Primary**—The selected package is a main part of the Advanced UI or Suite/Advanced UI installation. At run time, if all of the primary packages in the installation are absent from the target system, the installation runs as a first-time installation. If any of the primary packages are present on the target system, the installation runs in maintenance mode. • **Dependency**—The selected package should not be a factor in determining which mode is used to run the Advanced UI or Suite/Advanced UI installation. For more information, see Primary Packages vs. Dependency Packages in Advanced UI and Suite/Advanced UI Projects.
Cache Path	.appx, .exe, .msi, .msp, InstallScript	Specify where the cached package and other package files should be stored on the end user's system. You can enter a hard-coded value such as **C:\CachedFiles**, but it is recommended that you use a destination property value in the list for the path. The default value is as follows: `[LocalAppDataFolder]Downloaded Installations` The Setup.exe tab in the Releases view lets you specify whether you want to cache the packages on target systems for any packages that are run on target systems and that have a cache path defined. If you are building an uncompressed release, you may want to avoid caching packages on the target system.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Certificate File	.appx	The versions of Windows that support .appx packages do not install a sideloading package unless they trust the source of the package. If you are using a custom certificate, such as the one that is generated in Visual Studio, the Suite/Advanced UI installation can make Windows trust the source of your package by adding the custom certificate to the certificate store of target systems. The Suite/Advanced UI installation does this if you include the .cer file in your sideloading package, and specify it here.
Require Elevated Privileges	.exe, .msi, .msp, InstallScript	Specify whether the package requires elevation on Windows Vista and later and Windows Server 2008 and later systems.
Minor Upgrade Handling	.msi	Indicate the appropriate behavior that should occur when an earlier version of the package is present on the target system. Available options are: • **None**—The Advanced UI or Suite/Advanced UI installation launches the package without running it in minor upgrade mode. That is, the Advanced UI or Suite/Advanced UI installation does not set the **REINSTALL** or **REINSTALLMODE** properties for the package. • **Automatic**—The Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode by setting the **REINSTALL** property to *ALL* and the **REINSTALLMODE** property to *vomus*. It does not inform the end user that the product will be upgraded. • **Ask the User**—The Advanced UI or Suite/Advanced UI installation displays a secondary window that asks the end user whether they want to continue. If the end user chooses to continue, the Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode. If the end user chooses to not continue, the package does not run.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Status Messages Reported	.msi, .msp	Specify what sort of status messages you want to be available for displaying in the user interface of the Advanced UI or Suite/Advanced UI installation. Available options are: • **Action Text**—The Advanced UI or Suite/Advanced UI installation's status messages include the action text from the standard actions and custom actions in the package. • **Action Text and Action Data**—The Advanced UI or Suite/Advanced UI installation's status messages include the action text as well as action data from the standard actions and custom actions in the package. At run time, the Advanced UI or Suite/Advanced UI installation updates the **ISParcelStatus** property with the action text and, if applicable, the action data in the **ISParcelStatus** property, which is displayed on the InstallationProgress wizard page of the Advanced UI or Suite/Advanced UI installation by default. For example, when the InstallFiles action in an .msi package is executing, the **ISParcelStatus** property is updated with the action text "Copying new files" to inform end users about the current progress of the installation. If you choose to include action data in the status messages, the **ISParcelStatus** property may also be updated with action data such as the name, directory, and size of each file as it is being installed on the target system.
Enable Logging Support	.exe, .msi, .msp, InstallScript	Specify whether you want the package to generate a log file if the Advanced UI or Suite/Advanced UI installation is launched from the command line with the `/l*log` command-line parameter. Note that if a package does not have support for logging, it is recommended that you do not enable logging support for that package. If you select Yes, configure each subsetting under this setting as needed. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Log File	.msi, .msp	This setting is enabled if Yes is selected for the Enable Logging Support setting. Specify a name for the log file. Do not include a path for the file; the Advanced UI or Suite/Advanced UI `/l*log` command-line parameter lets end users specify the directory for the package log files. If you leave this setting blank, the name of the log file that the installation creates is *`PackageGUID`*`.log`, where *`PackageGUID`* is the GUID that is assigned to the package in the Package GUID setting in the Packages view. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation.
Log Options	.msi, .msp	This setting is enabled if Yes is selected for the Enable Logging Support setting. Specify the Windows Installer log `/L` flags that you want the package to use when generating the log file. For example, to generate a log file that logs everything verbosely, enter the following in this setting: *v For additional valid flags, see the /L description. If you leave this setting blank, the asterisk (*) and v flags are used to generate the log file. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Logging Command Line	.exe, InstallScript	This setting is enabled if Yes is selected for the Enable Logging Support setting. Specify the command line that the Advanced UI or Suite/Advanced UI installation should pass to the .exe package to enable the logging. Include any appropriate supported flags. If the .exe package that you are configuring supports it, include a path that references the Advanced UI or Suite/Advanced UI property **ISLogDir**, enclosed within square brackets, in place of the path to the directory where the log file should be created. For example, to generate a log file that logs everything verbosely for an .msi package that is run by a `Setup.exe` file that InstallShield built, enter the following command line: `/v"/l*v \"[ISLogDir]FileName.log\""` The Advanced UI or Suite/Advanced UI installation replaces **[ISLogDir]** with the path to the folder that will contain the log file. The Advanced UI or Suite/Advanced UI `/log` command-line parameter lets end users specify the path to the directory for the package log files. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Detection Condition	.appx, .exe, .msi, .msp, InstallScript	This setting lets you specify one or more conditions that the Advanced UI or Suite/Advanced UI installation should use to evaluate whether the package is already installed on target systems. For example, if the package installs a specific file or registry entry, you can create a condition that specifies the file or registry key that the installation should search for. To add one or more new detection conditions, click the New Condition button in this setting. InstallShield adds a new row under the Detection Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement. For more information, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects. If one or more conditional statements are configured, the Detection Condition setting says **(Condition)**. If none are configured, the Detection Condition setting says **(Empty)**.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Eligibility Condition	.appx, .exe, .msi, .msp, InstallScript	This setting lets you specify one or more conditions that the Advanced UI or Suite/Advanced UI installation should use to determine whether the target system meets the requirements that are necessary for the package to be run. For example, if the package should be run only on 64-bit systems, you could set up an x64 platform requirement in a condition; the Advanced UI or Suite/Advanced UI installation would launch the package only on 64-bit systems. You may also want to set up an eligibility condition to prevent end users from being able to install the current package version over a future newer version. To add one or more new eligibility conditions, click the New Condition button in this setting. InstallShield adds a new row under the Eligibility Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement. For more information, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects. If one or more conditional statements are configured, the Eligibility Condition setting says **(Condition)**. If none are configured, the Eligibility Condition setting says **(Empty)**.

Table 12-32 • General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Windows Features	.appx, .exe, .msi, .msp, InstallScript	 ***Project*** • *This setting is available in Suite/Advanced UI projects.* This setting lets you specify one or more Windows roles and features that the selected package requires be enabled on target systems that have Windows Vista or later or Windows Server 2008 or later. At run time, if this package is eligible to be installed and it requires one or more Windows roles and features that are disabled, the Suite/Advanced UI installation enables them before launching the package. To specify a required Windows role or feature, click the Add New Windows Feature button in this setting, and then click one of the available options. The Custom option lets you specify any Windows role or feature that is not listed as an option in this setting. When you select an option, InstallShield adds a new Windows Feature row under the Windows Features setting. Configure the Windows Feature setting as needed. For more information, see Enabling Windows Roles and Features During a Suite/Advanced UI Installation.
Release Flags	.appx, .exe, .msi, .msp, InstallScript	If you want to use release flags to be able to selectively include and exclude this package from different builds of your Advanced UI or Suite/Advanced UI installation, enter one or more release flags to identify this package. Separate multiple flags with a comma.

Operation Settings

Use a package's Operation settings to specify information such as the behavior that should occur if the Advanced UI or Suite/Advanced UI installation is installing, removing, repairing, or modifying the package. This includes information such as the command line that should be used when launching the package and the behavior that should occur if the package requires that the target system be rebooted.

Note that some settings are not applicable to all types of Advanced UI and Suite/Advanced UI package formats.

Table 12-33 • Operation Settings on the Common Tab

Setting	Type of Package File	Description
Install	.appx, .exe, .msi, .msp, InstallScript	If the Advanced UI or Suite/Advanced UI installation runs in first-time installation mode, specify whether you want this package to be launched as a first-time installation. The install operation is applicable if the target system meets the package's eligibility conditions and if this package's product is not already installed. If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.
Remove	.appx, .exe, .msi, InstallScript	If the Advanced UI or Suite/Advanced UI installation runs in remove mode, specify whether you want the product that this package installed to be removed. The remove operation is applicable if the target system meets the package's eligibility conditions and if this package's product is installed. If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.
Repair	.exe, .msi, InstallScript	If the Advanced UI or Suite/Advanced UI installation runs in repair mode, specify whether you want this package to be launched in repair mode to repair the product that is installed by this package. The repair operation is applicable if the target system meets the package's eligibility conditions and if this package's product is installed. If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Modify	.exe, .msi, InstallScript	If the Advanced UI or Suite/Advanced UI installation runs in modify mode, specify whether you want this package to be launched in maintenance mode to enable end users to install, remove, or modify the product that is installed by this package. The modify operation is applicable if the target system meets the package's eligibility conditions and if this package's product is installed. If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.
Target	.exe, .msi, .msp, InstallScript	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. Select the file in the package—the .msi file, the .msp file, or the executable file setup launcher—that the Advanced UI or Suite/Advanced UI installation should invoke.
EXE Command Line	.exe	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting. If all of the customization can be done without end-user intervention, consider including the command-line parameter for running the .exe package silently. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
MSI Command Line	.msi	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting. If you are configuring the Install and Remove operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer properties. If you are configuring the Repair and Modify operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer feature properties. To enter a Windows Installer property, use the following format: `MYPROPERTYNAME=MyPropertyValue` Note that an Advanced UI or Suite/Advanced UI installation always launches .msi packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msi package. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
MSP Command Line	.msp	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting. To update all of the features through an .msp package, you would enter command-line properties such as the following: `REINSTALLMODE=vomus REINSTALL=ALL` To update only certain features that are included in the .msp package, you would set **REINSTALL** to a comma-separated list of features that you want to be updated: `REINSTALLMODE=vomus` `REINSTALL=Feature1,Feature3,Feature5` Note that an Advanced UI or Suite/Advanced UI installation always launches .msp packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msp package. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Command Line	InstallScript	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If applicable, specify the command line that should be used to launch the InstallScript package that is associated with the selected target file (that is, the `data1.hdr` file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting. If you are configuring the Install and Modify operations for an InstallScript package, you can use the Advanced UI or Suite/Advanced UI properties **ISFeatureInstall** and **ISFeatureRemove** in your command line. Set these properties to a comma-delimited list of feature names as follows: `ISFeatureInstall=Feature1,Feature2` `ISFeatureRemove=Feature3` In the above example, **Feature1** and **Feature2** are selected to be installed; **Feature3** is selected to be removed, if it is present. Note that an Advanced UI or Suite/Advanced UI installation launches InstallScript packages silently by default. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the InstallScript package. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
MSI Silent Command Line	.msi	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting. If you are configuring the Install and Remove operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer properties. If you are configuring the Repair and Modify operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer feature properties. To enter a Windows Installer property, use the following format: `MYPROPERTYNAME=MyPropertyValue` Note that an Advanced UI or Suite/Advanced UI installation always launches .msi packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msi package. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
MSP Silent Command Line	.msp	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting. To update all of the features through an .msp package, you would enter command-line properties such as the following: `REINSTALLMODE=vomus REINSTALL=ALL` To update only certain features that are included in the .msp package, you would set **REINSTALL** to a comma-separated list of features that you want to be updated: `REINSTALLMODE=vomus` `  REINSTALL=Feature1,Feature3,Feature5` Note that an Advanced UI or Suite/Advanced UI installation always launches .msp packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msp package. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
EXE Silent Command Line	.exe	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting. If all of the customization can be done without end-user intervention, consider including the command-line parameter for running the .exe package silently. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Silent Command Line	InstallScript	If applicable, specify the command line that should be used to launch the InstallScript package that is associated with the selected target file (that is, the `data1.hdr` file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting. If you are configuring the Install and Modify operations for an InstallScript package, you can use the Advanced UI or Suite/Advanced UI properties **ISFeatureInstall** and **ISFeatureRemove** in your command line. Set these properties to a comma-delimited list of feature names as follows: `ISFeatureInstall=Feature1,Feature2` `ISFeatureRemove=Feature3` In the above example, **Feature1** and **Feature2** are selected to be installed; **Feature3** is selected to be removed, if it is present. Note that an Advanced UI or Suite/Advanced UI installation launches InstallScript packages silently by default. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the InstallScript package. For more information, including valid types of entries for this setting, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Exit Behavior	.exe	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If a detection condition is still not met on a target system after the package has been run, either one of the following may be true: • The executable file package was not run successfully. • The detection conditions that were specified for the package were not accurate. For example, a detection condition may indicate that the executable file needs to be launched if a particular file does not exist on the target system. If the file is still missing even after the Advanced UI or Suite/Advanced UI installation has run the executable file package, it is possible that the condition was created erroneously. Specify the behavior that should occur if one or more of the detection conditions still indicate that the package needs to be launched. Available options are: • **Ask whether to continue the setup**—If the Advanced UI or Suite/Advanced UI installation should display a message box that prompts the end user to specify whether the Advanced UI or Suite/Advanced UI installation should continue, select this option. • **Abort the setup**—If the Advanced UI or Suite/Advanced UI installation should end without proceeding further, select this option. • **Continue the setup**—If the Advanced UI or Suite/Advanced UI installation should essentially ignore the executable file's unmet condition and proceed to the next package in the installation (if one is required), select this option.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Reboot Request	.exe, .msi, .msp, InstallScript	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. The installation of an Advanced UI or Suite/Advanced UI package may require that the target system be restarted, as described in Restarting a Target System for an Advanced UI or Suite/Advanced UI Package. Specify the behavior that should occur if the package requires that a target system be restarted. Available options are: • **Allow the machine to reboot**—If the need for a restart is detected, the Advanced UI or Suite/Advanced UI installation exits and lets the package trigger a restart. If the package restarts the target system, the Advanced UI or Suite/Advanced UI installation continues with the next package in the Advanced UI or Suite/Advanced UI after the restart. If the package does not trigger a restart, the Advanced UI or Suite/Advanced UI installation resumes after the next restart. • **Ignore the reboot request**—The Advanced UI or Suite/Advanced UI installation continues without restarting the target system. Thus, if it appears that a restart is required but you want the Advanced UI or Suite/Advanced UI installation to try to skip it, select this option. If the package restarts the target system, the Advanced UI or Suite/Advanced UI installation then resumes with the next package in the installation. • **Delay the prompt, then exit or reboot the machine**—If the package requires that the target system be restarted, the restart is postponed until a subsequent package triggers a restart, or until the end of the Advanced UI or Suite/Advanced UI installation, after the last package has completed. If the restart occurs because of a subsequent package, the restart behavior follows the reboot behavior that is configured for that subsequent package. If the restart occurs at the end of the Advanced UI or Suite/Advanced UI installation, the Advanced UI or Suite/Advanced UI installation displays a message box that asks the end user whether to restart. If the end user chooses not to allow the restart, the Advanced UI or Suite/Advanced UI installation exits instead of restarting the target system.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Reboot Request (cont.)		• **Prompt, then exit or reboot the machine**—If the Advanced UI or Suite/Advanced UI installation detects that the package requires that the target system be restarted, the Advanced UI or Suite/Advanced UI installation displays a message box that asks the end user whether to restart. If the end user chooses to allow the restart, the Advanced UI or Suite/Advanced UI installation resumes after the restart. If the end user chooses not to allow the restart, the Advanced UI or Suite/Advanced UI installation exits instead of restarting the target system. • **Always prompt, then exit or reboot the machine**—When the package installation is complete, the Advanced UI or Suite/Advanced UI installation displays a message box that asks the end user whether to proceed with the restart, even if the Advanced UI or Suite/Advanced UI installation has not detected the need for a restart. If the end user chooses to allow the restart, the Advanced UI or Suite/Advanced UI installation resumes after the restart. If the end user chooses not to allow the restart, the Advanced UI or Suite/Advanced UI installation exits instead of restarting the target system. • **Always reboot the machine**—The Advanced UI or Suite/Advanced UI installation restarts the target system regardless of whether the Advanced UI or Suite/Advanced UI installation detects the need for a restart. The Advanced UI or Suite/Advanced UI installation resumes after the restart. For details on determining the best option to select, see Specifying the Behavior for an Advanced UI or Suite/Advanced UI Package that Requires a Restart.

Table 12-33 • Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Reboot Codes	.exe	This setting is a subsetting under the Install, Remove, Repair, and Modify settings. If the selected package requires that the target system be restarted after the product is installed, type the return code in this setting. If multiple return codes exist, list each one separated by a comma. If you do not know the return codes for the file that you are launching as the Advanced UI or Suite/Advanced UI package, contact the author of the package. For more information on Advanced UI or Suite/Advanced UI packages that require a restart, see Restarting a Target System for an Advanced UI or Suite/Advanced UI Package.
Force Application Shutdown	.appx	If the selected sideloading app package (or any package that depends on this package) is in use at installation run time, the processes that are associated with the package are forced to shut down so that registration can proceed.

Events Settings

Project • *The Events area is available in Suite/Advanced UI projects.*

Use a package's Events settings to schedule run-time actions that you want the Suite/Advanced UI installation to launch when installing, removing, repairing, or modifying the package. For more information, see Using Actions to Extend the Behavior of a Suite/Advanced UI Installation.

Table 12-34 • Events Settings on the Common Tab

Setting	Type of Package File	Description
Package Configuring	.appx, .exe, .msi, .msp, InstallScript	This setting lets you specify one or more run-time actions that the Suite/Advanced UI installation should launch before installing, removing, repairing, or modifying the package. The actions must already be added under the Actions explorer in the Events view. To specify an action, click the Add Events button in this setting, and then click the action. InstallShield adds a new Action setting under the Package Configuring setting, and sets its value to the name of the action that you selected. Use the buttons in the Action setting to specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the action should be launched.
Package Configured	.appx, .exe, .msi, .msp, InstallScript	This setting lets you specify one or more run-time actions that the Suite/Advanced UI installation should launch after installing, removing, repairing, or modifying the package. The actions must already be added under the Actions explorer in the Events view. To specify an action, click the Add Events button in this setting, and then click the action. InstallShield adds a new Action setting under the Package Configuring setting, and sets its value to the name of the action that you selected. Use the buttons in the Action setting to specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the action should be launched.

Table 12-34 • Events Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Action	.appx, .exe, .msi, .msp, InstallScript	This read-only setting shows the name of an action that is associated with the selected package and defined in the Events view. To define a condition that determines whether this action is run for this package, configure the subsettings under the Action setting as needed. If you associate more than one action with the package, list the actions from top to bottom in chronological order, according to when they are launched at run time. To change the order of the actions, point to the Move Condition button in the setting of an action that you want to move, and the click the appropriate direction (Move Up or Move Down).
Condition	.appx, .exe, .msi, .msp, InstallScript	This setting lets you specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the installation should run an action for the selected package. To add one or more new action conditions, click the New Condition button in this setting. InstallShield adds a new row under the Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement. For more information, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects. If one or more conditional statements are configured, the Condition setting says **(Condition)**. If none are configured, the Condition setting says **(Empty)**.

Table 12-34 • Events Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Display Text	.appx, .exe, .msi, .msp, InstallScript	Enter text that describes the selected action. For example, if the action is running a script that configures the target system, you could enter the following string: `Configuring the system` If the installation launches the action when the InstallationProgress wizard page is displayed, the text that you enter is displayed on the wizard page. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Features Tab

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Project-specific differences are noted where appropriate.

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The Features tab in the Packages view displays the feature tree for the Advanced UI or Suite/Advanced UI project. Use this tab to select the check box of each feature that you want to contain the selected package. Clear the check box of each feature that should not contain the selected package.

Dynamic Link Settings

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Project-specific differences are noted where appropriate.

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The Dynamic Link pane in the Packages view shows settings for the dynamic link that has been created for a package in the project. The Source and Filter settings are available for all dynamic links. The other settings may be available as subsettings under the Filter setting.

Table 12-35 • Dynamic Link Settings

Setting	Description
Source	This setting shows the path to the source folder that contains the package that you want to include in your Advanced UI or Suite/Advanced UI project. It also is the source of dynamically included files for the package. Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.
Filter	This setting lets you specify one or more filters that you want to configure for including and excluding files and folders from the project. To add a filter, click the **New filter** button in this setting. InstallShield adds a new row that you can use to define the filter. To remove a filter, click the subsetting of the filter that you want to remove, and in that subsetting, click the **Delete this filter** button. To learn more, see Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project.
Include File	Specify the name of the dynamic file that you want to include in your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a **ReadMe.txt** file in a subfolder called **MyDirectory**, where **MyDirectory** is a subfolder of the folder that contains the package, you could use the following filter: `.\MyDirectory\ReadMe.txt` For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project.

Table 12-35 • Dynamic Link Settings (cont.)

Setting	Description
Exclude File	Specify the name of the dynamic file that you want to exclude from your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a **ReadMe.txt** file in a subfolder called **MyDirectory**, where **MyDirectory** is a subfolder of the folder that contains the package, you could use the following filter: `.\MyDirectory\ReadMe.tx`t For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project.
Include Folder	Specify the name of the dynamic folder whose files you want to include in your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a **MyLibrary**, where **MyLibrary** is a subfolder of the folder that contains the package, you could use the following filter: `.\MyLibrary` For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project.
Exclude Folder	Specify the name of the dynamic folder whose files you want to exclude in your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a **MyLibrary** folder, where **MyLibrary** is a subfolder of the folder that contains the package, you could use the following filter: `.\MyLibrary` For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project.

DIM References View

Project • *The DIM References view is available in Basic MSI projects.*

Use the DIM References view to add and manage references to DIM projects in your Basic MSI project. This view also enables you to view any pertinent instructions that the DIM author noted, associate the DIM references with features in the Basic MSI project, override the default destination of the files in the DIM, schedule custom actions, and more.

The DIM support in InstallShield is targeted toward engineering teams who want to foster collaboration, enable distributed installation development, and maximize efficiency in their organizations. A DIM is a feature-sized collection of related items such as product files, shortcuts, registry entries, text file changes, IIS Web sites, and other elements that together make up a discrete, logically separated portion of a product installation. Once you have created a DIM, you can include references to it in one or more Basic MSI installation projects.

When you select a DIM reference in the DIM References view, several tabs are available:

- General tab
- Instructions tab
- Build Options tab
- Features tab
- Sequences tab

General Tab

Project • *The DIM References view is available in Basic MSI projects.*

The General tab in the DIM References view displays the following read-only settings for the selected DIM reference. Note that the values in these settings are not displayed or used at run time. You can use these settings as a reference for internally identifying a project.

Table 12-36 • Settings on the General Tab in the DIM References View

Setting	Description
File	This setting indicates the name of the selected DIM project file (.dim).
Name	This setting indicates the name of the feature or unit that this DIM represents. This setting is configured in the Subject setting in the General Information view of the DIM project.
DIM GUID	This setting displays the GUID that uniquely identifies the DIM. Whenever you create a new DIM, InstallShield generates a new GUID for it.
Package Code	This setting identifies the package code, which is the GUID for your DIM.
Version	This setting identifies the version number of the DIM.

Table 12-36 • Settings on the General Tab in the DIM References View (cont.)

Setting	Description
Description	This setting indicates a description of the DIM. This setting is configured in the Title setting in the General Information view of the DIM project.
Author	This setting is the name of the author of this DIM.
Link to	This setting indicates the location of the selected DIM project file (.dim).

Instructions Tab

Project • *The DIM References view is available in Basic MSI projects.*

The Instructions tab in the DIM References view displays the guidance, tips, or other comments that the author of the DIM project entered in the Build Instructions setting of the General Information view. These instructions may contain critical information that is necessary to properly configure any Basic MSI project that contains a references to this DIM.

Build Options Tab

Project • *The DIM References view is available in Basic MSI projects.*

The Build Options tab in the DIM References view displays the following read-only settings for the selected DIM reference:

Table 12-37 • Settings on the Build Options Tab in the DIM References View

Setting	Description
Destination	Select the folder on the target system into which the DIM's files should be installed, or click the ellipsis button (...) to select or create a directory. This setting lets you override the destination that was set in the DIM project. The default value of this setting is the value that was set in the DIM project. To install the files to the product's default destination folder, select **[INSTALLDIR]**. If you want the destination to be configurable at run time, the destination folder that you specify must be a public property (containing all uppercase letters). You can also set the destination folder of a component's feature. For information on the effects of setting the destination for a feature as well as its components, see Component Destination vs. Feature Destination.

Table 12-37 • Settings on the Build Options Tab in the DIM References View (cont.)

Setting	Description
Conflict Resolution	Indicate how you want to resolve conflicts between values of settings in the Basic MSI project with those in the selected DIM project. Available options are: • **Use Base Project Value**—If InstallShield encounters a conflict when merging the DIM data into the Basic MSI installation at build time, InstallShield uses the value that is in the Basic MSI project instead of the value that is in the DIM project. • **Use DIM Project Value**—If InstallShield encounters a conflict when merging the DIM data into the Basic MSI installation at build time, InstallShield uses the value that is in the DIM project instead of the value that is in the Basic MSI project. For more information, see Resolving Build-Time Conflicts Between a Basic MSI Project and a DIM Reference.

Features Tab

Project • *The DIM References view is available in Basic MSI projects.*

The Features tab in the DIM References view displays the feature tree for the Basic MSI project. Use this tab to select the check box of each feature that you want to contain the selected DIM. Clear the check box of each feature that should not contain the selected DIM.

Sequences Tab

Project • *The DIM References view is available in Basic MSI projects.*

Sequences direct all of the actions that are performed during the installation process—from file transfer to user interface display. These actions are given a number in the sequence, which then executes from the lowest number to the highest. Use the Sequences tab in the DIM References view to insert DIM actions and dialogs into a sequence, or edit the sequence timeline. To learn more, see Scheduling Custom Actions and Dialogs from a DIM Reference.

Application Data View

Project • *The Application Data view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Application data includes all of the files that you add to your project.

Files and Folders

Project • *The Files and Folders view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Files and Folders view lets you add files to your project. This view behaves similarly to Windows Explorer, enabling you to drag and drop files into your project. For installation projects, you can select which feature and component you would like your files associated with and the destination directory for those files.

Redistributables

Project • *The Redistributables view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

The Redistributables view enables you to add InstallShield objects and merge modules to Windows Installer–based projects. Including redistributables to your project lets you add distinct pieces of functionality to your installation. Examples of these types of functionality include Visual Basic run-time .dll files and the Microsoft C run-time libraries.

You can also use the Redistributables view to add InstallShield prerequisites to Basic MSI and InstallScript MSI projects. An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

Including InstallShield prerequisites in your project enables you to chain multiple installations together, bypassing the Windows Installer limitation that permits only one Execute sequence to be run at a time. The `Setup.exe` setup launcher serves as a bootstrap application that manages the chaining.

Prerequisites

Project • *The Prerequisites view is available in InstallScript projects.*

The Prerequisites view enables you to add InstallShield prerequisites to InstallScript projects.

Objects

Project • *The Objects view is available in the following project types:*

- *InstallScript*
- *InstallScript Object*

The Objects view enables you to add objects and merge modules to InstallScript and InstallScript Object projects.

Files and Folders View

Project • *The Files and Folders view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The main purpose of most installations is to transfer files from the source medium to the target destination. With InstallShield, adding files to your project is a simple drag-and-drop process.

Note • *The Files and Folders view from within Microsoft Visual Studio differs from the Files and Folders view in InstallShield. For more information, refer to Adding References to Visual Studio Solutions.*

Adding Files

You can add files to your project in one of three different ways. Each of these methods is described below:

Dragging and Dropping Files

You can add files to your project using the Files explorer in the Files and Folders view. The top two panes in this view are functionally equivalent to Windows Explorer. The bottom two panes represent the destination for your files.

You can drag source files from the top pane to the destination folder in the bottom pane. InstallShield also provides a context menu with additional drag and drop options that allow you to drag folder only and to preserve the source structure.

Dynamic File Linking

The second way to add files to your project is by linking to the contents of an entire folder, or to specific files in the folder. This method allows you to point to a specific folder, either locally or on a network, that contains files for your installation. Every time you build your installation, the contents of the folder are added to your feature.

Additionally, you can use wildcards to filter which files are added to your project. For more information, see Creating a Dynamic Link.

Note • *To improve performance, the list displayed in the Files and Folders view truncates when there are more than a predefined number of files in a dynamically linked file with subfolders. **List Truncated** appears as the first item in the file list when this occurs. All files contained in the subfolders are built into your setup project.*

Dependency Scanning

The final way to add files to your project is accomplished through the Dependency Scanners view. This view contains three wizards that can scan your project, a running application, or a Visual Basic project for possible dependency files and add them to your project. All three of these wizards can also be launched from the Project menu.

Working with Key Files

A key file is a file that the Windows Installer uses to detect the component's presence. Each component can have a key file. The key file is differentiated from non-key files by the key icon. You can set a key file in either the Components view or Setup Design view. To navigate to one of these views, right-click a component in the Destination pane of the Files and Folders view and click **Go to Advanced Components** view.

Extracting and Refreshing COM Data for Key Files

The **Files and Folders** view also offers the option to extract and refresh COM data for key files. These options are available from the context menu when you select a file.

Note • *The **Extract COM Data for Key File** and **Refresh COM Data for Key File** options are enabled only if the file is a self-registering .dll, .ocx, or .exe file, and if the file is the component's key file.*

Creating Folders on the Target System

Task: ***To create a new folder:***

1. Right-click a folder in the **Destination computer's folders** pane and click **New Folder**.
2. Type a name for the folder.

Note • *To change the folder's location in the Destination computer's folders tree structure, drag and drop the folder to a different location.*

Following Setup Best Practices

When you add files to your setup in this view, components are created according to Setup Best Practices. For example, all portable executable files (.exe, .dll, .ocx files) are given their own component. All other files are added to the default component for each destination directory. However, if you drag files directly to one of the components listed under a destination folder, the Setup Best Practices rules are ignored.

Automatically Creating New Components When You Add Files

New components can be created for you to properly handle the files as you add them to your setup project. To accommodate this, select the feature (or, in InstallScript projects, the component) with which you want to associate any newly created components. To set the feature, select it from the list box at the top of the Files and Folders view.

Note • *This list box is only for selecting the feature (or component) with which new components will be associated. It is not used to associate files directly with a specific feature.*

If no features exist, you have the option of creating one when you first add files in this view.

Changing the Component/Feature Relationship

You can change the component/feature relationship by right-clicking a component and then clicking **Properties**. Then, use the **Features** tab to make the necessary changes.

Note • *To display components in the Files and Folders view, right-click a destination folder (in the lower-left pane of the view) and click Show Components.*

Redistributables View

Project • *The Redistributables view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

Note that you can use the Prerequisites view and the Objects view to add redistributables to InstallScript projects.

The Redistributables view contains all of the InstallShield objects and third-party merge modules that are included with InstallShield. In Basic MSI and InstallScript MSI projects, this view also contains InstallShield prerequisites that you can add to your project.

InstallShield Prerequisites (Basic MSI and InstallScript MSI Projects)

An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

Including InstallShield prerequisites in your project enables you to chain multiple installations together, bypassing the Windows Installer limitation that permits only one Execute sequence to be run at a time. The `Setup.exe` setup launcher serves as a bootstrap application that manages the chaining.

InstallShield includes a base set of InstallShield prerequisites. You can also use the InstallShield Prerequisite Editor in InstallShield to define custom InstallShield prerequisites or to edit settings for any existing InstallShield prerequisites.

InstallShield includes support for two types of InstallShield prerequisites:

- **Setup prerequisite**—The installation for this type of prerequisite runs before your installation runs.
- **Feature prerequisite**—This type of prerequisite is associated with one or more features. It is installed if the feature that contains the prerequisite is installed and if the prerequisite is not already installed on the system. Thus, if a feature has a condition that is not met on the target system, or if the end user chooses not to install the feature, the feature is not installed. As a result, none of its associated feature prerequisites are installed, unless the feature prerequisites are also associated with other features that are installed.

Project • *Basic MSI projects include support for feature prerequisites.*

Merge Modules

A merge module (or .msm file) contains all of the logic and files needed to install distinct pieces of functionality. For example, many applications require Microsoft Visual Basic run-time .dll files. Instead of having to include the file in a component and figure out its installation requirements, you can simply attach the Visual Basic Virtual Machine merge module to one of your project's features.

Note • *Many of the merge modules included in the Redistributables view are authored by Microsoft or another third party. InstallShield distributes these modules as a courtesy to assist you in creating your installation project. However, InstallShield cannot modify or fix any problems that may exist within third party-authored modules. You are encouraged to contact the vendor regarding issues with specific third party-authored modules.*

InstallShield Objects

Like merge modules, objects contain logic and files needed to install distinct pieces of functionality. Some objects, such as the DirectX object included with InstallShield, require customization through a wizard. As soon as you add such an object to your installation, its customization wizard opens. You can either customize your object at the time you add it, or cancel the wizard and customize your object later by right-clicking the object and then clicking Change Objects Settings.

Live Redistributables Gallery

Because the file size of many of the redistributables is so large, some that are available for use in your projects are not added to your computer when you install InstallShield. However, these redistributables are still available for download from the Internet to your computer. In addition, a newer version of a redistributable that you have on your computer may be available for download.

Configurable Merge Modules

A configurable redistributable is a merge module or an object that has at least one row in the **ModuleConfiguration** table that is referenced by at least one row in the **ModuleSubstitution** table. This enables you to change a value in the redistributable. When you select a configurable module in the Redistributables view, the Merge Module Configurable Values dialog box is displayed to enable you to configure the module at the time you add it. To customize the merge module later, right-click it and click select **Configure merge module**.

Working with the Redistributables View

The Redistributables view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A list of redistributables
- A details pane, which shows information about the selected redistributables

The following table describes all of the buttons and other controls that are displayed in the Redistributables view.

Table 12-38 • Controls in the Redistributables View

Name of Control	Icon	Description
Expand All Groups		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.

Table 12-38 • Controls in the Redistributables View (cont.)

Name of Control	Icon	Description
Collapse All Groups		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Show Details		Shows or hides the right pane in this view, which shows details about the InstallShield prerequisite, merge module, or object that is selected in the list of available redistributables. This details pane provides information such as which files a redistributable installs.
Show Group Box		Shows or hides the group box area below the row of buttons in this view.
Refresh		Refreshes the list of redistributables.
Search Grid		Dynamically filters the redistributables that are displayed in the Redistributables view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
Redistributables View Help		Displays the help for the Redistributables view.
Drag a column header here to group that column		Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box. To learn more, see Working with the Group Box Area in Various Views.

The following table describes each of the columns in the Redistributables view.

Table 12-39 • Columns in the Redistributables View

Column	Description
Check Box	This column shows a check box for each redistributable. To add a redistributable to your project, select its check box.
Type/Status	This column shows an icon that represents the type of redistributable, as well as its status. For details about each icon, see Managing the Redistributables Gallery.

Table 12-39 • Columns in the Redistributables View (cont.)

Column	Description
Name	This column shows the name of each redistributable.
Version	This column shows the version number of the redistributable.
Type	This column lists the type of redistributable.
Location	This column indicates whether the redistributable is installed locally on your machine or it needs to be downloaded. For more information, see Downloading Redistributables to Your Computer.

Prerequisites View

Project • *The Prerequisites view is available in InstallScript projects.*

Note that you can use the Redistributables view to add InstallShield prerequisites to Basic MSI and InstallScript MSI projects.

The Prerequisites view contains all of the InstallShield prerequisites that are included with InstallShield. An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

InstallShield includes a base set of InstallShield prerequisites. You can also use the InstallShield Prerequisite Editor in InstallShield to define custom InstallShield prerequisites or to edit settings for any existing InstallShield prerequisites.

InstallShield includes support for two types of InstallShield prerequisites:

- **Setup prerequisite**—The installation for this type of prerequisite runs before your installation runs.
- **Feature prerequisite**—This type of prerequisite is associated with one or more features. It is installed if the feature that contains the prerequisite is installed and if the prerequisite is not already installed on the system. Thus, if a feature has a condition that is not met on the target system, or if the end user chooses not to install the feature, the feature is not installed. As a result, none of its associated feature prerequisites are installed, unless the feature prerequisites are also associated with other features that are installed.

Project • *Basic MSI projects include support for feature prerequisites.*

Live Redistributables Gallery

Because the file size of many of the redistributables is so large, some that are available for use in your projects are not added to your computer when you install InstallShield. However, these redistributables are still available for download from the Internet to your computer. In addition, a newer version of a redistributable that you have on your computer may be available for download.

Working with the Prerequisites View

The Prerequisites view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A list of redistributables
- A details pane, which shows information about the selected redistributables

The following table describes all of the buttons and other controls that are displayed in the Prerequisites view.

Table 12-40 • Controls in the Prerequisites View

Name of Control	Icon	Description
Expand All Groups		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Collapse All Groups		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Show Details		Shows or hides the right pane in this view, which shows details about the InstallShield prerequisite that is selected in the list of available redistributables. This details pane provides information such as which files a redistributable installs.
Show Group Box		Shows or hides the group box area below the row of buttons in this view.
Refresh		Refreshes the list of redistributables.
Search Grid		Dynamically filters the redistributables that are displayed in the Prerequisites view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
Prerequisites View Help		Displays the help for the Prerequisites view.

Table 12-40 • Controls in the Prerequisites View (cont.)

Name of Control	Icon	Description
Drag a column header here to group that column		Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box. To learn more, see Working with the Group Box Area in Various Views.

The following table describes each of the columns in the Prerequisites view.

Table 12-41 • Columns in the Prerequisites View

Column	Description
Check Box	This column shows a check box for each redistributable. To add a redistributable to your project, select its check box.
Type/Status	This column shows an icon that represents the type of redistributable, as well as its status. For details about each icon, see Managing the Redistributables Gallery.
Name	This column shows the name of each redistributable.
Version	This column shows the version number of the redistributable.
Location	This column indicates whether the redistributable is installed locally on your machine or it needs to be downloaded. For more information, see Downloading Redistributables to Your Computer.

Objects View

Project • *The Objects view is available in the following project types:*

- *InstallScript*
- *InstallScript Object*

Note that you can use the Redistributables view to add merge modules to Basic MSI and InstallScript MSI projects.

The Objects view lets you add InstallScript objects and third-party merge modules to your projects.

Merge Modules

A merge module (or .msm file) contains all of the logic and files needed to install distinct pieces of functionality. For example, many applications require Microsoft Visual Basic run-time .dll files. Instead of having to include the file in a component and figure out its installation requirements, you can simply attach the Visual Basic Virtual Machine merge module to one of your project's features.

Note • *Many of the merge modules included in the Objects view are authored by Microsoft or another third party. InstallShield distributes these modules as a courtesy to assist you in creating your installation project. However, InstallShield cannot modify or fix any problems that may exist within third party-authored modules. You are encouraged to contact the vendor regarding issues with specific third party-authored modules.*

InstallScript Objects

InstallShield enables you to create your own InstallScript objects that can be used in any of your installation projects or distributed for use by other installation developers.

Live Redistributables Gallery

Because the file size of many of the redistributables is so large, some that are available for use in your projects are not added to your computer when you install InstallShield. However, these redistributables are still available for download from the Internet to your computer. In addition, a newer version of a redistributable that you have on your computer may be available for download.

System Configuration View

Project • *The System Configuration view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Every installation changes the target system in some way. The simplest installations might only copy files. More in-depth installations make registry changes, edit .ini files, or create shortcuts. InstallShield provides the following views for making advanced configurations.

Shortcuts

Project • *The Shortcuts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Shortcuts offer quick access to your installed application. You can create shortcuts and program folders on the desktop, the Start menu, and various other locations.

Registry

Project • *The Registry view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*
- *QuickPatch*

In the Registry view, you can create registry entries or import existing registry data into your setup.

ODBC Resources

Project • *The ODBC Resources view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*

- *MSM Database*
- *Transform*

In the ODBC Resources view, you can add drivers, translators, and data sources to one or more of your application's features. Select from installed ODBC resources or add new ones to the list, associate them with features, and then customize their attributes.

INI File Changes

Project • *The INI File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The InstallScript language includes several initialization file functions for manipulating .ini files.

Although editing system .ini files is not recommended, you can edit these files in the INI File Changes view. This view enables you to create sections and keywords, or edit an .ini file on the target system.

Environment Variables

Project • *The Environment Variables view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The InstallScript language includes the GetEnvVar function for retrieving the current value of an environment variable, and it enables you to create an environment variable.

If you need to create, modify, or remove environment variables from the target system, you can define their settings in the Environment Variables view.

XML File Changes

Project *• The XML File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

Sometimes you need to modify XML files that store settings related to your product as well as standard configuration files like `web.config` and `machine.config`. You can use the XML File Changes view in InstallShield to specify any XML file changes that should be made on the target system.

Text File Changes

Project *• The Text File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The InstallScript language includes string functions for finding and modifying string variables and literals.

The Text File Changes view is where you configure search-and-replace behavior for content in text files—for example, .txt, .htm, .xml, .config, .ini, and .sql files—that you want to change at run time on the target system. The text files can be part of your installation, or they can be files that are already present on target systems.

Tip *• The Text File Changes view enables you to modify XML files without using MSXML (which is a run-time requirement if you use the XML File Changes view to modify XML files).*

Scheduled Tasks

Project *• The Scheduled Tasks view is available in the following project types:*

- *Basic MSI*
- *DIM*

- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The Scheduled Tasks view is where you create and configure automated tasks that you want to be created through the Windows task scheduler at run time on target systems. The files that you want to be launched by the scheduled tasks can be part of your installation, or they can be files that are already present on target systems.

Services

Project • *The Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The Services view is where you specify whether to install, configure, start, stop, and uninstall Windows services during installation and uninstallation.

As an alternative, you can use the Services area under the Advanced Settings node of the Components view and the Setup Design view to install, configure, start, stop, and uninstall Windows services. If you configure service information in either of these areas, the other area is automatically updated accordingly.

Shortcuts View

Project • *The Shortcuts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Shortcuts view provides a simple, visual way to create shortcuts to your application on the target system. This view contains a Shortcuts explorer that shows a set of predefined destination folders under which you can create shortcuts and subfolders. InstallShield offers the following standard shortcut destinations.

Table 12-42 • Standard Shortcut Destinations

Shortcut Destination	Project Type	Description
Programs Menu and Startup	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	The Programs Menu and Startup folders are located on the Start menu. The Programs Menu folder is the industry-standard place for installing product shortcuts. The Startup folder should contain shortcuts to only those items that need to be launched whenever Windows starts.
Send To	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	The Send To folder is available when an end user right-clicks a file; the context menu that is displayed contains a command called Send To. If you create a shortcut for your program in this folder, an end user can click any file and send it to your product. For example, you might want your end users to be able to open an HTML page in Notepad. If you created a shortcut to Notepad in the Send To folder in the Shortcuts view, end users could right-click an HTML file and click Notepad from your Send To menu. The source file for that page opens in Notepad.
Desktop	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	The Desktop folder contains shortcuts for the end user's desktop. When you create a shortcut in the Desktop folder, your product's icon is displayed on the end user's desktop.  ***Note*** • *The desktop is the most visible place to put a shortcut, but too many shortcut icons can clutter the end user's desktop.*

When you add a new shortcut, InstallShield adds it as a new node to the Shortcuts explorer in this view. The new shortcut node is displayed with the same icon that is selected in the Icon File setting for the shortcut—which is the icon that is used when the shortcut is added to target systems at run time—unless either of the following conditions is true:

- The project type is InstallScript.
- The shortcut is for a preexisting file on the target system.

For both of the aforementioned conditions, the icon file is not known until run time. Therefore, InstallShield shows the following icon for each shortcut in the Shortcuts explorer, instead of displaying the icon that is used at run time on target systems.

InstallShield also uses this icon for a shortcut in the Shortcuts explorer if the icon file does not contain an icon.

Note • *You cannot create shortcuts to a dynamically linked file. For more information, see Limitations of Dynamic File Linking.*

For details about each of the settings that you can configure for shortcuts and folders, see:

- Shortcut Settings
- Folder Settings

Shortcut Settings

Project • *The Shortcuts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The settings for a shortcut are organized into the following main categories in the Shortcuts view:

- Appearance
- Behavior
- General

Appearance

Use a shortcut's Appearance settings to specify details such as the display name and the icon for the shortcut.

Table 12-43 • Appearance Settings

Setting	Project Type	Description
Display Name	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter the name of the shortcut as it should appear on the target system. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** • *For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—You must enter a value for this setting; otherwise, a build error occurs.* *The display name is of the Windows Installer Filename data type. If the display name that you enter is not already in the 8.3 format, InstallShield uses the ShortName|LongName format for this setting. For example, if you enter* ***My Product Name*** *as the value in this setting, InstallShield sets the value to* ***MyProd~1|My Product Name****, or something similar, so that a short name is available at run time if needed.*

Table 12-43 • Appearance Settings (cont.)

Setting	Project Type	Description
Display Resource	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	If you are preparing an installation for a multilingual application and you are separating language-neutral portable executable files from .mui files for the display name of your shortcut, use the following settings: • **Display Resource**—Click the ellipsis button (...) in this setting if you want to browse to the DLL file that contains the multilingual user interface (MUI) manifest. InstallShield lists the path and file name in this setting if you do either of the following: you select a DLL file by browsing for it, or you manually enter a path and file name in the Display Resource DLL setting. InstallShield also lists the resource index that is specified in the Display Resource Index setting. If this setting contains a value, the value for the Display Name setting is ignored. If you leave this setting blank, Windows Installer uses the value for the Display Name setting. • **Display Resource DLL**—If you want to manually specify the path and file name of the DLL file that contains the MUI manifest, enter it. You can include Windows Installer directory properties—for example, **[INSTALLDIR]MyResource.dll**—instead of hard-coded directory paths. If you click the ellipsis button in the Display Resource setting to browse to the DLL file, InstallShield uses the format [#filekey] in the Display Resource DLL setting to identify the DLL file. • **Display Resource Index**—Specify the display name index for the shortcut. This must be a non-negative number.  ***Note*** • *If you specify a DLL, you must also enter a value for the Display Resource Index setting.* These settings enable you to separate language-neutral portable executable files from .mui files, which contain all of the language-dependent resources, and later add resources for additional languages without having to recompile or relink the application. Windows Vista and later and Windows Server 2008 and later include support for the display resource. Earlier systems ignore it.

Table 12-43 • Appearance Settings (cont.)

Setting	Project Type	Description
Description	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a description of the shortcut. The text that you enter is displayed as a tooltip when the end user places the mouse pointer over the shortcut. It is also displayed in the Description field of the shortcut's Properties dialog box. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-43 • Appearance Settings (cont.)

Setting	Project Type	Description
Description Resource	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	If you are preparing an installation for a multilingual application and you are separating language-neutral portable executable files from .mui files for the description of your shortcut, use the following settings: • **Description Resource**—Click the ellipsis button (...) in this setting if you want to browse to the DLL file that contains the multilingual user interface (MUI) manifest. InstallShield lists the path and file name in this setting if you do either of the following: you select a DLL file by browsing for it, or you manually enter a path and file name in the Description Resource DLL setting. InstallShield also lists the resource index that is specified in the Description Resource Index setting. If this setting contains a value, the value for the Description setting is ignored. If you leave this setting blank, Windows Installer uses the value for the Description setting. • **Description Resource DLL**—If you want to manually specify the path and file name of the DLL file that contains the MUI manifest, enter it. You can include Windows Installer directory properties—for example, **[INSTALLDIR]MyResource.dll**—instead of hard-coded directory paths. If you click the ellipsis button in the Description Resource setting to browse to the DLL file, InstallShield uses the format [#filekey] in the Description Resource DLL setting to identify the DLL file. • **Description Resource Index**—Specify the description index for the shortcut. This must be a non-negative number.  ***Note*** • *If you specify a DLL, you must also enter a value for the Description Resource Index setting.* These settings enable you to separate language-neutral portable executable files from .mui files, which contain all of the language-dependent resources, and later add resources for additional languages without having to recompile or relink the application. Windows Vista and later and Windows Server 2008 and later include support for the description resource. Earlier systems ignore it.

Table 12-43 • Appearance Settings (cont.)

Setting	Project Type	Description
Icon	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	To specify the icon that you want to be displayed for the shortcut, use the following settings: • **Icon**—Specify the file that contains the icon for the shortcut that you are creating. You must specify an .ico file or the executable file (.dll or .exe) that contains the icon resource. InstallShield lists the icon path and index in the Icon setting if you do either of the following: you select a file by browsing for it, or you manually enter a path and file name in the Icon File setting. The method that you use to specify the file depends on the type of project that you are using.  ***Project*** • *For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—Click the ellipsis button (...) in this setting if you want to browse to the .ico file or the .exe or .dll file that contains the icon resource.* *For InstallScript projects—Click the ellipsis button (...) in this setting if you want to browse to the location on the target system of the .ico file or the .exe or .dll file that contains the icon resource.* • **Icon File**—If you want to manually specify the path and name of the file that contains the icon, enter it. • **Icon Index**—If the icon file that you specify contains more than one icon resource, enter the index in this setting. A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon. Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.  ***Project*** • *For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—Note that because Windows Installer requires a separate icon file when the component is to be advertised, InstallShield extracts the first icon from the .exe or .dll file unless an icon index is specified. If you do not specify an icon file, the key file of this component is automatically used for the shortcut's icon.*

Behavior

Use a shortcut's Behavior settings to specify details such as the target and keyboard shortcut.

Table 12-44 • Behavior Settings

Setting	Project Type	Description
Advertised	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify whether you want to create an advertised shortcut. If you select Yes and the end user advertises the product or the feature that contains the shortcut, the shortcut is created but the component's files are not installed until the end user launches the shortcut. The first time that the shortcut is launched, the Windows Installer installs the component's files and other data, and then the shortcut launches the target file. Every time that the shortcut is used from then on, it behaves like a normal shortcut.  ***Note*** • *To create an advertised shortcut, the shortcut's component must have a key file. The key file is the shortcut's target.*
Target	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter the path to the file on the target system that should be launched when end users launch the shortcut. As an alternative to manually entering a value, you can click the ellipsis button (...) to browse to the shortcut target.  ***Project*** • *For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—Use Windows Installer directory properties—for example,* ***[INSTALLDIR]File.exe****—instead of hard-coded directory paths. If the shortcut is an advertised shortcut, this setting is read-only. The key file of the shortcut's component is automatically set as the shortcut's target. If the shortcut's component does not have a key file, the shortcut will not function properly on the target system.* *For InstallScript projects—Use system variables—for example,* ***<TARGETDIR>\File.exe****—instead of hard-coded directory paths.*

Table 12-44 • Behavior Settings (cont.)

Setting	Project Type	Description
Arguments	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter the command-line arguments for the shortcut. The arguments are added to the Target value on the shortcut's Properties dialog box on the target system. These arguments work in the same way as any other command-line arguments. For example, you can link a file to an executable file or cause an executable file to run silently by passing command-line arguments.  ***Note*** • *Verify that the syntax is correct because InstallShield does not do this.*  ***Tip*** • *Use* `%1` *in the argument for the selected file name. For example, if the end user right-clicks the file* `C:\File.ext` *and* `-p %1` *is the argument for this shortcut, the command-line argument becomes* `-p C:\File.ext`*. In some cases, it is necessary to enclose the %1 argument in quotation marks—as in* `"%1"`*—to correctly handle file names that contain spaces.*
Working Directory	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter the working directory for the shortcut target, or click the ellipsis button (...) to select or create a directory. The directory that you specify is displayed as the **Start in** field on the shortcut's Properties dialog box on the target system. The working directory is the default directory that is displayed in standard file-opening and file-saving dialog boxes, as well as the current directory used by the product.  ***Project*** • *For example, in Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects, if you want your working directory to be set to a subdirectory of* ***INSTALLDIR*** *called* ***Files****, select* ***[INSTALLDIR]*** *from the list and add the subdirectory name* `Files` *to the end of it. When you are finished, it should read* ***[INSTALLDIR]Files****.* *In an InstallScript project, if you want your working directory to be set to a subdirectory of TARGETDIR called* ***Files****, select* ***<TARGETDIR>*** *from the list and add the text* `\Files` *to the end of it. When you are finished, it should read* ***<TARGETDIR>\Files****.*

Table 12-44 • Behavior Settings (cont.)

Setting	Project Type	Description
Hot Key	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting contains the decimal value of the keyboard shortcut that is assigned to your shortcut. You can assign a keyboard shortcut to your product's shortcut so that end users can press the appropriate hot keys to launch the shortcut. If you want InstallShield to calculate the decimal value of the keyboard shortcut, click the ellipsis button (...) in this setting. For more information, see Specifying a Keyboard Shortcut for Accessing a Shortcut.  ***Caution*** • *It is recommended that you avoid configuring keyboard shortcuts for your shortcuts because they may conflict with existing keyboard shortcuts on the target system.*
Run	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Select the style of window that the target file should use when end users launch the shortcut. Available options are: • **Normal Window**—The file is launched in a standard-sized window. • **Maximized Window**—The file is launched in full-screen view. • **Minimized Window**—The file is launched in a minimized window, visible only on the taskbar.
Pin to Windows 8 Start Screen	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Specify whether you want the shortcut to be pinned by default to the Start screen on Windows 8 target systems. Available options are: • **Yes**—When the shortcut is installed on Windows 8 systems, it is pinned to the Start screen. End users can optionally unpin the shortcut. This is the default option. • **No**—When the shortcut is installed on Windows 8 systems, it is not pinned to the Start screen. It is available in the Apps list that contains shortcuts to all of the applications on the system. For more information, see Specifying Whether a Shortcut Should Be Pinned to the Windows 8 Start Screen.

Table 12-44 • Behavior Settings (cont.)

Setting	Project Type	Description
Prevent Pinning	InstallScript	Specify whether you want to prevent end users from being able to pin a shortcut to the taskbar and to the Start menu after end users install your product. Available options are: • **Yes**—When the shortcut is installed, the context menu commands for pinning a shortcut to the taskbar and to the Start menu are hidden. • **No**—When the shortcut is installed, the context menu commands for pinning the shortcut to the taskbar and to the Start menu are available, enabling end users to pin the shortcut. This is the default option. Windows 7 introduced support for this setting. Earlier versions of Windows ignore this setting. You may want to disable pinning for shortcuts that are for tools and secondary products that are part of your installation. Note that if you configure the shortcut to prevent this pinning, the target of the shortcut is ineligible for inclusion in the most frequently used list on the Start menu. For more information, see Specifying Whether End Users Should Be Able to Pin a Shortcut to the Taskbar or Start Menu.
Do Not Highlight as New	InstallScript	Specify whether you want to prevent a shortcut on the Start menu from being highlighted as newly installed after end users install your product. Available options are: • **Yes**—If the installation adds the shortcut to the Start menu, the shortcut is not highlighted as newly installed. This has the same effect as clearing the **Highlight newly installed programs** check box in the Customize Start Menu dialog box for an individual item on a target system. • **No**—If the installation adds the shortcut to the Start menu, the shortcut is highlighted as newly installed. This is the default option. Windows 7 introduced support for this setting. Earlier versions of Windows ignore this setting. You may want to select Yes for shortcuts that are for tools and secondary products that are part of your installation. For more information, see Preventing a Shortcut on the Start Menu from Being Highlighted as Newly Installed.

General

Use a shortcut's General settings to specify details such as the component that contains the shortcut.

Table 12-45 • General Settings

Setting	Project Type	Description
Key Name	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a key name for the shortcut. The key name is an internal name; it is not displayed to end users.
Internal Name	InstallScript	Enter an internal name for the shortcut. The internal name is not displayed to end users.
Component	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting indicates the component that contains the shortcut. Click the ellipsis button (...) to display the Browse for a Component dialog box, which lets you create new components or select an existing component for the shortcut. The shortcut is created on the target system if the selected component is installed.  ***Project*** • *In InstallScript projects, you can select more than one component for the shortcut.*
Feature	Basic MSI, InstallScript MSI, MSI Database, Transform	This setting indicates the feature or features with which the shortcut component is associated. If there is no feature-component association, this setting is blank.
Uninstall	InstallScript	Specify whether the shortcut should be removed when the product is uninstalled.
Replace Existing (If Found)	InstallScript	Specify whether the shortcut should overwrite an already existing shortcut with the same display name in the same location on the target system.
Internet Shortcut	InstallScript	Specify whether the shortcut is an Internet shortcut. The default setting is No; if you select Yes, the Target setting for the shortcut should be a valid URL.
VS .NET Project Output	InstallScript	Specify whether the shortcut points to a Visual Studio project output.

Table 12-45 • General Settings (cont.)

Setting	Project Type	Description
Type	InstallScript	Specify how the shortcut should be created. Available options are: • **Automatic**—The installation automatically determines where the shortcut should appear based on the value of the *ALLUSERS* system variable. If *ALLUSERS* is non-zero, the shortcut is created in the All Users profile so that it is available on the target system for all end users. If *ALLUSERS* is FALSE, the shortcut is created in the current user's profile. • **Personal**—The shortcut is created in the current user's profile. • **Common**—The shortcut is created in the All Users profile.
Comments	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter comments for this shortcut. Comments are saved in the project file for your reference and are not displayed to the end user.

Table 12-45 • General Settings (cont.)

Setting	Project Type	Description
Shell Properties	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting lets you specify one or more shortcut properties that need to be set by the Windows Shell at run time. To specify one or more properties, click the Add New Shell Shortcut Property button in this setting, and then click one of the available options: • **Prevent Pinning**—The context menu commands for pinning the shortcut to the taskbar or the Start menu are not displayed for this shortcut after end users install your product. In addition, this option makes the target of the shortcut ineligible for inclusion in the most frequently used list on the Start menu. If you select this option, InstallShield adds a Key Name setting, plus additional rows of subsettings, and configures them as needed. • **Do Not Highlight as New**—The Start menu entry for the shortcut is not highlighted as newly installed after end users install your product. This has the same effect as clearing the **Highlight newly installed programs** check box in the Customize Start Menu dialog box for an individual item on a target system. You may want to set this property for shortcuts that are for tools and secondary products that are part of your installation. If you select this option, InstallShield adds a Key Name setting, plus additional rows of subsettings, and configures them as needed. • **Custom Property**—To specify a custom property and value for shortcut properties that need to be set by the Windows Shell at installation run time, select this option. InstallShield adds a new Key Name setting, plus additional subsettings, that let you configure the appropriate property name and value. Specify additional properties as needed.  ***Note*** • *Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.* For more information, see Setting Shell Properties for a Shortcut.

Table 12-45 • General Settings (cont.)

Setting	Project Type	Description
Key Name	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting is displayed if you have used the Shell Properties setting to add one or more Shell properties to your shortcut. Enter a key name for the Shell shortcut property. The key name is an internal name; it is not displayed to end users. ***Note*** • *Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.* For more information, see Setting Shell Properties for a Shortcut.
Property	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting is displayed if you have used the Shell Properties setting to add one or more Shell properties to your shortcut. Enter the shortcut property that you want the Windows Shell to set at run time. ***Note*** • *Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.* For more information, see Setting Shell Properties for a Shortcut.
Value	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This setting is displayed if you have used the Shell Properties setting to add one or more Shell properties to your shortcut. Enter the value for the Shell shortcut property. ***Note*** • *Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.* For more information, see Setting Shell Properties for a Shortcut.

Folder Settings

Project • *The Shortcuts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

- *MSI Database*
- *MSM Database*
- *Transform*

The following settings are available for a folder in the Shortcuts view.

Table 12-46 • Folder Settings

Setting	Project Type	Description
Key Name	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a key name for the folder. The key name is the internal name that is used for the folder in the Directory column of the **Directory** table; it is not displayed to end users.
Internal Name	InstallScript	Enter an internal name for the folder. The internal name is not displayed to end users.
Display Name	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter the name of the folder as it should appear on the target system. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Project*** *• For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—You must enter a value for this setting; otherwise, a build error occurs.* *The display name is of the Windows Installer DefaultDir data type. If the display name that you enter has more than eight characters, InstallShield uses the ShortName|LongName format for this setting. For example, if you enter* ***My Product Name*** *as the value in this setting, InstallShield sets the value to* ***MyProd~1|My Product Name****, or something similar, so that a short name is available at run time if needed.* *For InstallScript and InstallScript MSI projects—You can enter the group name system variable* ***<SHELL_OBJECT_FOLDER>*** *as the display name for your folder. You can then define the display name of this folder at run time by setting the system variable SHELL_OBJECT_FOLDER in InstallScript. To use this functionality in an InstallScript MSI installation, any letters that are specified for the Key Name setting of the folder must be all uppercase (for example,* ***NEWFOLDER1****). For more information, see SHELL_OBJECT_FOLDER.*

Table 12-46 • Folder Settings (cont.)

Setting	Project Type	Description
Description	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a description of the folder.
Shared	InstallScript	Specify whether this file is shared with other installations: • **Yes**—If this folder contains any subfolders or files that were not created by the installation, the folder is not removed from the target system when your product is uninstalled. • **No**—When your product is uninstalled from the target system, this folder is removed.

Registry View

Project • *The Registry view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Registry view enables you to define registry keys and values to be created by your installation. This view has four different panes. The two top panes show the registry data contained on your development system, and the two bottom panes are where you set up the registry data to be created on the target system.

For Windows Installer projects (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform), you can use the View Filter list at the top of the view to select the component whose registry data you want to display.

All registry data (except the <Default> registry set in a InstallScript project) must be associated with a component. This way, for installation projects, if the component's feature is selected for installation, the component's registry data are set up on the target system.

In InstallScript projects, groups of registry keys and values are called registry sets. There is no limit to the number of registry sets you can create (or the number of keys and values inside a single registry set).

The installer automatically creates certain registry entries based on values you provide in the General Information view. These informational keys are required by Windows logo guidelines. Also, all of a component's advanced settings are used to register files on the target system.

ODBC Resources View

Project • *The ODBC Resources view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

One of the more complex areas of system configuration involves setting up ODBC drivers, data source names (DSNs), and translators. The ODBC resource must be properly registered on the system with all of the required attributes and, in the case of drivers and translators, install the necessary files, including any installation .dll files. This process is simplified in the ODBC Resources view, in which you can select the drivers, data sources, and translators installed on your development system.

For details about each of the settings that you can configure for ODBC resources, see ODBC Resource Settings.

Project • *For installation projects: The ODBC Resources view is exclusively for installing ODBC-related resources. To install the core ODBC files, select the MDAC 2.5 merge module in the Redistributables view.*

For DIM and Merge Module projects: The Merged Feature check box in the Associated Feature(s) pane of this view is selected when you add an item and cleared when you remove an item in the ODBC Resources pane. It does not affect your project.

ODBC Resource Settings

Project • *The ODBC Resources view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

- *MSI Database*
- *MSM Database*
- *Transform*

There is no universal list of ODBC resource attributes and their possible values. Check with the file's vendor or author if you are unsure about what to specify for its installation. Some attributes are common to each type of ODBC resource, as described below.

Note • *You can add your own ODBC attribute by clicking in the last row of the grid in the ODBC Resources view and specifying the property and value.*

Drivers

In addition to the required attributes below, the driver must have a name in the tree. This name is registered as the driver's description. The driver's name cannot be localized, which means that it does not appear as one of your project's string entries. Because of this, the same value is used regardless of the system's language.

Table 12-47 • ODBC Driver Attributes

Attribute	Expected Value
Driver Component	Enter the name of the component that you want to install the selected ODBC driver and its attributes.
Driver DLL	Enter the path to the DLL file that is on the development system and that serves as the ODBC driver, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Driver Component setting. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.
Setup Component	Enter the name of the component that you want to install the setup DLL for the ODBC driver. Usually, this component is the same one as the component for the driver if the setup code is in the same DLL.
Setup DLL	Enter the path to the setup DLL on the development system, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Setup Component setting. If the driver file is also the setup DLL, you can leave this setting blank. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.

Data Sources

In addition to the required attributes below, the DSN must have a name in the tree. This name is registered as the DSN's description. The DSN's name cannot be localized, which means that it does not appear in your project's list of string entries. Because of this, the same value is used regardless of the system's language.

Table 12-48 • Required Data Source Attributes

Attribute	Expected Value
Registration	Specify whether you want to use a system data source or a user data source. • **System data source**—The data source is available to all users on the system. • **User data source**—The data source is registered only for the current user.

Translators

In addition to the required attributes below, the translator must have a name in the tree. This name is registered as the translator's description. The translator's name cannot be localized, which means that it does not appear in your project's list of string entries. Because of this, the same value is used regardless of the system's language.

Table 12-49 • ODBC Translator Attributes

Attribute	Expected Value
Translator Component	Enter the name of the component that you want to install the translator and its attributes.
Translator DLL	Enter the path to the DLL file that is on the development system and that serves as the translator, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Translator Component setting. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.
Setup Component	Enter the name of the component that you want to install the setup DLL for the translator. Usually, this component is the same one as the component for the driver if the setup code is in the same DLL.
Setup DLL	Enter the path to the setup DLL on the development system, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Setup Component setting. If the driver file is also the setup DLL, you can leave this setting blank. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.

Note • *You cannot add an attribute to a translator.*

INI File Changes View

Project • *The INI File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

This view is not available in InstallScript projects; however, the InstallScript language includes .ini file functions for modifying .ini file data.

The INI File Changes view enables you to specify changes that should be made to initialization (.ini) files on the target system. These types of files serve as a database in which you can store and retrieve information between the uses of your applications. Some .ini files, such as `Boot.ini` and `Wininit.ini`, are used by the operating system. Although you can edit any .ini file found on the target system, editing system .ini files is not recommended.

Task: ***Editing an .ini file involves three steps:***

1. Create an .ini file reference.
2. Add a section to the .ini file.
3. Add a keyword to the .ini file.

Before you can create an .ini file reference, you must have at least one component in your project. If no components exist when your .ini file reference is created, the Create a New Component dialog box is displayed, enabling you to create a component.

Tip • *InstallShield lets you import an existing .ini file into your project. Once you have imported the .ini file, you can use the INI File Changes view to configure the changes that you want to be made on the target system as needed. To learn more, see Importing an Existing .ini File.*

For details about each of the settings that you can configure for .ini file changes, see:

- .ini File Settings
- Section Settings for an .ini File
- Keyword Settings for an .ini File

.ini File Settings

Project • *The INI File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

When you add an .ini file to your project, configure the following settings:

Table 12-50 • .ini File Settings

Setting	Description
Display Name	Enter the name of the .ini file, including the file extension, that you would like to edit—for example, **INIFile.ini**. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Note*** • *The display name is of the Windows Installer Filename data type. If the display name that you enter is not already in the 8.3 format, InstallShield uses the ShortName|LongName format for this setting. For example, if you enter **My File Name.ini** as the value in this setting, InstallShield sets the value to **MyFile~1.ini|My File Name.ini**, or something similar, so that a short name is available at run time if needed.*
Component	Select the component with which you want to associate this .ini file by using one of the following methods: • To select from a list of components that are already in your project, click the arrow. • To browse to the component that you want to use or to create a new component for the .ini file changes, click the ellipsis button (...). If the selected component is installed at run time, the .ini file is changed. The .ini file is not modified if the component is not installed.

Table 12-50 • .ini File Settings (cont.)

Setting	Description
Target	Specify the location of the .ini file on the target system. Instead of entering a hard-coded path, you can select a Windows Installer folder property from the list. ***Tip*** • *Do not separate subfolders from the folder property with a backslash, but separate further levels of subfolders with a backslash—for example,* ***[ProgramFilesFolder]MyCompany\Subdirectory****.*

Section Settings for an .ini File

Project • *The INI File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

When you select a section in the INI File Changes view, the following setting is displayed.

Table 12-51 • .ini File Section Settings

Setting	Description
Display Name	Enter the section name of the .ini file that you would like to edit. Although the section name has square brackets around it in the .ini file, you do not need to include square brackets when you type the section name in this setting. For example, to make a change to the [INISection] section of an .ini file, you could type `INISection` in this setting. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Keyword Settings for an .ini File

Project • *The INI File Changes view is available in the following project types:*

- *Basic MSI*

- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

When you select a keyword in the INI File Changes view, several settings are displayed.

Table 12-52 • .ini File Keyword Settings

Setting	Description
Display Name	Enter the name of the keyword that you would like to edit, exactly as it should appear in the target .ini file. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Action	Select the action that you would like to perform. Valid options are: • **Replace Old Value**—The existing value is replaced with the value that you enter in the Data Value setting. If it does not exist, the installation creates it. • **Do Not Overwrite**—Your value is added to the .ini file if the keyword does not already exist. No changes are made if the keyword is already present in the .ini file. • **Append Tag**—Select this option if you would like to add an additional tag to an keyword value. Tags are comma separated. If the keyword to which you would like to append a tag does not exist, no changes are made. • **Remove Whole Value**—The keyword and its value are both removed from the .ini file. If the specified keyword does not exist, no changes are made. If you select this option, leave the Data Value setting blank. • **Remove Tag**—Multiple values for a keyword are known as *tags*. Tags are separated by commas. To remove a tag from a keyword's value, select this option. In the Data Value setting, enter the tag that you want to be removed.
Data Value	Enter the value for the keyword. If you are adding or appending a value, enter the new value. If you are removing a tag, enter the tag that you would like to remove. If you are removing the keyword and value, leave this setting blank. You can use Windows Installer properties in your keyword's value. To do this, surround the property with square brackets—for example, `[INSTALLDIR]`.

Environment Variables View

Project • *The Environment Variables view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The InstallScript language includes the GetEnvVar function for retrieving the current value of an environment variable, and it enables you to create an environment variable.

Environment variables are variables that can be accessed by multiple applications on the target system. In the Environment Variables view, you can create new environment variables, modify the values of existing variables, and remove variables. The environment variable creation, modification, or removal takes place on the target system when the component that is associated with the environment variable is installed.

Environment Variable Settings

Project • *The Environment Variables view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The InstallScript language includes the GetEnvVar function for retrieving the current value of an environment variable, and it enables you to create an environment variable.

By specifying environment variable settings, you indicate how you want to affect existing variables on the target system and create new variables. Each environment variable property is described below:

Table 12-53 • Environment Variable Settings

Setting	Description
Component	Select the component with which you want to associate this environment variable by using one of the following methods: • To select from a list of components that are already in your project, click the arrow. • To browse to the component that you want to use or to create a new component for the environment variable, click the ellipsis button (...). The environment variable creation, modification, or removal takes place on the target system when the component that is associated with the environment variable is installed.
Value	Enter the path or value for this environment variable. You can use a predefined folder as part of this value—such as **[INSTALLDIR]Bin**. To enter multiple paths, separate the paths with a semicolon (;).  ***Note*** • *If you select Remove for the On Install setting, InstallShield clears any value entered in the Value setting, and the Value setting becomes read-only.*
On Install	Indicate the action that you want to take place when the associated component is installed to the target system. Available options are: • **Create**—The installation creates the specified environment variable on the target system—if it does not already exist—and sets its value. • **Set**—In conjunction with the Placement setting, this option sets the value of an existing environment variable. If you select this option and the environment variable does not already exist on the target system, the installation creates it and then sets its value. If the environment variable exists on the target system, the installation sets its value. • **Remove**—The installation removes the specified environment variable from the target system.  ***Note*** • *If you select Remove for the On Install setting, any value entered in the Value setting is cleared, and the Value setting becomes read-only.*

Table 12-53 • Environment Variable Settings (cont.)

Setting	Description
Placement	Select the action that you would like to perform. Available options are: • **Append**—The installation appends the new value that is entered in the Value setting to the end of the existing value. • **Prefix**—The installation adds the new value that is entered in the Value setting to the beginning of the existing value. • **Replace**—The installation replaces the value of the specified environment variable with the new value that is entered in the Value setting.  ***Note*** *• If you select Create for the On Install setting and the specified environment variable already exists on the target system, the Placement setting indicates how the new value should be added to the existing environment variable's value or if it should replace the existing environment variable's value. However, if—in this scenario—the specified environment variable does not exist on the target system, it is created and the Placement setting is ignored.*
On Uninstall	Indicate whether the environment variable should be updated when the associated component is uninstalled. Available options are: • **Remove**—If you select Append or Prefix for the Placement setting and the environment variable value on the target system contains the specified value at uninstallation time, only that value is removed from the existing variable's value. If you select Replace for the Placement setting, and if either of the following conditions are true at uninstallation time, the entire environment variable is removed: the value on the target system matches the specified value, or the value on the target system is empty. In all other cases, the environment variable and its value are left as is on the target system. • **Leave**—The environment variable and, if it is available, its value are left as is on the target system.
Type	Indicate whether the environment variable name refers to a system or user environment variable. Available options are: • **System**—The installation creates, modifies, or removes the specified system environment variable. • **User**—The installation creates, modifies, or removes the environment variable from the end user's environment. The specified environment variable is available only to the end user who is logged on at the time of installation.

XML File Changes View

Project • *The XML File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The XML File Changes view is where you add references for nodes and node sets of XML files that you want to change at run time. The XML files can be part of your installation, or they can be files that are already present on target systems.

Two key parts of this view are the View Filter (a list of the project's features and components) and the XML Files explorer (a tree view):

- The View Filter enables you to filter data by feature or component.
- The XML Files explorer is where you add references to XML files and XML data that you want to create, modify, or remove at run time. Each node represents an XPath expression that your installation carries out at run time to select existing nodes or node sets in an XML file.

Important • *The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:*

- *If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.*
- *If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.*

Therefore, when you are importing a file, import only the nodes in the XML file that you want to modify at run time. Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.

The XML File Changes view also displays different tabs in the right pane, depending on what is selected in the XML Files explorer. For reference information about each of the settings on these tabs, see the following:

- General Tab for an XML File
- Advanced Tab for an XML File
- Namespace Tab for an XML File
- General Tab for an XML Element

- Advanced Tab for an XML Element

To learn more about how to use the XML Files Changes view and configure XML file changes, see Modifying XML Files.

General Tab for an XML File

Project • *The XML File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The General tab exposes the following settings for an XML file in the XML File Changes view:

Table 12-54 • General Tab Settings for a File in the XML File Changes View

Setting	Description
File Name	The file name represents the XML file name as it appears in the explorer. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see Using String Entries in InstallShield.
XML File Destination	Specify the location of the XML file on the target machine. Click Browse to locate an existing directory or to add or create a new one.
Select the Features the XML File Belongs to	Select or clear the check boxes for one or more features that you want to associate with the XML file. InstallShield automatically associates a feature with an XML file when it is added to the XML File Changes view.  ***Project*** • *For DIM and Merge Module projects—The Merged Feature check box in this pane is selected and disabled when you select an XML file in this view. When you add a DIM or merge module to an installation project, you specify the feature that should contain that DIM or merge module.*

Advanced Tab for an XML File

Project • *The XML File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The Advanced tab exposes the following settings for an XML file in the XML File Changes view.

XML file options

The following file settings are available at run time:

Table 12-55 • XML File Settings Available at Run Time

Setting	Description
Always create XML file if it does not already exist	If an XML file does not exist on the target system at run time, then one will be created based on the specifications for that file in the XML File Changes view.
Remove XML file on uninstall	Select this check box if you want to remove the XML file on the target system upon uninstallation.
Format XML after changes	If you want the XML file to be formatted after the run-time changes are made to the file, select this check box. When formatting the file, the installation adds indentations to the file and replaces empty-element tags with start tags and end tags. Note that the formatting may cause problems for `web.config` files, so you may want to clear this check box for the XML file.
Encoding used for a new file	Specify the encoding that should be used for a new XML file. Note that if the XML file is already present on the target machine, or if it is being installed as part of your installation, the installation uses the encoding that is specified in the XML file, rather than the encoding that is specified in this setting. The encoding value that you specify is used only if you have used the XML File Changes view to create the entire XML file.

XPath Query

This read-only grid displays the XPath expressions to be executed on the target machine at run time based on the XML changes you have configured in the XML File Changes view.

Tip • *For more information about XPath expressions, consult the World Wide Web Consortium (W3C) Web site. Another relevant article entitled Things to Know and Avoid When Querying XML Documents with XPath can be found in the MSDN Library.*

Namespace Tab for an XML File

Project • *The XML File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The Namespace tab contains a table with the following settings for an XML file in the XML File Changes view.

Table 12-56 • XML Namespace Settings

Setting	Description
Prefix	Specify the prefix that should be added to elements that are associated with this namespace.
URI	Specify the uniform resource identifier that identifies the Internet resource for the namespace. The URI can be a URL or a string of characters.  ***Note*** • *The MSXML parser does not use the URI to look up information about the namespace. The only purpose of the URI is to give the namespace a unique name within the XML file.*

General Tab for an XML Element

Project • *The XML File Changes view is available in the following project types:*

- *Basic MSI*

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The General tab exposes the following settings for an XML element in the XML File Changes view.

Element Name

The element name represents the declared element type for the XML file.

When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Attributes

Table 12-57 • Settings for XML Element Attributes

Setting	Description
Attribute	Enter the name of an XML element attribute to created, updated, or removed at run time. You can add Windows Installer properties for the attribute. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Value	Enter the value for the attribute type. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Operation	Select from the following run-time operations: • **Create**—Adds the attribute to the element at run time. • **Remove**—Removes the attribute from the element at run time. • **Append**—Appends the attribute value that you specify to the end of the existing value.
Scheduling	Specify when to apply the attribute changes by selecting from the following scheduling options: Install, Uninstall, and Both.

Tip • *You can use dynamic values from Windows Installer properties or text substitution to store different values into the XML file.*

Advanced Tab for an XML Element

Project • *The XML File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*

- *Transform*

The Advanced tab exposes the following settings for an XML element in the XML File Changes view.

Table 12-58 • XML Element Settings

Setting	Description
Update first matching element only	To modify only the first matching element in the target XML file, select this check box. If you clear this check box, every matching element in the target XML file is changed.
Always create this element if it does not already exist	To always create this element on the target machine if it does not already exist, select this check box. Note that if this check box is cleared for an element that is not present in the target file, its child elements are not created at run time. Thus, for an XML file such as //A/B/C, C is not created on the target system if B is neither present nor set to be created.
Remove element on uninstall	To remove this element from the XML file when the component containing this XML file change is uninstalled, select this check box.
Set Element Content	To add text content to the element, select this check box and enter the text in the Content box. In the following XML example, **feature** is the content for the element **product**: `<product>feature</product>`
Content	Enter a string with which to update the element. There is a 255-character limitation. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Text File Changes View

Project • *The Text File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

This view is not available in InstallScript projects; however, the InstallScript language includes string functions for finding and modifying string variables and literals.

The Text File Changes view is where you configure search-and-replace behavior for content in text files—for example, .txt, .htm, .xml, .config, .ini, and .sql files—that you want to modify at run time on the target system. The text files can be part of your installation, or they can be files that are already present on target systems.

Task: ***Configuring text file changes involves the following steps:***

1. Create a text file reference.
2. Specify the search-and-replace criteria for the text file.

Note • *Each text file reference must be associated with a component in your project. Therefore, before you can create a text file reference, your project must have at least one component. If no components exist when you are creating a text file reference, the Create a New Component dialog box is displayed, enabling you to create a component.*

Tip • *The Text File Changes view enables you to modify XML files without using MSXML (which is a run-time requirement if you use the XML File Changes view to modify XML files).*

For details about each of the settings that you can configure for text file changes, see:

- Replacement Set Settings
- Replacement Settings

Replacement Set Settings

Project • *The Text File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

This view is not available in InstallScript projects; however, the InstallScript language includes string functions for finding and modifying string variables and literals.

When you select a replacement set item in the Text File Changes explorer of the Text File Changes view, the following settings are available for you to configure.

Table 12-59 • Replacement Set Settings

Setting	Description
Target Folder	Specify the location of the text file (that is, any non-binary file, such as a .txt, .htm, .xml, .config, .ini, or .sql file) on the target system. Instead of entering a hard-coded path, you can select a Windows Installer folder property from the list. ***Tip*** • *Do not separate subfolders from the folder property with a backslash, but separate further levels of subfolders with a backslash—for example,* ***[ProgramFilesFolder]MyCompany\Subdirectory****.*
Include Files	Specify one or more text files that you want to be searched. Separate multiple files with a semicolon (;). To indicate a wild-card character, use an asterisk (*). For example, if you want to search all .xml and .config files in the specified directory, enter the following: `*.xml;*.config` ***Tip*** • *You can use Windows Installer public properties to specify the names of the text files that you want to include in or exclude from your search. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see Using Windows Installer Properties to Dynamically Modify Text Files.*
Exclude Files	Specify the file or files that you want to be excluded from the search. Separate multiple files with a semicolon (;). To indicate a wild-card character, use an asterisk (*). For example, if you want to exclude all .htm and .html files in the specified directory, enter the following: `*.htm;.html` ***Tip*** • *You can use Windows Installer public properties to specify the names of the text files that you want to include in or exclude from your search. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see Using Windows Installer Properties to Dynamically Modify Text Files.*
Include Subfolders	Specify whether you want the installation to search the subfolders of the location that you specified in the Target Folder setting.
Run on Install	Specify whether you want the search-and-replace behavior to occur when the replacement set's component is installed on the target system.

Table 12-59 • Replacement Set Settings (cont.)

Setting	Description
Run on Uninstall	Specify whether you want the search-and-replace behavior to occur when the replacement set's component is removed from the target system.
Component	Select the component with which you want to associate this text file by using one of the following methods: • To select from a list of components that are already in your project, click the arrow. • To browse to the component that you want to use or to create a new component for the text file changes, click the ellipsis button (...).

Replacement Settings

Project • *The Text File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

This view is not available in InstallScript projects; however, the InstallScript language includes string functions for finding and modifying string variables and literals.

When you select a replacement item in the Text File Changes explorer of the Text File Changes view, the following settings are available for you to configure.

Table 12-60 • Replacement Settings

Setting	Description
Find What	Enter the string that you want to replace, or select a Windows Installer property from the list. The list consists of all of the properties that are available in the Property Manager view of your project.  ***Tip*** • *You can use Windows Installer public properties to specify the search strings and the replacement strings. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see Using Windows Installer Properties to Dynamically Modify Text Files.*

Table 12-60 • Replacement Settings (cont.)

Setting	Description
Replace With	Enter the new string that should replace the existing string that is found, or select a Windows Installer property from the list. The list consists of all of the properties that are available in the Property Manager view of your project. ***Tip*** • *You can use Windows Installer public properties to specify the search strings and the replacement strings. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see Using Windows Installer Properties to Dynamically Modify Text Files.*
Match Whole Word Only	Specify whether you want to find only whole-word instances of the value that you have entered for the Find What setting. For example, if you specify Yes and you enter `install` for the Find What setting, the installation searches only for instances of *install*; it does not search for other forms of the word, such as *installs*, *installation*, or *uninstall*.
Match Case	Specify whether you want to restrict your search to strings with the same capitalization that you use in the Find What setting. For example, if you specify Yes and you enter `install` for the Find What setting, the installation searches only for all-lowercase instances of that string. If you select No, the installation searches for *install*, as well as *INSTALL*, *Install*, and other mixed-case instances.
Replace Only Once	Specify whether you want the installation to replace only the first occurrence of the search string. If you specify No, the installation replaces all instances of the search string.

Scheduled Tasks View

Project • *The Scheduled Tasks view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The Scheduled Tasks view is where you add to your project automated tasks that you want to be created through the Windows task scheduler at run time on target systems. The scheduled tasks that you create can launch files that are part of your installation, or ones that are already present on target systems.

For details about each of the settings that you can configure for a scheduled task, see Scheduled Tasks Settings.

Note • *Each scheduled task must be associated with a component in your project. Therefore, before you can add a scheduled task, your project must have at least one component. If no components exist when you are adding a scheduled task, the Create a New Component dialog box is displayed, enabling you to create a component.*

Scheduled Tasks Settings

Project • *The Scheduled Tasks view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The settings for a scheduled task are organized into the following main categories in the Scheduled Task view.

- General
- Schedule

General

Use a scheduled task's General settings to specify details such as the name of the task, the component that contains the task, and the file that you want the task to run.

Table 12-61 • General Settings for a Scheduled Task

Setting	Description
Task Name	Enter the name that you want to use for the selected scheduled task. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-61 • General Settings for a Scheduled Task (cont.)

Setting	Description
Component	Select the component that you want to contain this scheduled task by using one of the following methods: • To select from a list of components that are already in your project, click the arrow in this setting. • To browse to the component that you want to use or to create a new component for the scheduled task, click the ellipsis button (...) in this setting. If the installation installs this component at run time, the scheduled task is added to the target system.
Comments	Enter the description that you want to be displayed in the Windows task scheduler for this task. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Target	Enter the path to the file on the target system that should be launched when the scheduled task is run. Use Windows Installer directory properties—for example, **[INSTALLDIR]File.exe**—instead of hard-coded directory paths. As an alternative to manually entering a value, you can click the ellipsis button (...) to browse to the target location and specify the file name.
Arguments	Enter the command-line arguments for the target file.
Working Directory	Enter the working directory for the target, or click the ellipsis button (...) to select or create a directory. For example, if you want your working directory to be set to a subdirectory of **INSTALLDIR** called **Files**, select **[INSTALLDIR]** from the list and add the subdirectory name `Files` to the end of it. When you are finished, it should read **[INSTALLDIR]Files**.

Table 12-61 • General Settings for a Scheduled Task (cont.)

Setting	Description
Run As	Enter the account that should be used to run the scheduled task. For example: **DomainName\UserName** Note that if you select Yes for this setting, you must also specify a password in the Password setting. Otherwise the scheduled task cannot be created at run time, and the installation aborts.  ***Tip*** *• You can use a Windows Installer public property to specify this information. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when a scheduled task is configured at run time. For more information, see Using Windows Installer Properties to Dynamically Configure a Scheduled Task.*
Password	Enter the password that should be used to with the user account that is specified in the Run As setting to run the scheduled task. Note that if you select Yes for the Run Only If Logged On setting, you must also specify a password in the Password setting. Otherwise the scheduled task cannot be created at run time, and the installation aborts.  ***Tip*** *• You can use a Windows Installer public property to specify this information. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when a scheduled task is configured at run time. For more information, see Using Windows Installer Properties to Dynamically Configure a Scheduled Task.*
Run Only If Logged On	Specify whether you want the task to run only if the user account that is specified in the Run As setting is logged on to the system at the time that the task is scheduled. Note that if you select Yes for this setting, you must also specify a password in the Password setting (which is under the Run As setting). Otherwise the scheduled task cannot be created at run time, and the installation aborts.

Schedule

Use a scheduled task's Schedule settings to specify details such as how often you want the task to run. Note that some of the settings are displayed only if you select certain schedule options.

Table 12-62 • Schedule Settings for a Scheduled Task

Setting	Description
Schedule Type	Select the option that describes how often you want the scheduled task to be run.

Table 12-62 • Schedule Settings for a Scheduled Task (cont.)

Setting	Description
Start Time	Enter the time that the task should start to be run in the following format: hh:mm where hh is the number of hours that have passed since midnight, and mm is the number of minutes that have passed since the start of the hour. The time that you specify should be from 00:00 to 23:59. For example, for a start time of 2:45 PM, enter `14:45`.
Start Date	Enter the date on which the task should start to be run. Use the same date format that is configured for the operating system of the machine on which you are using InstallShield.
Interval	Specify how often the scheduled task should be run, starting at the specified time and date.
Run On	This setting varies, depending on the option that you select in the Schedule Type setting. • **For a weekly schedule**—To specify the days of the week on which you want the weekly scheduled task to be run, click the ellipsis button (...) in this setting, and then select the check boxes of the appropriate days. • **For a monthly schedule**—Specify whether you want the scheduled task to be run on a specific day or week of the month. • **For a run-once schedule**—Enter the date on which the task should be run. Use the same date format that is configured for the operating system of the machine on which you are using InstallShield.
Week	Select which week of the month you want the monthly scheduled task to be run.
Day	To specify the days on which you want the monthly scheduled task to be run, click the ellipsis button (...) in this setting, and then select the check boxes of the appropriate days.
Months	To specify the months of the year in which you want the monthly scheduled task to be run, click the ellipsis button (...) in this setting, and then select the appropriate check boxes.
Idle Time	Specify the number of minutes that the target system should be idle before running the scheduled task.

Services View

Project • *The Services view (and the Services area for a component) is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

You can use the Services view to configure a component that installs, starts, stops, or deletes a service during installation or uninstallation. You can also use this view to configure extended service customization options that are available with Windows Installer 5. As an alternative to using the Services view, you can use the Services area under the Advanced Settings node of the Components view or the Setup Design view. If you configure service information in any of these areas, the other areas are automatically updated accordingly.

Note the following details about working with services:

- The name that you enter for the service in the Services node must match the name that is shown on the service's Properties dialog box. (To access an installed service's properties: In the Services administrative tool, right-click the service and then click Properties.)
- The service that you are starting, stopping, deleting, or configuring can either be already present on the target system during installation or uninstallation, or it can be installed as part of your installation.
- The service executable file should be the key file of its component. For more information, see Component Key Files.
- The Remote Installation setting for the service's component must be set to Favor Local. For more information, see Setting a Component's Remote Installation Setting.

Note • *A service must be a single executable file (.exe), since the Windows Installer does not support driver services.*

For details about each of the settings that you can configure for a service, see Services View Settings.

Services View Settings

Project • *The Services view (and the Services area for a component) is available in the following project types:*

- *Basic MSI*
- *DIM*

- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Tip • *The View Filter at the top of the Services view lets you select a component or feature whose service data you want to display in the view. The View Filter lists your project's hierarchy of features, subfeatures, and components. Selecting a feature shows the services for all of the components in that feature.*

The Services settings are organized into the following main categories:

- General Settings
- Install Settings
- Control Settings
- Configure Settings

Tip • *You must be familiar with the technical details of your service before you can configure its settings.*

General Settings

Use the General area to specify the component that you want to contain your service.

Table 12-63 • General Settings

Setting	Description
Component	Select the component that contains the service executable file, or click the ellipsis button (...) in this setting to create or select a component for the service executable file. The service executable file should be the key file of its component. For more information, see Component Key Files. In addition, the Remote Installation setting for the component must be set to Favor Local. For more information, see Setting a Component's Remote Installation Setting.

Install Settings

Use the Install Settings area to specify whether you want the installation to install your service. If the service should be installed, also use these settings to specify information such as the display name and description, as well as when the service should be started.

Table 12-64 • Install Settings

Setting	Description
Enable Service Install	Specify whether the service should be installed at run time. If you select No for this setting, any values that you entered for the remaining settings in the Install Settings section are deleted from the project. Note that when No is selected for this setting, the remaining settings in the Install Settings section are read-only.
Key Name	Enter a key name for the service. The key name is a database key; it is not displayed to end users.
Display Name	Enter the name that you want to be displayed in the service control manager for this service. If you leave this setting blank, the service's name (that is, the text that is used for the name of your service's subnode under the Advanced Settings node) is used. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Description	Enter a description of the service. This description is registered on the target system when the service is installed, and it is displayed in the service control manager's Description column. It is also displayed in the Description box on the General tab of the service's Properties dialog box. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Service Type	Select the type of service that you are installing. Available options are: • Win32 that runs in its own process • Win32 that shares a process The WIN32_OWN_PROCESS type of service contains the code for only one service. The WIN32_SHARE_PROCESS type of service contains code for more than one service, enabling them to share code.

Table 12-64 • Install Settings (cont.)

Setting	Description
Interact with Desktop	Specify whether the service interacts with the desktop. If your service has a user interface, select Yes. If you select Yes, the User Name setting must be left blank, since the service will be installed to run in the built-in LocalSystem account.
Start Type	Specify when to start the service. Available options are: • **Automatic**—The service starts automatically when the system starts. • **On Demand**—The service starts when the service is requested through the service control manager. • **Disabled**—The service cannot be started. Note that some services may support other start types (that is, during operating system initialization or by the operating system loader). However, these options are not available for the Start Type setting because the Windows Installer does not include support for them.
Error Control	Select the appropriate action that the service control manager should perform if the service fails to start. Available options are: • Log the error and continue • Log the error, display a message, and continue • Log the error and restart
Abort Install on Failure	Specify whether the entire installation should fail if the service cannot be installed on the target system. The default value is No.  ***Note*** • *If you select Yes for this setting and end users run the installation in silent or basic UI mode, Windows Installer 3 or later must be present on the target system.*
Load Order Group	Enter the name of the load-ordering group, if any, of which this service is a member.
Dependencies	Enter any service or load-ordering groups that this service requires. The system attempts to start the required service or at least one member of the load-ordering group before starting this service. Separate multiple dependencies with a comma (,). You must precede the name of each load-ordering group with the SC_GROUP_IDENTIFIER—which is typically the plus sign (+)—so that the service control manager can distinguish it from a service.

Table 12-64 • Install Settings (cont.)

Setting	Description
User Name	Enter the account under which the service will be logged on. To install the service under the local system account, leave this setting blank. (Microsoft does not recommend installing services that impersonate the privileges of a single user.) If the service type is **Win32 that runs in its own process**, the value that you enter should use the following format: `DomainName\UserName` If the service will be logged on under the built-in domain, you can use the following format: `.\UserName`
Password	Enter a password for this service. Leave this setting blank if the User Name setting is empty—that is, when the service is logged on under the local system account. The password is not used if you have not specified a user name.
Start Parameters	Enter any command-line parameters or properties that are required to run the service.
Permissions	This setting lets you set permissions for your service. To configure permissions, click the Add New Service Permissions button. InstallShield adds a new permission setting, plus additional rows of related settings under it. Configure each of the settings as necessary. You may want to add multiple permission items if, for example, you want to pass different arguments during installation and uninstallation.  ***Note*** • *The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.* *An installation should not contain both the* ***MsiLockPermissionsEx*** *table and the* ***LockPermissions*** *table. If you use this Permissions setting, and the settings under it, you are configuring the* ***MsiLockPermissionsEx*** *table of the package. If* ***Traditional Windows Installer handling*** *is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the* ***LockPermissions*** *table of the package.*

Table 12-64 • Install Settings (cont.)

Setting	Description
Key Name	Enter a key name for the permissions. The key name is an internal name; it is not displayed to end users.  ***Note*** *• The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.* *An installation should not contain both the* ***MsiLockPermissionsEx*** *table and the* ***LockPermissions*** *table. If you use this Permissions setting, and the settings under it, you are configuring the* ***MsiLockPermissionsEx*** *table of the package. If* ***Traditional Windows Installer handling*** *is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the* ***LockPermissions*** *table of the package.*
Security Descriptor	Use valid security descriptor definition language (SDDL) to enter a valid SDDL string. For more information about SDDL, see the “Access Control” section of the Microsoft Windows Software Development Kit (SDK).  ***Tip*** *• You can use angle brackets (for example,* ***<DomainName\UserName>****) or environment variables (for example,* ***[%UserDomain][%UserName]****) to indicate the domain and user name of the user whose account SID is going to be determined at run time.*  ***Note*** *• The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.* *An installation should not contain both the* ***MsiLockPermissionsEx*** *table and the* ***LockPermissions*** *table. If you use this Permissions setting, and the settings under it, you are configuring the* ***MsiLockPermissionsEx*** *table of the package. If* ***Traditional Windows Installer handling*** *is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the* ***LockPermissions*** *table of the package.*

Table 12-64 • Install Settings (cont.)

Setting	Description
Condition	This setting lets you enter a statement that the installation must evaluate before securing permissions for the service on the target system. The permissions are not configured if the condition evaluates to false. However, the permissions are configured if the condition evaluates to true, assuming that the service's feature is installed. To create a condition for the permissions, click the ellipsis button (...) in this setting. For more information, see Condition Builder Dialog Box.  ***Note*** • *The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.* *An installation should not contain both the* ***MsiLockPermissionsEx*** *table and the* ***LockPermissions*** *table. If you use this Permissions setting, and the settings under it, you are configuring the* ***MsiLockPermissionsEx*** *table of the package. If* ***Traditional Windows Installer handling*** *is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the* ***LockPermissions*** *table of the package.*

Control Settings

Use the Control Settings area to specify how you want to control the service when this component is installed or uninstalled. For example, before updating a running service, your installation may need to delete it.

Table 12-65 • Control Settings

Setting	Description
Events	This setting lets you specify one or more control events that are required for your service. To add an event, click the **Add New Service Control Event** button. InstallShield adds a new event setting, plus additional rows of related settings under it. Configure each of the settings as necessary. You can place all of your control options in a single event. However, you might need to create additional events if, for example, you want to pass different arguments during installation and uninstallation.
Key Name	Enter a key name for the control event. The key name is an internal name; it is not displayed to end users.

Table 12-65 • Control Settings (cont.)

Setting	Description
Operation Time	To specify how you would like to schedule the operation that occurs for the service at run time, select the appropriate option for each of the following settings: • **Install Start**—Specify whether you want to start the service during installation. If you select Yes, the service starts when the installation reaches the StartServices action in the Installation sequence. • **Install Stop**—Specify whether you want to stop the service during installation. If you select Yes, the service stops when the installation reaches the StopServices action in the Installation sequence. • **Install Delete**—Specify whether you want to delete the service during installation. If you select Yes, the service is deleted when the installation reaches the DeleteServices action in the Installation sequence. • **Uninstall Start**—Specify whether you want to start the service during uninstallation. If you select Yes, the service starts when the uninstallation reaches the StartServices action in the Installation sequence. • **Uninstall Stop**—Specify whether you want to stop the service during uninstallation. If you select Yes, the service stops when the uninstallation reaches the StopServices action in the Installation sequence. • **Uninstall Delete**—Specify whether you want to delete the service during uninstallation. If you select Yes, the service is deleted when the uninstallation reaches the DeleteServices action in the Installation sequence.
Wait Type	Specify how Windows Installer should proceed after initiating the control event. Available options are: • **Wait for the event to complete**—Windows Installer waits for the event—starting, stopping, or deleting—to finish, up to a maximum of 30 seconds, before proceeding. Select this option if the event is critical to the installation and you want to allow additional time for the event to return a failure error. • **Wait for the SCM**—Windows Installer waits for the service control manager to report that the service is in a pending state. The service control manager maintains the system's database of services and exposes an interface for controlling these services.
Service Argument	Specify the arguments that you want to be passed to the service. Separate multiple arguments with a comma (,).

Configure Settings

Use the Configure Settings area to specify how to customize the service that is included in the selected component.

Note • *The configuration settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.*

Table 12-66 • Configure Settings

Setting	Description
Events	This setting lets you specify one or more configuration changes that are required for your service. To add an event, click the **Add New Service Configuration Event** button. InstallShield adds a new event setting, plus additional rows of related settings under it. Configure each of the settings as necessary. ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
Key Name	Enter a key name for the configuration event. The key name is an internal name; it is not displayed to end users. ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
Run Time	To specify when you would like the service configuration event to occur at run time, select the appropriate option for each of the following settings: • **During Install**—Specify whether you want the event to occur during installation. • **During Uninstall**—Specify whether you want the event to occur during uninstallation. • **During Reinstall**—Specify whether you want the event to occur during reinstallation. ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*

Table 12-66 • Configure Settings (cont.)

Setting	Description
Configuration Type	Specify what configuration change should be made to the service. The change takes effect the next time that the system is started. Available options are: • **Configure time delay of an auto-start**—This option is applicable if the service is an installed auto-start service, or if Automatic is selected for the Start Type setting in the Install Settings area. If you select this option, click the ellipsis button (...) in the Arguments setting to indicate the time delay. • **Configure when to run recovery actions**—If you select this option, click the ellipsis button (...) in the Arguments setting to specify when to run the recovery actions for the selected service. • **Add a service SID type to the process token**—If you select this option, click the ellipsis button (...) in the Arguments setting to indicate the appropriate security identifier (SID) type that you want to add for the service. • **Change list of required privileges**—If you select this option, click the ellipsis button (...) in the Arguments setting to select the appropriate privileges. • **Configure SCM pre-shutdown delay**—If you select this option, enter the length of the time delay (in milliseconds) in the Arguments setting. To reset the time delay to the default of 3 minutes, leave the Arguments setting blank. The service control manager waits for the specified period of time after sending the SERVICE_CONTROL_PRESHUTDOWN notification to the service. Note that each option has its own set of corresponding values for the Arguments setting. Therefore, if you change the value for the Arguments setting and next change the value for the Configuration Type setting, you may need to change the value for the Arguments setting again.  ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
Arguments	To specify the value that corresponds with the configuration change that you selected in the Configuration Type setting, click the ellipsis button (...).  ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*

Table 12-66 • Configure Settings (cont.)

Setting	Description
Recovery Actions	This setting lets you specify one or more recovery actions that are to be run after the service fails. To add a recovery action, click the **Add New Recovery Action** button. InstallShield adds a new recovery action setting, plus additional rows of related settings under it. Configure each of the settings as necessary. ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
Key Name	Enter a key name for the recovery action. The key name is an internal name; it is not displayed to end users. ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
Run Time	To specify when the system should run the recovery action after the service has failed, select the appropriate option for each of the following settings: • **During Install**—Run the action when the service's component is being installed. • **During Uninstall**—Run the action when the service's component is being uninstalled. • **During Reinstall**—Run the action when the service's component is being reinstalled. ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*

Table 12-66 • Configure Settings (cont.)

Setting	Description
Reset Period	Specify the amount of time (in seconds) between the reset intervals for the service's failure count. The service control manager counts the number of times that the service has failed since the system was last restarted. When this interval has elapsed, the count is reset to the number 0 if the service has not failed during the reset period. When the service fails, the system performs an action that is specified for the SCM Actions setting. The appropriate action is determined by subtracting the number 1 from the number of failures since the last system restart. For example, if the action fails a sixth time, the system performs the fifth action type that is listed in the SCM Actions setting. If actions are not specified in the SCM Actions setting, the Reset Period setting is ignored. To indicate that the failure count should never be reset, leave this setting blank.  ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
Reboot Message	Specify the message that should be displayed before the computer is restarted in response to a service control manager action of Reboot Computer. Note that Reboot Computer must be listed as one of the action types for the SCM Actions setting; otherwise, the Reboot Message setting is ignored. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*

Table 12-66 • Configure Settings (cont.)

Setting	Description
Run Command	Specify the command line that should be run in response to a service control manager action of Run Command. Use the absolute path; UNC paths are not supported. For example, enter `C:\myscripts\recovery.cmd`, rather than `\\computername\c$\myscripts\recovery.cmd`. Programs or scripts that you specify should not require input from end users. The command line that you specify is used by a new process that runs under the same account as the service. Note that Run Command must be listed as one of the action types for the SCM Actions setting; otherwise, the Run Command setting is ignored. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
SCM Actions	This setting lets you specify one or more service control manager actions that should occur if the service fails. The actions are performed in the order that they are listed under this setting. To add an action, click the **Add New SCM Action Event** button. InstallShield adds a new Type setting, plus a Delay setting under it. Configure both of the settings as necessary.  ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*
Type	Specify the type of action that the service control manager should perform if the service fails. Available options are: • Restart Service • Run Command • Reboot Computer • Take No Action  ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*

Table 12-66 • Configure Settings (cont.)

Setting	Description
Delay	Specify the time (in milliseconds) that the service control manager should wait before performing the action that is specified in the Type setting. ***Note*** • *This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.*

Server Configuration View

Project • *The Server Configuration view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

InstallShield offers the following views to help you configure server-side installations.

Internet Information Services (IIS)

Project • *The Internet Information Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

If you want to create an IIS Web site, application, virtual directory, application pool, or Web service extension on the target machine upon installation, you can configure it in the Internet Information Services view.

Component Services

Project • *The Component Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Component Services view enables you to manage COM+ server applications and components for your installation package.

SQL Scripts

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The SQL Scripts view provides a central location for managing and organizing all SQL scripts by connections and settings.

Internet Information Services View

Project • *The Internet Information Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

The Internet Information Services view enables you to create and manage new IIS Web sites, applications, virtual directories, application pools, and Web service extensions.

The Internet Information Services view contains several areas:

- Web Sites (This area lets you add Web applications and virtual directories. For more information, see Application and Virtual Directory Settings.)
- Application Pools
- Web Service Extensions

The following table describes the buttons that are displayed above the settings in the Internet Information Services view. The buttons are displayed if a Web site, application, virtual directory, application pool, or Web service extension is selected in the center pane.

Table 12-67 • Controls in the Internet Information Services View

Name of Control	Icon	Description
Categorized		Sorts the settings according to categories.
Alphabetical		Sorts the settings alphabetically.

Tip • *You can configure an IIS setting dynamically at run time through the use of Windows Installer public properties (in Basic MSI, DIM, InstallScript MSI, and Merge Module projects) or text substitution string variables (in InstallScript projects). This enables you to let end users specify the name of the virtual directory, the TCP port, the site number, or other IIS settings for the Web sites, applications, virtual directories, application pools, and Web service extensions that they are installing on the target machine. To learn more, see Using Windows Installer Properties to Dynamically Modify IIS Settings and Using InstallScript Text Substitution to Dynamically Modify IIS Settings.*

Web Site Settings

Project • *The Internet Information Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

Use the Web Sites item in the Internet Information Services view to add and delete Web sites, and to configure system-wide settings for the Web server.

Web Server Settings that Apply to All Web Sites in a Project

When you select the Web Sites explorer in the Internet Information Services view, the following Web server settings are displayed.

Table 12-68 • Web Server Settings

Setting	Description
Restart Web Server After Configuring IIS (IIS 6 and earlier only)	To restart IIS after each time the installation is done making IIS changes to the system, select Yes. Some applications may require IIS to be restarted. This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.
SSIEnableCmdDirecti ve Registry Value	Specify how you want the SSIEnableCmdDirective registry value for the HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W3SVC\Parameters registry key to be set on the target system. The SSIEnableCmdDirective registry value controls whether the Web server allows the #exec CMD directive of server-side includes (SSIs) to be used to execute shell commands. Valid options are: • **Ignore**—Do not change the SSIEnableCmdDirective registry value on the target system. This is the default option. • **FALSE (0)**—Set the SSIEnableCmdDirective registry value on the target system to 0. This prevents the #exec CMD directive of server-side includes to be used to execute shell commands. Note that if you select this value and an IIS Web server has applications that rely on #exec CMD directives, those applications may stop working properly after your installation project's Web site and virtual directory are installed. • **TRUE (1)**—Set the SSIEnableCmdDirective registry value on the target system to 1. This allows the #exec CMD directive of server-side includes to be used to execute shell commands. If you select the FALSE or TRUE options, InstallShield stores the value—either 0 for FALSE or 1 for TRUE—in the **INSTALLSHIELD_SSI_PROP** property. Because of security concerns, the default SSIEnableCmdDirective registry value is FALSE (0); the FALSE (0) value prevents end users from running unauthorized server-side executable files.  ***Note*** • *If your product is uninstalled from a target system, the SSIEnableCmdDirective registry value is not changed, even if its value was changed during installation.* For more information, see Specifying Whether a Web Server Should Allow the CMD Command to Be Used for SSI #exec Directives.

Note • *The aforementioned Web server settings are not updated on a target system at installation run time if no IIS items (Web sites, applications, virtual directories, application pools, or Web service extensions) are installed.*

Settings that Are Configurable for Each Web Site in a Project

When you select a Web site in the explorer, many settings are displayed. The Web site settings are organized into several main categories:

- Identification
- General
- Home Directory
- Application Settings
- Security
- Advanced

Identification Settings

The following settings are available in the Identification area for a Web site in the Internet Information Services view.

Table 12-69 • Identification Settings for a Web Site

Setting	Description
Name	Enter a name for the Web site. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
IP Address	To target a specific IP address, enter it. As an alternative, you can leave an asterisk (*), which is the default value. An asterisk or a blank value for this setting indicates that any unused IP address should be used.
TCP Port	The TCP Port setting for an IIS Web site indicates the port number on which the service is running on the target machine. Some versions of the IIS Web server can host multiple Web sites. Each Web site is associated with a unique port number. If you do not know what the port number on the target system should be, you can enter 0 for this setting. To learn which port and site numbers are used for the Web site when it is installed, see Configuring the TCP Port and Site Numbers.

Table 12-69 • Identification Settings for a Web Site (cont.)

Setting	Description
Host Header Name	To specify the host header name that identifies the IIS Web site that is installed during your installation, type it in this box. For example: `www.mycompany.com` Host headers (also known as domain names) enable you to assign more than one Web site to an IP address on a Web server.
Site Number	The Site Number setting indicates the number in the path at which the Web site will be created (that is, w3svc/3). The default value is 0. If you do not know what the site number on the target system should be, you can enter 0 for this setting. To learn which port and site numbers are used for the Web site when it is installed, see Configuring the TCP Port and Site Numbers.

General Settings

The following settings are available in the General area for a Web site in the Internet Information Services view.

Table 12-70 • General Settings for a Web Site

Setting	Description
Component	Select the component with which the Web site is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.
ASP.NET Version	To set the ASP.NET version for the Web site, enter the complete version number, or select it from the list. For example, to specify version 2 of ASP.NET, type `2.0.50727`. To specify version 1.1 of ASP.NET, type `1.1.4322`. If you specify an ASP.NET version for a Web site, IIS uses that same version number for any of the Web site's applications.  ***Important*** • *If your installation may be run on a Windows Vista or later system, you may not want to set the ASP.NET version. Also note that if you specify version 3 of ASP.NET, an error occurs at run time. For more information, see Setting the ASP.NET Version for a Web Site or Application.*

Table 12-70 • General Settings for a Web Site (cont.)

Setting	Description
ASP.NET Platform	If the installation may be run on a 64-bit version of Windows with the .NET Framework, specify which ASP.NET platform should be used to map the Web site or application to the ASP.NET version: • **32-bit**—The 32-bit version of the ASP.NET IIS Registration tool should be used. Select this option if Yes is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails. • **64-bit**—The 64-bit version of the ASP.NET IIS Registration tool should be used. Select this option if No is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails. For more information, see Considerations for Supporting IIS 6 on 64-Bit Platforms.
Delete on Uninstall	Specify whether you want to delete the selected Web site during uninstallation. For more information, see Uninstalling Web Sites, Applications, and Virtual Directories.
Default Documents	Type the name of the default page on your Web site. To specify multiple pages, separate each with a comma. A Web site serves a default page whenever a browser request does not specify a document name.

Home Directory Settings

The following settings are available in the Home Directory area for a Web site in the Internet Information Services view.

Table 12-71 • Home Directory Settings for a Web Site

Setting	Description
Content Source Path (Local or UNC)	This setting identifies the local path or network directory path that stores your Web site files. • If the content for the Web site is on the target system, click the ellipsis button (...) in this setting to specify a local path. The Browse for Directory dialog box opens. In a Basic MSI or InstallScript MSI project, this dialog box enables you to select a Windows Installer property (such as [IISROOTFOLDER]) or create a new one. In an InstallScript project, this dialog box enables you to select an InstallScript variable (such as <IISROOTFOLDER>) or create a new one. By default, the files are stored in IISROOTFOLDER. • If the content for the Web site is not on the target system, click the UNC button in this setting to specify a network location. Following is an example: \\server\share  ***Tip*** • *Each Web site should have a unique physical path, especially if the Web site is going to be installed on a Windows Vista or later system or a Windows Server 2008 or later system. To learn more, see Run-Time Requirements for IIS Support.*
Script Source Access	Specify whether you want to allow end users to access source code if either read or write permissions are set. Source code includes scripts in ASP applications.
Read Access	Specify whether you want to provide end users with read access to the Web site.
Write Access	Specify whether you want to provide end users with write access to the Web site. This means that end users can change the Web site's properties on the target machine.
Directory Browsing	Specify whether you want to allow end users to see all the virtual directories and subdirectories below this Web site.
Log Visits	Specify whether you want to record visits to this Web site in a log file. Visits are recorded only if logging is enabled for this Web site.

Table 12-71 • Home Directory Settings for a Web Site (cont.)

Setting	Description
Index this Resource	Specify whether you want to allow Microsoft Indexing Service to include this directory in a full-text index of your Web site. This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.

Application Settings

The following settings are available in the Application Settings area for a Web site in the Internet Information Services view.

Table 12-72 • Application Settings for a Web Site

Setting	Description
Application Pool	To associate the selected Web site with an application pool, select its name in the list. As an alternative, you can click the ellipsis button (...) to select or create a string entry for the application pool. For more information, see Using String Entries in InstallShield. This setting applies to IIS 6 and later. Earlier versions of IIS ignore this setting.  ***Important*** • *The application pool that you specify should be on the target system at run time or part of your installation; otherwise, the server may generate an error such as error 403.18.*
Application Mappings	To customize the directory's application mappings, click the ellipsis button (...) in this setting. This opens the Application Mappings dialog box, which enables you to add, edit, and delete a mapping between a file name extension and the application that processes those files.
MIME Types	To add, edit, or delete MIME types for the selected Web site, click the ellipsis button (...) in this setting. This opens the MIME Types dialog box, which enables you to add, edit, and delete a mapping between a file name extension and the corresponding content type that is served as a static file by the Web server on the target system to a browser or mail client.
Session Timeout (minutes)	Specify the number of minutes that a session can remain idle before the server terminates it automatically. If the end user does not refresh or request a page within the timeout period, the session ends. The default value is 20 minutes.
ASP Script Timeout (seconds)	Specify the length of time in seconds that .asp pages will allow a script to run before terminating and writing an event to the Windows Event Log. The minimum value for this property is 1 second; the default value is 90 seconds.

Security Settings

When you select a Web site in the Internet Information Services view, InstallShield displays several security-related settings in the Security area. The Security area lets you configure your Web server to verify the identify of users. You can authenticate users to prevent unauthorized ones from establishing a Web (HTTP) connection to restricted content. For more information, refer to the IIS documentation.

The Security area contains several categories of settings:

- Anonymous Connection
- Authenticated Access
- Secure Communication

The settings in the Anonymous Connection area are as follows.

Table 12-73 • Anonymous Connection Settings in the Security Settings Area

Setting	Description
Enable Anonymous Access	Specify whether you want to allow users to establish an anonymous connection. If you do want to allow anonymous connections, also enter the appropriate Windows user account information. If you do not need the Web server to confirm the identity of end users before they can access the content, select No for this setting.
IIS Controls Anonymous Password	Specify whether you want to automatically synchronize your anonymous password settings with those set in Windows on the target system. If the password that you type for the anonymous account differs from the password that Windows has, anonymous authentication will not work.  ***Note*** • *Password synchronization should be used only with anonymous user accounts defined on the local computer, not with anonymous accounts on remote computers.*
Anonymous User Name	If you are enabling anonymous connections, type the name of the anonymous account.
Anonymous Password	If you have selected No for the IIS Controls Anonymous Password setting, type the anonymous user account password. The password is used only within Windows. Anonymous users do not log on by using a user name and password.

The settings in the Authenticated Access area are as follows.

Table 12-74 • Authenticated Access Settings in the Security Settings Area

Setting	Description
Basic authentication	Specify whether you want to enable the basic authentication method for collecting user name and password information for end users who access the Web site.  ***Important*** • *With the basic method of authentication, user names and passwords are not encrypted when they are transmitted across the network. An unscrupulous end user who has network monitoring tools could intercept user names and passwords.*
Integrated Windows authentication	Specify whether you want to enable integrated Windows authentication. Integrated Windows authentication uses a cryptographic exchange with the end user's browser to confirm the identity of the user. When integrated Windows authentication is enabled, the Web site will use it only under the following conditions: • Anonymous access is disabled. • Anonymous access is denied because Windows file system permissions have been set, requiring end users to provide a Windows user name and password before establishing a connection with restricted content.

The settings in the Secure Communication area are as follows.

Table 12-75 • Secure Communication Settings in the Security Settings Area

Setting	Description
SSL certificate	To specify a server certificate that should be installed on the target system, click the ellipsis button (...) in this setting, and then select the appropriate security certificate file (.cer or .pfx). As an alternative, you can select a certificate from the list if your project already contains one or more certificates. InstallShield stores the .cer file in the **Binary** table. If no certificate is configured to be installed, this setting is blank.
SSL certificate password	If the certificate that you specified has a password, enter it in this setting.

Advanced Settings

The following settings are available in the Advanced area for a Web site in the Internet Information Services view.

Table 12-76 • Advanced Settings for a Web Site

Setting	Description
Custom Errors	To customize HTTP errors that are sent to clients when Web server errors occur, select the ellipsis button (...) in this setting. The Custom Errors dialog box opens, enabling you to specify the page that should be displayed for one or more HTTP errors. Administrators can use generic HTTP 1.1 errors, detailed custom error pages that IIS provides, or your own custom error pages that are you including in the installation.
Other IIS Properties	To specify values for IIS settings that are not displayed in the other areas in this view, select the ellipsis button (...) in this setting. The Other IIS Properties dialog box opens, enabling you to set the value of one or more IIS properties. To learn more, see Configuring Advanced IIS Settings. The advanced settings apply to IIS 6 and earlier. IIS 7 ignores these settings. For help on specific settings, see “Metabase Property Reference” on the MSDN Web site.

Application and Virtual Directory Settings

Project • *The Internet Information Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

You can add applications and virtual directories to your Web site in the Internet Information Services view. When you select an application or virtual directory in this view, many settings are displayed. The settings are organized into several main categories:

- General
- Virtual Directory
- Application Settings
- Security
- Advanced

General Settings

The following settings are available in the General area for an application or a virtual directory in the Internet Information Services view.

Table 12-77 • General Settings for an Application or a Virtual Directory

Setting	Description
Name	Enter a name for the application or virtual directory. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Component	Select the component with which the application or virtual directory is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.
ASP.NET Version	 ***Note*** • *This setting applies to applications but not virtual directories.* To set the ASP.NET version for the application, enter the complete version number, or select it from the list. For example, to specify version 2 of ASP.NET, type `2.0.50727`. To specify version 1.1 of ASP.NET, type `1.1.4322`. If you specify an ASP.NET version for a Web site, IIS uses that same version number for any of the Web site's applications.  ***Important*** • *If your installation may be run on a Windows Vista or later system, you may not want to set the ASP.NET version. Also note that if you specify version 3 of ASP.NET, an error occurs at run time. For more information, see Setting the ASP.NET Version for a Web Site or Application.*

Table 12-77 • General Settings for an Application or a Virtual Directory (cont.)

Setting	Description
ASP.NET Platform	 ***Note*** • *This setting applies to applications but not virtual directories.* If the installation may be run on a 64-bit version of Windows with the .NET Framework, specify which ASP.NET platform should be used to map the application to the ASP.NET version: • **32-bit**—The 32-bit version of the ASP.NET IIS Registration tool should be used. Select this option if Yes is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails. • **64-bit**—The 64-bit version of the ASP.NET IIS Registration tool should be used. Select this option if No is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails. For more information, see Considerations for Supporting IIS 6 on 64-Bit Platforms.
Default Documents	Type the name of the default page on your application or virtual directory. To specify multiple pages, separate each with a comma. A application or virtual directory serves a default page whenever a browser request does not specify a document name.

Virtual Directory Settings

The following settings are available in the Virtual Directory area for an application or a virtual directory in the Internet Information Services view.

Table 12-78 • Virtual Directory Settings for an Application or a Virtual Directory

Setting	Description
Content Source Path (Local or UNC)	This setting identifies the local path or network directory path that stores the default files for your application or virtual directory. • If the content for the application or virtual directory is on the target system, click the ellipsis button (...) in this setting to specify a local path. The Browse for Directory dialog box opens. In a Basic MSI or InstallScript MSI project, this dialog box enables you to select a Windows Installer property (such as [IISROOTFOLDER]) or create a new one. In an InstallScript project, this dialog box enables you to select an InstallScript variable (such as <IISROOTFOLDER>) or create a new one. By default, the files are stored in IISROOTFOLDER. • If the content for the application or virtual directory is not on the target system, click the UNC button in this setting to specify a network location. Following is an example: \\server\share  ***Tip*** • *Each application or virtual directory should have a unique physical path, especially if it is going to be installed on a Windows Vista or later system or a Windows Server 2008 or later system. To learn more, see Run-Time Requirements for IIS Support.*
Script Source Access	Specify whether you want to allow end users to access source code if either read or write permissions are set. Source code includes scripts in ASP applications.
Read Access	Specify whether you want to provide end users with read access to the application or virtual directory.
Write Access	Specify whether you want to provide end users with write access to the application or virtual directory. This means that end users can change the application's or virtual directory's properties on the target machine.
Directory Browsing	Specify whether you want to allow end users to see all the virtual directories and subdirectories below this application or virtual directory.
Log Visits	Specify whether you want to record visits to this application or virtual directory in a log file. Visits are recorded only if logging is enabled.

Table 12-78 • Virtual Directory Settings for an Application or a Virtual Directory (cont.)

Setting	Description
Index this Resource	Specify whether you want to allow Microsoft Indexing Service to include this application or virtual directory in a full-text index. This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.

Application Settings

The following settings are available in the Application Settings area for an application or a virtual directory in the Internet Information Services view.

Table 12-79 • Application Settings for an Application or a Virtual Directory

Setting	Description
Application Name	To associate the selected virtual directory with an application, specify the application name. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Note*** • *This setting is available for virtual directories, but not for applications.* *If the virtual directory was created in InstallShield 2009 or earlier and then upgraded to the current version of InstallShield, this setting is displayed. Otherwise, this setting is not included.*
Application Pool	 ***Note*** • *This setting applies to applications but not virtual directories.* To associate the selected application with an application pool, select its name in the list. As an alternative, you can click the ellipsis button (...) to select or create a string entry for the application pool. For more information, see Using String Entries in InstallShield. This setting applies to IIS 6 and later. Earlier versions of IIS ignore this setting.  ***Important*** • *The application pool that you specify should be on the target system at run time or part of your installation; otherwise, the server may generate an error such as error 403.18.*

Table 12-79 • Application Settings for an Application or a Virtual Directory (cont.)

Setting	Description
Application Mappings	To customize the directory's application mappings, click the ellipsis button (...) in this setting. This opens the Application Mappings dialog box, which enables you to add, edit, and delete a mapping between a file name extension and the application that processes those files.
MIME Types	To add, edit, or delete MIME types for the selected application or virtual directory, click the ellipsis button (...) in this setting. This opens the MIME Types dialog box, which enables you to add, edit, and delete a mapping between a file name extension and the corresponding content type that is served as a static file by the Web server on the target system to a browser or mail client.
Session Timeout (minutes)	Specify the number of minutes that a session can remain idle before the server terminates it automatically. If the end user does not refresh or request a page within the timeout period, the session ends. The default value is 20 minutes.
ASP Script Timeout (seconds)	Specify the length of time in seconds that .asp pages will allow a script to run before terminating and writing an event to the Windows Event Log. The minimum value for this property is 1 second and the default value is 90 seconds.
Execute Permissions	Specify what level of program execution is allowed for the selected application or virtual directory. Available options are: • **None**—Only static files such as HTML and image files can be accessed. • **Scripts Only**—Only scripts such as ASP scripts can be run. • **Scripts and Executables**—All file types can be accessed or run.
Application Protection	 ***Note*** • *This setting applies to applications but not virtual directories.* Specify the level of protection: • **High**—The application is run in an isolated process that is separate from other processes. • **Medium**—The application is run in an isolated pooled process with other applications. • **Low**—The application is run in the same process as Web services. This setting applies to IIS 5 and earlier. Later versions ignore this setting.

Security Settings

When you select an application or a virtual directory in the Internet Information Services view, InstallShield displays several security-related settings in the Security area. The Security area lets you configure your application or virtual directory to verify the identify of users. You can authenticate users to prevent unauthorized ones from establishing a Web (HTTP) connection to restricted content. For more information, refer to the IIS documentation.

The Security area contains the following categories of settings:

- Anonymous Connection
- Authenticated Access

The settings in the Anonymous Connection area are as follows.

Table 12-80 • Anonymous Connection Settings in the Security Settings Area

Setting	Description
Enable Anonymous Access	Specify whether you want to allow users to establish an anonymous connection. If you do want to allow anonymous connections, also enter the appropriate Windows user account information. If you do not need the Web server to confirm the identity of end users before they can access the content, select No for this setting.
IIS Controls Anonymous Password	Specify whether you want to automatically synchronize your anonymous password settings with those set in Windows on the target system. If the password that you type for the anonymous account differs from the password that Windows has, anonymous authentication will not work.  ***Note*** • *Password synchronization should be used only with anonymous user accounts defined on the local computer, not with anonymous accounts on remote computers.*
Anonymous User Name	If you are enabling anonymous connections, type the name of the anonymous account.
Anonymous Password	If you have selected No for the IIS Controls Anonymous Password setting, type the anonymous user account password. The password is used only within Windows. Anonymous users do not log on by using a user name and password.

The settings in the Authenticated Access area are as follows.

Table 12-81 • Authenticated Access Settings in the Security Settings Area

Setting	Description
Basic authentication	Specify whether you want to enable the basic authentication method for collecting user name and password information for end users who access the application or virtual directory.  ***Important*** • *With the basic method of authentication, user names and passwords are not encrypted when they are transmitted across the network. An unscrupulous end user who has network monitoring tools could intercept user names and passwords.*

Table 12-81 • Authenticated Access Settings in the Security Settings Area (cont.)

Setting	Description
Integrated Windows authentication	Specify whether you want to enable integrated Windows authentication. Integrated Windows authentication uses a cryptographic exchange with the end user's browser to confirm the identity of the user. When integrated Windows authentication is enabled, the Web site will use it only under the following conditions: • Anonymous access is disabled. • Anonymous access is denied because Windows file system permissions have been set, requiring end users to provide a Windows user name and password before establishing a connection with restricted content.

Advanced Settings

The following settings are available in the Advanced area for an application or a virtual directory in the Internet Information Services view.

Table 12-82 • Advanced Settings for an Application or a Virtual Directory

Setting	Description
Custom Errors	To customize HTTP errors that are sent to clients when Web server errors occur, select the ellipsis button (...) in this setting. The Custom Errors dialog box opens, enabling you to specify the page that should be displayed for one or more HTTP errors. Administrators can use generic HTTP 1.1 errors, detailed custom error pages that IIS provides, or your own custom error pages that are you including in the installation.
Other IIS Properties	To specify values for IIS settings that are not displayed in the other areas in this view, select the ellipsis button (...) in this setting. The Other IIS Properties dialog box opens, enabling you to set the value of one or more IIS properties. To learn more, see Configuring Advanced IIS Settings. The advanced settings apply to IIS 6 and earlier. IIS 7 ignores these settings. For help on specific settings, see “Metabase Property Reference” on the MSDN Web site.

Application Pool Settings

Project • *The Internet Information Services view is available in the following project types:*

- *Basic MSI*

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

Note • *Application pools are available only on machines with IIS 6.0 or later installed.*

Use the Application Pools item in the Internet Information Services view to add and delete application pools.

When you select an application pool in the explorer, many settings are displayed. The application pool settings are organized into several main categories:

- General
- CPU Settings
- Process Model
- Recycling

General Settings

The following settings are available in the General area for an application pool in the Internet Information Services view.

Table 12-83 • General Settings for an Application Pool

Setting	Description
Name	Provide a display name for the application pool that you want to configure. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Component	Select the component with which the application pool is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.

Table 12-83 • General Settings for an Application Pool (cont.)

Setting	Description
Overwrite Existing Application Pool	Select the appropriate option to indicate the behavior that you want to occur if the application pool already exists on the target system at run time. Available options are: • **Yes**—If the application pool already exists on the target system, the installation overwrites its settings with the values that you have configured for it in your project. During uninstallation, the application pool is uninstalled. • **No**—If the application pool already exists on the target system, the installation does not overwrite any of its settings; during uninstallation, the application pool is left on the target system. If the application pool does not exist on the target system, the installation creates it; during uninstallation, the application pool is uninstalled.
Mark Component as Permanent	Specify whether you want the component that contains the application pool to be removed when the component's feature is uninstalled. If you want the component to be marked as permanent so that it is not uninstalled, select Yes.
.NET Framework Version	If appropriate, select the .NET Framework version that the application pool should load. This setting applies to IIS 7 and later. Earlier versions of IIS ignore this setting.
Queue Length	Specify the maximum number of requests that HTTP.sys should queue for the application pool. The default value is 4000.
Managed Pipeline Mode	Specify the appropriate request-processing pipeline mode for the selected application pool: • **Integrated**—The ASP.NET request processing is integrated into the IIS 7 request-processing pipeline. This is the default option. • **Classic**—IIS routes requests for code through ISAPI, which processes the requests as if the application were running in IIS 6. This setting applies to IIS 7. Earlier versions of IIS ignore this setting.
Enable 32-Bit Applications	Specify whether you want to allow 32-bit applications in the selected application pool to be run on 64-bit systems. This setting applies to application pools that are installed on IIS 7 or later. Earlier versions of IIS ignore this setting. For more information, see Considerations for Supporting IIS 6 on 64-Bit Platforms.

CPU Settings

The following settings are available in the CPU area for an application pool in the Internet Information Services view.

Table 12-84 • CPU Settings for an Application Pool

Setting	Description
Limit	Specify the maximum percentage of CPU time (in 1/1000ths of a percent) that the worker processes in the application pool are allowed to consume over the period of time that is indicated for the Limit Interval setting. To avoid limiting the worker processes to a percentage of CPU time, specify the number 0. If you leave this setting blank, InstallShield does not configure the CPU limit, and whatever value is set by default on the server is used for your application pool.
Limit Action	Specify the action that should occur if the CPU limit that is set for the application pool is exceeded. Available options are: • **No action**—An event entry is added to the event log. No other action occurs. • **Shutdown**—An event entry is added to the event log. In addition, the application pool is shut down for the remainder of the limit interval.
Limit Interval (minutes)	Specify the amount of time (in minutes) between the reset intervals for CPU monitoring and throttling limits on the application pool. When this time interval has elapsed, IIS resets the CPU timers for the logging and limit intervals. To disable CPU monitoring, specify the number 0. If you leave this setting blank, InstallShield does not configure the CPU limit interval, and whatever value is set by default on the server is used for your application pool.

Process Model Settings

The following settings are available in the Process Model area for an application pool in the Internet Information Services view.

Table 12-85 • Process Model Settings for an Application Pool

Setting	Description
Identity	Specify the account under which the application pool's worker process should run. Available options are: • **NetworkService**—This account is a member of the Users group, and it has the fewest user rights that are required to run the application. This account provides the most security against an attack that might try to take over the Web server. • **LocalService**—This account is a member of the Users group, and it has the same user rights as the NetworkService account. However, the LocalService account is limited to the local computer. • **LocalSystem**—This account has all user rights, and it is part of the Administrators group. • **SpecificUser**—If you do not want to use one of the predefined accounts, select this option, and also specify the user name and password for the account that you want to use. • **ApplicationPoolIdentity**—This account uses a virtual identity that is unique to the selected application pool for running the application pool's worker process. Support for this option is available on target systems that have IIS 7 and later. If this new option is selected in an installation that is run on a system that has IIS 6, the NetworkService account is used instead for the application pool's identity.  ***Note*** • *If you use a SpecificUser identity, ensure that the user account that you specify is a member of the IIS_IUSRS group on the Web server so that the account can access the appropriate resources.*
SpecificUser User Name	If you select SpecificUser for the Identity setting, enter the specific user's user name.
SpecificUser User Password	If you select SpecificUser for the Identity setting, enter the specific user's password.  ***Project*** • *In Basic MSI and InstallScript MSI projects, you can specify a Windows Installer property for the password. To prevent the password from being logged, set the value of the* ***MsiHiddenProperties*** *property to the name of the Windows Installer property that you are using for the password. For more information, see MsiHiddenProperties in the Windows Installer Help Library.*

Table 12-85 • Process Model Settings for an Application Pool (cont.)

Setting	Description
Idle Timeout (minutes)	Specify the amount of time (in minutes) for which a worker process should remain idle before it is shut down.
Maximum Worker Processes	Specify the maximum number of worker processes that can service requests for the application pool. If you specify a number greater than 1, the application pool is considered to be a Web garden.

Recycling Settings

The Recycling settings for an application pool in the Internet Information Services view let you configure the recycling of worker processes. In worker process isolation mode, you can configure IIS to periodically restart worker processes in an application pool, enabling you to manage precisely those worker processes that are faulty. This helps to ensure that specified applications in those pools remain healthy and that system resources can be recovered.

The following settings are available in the Recycling area for an application pool in the Internet Information Services view.

Table 12-86 • Recycling Settings for an Application Pool

Setting	Description
Regular Time Interval (minutes)	Specify the amount of time (in minutes) after which the application pool should be recycles. To prevent the application pool from being recycled on a regular interval, enter the number 0.
Request Limit	Specify the maximum number of requests that the application pool can process before it is recycled. To allow the application pool to process an unlimited number of requests, enter the number 0.

Table 12-86 • Recycling Settings for an Application Pool (cont.)

Setting	Description
Specific Times	To specify the time of day when the application pool should be recycled, click the ellipsis button (...) in this setting. The Recycling Specific Times dialog box opens, enabling you to configure the specific local time or times. When you specify a time, use the 24-hour format. For example, to specify 10:00 P.M., enter a time of **22:00**. In this setting, InstallShield indicates the number of times that were specified, and also lists the times in square brackets. Times are separated with a vertical bar. For example, the following value indicates that the specific recycling times are 5:00 A.M. and 11:00 P.M.: `2 defined [05:00|23:00]`

Web Service Extension Settings

Project • *The Internet Information Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

Note • *Web service extensions are available only on machines with IIS 6.0 or later installed.*

On systems with IIS 7, Web service extensions require that the IIS Metabase and IIS 6 Configuration Compatibility feature be installed. For more information, see Version-Specific Information for IIS Support in InstallShield.

Use the Web Service Extensions item in the Internet Information Services view to add and delete Web service extensions.

When you select a Web service extension in the explorer, the following settings are available for you to configure.

Table 12-87 • General Settings for a Web Service Extension

Setting	Description
Description	Type the name of the new Web service extension file. The name is associated with a string ID, which can be translated. Click the Browse button to locate an existing string, or create a new one once the Select String dialog box has been launched.

Table 12-87 • General Settings for a Web Service Extension (cont.)

Setting	Description
Component	Select the component with which the Web service extension is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.
Mark Component as Permanent	Specify whether you want the component that contains the Web service extension to be removed when the component's feature is uninstalled. If you want the component to be marked as permanent so that it is not uninstalled, select Yes.
Full Path to File	Type the name of the Web service extension file.  ***Tip*** • *You can use directory IDs to specify a file. For example, you can specify a directory and a file as* ***[INSTALLDIR]file.exe****.*
Group ID	Type the name of Web service extension's group ID. Group IDs enable you to classify different DLLs and common gateway interfaces (CGIs) and have dependencies for the applications.  ***Tip*** • *You can use directory IDs to specify a group.*
Allow	Specify whether you want to set the status of the Web service extension to Allow.
UI Deletable	Specify whether you want to allow the Web service extension file to be deleted from within IIS Manager.
Overwrite Existing Extensions	Specify whether you want to enable existing extensions to be overwritten.

Component Services View

Project • *The Component Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*

- *Transform*

The Component Services view enables you to manage COM+ applications and components for your installation package. You can manage both COM+ server applications and application proxies. A COM+ application proxy consists of a subset of the attributes of the server application, and it enables remote access from a client machine to the machine where the application resides.

Note the following information regarding component services in InstallShield:

- Only non-system COM+ applications can be added to your project. Therefore, InstallShield displays only non-system COM+ applications under the COM+ Applications explorer in the Component Services view.
- Only the COM+ applications that are installed on the local machine are included in the Component Services view and available for you to add to your projects.
- An application proxy is available for COM+ server applications only, not for library applications.

When you select a COM+ application in the Component Services view, several tabs are displayed:

- Installation
- General
- Security
- Identity
- Activation
- Queuing
- Advanced
- Dump
- Pooling/Recycling

The settings on the Installation tab are InstallShield-specific settings. The settings on the other tabs are similar to those in the Component Services administrative tool in the Control Panel. For details on each of the settings on the Installation tab, see Installation Tab. To learn about the settings on the other tabs, consult the Component Services help.

Installation Tab

Project • *The Component Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*

- *MSM Database*
- *Transform*

The Installation tab is one of the tabs that is displayed when you select a COM+ application in the Component Services view.

Table 12-88 • Installation Tab Settings

Setting	Description
Server	To install the selected COM+ application on other machines, select this check box.
Destination (Server)	The default destination location for COM+ applications is: `[ProgramFilesFolder]COMPlus Applications\{UID}` To install the COM+ files to a different location, select the target destination. If the destination that you want to specify is not available in the list, select the **Browse, create, or modify a directory entry** option.
Condition (Server)	Specify a condition for the COM+ server application if appropriate.
Install user identities with roles	To install the selected COM+ application with the user identities and roles that are configured for the COM+ application on your local machine, select this check box.
Refresh the COM+ settings from the client machine at build	The Component Services view shows COM+ settings that are available in Component Services on the local machine. To refresh the COM+ settings that are displayed in your project with the settings that are available from Component Services on the local machine, select this check box. InstallShield refreshes the settings each time that you build a release.
Install after InstallFinalize action	If the selected COM+ application contains .NET assemblies that need to be installed to the global assembly cache (GAC), select this check box. If you select this check box, the ISComponentServiceFinalize action installs the selected COM+ application after the InstallFinalize action. Windows Installer does not commit changes made in the in-script session to the GAC until InstallFinalize.
Proxy	To install the selected COM+ application as an application proxy, select this check box. A COM+ application proxy consists of a subset of the attributes of the server application, and it enables remote access from a client machine to the machine where the application resides.

Table 12-88 • Installation Tab Settings (cont.)

Setting	Description
Destination (Proxy)	The default destination location for COM+ applications is: `[ProgramFilesFolder]COMPlus Applications\{UID}` To install the COM+ files to a different location, select the target destination. If the destination that you want to specify is not available in the list, select the **Browse, create, or modify a directory entry** option.
Condition (Proxy)	Specify a condition for the proxy server support if appropriate.
Remote Server Name	Specify the name of the remote server computer where the application resides. You can type the exact name or use the default **[REMOTESERVERNAME]** property, which is automatically created when you select the Proxy check box for a COM+ application in your installation.  ***Note*** • *The default value for the **[REMOTESERVERNAME]** property is the name of the machine used to add the COM+ application to the installation project in InstallShield. To change the value of the [**REMOTESERVERNAME]** property, use the Property Manager view.* If you would like the end user to be able to specify the remote server, add a Remote Server edit field control to an end-user dialog in the Dialogs view. Set the Property value of this control to `REMOTESERVERNAME`.
Enable distributed COM on the client machine	Select this check box if appropriate. Clear this check box if you know that distributed component object model (DCOM) is already enabled on all client machines and you will not have administrative privileges on them. If you select this check box, Y is written at installation time to the EnableDCOM entry of the HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Ole registry key to enable DCOM.  ***Note*** • *End users can enable or disable DCOM on their machines using the Component Services administrative tool in the Control Panel. However, the application proxy will not work on a client machine if DCOM is disabled on that machine. For this reason, you may want to select the **Enable distributed COM on the client machine** check box.* *If an end user uninstalls the application proxy support, the EnableDCOM registry entry is not changed, even if the installation process involved changing this registry entry to Y on the target machine.*

Table 12-88 • Installation Tab Settings (cont.)

Setting	Description
Features	Select the feature that should contain the selected COM+ application. To add the COM+ application to a new feature, first create a feature in the Features view, and then select its check box in this list.

SQL Scripts View

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The SQL Scripts view provides a central location for managing and organizing all SQL scripts by server connections and settings. This view provides support for Microsoft SQL Server, Microsoft Windows Azure, MySQL, and Oracle. You can perform most of the following major functions to configure your SQL servers from the SQL Scripts view. Some limitations apply to certain server types.

- Connect to SQL servers.
- Import catalog schema and/or data.
- Associate SQL scripts with features.
- Set required SQL server/script properties (server name, database name, authentication method, etc.).
- Set SQL script for execution during installation or uninstallation.
- Edit SQL scripts.
- Require and/or target specific versions of Windows Azure SQL, SQL Server, MySQL, or Oracle.
- Define SQL script text replacement.
- Open scripts in Microsoft SQL Server Management Studio or Microsoft SQL Server Query Analyzer.

Note • *The import database functionality applies to the Microsoft SQL Server Database. Oracle users should refer to the Oracle Web page on Oracle Database Utilities for information on utilities that may work in conjunction with InstallShield.*

If you have Microsoft SQL Server Management Studio or Microsoft SQL Server 2000 SQL Query Analyzer installed on your system, you can open a new SQL script that you have added to your project to test, edit, and syntax-check the script. To launch one of those tools and open your script from within InstallShield, right-click the script file in the

SQL Scripts view and then click Open Script in Microsoft SQL Server Management Studio. InstallShield searches your system for the following tools in order and launches the first one that it finds:

1. *Microsoft SQL Server 2008 Management Studio (any edition, including Express; `ssms.exe`)*
2. *Microsoft SQL Server 2005 Management Studio (`SqlWb.exe`)*
3. *Microsoft SQL Server 2005 Management Studio Express (`ssmsee.exe`)*
4. *Microsoft SQL Server 2000 Query Analyzer (`isqlw.exe`)*

SQL Connections

In the SQL Scripts view, scripts are organized by connection, since no script can run on a server until a connection has been established. Furthermore, the grouping of connections with corresponding scripts facilitates the sharing of connection settings to different scripts.

When you create or select a SQL connection in the SQL Scripts view, the following tabs are available:

- General tab
- Requirements tab
- Advanced tab

General Tab

Project *• The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

You can configure the following settings on the General tab for a SQL connection in the SQL Scripts view.

Table 12-89 • General Tab Settings for a SQL Connection

Setting	Description
Catalog Name	 ***Note*** • *Creating a new application catalog based on Oracle database settings is equivalent to creating a new database based on SQL Server settings in InstallShield. However, terminology is slightly different in reference to Oracle. In Oracle, the catalog is equivalent to the schema being used for every new application catalog. Therefore, note the semantic differences between "catalog" and "database" when understanding the differences between SQL Server and Oracle support in the documentation.* Enter the name of the SQL catalog to which you want to create a connection during the installation. If you leave this setting blank, the installation attempts to connect to the default catalog during the connection test phase at run time. If the catalog you specify is not found at that time, the installation still creates the specified catalog upon connection verification. This is because the Create Catalog If Absent option is selected in InstallShield by default.
Create Catalog If Absent	This option is selected by default. If this option is selected, the installation creates the specified catalog upon connection verification at the SQLLogin dialog at run time. You should note that when the **Create Catalog If Absent** option is selected, different SQL commands are issued for the various supported server types. For Microsoft SQL Server, Microsoft Windows Azure SQL, and MySQL, selecting this option results in the following: `CREATE DATABASE CatalogName` *CatalogName* is the value that you specify in the Catalog Name box on the General tab for a connection in the SQL Scripts view. For Oracle, selecting the **Create Catalog If Absent** option results in the following: `CREATE USER CatalogName IDENTIFIED BY CatalogName DEFAULT TABLESPACE USERS QUOTA UNLIMITED on USERSGRANT CONNECT TO CatalogNameGRANT DBA TO CatalogNameALTER USER CatalogName DEFAULT ROLE ALL` Therefore, you should note that for Oracle, the schema name serves as the user name and password for the selected catalog by default.

Table 12-89 • General Tab Settings for a SQL Connection (cont.)

Setting	Description
Create Catalog If Absent (cont.)	If you do not wish to use the **Create Catalog If Absent** option to create a catalog, you can run a customized script to create a catalog. When you run a custom script, you can use the Runtime tab for the script in the SQL Scripts view to schedule the execution of the script during login. For more information about running a customized script, see the following instructions: • Creating a Sample Installation that Creates a SQL Server Database by Running Customized SQL Script • Creating a Sample Installation that Creates an Oracle Schema by Running Customized SQL Script  ***Project*** *• In the case where the* ***Create Catalog If Absent*** *option is cleared during installation design and the catalog is not found at run time, the installation behavior slightly differs for the following project types at run time.* • *For Basic MSI, DIM, and InstallScript MSI projects—The installation connects to the default catalog at the SQLLogin dialog during run time to test the connection. This enables the installation to run custom code during the InstallExecuteSequence. However, the presence of the catalog needs to be guaranteed when the SQL scripts that are specified in your project are executed. The run time re-establishes the connection with the specified catalog to run the scripts. If the catalog is absent at this point, the connection fails.* • *For InstallScript projects—The catalog needs to be present at the SQLLogin dialog since the run time holds the connection until the installation ends, once the connection is established. In this scenario, you can run custom InstallScript code to create the catalog before the SQLLogin dialog shows up to override the default behavior.*

Table 12-89 • General Tab Settings for a SQL Connection (cont.)

Setting	Description
Default Target Server Name	For Microsoft SQL Server and MySQL, you can enter the machine name of the target SQL Server here. This setting is optional. For Microsoft Windows Azure SQL, enter a fully qualified server name in the following format: `tcp:`*`ServerName`*`.database.windows.net` Following is an example: `tcp:wbzdh64drd.database.windows.net` For Oracle client machines with Oracle 11g client software installed, enter a SQL connection URL string in the following format: `//host: [port] [/service name]` The following is an example of what you would type to connect to a specified remote Oracle machine: `//sch01jsmithrxp.installshield.com:1521/ORCL` You can also specify a local net service name if you have tnsnames.ora configured on the client machine. For more details, consult the Oracle Support Web site.
Connect using	Select the type of authentication you want to use to connect to the specified catalog. For SQL Server Authentication, enter login and password information for the targeted server.
Comments	Enter comments about this connection. These comments are not displayed to the end user.

Requirements Tab

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

On the Requirements tab, you can select a database server and specify version requirements for the type of server that the installation should target at run time. You have the option to add, delete, or edit existing version requirements that are associated with a particular database server.

Task: ***To select a database server and specify version requirements for the type of server that the installation will target at run time:***

1. In the **Database Servers** list, select the check box for the appropriate database server, and then highlight that server type.

   If you select more than one database server, at run time, the installation establishes a connection and performs the specified requirement checks on the selected server types based on the sequence of the server types as they appear in the table. That is, if the installation finds a match after checking requirements against the first database server in the table, a connection and a check is not done on any selected subsequent database types in the table. The SQL scripts that are associated with the connection are installed to that first database server that is verified.

2. Click the **Add** button. The New Version Requirement dialog box for the type of database server that you highlighted opens.
3. Specify version requirements for the type of server that the installation should target at run time.
4. Click **OK**.

InstallShield adds a new database server entry and its appropriate version information to the table next to the Database Servers list.

Task: ***To delete or edit an entry in the Database Servers table:***

1. Select the database server that the installation is targeting at run time.
2. Select the version requirement that you want to delete or edit.
3. Click **Delete** or **Edit**. When you click **Edit**, either the Edit Version Requirement dialog box for the appropriate database server type opens.
4. Update the settings and click **OK**.

Note • *Multiselection of items in the version requirements section of the table applies only to the Delete operation.*

Allow installation to continue when minimum requirements are not met

If you want to allow the installation to continue if the minimum database server requirements are not met, select this check box.

If you select this check box and the minimum requirements are not met, the installation skips the SQL connection and all of its SQL scripts, and continues with the rest of the installation.

If you clear this check box and the minimum requirements are not met, the installation does not allow the end user to continue with the rest of the installation.

This check box is cleared by default.

Allow installation to Microsoft SQL Server Desktop Engine/SQL Server Express

Select this check box if it is true. Clear this check box if you want to prohibit installation to SQL Server Desktop Engine and SQL Server Express.

Advanced Tab

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The Advanced tab provides advanced settings that should be set only by expert users to expand and customize the default functionality that is available in InstallShield.

Table 12-90 • Advanced Tab Settings for a SQL Connection

Setting	Project Type	Description
Command Timeout (seconds)	Basic MSI, DIM, InstallScript, InstallScript MSI	Specify the command timeout period. The default is 30 seconds. The valid range of this value is 0 to 2147483647. A value of 0 indicates no limit. Once this period of time has elapsed without completing the command, an error occurs and ADO cancels the command.

Table 12-90 • Advanced Tab Settings for a SQL Connection (cont.)

Setting	Project Type	Description
Batch Separator	Basic MSI, DIM, InstallScript, InstallScript MSI	Specify the appropriate batch separator for the selected connection. The batch separator is used for all SQL scripts that are associated with this connection. The default value is **GO**, which is the same default that is used in Microsoft products. Oracle utilities use a slash (/) as the default value. A batch separator is a command that is recognized by SQL utilities such as osql, isql, and Microsoft SQL Server Management Studio, as well as InstallShield. The run time interprets a batch separator as a signal that it should send the current batch of SQL statements to a database server.  ***Note*** • *A semicolon (;) is the only batch separator that does not need to be on a separate new line by itself. All other batch separators must be on a separate line. For example, if you specify a slash as a batch separator and you have the following SQL script, the installation sends* ***some statement*** *to a SQL server as a batch first; then it sends* ***another statement*** *as another batch:* `some statement` `/` `another statement` `/` *If you have the following script, the installation sends all of the lines, including the slashes at the end of lines, as a batch:* `some statement/` `another statement/`

Table 12-90 • Advanced Tab Settings for a SQL Connection (cont.)

Setting	Project Type	Description
Target Server Property Name	Basic MSI, DIM, InstallScript MSI	Select the property that identifies one of the following, depending on the type of database server that the installation is targeting: • The name of the target server instance (for Microsoft SQL Server and MySQL) • The fully qualified server name (for Microsoft Windows Azure SQL) • The connect URL string or local net service name (for Oracle) The default property is **IS_SQLSERVER_SERVER**. If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties.
Target Catalog Property Name	Basic MSI, DIM, InstallScript MSI	This setting enables you to select a property that identifies the name of the SQL catalog to which you want to create a connection during the installation. The default property is **IS_SQLSERVER_DATABASE**. If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties.
Authentication Type Property Name	Basic MSI, DIM, InstallScript MSI	This setting enables you to select a property that identifies the type of authentication that you want to use to connect to the specified catalog. The default property is **IS_SQLSERVER_AUTHENTICATION**. The following numbers are valid property values: • **0**—Windows authentication credential of the current user • **1**—Server authentication If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties.

Table 12-90 • Advanced Tab Settings for a SQL Connection (cont.)

Setting	Project Type	Description
Server Authentication Login ID Property Name	Basic MSI, DIM, InstallScript MSI	This setting enables you to select a property that identifies the login ID that should be used for server authentication. The default property is **IS_SQLSERVER_USERNAME**. If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties.
Server Authentication Password Property Name	Basic MSI, DIM, InstallScript MSI	This setting enables you to select a property that identifies the password that should be used for server authentication. The default property is **IS_SQLSERVER_PASSWORD**. If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties.

Project • *If you change any of the SQL properties on the Advanced tab of a SQL connection in a Basic MSI project, the corresponding properties are not automatically updated in the SQLLogin dialog in the Dialogs view. Therefore, you must manually change the properties in the dialog to match the properties that selected on the Advanced tab of the SQL connection.*

SQL Script Level

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

When you click a SQL script in the SQL Scripts view, the following tabs are available:

- General tab
- Script tab
- Runtime tab

- Database Import tab
- Text Replacement tab

Note • *If you have Microsoft SQL Server Management Studio or Microsoft SQL Server 2000 SQL Query Analyzer installed on your system, you can open a new SQL script that you have added to your project to test, edit, and syntax-check the script. To launch one of those tools and open your script from within InstallShield, right-click the script file in the SQL Scripts view and then click Open Script in Microsoft SQL Server Management Studio. InstallShield searches your system for the following tools in order and launches the first one that it finds:*

1. *Microsoft SQL Server 2008 Management Studio (any edition, including Express; `ssms.exe`)*
2. *Microsoft SQL Server 2005 Management Studio (`SqlWb.exe`)*
3. *Microsoft SQL Server 2005 Management Studio Express (`ssmsee.exe`)*
4. *Microsoft SQL Server 2000 Query Analyzer (`isqlw.exe`)*

General Tab

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

You can configure the following settings on the General tab for a SQL script in the SQL Scripts view.

Table 12-91 • General Tab Settings for a SQL Script

Setting	Description
SQL Script File Name	Click the ellipsis button (...) next to this setting to browse to the SQL script that your installation will execute at run time.
Select Features the SQL Script Belongs to	Select or clear the check boxes for one or more features that you want to contain the SQL script.  ***Project*** • *For DIM projects—The Merged Feature check box in this pane is selected and disabled when you select a SQL script in this view. When you add a DIM to an installation project, you specify the feature that should contain that DIM.*
Component Name	This setting shows the name of the component that contains the SQL script. To move to the Components view and see the component that contains this SQL script, click the hyperlink.

Table 12-91 • General Tab Settings for a SQL Script (cont.)

Setting	Description
Schema Version	Specify a version number to enable script versioning. For more information on this setting, see Specifying a Version Number for a SQL Script File. ***Tip*** • *When you specify a number for the Schema Version setting and InstallShield adds the custom **InstallShield** table for storing the schema version number on the target database, the data is not automatically removed upon uninstallation. Therefore, if you want the installation to be able to roll back the changes, you need to create a custom script upon uninstallation to drop the **InstallShield** table.*
Comments	Enter comments about this SQL script. These comments are not displayed to the end user.

Script Tab

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The Script tab is intended for advanced users. To create a script from an existing database with step-by-step instructions, use the Database Import Wizard.

Note • *This functionality applies to the Microsoft SQL Server Database.*

Runtime Tab

Project • *The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

You can configure the following settings on the Runtime tab for a SQL script in the SQL Scripts view.

Table 12-92 • Runtime Tab Settings for a SQL Script

Setting	Project Type	Description
Script Execution	Basic MSI, DIM, InstallScript, InstallScript MSI	To indicate when you want the installation to execute a SQL script, select the appropriate check box. Available options are: • **Run Script During Install**—This option enables you to run a custom script during installation. This option is also associated with component state because each script is associated in with a feature. Therefore, in Basic MSI, DIM, and InstallScript MSI projects, you can specify conditional statements in conjunction with this setting in the Script Condition area of this tab. In Basic MSI, DIM, and InstallScript MSI projects, the ISSQLServerInstall action is associated with this option. In InstallScript projects, the InstallScript function **SQLRTComponentInstall** is associated with this option. • **Run Script During Uninstall**—This option enables you to run a custom script during uninstallation. This option is also associated with component state because each script is tied in with a feature by design. Therefore, you can specify conditional statements in conjunction with this setting in the Script Condition (only available for Basic MSI and InstallScript MSI projects) section of this tab. In Basic MSI, DIM, and InstallScript MSI projects, the **ISSQLServerUninstall** action is associated with this option. In InstallScript projects, the InstallScript function **SQLRTComponentUninstall** is associated with this option.

Table 12-92 • Runtime Tab Settings for a SQL Script (cont.)

Setting	Project Type	Description
Script Execution (cont.)		• **Run Script During Rollback**—This option enables you to run a custom script during rollback. InstallShield does not roll back the changes automatically. You will have to run a custom script allowing rollback when you select the Run Script During Rollback option. In Basic MSI, DIM, and InstallScript MSI projects, the ISSQLServerRollback action is associated with this option. • **Run Script During Login**—This option enables you to run your script during login. Note that there are some limitations with this option. For example, note that the script changes are irreversible once the end user clicks the Next button on the SQLLogin dialog at run time. If the end user attempts to cancel the installation before clicking the Install button on the ReadyToInstall dialog, the script changes are not rolled back. Also note that the script is executed after credentials and requirements are verified and before a connection has been made to the catalog. Therefore, any schema version requirements that you set for the script during installation design will not have taken place at run time. In Basic MSI, and DIM projects, the ISSQLServerValidate action is associated with this option. In InstallScript MSI projects, the InstallScript function **SQLRTServerValidate** is associated with this option. In InstallScript projects, the InstallScript function **SQLRTConnect** is associated with this option.
Script Error Handling	Basic MSI, DIM, InstallScript, InstallScript MSI	Specify how you want SQL script errors to be handled at run time. Available options are: • On Error, Go to Next Script • On Error, Go to Next Statement • On Error, Abort Installation
Script Condition	Basic MSI, DIM, InstallScript MSI	If you want to specify a condition that Windows Installer must evaluate before the SQL script is run during installation or uninstallation, select the check box and type the conditional statement in the text box. The SQL script is not run if the condition evaluates to false. As an alternative to manually entering a statement, you can click the ellipsis button (...) to launch the Condition Builder dialog box, which simplifies the process of creating a condition.

Database Import Tab

Project *• The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

Tip *• The Database Import functionality currently is only available for Microsoft SQL Server. Oracle users should refer to the Oracle Web page on Oracle Database Utilities for information on utilities that may work in conjunction with InstallShield.*

You can run the Database Import Wizard from this tab to view and modify your import settings. The wizard will walk you through the process of generating a SQL script that re-creates part or all of an existing Microsoft SQL Database. Once you complete the wizard, you can click the Regenerate button on this tab to refresh your script.

The **Regenerate SQL Script at Build** option lets you indicate whether the script should be regenerated each time that you build a release. Regenerating a script every time you build your release can slow down the build process.

Text Replacement Tab

Project *• The SQL Scripts view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The Text Replacement tab lets you specify strings to replace in your SQL script at run time. You should replace text only if it is unique and will not cause any script syntax errors. At run time, the installation replaces the text according to the parameters that you specify.

To add a new search-and-replace entry, click the Add button. To modify an existing search-and-replace entry, select that entry and then click the Edit button. In both cases, the Find and Replace dialog box opens, enabling you to specify search-and-replace parameters.

To delete an existing search-and-replace entry, select that entry and then click the Delete button.

Behavior and Logic View

Project • *The Behavior and Logic view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

By adding custom actions; sequencing actions and dialogs; adding support files; using InstallScript; searching the target system for required files, folders, or other elements; or configuring Windows Installer properties, you can design any custom functionality that your installation requires.

InstallScript

Project • *The InstallScript view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

InstallScript is an installation authoring language that is similar to the C programming language. The InstallScript view provides you with a script editor pane in which you can create and edit your scripts.

Custom Actions and Sequences

Project • *The Custom Actions and Sequences view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

Sequences direct all the actions that are performed during installation, from file transfer to displaying the user interface. Use the Custom Actions and Sequences view to sequence the actions and dialogs in your project.

If Windows Installer does not directly support functionality that is required by your installation program, you can extend your installation program through the use of custom actions in the Custom Actions and Sequences view.

Custom Actions

Project • *The Custom Actions view is available in the following project types:*

- *DIM*
- *Merge Module*
- *MSM Database*

Although merge modules do support the use of custom actions, sequences are not defined through a dedicated view in merge module projects.

Tip • *You can control the launch of custom actions in a merge module by modifying the* ***ModuleInstallExecuteSequence*** *table in the Direct Editor. When you add the merge module to your installation project, all custom actions and dialogs included in the merge module are available for you to insert in the installation's sequences via the Custom Actions and Sequences view.*

Support Files/Billboards

Project • *The Support Files view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript Object*
- *Suite/Advanced UI*

The Support Files/Billboards view is available in the following project types:

- *InstallScript*
- *InstallScript MSI*

Support Files

The Support Files view lets you add, sort, and delete support files—files that are required by your installation project *only* during the installation process.

Billboards

The Billboards area in the Support Files/Billboards view lets you add billboards to your project. Billboards are images that are displayed for a specified amount of time while your installation runs. You can use billboards to provide information about the product being installed or to entertain the end user during the installation process.

System Search

Project *• The System Search view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

Use the System Search view to search for a particular file, folder, registry key, or .ini value on the target system prior to an installation.

Property Manager

Project *• The Property Manager view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

In Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects, the Property Manager view enables you to edit the **Property** table from within the InstallShield interface. Windows Installer properties give you access to many machine-specific variables such as the user's name or company.

In Advanced UI and Suite/Advanced UI projects, the Property Manager view lets you set Advanced UI or Suite/Advanced UI properties that you want to be available to the Advanced UI or Suite/Advanced UI installation at run time.

InstallScript View

Project *• The InstallScript view is available in the following project types:*

- *Basic MSI*

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

The InstallScript view enables you to customize your setup script using the InstallScript language.

Files, Functions, Properties, and Methods Folders

The InstallScript explorer in the center pane of the InstallScript view contains the following folders:

Table 12-93 • Folders in the InstallScript View

Folder	Project Type	Description
Files	Basic MSI, Merge Module, InstallScript MSI, InstallScript, InstallScript Object	The Files folder lists all of your script (.rul) files. Click a script file to display its contents in the script editor. Your setup script must be named `Setup.rul`. You can include files with different names, but they must be included in `Setup.rul` with the #include preprocessor statement.
Functions	Basic MSI, Merge Module, InstallScript MSI, InstallScript, InstallScript Object	The Functions folder contains a list of the InstallScript functions in all of the script files of your project. Click a function to display that function in the script editor. ***Note*** • *If auto completion for local variables is disabled in the script editor, the Functions folder does not list any functions from your script files. To learn how to enable auto completion for local variables, see Enabling or Disabling Auto Completion in the Script Editors.*
Properties	InstallScript, InstallScript Object	The Properties folder contains a list of the InstallScript properties in all of the script files of your project. Click a property to display that property's declaration in the script editor. (The property's procedures are listed in the Functions folder.) ***Note*** • *If auto completion for local variables is disabled in the script editor, the Properties folder does not list any properties from your script files. To learn how to enable auto completion for local variables, see Enabling or Disabling Auto Completion in the Script Editors.*

Table 12-93 • Folders in the InstallScript View (cont.)

Folder	Project Type	Description
Methods	InstallScript Object	The Methods folder contains a list of the InstallScript methods in all of the script files of your project. Click a method to display that method in the script editor. ***Note*** • *If auto completion for local variables is disabled in the script editor, the Methods folder does not list any methods from your script files. To learn how to enable auto completion for local variables, see Enabling or Disabling Auto Completion in the Script Editors.*

Script Editor

Clicking an item under any of the folders in the InstallScript view displays the script editor in the right pane in the InstallShield interface. To learn more, see Script Editor in the InstallScript View.

Script Editor in the InstallScript View

Project • *The script editor is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

The script editor displays the text of the selected InstallScript file. You can modify or edit the script using commands from the Edit and Tools menus.

The Script Toolbar in the Script Editor

Project • *The script toolbar is available in the following project types:*

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

InstallScript event handlers are not available in Basic MSI or Merge Module projects because these project types use custom actions to run InstallScript.

The script toolbar is displayed across the top of the script editor in the InstallScript view; it contains an event category list box, as well as an event list box. The script toolbar lets you paste installation event handler function blocks in your script files. Event handlers in your script files override the default actions that are associated with installation events. You can modify the event handler code to change the actions performed during the installation.

Event Categories (list box, on the left)

Select the category containing the installation event whose event handler function block you want to paste in a script file. Events in the selected category are displayed in the Events list box.

Events (list box, on the right)

Select the installation event whose event handler function block you want to paste in a script file. If you select a feature event, its event handler is pasted in `FeatureEvents.rul`. If this file does not exist in your project, selecting a feature event automatically creates the file. If you select some other type of installation event, its event handler is pasted in `Setup.rul`.

If you change the default feature event handler code in `FeatureEvents.rul`, you must put the following statement in `Setup.rul` to include your changes in the installation:

```
#include "FeatureEvents.rul"
```

Custom Actions and Sequences View (or Custom Actions View)

Project • *The Custom Actions and Sequences view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

This view is called the Custom Actions view in the following project types:

- *DIM*
- *Merge Module*
- *MSM Database*

The Custom Actions and Sequences view has three separate areas: a Custom Actions area, an Action Text area, and a Sequences area. The Custom Actions view has the Custom Actions area.

Custom Actions

Microsoft enables you to add flexibility to your installation that is not directly supported by Windows Installer. This additional functionality is achieved through the use of custom actions.

InstallShield supports the use of custom actions to run InstallScript, VBScript, or JavaScript code; call DLL functions; run executable files; call a managed method in a managed assembly; set a property or a directory; trigger an error and end the installation; run PowerShell scripts; terminate a process; or run other installation packages.

The Custom Actions explorer in the Custom Actions and Sequences view behaves the same way as the Custom Actions explorer in the Custom Actions view. For descriptions of each type of custom action, see Custom Action Types. For a description of each custom action setting, see Custom Action Settings.

Action Text

To keep end users informed, installations commonly display text on the progress dialog to describe the installation's current activity. This usually accompanies the progress bar as a means of installation status. As each standard action and custom action is encountered, a message about the action is displayed on the progress dialog. This may be especially useful for actions that take a long time to execute. The same action text is also written to a log file if one is created at run time.

The Action Text explorer in the Custom Actions and Sequences view (for Basic MSI, InstallScript MSI, MSI Database, and Transform projects) lets you specify the action text for any action in your project. For a description of each action text setting, see Action Text Settings.

Important • *The names of the action text items under the Action Text explorer should match the names of standard and custom actions that are in your project. If you change the name of a custom action, you must also change the name of its action text item; otherwise, the action's text is not displayed at run time or written to the installation's log file.*

Sequences

Sequences direct all of the actions that are performed during the installation process—from file transfer to user interface display (for Basic MSI, MSI Database, and Transform projects). These actions are given a number in the sequence, which then executes from the lowest number to the highest. Rather than having to manually provide a numeric value for every action, you can use the Custom Actions and Sequences view to insert actions into a sequence, or edit the sequence timeline.

Project • *In InstallScript MSI projects, the installation's user interface is generated through the script; the dialogs are not inserted into sequences in the Custom Actions and Sequences view.*

If you are creating a custom action or custom dialog in a DIM project or a Merge Module project, you need to first import that DIM or module into an installation project and then add it to a sequence through the Custom Actions and Sequences view of that installation project.

There are three main sequences into which you can insert your dialogs (in Basic MSI, MSI Database, and Transform projects) and custom actions.

- Installation Sequence
- Advertisement Sequence
- Administration Sequence

Each of these sequences plays a different role. The Installation sequence is run during a normal installation. The Advertisement sequence runs when an application is being advertised rather than installed. The Administration sequence is run during an administrative installation.

Modifying Sequences, Actions, and Dialogs

The Custom Actions and Sequences view supports drag-and-drop editing and copying. The context menus in this view provide additional editing methods.

- To sequence a new custom action, drag it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence.
- To move a dialog, standard action, or custom action to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.
- To copy a custom action from one sequence to another, press and hold CTRL while dragging the custom action from one sequence to another sequence, and drop it onto the action or dialog that should be directly before it.
- When you select a dialog or standard action in the Sequences explorer, the Sequence tab on the right enables you to change the sequence number and add or modify the associated conditions.
- When you select a custom action in the Sequences explorer, more than one tab is displayed on the right:
  - Sequence tab—Use this tab to change the sequence number and to add or modify any conditions for the action.
  - Action tab—Use this tab to change any settings for the custom action.
  - Script tab—This tab is displayed for VBScript and JScript custom actions. It has a script editor that lets you edit your VBScript or JScript code.
- To edit the layout or behavior of a dialog, right-click the dialog in the Sequences explorer and then click Edit Behavior or Edit Layout.

Note • *A custom action cannot be called twice in the same sequence, since the custom action name is the key in the* ***CustomAction*** *table. Therefore, you cannot move or copy a custom action to a sequence that already contains that custom action.*

Dialogs and standard actions cannot be moved to a different type of sequence through a drag-and-drop operation.

Custom Action Types

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*

- *MSM Database*
- *Transform*

Note that some custom action types are not available in some project types. Project-specific differences are noted where appropriate.

InstallShield includes support for several kinds of custom actions:

Table 12-94 • Custom Actions Supported in InstallShield

Icon	Action Type	Project Type	Custom Action Behavior
	**InstallScript**	Basic MSI, InstallScript MSI, Merge Module	Run InstallScript code.
	**EXE**	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Launch an executable file.
	**Standard DLL**	Basic MSI, InstallScript MSI	Call a function in a standard DLL.
	**MSI DLL**	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Call a function in a DLL that was written specifically for Windows Installer. The entry point of the .dll file must have a predefined parameter and return value.
	**Managed Code**	Basic MSI, DIM, InstallScript MSI, Merge Module	Call a public method in a managed assembly that is written in managed code such as Visual Basic .NET or C#. For more information, see Calling a Public Method in a Managed Assembly.
	**Set Property**	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Set a property in the **Property** table. This is useful if you need to get information from the end user and store it so that it can be used later in your installation.

Table 12-94 • Custom Actions Supported in InstallShield (cont.)

Icon	Action Type	Project Type	Custom Action Behavior
	**Set Directory**	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Set a directory in the **Directory** table at run time. For example, if you want to create a temp directory that is a subdirectory of the installation directory selected by the end user, you can use this option to set that new temp directory for use later in the installation.
	**Nested MSI**	Basic MSI, InstallScript MSI, MSI Database, Transform	Launch another .msi package. This is also known as a nested installation.  ***Important*** • *Nested installations is a deprecated feature of the Windows Installer. Applications installed with nested installations sometimes fail because they are difficult for end users to service correctly. Microsoft Corporation recommends that you avoid using nested installations and nested-installation custom actions to install products that are intended to be released to the public. To learn more, see Concurrent Installations in the Windows Installer Help Library.*
	**VBScript**	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Run 32-bit or 64-bit VBScript code.
	**JScript**	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Run 32-bit or 64-bit JScript code.
	**Error**	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Display a specified error message, return failure, and end the installation. For example, you may want to add an error custom action to your project to handle scenarios where an end user tries to install the current version of your product over a future major version. For more information, see Preventing the Current Installation from Overwriting a Future Major Version of the Same Product.
	**Kill Process**	Basic MSI, InstallScript MSI	Terminate a process at run time. For more information, see Calling a Kill-Process Custom Action.

Table 12-94 • Custom Actions Supported in InstallShield (cont.)

Icon	Action Type	Project Type	Custom Action Behavior
	**PowerShell**	Basic MSI, InstallScript MSI	Run a PowerShell script to perform system configuration tasks at installation run time. For target system requirements, as well as other information about this type of custom action, see Calling a PowerShell Custom Action.

To help you differentiate between immediate, deferred, commit, and rollback custom actions in your project, InstallShield adds color-coded dots to some of the action's icons. The dots are displayed on the icons for actions that are listed under the Custom Actions explorer in the Custom Actions and Sequences view or the Custom Actions view. The following table shows the icon for the executable file custom action.

Table 12-95 • Determining the In-Script Execution of a Custom Action by Viewing Its Icon

Icon	Description
	If a custom action does not have a dot, it indicates that the In-Script Execution setting is not applicable to that type of custom action, or one of the following values is selected: • Immediate Execution • Immediate Execution (Terminal Service Aware)
	If a custom action has a blue dot, one of the following values is selected for the action's In-Script Execution setting: • Deferred Execution • Deferred Execution (Terminal Service Aware) • Deferred Execution in System Context
	If a custom action has a green dot, one of the following values is selected for the action's In-Script Execution setting: • Commit Execution • Commit Execution (Terminal Service Aware) • Commit Execution in System Context
	If a custom action has a red dot, one of the following values is selected for the action's In-Script Execution setting: • Rollback Execution • Rollback Execution (Terminal Service Aware) • Rollback Execution in System Context

For details about each of the InstallShield custom actions that are added automatically to InstallShield projects to support different functionality, see InstallShield Custom Action Reference.

Windows Logo • *If you are applying for the Windows logo, any custom actions in your installation must follow best practices guidelines for custom action creation. You can use the InstallShield validation suites and the Full MSI Validation Suite to verify whether your installation package meets most of the custom action–related logo requirements. However, some of the requirements cannot be verified through the validation suite. To learn more, see Guidelines for Creating Custom Actions that Meet Requirements of the Windows Logo Program.*

Custom Action Settings

Project • *Use the Custom Actions and Sequences view to configure custom action settings in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

Use the Custom Actions view to configure custom action settings in the following project types:

- *DIM*
- *Merge Module*
- *MSM Database*

Note that some custom action types are not available in some project types.

The settings in the Custom Actions and Sequences view (or Custom Actions view) are organized into the following categories:

- Action area settings
- Sequence area settings

To learn about displaying action information on the progress dialog and in the installation's log file, see Using Action Text.

Action Area Settings

The following custom action settings are available in the Action area.

Table 12-96 • Custom Action Settings in the Action Area

Setting	Description
Function Name	 ***Note*** • *This setting applies to InstallScript custom actions.* In the list of functions that are included in the project's InstallScript files, select the InstallScript function that you want to call.

Table 12-96 • Custom Action Settings in the Action Area (cont.)

Setting	Description
DLL File Name	 ***Note*** • *This setting applies to standard DLL custom actions that are stored in the **Binary** table or located in the target system's search path. This setting also applies to MSI DLL custom actions that are stored in the **Binary** table.* For the **Binary** table location: Enter the path to the DLL file that you would like to use for your custom action. As an alternative, you can select it from the list of available DLL files in the **Binary** table, or click the ellipsis button (...) to browse to it. For the target system's search path location: Enter the name of the DLL file that you would like to use for your custom action. As an alternative, you can click the ellipsis button (...) to browse to it. Only the file name is needed, since the custom action searches in the target system's search path to find this DLL. If the custom action type is an MSI DLL, the DLL file must comply with the required Windows Installer function signature. To learn more, see Calling Functions in Windows Installer DLL Files.
DLL Filekey	 ***Note*** • *This setting applies to standard and MSI DLL custom actions that are installed with the product.* In the list of DLL files that are included in your project, select the DLL file that you would like to use for your custom action.
Function Signature	 ***Note*** • *This setting applies to standard DLL custom actions.* To specify the parameters for the entry-point function in your DLL file, click the ellipsis button (...) in this setting. This opens the Function Signature dialog box, which has various settings that let you specify the function name, arguments, return type, and return property for the entry point function in your standard DLL.
Function Name	 ***Note*** • *This setting applies to MSI DLL custom actions.* Enter the name of the function in the MSI DLL that you would like to call.
Executable File Name	 ***Note*** • *This setting applies to executable file custom actions that are stored in the **Binary** table.* Enter the path to the executable file that you would like to use for your custom action. As an alternative, you can select it from the list of available executable files in the **Binary** table, or click the ellipsis button (...) to browse to it.

Table 12-96 • Custom Action Settings in the Action Area (cont.)

Setting	Description
Executable Filekey	 ***Note*** • *This setting applies to executable file custom actions that are installed with the product.* In the list of executable files that are included in your project, select the executable file that you would like to use for your custom action.
Working Directory	 ***Note*** • *This setting applies to executable file custom actions that are located in a path that references a directory.* Enter the working directory name for the executable file that you would like to use for your custom action, or select it from the list of available directories.
File Name & Command Line	 ***Note*** • *This setting applies to executable file custom actions that are located in a path that references a directory.* Enter path and name of the executable file that you would like to use for your custom action. If appropriate, you can include any command-line parameters that should be passed to the executable file. Use quotation marks around long file names. For example: • "[INSTALLDIR]subdirectory1\filename.exe" • "[WindowsFolder]Notepad.exe" • "[SUPPORTDIR]\fileFromSupportFilesView.exe" Note that the path is optional only if the executable file is already present in the operating system search path (that is, **WindowsFolder** or **SystemFolder**).
Executable Property	 ***Note*** • *This setting applies to executable file custom actions that are located in a path that is identified by a property.* Enter the name of the property that identifies the full path to your executable file, or select the property from the list of properties in your project.
Command Line	 ***Note*** • *This setting applies to executable file custom actions that are stored in the **Binary** table, installed with the product, or located in a path that is identified by a property.* Enter any command-line parameters that you would like to pass to your executable file. Enclose long file names within quotation marks.

Table 12-96 • Custom Action Settings in the Action Area (cont.)

Setting	Description
Assembly File	 ***Note*** *• This setting applies to custom actions that use a managed assembly whose location is set to* ***Binary*** *table.* Specify the .NET assembly file that you want to use for your managed-code custom action. You can select the **Browse to file** option to specify the file, or select the file from the list of DLL and .exe files that will be stored in the **Binary** file. At build time, InstallShield adds the managed assembly to a C++ Windows Installer wrapper DLL and adds the wrapper DLL to the **Binary** table of your .msi package. The wrapper DLL contains the information that is required to mediate, load, and run your assembly.
Assembly Filekey	 ***Note*** *• This setting applies to custom actions that use a managed assembly installed with the product.* To specify the managed assembly that you want to use for your custom action, select the file from the list of DLLs and .exe files that are included in your project.
Assembly Property	 ***Note*** *• This setting applies to custom actions that use a managed assembly whose path references a property or a directory in the* ***Directory*** *table.* To specify the managed assembly that you want to use for your custom action, do one of the following: • Select a Windows Installer property in the list. • Type the name of a new property. • Type the name of a directory in the **Directory** table. The property or directory name must be enclosed within square brackets ([]). You can add a string after the property if appropriate. The resulting path should indicate the location of the assembly file.
Method Signature	 ***Note*** *• This setting applies to custom actions that use a managed assembly.* Click the ellipsis button (...) to launch the Method Signature dialog box, which is where you specify arguments and return values for the managed method. When you have specified signature information on this dialog box, InstallShield uses it as the value of the Method Signature setting. To learn more, see Specifying the Signature for a Managed Method in an Assembly Custom Action.

Table 12-96 • Custom Action Settings in the Action Area (cont.)

Setting	Description
Error Message	 ***Note*** • *This setting applies to custom actions that trigger an error message.* Type the error message text that should be displayed when the custom action's conditions are met on the target system. As an alternative, you can type a property name whose value contains the error text. The property name must be enclosed within square brackets ([]).
Function Name	 ***Note*** • *This setting applies to kill-process custom actions.* Select the appropriate function: • **KillProcess**—If you selected one of the immediate options in the In-Script Execution setting and you want to kill a process that has a particular name, select this option. • **KillProcessByID**—If you selected one of the immediate options in the In-Script Execution setting and you want to kill a process that has a particular process identifier (PID), select this option. • **KillProcessDeferred**—If you selected one of the deferred, commit, or rollback options in the In-Script Execution setting and you want to kill a process that has a particular name, select this option. • **KillProcessByIDDeferred**—If you selected one of the deferred, commit, or rollback options in the In-Script Execution setting and you want to kill a process that has a particular PID, select this option. For information on configuring this type of custom action, see Calling a Kill-Process Custom Action.
PowerShell File Name	 ***Note*** • *This setting applies to PowerShell custom actions that are stored in the **Binary** table.* Select the PowerShell script file (.ps1) in the list of files that are stored in the **Binary** table or that are included in your project. If the location that you specified is stored in the **Binary** table, you can click this ellipsis button (...) in this setting to browse to the file. For target system requirements, as well as other information about this type of custom action, see Calling a PowerShell Custom Action.

Table 12-96 • Custom Action Settings in the Action Area (cont.)

Setting	Description
PowerShell Script FileKey	 ***Note*** • *This setting applies to PowerShell custom actions that use a PowerShell script that is installed with the product.* To specify the PowerShell script file (.ps1) that you want to use for your custom action, select the file from the list of PowerShell files that are included in your project. For target system requirements, as well as other information about this type of custom action, see Calling a PowerShell Custom Action.
Return Processing	Specify how the custom action thread should be processed. Valid options are: • Asynchronous (No wait for completion) • Asynchronous (Wait for exit code) • Synchronous (Check exit code) • Synchronous (Ignore exit code) These flags are used to specify that the main and custom action threads run synchronously (the installer waits for the custom action thread to complete before resuming the main installation thread) or asynchronously (the installer runs the custom action simultaneously as the main installation continues). Note that some options are not applicable to some types of custom actions. Only options that pertain to the selected type of custom action are available in this list.
In-Script Execution	Select which iteration of the sequence will trigger your action. For details about each option, see In-Script Execution. These options copy the action code into the execution, rollback, or commit script. If you select a Terminal Server Aware option, the custom action impersonates the user during per-machine installations on terminal server machines.

Table 12-96 • Custom Action Settings in the Action Area (cont.)

Setting	Description
Execution Scheduling	Specify how many times you want the action to run. For example, if an action is listed in both the user interface and execute sequences, it can be set to run both times, or it can run only once. Available options are: • **Always execute**—The action runs every time it is encountered. Therefore, it could run in the user interface sequence and again in the execute sequence. • **Execute only if running on client after UI sequence**—The action runs only if the execute sequence is run after the user interface sequence. • **Execute only once**—The action runs only once—even if it exists in both the user interface and execute sequences. The action is skipped in the execute sequence if the user interface sequence has run. • **Execute only once per process**—The action runs once per process if it exists in both the user interface and execute sequences. If the execute sequence runs in the same process as the user interface sequence, the installation skips this action in the execute sequence. This scheduling lets you avoid rerunning actions that modify session state such as properties. If you selected anything other than Immediate execution in the In-Script Execution setting, the Execution Scheduling setting is not available and is set to Always execute.  ***Project*** *• The* ***Execute only once*** *option does not work for InstallScript MSI projects. If your custom action exists in both the user interface and execute sequences, it is executed twice. This is because—in an InstallScript MSI project—the InstallScript engine executes the user interface sequence and Windows Installer executes the execute sequence.*
Silent Mode	 ***Note*** *• This setting applies to standard DLL custom actions.* Specify whether you want the installation to suppress a warning message if the custom action fails to load the DLL file and call the function.
MSI Type Number	This read-only setting identifies the Windows Installer numeric value for the selected custom action. For more information about basic custom action types, see Custom Action Type Overview.
Comments	Enter any internal comments that you want to record for this custom action. These comments are for your reference only and are not displayed to end users.

Table 12-96 • Custom Action Settings in the Action Area (cont.)

Setting	Description
Help File Path	Click the ellipsis button (...) to browse to the file that describes the behavior of the custom action. The file should be a text-based file such as a .txt, .htm, or .rtf file. At build time for Basic MSI, DIM, InstallScript MSI, and Merge Module projects, InstallShield streams the contents of this file into the Description column of the **ISCustomActionReference** table. If you are working on a project in Direct Edit mode, InstallShield streams the contents of the file that you select into the Description column of the **ISCustomActionReference** table as soon as you select the help file. In addition, InstallShield makes this setting read-only and displays `[Text Data]` as the value for this setting.  ***Windows Logo*** • *The intended behavior of each custom action must be documented for the Windows logo program. This is especially helpful if system administrators deploy your product to enterprise environments; they sometimes need to know what the custom actions do. If you validate your installation package but you have not specified a value for the Help File Path setting, InstallShield generates validation error ISICE10. For more information, see ISICE10.* For any built-in InstallShield custom actions, InstallShield makes this setting read-only and displays `InstallShield Custom Action` as the value.
Run During Patch Uninstall	 ***Project*** • *If you are working on a project in Direct Edit mode, this setting is not applicable unless the database schema is a minimum of 405 (for Windows Installer 4.5 or later).* Specify whether Windows Installer should run the custom action only when a patch is being uninstalled. You can select Yes for a custom action in an .msi package. You can also select Yes for a new custom action that is added by a patch. However, Yes should not be selected for a custom action that is being added or removed by a patch to an existing custom action. The default value for this setting is No. When Windows Installer 4.5 runs the patch uninstall custom action, it uses the custom action in the patch that is being uninstalled.  ***Note*** • *Windows Installer 4.5 includes support for this setting, but Windows Installer 4.0 and earlier do not. Therefore, if you select Yes for this setting and some target systems may have Windows Installer 4.0 or earlier, add a condition to this custom action to prevent Windows Installer 4.0 and earlier from running it. Otherwise, Windows Installer 4.0 and earlier would call the custom action during the installation, repair, or update of the package.* For the condition, use the **MSIPATCHREMOVE** property. For more information, see MSIPATCHREMOVE in the Windows Installer Help Library.

Sequence Area Settings

The following custom action settings are available in the Sequence area.

Table 12-97 • Custom Action Settings in the Sequence Area

Setting	Description
Install UI Sequence	To schedule this custom action during the user interface sequence of the installation mode, select the appropriate option. To leave this custom action out of the sequence, select **<Absent from sequence>**. As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.
Install UI Condition	If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false. As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition. For more information, see Building Conditional Statements.
Install Exec Sequence	To schedule this custom action during the execute sequence of the installation mode, select the appropriate option. To leave this custom action out of the sequence, select **<Absent from sequence>**. As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.
Install Exec Condition	If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false. As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition. For more information, see Building Conditional Statements.

Table 12-97 • Custom Action Settings in the Sequence Area (cont.)

Setting	Description
Advertise Exec Sequence	To schedule this custom action during the execute sequence of the advertisement mode, select the appropriate option. To leave this custom action out of the sequence, select **<Absent from sequence>**. As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.
Advertise Exec Condition	If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false. As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition. For more information, see Building Conditional Statements.
Admin UI Sequence	To schedule this custom action during the user interface sequence of the administration mode, select the appropriate option. To leave this custom action out of the sequence, select **<Absent from sequence>**. As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.
Admin UI Condition	If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false. As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition. For more information, see Building Conditional Statements.

Table 12-97 • Custom Action Settings in the Sequence Area (cont.)

Setting	Description
Admin Exec Sequence	To schedule this custom action during the execute sequence of the administration mode, select the appropriate option. To leave this custom action out of the sequence, select **<Absent from sequence>**. As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.
Admin Exec Condition	If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false. As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition. For more information, see Building Conditional Statements.

For more information about these settings, see CustomAction Table in the Windows Installer Help Library.

Action Text Settings

Project • *Use the Custom Actions and Sequences view to configure action text settings in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

To keep end users informed, installations commonly display text on the progress dialog to describe the installation's current activity. This usually accompanies the progress bar as a means of installation status. As each standard action and custom action is encountered, a message about the action is displayed on the progress dialog. This may be especially useful for actions that take a long time to execute. The same action text is also written to the installation's log file if one is created.

The Action Text explorer in the Custom Actions and Sequences view lets you specify the action text for any action in your project.

When you click a custom action item or a standard action item in the Action Text area of the Custom Actions and Sequences view, the following settings are available.

Table 12-98 • Action Text Settings

Setting	Description
Description	Enter text that describes the selected action. For example, the default description for the InstallFiles action is: `Copying new files` When the Windows Installer launches this action, the text that you enter is displayed on the progress dialog. For more information, see Displaying Action Descriptions on the Progress Dialog. If a log file is created at run time, this description is written to the log file when the Windows Installer launches this action. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (**...**) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-98 • Action Text Settings (cont.)

Setting	Description
Template	Enter the template that should be used to format action data records. For example, the default template for the InstallFiles action is: `File: [1], Directory: [9], Size: [6]` When the Windows Installer launches this action, the action details may be displayed on the progress dialog. For the aforementioned InstallFiles example, the [1] property is replaced with the names of files as they are transferred to the target system. The [9] property is replaced with the directory that contains the file, and the [6] property is replaced with the file's size in bytes. Note that by default, the action data is not displayed on the progress dialog. For more information, see Displaying Action Data on the Progress Dialog. If a template is not specified for the selected action, no data is displayed when the action is launched. In addition, the installation must be run with a full user interface; if the installation is run silently or with a reduced or basic user interface, the action data is not shown. To find out what data fields are available for use in the Template setting value of a particular standard action, see Standard Actions Reference in the Windows Installer Help Library, and then refer to the help for the specific action.  ***Project*** • *InstallScript MSI installations cannot display action data on the status dialog. However, the template is written to the installation's log file.*  ***Note*** • *The value of this setting must always be `[1]` for several standard actions:* • *GenerateScript* • *Rollback* • *RollbackCleanup* *Therefore, the Template setting is disabled for these actions.* When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (**...**) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Support Files View (Advanced UI, Basic MSI, InstallScript Object, and Suite/Advanced UI Projects)

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript Object*
- *Suite/Advanced UI*

The Support Files view is where you can add support files to your project, and—in Basic MSI projects—add files to disk image folders.

The Support Files view contains the following main areas:

Support Files

The Support Files area lets you add, sort, and delete support files—files that are required by your installation only during the installation process. The installation removes the support files when the installation is complete. Add any language-dependent files to the appropriate language-specific area. Add language-independent files to the Language Independent area.

Splash Screen

Project • *The Splash Screen area is available for Basic MSI projects.*

The Splash Screen area lets you add to your project a startup graphic—the graphic that is displayed when the end user begins the installation. The graphic file must be a bitmap file (.bmp). Add the file to the appropriate language-specific or language-independent folder.

Note • *In a single-language installation, the splash screen that is specified for the single language (or the language-independent splash screen if no splash screen is specified for the single language) is displayed.*

In a multilanguage installation, the splash screen for the language in which the installation is running is displayed. If no splash screen is specified for the language in which the installation is running, the language-independent splash screen is used.

Only one splash screen is displayed to the end user during the installation. If you have more than one splash screen file in the language-independent area or for a specific language, the first file in the list is displayed at run time.

Advanced Files

Project • *The Advanced Files area is available for Basic MSI projects.*

The Disk1 item in the Advanced Files area enables you to indicate files and folders that you want to go on Disk1 of your installation media. These files and folders are not automatically installed to the target system when your installation is run. Rather, you can link to the installation media from your application or from the installation. For example, you might include a large redistributable file with your application that you do not want included in the application installation. This file should be placed in the Disk1 folder.

Support Files/Billboards View (InstallScript and InstallScript MSI Projects)

Project • *This information applies to the following project types:*

- *InstallScript*
- *InstallScript MSI*

The Support Files/Billboards view is where you can add support files and billboard files to your project, and add files to disk image folders.

The Support Files/Billboards view contains the following main areas:

Support Files

The Support Files area lets you add, sort, and delete support files—files that are required by your installation project only during the installation process. Add any language-dependent files to the appropriate language-specific area. Add language-independent files to the Language Independent area.

In your InstallScript code, support files are uncompressed into a temporary directory and then deleted when the installation is complete.

Billboards

The Billboards item enables you to specify files that you want to display to the end user during the installation process. The billboards can be used to communicate, advertise, educate, and entertain end users. To learn more, see Displaying Billboards in InstallScript and InstallScript MSI Installations.

Splash Screen

Project • *In InstallScript projects, you can use .bmp and .gif files as splash screen files. In InstallScript MSI projects, only .bmp files can be used as splash screen files.*

The Splash Screen area lets you add to your project a startup graphic—the graphic that is displayed when the end user begins the installation. Add the file to the appropriate language-specific or language-independent folder.

Note • *In a single-language installation, the splash screen that is specified for the single language (or the language-independent splash screen if no splash screen is specified for the single language) is displayed.*

In a multilanguage installation, the splash screen for the language in which the installation is running is displayed. If no splash screen is specified for the language in which the installation is running, the language-independent splash screen is used.

Only one splash screen is displayed to the end user during the installation. If you have more than one splash screen file in the language-independent area or for a specific language, the first file in the list is displayed at run time.

Project • *In an InstallScript project, the splash screen file must be named* `Setup.bmp` *or* `Setup.gif`*. This file name requirement does not apply to InstallScript MSI projects.*

Advanced Files

The Advanced Files item enables you to indicate files and folders that you want to go on a disk of your installation media. These files and folders are not automatically installed to the target system when your installation program is run. Rather, you can link to the installation media from your application or from the installation. For example, you might include a large redistributable file with your application that you do not want included in the application installation.

Table 12-99 • Advanced File Items

Item	Description
Disk1	Add files and folders that you want to go on the first disk of your installation media.
Last Disk	Add files and folders that you want to go on the last disk of your installation media. ***Project*** • *This applies to InstallScript projects.*
Other	Add files and folders that you want to go on a specific disk of your installation media; you specify the disk at build time in the General Options panel of the Release Wizard. ***Project*** • *This applies to InstallScript projects.*

System Search View

Project • *The System Search view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The System Search view provides the Windows Installer capability to search for a particular file, folder, registry key, .ini file value, or .xml file value on a target system prior to installation. This functionality lets you perform application, version, and configuration data searches.

The System Search view displays a grid listing each search that you want to conduct on the target system. You can use this view to add a predefined system search—whether it is a search that is included with InstallShield or one that is stored in a repository—to your project. You can also use the System Search view to customize any predefined searches or define your own system searches for your project.

Whenever you define your own search, the System Search Wizard is launched. From there, you can select from a list of search options and specify search details, such as the number of subfolder levels to search. When you modify an existing search, you can alter your initial selections in the System Search Wizard.

Property Manager View

Project • *The Property Manager view is available in the following Windows Installer–based projects:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

This view is also available in Advanced UI and Suite/Advanced UI projects.

Note that some differences between the Property Manager view in Windows Installer–based projects and that in Advanced UI and Suite/Advanced UI projects exist; these differences are noted where appropriate.

The Windows Installer engine and the Advanced UI and Suite/Advanced UI engine maintain global information using properties. The Property Manager view displays a list of installation properties that are used by the Windows Installer engine or the Advanced UI and Suite/Advanced UI engine at run time. You can modify, create, and delete installer properties in the Property Manager view. At build time, InstallShield writes the properties in the Property Manager view to installation that it creates.

Following is a list of some of the tasks that you can perform in this view:

- View the properties that are defined in your project.
- Add, modify, and delete properties.
- Filter the properties that are shown in the view to hide ones that do not contain a specific string.
- Resize and reorder the columns in the view.
- Sort the rows in the view by any column by clicking the column heading.
- Drag and drop column headings on to the group box area (the area below the view's buttons) to organize the rows in the view in a hierarchical format.

- Windows Installer–based projects: Make a property localizable so that it can have different values based on the language that your installation uses.

Project • *In Windows Installer–based projects, properties that appear in all uppercase letters are called public properties, and they can be changed by the end user on the command line at run time. All others must be set before the release is built or—at run time—through a custom action or dialog's behavior.*

Working with the Property Manager View

The Property Manager view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A spreadsheetlike table

Each row in the table represents a property in your project.

The following table describes all of the buttons and other controls that are displayed in the Property Manager view.

Table 12-100 • Controls in the Property Manager View

Name of Control	Icon	Description
New Property		Adds a new property to your project.  ***Project*** • *In Windows Installer–based projects: To create a localizable property, you can click the arrow next to this button, and then click Localizable Property. To learn more, see Creating a Localizable Property.*
Delete Selected Properties		Deletes the selected row or rows.
Clear Selected Properties		Deletes the value of the selected properties.
Make Selected Properties Localizable		Adds a string identifier to the value of the selected properties, enabling you to set a different property value for every language that your project supports. To learn more, see Making an Existing Property Localizable.  ***Project*** • *This button is available in Windows Installer–based projects.*
Expand All Groups		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.

Table 12-100 • Controls in the Property Manager View (cont.)

Name of Control	Icon	Description
Collapse All Groups		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Search Grid		Dynamically filters the properties that are displayed in the Property Manager view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
Property Manager Help		Displays the help for the Property Manager view.
Drag a column header here to group that column		Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box. To learn more, see Working with the Group Box Area in Various Views.

The following table describes each of the columns in the Property Manager view.

Table 12-101 • Columns in the Property Manager View

Column	Description
Name	This column shows the name of the Windows Installer or Advanced UI and Suite/Advanced UI property.
Value	This column shows the value of the property.  ***Project*** • *In Windows Installer–based projects: If the property is configured to be localizable, this column shows the string identifier in curly brackets before the string value.*
Comments	This column contains an internal note about the properties. The comments are not displayed at run time.  ***Project*** • *This column is available in Windows Installer–based projects.*

Table 12-101 • Columns in the Property Manager View (cont.)

Column	Description
Formatted	This column contains a check box that lets you indicate whether you want the properties in the Value column to be resolved and replaced by their property values at run time. To replace properties that are enclosed within square brackets (such as [PropertyName]) at run time, select this check box. To leave square brackets and the content within them as is, clear this check box.  ***Project*** *• This column is available in the following project types:* • *Advanced UI* • *Suite/Advanced UI*

Events View

Project *• The Events view is available in Suite/Advanced UI projects.*

Edition *• The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The Events view enables you to create your own actions and add them to your Suite/Advanced UI project. You can also use this view to schedule an action to occur during one or more run-time events, or you can use the Packages view to schedule an action to occur immediately before or after a specific package in your installation is run.

The Events view has two separate area: an Actions tab and an Events area.

Actions

Use the Actions explorer in the Events view to define and configure actions in your project. You can create actions that run executable files, call DLL functions, run PowerShell scripts, or set a Suite/Advanced UI property.

For a description of each action setting, see Events View Settings.

Events

Events direct all of the actions that are performed during install mode, maintenance mode, and stage-only mode. The Suite/Advance UI engine executes actions that are scheduled for an event in the order that they are listed in this view. For descriptions of each type of event, see Types of Events in a Suite/Advanced UI Installation.

Events View Settings

Project • *The Events view is available in Suite/Advanced UI projects.*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The settings in the Events view are organized into the following categories:

- Action area settings on the Action tab
- Return Process Handling area settings on the Action tab for an .exe action
- Events area settings

If you select a PowerShell action in the Actions explorer or the Events explorer, InstallShield displays a PowerShell Script tab on the right; you can use this tab to edit your script.

Action Area Settings on the Action Tab

The following action settings are available in the Actions area on the Action tab.

Table 12-102 • Action Settings in the Action Area on the Action Tab

Setting	Description
File	 ***Note*** • *This setting applies to .exe and DLL actions.* Enter the run-time path to the file that you want to use for your action. As an alternative, if the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can click the ellipsis button (...) in this setting to browse to it. If you browse to the file, InstallShield adds it to your project as a support file in the Support Files view of your Suite/Advanced UI project. At run time, the file is available on the target system only during your product's installation process.

Table 12-102 • Action Settings in the Action Area on the Action Tab (cont.)

Setting	Description
Source Path	 ***Note*** • *This setting applies to PowerShell actions.* Enter the source path to the PowerShell script (.ps1) that you want to use for your action. As an alternative, you can click the ellipsis button (...) in this setting to browse to it. When you browse to the file, InstallShield adds it to your project as a support file in the Support Files view of your Suite/Advanced UI project. At run time, the file is available on the target system only during your product's installation process. Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.  ***Tip*** • *Use the PowerShell Script tab in this view to edit the code for this action.*
Arguments	 ***Note*** • *This setting applies to .exe actions.* If appropriate, specify the command-line parameters that should be used with the action. Separate multiple parameters with spaces.
Function Name	 ***Note*** • *This setting applies to DLL actions.* Enter the name of the function in the DLL that you would like to call.
Requires Administrative Privileges	 ***Note*** • *This setting applies to .exe, DLL, and PowerShell actions.* Specify whether this action requires administrative privileges on systems that have Windows Vista or later or Windows Server 2008 or later. To learn more, see Minimizing the Number of User Account Control Prompts During Advanced UI and Suite/Advanced UI Installations.

Table 12-102 • Action Settings in the Action Area on the Action Tab (cont.)

Setting	Description
Verb	***Note*** • *This setting applies to .exe actions.* Specify the verb that should be used with the selected action's file, or select the appropriate verb from the list. If you leave this setting blank, the verb that is the default one on the target system for this file is used. If the default verb is not available, the *open* verb is used. If neither verb is available, the first verb that is listed in the registry is used. The use of the runas verb is not recommended. If the action requires administrative privileges, select Yes for the action's Requires Administrative Privileges setting. For more information, see Minimizing the Number of User Account Control Prompts During Advanced UI and Suite/Advanced UI Installations.
Window	***Note*** • *This setting applies to .exe actions.* Select the initial window state of the .exe action when it is launched. Available options are: • **Show**—Display the window in its current size and position. • **Hide**—Hide the window. • **Minimize**—Display the window as minimized. • **Maximize**—Display the window as maximized. • **Normal**—Display the window in its original size and position.
Wait for Exit	***Note*** • *This setting applies to .exe actions.* Specify whether you want the installation to wait for the action to complete before proceeding with the next part of the installation. Available options are: • **Yes**—The installation waits for the action to complete before resuming. This is the default option. • **No**—The installation runs the action simultaneously as the next part of the installation proceeds. If you select Yes for this setting, you can use the settings in the Return Process Handling area to specify the various codes that the action may return.

Table 12-102 • Action Settings in the Action Area on the Action Tab (cont.)

Setting	Description
Property Name	 ***Note*** • *This setting applies to actions that set a property.* Enter the property name, or select it from the list of available properties. The property names that are displayed in the list are the ones in the Property Manager view. You can enter any other property name and it will be available at run time. If you want to explicitly create a new property, you can do so from the Property Manager view.
Property Value	 ***Note*** • *This setting applies to actions that set a property.* Enter the value of the property. If you select Yes for the Format Property Value setting, the value that you enter can be a property. For example: `[PropertyName]` At run time, if Yes is selected for the Format Property Value setting, the above entry resolves to the value of the specified property.
Format Property Value	 ***Note*** • *This setting applies to actions that set a property.* Specify whether you want the properties that you enter in the Value setting to be resolved and replaced by their property values at run time. To replace properties that are enclosed within square brackets (such as [PropertyName]) at run time, select Yes. To leave square brackets and the content within them as is, select No.

Return Process Handling Area Settings on the Action Tab for an .exe Action

The following action settings are available in the Return Process Handling area on the Action tab for an .exe action.

Table 12-103 • Return Process Handling Settings in the Action Area on the Action Tab for an .exe Action

Setting	Description
Ignore Code	 ***Note*** • *This setting applies to .exe actions.* Specify a comma-delimited list of the codes that the action could return when the installation should proceed with the next part of the installation. This setting is available if you select Yes in the action's Wait for Exit setting.
Abort Code	 ***Note*** • *This setting applies to .exe actions.* Specify a comma-delimited list of the codes that the action could return when the installation should be aborted. Note that if the action cannot be launched or loaded, the installation is aborted. This setting is available if you select Yes in the action's Wait for Exit setting.
Reboot Code	 ***Note*** • *This setting applies to .exe actions.* Specify a comma-delimited list of the codes that the action could return when the target system should be restarted. This setting is available if you select Yes in the action's Wait for Exit setting.
Cancel Code	 ***Note*** • *This setting applies to .exe actions.* Specify a comma-delimited list of the codes that the action could return when the installation should be cancelled. This setting is available if you select Yes in the action's Wait for Exit setting.

Table 12-103 • Return Process Handling Settings in the Action Area on the Action Tab for an .exe Action (cont.)

Setting	Description
Default Response	 ***Note*** • *This setting applies to .exe actions.* Select the option that describes how you want the installation to respond if the code that the action returns is not specified for any of the other settings in the Return Process Handling area. Available options are: • **Ignore**—The installation proceeds with the next part of the installation. This is the default option. • **Abort**—The installation is aborted. • **Reboot**—The target system is restarted. • **Cancel**—The installation is cancelled. This setting is available if you select Yes in the action's Wait for Exit setting.

Event Area Settings

The following action settings are available in the Events area.

Table 12-104 • Action Settings in the Events Area

Setting	Description
Condition	This setting lets you specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the action should be run. For example, if the action should be run only on certain platforms, you can create a platform requirement in a condition for this action; the Suite/Advanced UI would launch the action only on appropriate platforms. To add one or more new action conditions, click the New Condition button in this setting. InstallShield adds a new row under the Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement.  ***Tip*** • *If you define a Feature Operation condition or a Package Operation condition for an action, the earliest event for which you can schedule the action is OnStaging.* For more information, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects. If one or more conditional statements are configured, the Condition setting says **(Condition)**. If none are configured, the Condition setting says **(Empty)**.

Table 12-104 • Action Settings in the Events Area (cont.)

Setting	Description
Display Text	Enter text that describes the selected action. For example, if the action is running a script that configures the target system, you could enter the following string: `Configuring the system` If the installation launches the action when the InstallationProgress wizard page is displayed, the text that you enter is displayed on the wizard page. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

User Interface View

Project • *The User Interface view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

The appearance of your installation is one of the main aspects that differentiates your product from that of your competition. You can easily customize the way your installation looks through the views listed below.

Dialogs

Project • *The Dialogs view is available in the following project types:*

- *Basic MSI*
- *DIM*

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

In the Dialogs view, you can select dialogs to display at run time. The way in which you control a dialog's behavior depends on which engine controls the user interface: the Windows Installer engine displays the dialogs for Basic MSI projects, and the InstallScript engine displays the dialogs for InstallScript and InstallScript MSI projects. For more information, see:

- Dialogs View (InstallScript, InstallScript MSI, and InstallScript Object Projects)
- Dialogs View (Basic MSI and Other Windows Installer–Based Projects)

Wizard Interface

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

Use the Wizard Interface view to customize the user interface of your Advanced UI or Suite/Advanced UI installation. This view lets you add wizard pages to and remove wizard pages from the default list of pages, as well as customize the layout and behavior of each page.

Billboards

Project • *The Billboards view is available in Basic MSI projects.*

For information about billboard support in InstallScript or InstallScript MSI projects, see Support Files/Billboards View (InstallScript and InstallScript MSI Projects).

Billboards are images or Adobe Flash application files that are displayed for a specified amount of time during the file transfer portion of your installation. The billboards can be used to communicate, advertise, educate, and entertain end users. For example, billboards can present overviews on new features of the product being installed or other products from your company. Each billboard is a file that you or your company's graphics department creates for complete control over the look and feel of the file transfer.

String Editor

Project *• The String Editor view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

To help streamline the process of localizing a project, all of the text strings that may be displayed at run time during the installation process are available in one consolidated view: the String Editor view. You can use this view to edit the strings for everything from button text to feature descriptions. You can also use this view to export each language's string entries to a file, translate the values that are listed in the file, and then import the translated file into your project.

Dialogs View (InstallScript, InstallScript MSI, and InstallScript Object Projects)

Project *• This information applies to the following project types:*

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The Dialogs view contains a list of the standard end-user dialogs. The dialogs are identified by their function names. Click a dialog in this view to view a sample dialog in the right pane.

The dialog names in the list are *ghosted* until you edit the layout. A ghosted name means that the default dialog (from `isres.dll`) will be used in the user interface. If you edit the layout of a dialog, its name appears in bold in the list, and the dialog is pulled from `isuser.dll` at run time.

If your installation project supports additional languages, those languages appear as nodes beneath the edited dialog. You can edit the layout for each language separately.

Tip *• Selecting and editing a dialog in the Dialog Editor does not automatically place the dialog in the end-user interface. In order for a dialog to be displayed at run time, it needs to be included in the InstallScript code. For example, code for the dialogs that are displayed during a first-time installation are part of the* ***OnFirstUIBefore*** *and* ***OnFirstUIAfter*** *event handlers. To learn more, see Displaying Dialogs During InstallScript and InstallScript MSI Installations.*

Dialog Resource Files

By default, all dialogs in InstallScript and InstallScript MSI projects are kept in a resource .dll file called `_IsRes.dll`. This .dll file is built into your distribution package when you build the installation. There is a separate `_IsRes.dll` for every supported language; they are located in the InstallShield folder's Redist folder (for example, *`InstallShield Program Files Folder`*\Redist). None of the `_IsRes.dll` files should ever be modified.

When you edit a dialog in the Dialog Editor, InstallShield makes a copy of the dialog from the original `_IsRes.dll` file. This copy is stored in your project file. When your project is built, all edited dialogs (and any new dialogs you have created) are built into a resource .dll file called `_IsUser{CurrentLanguage}.dll`. For English, a .dll file called `_IsUser1033.dll`. `_IsUser{LanguageID}.dll` is then built into your distribution package.

At run time, the engine that displays the dialogs first looks for a dialog in `_IsUser{LangId}.dll`. If the dialog is not found, it then looks for the default version in `_IsRes.dll`. The engine looks for dialogs based on their resource identifier. You can see the resource identifier of a dialog by going to the **Dialog** table in the Direct Editor.

Dialogs View (Basic MSI and Other Windows Installer–Based Projects)

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Dialogs view contains a Dialogs explorer. The Dialogs explorer contains two main folders: Themes and All Dialogs.

Themes

The Themes folder contains a list of all of the dialog themes that you can use for the dialogs in your project. A dialog theme is a predefined set of images that give your end-user dialogs a unified and distinctive look.

All Dialogs

The All Dialogs folder contains a list of the dialogs in your project. Each dialog item in the Dialogs explorer contains a Behavior item, which enables you to configure the behavior that is associated with a dialog, and at least one language item, which displays the dialog in the Dialog Editor of the selected language. The Dialog Editor enables you to edit the layout for each language separately.

When you create a new Basic MSI project, InstallShield provides a series of default dialogs for the two User Interface sequences in which a Windows Installer package typically displays dialogs: the Installation sequence (which runs when the installation is launched in the default mode, for example, by double-clicking an .msi file)—with separate dialogs depending on whether the package is being installed for the first time, reinstalled, or uninstalled—and the Administration sequence (the list of actions that are executed when you launch the

installation with the /a command-line option). (End-user dialogs are not usually displayed in the Advertisement sequence, which contains the list of actions that are executed when you launch the installation with the /j command-line option.)

Project *• Although you can create dialogs in DIM and Merge Module projects, you cannot add them to a sequence until you add the DIM or merge module to an installation project. Then, all the dialogs included in your module are available to be included.*

Wizard Interface View

Project *• This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition *• The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The Wizard Interface view contains a Wizard Interface explorer. The Wizard Interface explorer contains the following main areas: styles, wizard pages, and secondary windows.

Styles

The Styles area of the Wizard Interface view lets you configure sets of formatting characteristics that you can apply to one or more parts of the wizard interface to quickly change its appearance. The Styles area lets you define the following types of styles:

- **Font sets**—A font set is a collection of fonts (including attributes such as font name, size, and weight). For each font in a font set, you can specify to which language the font is applicable. This enables you to select a different font for each language that your project supports.
- **Text styles**—A text style defines text attributes such as text color, as well as font name, style, and size. Text styles are typically applied to the text that is displayed in the Advanced UI or Suite/Advanced UI wizard interface.
- **Brush styles**—A brush style defines a color or image for various elements of the wizard interface, such as the background of wizard pages and controls. A brush style also indicates whether the color is solid, it uses a gradient, or it shows an image.

Font sets work in conjunction with text styles. Text styles reference a font set but can optionally override various font attributes that are defined at the font set level.

To add a style to your project, right-click the Styles node and then click the appropriate command, depending on the type of style that you want to add.

To learn more, see Using Styles to Customize the Wizard Interface.

Wizard Pages

The main type of window that is displayed to end users of an Advanced UI or Suite/Advanced UI installation is a wizard page. The Wizard Pages area of the Wizard Interface view lets you view, edit, add, and remove wizard pages in your Advanced UI or Suite/Advanced UI project.

To configure and edit settings that apply to all of the wizard pages in your Advanced UI or Suite/Advanced UI project, click the Wizard Pages node. The settings that are displayed for this node let you specify dimensions, the caption that is used in the title bar of the wizard pages, and more.

The specific wizard page subnodes under the Wizard Pages node let you preview, sequence, and remove pages as needed; these subnodes also let you modify the layout of each wizard page—adding, moving, and removing a variety of different kinds of controls. To change the run-time order of the wizard pages, click a page that you want to resequence, and then press CTRL+UP ARROW or CTRL+DOWN ARROW until the page reaches the appropriate place under the Wizard Pages node.

To add a wizard page to your project, right-click the Wizard Pages node and then click the appropriate command, depending on the type of page that you want to add.

Secondary Windows

A secondary window in an Advanced UI or Suite/Advanced UI installation is a pop-up window that lets end users perform a command, asks end users a question, or provides end users with information. One example of a secondary window is a FilesInUse window, which informs end users about one or more applications that are open and locking files that need to be updated by the installation. The specific window subnodes under the Secondary Windows node let you preview and remove pages as needed; these subnodes also let you modify the layout of each window, just as you can edit the layout of wizard pages.

To add a secondary window to your project, right-click the Secondary Windows node and then click Add Blank Window.

Settings for the Wizard Interface

For information about various settings for each area in the Wizard Interface view, see the help panes that are displayed when you click any setting in this view.

Wizard Interface View Toolbar

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

If you select a wizard page or secondary window in the Wizard Interface view, the toolbar that InstallShield shows directly above the wizard interface preview pane includes several different buttons and other controls that let you modify the layout of the selected page or window. InstallShield also displays this toolbar in the Wizard Interface view if you select one or more controls on a wizard page or a secondary window.

Table 12-105 • Wizard Interface View Toolbar

Name of Control	Icons	Description
New Control		Lets you add a control to the selected wizard page or secondary window. Select one of the control buttons, or the control types that are listed in the drop-down list next to the control buttons.

Table 12-105 • Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
New Control (cont.)		The control types that are available from the drop-down list next to the Label button are: • **Label**—The Label control displays text. Use this type of control for labels that you want to position next to other controls—such as a text box control—and for instructions or information that you want to include on a wizard page or secondary window. • **Hyperlink**—The hyperlink control displays an HTML link; clicking the link at run time opens a page in the default browser on the target system. • **Group Box**—A group box can be used to enclose various controls in one area. A group box also provides a label that you can use to express the relationship between the controls that are contained within it. • **Frame**—A frame control lets you draw the outline of a box. • **Image**—An image control displays an image. • **Billboard**—A billboard control displays one or more images that can be updated in response to a property such as the **ISInstallProgress** property, or configured to display for a predetermined duration. You can add billboards to your projects to display information to end users during the installation process. The billboards can be used to communicate, advertise, educate, and entertain end users. • **Progress Bar**—A progress bar is a dynamic bar that fills up in response to a property such as the **ISInstallProgress** property. • **Progress Circle**—A progress circle is a pair of dynamic circles that fill up in response to two properties: a property such as **ISParcelProgress**, which indicates the completion percentage of the current package, and a property such as **ISInstallProgress**, which indicates the completion percentage of the overall entire installation. The outside progress circle typically shows the overall progress, and the inside progress bar typically shows the progress of the entire package.

Table 12-105 • Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
New Control (cont.)		The control types that are available from the drop-down list next to the Text Box button are: • **Text Box**—A text box control is a field in which end users can enter text and numbers. • **Password Box**—A password box control is a field in which end users can enter a password. • **Rich Text Box**—A rich text box is a read-only control that displays text from an .rtf file. This type of control is often used on license agreement or readme wizard pages.
New Control (cont.)		The control types that are available from the drop-down list next to the Button button are: • **Button**—A button control is a control that carries out a command when an end user clicks it. • **Command Link**—A command link control offers a set of mutually exclusive options, similar to radio buttons. Each option includes an icon, a command link label next to the icon, and an optional supplemental explanation about the option. • **Check Box**—A check box control displays a check box that an end user can select or clear to toggle on or off an option. • **Radio Button**—A radio button control is one of two or more mutually exclusive options that end users can select. A radio button must be inserted into a group box control; it functions as part of that control. • **Image Button**—An image button control displays an image, and it carries out a command when an end user clicks it.

Table 12-105 • Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
New Control (cont.)		The control types that are available from the drop-down list next to the Combo Box button are: • **Combo Box**—A combo box control is a box that contains a drop-down list of predefined values. The box is also a text box that lets end users enter a custom value. To change this control to a drop-down list without the text box (that is, if end users should be able to select a predefined value but not enter a custom value), set the CBS_DROPDOWNLIST style for this control to True. • **List Box**—A list box control is a standard list box that lets end users select a single option from a list of predetermined options. • **Checked List Box**—A checked list box is a list box in which each of the predefined values is associated with a check box. A checked list box lets end users select one or more options, or leave all of the options unselected. • **Feature Selection Tree**—A feature selection tree control is a special tree view control that contains a hierarchically organized collection of the Advanced UI or Suite/Advanced UI installation's features; it lets end users select one or more features to install.
Position Controls		Lets you change the position of two or more selected controls.

Table 12-105 • Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
Position Controls (cont.)		The position change options that are available from the drop-down list next to the Align Left button are: • **Align Left**—Align the left edges of two or more selected controls with the left edge of the control that was selected last. • **Align Center**—Align the center of two or more selected controls with the center of the control that was selected last. • **Align Right**—Align the right edges of two or more selected controls with the right edge of the control that was selected last. • **Align Top**—Align the top edges of two or more selected controls with the top edge of the control that was selected last. • **Align Middle**—Align the middle of two or more selected controls with the middle of the control that was selected last. • **Align Bottom**—Align the two or more selected controls with the bottom of the control that was selected last. • **Distribute Horizontally**—Position three or more selected controls so that they are an equal distance from each other horizontally. • **Distribute Vertically**—Position three or more selected controls so that they are an equal distance from each other vertically.
Position Controls (cont.)		The position change options that are available from the drop-down list next to the Make Same Width button are: • **Make Same Width**—Increase or decrease the width of each of the selected controls so that each width matches that of the control that was selected last. • **Make Same Height**—Increase or decrease the height of each of the selected controls so that each height matches that of the control that was selected last. • **Make Same Size**—Increase or decrease the dimensions of each of the selected controls so that each control's dimensions match that of the control that was selected last.
Default Language		Lets you switch the strings that InstallShield displays on the wizard pages and secondary windows in this view to those in a different language in your project. The available language options are the ones that are selected in the Setup Languages setting in the General Information view. This setting also lets you change the default language for the project.

Billboards View

Project • *The Billboards view is available in Basic MSI projects.*

For information about billboard support in InstallScript or InstallScript MSI projects, see Support Files/Billboards View (InstallScript and InstallScript MSI Projects).

You can add billboards to your projects to display information to end users during the installation process. The billboards can be used to communicate, advertise, educate, and entertain end users. For example, billboards can present overviews on new features of the product being installed or other products from your company. Each billboard is a file that you or your company's graphics department creates for complete control over the look and feel of the file transfer.

If you add one or more billboards to your project, the billboards are displayed at run time as the SetupProgress dialog reports the modifications that Windows Installer is making to the system. You can control the length of time the billboard is shown and its position by configuring its settings in the Billboards view.

To learn about the settings in the Billboards view, see:

- Billboard Settings—These are project-wide billboard settings.
- Settings for Adobe Flash Application File Billboards and Image Billboards—These settings are displayed in the right pane in the Billboards view when you click a Flash billboard or image billboard in the center pane.

Billboard Settings

Project • *The Billboards view is available in Basic MSI projects.*

When you click the Billboards explorer in the center pane of the Billboards view, InstallShield displays the following settings in the right pane. These are project-wide settings for billboards.

Table 12-106 • Billboard Settings

Setting	Description
Billboard Type	Select the type of billboard that you want to use for your installation. Available options are: • **Fullscreen with Small progress (displayed in lower right)**—When the installation displays the standard end-user dialogs, it also displays a full-screen background. During file transfer, the installation shows full-screen backgrounds, with billboards in the foreground, and a small progress box in the lower-right corner of the screen. • **Windowed with Standard progress**—During file transfer, the installation displays a standard-size dialog that shows the billboards. The bottom of this dialog shows the progress bar. The installation does not display a background for this style. • **Windowed with Small (displayed in lower right, no billboards)**—The installation displays a small progress box in the lower-right corner of the screen during file transfer, but it does not display any billboards or a background. For more information, including sample screen shots of each billboard type, see Types of Billboards for Basic MSI Projects.
Loop Billboards	Specify whether you want your installation to continuously loop the image billboards until the file transfer completes and the installation shows the appropriate SetupComplete dialog. If you select No for this setting and the file transfer takes more time than you have allocated for the billboards, the installation continues displaying the last image billboard until the file transfer ends. If you select Yes for this setting and the file transfer takes more time than you have allocated for the billboards, the installation restarts the display of billboards from the beginning. The loop continues, if necessary, until the file transfer ends. The default value for this setting is No. This setting has no effect on Adobe Flash application file billboards.

Settings for Adobe Flash Application File Billboards and Image Billboards

Project • *The Billboards view is available in Basic MSI projects.*

A Flash or image billboard's settings determine which file is shown, how long it is displayed, and its position on the screen. To access these settings, open the Billboards view, and in the Billboards explorer, select the billboard that you want to configure.

Table 12-107 • Settings for Adobe Flash Application File Billboards and Image Billboards

Setting	Description
File Name	Do one of the following: • **For an Adobe Flash application file billboard**—Enter the path to the Flash application file (.swf) that you would like to use for the selected billboard, or click the ellipsis button (...) to browse to the file. Flash application files can consist of videos, movies, sounds, interactive interfaces, games, text, and more—anything that is supported by the .swf type of file. It is recommended that files such as Flash video files (.flv) and MP3 audio files be embedded in the .swf file so that they are available locally on the target system during file transfer. Although .swf files can reference external files that you can post on a Web site, this external implementation would require that end users have an Internet connection. • **For an image billboard**—Enter the path to the image file (.bmp, .gif, .jpg, or .jpeg) that you would like to use for the selected billboard, or click the ellipsis button (...) to browse to the file. Note that animated .gif files are not supported. If you want to use animation in a billboard, consider using an Adobe Flash application file billboard.  ***Note*** • *If the version of Flash or other tool that you use to create your .swf file is newer than the version of the Flash Player that is installed on a target system, it is possible that some of the Flash features may not work as expected on that target system.*
Duration	Enter the amount of time, in seconds, that this billboard should be displayed. The number that you enter must be from 1 to 32767 (which is a little more than 9 hours). The effect that the duration has on the run-time behavior depends on whether the installation is displaying a Flash billboard or image billboards. To learn more, see Run-Time Behavior of a Basic MSI Installation that Includes Billboards.

Table 12-107 • Settings for Adobe Flash Application File Billboards and Image Billboards (cont.)

Setting	Description
Origin	Select where on the screen you want your billboard to be anchored. Available options are: • Upper Right • Upper Left • Lower Right • Lower Left • Centered The X and Y coordinates are measured from this point.  ***Note*** *• This setting is used only if the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*
X Coordinate	To change the horizontal location of your billboard relative to the location you selected for the Origin setting, enter the distance, in pixels. For example, if the billboard's origin is Lower Left, an X Coordinate value of 100 places the left side of the billboard 100 pixels from the left side of the screen.  ***Note*** *• This setting is used only if the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*
Y Coordinate	To change the vertical location of your billboard relative to the location you selected for the Origin setting, enter the distance, in pixels. For example, if the billboard's origin is Lower Left, a Y Coordinate value of 100 places the bottom of the billboard 100 pixels from the bottom of the screen.  ***Note*** *• This setting is used only if the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*
Effect	Select the transition effect for this billboard. Rather than just appearing on the screen and disappearing after an allotted amount of time, a transition effect makes the change between billboards much smoother.  ***Note*** *• This setting is applies to image billboards, but not to Adobe Flash application file billboards.* *In addition, this setting is used only if the* ***Windowed with Standard Progress*** *option or the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*

Table 12-107 • Settings for Adobe Flash Application File Billboards and Image Billboards (cont.)

Setting	Description
Background Color	This setting displays the currently selected background color for your billboard. To change this color, click the ellipsis button (...). InstallShield displays the Color dialog box, which lets you select a predefined color or define a custom color for the background.  ***Note*** *• This setting is used only if the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*
Title	Enter the title of this billboard, as you want it to appear in the upper-left corner of the background. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.  ***Tip*** *• The maximum number of characters that the installation can display for the title at run time varies, depending on the font, the font size, the font attributes, and the length of the title string that you specify for this setting. It also depends on the screen resolution on the target system. Therefore, if you specify a long title, preview the billboard using different screen resolutions to test whether the entire title will be displayed at run time.*  ***Note*** *• This setting is used only if the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*
Background Style	Select the style of background that you would like to use. Available options are: • **Gradient**—The background fades from dark to light. • **Solid**—The background is displayed as one solid color.  ***Note*** *• This setting is used only if the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*
Font	Click the ellipsis (...) button to select the font that you want to use for the title in the selected billboard's background. If the target machine does not have the font you selected, a default system font is used instead.  ***Note*** *• This setting is used only if the* ***Fullscreen with Small progress (displayed in lower right)*** *option is selected for the Billboard Type setting.*

String Editor View

Project • *The String Editor view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

In the String Editor view, you have complete and centralized control over the localizable text strings that are displayed at run time during the installation process. You can use this view to edit the strings for everything from button text to feature descriptions.

The String Editor view shows the collection of language-independent identifiers and corresponding language-specific values for your project. Following is a list of some of the tasks that you can perform in this view:

- View all of the strings in your project.
- Add, modify, and delete strings.
- Filter the strings that are shown to hide ones that do not contain a specific string.
- Resize and reorder the columns in the view.
- Sort the rows in the view by any column by clicking the column heading.
- Drag and drop column headings on to the group box area (the area below the view's buttons) to organize the rows in the view in a hierarchical format.
- Export all of the string identifiers and their corresponding values into a text file (.txt).
- Import the translated strings from a .txt file into the project.
- Search the project to identify all of the instances in which a specific string identifier is used. Find out if a string is not used anywhere within a project.

Working with the String Editor View

The String Editor view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A spreadsheetlike table

Each row in the table represents a string entry in your project.

The following table describes all of the buttons and other controls that are displayed in the String Editor view.

Table 12-108 • Controls in the String Editor View

Name of Control	Icon	Description
New String Entry		Displays the String Entry dialog box, which lets you add a new string entry.
Edit Selected String		Displays the String Entry dialog box, which lets you edit the selected string entry.
Delete Selected Strings		Deletes the selected row or rows.
Expand All Groups		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Collapse All Groups		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Find String		Displays the Find dialog box, which lets you search for instances of a string. This dialog box lets you specify criteria such as whether you want to match the case.
Find Next		Searches for the next occurrence of the specified string.
Find and Replace		Displays the Replace dialog box, which lets you search for instances of a string and replace them with a new string. This dialog box lets you specify criteria such as whether you want to find or ignore a string with specific capitalization.
Search for Selected Strings in Project		Searches the entire project for all instances of the string whose row is selected, and shows the search results in the Output window.
Export Strings		Lets you export all of the strings for a particular language to a text file (.txt). You can provide that .txt file to a translator who can update the file with translated text.
Import Strings		Lets you select the text file (.txt) that contains the strings that you want to import into your project. Also lets you specify the language for those strings.

Table 12-108 • Controls in the String Editor View (cont.)

Name of Control	Icon	Description
Search Grid		Dynamically filters the strings that are displayed in the String Editor view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
Default Language		Lets you view and change the default language for the project.
String Editor Help		Displays the help for the String Editor view.
Drag a column header here to group that column		Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box. To learn more, see Working with the Group Box Area in Various Views.

The following table describes each of the columns in the String Editor view.

Table 12-109 • Columns in the String Editor View

Column	Description
Language	This column shows the language of the string entry.
Identifier	This column contains the language-independent ID for the string. Each string identifier in a project is linked to one or more values.
Value	This column shows the run-time string.  ***Project*** • *In Basic MSI, InstallScript MSI, and Merge Module projects, some of the string values contain Windows Installer properties inside square brackets—for example,* ***Install [ProductName]****. At run time, the property and brackets are replaced by the property value.* *String values in these same project types may also contain font information in curly brackets—for example,* ***{&MSSansBold8}OK****. The font information indicates style details that should be used to display the strings at run time.*
Comments	This column contains an internal note about the string entries. The comments are not displayed at run time.
Modified	This column lists the date and time that the string entry was last modified.

Media View

Project • *The Media view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The final step in creating your installation project is to build and test your installation. InstallShield provides you with many different media types to choose from, as well as the ability to test your installation from within InstallShield.

Path Variables

Project • *The Path Variables view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

With path variables, you can define commonly used paths in a central location so that you do not need to change every source file's path each time you move the project or change the directory structure.

Upgrades

Project • *The Upgrades view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Upgrades view provides a visual, integrated method for adding and authoring settings within the **Upgrade** table of your .msi database.

Releases

Project • *The Releases view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The Releases view enables you to build different configurations of your installation, test the user interface, or launch your installation for a trial run.

Patch Design

Project • *The Patch Design view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

In the Patch Design view, you can create a Windows Installer patch package (.psp) to update your application on an end user's system.

Path Variables View

Project • *The Path Variables view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The traditional way to link to source files in an installation project is to create a reference to that file using a hard-coded path. For example, you might have a source file called **Program.exe** located at **C:\Work\Files** that you want to include in your installation.

Using Hard-Coded Paths

If you use hard-coded paths, you have to enter the entire path every time you want to associate a source file from that directory. If you move the file to another directory, you have to change the hard-coded path as it appears in your installation project. If your installation consisted of a small number of source files, this might not be a problem. Unfortunately, some installations contain thousands of files that all need to be remapped if you change the folder structure or migrate the project to a different machine.

Using Path Variables

With path variables, you can define commonly used paths in a central location so that you do not need to change every source file's path each time you move the project or change the directory structure. In the previous example, if you keep all of your application's source files in various subfolders under **C:\Work\Files**, you could create one variable that points to the Files folder—*<MyFiles>*. If you want to include a file that is in **C:\Work\Files\Images**, you enter `<MyFiles>\Images`. If you move your files to **D:\Work\Files**, you can go to one place, your variable *<MyFiles>*, and change the folder that it points to.

All path variables can be viewed and modified in the Path Variables view. You can use path variables in almost any location in InstallShield where you link to source files, such as in the Dialog Editor, dynamic file links, and the release location. Instead of entering the path variables yourself, you can have InstallShield recommend them whenever you browse to a path.

Note • *Path variables are used during the development of your installation project. These paths do not apply to the target machines where the application is being installed. Rather, they are used to link to source files for your installation project. When the project is built, those links are evaluated and the files they point to will be built into the installation.*

Path Variables Types

There are four types of path variables that you can use. Each type functions somewhat differently from the others. Regardless of the path variable type you use, the variable name is provided in the same manner throughout InstallShield.

Table 12-110 • Types of Path Variables

Variable Type	Description
	Predefined path variables are path variables that point to some of the most commonly used folders. Unlike other types of path variables, these values cannot be edited in InstallShield. For more information, see Predefined Path Variables.
	The values of registry-based path variables are derived from the registry keys you created. After creating the registry key, you need to set a path variable to this key. For more information, see Registry Path Variables.
	Environment path variables are based on the values of your system's environment variables. You can set an environment path variable to an existing environment variable. For more information, see Environment Variables.

Table 12-110 • Types of Path Variables (cont.)

Variable Type	Description
	Standard, or user-defined, path variables are defined through InstallShield. You can specify a path variable such as <MyFiles> with a value of C:\Work\Files. These variables do not rely on any outside sources, such as the registry or system paths. For more information, see Standard Path Variables.

You also have the option of converting existing static links to path variables with the Convert Source Paths Wizard. This wizard scans your installation project for static links and changes those links to path variables, which makes your project more easily portable.

Working with the Path Variables View

The Path Variables view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A list of path variables that are defined in your project

The following table describes all of the buttons and other controls that are displayed in the Path Variables view.

Table 12-111 • Controls in the Path Variables View

Name of Control	Icon	Description
New Path Variable		Adds a new standard path variable to your project. To create a registry path variable or an environment variable, you can click the arrow next to this button, and then click the appropriate command. To learn more, see Creating and Defining a Path Variable.
Delete Selected Path Variables		Deletes the selected variable or variables.
Refresh		Refreshes the list of variables in the view.
Expand All Groups		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Collapse All Groups		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
Show Group Box		Shows or hides the group box area below the row of buttons in this view.

Table 12-111 • Controls in the Path Variables View (cont.)

Name of Control	Icon	Description
Search Grid		Dynamically filters the path variables that are displayed in the Path Variables view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
Path Variables View Help		Displays the help for the Path Variables view.
Drag a column header here to group that column		Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box. To learn more, see Working with the Group Box Area in Various Views.

The following table describes each of the columns in the Path Variables view.

Table 12-112 • Columns in the Path Variables View

Column	Description
Name	In this column, enter the name of your variable. You do not need to enter angle brackets, but the path variable is displayed in angle brackets whenever it is used in a path. For example, if your variable is named *MyRegVar* and a component's files are linked to the folder contained in its value, the component's Link To folder shows **<MyRegVar>**.

Table 12-112 • Columns in the Path Variables View (cont.)

Column	Description
Defined Value	In this column, define the value of the path variable. **For Standard Path Variables** For standard variables, enter the directory to which you would like your variable to point.  ***Note*** • *You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called `MyRoot` with a value of `C:\`, you can refer to it in a path variable definition for another variable, such as `Games`. The actual path for the `Games` variable might be `C:\Programs\GameFiles`, but you can define `Games` as `<MyRoot>\Programs\GameFiles`. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining `Games` as `<MyRoot>\Programs\<Games>` actually results in `Games` defined as `C:\Programs\<Games>`.* **For Registry Path Variables** Enter the complete registry key, with the final "subkey" being the name of the value whose data contains the folder. For example, define *`MyRegVar`* as follows: `HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue` Assume that TestKey has the following subkey and values: `[HKEY_LOCAL_MACHINE\SOFTWARE\TestKey]` `@="C:\\MyPath1"` `"TestValue"="C:\\MyPath2"` `[HKEY_LOCAL_MACHINE\Software\TestKey\TestValue]` `@="C:\\MyPath3"` Even though HKEY_LOCAL_MACHINE\SOFTWARE\TestKey has a subkey called TestValue, *`MyRegVar`* points to the value TestValue, and the current value will be `C:\MyPath2`. (Note, however, that if a value named TestValue does not exist, InstallShield reads the default value (`C:\MyPath3`) of the subkey HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue.) **For Environment Path Variables** For environment path variables, enter the name of the variable as it appears on the Environment dialog box.
Current Value	This is a read-only column that contains the actual path that the variable points to. This is a useful reference for environment and registry path variables, since they are defined outside InstallShield.

Table 12-112 • Columns in the Path Variables View (cont.)

Column	Description
Test Value	 ***Project*** • *This column applies to the following project types:* • *Basic MSI* • *DIM* • *InstallScript MSI* • *Merge Module* This column enables you to enter a hard-coded path that can be used when the registry path variable is resolved. To use test values in your release, you must select the **Use path variable test values** option on the Advanced Settings panel of the Release Wizard. This option is deselected by default. When this option is selected, the test value is used for all registry path variables. Otherwise, the test value is not used at all.
Type	This column shows the type of variable (predefined, standard, environment, or registry). Click a field in this column to change from one type of path variable to another. Note that you cannot change the type of a predefined path variable.

Tip • *To override the value of a user-defined path variable, an environment variable, or a registry value for a particular release at build time, use the Path Variable Overrides setting on the Build tab for that release. To learn more, see Build Tab for a Release.*

Upgrades View

Project • *The Upgrades view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Upgrades view provides a visual, integrated method for adding and authoring settings within the **Upgrade** table of an .msi database.

To add an upgrade item, right-click the Upgrade Windows Installer Setup node. Other available options are described below.

Table 12-113 • Upgrades View Options

Option	Description
Automatic Upgrade Item	 ***Note*** • *This is the preferred method for configuring upgrade settings. This option takes into account any potential future changes in the product code and handles both major and minor upgrades. If you do not know the difference between upgrade types and/or do not care, then choose this upgrade option.* When you add an automatic upgrade item, the build engine determines which settings need to be populated into your installation to perform a successful upgrade of your previous installation. This option does not require any additional authoring of advanced settings on your part. For more information, see Configuring InstallShield to Automatically Determine the Upgrade Type.
Minor Upgrade Item	Small updates and minor upgrades are functionally identical except the product version changes for a minor upgrade, but not a small update. A minor upgrade installs over an existing application while a major upgrade effectively uninstalls the existing installation of a product, and then installs the newer product version. The functionality required to install a minor upgrade is in the Setup.exe installation launcher, which you must include in your release in order for a minor upgrade to work properly. The installation specified at build time will also be used to perform upgrade validation. The build will also verify that the referenced installation can indeed be updated using a minor upgrade. Note that the build will warn you if you do not include Setup.exe when you build your release. For more information, see Creating Minor Upgrades.
Major Upgrade Item	A major upgrade will effectively uninstall the existing installation of a product, and then install the latest product version. A major upgrade is appropriate for substantial installation architecture changes that may or may not change the major version number of the product (such as upgrading version 1.1.0 to version 2.0.0). A major upgrade is required if any of the following are true: • The upgraded project contains new components in existing features. (This restriction does not apply to Windows Installer version 2.0 or later.) • An existing component's Component Code property has changed, or a component has been removed from the product tree. • An existing feature has been moved in the product tree, or deleted from the product tree. • The name of the .msi file has changed. For more information, see Creating Major Upgrades.

Table 12-113 • Upgrades View Options (cont.)

Option	Description
Validate All Items	This option will allow you to perform validation on the latest release or browse for a particular package to validate against a different release. For more information, see Validating Upgrades, Patches, and QuickPatch Packages. ***Note*** • *You can individually validate each upgrade item separately when you right-click on an upgrade item, and choose Validate Item from the context menu.* ***Tip*** • *Whenever you make changes in the Upgrades view, remember to rebuild your package before performing validation.*

Common Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Common tab exposes some global settings for both major and minor upgrades.

Small and Minor Upgrade Settings

The functionality required to install a minor upgrade is in `Setup.exe`. You must include `Setup.exe` for a minor upgrade to work properly. When `Setup.exe` detects different product codes for matching products, then it will display the “do you want to continue” dialog. This is an inherent feature of setup.exe. Choose from the following options to configure this setup.exe functionality:

Note • *Small and minor upgrades are functionally identical except the product version does not change for a minor upgrade. A minor upgrade installs over an existing application while a major upgrade effectively uninstalls the existing installation of a product, and then installs the newer product version.*

Table 12-114 • Small and Minor Upgrade Options

Option	Description
Disable	When you choose this option, you are required to detect the upgrade scenario and ensure that the latest version of your setup is running in upgrade mode.

Table 12-114 • Small and Minor Upgrade Options (cont.)

Option	Description
Don't prompt the user; just install the upgrade	This option will automatically start the setup in minor upgrade mode.
Prompt	Choosing this option will prompt the "do you want to continue dialog." If you choose yes, the setup will begin in upgrade mode. If you choose no, you will cancel the setup in upgrade mode.

Major Upgrade Settings

When you are performing a major upgrade, you can select how you want the upgrade to proceed. You can choose from the following options:

Table 12-115 • Options for Performing a Major Upgrade

Option	Description
Completely uninstall old setup before installing new setup	This is the most reliable setting, however, it is the least efficient. It will first remove all the files, registry entries, shortcuts, and settings of the old setup. Then it will apply new data from the latest version of your setup
Install setup then remove unneeded files	This is the most efficient setting, but it requires that you follow certain authoring rules. This option will first install the setup, and then remove all unnecessary files, registry entries, shortcuts, and settings after installing the latest version of your setup. ***Caution*** • *The removal of unnecessary resources relies on component reference counts being accurate. Keep in mind that reference counts occur at the component level. Therefore, you should be careful when you delete a component and move the associated resource to a different component. You do not want to choose this option if you have moved existing resources to different components.*
Rollback all changes if removal of old files fails	In the event of upgrade failure, the machine will be returned to its previous good state. This option will undo the changes made by the uninstallation of a previous version and the installation of the latest version.

Note • *This setting controls the sequencing of the RemoveExistingProducts action in the Install Execute Sequence. For more details, see RemoveExistingProducts in the Windows Installer Help Library.*

Advanced Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Advanced tab presents specific settings for major and minor upgrades in addition to some shared settings.

Table 12-116 • Advanced Properties in the Upgrades View

Property	Description
Upgrade Code	The upgrade code identifies a family of products for upgrade purposes. It is especially important for major upgrades.
On Upgrade	The functionality required to install a minor upgrade is in `Setup.exe`. You must include `Setup.exe` for a minor upgrade to work properly. When `Setup.exe` detects different product codes for matching products, then it will prompt the "do you want to continue" dialog. This is an inherent feature of `Setup.exe`. Choose from the following options to configure this `Setup.exe` functionality:  ***Note*** • *Small and minor upgrades are functionally identical except the product version does not change for a small update. A minor upgrade installs over an existing application while a major upgrade effectively uninstalls the existing installation of a product, and then installs the newer product version.* • **Disable**—When you choose this option, you are required to detect the upgrade scenario and ensure that the latest version of your setup is running in upgrade mode. • **Don't prompt the user; just install the upgrade**—This option will automatically start the setup in minor upgrade mode. • **Prompt**—Choosing this option will prompt the "do you want to continue" dialog. If you choose yes, the setup will begin in upgrade mode. If you choose no, you will cancel the setup in upgrade mode.

Table 12-116 • Advanced Properties in the Upgrades View (cont.)

Property	Description
Style	Choose from the following options: • **Install Then Remove Unused Files, with Rollback**—This is the most efficient setting, but it requires that you follow certain authoring rules. This option will first install the setup, and then remove all unnecessary files, registry entries, shortcuts, and settings after installing the latest version of your setup.  ***Caution*** *• The removal of unnecessary resources relies on component reference counts being accurate. Keep in mind that reference counts occur at the component level. Therefore, you should be careful when you delete a component and move the associated resource to a different component. You do not want to choose this option if you have moved existing resources to different components.*  ***Note*** *• In the event of upgrade failure, the Rollback option will return the machine to its previous good state. This option will undo the changes made by the uninstallation of a previous version and the installation of the latest version.* • **Install Then Remove Unused Files**—This is the most efficient setting, but it requires that you follow certain authoring rules. This option will first install the setup, and then remove all unnecessary files, registry entries, shortcuts, and settings after installing the latest version of your setup.  ***Caution*** *• The removal of unnecessary resources relies on component reference counts being accurate. Keep in mind that reference counts occur at the component level. Therefore, you should be careful when you delete a component and move the associated resource to a different component. You do not want to choose this option if you have moved existing resources to different components.* • **Complete Uninstall Then Reinstall**—This is the most reliable setting, however, it is the least efficient. It will first remove all the files, registry entries, shortcuts, and settings of the old setup. Then it will apply new data from the latest version of your setup.

Automatic Upgrade Item Properties

Project *• This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Note • *This is the preferred method for configuring upgrade settings. This option takes into account any potential future changes in the product code and handles both major and minor upgrades. If you do not know the difference between upgrade types and/or do not care, then choose this upgrade option.*

When you add an automatic upgrade item, the build engine determines which settings need to be populated into your setup to perform a successful upgrade of your previous setup. This option does not require any additional authoring of advanced settings on your part.

You can configure the following options for an automatic upgrade item in the Upgrades view:

Table 12-117 • Options for Automatic Upgrade Items

Option	Description
Setup to Upgrade	Enter the path to the setup project that needs to be upgraded or click the browse button to browse for it.
Release Flags	Associating a release flag with the automatic upgrade item will allow you to optionally exclude it from the build on a per release basis.

Minor/Small Upgrade Item Properties

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Minor and small upgrades are fundamentally the same except with minor upgrades, the product version changes.

You need to apply a small/minor upgrade any time you are upgrading a setup that has the same product code as the latest version of your setup. You are not required to change the product code of a setup unless you delete a component from a feature or you delete a feature from a setup.

Note • *If you move a component from one feature to another, you are essentially deleting that component from the first feature and therefore must change the product code.*

For upgrade scenarios in which the setup's product code has changed, you must apply a major upgrade.

This tab exposes the following settings:

Table 12-118 • Options for Minor and Small Upgrade Items

Option	Description
Setup to Upgrade	The functionality required to install a minor upgrade is in Setup.exe, which you must include in order for a minor upgrade to work properly. The setup specified at build time will also be used to perform upgrade validation. The build will also verify that the referenced setup can be updated using a minor upgrade. Note that the build will warn you if you do not include setup.exe when you build your release.
Release Flags	Specify release flags to include and exclude features depending on the type of release.

Common Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

A major upgrade is required when the product code for a setup differs from the product code of the setup that it needs to upgrade. You are not required to change the product code of a setup unless you delete a component from a feature or you delete a feature from a setup.

Note • *If you move a component from one feature to another, you are essentially deleting that component from the first feature list and therefore, must change the product code.*

At run time, a major upgrade effectively uninstalls the previous version of your application before installing the newest version of your application.

The Common tab exposes the most frequently used settings of a major upgrade item. For more detailed settings, use the Advanced tab.

Major Upgrade

Major upgrades use an upgrade code to detect previous versions of an application. The upgrade code for a setup groups that setup into a specific product family. If you want to target specific setups within that product family, you can configure the product version attribute of this upgrade item.

Table 12-119 • Options for Major Upgrade Items

Option	Description
Products Sharing My Upgrade Code	When this option is selected, the upgrade code of this major upgrade item is read from the currently open project file.
Products Having Another Upgrade Code	When this option is selected, you will have the ability to edit the upgrade code that this major upgrade item will target. Selecting this option also enables a Browse button allowing you to browse for the setup that you intend to upgrade. In this case, the upgrade code will be extracted from the setup which you have selected in the browse dialog.

Product Version

Choose a particular product version to target or define a range. You can choose from the following selections:

Table 12-120 • Options Associated with Product Version

Option	Description
Any earlier version	When you select this option, the major upgrade item will try to upgrade any setup in the specified product family that has a version number lower than the product version of the currently open project file.
Within a specific range of versions	Selecting this option will allow you to specify a range of product versions that should be targeted for upgrade. For instance, a minimum version of 1.00 and a maximum version of 4.00 will result in a setup that will upgrade any existing setup in the specified product family that has a version number falling between 1.00 and 4.00.
Version range Inclusive	When you select this option, the range specified will include the upper and lower bounds.
With a specific version	Selecting this option will allow you to target only a single previous version of a setup.

Advanced Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Advanced tab exposes more advanced level configurations, in addition to the settings in the Common tab. Click on each setting in the properties grid to configure the following settings.

Table 12-121 • Advanced Properties for Major Upgrade Items

Property	Description
Upgrade Code	The upgrade code is a GUID representing a related set of products. It is used in the **Upgrade** table to search for related versions of the product that are already installed.
Minimum Version	Enter the minimum product version that your setup should upgrade. Version numbers should be in the format xxxx.xxxx.xxxx.
Include Minimum Version	This setting is useful when you are specifying upper and lower bounds for a range of product versions which your upgrade will support. Choose Yes to include the min version value in the range of product versions to upgrade.
Maximum Version	Enter the maximum product version that your setup should upgrade. Version numbers should be in the format xxxx.xxxx.xxxx.
Include Maximum Version	This setting is useful when you are specifying upper and lower bounds for a range of product versions which your upgrade will support. Choose Yes to include the max version value in the range of product versions to upgrade.
Language	Specify a comma separated list of languages to upgrade. The language identifiers should be specified in decimal format. For example, specify 1033 for English.
Exclude Specified Languages	When set to No, the setup only will perform an upgrade if the target setup language matches one of the languages listed in the Language attribute. When set to Yes, the setup only will perform an upgrade if the target setup DOES NOT match one of the languages in the Language attribute.
Detect Only	If Detect Only is set to Yes, the setup will detect that an upgrade needs to occur, but it will not actually perform the upgrade. Additionally, the property specified in the Detect Property attribute will be set to the product code of the detected setup.
Detect Property	When a product is detected, it will set the property specified in the Detect Property setting. You can use that property in a conditional statement to control the flow of the installation or even stop the installation altogether. This property will not be set until the FindRelatedProducts action is run in the installation sequences.

Table 12-121 • Advanced Properties for Major Upgrade Items (cont.)

Property	Description
Only Remove Specified Features	This setting provides an alternative to doing a complete uninstall of an existing product by removing select features. ***Caution*** • *If you author this setting, the Installer will not completely uninstall the previous setup. Therefore, you will be left with two entries in Add or Remove Programs.*
Continue On Failure	Select Yes to continue an installation, even if the uninstallation of a previous version fails. Select No to stop the upgrade installation when it fails to uninstall a previous version.
Migrate Feature States	When you select Yes, the upgrade will install using the feature states of the setup being upgraded. When you select No, the upgrade will use the default states for the setup.

Releases View

Project • *The Releases view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

After you have completely designed your project in InstallShield, you are ready to build a release for testing and, ultimately, distribution to end users. The Releases view contains settings that indicate how InstallShield should build your release.

When you build a release, InstallShield takes all of the information from your project and compiles it into a Windows Installer installation package (.msi file), merge module (.msm file), or an executable file and related files, depending on the project type, that are capable of installing your product onto any supported Windows platform.

Tip • *In some project types, you can also use the Release Wizard to configure the settings for your release.*

Product Configuration Settings

Project • *Product configurations are available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

For Basic MSI, InstallScript MSI, and Merge Module projects, every release that you build belongs to a product configuration. A product configuration provides a means for grouping together releases that share similar properties, such as the product name, product code, and package code.

Each product configuration has two tabs:

- General tab (available for Basic MSI, InstallScript MSI, and Merge Module projects)
- Multiple Instances tab (available for Basic MSI projects)

General Tab for a Product Configuration

Project • *The General tab for a product configuration is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The General tab of each product configuration has the following settings, primarily for overriding other settings in the resulting releases:

Table 12-122 • Product Configuration Settings

Setting	Project Type	Description
Product Name	Basic MSI, InstallScript MSI, Merge Module	To override the product name in each release that you build under this product configuration, enter a new name. For information on how the product name is used, see Specifying a Product Name. Changing the product name in this setting does not affect any built releases. You must rebuild each release to see the changes reflected in the product name and in the project's folders and files.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Product Version	Basic MSI, InstallScript MSI, Merge Module	To override the product version in each release that you build under this product configuration, enter the version number. The version must contain only numbers. It is typically in the format *aaa.bbb.ccccc* or *aaa.bbb.ccccc.ddddd*, where *aaa* represents the major version number, *bbb* represents the minor version number, *ccccc* represents the build number, and *ddddd* represents the revision number. The maximum value for the *aaa* and *bbb* portions is 255. The maximum value for *ccccc* and *ddddd* is 65,535. Note that although you can include the fourth field (*ddddd*), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see Specifying the Product Version. If your release includes a `Setup.exe` file, the product version that you specify is displayed on the Properties dialog box for `Setup.exe`. For more information, see Customizing File Properties for the Setup Launcher.
Package Code	Basic MSI, InstallScript MSI, Merge Module	To override the package code that is entered in the General Information view, enter a new GUID. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting.  ***Note*** • *This package code is ignored if Yes is selected for the Generate Package Code setting.*

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Generate Package Code	Basic MSI, InstallScript MSI, Merge Module	Specify whether you want InstallShield to generate a new package code every time that a release under this product configuration is built: • **Yes**—InstallShield generates a new package code at build time and includes it in the .msi package. The package code that is displayed in the Package Code setting in the General Information view does not change. • **No**—InstallShield does not generate a new package code at build time. If you enter a package code for the product configuration, that package code is used. If you do not specify a package code for the product configuration, InstallShield uses the package code that is set in the General Information view.
Product Configuration Flags	Basic MSI, InstallScript MSI, Merge Module	Enter the release flags for the features, InstallShield prerequisites, and chained .msi packages that you would like to include in the releases that are associated with this product configuration. Separate multiple flags with a comma. Product configuration flags enable you to customize your installation by including or excluding certain features, InstallShield prerequisites, and chained .msi packages in each release that you build under this product configuration. Note that you can also specify release flags at the release level. For more information on filtering features, InstallShield prerequisites, and chained .msi packages, see Release Flags.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Subject	Basic MSI, InstallScript MSI, Merge Module	To override the value of the Subject setting in the General Information view for every release you build under this product configuration, enter the name of the product. The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (**...**) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Title	Basic MSI, InstallScript MSI, Merge Module	To override the value of the Title setting in the General Information view for every release you build under this product configuration, enter a new title. The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (**...**) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Template Summary	Basic MSI, InstallScript MSI, Merge Module	To override the Template Summary setting in the General Information view for a specific product configuration, specify the processor type and default language that your installation supports. List the processor type first, followed by your installation's default language, and separate them with a semicolon. If you have multiple entries in the language category, separate them with a comma. For example, if your installation runs only on Intel processors and English-based systems, enter `Intel;1033`. If your product runs on x64 processors and supports English and German, enter `x64;1033,1031`. For the language portion of this setting, use the number 0 if your installation is language neutral. Valid processor values include: • Alpha (Alpha is supported by Windows Installer 1.0 only.) • Intel • Intel64 (Intel64 is supported by Windows Installer 2.0 only.) • x64 Note that you can specify only one processor value. For more information, see Using the Template Summary Property. If the target machine does not meet the requirements that you specify for this setting, an error message is displayed and the installation exits.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Architecture Validation	Basic MSI, Merge Module	Select the type of architecture validation that you want to use at build time. Available options are: • **Lenient**—This type of validation lets you build x86 and x64 .msi packages (as indicated by the Template Summary property), and mix x86 and x64 product files and custom action files in both of those types of packages. Lenient architecture validation does not trigger build errors or warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or the custom action files that are being included in the release. At build time, the ISRedistPlatformDependentFolder and ISRedistPlatformDependentExpressFolder path variables point to the x86 locations that contain x86 InstallShield custom action DLLs. InstallShield includes these x86 custom action DLLs in the build if your project includes support that requires these custom actions. Lenient is the default option.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Architecture Validation (cont.)		• **Strict**—With this type of validation, InstallShield attempts to build a pure x86 or pure x64 .msi package, depending on whether the Template Summary property specifies Intel (for x86) or x64. Strict validation may trigger build errors if the architecture that the Template Summary property specifies does not match the architecture for one or more of the custom action files that are being included in the release. This type of validation may also trigger build warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files that are being included in the release. If the Template Summary property specifies Intel, the ISRedistPlatformDependentFolder and ISRedistPlatformDependentExpressFolder path variables point to the x86 locations that contain x86 InstallShield custom action DLLs. However, if the Template Summary property specifies x64 and you are using strict validation, these path variables point to the x64 locations that contain x64 InstallShield custom action DLLs. If your project includes support that requires any of these custom actions, InstallShield adds the appropriate x86 or x64 versions of the DLLs. To learn more, see Selecting the Appropriate Type of Architecture Validation for Builds.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Comments	Basic MSI, InstallScript MSI, Merge Module	To override the Summary Information Stream Comments setting in the General Information view for a specific product configuration, enter any comments about your product. A typical value for this setting is as follows: `This installer database contains the logic and data required to install MyProduct.` The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.
Schema	Basic MSI, InstallScript MSI, Merge Module	The schema version is an integer that identifies the minimum Windows Installer version that is required for the installation package. To override the Schema setting in the General Information view for a specific product configuration, enter the appropriate integer. For a minimum of Windows Installer 2.0, enter `200`. For a minimum of Windows Installer 3.0, enter `300`. For a minimum of Windows Installer 3.1, enter `301`. For a minimum of Windows Installer 4.5, enter `405`. If the end user's system has a Windows Installer version earlier than the minimum requirement that you specify for the Schema setting—for example, if you specify a schema value of 405 because your installation uses Windows Installer 4.5 features, but an end user has Windows Installer 3.1—the installation displays an error message and exits. The value that you enter for the Schema setting is used for the Page Count Summary property of your Windows Installer database.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Product Code	Basic MSI, InstallScript MSI	To override the Product Code setting in the General Information view for a specific product configuration, enter a GUID that uniquely identifies this product. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting. Since this code uniquely identifies your product, changing the product code after you have already distributed your release is not recommended. For more information, see Setting the Product Code in a Windows Installer–Based Project.
Upgrade Code	Basic MSI, InstallScript MSI	To override the Upgrade Code setting in the General Information view for a specific product configuration, enter a GUID that can be used for your product's upgrade code. To have InstallShield generate a different GUID for you, click the **Generate a new GUID** button ({...}) in this setting. The upgrade code is a GUID that identifies a related set of products. The Windows Installer uses a product's upgrade code when performing major upgrades of an installed product. The upgrade code, stored in the **UpgradeCode** property, should remain the same for all versions of a product. For more information, see Setting the Upgrade Code.

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Preprocessor Defines	Basic MSI, InstallScript MSI	To override the Preprocessor Defines setting on the Compile/Link tab of the Settings dialog box for a specific product configuration, specify any preprocessor definitions. Use the following format, with no spaces before or after equal signs or commas: `MYVARIABLE1=123,MYVARIABLE2=456` You can test those types of constants in your script by using #if and #ifdef statements that control the flow of the script. For example, type MYVARIABLE in this box, and the code in the following #ifdef loop will be executed: `#ifdef MYVARIABLE` `  // Commands` `#endif` After you add or change a preprocessor definition in this box, you must compile your script for the addition or change to take effect.  ***Note*** • *Many Windows API functions are declared in the header file `ISRTWindows.h`, which is automatically included when you include `Ifx.h` in your script. You can prevent the automatic definition of Windows APIs by placing the preprocessor constant ISINCLUDE_NO_WINAPI_H in the Preprocessor Defines box on the Compile/Link tab of the Settings dialog box.*
MSI Package File Name	Basic MSI, InstallScript MSI	Specify the file name—without the period or the file extension—that InstallShield should use for the .msi file and—if applicable—the package definition file that it generates at build time. If this setting is blank, the product name is used.  ***Important*** • *If you want to be able to release minor upgrades or small updates to update your product, the previous and latest versions of your installation must have the same .msi package name. Attempting to perform a minor upgrade or a small update when the .msi file name has changed can lead to Windows Installer run-time error 1316.*

Table 12-122 • Product Configuration Settings (cont.)

Setting	Project Type	Description
Setup File Name	Basic MSI, InstallScript MSI	Specify the file name—without the .exe file extension—that InstallShield should use for the setup launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of *Setup*, and the setup launcher file is called `Setup.exe`.
Include Custom Action Help	Basic MSI, InstallScript MSI, Merge Module	Specify whether InstallShield should stream the contents of each of the custom action help files into the .msi file every time that a release in the selected product configuration is built. The path to a custom action's help file is indicated in the Help File Path setting in the Custom Actions and Sequences view (in Basic MSI and InstallScript MSI projects) or the Custom Actions view (in Merge Module projects). Selecting Yes is helpful if system administrators deploy your product to enterprise environments; they sometimes need to know what the custom actions do. If you select Yes, the following tasks occur at build time: • InstallShield adds the **ISCustomActionReference** table to the .msi file that is being built. The contents of all of custom actions' help files that are specified in the Custom Actions and Sequences view are streamed into the Description column of this table. • If your project includes any merge modules that contain custom actions, the contents of the help files that are specified in the Custom Actions view of the merge module projects are also included in the **ISCustomActionReference** table. For more information, see Documenting the Behavior of Custom Actions.

Multiple Instances Tab for a Product Configuration

Project • *The Multiple Instances tab for a product configuration is available in Basic MSI projects.*

For information on multiple-instance support for InstallScript projects, see Running an InstallScript Installation Multiple Times.

Windows Installer allows only one instance of a product code to be installed in the machine context and only one instance to be installed in each user context. Windows Installer 3.x and later includes support for a product code–changing transform. This type of transform—called an instance transform—enables the same .msi package to be used to install multiple instances of the same product in the same context because it changes the product code for each instance.

To create an installation that lets end users install multiple instances of your product, use the Multiple Instances tab. This tab is where you define different instances of your product and configure the properties that are associated with each instance. At build time, InstallShield creates an instance transform for each instance and streams the instance transforms into the .msi package. At run time, the installation typically displays an instance selection dialog that lets end users specify whether they want to install a new instance or maintain an existing one.

Caution • *Creating an installation that lets end users install multiple instances of a product on the same machine and in the same context requires sophisticated authoring and serious commitment on the part of the installation developer. This functionality is recommended for only advanced installation developers.*

Release Settings

The settings for a release are organized by category on several different tabs in the Releases view:

- Build tab (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, and Suite/Advanced UI projects)
- Setup.exe tab (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, and Suite/Advanced UI projects)
- Signing tab (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, and Suite/Advanced UI projects)
- .NET/J# tab (available for Basic MSI and InstallScript MSI projects)
- Internet tab (available for Basic MSI, InstallScript, and InstallScript MSI projects)
- Events tab (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, and Suite/Advanced UI projects)

Build Tab for a Release

Project • *The Build tab is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

- *Suite/Advanced UI*

The Build tab is where you configure how InstallShield should package your release.

Table 12-123 • Settings on the Build Tab

Setting	Project Type	Description
Release Location	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Enter the path to the top-level directory where your release will start to be built, or click the ellipsis button (...) to browse to the location.
Build Location	Advanced UI, Suite/Advanced UI	Enter the path to the top-level directory where your release will start to be built, or click the ellipsis button (...) to browse to the location.
Media Format	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	This read-only setting enables you to view the type of media selected for this release. You can set the media type only through the Release Wizard's Media Type panel; for InstallScript object projects, you cannot set the media type.

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Compression	Basic MSI, InstallScript MSI	Specify whether the release should be compressed: • **Compressed**—InstallShield compresses all of your product's data files into .cab files. • **Uncompressed**—InstallShield does not compress your product's files into .cab files. As an alternative, you can use a custom compression method, which enables you to compress only the files that are associated with one or more features into .cab files. To set custom compression options, you must use the Release Configuration panel and the Custom Compression Settings panel in the Release Wizard. Note that when you use the Release Wizard to configure custom compression, InstallShield changes the Compression setting in the Releases view to a read-only value of **Custom (One Cab per Feature)** or **Custom (One Cab per Component)**. To change the compression from a custom method to the standard compressed method or the uncompressed method, you must use the Release Wizard again; you cannot do this from the Compression setting in the Releases view.  ***Note*** • *The output of the build process depends on the media type that you are building (such as CD-ROM, DVD-5, or Network Image), whether compression is used (as specified in the Compression setting), whether you are including a setup launcher (as specified in the Setup Launcher setting on the Setup.exe tab), and whether you are using disk spanning (as specified in the Disk Spanning setting, which is applicable to CD-ROM, DVD, and Custom media types).* *For example, if you select Compressed for the Compression setting, you select Yes for the Setup Launcher setting, and you are building a Network Image release, your data files are compressed into .cab files, and the .cab files are streamed into your `Setup.exe` file. If you select Uncompressed for the Compression setting, you select No for the Setup Launcher setting, and you are building a CD-ROM release that fits on one CD-ROM and uses automatic disk spanning, your data files are left uncompressed in a subfolder of the folder that contains the .msi file.*

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Cab Optimization Type	Basic MSI, InstallScript MSI	If Compressed or one of the custom options is selected for the Compression setting, specify the type of compression that InstallShield should use when building this release's .cab files. Available options are: • **LZX**—InstallShield uses LZX compression to compress your product's data files into .cab files. This option results in the smallest .cab files; however, it also takes the most time to extract the data from these .cab files at run time. • **MSZIP**—InstallShield uses MSZIP compression to compress your product's data files into .cab files. This is the default option. • **None**—InstallShield does not use any compression when creating the .cab files.  ***Important*** • *Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select the LZX option, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.*
Compress Script	InstallScript, InstallScript Object	Specify whether the compiled script file (.inx file) is placed in a cabinet file (Yes), or it is placed uncompressed in the Disk1 disk image folder (No).

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Compiler Preprocessor Defines	InstallScript, InstallScript Object	Optionally specify any preprocessor variable definitions. Preprocessor variable definitions that are specified here apply only to the current release; they are not used when compiling the script for other releases. Use the following format, with no spaces before or after equals signs or commas: MYVARIABLE1=123,MYVARIABLE2 Such variables can be tested in the script by #if and #ifdef statements that control the flow of the script. If you are creating an InstallScript object, enter `IFX_OBJECTS`. Entering the name of a preprocessor variable for this setting defines the variable. For example if you enter **MYVARIABLE** for this setting, the script commands in the following #ifdef loop are executed: `#ifdef MYVARIABLE` `  // Commands` `#endif` After you add or change a preprocessor variable definition for this setting, you must compile your installation for the addition or change to take effect.
Disk Spanning	Basic MSI, InstallScript MSI	This read-only setting indicates how your installation is spread across different disks. You can select a different option through the Disk Spanning Options panel in the Release Wizard. Available options are: • **Automatic**—InstallShield automatically splits your release files over as many disks as necessary. • **Custom - Enforce disk size**—InstallShield displays a warning and aborts the build if any feature's files are larger than the disk size. • **Custom - Do not enforce disk size**—InstallShield builds the release to span as many disks as necessary. This setting applies to the CD-ROM, DVD, and Custom media types. ***Important*** • *Multi-disk installations cannot be run from a non-removable media (for example, from a hard drive). If you want to test an installation that spans disks, you need to put the installation on your target media. If you do not, the installation will fail because of a limitation of the Windows Installer.*

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
File Name Format	Basic MSI, InstallScript MSI, Merge Module	Select the file name format that should be used to determine how the paths of your files are stored in the .msi package. InstallShield stores the option that you specify in your .msi package's Summary Information Stream. If your installation will be distributed on media that does not support long file names, such as a UNIX server, select the Short File Names option.
Platform(s)	InstallScript, InstallScript Object	If the release is specific to one or more platforms, use this setting to indicate the platforms: click the value of this setting, and then click the ellipsis (...) button to specify the appropriate platforms. If the platform specified for a component does not match one of the platforms that is selected for this setting, the component is not included in the release. The default value for this setting is Use Project Settings. This value indicates that the release supports the platforms that are specified at the project level.
Layout	InstallScript	This read-only setting indicates whether the project's files are stored in cabinet files or placed uncompressed in the disk image. You can modify this setting through the Media Layout panel in the Release Wizard. Available options are: • **Cabinet File(s)**—InstallShield places all data files in one or more data cabinet files at build time. • **CD-ROM Folder(s)**—InstallShield places all data files in one or more CDROM folders at build time. • **Custom**—InstallShield places some data files in one or more CD-ROM folders and some in one or more data cabinet files at build time.
Data Languages	Basic MSI, InstallScript MSI, Merge Module	If you want to include certain components and exclude others based on the language that is selected for each component, click the ellipsis button (...) in this setting and specify the appropriate languages. If the language specified for a component does not match one of the languages that is selected for this setting, InstallShield does not include the component in the release. By default, releases are language independent; that is, none of the project's components are excluded from the release.

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
UI Languages	Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/ Advanced UI	This setting lets you specify which user interface languages you want to include in a release. To select the appropriate languages, click the ellipsis button (...) in this setting. Note that if a language is not selected in the Setup Languages setting in the General Information view of the project, it is not listed as one of the available languages for the UI Languages setting.
Language(s)	InstallScript, InstallScript Object	Use this setting if you want to include certain components and exclude others based on the language that is selected for each component. This setting also lets you specify which user interface languages you want to include in a release. If the language specified for a component does not match one of the languages that is selected for this setting, InstallShield does not include the component in the release. In addition, if a UI language that is included in the project does not match one of the languages that is selected for this setting, InstallShield does not include the UI strings in the release. By default, releases are language independent; that is, none of the project's components or UI strings are excluded from the release. Note that if a language is not selected in the General Information view of a project, it is not listed as one of the available languages for the Language(s) setting.
Default Language	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Suite/ Advanced UI	To override the release's default project language that is configured in the General Information view or the String Editor view, select the appropriate default user interface language for your installation. For more information, see Setting the Default Project Language.
Languages Dialog	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Suite/ Advanced UI	Specify whether you want your installation to display the language selection dialog when the installation is run with a full user interface.  ***Tip*** • *For Basic MSI projects—If you want the language selection dialog to be displayed, a* `Setup.exe` *setup launcher is required. To learn more, see Creating a Setup Launcher.*

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Build UTF-8 Database	Basic MSI, InstallScript MSI, Merge Module	Specify whether you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding. The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system.  ***Important*** • *As documented in Microsoft KB 979849, the Windows Installer does not fully support UTF-8 databases; therefore, some scenarios result in user interface issues. For example, if an end user runs the installation with a basic user interface (by using the /qb command-line option) or uninstalls the product from Add or Remove Programs, the Windows Installer uses very small fonts to display the user interface text in a UTF-8 database.* If you specify No, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages. The default value for this setting is No.
Previous Package	Basic MSI, InstallScript MSI, Merge Module	Enter the fully qualified path to a previous release (.msi file for an installation project, or .msm file for a merge module project) to minimize the size of future patch packages. This setting corresponds to the Patch Optimization setting in the Release Wizard.  ***Note*** • *If your package uses dynamic file linking, it is recommended that you specify a previous package in this setting so that the file keys are consistent across releases.* For more information, see Upgrade Considerations.

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Generate File Hash Values	Basic MSI, InstallScript MSI, Merge Module	Indicate whether you want InstallShield to populate the **MsiFileHash** table for every unversioned file in your build. Available options are: • **Yes**—InstallShield populates the **MsiFileHash** table for every unversioned file in your build. • **No**—InstallShield does not populate the **MsiFileHash** table. If you select No, InstallShield builds any entries that are found in the project's **MsiFileHash** table (populated using the Direct Editor). If you have already populated the **MsiFileHash** table for a particular file, the build uses that information instead of generating the information at build time. For more information, see MsiFileHash Table in the Windows Installer Help Library.
Shallow Folder Structure	Basic MSI, InstallScript MSI	If you want InstallShield to create the .msi file and related files directly in the location that is specified in the Release Location setting, without any of the subfolders, select Yes. To build the release if the release location is in <ISProjectDataFolder> or <ISProjectFolder>, click Build Tables & Refresh Files on the Build menu.
Generate Autorun.inf	Basic MSI, InstallScript MSI	Select Yes if you are distributing your installation on a CD-ROM or DVD-ROM and you want to support the AutoPlay feature. InstallShield creates a text file called `Autorun.inf`, which contains the instructions to autoplay your installation, in the root of your disk images folder. You can edit this file to add additional AutoPlay options or to pass command-line parameters to `MsiExec.exe`, `Setup.exe`, or `Update.exe`.

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Release Flags	Advanced UI Basic MSI, InstallScript MSI, Suite/ Advanced UI	Release flags enable you to customize your installation by including or excluding certain items in each release. Enter the flags that you would like to include in this release. Separate multiple flags with a comma.  ***Project*** • *For Basic MSI and InstallScript MSI projects—Once you have assigned release flags to your features, InstallShield prerequisites, and chained .msi packages, you can create a release that includes features, InstallShield prerequisites, and chained .msi packages based on those flags. By default, all features, InstallShield prerequisites, and chained .msi packages are included in a release. Once you specify a flag in either the Releases view or the Release Wizard, only unflagged items and items that contain the specified release flag are included in your installation.* *For Advanced UI and Suite/Advanced UI projects—Once you have assigned release flags to features and packages in the Advanced UI or Suite/Advanced UI project, you can create a release that includes features and packages based on those flags. By default, all features and packages are included in a release. Once you specify a flag in the Releases view, only unflagged items and items that contain the specified release flag are included in your installation.*  ***Note*** • *If a release does not have release flags, it will include all applicable items that have release flags. To include only unflagged items, specify a flag that does not exist. For example, you might use* ***NoFlags****. This way, only unflagged items are built into a release.* *For Basic MSI and InstallScript MSI projects—Note that you can also specify release flags at the product configuration level. For more information, see Product Configuration Flags vs. Release Flags.*
Use Path Variable Test Values	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If you used test values for any of your path variables, select Yes to set those variables to their actual values at this time.

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Path Variable Overrides	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	To override a path variable in your project at build time for the selected release, click the ellipsis button (...) in this setting, which launches the Path Variable Overrides dialog box. This dialog box lets you select one or more path variables that you want to override. InstallShield adds a new path variable setting for each path variable that you select. Configure each path variable setting as necessary. Note that you can override user-defined path variables, environment variables, and registry variables that are configured in the Path Variables view; however, you cannot override predefined path variables such as *<WindowsFolder>*. To learn more about path variables, see Using Path Variables.
Path Variable Overrides Item	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify the new value of the path variable that you want InstallShield to use at build time for the selected release. The default value is the setting that is configured in the Path Variables view. InstallShield uses the new value that you specify in this setting to override the value that is set in the Path Variables view. To delete the path variable override, click the Delete button in this setting.  ***Tip*** • *You can refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called MyRoot with a value of C:\, you can refer to it in a path variable definition for another variable, such as Games. The actual path for the Games variable might be C:\Programs\GameFiles, but you can define Games as <MyRoot>\Programs\GameFiles. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining Games as <MyRoot>\Programs\<Games> actually results in Games defined as C:\Programs\<Games>.* If you override a path variable both in the Path Variables Overrides setting, and with the `-l` parameter to `IsCmdBld.exe` or through MSBuild, the command line or MSBuild value takes precedence over the value that is set in the release setting. To learn more about path variables, see Using Path Variables.

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Features	InstallScript, InstallScript Object	This read-only setting indicates which features are included in the built release. You can modify the value of this setting from the Features panel in the Release Wizard. • **Use the "Include in Build" feature property**—If this option is selected, each feature whose Include In Build setting is set to Yes is included in the built release, and each feature whose Include In Build setting is set to No is not included. • **Specify the features to be included directly**—Specify for each feature whether the feature is included in the built release.
Specify Skin	InstallScript	Select the dialog skin that is applied to this release. The default value, <Use Project Setting>, uses the skin that is selected in the Skins folder of the Dialogs view; selecting any other value for this setting overrides the Skins folder selection.
Differential Media	InstallScript	Specify whether the current release (the release that is selected in the Releases view) is a differential release—that is, a release that contains only those files that were absent from one or more of a specified set of existing releases—or a full release, which contains all your product's files, so that your product can be installed on a system on which no version of your product is currently installed. For more information, see Differential vs. Full Releases.
Support Version(s)	InstallScript	This setting is applicable only if No is selected for the Differential Media setting. Optionally enter a semicolon-delimited list of version numbers (for example, 1.2.3;1.2.4) of the earlier versions of your product to which this release can be applied as an update. If you leave this setting blank, the installation can be run on a system on which any earlier version, or no version, of your product is currently installed.

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Object Difference	InstallScript	This setting is applicable only if Yes is selected for the Differential Media setting. Select the conditions for including InstallShield objects in your differential release. • **Include All**—The differential release includes all objects that would be included in the equivalent full update release. • **Exclude All**—The differential release does not include any objects. • **Include If Changed**—The differential release includes those objects that would be included in the equivalent full update release and that are not found in, or are different from, the corresponding object in at least one of the comparison releases.
Keep Unused Directories	Basic MSI, InstallScript MSI, Merge Module	Specify whether you want InstallShield to remove unused directories from the **Directory** table of the .msi file when you build this release. Available options are: • **No**—If a directory that is listed in the Directory column of the **Directory** table is not referenced in any known location in the .msi file, InstallShield removes it from the **Directory** table of the .msi file that it creates at build time. For Basic MSI and InstallScript MSI projects, this occurs after any merge modules are merged, but only directories that are present in the .msi file are removed; therefore, if a merge module contains new unused directories in its **Directory** table, the new unused directories are added to the installation. • **Yes**—InstallShield does not remove any directories from the **Directory** table of the .msi file that it creates at build time. The default value is No.  ***Note*** • *Under some conditions, predefined directories cannot be resolved, causing an installation to fail. Removing unused directories from the* ***Directory*** *table enables you to avoid unnecessary failures. Therefore, it is recommended that you select No for this setting.*

Table 12-123 • Settings on the Build Tab (cont.)

Setting	Project Type	Description
Disable Trialware Build	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	To build a trialware release of your product, select No for this setting. This is the default setting. InstallShield will wrap a trialware shell around the executable file (.exe, .dll, .ocx, or .scr) specified in the Trialware view. The executable file can be unwrapped and used only according to the license settings that you configure, such as the trial limit (a specified number of days or a specified number of uses). To build a release of your product that does not have the trialware protection, select Yes for this setting. If you select Yes, you can use this release if you want to test the installation of your product but you do not want to test the trialware run time. You also may want to build a release without trialware protection if you distribute the Try and Die type of trialware to prospective customers. You can give them the unprotected release when they have finished evaluating your product and they purchase it from you. If you test a Try and Die product by running the protected trial version, it will expire at the end of the trial period; you will not be able to test your product further on the same test machine without removing the license. To learn how to remove a license from a test machine, see Testing a Trialware Release of Your Product. If you have not added a trialware file to your project in the Trialware view, the Disable Trialware Build setting has no effect on the release build.
Hide Add/ Remove Panel Entry	InstallScript MSI	Specify whether you want to hide your product's entry in Add or Remove Programs in the Control Panel: • **No**—Your product's entry is displayed on the target machine in Add or Remove Programs. • **Yes**—Your product's entry is not displayed on the target machine in Add or Remove Programs. The end user cannot use Add or Remove Programs to remove, modify, or view support information for your product. To learn about how to indicate which information should be displayed for your product—including how to hide buttons in the Add or Remove Programs—see General Information View Settings.

Setup.exe Tab for a Release

Project • *The Setup.exe tab is available in the following project types:*

- *Advanced UI*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Suite/Advanced UI*

For more information on including Windows Installer redistributables in installations, see Adding Windows Installer Redistributables to Projects.

The Setup.exe tab is where you configure settings about your `Setup.exe` file. It is also where you specify whether you want to include redistributables for Windows Installer 3.1 or earlier. For more information on Windows Installer redistributables, see Adding Windows Installer Redistributables to Projects.

Table 12-124 • Settings on the Setup.exe Tab

Setting	Project Type	Description
Setup Launcher	Basic MSI, InstallScript MSI	Specify whether you want to create a `Setup.exe` setup launcher. To learn about scenarios that require a setup launcher, see Creating a Setup Launcher.
Executable File Name	Advanced UI, Suite/Advanced UI	Specify the file name—without the .exe file extension—that InstallShield should use for the setup launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of *Setup*, and the setup launcher file is called `Setup.exe`.
Single .exe File Name	InstallScript	If you want InstallShield to build a self-extracting executable file that runs your installation, specify its file name (including the file extension). If you specify a file name, InstallShield creates a self-extracting executable file and adds it to the Package subfolder of the folder that is specified in the Release Location setting on the Build tab for this release. If you leave this setting empty, InstallShield does not create a self-extracting executable file at build time.
Setup.exe Icon File	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	To use your own icon for the `Setup.exe` file, specify the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable, or click the ellipsis button (...) to browse to the file from within the Change Icon dialog box. By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, **C:\Temp\MyLibrary.dll,2** indicates the icon with an index of 2, and **C:\Temp\MyLibrary.dll,-100** indicates the icon with a resource ID of 100. If you leave this setting blank, InstallShield uses a default icon for your `Setup.exe` file.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
MSI Command-Line Arguments	Basic MSI, InstallScript MSI	Indicate any command-line arguments that you want to pass from the setup launcher to Windows Installer. InstallShield writes the value that you enter in the `Setup.ini` file. `[Startup]` `CmdLine=Your Value`  ***Tip*** • *To set a property, enter* ***`MYPROPERTY="My Value"`*** *for this setting.*
Setup Command Line	InstallScript	Enter any command-line parameters that you want to pass to `Setup.exe` when end users launch the installation.
Generate Package Definition File	Basic MSI, InstallScript MSI	Specify whether you want InstallShield to create a package definition file (.pdf) that enables end users to run your installation as an SMS job. If you select Yes, InstallShield creates a version 2.0 .pdf.
Required Execution Level	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	Use the Required Execution Level setting to specify the minimum level required by your installation's `Setup.exe` file for running the installation (the setup launcher, any InstallShield prerequisites, and the .msi file) on Windows Vista and later platforms. The available options are: • **Administrator**—`Setup.exe` requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator. • **Highest available**—`Setup.exe` prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges. This is the default option for InstallScript and InstallScript MSI projects. • **Invoker**—`Setup.exe` does not require administrative privileges, and all users can run it without administrative privileges. `Setup.exe` does not display any UAC messages prompting for credentials or for consent. This is the default option for Advanced UI, Basic MSI, and Suite/Advanced UI projects. For Advanced UI, InstallScript, InstallScript MSI, and Suite/Advanced UI projects, and for Basic MSI projects if Yes is selected for the Setup Launcher setting, InstallShield embeds an application manifest in the `Setup.exe` launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level. If No is selected for the Setup Launcher setting for a Basic MSI project, InstallShield does not embed the Windows application manifest in a `Setup.exe` launcher.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
Required Execution Level (cont.)		The benefit of elevating the required execution level in Basic MSI projects is that privileges can be elevated only once if necessary to run `Setup.exe`, and that these privileges can be carried over to all of the installation's InstallShield prerequisites and the Execute sequence of the .msi package without requiring multiple prompts for approval. Thus, if two of your InstallShield prerequisites require administrative privileges, for example, you can change this setting to Administrator, and then end users are prompted only once during the installation, before Windows Installer runs the `Setup.exe` file. A similar benefit exists for Advanced UI and Suite/Advanced UI projects, where privileges can be elevated only once if necessary to run `Setup.exe`, and that these privileges can be carried over to all of the installation's Advanced UI or Suite/Advanced UI packages without requiring multiple prompts for approval. Note, however, that if you elevate the privileges and also launch the application at the end of the installation, the elevated privileges are carried over to the application. In most cases, running an application with elevated privileges on Windows Vista and later platforms is discouraged. For more information, see Minimizing the Number of User Account Control Prompts During Installation.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
Advertise If Prerequisites Are Elevated	Basic MSI, InstallScript MSI	In the following common scenario, you may want to advertise your .msi file to help end users avoid a second User Account Control (UAC) prompt during your product's installation on Windows Vista and later systems: • Your installation includes one or more InstallShield prerequisites that require elevation. • In addition, your .msi file requires elevation. (That is, the Require Administrative Privileges setting in the General Information view is set to the default value of Yes.) If this scenario does not apply to your installation, it is recommended that you leave the default value of No for the Advertise If Prerequisites Are Elevated setting because setting it to Yes would not avoid a second UAC prompt. The Advertise If Prerequisites Are Elevated setting applies to installations that are run on Windows Vista and later systems. Installations that are run on earlier versions of Windows ignore this setting. Valid options are: • **Advertise: Silent**—Indicates that if InstallShield prerequisites in the installation are successfully installed with elevated privileges, the .msi file should be advertised and run silently (without a user interface). Then the main part of the installation does not require an additional UAC prompt for consent or credentials. • **Advertise: Full UI**—Indicates that if InstallShield prerequisites in the installation are successfully installed with elevated privileges, the .msi file should be advertised and run with a full user interface. Then the main part of the installation does not require an additional UAC prompt.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
(cont.)		• **No**—Indicates that the .msi file should not be advertised. When end users run the installation, one or more UAC prompts may be displayed to install the InstallShield prerequisites. If the .msi file also requires elevation, an additional UAC prompt may be displayed before the main part of the installation occurs. ***Note*** • *The package must support advertisement in order for either of the advertise options to work. Advertisement is not instantaneous, and it adds extra delays to the installation. In addition, unexpected behavior may occur if the end user clicks Cancel after advertisement but before the main part of the installation has finished. For example, advertised shortcuts for your product may appear on the desktop before the main installation begins, and a confused user canceling the main installation may leave your package advertised but not fully installed. Therefore, in some cases, it may be better to leave this setting as No to allow the second UAC prompt and avoid product advertisement.* In some cases, the .msi file is not advertised, and as a result, the second UAC prompt is displayed. For more information, see Specifying Whether a Product Should Be Advertised If Its InstallShield Prerequisites Are Run with Elevated Privileges.
Include MSI Engine	Basic MSI, InstallScript MSI	Specify whether you want to include redistributables for Windows Installer 3.1earlier. ***Note*** • *This setting applies to redistributables for Windows Installer 3.1. For information on different methods of adding various versions of Windows Installer redistributables to a project, see Adding Windows Installer Redistributables to Projects.*

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
MSI Engine Location	Basic MSI, InstallScript MSI	 ***Note*** *• This setting applies to redistributables for Windows Installer 3.1. For information on different methods of adding various versions of Windows Installer redistributables to a project, see Adding Windows Installer Redistributables to Projects.* Specify where the Windows Installer engine installers should be located. Available options are: • **Copy from Source Media**—Leave the selected Windows Installer engine installers on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into `Setup.exe`. • **Extract Engine from Setup.exe**—Compress the selected Windows Installer engine installers into `Setup.exe`, to be extracted at run time. • **Download Engine from the Web**—Download the Windows Installer engine installer (if necessary) from a URL that you specify. If you select this setting, be sure to set the engine URL settings to the appropriate Web locations, or leave the default value.
MSI 3.1 Engine URL	Basic MSI, InstallScript MSI	This setting specifies the location from which the setup launcher downloads the Windows Installer 3.1 engine, if needed. This setting is ignored unless the MSI Engine Location setting for the current release is set to Download Engine from the Web. Do not specify the file name in the URL.  ***Note*** *• The default URL (http://www.installengine.com/Msiengine30) is a site maintained by Flexera Software for your convenience. The 3.1 engine is available for download from this location.*

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
Delay MSI Engine Reboot	Basic MSI, InstallScript MSI	***Note*** • *This setting applies to redistributables for Windows Installer 3.1 and earlier. For information on different methods of adding various versions of Windows Installer redistributables to a project, see Adding Windows Installer Redistributables to Projects.* Specify whether you want to postpone any reboot associated with installing or updating the Windows Installer engine on the target system until after your installation has completed. Select Yes to postpone the reboot, if one is necessary. Select No to allow the system to reboot, if necessary, immediately after the Windows Installer engine has been installed or updated and before performing your installation.
Cache MSI Locally	Basic MSI, InstallScript MSI	Specify whether the .msi file and other installation files for the current build should be cached on the target system. • **Yes**—Cache the .msi file and other installation files on the target system for use with application maintenance and repair. The Cache Path setting for the current release specifies where files should be cached. • **No**—Do not cache the .msi file and other installation files on the target system. ***Note*** • *This setting is enabled for releases that do not have the .msi file available in the same folder as the `Setup.exe` file on the target system.*
Cache Path	Basic MSI, InstallScript MSI	Specify where the cached .msi file and other cached installation files should be stored on the end users's system. You can enter a hard-coded value such as **C:\CachedFiles**, but it is recommended that you cache files in a path using a destination variable selected from the list. The default value is **[LocalAppDataFolder]Downloaded Installations**. ***Note*** • *This setting is used only if the Cache MSI Locally setting for the current release is set to Yes.*
Media Password	InstallScript	Enter the password that end users must enter in order to run the installation. Leave this setting empty if you do not want to password-protect your installation.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
Show Password Dialog	InstallScript	This setting is applicable only if you specify a non-null password in the Media Password setting. Select Yes to set the *SHOW_PASSWORD_DIALOG* system variable to a non-zero value, which executes the password-checking code in the OnCheckMediaPassword event handler function's default code. If you select No, you must enter your own code in the script to request the password from the end user and check it by calling **FeatureValidate**.
Small Initialization Dialog	Basic MSI, InstallScript, InstallScript MSI	Specify whether you want to display a small initialization dialog when end users run this release. When the installation initializes, by default, an initialization dialog is displayed. The standard initialization dialog is the same size as the Welcome dialog and contains initialization text, a progress bar, and a Cancel button. The small initialization dialog contains initialization text, progress and a Cancel button; however, it is smaller, it does not contain a bitmap image, and its background is the window color of the end user's system.
Init Dialog Product Name	InstallScript	Optionally enter the product name to display in the setup initialization dialog. If you leave this setting empty, InstallShield uses the product name that you specify in the General Information view.
Minimum Initialization Time	Basic MSI, InstallScript, InstallScript MSI	Specify the minimum number of seconds that the installation should display the initialization dialog when end users run this release. InstallShield uses the value that you specify for this setting as the value of the SplashTime keyname in the `Setup.ini` file. When the installation initializes, by default, an initialization dialog is displayed. The splash screen, if provided, is also shown at this time. If you specify a minimum initialization time in this setting, the initialization dialog and splash screen are shown for at least the specified number of seconds. If initialization takes longer than the time specified, the dialog and splash screen are still displayed until the installation completes initialization. If initialization takes less time than the time specified, the installation continues to display the dialog and splash screen until the specified time has elapsed, and then the installation continues.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
Password Protect Launcher	Advanced UI, Basic MSI, InstallScript MSI, Suite/ Advanced UI	To password-protect your installation, select Yes, and then type a password for the Launcher Password setting.  ***Project*** • *In Basic MSI and InstallScript MSI projects, this setting is available only if you select Yes for the Setup Launcher setting.*
Launcher Password	Advanced UI, Basic MSI, InstallScript MSI, Suite/ Advanced UI	Type a password to protect your installation. Passwords are case-sensitive. This setting is used only if you select Yes for the Password Protect Launcher setting.  ***Project*** • *In Basic MSI and InstallScript MSI projects, this setting is available only if you select Yes for the Setup Launcher setting.*
Use Custom Version Properties	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	Specify whether you want to override the default copyright notice and file description for `Setup.exe` with your own copyright notice and file description. If you select Yes, enter your own information in the Launcher Copyright setting and the File Description setting. The copyright and description are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the `Setup.exe` file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.
Launcher Copyright	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	If you want to override the default copyright notice for `Setup.exe` with your product's copyright notice, enter your product's copyright notice. Note that you must also select Yes in the Use Custom Version Properties setting. The copyright is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the `Setup.exe` file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
File Description	Basic MSI, InstallScript, InstallScript MSI	If you want to override the default file description for `Setup.exe` with your own description, enter the appropriate description. Note that you must also select Yes in the Use Custom Version Properties setting. The description is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the `Setup.exe` file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.
Version	Advanced UI, Suite/Advanced UI	If you want to override the default product version and file version for `Setup.exe` with your own version number, enter the appropriate version number. Note that you must also select Yes in the Use Custom Version Properties setting. The product version and file version are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the `Setup.exe` file and then click Properties. Note that the file version always contains four fields. If you specify fewer than four fields for your product version, the remaining fields are filled with zeros. For example, if you specify a product version of **1.1**, the file version that is used in the version resources of `Setup.exe` is **1.1.0.0**. To learn more, see Customizing File Properties for the Setup Launcher.
Company	Advanced UI, Suite/Advanced UI	If you want to override the default company name for `Setup.exe` with your own company name, enter the appropriate name. Note that you must also select Yes in the Use Custom Version Properties setting. The company name is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the `Setup.exe` file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
InstallShield Prerequisites Location	Basic MSI, InstallScript, InstallScript MSI	Specify where the InstallShield prerequisites that are selected in the Redistributables view (in Basic MSI and InstallScript MSI projects) or in the Prerequisites view (in InstallScript projects) should be located.  ***Project*** • *The available options differ, depending on which project type you are using.* • **Follow Individual Selections**—Use the locations that are specified for each individual InstallShield prerequisite's properties in the Redistributables or Prerequisites view. This option is available for Basic MSI, InstallScript, and InstallScript MSI projects. • **Download From The Web**—Download all of the InstallShield prerequisite files included in your project (if necessary) from the URL specified in the InstallShield prerequisite (.prq) file for each prerequisite. This option overrides the locations that are specified in the Redistributables or Prerequisites view for each InstallShield prerequisite's properties. This option is recommended if your installation will be downloaded from the Internet and you want to minimize the package size and download time. An InstallShield prerequisite will not be downloaded if the correct version is already present on the target machine. This option is available for Basic MSI, InstallScript, and InstallScript MSI projects. • **Extract From Setup.exe**—Compress the InstallShield prerequisite files into `Setup.exe`, to be extracted at run time, if necessary. This option overrides the locations that are specified in the Redistributables view for each InstallShield prerequisite's properties. Select this option if the entire installation must be self-contained in `Setup.exe`. Note that the Download From The Web option results in smaller installations and shorter download time; however, the Extract From Setup.exe option provides for a completely self-contained installation. This option is available for Basic MSI and InstallScript MSI projects.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
InstallShield Prerequisites Location (cont.)		• **Copy From Source Media**—Store the InstallShield prerequisite files on the source media. This option overrides the locations that are specified in the Redistributables view for each InstallShield prerequisite's properties. Use this option if the installation will be run uncompressed from fixed media—CD, DVD, or local network. This option is available for Basic MSI and InstallScript MSI projects. • **Include with Media**—Store the InstallShield prerequisite files on the source media or in `Setup.exe`, depending on how you configure the settings for the release. This option overrides the locations that are specified in the Prerequisites view for each InstallShield prerequisite's properties. This option is available for InstallScript projects. Note that if an InstallShield prerequisite is added to a project as a dependency of another prerequisite, the location for the prerequisite dependency follows the location setting of the prerequisite that requires it.  ***Tip*** • *If you select the Extract From Setup.exe option, the Copy From Source Media option, or the Include with Media option and then build a release that includes an InstallShield prerequisite that is not available on your computer, one or more build errors are generated for every file that the prerequisite requires. To avoid these build errors, use the Redistributables view or the Prerequisites view to either download the InstallShield prerequisite from the Internet to your computer or remove it from your project before building the release.* To learn more, see Specifying the Run-Time Location for InstallShield Prerequisites at the Release Level.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
Package Location	Advanced UI, Suite/Advanced UI	Specify the run-time location for the packages that are configured in the Packages view. Available options are: • **Copy From Source Media**—Store the packages on the source media. This option overrides the run-time locations that are specified for each individual package's Location setting in the Packages view. If the Advanced UI or Suite/Advanced UI installation will be run uncompressed from fixed media—CD, DVD, or local network—select this option. • **Extract From Setup.exe**—Compress the packages into `Setup.exe`, to be extracted at run time, if necessary. This option overrides the run-time locations that are specified for each individual package's Location setting in the Packages view. If the entire installation must be self-contained in `Setup.exe`, select this option. Note that the **Download from the Web** option results in smaller installations and shorter download time; however, the **Extract from Setup.exe** option provides for a completely self-contained installation. • **Download from the Web**—Download all of the packages that are included in your project (if necessary) from the URLs that are specified for each package in the Packages view. This option overrides the run-time locations that are specified for each individual package's Location setting in the Packages view. This option is recommended if your Advanced UI or Suite/Advanced UI installation will be downloaded from the Internet and you want to minimize the installation size and download time. A package will not be downloaded if the correct version is already present on the target system. • **Follow Individual Selections**—Use the locations that are specified for each individual package's the Location setting in the Packages view. To learn more, see Specifying the Run-Time Location for Advanced UI or Suite/Advanced UI Packages at the Release Level.

Table 12-124 • Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
Cache Packages Locally	Advanced UI, Suite/Advanced UI	Specify whether you want to cache the Advanced UI or Suite/Advanced UI packages that are run on a target system in the location that is defined for each package in the Packages view. The default value is Yes. If you are building an uncompressed release, you may want to select No for this setting.
Update URL	Advanced UI, Suite/Advanced UI	If you may want to make updates for your Advanced UI or Suite/Advanced UI setup launcher available for download automatically when they are available, specify the absolute path, including the file name, for an updated Advanced UI or Suite/Advanced UI setup launcher. For more information about updates for your Advanced UI or Suite/Advanced UI installation, including requirements for the update, see Adding Support for Automatic Updates to an Advanced UI or Suite/Advanced UI Installation.
Expiration Date	Basic MSI, InstallScript MSI	To prevent end users from being able to run `Setup.exe` on or after a certain date, enter the expiration date, or click the arrow in this setting to select the date from a calendar. To remove the expiration date, click the Delete button in this setting. If you specify an expiration date in this setting, use the Expiration Date setting to specify the message that you want to be displayed at run time if an end user tries to launch `Setup.exe` on or after the expiration date.
Expiration Message	Basic MSI, InstallScript MSI	Enter the message that you want to be displayed at run time if an end user tries to launch `Setup.exe` on or after the expiration date that is configured in the Expiration Date setting.

Signing Tab for a Release

Project • *The Signing tab is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The Signing tab is where you specify the digital signature information—including the digital signature files granted to you by a certification authority—that InstallShield should use to sign your files. It is also where you specify which files in your installation should be digitally signed at build time.

Table 12-125 • Settings on the Signing Tab

Setting	Project Type	Description
Sign Setup.exe File	Advanced UI, Suite/Advanced UI	Specify whether you want to sign the Advanced UI or Suite/Advanced UI installation.
Certificate URL	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	Type a fully qualified URL—for example, **http://www.mydomain.com**. This URL is used in your digital certificate to link to a location you would like end users to visit in order to learn more about your product, organization, or company.
Digital Certificate File	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	Specify the location of your digital certificate file (.spc or .pfx) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location. If you specify an .spc file, you must also specify a .pvk file.
Private Key File	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	If you are using an .spc file, you must also specify the location of your private key file (.pvk) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location.

Table 12-125 • Settings on the Signing Tab (cont.)

Setting	Project Type	Description
Certificate Password	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	If you would like to pass the password for the .pvk file or the .pfx file to `ISCmdBld.exe` to digitally sign your application while building the release from the command line, type the password in this box. InstallShield encrypts this password and stores it in your project file (.ism). If you do not specify a password in this box but you are digitally signing the release while building it from the command line, you will need to manually enter the password when you are prompted each time that you build the release from the command line.

Table 12-125 • Settings on the Signing Tab (cont.)

Setting	Project Type	Description
Sign Output Files	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify which files you want to be signed. Available options are: • **Media Header**—To sign only your media header file (`Data1.hdr`), select this option. This option is available for InstallScript projects. • **None**—To avoid signing your installation, select this option. This option is available for Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, and Merge Module projects. • **Setup.exe**—To sign your `Setup.exe` file, select this option. This option is available for Basic MSI, InstallScript, and InstallScript MSI projects. • **Setup.exe and Media Header**—To sign your `Setup.exe` file and your media header file (`Data1.hdr`), select this option. This option is available for InstallScript projects. • **Setup.exe and Windows Installer Package**—To sign your `Setup.exe` file and your Windows Installer package (.msi), select this option. This option is available for Basic MSI and InstallScript MSI projects. • **Windows Installer Package**—To sign your Windows Installer package (.msi or .msm), select this option. This option is available for Basic MSI, InstallScript MSI, and Merge Module projects.  ***Project*** • *InstallShield does not support using .pfx files to sign media header files (.hdr files), which are used for the One-Click Install type of installation for InstallScript projects. For this type of installation, consider one of the following alternatives:* • *Use .spc and .pvk files instead of a .pfx file for your digital signature.* • *Build a compressed installation, which would enable you to sign with a .pfx file.*

Table 12-125 • Settings on the Signing Tab (cont.)

Setting	Project Type	Description
Sign Files in Package	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify whether you want to sign any of the files in your release. If you select Yes, use the Include Patterns and Files setting and the Exclude Patterns and Files setting to indicate which files should be signed.  ***Windows Logo*** • *All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.*
Sign Files That Are Already Signed	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If any of the files in your project are already digitally signed, determine whether you want InstallShield to replace those existing digital signatures with the digital signature that you specify on the Signing tab. Note that this affects only files that meet the requirements that are specified in the Include Patterns and Files setting and the Exclude Patterns and Files setting. • To use the digital signature information that you are providing on the Signing tab to sign a file instead of any existing digital signature information that is already included with the file, select Yes. • To leave the existing digital signature information intact for any files that are already signed, select No. The default value is No.
Sign Files in Their Original Location	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Determine whether you want InstallShield to sign your original files or just the files that are built into the release: • If you want InstallShield to sign a temporary copy of each file and then use that signed temporary copy to build a release, select No. Note that if you select No, InstallShield will not modify or sign your original files. • If you want InstallShield to sign your original files, select Yes. The default value is No.

Table 12-125 • Settings on the Signing Tab (cont.)

Setting	Project Type	Description
Include Patterns and Files	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	To specify the files and file patterns that you want to be digitally signed at build time, do one of the following: • To select one or more file names or file patterns from a list of all of the static files that are currently in your project, as well as file patterns such as *.dll, click the ellipsis button (...) in this setting. The Browse for file dialog box opens, enabling you to select one or more patterns and files. When you are done selecting items, InstallShield adds one or more new Include settings under the Include Patterns and Files setting. • To type a file name or pattern manually, click the Add button in this setting. InstallShield adds a new Include setting under the Include Patterns and Files setting; use this new setting to specify the file name or pattern.
Include	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify the file or file pattern that you want to be digitally signed at build time. Note the following guidelines: • To indicate a wild-card character, use an asterisk (*). For example, if you want to sign all .exe files, specify the following: ***.exe** Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern. • Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify ***.exe** in an Include setting and in an Exclude setting, InstallShield does not sign any .exe files. To delete the file or file pattern, click the Delete button in this setting. To add another file or file pattern, use the Include Patterns and Files setting.

Table 12-125 • Settings on the Signing Tab (cont.)

Setting	Project Type	Description
Exclude Patterns and Files	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	To specify the files and file patterns that you do not want to be digitally signed at build time, do one of the following: • To select one or more file names or file patterns from a list of all of the static files that are currently in your project, as well as file patterns such as *.dll, click the ellipsis button (...) in this setting. The Browse for file dialog box opens, enabling you to select one or more patterns and files. When you are done selecting items, InstallShield adds one or more new Exclude settings under the Exclude Patterns and Files setting. • To type a file name or pattern manually, click the Add button in this setting. InstallShield adds a new Exclude setting under the Exclude Patterns and Files setting; use this new setting to specify the file name or pattern.
Exclude	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify the file or file pattern that you do not want to be digitally signed at build time. Note the following guidelines: • To indicate a wild-card character, use an asterisk (*). For example, if you do not want to sign any .drv files, specify the following: ***.drv** Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to avoid signing all files that match a certain pattern. • Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify ***.exe** in an Include setting and in an Exclude setting, InstallShield does not sign any .exe files. To delete the file or file pattern, click the Delete button in this setting. To add another file or file pattern, use the Exclude Patterns and Files setting.

.NET/J# Tab for a Release

Project • *The .NET/J# tab is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The .NET/J# tab is where you add support for the 32-bit versions of the .NET Framework 1.0, 1.1, or 2.0. It is also where you add J# support to your project.

Note • *To include other versions of the .NET Framework redistributables in your project, use the Redistributables view to add the appropriate InstallShield prerequisite for the Microsoft .NET Framework to your project.*

For more information, see Adding .NET Framework Redistributables to Projects.

Table 12-126 • Settings on the .NET/J# Tab

Setting	Project Type	Description
.NET Framework Location	Basic MSI, InstallScript MSI	Specify where the .NET Framework runtime should be located. The .NET Framework is required for applications that are using any .NET features. Valid options are: • **Copy From Source Media**—Leave the .NET Framework runtime on the root of the source media. This option is not applicable to Web media types or Network Image media types with all of your files compressed into `Setup.exe`. • **Extract From Setup.exe**—Compress the .NET Framework runtime into `Setup.exe`, to be extracted at run time. • **Download from the Web**—Download the .NET Framework runtime (if necessary) from a URL that you specify. If you select this option, you must set the value of the .NET and J# Framework URL setting to the appropriate Web location. • **Do Not Include**—Do not include one of the 32-bit versions of the .NET Framework 1.0, 1.1, or 2.0 in the selected release.
.NET Framework Version	Basic MSI, InstallScript MSI	Select the 32-bit version of the .NET Framework that you want to distribute with your installation.  ***Note*** • *To include .NET Framework 3.5, 3.0 SP1, 3.0, 2.0 SP1 (x86, x64, IA64), or 2.0 (only x64, IA64) redistributables in your project, use the Redistributables view to add the appropriate InstallShield prerequisite for the Microsoft .NET Framework to your project.* *For more information, see Adding .NET Framework Redistributables to Projects.*
.NET 1.1/2.0 Core Language	Basic MSI, InstallScript MSI	If you selected .NET version 1.1 for the .NET Framework Version setting, you can specify one .NET core language that you want to distribute. This is the language that is used while the .NET 1.1 core redistributable is installed. If you selected version 2.0, the language options are all selected and disabled since they are all included with this version of the redistributable. To change the core language, click the ellipsis button (...) in this setting.

Table 12-126 • Settings on the .NET/J# Tab (cont.)

Setting	Project Type	Description
Command Line to Pass to Dotnetfx.exe	Basic MSI, InstallScript MSI	***Note*** • *This setting applies only if .NET 1.1 is selected for the .NET Framework Version setting.* Enter the command line that you want to pass to Microsoft's `DotNetFx.exe`.
.NET 1.1/2.0 Language Packs	Basic MSI, InstallScript MSI	To include .NET language packs, click the ellipsis button (...) in this setting. The options that are available depend on the Microsoft language packs that you have installed on your build machine. If you click the ellipsis button, you can download additional available language packs.
Command Line to Pass to Language Packs	Basic MSI, InstallScript MSI	***Note*** • *This setting applies only if .NET 1.1 is selected for the .NET Framework Version setting.* Enter the command line that you want to send to all of the Microsoft `LangPack.exe` files included with the installation.
Display .NET Option Dialog	Basic MSI, InstallScript MSI	Indicates whether `Setup.exe` displays a Yes/No message box asking the end user if they want to install .NET Framework on the target system. This setting does not determine whether your installation includes the .NET Framework, only whether the end user has a choice to install it. • **No**—Installs the .NET Framework, if required, without displaying a message box to the end user. • **Yes**—Displays the .NET option message box, which allows the end user to specify whether to install the .NET Framework. If you select Yes, a message box is displayed on the target system at run time. The message box states that the installation optionally uses the Microsoft .NET Framework and asks if they would like to install it.
Show Full User Interface when Installing .NET Framework	Basic MSI, InstallScript MSI	Specify whether you want the full interface for the .NET Framework installation to be displayed. If you select Yes, the Microsoft .NET Framework (English) Setup wizard appears when `dotnetfx.exe` installs the .NET Framework on the target system. This wizard shows the progress of the .NET Framework installation. If you select No, the InstallShield Wizard appears when `dotnetfx.exe` installs the .NET Framework on the target system. This InstallShield Wizard shows the progress of the .NET Framework installation.

Table 12-126 • Settings on the .NET/J# Tab (cont.)

Setting	Project Type	Description
.NET Build Configuration	Basic MSI, InstallScript MSI	The .NET Build Configuration setting contains the name of the build configuration of the .NET solution. InstallShield uses this setting to determine the location of a project outputs' files (for example, Debug or Release). The C# and VB.NET project wizards automatically update the value of this setting when you create a new project or change the solution for the project.
.NET and J# Framework URL	Basic MSI, InstallScript MSI	Specify the location from which your installation downloads the .NET Framework runtime and the J# redistributable, if included. It is not necessary to specify the file name in the URL. This setting is required only if the **.NET Framework Location** or **J# Redistributable Location** setting (if included) for the current release is set to **Download from the Web**. The installation downloads and runs the InstallShield file `Dotnetfx.exe`, which in turn downloads `Dotnetredist.exe` from the Microsoft Web site. This behavior is hard-coded in `Dotnetfx.exe`, which can be hosted anywhere.
J# Redistributable Location	Basic MSI, InstallScript MSI	Specify where the J# redistributable should be located. The .NET Framework is required for applications that use .NET features. Available options are: • **Copy from Source Media**—Leave the J# redistributable on the root of the source media. This option is not applicable to Web media types or Network Image media types with all of your files compressed into `Setup.exe`. • **Extract from Setup.exe**—Compress the J# redistributable into `Setup.exe`, to be extracted at run time. • **Download from the Web**—Download the J# redistributable (if necessary) from the URL specified in the .NET and J# Framework URL setting. • **Do Not Include**—Do not include the J# redistributable in the selected release. ***Note*** • *The J# version number that is used matches whatever version number that you select for the .NET Framework. You cannot install version 1.1 of one of these redistributables and version 2.0 of the other.*
Command Line to Pass to the J# Redistributable	Basic MSI, InstallScript MSI	Specify a command-line parameter to pass to `vjredist.exe`. Consult Microsoft Support for valid command-line parameters.

Table 12-126 • Settings on the .NET/J# Tab (cont.)

Setting	Project Type	Description
Display J# Option Dialog	Basic MSI, InstallScript MSI	Specify whether the installation should display a dialog that lets end users indicate if they want to install J# on the target system. ***Note*** • *If the .NET Framework 1.1 is also included in the installation, the dialog states that .NET Framework 1.1 will also be installed.*
Install J# if Installation Runs Silently	Basic MSI, InstallScript MSI	Specify whether you want to install J# on the target system if the J# Option dialog cannot be shown (for example, if the installation is run silently).

Internet Tab for a Release

Project • *The Internet tab is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Internet tab is where you specify Web-related information.

Table 12-127 • Settings on the Internet Tab

Setting	Project Type	Description
Web Type	Basic MSI, InstallScript MSI	Select the configuration of your Web installation package. Available options are: • **One Executable**—Build this release as a single self-extracting `Setup.exe` file. This Web type is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note, however, that the entire installation package is downloaded, so the download time is longer than with the Install from the Web type that is described below. • **Downloader**—Build this release as a combination of `Setup.exe` and your .msi package, where the end user downloads and launches `Setup.exe`, which in turn downloads and runs the .msi database, which contains all of your files. • **Install from the Web**—Build this release as a combination of `Setup.exe`, your .msi database, and external cabinet files (.cab). The end user downloads and run `Setup.exe`, which in turn downloads and runs the .msi database; based on the end user's setup type and feature selections, only the requested .cab files are downloaded and installed, which minimizes download time. For the Downloader and Install from the Web types, application maintenance and repair uses the URL that you specify in the URL for Your Files setting as the installation source.
URL for Your Files	Basic MSI, InstallScript MSI	Specify the directory that contains the data cabinet files that will be downloaded. This setting accepts a URL in the form **http://www.yourcompany.com/download**. This setting is used only if the Web Type setting for the current release is set to Install from the Web or Downloader.
IFTW .cab Size (KB)	Basic MSI, InstallScript MSI	Specify the size, in kilobytes, of the cabinet files (.cab) for the Web media type. Specify the value 0 (zero) to build a separate .cab file for each component. This setting is used only if the value of the Web Type setting for the current release is Install from the Web.

Table 12-127 • Settings on the Internet Tab (cont.)

Setting	Project Type	Description
Generate One-Click Install	Basic MSI, InstallScript, InstallScript MSI	Specify whether to create a One-Click Install, which is an installation program whose initial user interface is an HTML page. When an end user visits your Web page and clicks an Install button on it, the installation files are downloaded to the target system and then launched.  ***Project*** • *For Basic MSI and InstallScript MSI projects: What files are downloaded to the end user's system depends on the option that is selected for the Web Type setting for the current release. If you select Yes for the Generate One-Click Install setting, you must specify file names in the One-Click HTML Base Name setting and the One-Click .cab Base Name setting for this release. This setting is used only if you select Web for the release's Media Format setting.* *For InstallScript projects: If you select Yes for this setting, InstallShield includes with your installation an external setup player (`Setup.ocx` file) that downloads and then launches the `Setup.exe` file with the appropriate command line. For details, see One-Click Install Installations in InstallScript Projects.*
One-Click HTML Base Name	Basic MSI, InstallScript MSI	Specify the base file name of the HTML file that InstallShield should generate at build time. The .htm file name extension is appended to the base name that you specify, and the generated file is created in the Disk1 folder of the current release location. This setting is used only if the value of the Generate One-Click Install setting is Yes.
One-Click .cab Base Name	Basic MSI, InstallScript MSI	Specify the base file name for the cabinet file (.cab) that is generated by the build process for a One-Click Install installation. The .cab file name extension is appended to the name that you specify here. The generated files are created in the Disk1 folder for the current release. The name that you specify for this setting is displayed at run time in the Digital Certificate when you digitally sign your installation. This setting is used only if the value of the Generate One-Click Install setting is Yes.
Create Default Web Page	InstallScript	Specify whether you want InstallShield to create a default Web page (.htm file) and place it in the Disk1 folder.

Table 12-127 • Settings on the Internet Tab (cont.)

Setting	Project Type	Description
Web Page URL	InstallScript	Do one of the following to indicate what URL should be launched if you click the Run From Web command on the Build menu: • To launch the `Setup.htm` file that InstallShield creates at build time and places in the Disk1 folder, leave this box blank. • To launch a different Web page, type the URL in this box or click the browse button to select the Web file.  ***Tip*** • *If you enter a URL, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the `Setup.htm` file is **http://www.mypages.com/setup/Setup.htm**, enter the following as the Web page URL: `http://www.mypages.com/setup`* *When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (**http://www.mypages.com/setup/Setup.htm**, in the aforementioned example).*

Events Tab for a Release

Project • *The Events tab is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The Events tab lets you configure settings for various tasks that you want InstallShield to perform before, during, or after builds.

The Events tab settings are organized into the following main categories:

- Commands
- Publishing
- Distribution

Commands Settings

Use the Commands area on the Events tab to specify commands that you want to be run at various stages of the build process.

Table 12-128 • Commands Settings on the Events Tab

Setting	Project Type	Description
Prebuild Event	Basic MSI, InstallScript, InstallScript MSI, Merge Module, Suite/ Advanced UI	Specify the command that you want to be run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release. To specify more than one command, click the ellipsis button (...) in this setting, which opens the Prebuild Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one. When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.  ***Edition*** • *This setting is available in the Premier edition of InstallShield.*
Precompression Event	Basic MSI, InstallScript MSI	Specify the command that you want to be run after InstallShield has built the .msi package and the .cab files (if your product's data files are to be stored in .cab files). Note that this event occurs after .cab files are streamed into the .msi package, but before the .msi package has been digitally signed and streamed into the `Setup.exe` file. To specify more than one command, click the ellipsis button (...) in this setting, which opens the Precompression Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one. When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.  ***Edition*** • *This setting is available in the Premier edition of InstallShield.*

Table 12-128 • Commands Settings on the Events Tab (cont.)

Setting	Project Type	Description
Execute Batch File	InstallScript, InstallScript Object	To launch a batch file (.bat) or executable file (.exe) after the release has been built, enter the path to the file, or click the ellipsis button (...) to browse to the file. You can use path variables, enclosed within angle brackets (<>), as part of the path. If you specify a file for this, InstallShield sets environment variables with the same names (including the angle brackets) and values as the project's build variables. InstallShield also sets the environment variable <ISMEDIADIR>, whose value is the path to the folder in which the release's Disk Images, Log Files, and Report Files folders are created. You can refer to the value of an environment variable in a batch file by surrounding the variable name with percent signs (%); for example: set PATH = %<ISPROJECTDIR>%;%PATH% When the file is finished, InstallShield deletes the environment variables that it set.
Postbuild Event	Basic MSI, InstallScript, InstallScript MSI, Merge Module, Suite/ Advanced UI	Specify the command that you want to be run after InstallShield has built and signed the release. To specify more than one command, click the ellipsis button (...) in this setting, which opens the Postbuild Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one. When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.  ***Edition*** • *This setting is available in the Premier edition of InstallShield.*

Publishing Settings

The Publishing settings that are displayed depend on what project type you are using; they also depend on whether you are using the version of InstallShield that ships by itself, or the one that is included in AdminStudio.

Publishing Settings in the Version of InstallShield that Ships By Itself (Without AdminStudio)

For the version of InstallShield that ships by itself (without AdminStudio), the settings in the Publishing area on the Events tab are available in merge module projects. Use these settings to specify information such as whether you want the merge module to be available in the Merge Modules folder or a repository after each successful build of the release.

Table 12-129 • Publishing Settings on the Events Tab—for InstallShield Without AdminStudio

Setting	Project Type	Description
Publish Merge Module	Merge Module	Specify whether you want the merge module to be available in the Merge Modules folder or a repository after each successful build of the selected release. Available options are: • **Publish to repository**—InstallShield publishes the merge module to the repository that is specified in the Repository Name setting whenever you successfully build the release. Note that this option is available only if one or more repositories have been configured. (To configure a repository, on the Tools menu, click Options, and then click the Repository tab. Use this tab to configure a repository.) • **Copy to Merge Modules folder**—InstallShield updates the Merge Modules folder with this new merge module whenever you successfully build the release. • **Do not publish**—InstallShield does not publish the merge module to a repository or copy it to the Merge Modules folder when you build the release. To learn more, see Using a Repository to Share Project Elements.
Repository Name	Merge Module	Select the repository where the merge module that you are building should be published when the release is successfully built. Note that this option is available only if one or more repositories have been configured. (To configure a repository, on the Tools menu, click Options, and then click the Repository tab. Use this tab to configure a repository.)
Display Name	Merge Module	Specify a display name for the merge module that you are publishing to the repository. When you select this merge module in the Redistributables view after it has been published to the repository, the display name is available in the details pane.

Table 12-129 • Publishing Settings on the Events Tab—for InstallShield Without AdminStudio (cont.)

Setting	Project Type	Description
Publisher	Merge Module	Type the name of the person publishing this merge module to the repository. This name will be displayed in the description pane when you select this merge module in the Redistributables view. When you select this merge module in the Redistributables view after it has been published to the repository, the publisher name is available in the details pane.
Description	Merge Module	Type the description that should be displayed for this merge module. When you select this merge module in the Redistributables view after it has been published to the repository, the description is available in the details pane.

Publishing Settings in the Version of InstallShield that Ships as Part of AdminStudio

For the version of InstallShield that ships as part of AdminStudio, the settings in the Publishing area on the Events tab are available in Basic MSI projects. Use these settings to specify information such as whether you want the Windows Installer package that you are building to be published to the software repository.

Table 12-130 • Publishing Settings on the Events Tab—for InstallShield with AdminStudio

Setting	Project Type	Description
Publish to AdminStudio Repository	Basic MSI	Specify whether you want the Windows Installer package that you are building to be published to the software repository. If you use the software repository to manage a Windows Installer package, the .msi file and all of its other associated files and subfolders are stored in a subfolder of the software repository location that is identified for the package's Application Catalog.
Group	Basic MSI	If you select Yes for the Publish to AdminStudio Repository setting and you want to associate the Windows Installer package with one or more groups in the Application Catalog, click the ellipsis button (...) in this setting. The Select Application Manager Groups dialog box opens. Select the check box for each group that you want to contain the Windows Installer package.

Table 12-130 • Publishing Settings on the Events Tab—for InstallShield with AdminStudio (cont.)

Setting	Project Type	Description
Update Option	Basic MSI	Specify how you want to handle the importing of the Windows Installer package that is built for the selected release into the Application Catalog. Available options are: • **New Package Version**—A new build is treated as a new package in the Application Catalog. • **Overwrite Existing Version**—A new build overwrites the existing version in the Application Catalog. • **New Package History Version**—A new build is treated as a new version of the package that exists in the Application Catalog. • **Ignore if Exists**—A new build is imported only if it does not already exist in the Application Catalog.

Distribution

Use the Distribution area on the Events tab to configure settings for distributing releases to a folder or FTP site automatically at build time.

Table 12-131 • Distribution Settings on the Events Tab

Setting	Project Type	Description
Copy to Folder	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If you want to be able to automatically distribute your release to a folder, specify location. Existing folders with the same names as copied folders are overwritten, but no folders are deleted. Specify the folder path by entering the path in this setting, or click the ellipsis button (...) to browse to the location. If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.  ***Project*** • *For InstallScript and InstallScript Object projects, InstallShield automatically copies the release to the folder that you specify on the Events tab every time that you build the release.* *For any of the following project types, InstallShield copies all of the relevant files for your release to the specified folder whenever you right-click the release in the Releases view and then click Distribute:* • *Basic MSI* • *InstallScript MSI* • *Merge Module* *If you want the build engine to copy your release to the specified folder after every build in a Basic MSI, InstallScript MSI, or Merge Module project, select Yes for the Distribute After Build setting.*  ***Note*** • *If you specify a folder for this setting and you also specify an FTP location on the Events tab, InstallShield copies the release to only the FTP location.*

Table 12-131 • Distribution Settings on the Events Tab (cont.)

Setting	Project Type	Description
FTP Location	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If you want to be able to automatically distribute your release to an FTP server, specify the FTP URL for the location. Each release in your project can have a different FTP location. ***Note*** • *If you need to distribute your release to a path outside the FTP default folder, use a double slash (//). For example, to distribute your release to a root-level folder called* ***myproduct****, where the URL of the FTP server is* ***ftp:****//* ***ftp.mydomain.com****, enter* `ftp://ftp.mydomain.com//myproduct` *for the FTP location.* ***Project*** • *For InstallScript and InstallScript Object projects, InstallShield automatically copies the release to the FTP location that you specify on the Events tab every time that you build the release.* *For any of the following project types, InstallShield copies all of the relevant files for your release to the specified FTP location whenever you right-click the release in the Releases view and then click Distribute:* • *Basic MSI* • *InstallScript MSI* • *Merge Module* *If you want the build engine to copy your release to the specified location after every build in a Basic MSI, InstallScript MSI, or Merge Module project, select Yes for the Distribute After Build setting.*
FTP Site User Name	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If a user name is required to upload to the FTP location that you are specifying, enter the user name. ***Project*** • *If you enter a user name for one of the releases in a Basic MSI, InstallScript MSI, or Merge Module project, that same user name is used for other releases in the same project and in other Basic MSI, InstallScript MSI, and Merge Module projects.*
FTP Site Password	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If a password is required to upload to the FTP location that you are specifying, enter the password. ***Project*** • *If you enter a password for one of the releases in a Basic MSI, InstallScript MSI, or Merge Module project, that same password is used for other releases in the same project and in other Basic MSI, InstallScript MSI, and Merge Module projects.*

Table 12-131 • Distribution Settings on the Events Tab (cont.)

Setting	Project Type	Description
Distribute After Build	Basic MSI, InstallScript MSI, Merge Module	Specify whether you want the build engine to automatically distribute your release after each build to the location that you specified. ***Tip*** • *To quickly distribute your release on demand, instead of after each build, right-click the release and click Distribute. Note that the Distribute command is available only if the release has been built at least once.*

Chained .msi Package Settings

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Windows Installer 4.5 includes support for installing multiple packages using transaction processing. The packages are chained together and processed as a single transaction. If one or more of the packages in the transaction cannot be installed successfully or if the end user cancels the installation, the Windows Installer initiates rollback for all packages to restore the system to its earlier state.

The Chained .msi Packages area in the Releases view is where you identify .msi packages that you want InstallShield to include in your installation as chained packages. This area is also where you configure settings such as the properties that should be passed to the chained packages.

The Windows Installer chaining functionality supports any packages that can be installed through **MsiInstallProduct**; it does not support the chaining of InstallScript MSI packages.

Windows Installer 4.0 and earlier versions do not install any chained .msi packages.

Tip • *To learn how to add Windows Installer 4.5 redistributables, see Adding Windows Installer Redistributables to Projects.*

The following table describes the settings for chained .msi packages.

Table 12-132 • Chained .msi Package Settings

Setting	Description
Installation (run-time path)	Specify the name of the Windows Installer package (.msi file), or click the Browse button to browse to it. If you click the Browse button, InstallShield automatically enters the product code for you. InstallShield also prompts you to specify whether you want to stream the .msi package—and its uncompressed files, if the .msi package is not compressed—into your product's main .msi package: • If you specify that you want InstallShield to stream the files, InstallShield adds the name of the .msi package to the **Installation (run-time path)** setting. InstallShield also automatically adds either the file name (if it is a compressed .msi package) or the entry ***.*** (if it is an uncompressed .msi package) to the **Streamed files** box. For the *.* entry, InstallShield streams in the .msi package, all of the files in the same folder as the .msi package, and all of the subfolders and their files. The value that you use for this setting is relative to a temporary extraction path. That is, you could add a streamed supporting file as **Support\File.ext**, and refer to it in the chained package as **[SourceDir]Support\File.ext**. • If you specify that you do not want InstallShield to stream the files, InstallShield adds the following path to the **Installation (run-time path)** setting: `[SourceDir]FileName.msi` You can change this path if appropriate. For example, you may want to use a path such as the following one, and also clear the **Delete streamed files after installation** check box: `[LocalAppDataFolder]{ProductCodeGUID}\FileName.msi` In this example, the .msi package is cached on the local system, and it is available for maintenance.  ***Tip*** *• You may not want to stream many or large files in the .msi package, since the Windows Installer has limitations for the file size of .msi packages.*

Table 12-132 • Chained .msi Package Settings (cont.)

Setting	Description
Product code	This setting indicates the product code of the .msi package that is being chained to your main installation. The product code is used for uninstalling the chained package when appropriate. InstallShield automatically adds the product code for this setting if you use the Browse button for the **Installation (run-time path)** setting to select the .msi package.
UI level	Specify the user interface (UI) level that you want to be used for the chained .msi package. Valid options are: • **Basic UI (/qb)**—Display the built-in small progress dialog. • **Full UI (/qf)**—Display the modal and modeless dialogs that are available in the .msi package. • **No UI (/qn)**—Run the installation silently. • **Reduced UI (/qr)**—Display only modeless dialogs, such as the full-size progress dialog.

Table 12-132 • Chained .msi Package Settings (cont.)

Setting	Description
Install condition	Enter any installation condition that you want to use for the chained .msi package. If the condition evaluates to True at run time, the Windows Installer launches the chained .msi package if the chained package's product has not already been installed. The default condition is: `Not Installed` You can modify this if necessary. For example, if you are adding the chained .msi package to a minor upgrade and you want the Windows Installer to launch the chained .msi package during a first-time installation and during an upgrade, consider adding a condition such as the following one: `Not Installed OR REINSTALL><"FeatureName"` In this example, **FeatureName** is the name of a feature that will be updated if the main installation is running in upgrade mode. It will also be updated during a repair.  ***Note*** • *At run time, the installation evaluates the install condition; if it evaluates to False, the installation evaluates the removal condition. If the install condition always evaluates to True (even during uninstallation of the main product), the removal condition is never evaluated, and the chained .msi package is never uninstalled. Therefore, you may want to avoid specifying an install condition that will always evaluate to True.* For information on condition syntax, see Conditional Statement Syntax in the Windows Installer Help Library.
Install properties	To pass one or more properties from the main installation to this chained .msi package during the installation, enter the properties and their corresponding values. For example, to install a specific feature of a chained package to a subfolder of the main installation's INSTALLDIR location, you could enter the following string for this setting: `INSTALLDIR="[INSTALLDIR]Subfolder\" ADDLOCAL=Feature1`

Table 12-132 • Chained .msi Package Settings (cont.)

Setting	Description
Removal condition	Enter any uninstallation condition that you want to use for the chained .msi package. If the Install condition evaluates to False and the Removal condition evaluates to True, Windows Installer removes the chained package's product if it is present. The default condition is: `REMOVE="ALL"` For information on condition syntax, see Conditional Statement Syntax in the Windows Installer Help Library.
Removal properties	To pass one or more properties from the main installation to this chained .msi package during the uninstallation, enter the properties and their corresponding values. This setting is often left blank.
Release flags	You can assign one or more release flags to a chained .msi package that you want to include in only certain builds. For example, if you have a chained .msi package that should be included only in a special edition of your product that contains a special add-on that requires the chained .msi package, you can flag that chained package and include it only when it is needed. If you want to assign a release flag to this chained .msi package, enter it for this setting. The string that you enter can be any combination of letters or numbers. To have more than one flag on a chained package, use a comma to separate the flags.
Streamed files	This box indicates the files for the chained .msi package that are being streamed into the main installation's package. Use the Add File and Add Folder buttons to add more files or entire folders to the list of streamed files. To specify an alternate extraction location, edit the entry's **Run-time path** value by selecting and then clicking it again. InstallShield highlights the entry's text, enabling you to edit it. The files are extracted to a temporary folder by default. To remove an entry in this box, select it and then click the Remove button.

Table 12-132 • Chained .msi Package Settings (cont.)

Setting	Description
Delete streamed files after installation	If you want the installation to delete the streamed files after installation, select this check box. If the streamed files should remain on the target system, clear this check box. It is generally most useful to let the files remain on the system only if you have extracted them to a non-temporary location, such as **[LocalAppDataFolder]{PackageCode}*.***, to cache an extracted package locally. This check box is selected by default for chained .msi packages that included one or more streamed files. This check box is disabled for chained .msi packages that do not include any streamed files.

Patch Design View

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Once you have added an upgrade item in the Upgrades view, you can use the Patch Design view to create a patch configuration for that upgrade so that you can deliver it as a patch. The patch can be applied to target systems that have an earlier version of the product.

You can create multiple patch configurations in the Patch Design view. Each patch configuration contains the settings and data required to build a patch. Each patch configuration must contain at least one latest setup and one previous setup. With these minimal settings, you can create a patch.

Patch Configuration

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

To create a patch, you begin by right-clicking the Patch Design explorer in the Patch Design view and then clicking Add New Patch Configuration. A patch configuration consists of one latest setup and one or more previous setups. Before you specify the latest and previous setups, you can specify overall patch properties on the following tabs for your patch configuration:

- Common

- Identification
- Digital Signature
- Sequence
- Advanced

Common Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Common tab for a patch configuration exposes frequently used patch settings.

Patch Output Location

Specify where you want your patch file built or browse for an existing folder. InstallShield appends the following subdirectories to your output location:

PatchConfigName\Patch

Note • *InstallShield also adds a folder called Interim to your output directory. The Interim folder contains the following files after you build a patch:*

- *.log—contains output from the patch creation process; this usually contains information that is useful for troubleshooting*
- *.pcp—patch creation properties file; this contains all of the settings necessary to generate a patch package*

Launcher Settings

In this area, you can configure the following launcher settings:

Table 12-133 • Configurable Launcher Settings

Setting	Description
Create Update.exe	If you want to create an `Update.exe` update launcher for the current patch, select this check box. To learn when an `Update.exe` update launcher is required, see Patching Considerations.
Include Windows Installer 3.1 Engine	Select this check box to include the Windows Installer 3.1 engine with your patch package.

Table 12-133 • Configurable Launcher Settings (cont.)

Setting	Description
Include .NET Framework	Select this check box to include the .NET Framework with your patch package.

Patch Creation Cache

In this area, you can set the following:

Table 12-134 • Patch Creation Cache Settings

Setting	Description
Enable	When you select this check box, InstallShield creates intermediate files that are used in subsequent builds to improve performance speed. These intermediate files are left indefinitely on your system. Do not select this check box if you have limited disk space.

Optimize Patch for Large Files

Select this check box to create small bit-level patches for all application files larger than 4 MB in your installation project.

Allow Patch to be Uninstalled (Requires Windows Installer 3.0)

Select this check box if you would like the patch to be uninstallable without having to uninstall and reinstall the entire application and other patches. Note that uninstallation of patches works only under certain conditions. For example, versions of Windows Installer earlier than version 3.0 cannot remove just the patch from an application. For more information, see Removing Patches in the Windows Installer help.

Project • *The uninstallable patch functionality is not available for InstallScript MSI projects if the InstallScript user interface (UI) style is the traditional style (which uses the InstallScript engine as an external UI handler).*

This functionality is applicable to InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler). To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.

Build Patch

Click this button to build your patch after you have configured all of the appropriate settings.

Note • *You can also build your patch from the Patch Design explorer. Right-click the appropriate patch configuration, and then click Build Patch.*

Identification Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Identification tab exposes settings for display strings. The display strings are used to populate information about the patch in Add or Remove Programs. It is also used by the Windows Installer 3.0 (and later) APIs that interrogate and catalog patches applied to a target machine.

Tip • *Every time that you change the latest setup for a patch configuration in the Patch Design view, InstallShield uses the Add or Remove Programs information from the latest setup as the values for the Identification tab settings. You can override the values on the Identification tab as needed.*

Table 12-135 • Identification Tab Settings

Setting	Description
Display name	Specify the name of your patch.
Support URL	Specify the uniform resource locator (URL) that you would like your customers to visit for technical support.
Description	Specify a brief description of your patch.
Manufacturer name	Specify the name of the application's manufacturer.
Target product name	Specify the name of the application or the target application suite.
Classification	Specify the category of upgrade. Examples include Critical Update, Hotfix, and Service Pack.

Digital Signature Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Digital Signature tab is where you specify settings if you want to digitally sign your patch.

Note • *If you want to digitally sign the files—such as your application's executable files—in your patch, you can specify which files should be signed through the Signing tab in the Releases view.*

Table 12-136 • Digital Signature Tab Settings

Setting	Description
Sign the patch package	Select this check box if you would like to digitally sign your patch package.
Sign update.exe	Select this check box if you would like to digitally sign the Update.exe file.
URL	Type a fully qualified URL—for example, **http://www.mydomain.com**. This URL is used in your digital certificate to link to a location you would like end users to visit in order to learn more about your product, organization, or company.
Software publishing credentials file	Specify the location of your digital certificate file (.spc or .pfx) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location. If you specify an .spc file, you must also specify a .pvk file.
Corresponding private key file	If you are using an .spc file, you must also specify the location of your private key file (.pvk) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location.
Password	Type a fully qualified URL—for example, **http://www.mydomain.com**. This URL is used in your digital certificate to link to a location you would like end users to visit in order to learn more about your product, organization, or company.

Sequence Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Sequence tab is where you specify the order that Windows Installer version 3.0 and later should apply patches to an installed product, regardless of the order in which they are provided to the target machine. For versions of Windows Installer earlier than version 3.0, the patch sequence is ignored, and any patches are applied to the product in the order that they are provided to the target machine.

Use default patch sequencing

Select this check box if you want to use the default sequencing for the patches of your product. This default sequence accounts for obsolete patches, superseded patches, and patches that have already been applied to the product.

If you clear this check box, you can add your own custom sequence. If you clear this check box but do not add a sequence, no sequencing information is built into your patch.

Advanced Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Advanced tab for a patch configuration exposes a comprehensive set of build settings that you can configure for a patch.

Patch Settings

In this area, you can configure the following settings for your patch:

Table 12-137 • Patch Configuration Settings

Property	Description
Patch Output Location	Specify where you want your patch file built or browse for an existing folder. InstallShield appends the following subdirectories to your output location: `\PatchConfigName\Patch.`  ***Note*** • *InstallShield also adds a folder called Interim to your output directory. The Interim folder contains the following files after you build a patch:* • *.log—contains output from the patch creation process; this usually contains information that is useful for troubleshooting* • *.pcp—patch creation properties file; this contains all of the settings necessary to generate a patch package*
Generate Patch GUID	Specify whether you want a new GUID generated each time that you build your patch. If you select No, the GUID listed for the Patch GUID property is used. The default setting is Yes.
Patch GUID	The patch GUID is used to uniquely identify a patch package. InstallShield automatically generates a new GUID for this property every time you build the patch if the Generate Patch GUID property is set to Yes.

Table 12-137 • Patch Configuration Settings (cont.)

Property	Description
Minimum Windows Installer Version	Specify the minimum version of Windows Installer that is required by the patch. For example, for a minimum of Windows Installer 2.0, enter **200**. For a minimum of Windows Installer 3.0, enter **300**. For a minimum of Windows Installer 3.1, enter **301**. ***Note*** • *If you specify an early version of Windows Installer, you will not be able to use any of the features that are supported by only the latest version of the Windows Installer engine.*

Build Settings

In this area, you can configure the following build settings for your patch:

Table 12-138 • Build Settings for a Patch

Property	Description
Include Whole Files	Specify whether to include whole files for every file included in the patch package. ***Note*** • *You can override this setting on a file-by-file basis in the Latest Setup settings.*
Validate at Build	Specify whether you want to use the upgrading and patching validation every time you build a patch.
Leave Patch Components Decompressed	Select Yes to leave all .msp file information in a temporary folder. This information can be useful when troubleshooting. If you do not want this information stored, select No.
Enable Patch Creation Caching	Select Yes if you want InstallShield to create intermediate files that are used in subsequent builds to improve performance speed. These intermediate files are left indefinitely on your system. Select No if you have limited disk space. The Patch Cache Folder is where you specify where the intermediate files should be created.
Patch Cache Folder	Specify a directory where the temporary files from patch caching should be stored. These intermediate files are left indefinitely on your system.

Table 12-138 • Build Settings for a Patch (cont.)

Property	Description
Generate MsiPatchOldAssembly tables	Specify whether to automatically generate entries for the **MsiPatchOldAssemblyFile** and **MsiPatchOldAssemblyName** tables, which allow a patch package that is running under Windows Installer 3.0 or later to patch an assembly in the global assembly cache (GAC) without making a run-time request for the original installation source. For more information, see Patching Assemblies in the Global Assembly Cache.

Run-time Settings

In this area, you can configure the following run-time settings for your patch:

Table 12-139 • Run-time Settings for a Patch

Property	Description
Allow Product Codes to Differ	Specify whether you want the patch creation executable to suppress build-time prompts if product codes differ between the original and latest installations. For a major upgrade, be sure to select .
Allow Product Versions to Differ	Specify whether you want the patch creation executable to suppress build-time prompts if product versions differ between the original and latest installations.
List of Patch GUIDs to Replace	To replace one or more earlier installed patches with the current patch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example: `{C86838C9-DEDC-4451-B96F-94AFB9460F15},{C8633E5B-AC44-45d8-B487-C68B3B1F60D6}` Setting this property is typically *not* required, even if you have several patch configurations in the Patch Design view. However, if your patch does not overwrite files added in an earlier patch, it may be necessary to set this property.  ***Note*** • *This property affects only the installation portion of the patch. It does not revert files back to their original versions.*
List of Target Product Codes	Specify the product codes that you want to target with this patch, and separate each with a comma. If you enter an asterisk (*) for this setting, InstallShield replaces it at build time by the product codes of the installations that are listed as previous images in this patch configuration.

Table 12-139 • Run-time Settings for a Patch (cont.)

Property	Description
Create Update.exe	Specify whether you want to create an `Update.exe` update launcher for the current patch. To learn when an `Update.exe` update launcher is required, see Patching Considerations.
MSI Command-Line Arguments	Specify Windows Installer arguments to be written to `Setup.ini`. `[Startup]` `CmdLine=Your Value` The default value for this property is `REINSTALLMODE=omus REINSTALL=ALL` The **REINSTALL** property is a string that contains letters specifying the type of reinstallation to be performed. For more information, see "REINSTALLMODE Property in the Windows Installer Library.
Password Protect Launcher	To password-protect your patch, select Yes, and then type a password for the Launcher Password setting. When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update. This setting is applicable only to patches that use an `Update.exe` file.
Launcher Password	Type a password to protect your application. You must select Yes for the Password Protect Launcher setting to activate password protection. When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update. This setting is applicable only to patches that use an `Update.exe` file.

Table 12-139 • Run-time Settings for a Patch (cont.)

Property	Description
Minor Update to Target RTM Version (MSI 3.1 Required)	If you want your minor-upgrade patch to essentially remove all of the patches up to the release to manufacturing (RTM) version of the product (or the most recent major upgrade of the product, if one has been installed) before applying the current minor-upgrade patch, select Yes for this property. With this option, all patches (with or without sequencing data) are removed. You do not need to target additional baseline versions and thus increase the patch payload. All end users can successfully apply the patch without applying any intermediate patches. If you do not want your minor-upgrade patch to remove all of those earlier patches, select No. If you select this option, it may be necessary for your patch to contain the information needed to target each of the earlier minor upgrades that were created after the RTM (or the most recent major upgrade of the product, if one was created). For example, if you are creating a minor-upgrade patch for service pack 2 and you select No for this property, your patch needs to target the minor-upgrade patch for service pack 1. You could also optionally target other baselines (such as RTM); doing so would increase the patch payload. Note that if you do not target the RTM version, any end user who has the RTM version but not the service pack 1 minor-upgrade patch would need to install service pack 1 before service pack 2. Versions of Windows Installer earlier than 3.1 ignore this setting.
Optimized Install Mode (MSI 3.1 Required)	If you want Windows Installer 3.1 to optimize the patching process so that it reduces the time that is required to apply the current patch, select Yes. If the patch only modifies a select list of tables, Windows Installer 3.1 ignores the actions that are associated with all other tables. For more information, including the list of tables, see” Patch Optimization” in the Windows Installer Help Library. If you select Yes for this property, Microsoft Corporation recommends that you test your patch extensively to ensure that it behaves as expected. If you do not want Windows Installer 3.1 to optimize the patching process for the current patch, select No. Windows Installer will run a complete repair of the application when the patch is applied to the target machine. Versions of Windows Installer earlier than 3.1 ignore this property. Windows Installer 3.0 optimizes patches if the patch only modifies the select list of tables. To avoid patch optimization by Windows Installer 3.0, you must use the DisableFlyWeightPatching policy. For more information, see DisableFlyWeightPatching in the Windows Installer Help Library. Versions of Windows Installer earlier than 3.0 run a complete repair of the installation when a patch is applied.

Windows Installer Engine

In this area, you can configure the following settings for the Windows Installer engine:

Table 12-140 • Windows Installer Settings for a Patch

Property	Description
Include MSI 3.1 Engine	Specify whether the Windows Installer engine should be included with your patch package.
Engine Location	Select one of the following options: • **Download Engine From The Web**—If the Windows Installer engine needs to be installed, it is downloaded at run time. • **Extract Engine From Update.exe**—The build streams the Windows Installer engine into the `Update.exe` file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required. • **Copy From Source Media**—The build copies the Windows Installer engine into the same directory as the `Update.exe` file.
Windows Installer 3.1 engine URL	Specify the URL for the location of the engine. This is the location that the Update.exe file uses at run time to download the engine. The default URL location is a live site maintained by Flexera Software for your convenience.  ***Note*** • *The 3.1 engine is available for download from the default URL (http://www.installengine.com/Msiengine30).*

Microsoft .NET Framework

In this area, you can configure the following settings for the Microsoft .NET Framework:

Table 12-141 • Microsoft .NET Framework Settings for a Patch

Property	Description
Include in Build	Specify whether to include the Microsoft .NET Framework in your patch. If you select Yes, the same version of the .NET Framework that was included in the latest release is included in this new patch.

Table 12-141 • Microsoft .NET Framework Settings for a Patch (cont.)

Property	Description
Engine Location	Select one of the following options: • **Download Engine From The Web**—If the .NET Framework needs to be installed, it is downloaded at run time. • **Extract Engine From Update.exe**—The build streams the .NET Framework into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the `Update.exe` file and installed if required. • **Copy From Source Media**—The build copies the .NET Framework into the same directory as the `Update.exe` file.
Engine URL	Specify the URL for the location of the .NET Framework. This is the location that the Update.exe file uses at run time to download the .NET Framework. The default URL location is a live site maintained by Flexera Software for your convenience.

Update Launcher Settings

In this area, you can configure the following settings for the `Update.exe` launcher:

Table 12-142 • Update Launcher Settings for a Patch

Property	Description
Company Name	If you want to override the default company name for `Update.exe` with your company name, enter your company name. The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.
Product Name	If you want to override the default product name for `Update.exe` with your product name, enter your product name. The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.

Table 12-142 • Update Launcher Settings for a Patch (cont.)

Property	Description
Product Version	If you want to override the default product version for `Update.exe` with your product version, enter your product version. The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.
Description	If you want to override the default description for `Update.exe` with your own description, enter the appropriate description. The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.
Copyright	If you want to override the default copyright notice for `Update.exe` with your product's copyright notice, enter your product's copyright notice. The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.

Table 12-142 • Update Launcher Settings for a Patch (cont.)

Property	Description
Required Execution Level	Use the Required Execution Level setting to specify the minimum level required by your installation's `Update.exe` file for running the installation (the setup launcher, any InstallShield prerequisites, and the .msi file) on Windows Vista and later platforms. The available options are: • **Administrator**—`Update.exe` requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator. • **Highest available**—`Update.exe` prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges. • **Invoker**—`Update.exe` does not require administrative privileges, and all users can run it without administrative privileges. `Update.exe` does not display any UAC messages prompting for credentials or for consent. • **Use Previous Setup Manifest**—The `Update.exe` manifest uses the same required execution level that was specified for the previous setup. This is the default option. For InstallScript MSI projects, and for Basic MSI projects if the Create Update.exe check box is selected, InstallShield embeds an application manifest in the `Update.exe` launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level. If the Create Update.exe check box is cleared for a Basic MSI project, InstallShield does not embed the Windows application manifest in an `Update.exe` launcher. For more information, see Minimizing the Number of User Account Control Prompts During Installation.
Icon	To use your own icon for the `Update.exe` file, specify the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable, or click the ellipsis button (...) to browse to the file from within the Change Icon dialog box. By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, **C:\Temp\MyLibrary.dll,2** indicates the icon with an index of 2, and **C:\Temp\MyLibrary.dll,-100** indicates the icon with a resource ID of 100. If you leave this setting blank, InstallShield uses a default icon for your `Update.exe` file.

Latest Setup

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The Latest Setup item for a patch configuration is where you specify settings for the latest version of your installation.

Latest Setup Path

The latest setup should be the latest version of your installation for which you want to create a patch. The default setting, <ISLatestRelease>, resolves to the last full release that you build.

The release that you specify in this box should be an uncompressed release, ideally created with an administrative installation if the previous product versions were compressed.

Include Whole Files

Select the files that you want to include as whole files in your patch rather than have the build perform a bit-level difference of the files.

Note • *To include all of your files as whole files, set the Include Whole Files property for the patch configuration to Yes.*

Previous Setups

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Each patch configuration in the Patch Design view must contain at least one latest setup and one previous setup in order for you to create a patch. If your patch will target multiple earlier versions of your product, ensure that each target image has its own previous setup item.

For example, if your company supports versions 1.0 and 1.1 of an application, you may want to create a patch that will upgrade both of these applications to version 2.0. To create a single patch to update both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

When you click a previous setup item in the Patch Design view, the following tabs are available:

- Common
- Advanced

Common Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click a previous setup item in the Patch Design view, InstallShield displays different tabs. The Common tab exposes the basic previous setup configuration settings.

Table 12-143 • Common Settings for Previous Setup Configuration

Option	Description
Previous Setup	Specify the installation (.msi file or Setup.exe file) that needs to be patched to update it to the latest version of your setup. Because the patch-creation process requires an uncompressed release, you will be prompted for a location to decompress the previous version, if necessary.  ***Caution*** • *Keep the following in mind when specifying paths. You cannot decompress setups that span multiple disks from a local or network drive. You will need to find an alternate method of decompressing the setup.*
Ignore Missing Files	If any files that are included in two separate versions cannot be found in a more recent version, then the files will be excluded from the patch package unless they have changed in the later version. The advantage of ignoring the files is that only the modified files need to be added to the package. A complete setup image is not required if you choose to ignore missing source files.

Advanced Tab

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click a previous setup item in the Patch Design view, InstallShield displays different tabs. The Advanced tab contains the settings that are accessible on the Common tab, in addition to the following transform filter settings:

Table 12-144 • Advanced Settings for Previous Setup Configuration

Option	Description
Version Relationship	Select the condition that describes the required relationship between the latest version of your product and the previous version whose settings you are specifying for the patch. InstallShield will create a transform between the selected previous setup and the latest setup only if the selected condition is met.
Version to Check	Select what part or parts of the three-part version number should be used to determine whether a transform between the selected previous setup and the latest setup should be created, based on the option selected for the Version Relationship. Available options are: • **Check Major, Minor, and Upgrade Versions**—If InstallShield should check all three parts of the previous setup's version number with all three parts of the latest setup's version number, select this option. • **Check Major and Minor Versions**—If InstallShield should check the first two parts of the previous setup's version number with first two parts of the latest setup's version number, select this option. The third part of the version number is ignored. • **Check Major Version Only**—If InstallShield should check the first part of the previous setup's version number with first part of the latest setup's version number, select this option. The second and third parts of the version number are ignored. • **Do Not Check Versions**—If InstallShield should create the transform regardless of the relationship between the previous setup version number and the latest setup version number, select this option. For example, if you select Check Major, Minor, and Upgrade Versions for this property and you select Previous Setup Version <= Latest Setup Version for the Version Relationship property, InstallShield will create a transform for the differences between the previous setup and the latest setup if the previous setup version number is 1.2.3 and the latest setup version number is 1.2.4. However, InstallShield will not create the transform if the previous setup version number is 1.2.0 and the latest setup version number is 1.1.0. For a version number of 1.2.3, 1 represents the major version number, 2 represents the minor version number, and 3 represents the upgrade version number.
Match Product Code	To create a transform only if the previous setup and the latest setup have the same product code, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the product code.

Table 12-144 • Advanced Settings for Previous Setup Configuration (cont.)

Option	Description
Match Upgrade Code	To create a transform only if the previous setup and the latest setup have the same upgrade code, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the upgrade code.
Match Language	To create a transform only if the previous setup and the latest setup have the same language, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the language.

Additional External Files

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Patching an additional external file provides the ability to create a binary file patch against versions of an application file that have not been shipped as part of the previous installation.

For example, if one of your application files was potentially updated by another installation, you should reference that file version so that the file-level patch can be applied successfully at run time.

External File

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

When you click an external file that you added to the External File area in the Patch Design view, InstallShield displays two settings that need to be configured for that file.

For the first box, browse for the file key with which you want to associate the external file, or type the **File** table key for that file.

For the second box, browse for the external file to associate with the **File** key that you specified in the first box.

Additional Tools View

Project • *The Additional Tools view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

The additional tools provide added functionality for your project. Not all of the items in this view apply to every project type. Click the following links to see the project types for which the items are available.

Dependency Scanners

Project • *The Dependency Scanners view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The Dependency Scanners view includes three different scanning tools that you can use to identify possible dependencies that you may need to add to your project. These scanners include a Visual Basic project scanner, a static scanner that scans files that are in your project, and a dynamic scanner that scans a running application for any dependencies.

MSI Debugger

Project • *The MSI Debugger view is available in the following project types:*

- *Basic MSI*
- *MSI Database*
- *Transform*

Debug your setup by setting breakpoints at any action or dialog in the User Interface sequence and watching and changing the Windows Installer properties at each step.

Direct Editor

Project • *The Direct Editor is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

The Direct Editor is a view in InstallShield that lets you review all of the tables in your project file (.ism) or database file (.msi, .msm, or .mst). In some project types, this view also offers functionality for advanced users who are very familiar with the Windows Installer database format.

Dependency Scanners

Project • *The Dependency Scanners view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

A file often relies on functions in other files to perform a task. However, you may not be aware of all these other files—known as *dependencies*—when you include your application's files in your installation project. InstallShield offers the following scanning wizards to assist you in identifying and working with these files. You can access these scanners in the Dependency Scanners view.

Table 12-145 • Dependency Scanners

Scanning Option	Description
Perform Static Scanning	The Static Scanning Wizard looks at portable executable files (for example, .exe, .ocx, .com, .tlb, .hlp, and .chm) in your project and checks for dependencies that they may require.
Perform Dynamic Scanning	The Dynamic Scanning Wizard monitors your system while an executable file is running and checks for .dll or .ocx files that may be required by the executable file.

Any files that are added to a Basic MSI or InstallScript MSI project through one of these scanners are added in accordance with Setup Best Practices.

If you use the Static and Dynamic scanning wizards, you can specify files that you want to be included or excluded automatically any time that you perform a static or dynamic scan through InstallShield. For more information, see Filtering Files in Dependency Scanners.

MSI Debugger

Project • *The MSI Debugger view is available in the following project types:*

- *Basic MSI*
- *MSI Database*
- *Transform*

When you debug a release in the MSI Debugger, you can view and set Windows Installer properties as you step through the package's User Interface and Execute sequences.

Task: ***Follow the steps below to begin going through a setup in the MSI Debugger:***

1. Build your release. However, there is one important restriction when you intend on debugging the release: You cannot debug a package that is compressed inside Setup.exe.
2. Go to the **MSI Debugger** view. The debugger lists every standard action and custom action in the User Interface and Execute sequences as well as every dialog in your project. You can also click the **Debug** button on the toolbar or choose **Debug** from the **Build** menu to launch the MSI Debugger.
3. Set a breakpoint on an action or dialog.
4. Start the debugger.

The MSI Debugger runs through each action and dialog until it reaches your breakpoint, at which point it halts execution. Now, you can view and set properties in the Watch window and the Variable window. Finally, you can step through each of the remaining actions, or you can stop the debugger.

Note • *The MSI Debugger supports deferred custom actions that delay the execution of a system change to the time when the installation script is executed.*

Do not confuse the MSI Debugger with the InstallScript Debugger, since they have completely separate purposes. You cannot debug a setup package with the InstallScript Debugger, and you cannot debug an InstallScript custom action with the MSI Debugger.

Tip • *When InstallShield steps into one of the following types of custom actions (You can step into a custom action by pressing the F11 key.), it will give you the option to launch a registered debugger installed on a client machine. A dialog will appear allowing you to choose one of two options. Select Yes to launch a registered debugger. Select No to step over to the next action. The supported custom actions are as follows:*

- *MSI DLL*
- *Standard DLL*

Direct Editor

Project • *The Direct Editor is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

Note that the following information includes additional project-specific details.

The Direct Editor is a view in InstallShield that lets you review all of the tables in your project file (.ism) or database file (.msi, .msm, or .mst). In some project types, this view also offers functionality for advanced users who are very familiar with the Windows Installer database format.

For Windows Installer–based projects, the Direct Editor can run in two different modes:

- **Project edit mode**—This mode lets you edit tables in the project file. The changes that are made in the Direct Editor are incorporated into the Windows Installer package that InstallShield creates at build time.

  Any changes that you make in the other views within InstallShield are reflected in the Direct Editor; in addition, any changes that you make in the Direct Editor are also reflected in the other corresponding views (if available). For example, if you use the Features view to add a new feature to your project, InstallShield automatically adds that feature to the **Feature** table in the Direct Editor. If you use the Direct Editor view to add the feature, InstallShield automatically updates the Features view accordingly.

  When you are working in any of the following Windows Installer–based project types, you are working in project edit mode: Basic MSI, DIM, InstallScript MSI, Merge Module, and QuickPatch.

- **Direct edit mode**—This mode lets you edit tables in the Windows Installer database (.msi, .msm, or .mst file). When you save the changes that you have made in the Direct Editor, InstallShield updates the Windows Installer database.

  Many of the other standard InstallShield views are not available in direct edit mode, since they require build-time functionality that is not available when you are directly editing the Windows Installer database.

  When you are working in any of the following Windows Installer–based project types, you are working in direct edit mode: MSI Database, MSM Database, and Transform.

Using the Direct Editor in Any Project Type

The Direct Editor has a Tables explorer that lists each table in your project or database. When you select a table in this explorer, the right pane shows the following elements:

- A row of buttons and other controls
- A spreadsheetlike table

Each row in a table represents a record in your project or database. The parenthetical note in each column heading indicates the type and size of data that you enter in the column. For example, *S255* indicates a string with up to 255 characters; *I2* indicates a 2-byte integer.

The following table describes all of the buttons and other controls that are displayed when you select a table in the Direct Editor.

Table 12-146 • Controls in the Direct Editor View

Name of Control	Icon	Description
New Record		Displays the Add Record to Table dialog box, which lets you adds a new row to the selected table.
Edit Selected Record		Displays the Edit Record in Table dialog box, which lets you edit the data in the selected row.
Delete Selected Records		Deletes the selected row or rows.
Cut Selected Records		Removes the currently selected rows and places them on the Clipboard.
Copy Selected Records		Copies the currently selected rows to the Clipboard.
Paste Records		Inserts the rows that are saved to the Clipboard.
Find String		Displays the Find dialog box, which lets you search for instances of a string. This dialog box lets you specify criteria such as whether you want to search in the selected table, or all tables.
Find Next		Searches for the next occurrence of the specified string.
Find and Replace		Displays the Replace dialog box, which lets you search for instances of a string and replace them with a new string. This dialog box lets you specify criteria such as whether you want to search in the selected table, or all tables.

Table 12-146 • Controls in the Direct Editor View (cont.)

Name of Control	Icon	Description
Search Grid		Dynamically filters the records that are displayed in the Direct Editor view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
Direct Editor Help		Displays the help for the Direct Editor view.

Using the Direct Editor with Project Edit Mode in Windows Installer–Based Projects

In Basic MSI, DIM, InstallScript MSI, Merge Module, and QuickPatch projects, advanced users can use the Direct Editor to perform tasks such as the following:

- View all of the tables in the project file (.ism).
- Add and remove records from tables.
- Cut, copy, and paste records or fields.
- Edit individual fields in the tables.
- Add custom tables.
- Filter the table records that are shown to hide ones that do not contain a specific string.
- Search one table or all tables for a specific string and replace it if necessary.
- Resize and reorder the columns in a table.

Tip • *If you press F1 while a standard Windows Installer table is selected, the Windows Installer Help Library opens to provide information about that specific table.*

Note the following details when using the Direct Editor with project edit mode in Windows Installer–based projects:

- The **File** table displays only static data. InstallShield may add additional information, such as dynamically linked files, to the **File** table in the Windows Installer database that it creates at build time.
- Unlike the corresponding tables in the Windows Installer database, tables such as the **Binary**, **Icon**, and **Patch** tables in the .ism file do not store binary data. Rather, they store links to build-source paths.
- Column attributes for both standard tables and InstallShield tables cannot be altered while in project edit mode. They can, however, be edited for custom tables. Note that column attributes can be edited in standard, InstallShield, and custom tables in direct edit mode.
- You cannot use localizable properties in the **Directory** table.

Using the Direct Editor with Direct Edit Mode in Windows Installer–Based Projects

In MSI Database, MSM Database, and Transform projects, you can use the Direct Editor to essentially perform all of the tasks that are available in this view with direct edit mode. However, instead of working with tables in the .ism file, you are working directly with the Windows Installer database (.msi, .msm, or .mst).

Using the Direct Editor in InstallScript and InstallScript Object Projects

The Direct Editor in InstallScript and InstallScript Object projects lets you see all of the tables in your .ism file; however, it is recommended that you use the other views in InstallShield to modify these types of projects.

Note that although InstallScript and InstallScript Object projects use many of the same tables that are available in Windows Installer–based projects, many of the common tables have different meanings. In addition, InstallShield ignores custom tables in InstallScript and InstallScript Object projects; custom tables are not available at run time.

InstallShield Table Reference

The following table lists some InstallShield tables that add specific functionality to your application. Click a link for more information about a specific table.

Table 12-147 • InstallShield Table Names and Descriptions

Table Name	Project Type	Description
ISAlias	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	This table contains alias information used when an InstallShield Professional project is converted to a Windows Installer–based project or an InstallScript project in the latest version of InstallShield.
ISComCatalogAttribute	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog attributes. Each entry has a foreign key to a **ISComCatalogObject** table entry to which the attribute belongs.
ISComCatalogCollection	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog collections. A COM+ catalog collection is a folder of a same type of COM+ catalog objects. For example, the COM+ applications item, the Components item, and the Legacy Components item in the Component Services view are the COM+ catalog collections. Each entry has a foreign key to a **ISComCatalogObject** table entry to which the collection belongs.
ISComCatalogCollectionObject	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog collections where COM+ catalog objects belong.

Table 12-147 • InstallShield Table Names and Descriptions (cont.)

Table Name	Project Type	Description
ISComCatalogObject	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog objects. A COM+ catalog object is an item that is contained within a COM+ catalog collection. Each entry has the display name.
ISComPlusApplication	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about a COM+ application. A COM+ application is a COM+ catalog object with extra information. This table has application specific information and a foreign key to a **ISComCatalogObject** table entry which has the basic information.
ISCustomActionReference	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about the behavior of each of the custom actions that are included in the installation.
ISDRMFile	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	This table contains information about the file being wrapped for trialware protection.
ISDRMFileAttribute	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	This table contains information about a trialware license.
ISDRMLicense	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	This table contains information about a trialware license.
ISIISItem	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	This table contains information about each IIS element (Web site, application, virtual directory, application pool, and Web service extension) that is configured in the Internet Information Services view.

Table 12-147 • InstallShield Table Names and Descriptions (cont.)

Table Name	Project Type	Description
ISIISProperty	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	This table contains values for settings that are configured in the Internet Information Services view.
ISProductConfigurationInstance	Basic MSI	This table provides support for installing multiple instances of a product in the same context on the same machine.
ISSelfReg	Basic MSI, DIM, InstallScript MSI, Merge Module	If you have selected ISSelfReg as the self-registration method for COM servers, and if your project contains any files (or dynamic links) marked as self-registered, InstallShield adds information about those files to the **ISSelfReg** table of your .msi database.

ISAlias Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

If you upgrade a project that was created with InstallShield Professional to InstallShield 2013, InstallShield might add data to the **ISAlias** table.

In Windows Installer, identifiers cannot contain spaces and must contain only specified characters. Because of this, some of your component names, feature names, or script-defined folder names that you used in InstallShield Professional might not be valid in a project that you upgraded to a Windows Installer–based project. To address this issue, InstallShield uses aliasing to match the old name with a new identifier. (InstallShield does not perform a lexicon change for these names because they might be used as strings within your script.)

Note • *If you upgrade to an InstallScript project, the only invalid characters in feature names or script-defined folder names are the following:*

\ / : * ? " < > |

In component names, the preceding characters and the single quotation mark (') are invalid.

The **ISAlias** table contains the following information.

Table 12-148 • ISAlias Table Information

Column Name	Information
Alias	Name string used in InstallShield Professional.
Identifier	String that is used by InstallShield to reference the alias.
Table	Name of the table that uses the alias (for example, Feature). This table is available in the Direct Editor.

ISCOMCatalogAttribute Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The **ISCOMCatalogAttribute** table contains the information about COM+ catalog attributes. Each entry has a foreign key to a **ISComCatalogObject** table entry to which the attribute belongs.

Columns

ISCatalogObject_(primary key)

A foreign key into the **ISCatalogObject** table

ItemName (primary key)

The named attribute for a catalog object

ItemValue

A value associated with the attribute defined in ItemName

ISCOMCatalogCollection Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*

- *Merge Module*

The **ISCOMCatalogCollection** table contains information about COM+ catalog collections. A COM+ catalog collection is a folder of a same type of COM+ catalog objects. For example, COM+ application, Component and Legacy Component nodes in the Component Services view are the COM+ catalog collections. Each entry has a foreign key to a **ISComCatalogObject** table entry to which the collection belongs.

Columns

ISCatalogCollection (primary key)

A unique key for the **ISCatalogCollection** table.

ISCatalogObject_

A foreign key into the **ISCatalogObject** table. This is the catalog object that a catalog collection belongs to.

Name

A catalog collection name.

ISCOMCatalogCollectionObject Table

Project *• This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The **ISCOMCatalogCollectionObject** table contains information about COM+ catalog collections where COM+ catalog objects belong.

Columns

ISCatalogCollection_(primary key)

A unique key for the **ISCatalogCollection** table

ISCatalogObject_(primary key)

A foreign key into the **ISCatalogObject** table; This is the catalog object that a catalog collection contains.

ISCOMCatalogObject Table

Project *• This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The **ISCOMCatalogObject** table contains information about COM+ catalog objects. A COM+ catalog object is an item that is contained within a COM+ catalog collection. Each entry has the display name.

Columns

ISCatalogObject (primary key)

A unique key for the **ISCatalogObject** table

DisplayName

The display name of a catalog object

ISCOMPlusApplication Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The **ISCOMPlusApplication** table contains information about a COM+ application. A COM+ application is a COM+ catalog object with extra information. This table has application specific information and a foreign key to an **ISComCatalogObject** table entry that has the basic information.

Columns

ISCatalogObject_(primary key)

A foreign key into the **ISComCatalogObject** table. This is the root level application object. All other data associated with this application can be derived through the **ISComCatalogObject** table.

ComputerName

If the ComponentService object was loaded from a remote machine, store the computer name here. This can be NULL for the local computer.

Component_

A foreign key to the component table.

ISCustomActionReference Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The **ISCustomActionReference** table contains information about the intended behavior of each custom action that is included in the project.

Table 12-149 • ISCustomActionReference Table Information

Column	Type	Key	Nullable	Description
Action_	Identifier	Yes	No	Identifier that references an entry in the **CustomAction** table.
Description	Text	No	No	Text that describes the behavior of the custom action. When InstallShield builds a release of a Basic MSI, InstallScript MSI, or merge module project, it populates this column with the text in the file that is referenced in the ISCAReferenceFilePath column. If you are working on a project in Direct Edit mode, InstallShield streams the contents of the file into this column as soon as you select the help file in the Custom Actions and Sequences view (or the Custom Actions view).
FileType	Text	No	No	The file type of the help file.
ISCAReferenceFilePath	Text	No	No	The full path, including the file name, for the file that describes the behavior of the custom action. This column is included in the InstallShield project file (.ism), but not in the .msi file.

ISDRMFile Table

Project • *This information applies to the following project types:*

- *Basic MSI*

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

The **ISDRMFile** table contains information about the file being wrapped for trialware protection. For more information, see Trialware Technology.

Table 12-150 • ISDRMFile Table Information

Column	Type	Key	Nullable	Description
ISDRMFile	Identifier	Yes	No	Primary table key.
File_	Identifier	No	No	Foreign key into the File table.
ISDRMLicense_	Identifier	No	No	Foreign key into the ISDRMLicense table.
Shell	String	No	No	Type of trialware.

ISDRMFileAttribute Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

The **ISDRMFileAttribute** table contains information about a trialware license.

Table 12-151 • ISDRMFileAttribute Table Information

Column	Type	Key	Nullable	Description
ISDRMFile_	Identifier	Yes	No	Primary foreign key into the ISDRMFile table.
Property	String	No	No	Text that specifies the property name.
Value	String	No	Yes	Text that specifies the value of the property.

ISDRMLicense Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

The **ISDRMLicense** table contains information about a trialware license.

Table 12-152 • ISDRMLicense Table Information

Column	Type	Key	Nullable	Description
ISDRMLicense	Identifier	Yes	No	Primary table key that identifies the internal name of the trialware license.
Description	String	No	No	Text that you may specify to give the license a more meaningful name than the name in the ISDRMLicense column.
ProjectVersion	String	No	No	Text that specifies the product version that is associated with this license.
Attributes	Number	No	Yes	Bit 0x1 is the version-independent or free-upgrade field that specifies that this license is used independently of the ProjectVersion. The build uses this bit to know whether to warn that a new license is required.
LicenseNumber	String	No	No	Location that stores the license number of the trialware license.
RequestCode	String	No	No	Location that stores the request code of the trialware license.
ResponseCode	String	No	No	Location that stores the response code of the trialware license.

ISIISItem Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

The **ISIISItem** table contains information about IIS settings that are configured in the Internet Information Services view.

Table 12-153 • ISIISItem Table Information

Column	Type	Key	Nullable	Description
ISIISItem	String	Yes	No	Primary key for table. This item identifies the Web site or other IIS item that is being created.
ISIISItem_Parent	String	No	Yes	Foreign key into the ISIISItem column. This item identifies the Web site or other IIS item that contains the current item.
DisplayName	Localizable string	No	Yes	An optional localized name for the Web site or other IIS item.
Type	Integer	No	No	Identifies the type of IIS item. Available options are: • 1—Web site • 2—Application • 3—Virtual directory • 4—Application pool • 5—Web service extension
Component_	String	No	Yes	Name of the component that contains the IIS item.

ISIISProperty Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

- *Merge Module*

The **ISIISProperty** table contains information about IIS settings that are configured in the Internet Information Services view.

Note • *When you configure advanced settings for a Web site, application, or virtual directory in the Internet Information Services view, InstallShield configures the MetaData* fields in the* ***ISIISProperty*** *table automatically. For help on specific settings, see IIS Metabase Properties in the MSDN Help Library.*

Table 12-154 • ISIISProperty Table Information

Column	Type	Key	Nullable	Description
ISIISProperty	String	Yes	No	Primary key for table.
ISIISItem	String	Yes	No	Primary key for table; foreign key into the **ISIISItem** table. This item identifies the Web site or other IIS item that this property is for.
Schema	String	No	Yes	This column is reserved for future use.
FriendlyName	String	No	Yes	This column is reserved for future use.
MetaDataProp	Integer	No	Yes	Equates to the dwMDIdentifier field of the METADATA_RECORD structure.
MetaDataType	Integer	No	Yes	Equates to the dwMDDataType field of the METADATA_RECORD structure.  ***Note*** • *InstallShield supports the following values:* • *1 (DWORD_METADATA)* • *2 (STRING_METADATA)* • *5 (MULTISZ_METADATA)*
MetaDataUser Type	Integer	No	Yes	Equates to the dwMDUserType field of the METADATA_RECORD structure. Available options, which are defined in the Windows SDK header `IISCnfg.h`, are: • 1 (IIS_MD_UT_SERVER) • 2 (IIS_MD_UT_FILE) • 100 (IIS_MD_UT_WAM) • 101 (ASP_MD_UT_APP)

Table 12-154 • ISIISProperty Table Information (cont.)

Column	Type	Key	Nullable	Description
MetaDataAttributes	Integer	No	Yes	Equates to the pbMDAttributes field of the METADATA_RECORD structure.
MetaDataValue	String	No	Yes	Equates to the pbMDData field of the METADATA_RECORD structure.
Order	Integer	No	Yes	The order that you would like the property to be applied to the IIS item.
ISAttributes	Integer	No	Yes	Indicates whether the IIS property is a standard property or an advanced property. Advanced properties are configurable through the Other IIS Properties setting in the Internet Information Services view. Available options are: • 0 (Standard property) • 1 (Advanced property) All other options are reserved for future use.

ISProductConfigurationInstance Table

Project • *This information applies to the following project types:*

- *Basic MSI*

The **ISProductConfigurationInstance** table provides support for installing multiple instances of a product in the same context on the same machine. This table defines each of the property values for each instance that an installation supports. For more information, see Setting Properties for an Instance.

Caution • *Creating an installation that lets end users install multiple instances of a product on the same machine and in the same context requires sophisticated authoring and serious commitment on the part of the installation developer. This functionality is recommended for only advanced installation developers.*

Table 12-155 • ISProductConfigurationInstance Table Information

Column	Type	Key	Nullable	Comments
ISProductConfiguration_	Text	Yes	No	Identifies the product configuration to which this instance applies.
InstanceId	Integer	Yes	No	Identifies the instance number of this instance. This value is stored in the property InstanceId.
Property	Identifier	Yes	No	Identifies the property to create for this instance.
Value	Text	Yes	No	Specifies the value for this property for this instance.

ISSelfReg Table

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

If you have selected ISSelfReg as the self-registration method for COM servers, and if your project contains any files (or dynamic links) marked as self-registered, InstallShield adds information about those files to the **ISSelfReg** table of your .msi database.

Table 12-156 • ISSelfReg Table Information

Column Name	Description
FileKey	Foreign key into the File table, identifying the file (.dll, .ocx, .exe, .tlb, .olb) to be self-registered.
Cost	Reserved for future use.

Table 12-156 • ISSelfReg Table Information (cont.)

Column Name	Description
Order	A nonnegative number identifying the order in which self-registration will occur. Any files with an Order value of 1 will be registered first, followed by files with an Order value of 2, and so forth. Finally, all files with an Order value of 0 will be registered.
CmdLine	For self-registering .exe files, stores a command line to be passed to the executable when it is self-registered. By default the field is empty, and the InstallShield run-time engine registers the .exe file with the /regserver argument and unregisters it with the /unregserver argument. To specify different arguments to pass during registration and unregistration, separate the arguments with a vertical bar (|), as in /hello|/goodbye.

InstallShield Columns in Standard Windows Installer Tables

InstallShield extends some standard Windows Installer tables for increased functionality. Following is a listing of the tables affected, columns added, and descriptions of the data to be placed in the new fields.

Table 12-157 • Additions to Standard MSI Tables

Table Name	Column Name	Description
AdminExecuteSequence	ISComments	Author's comments on this Sequence.
AdminUISequence	ISComments	Author's comments on this Sequence.
AdvtExecuteSequence	ISComments	Author's comments on this Sequence.
AdvtUISequence	ISComments	Author's comments on this Sequence.
Binary	ISBuildSourcePath	Full path to the ICO or EXE file.
Component	ISAttributes	This is used to store InstallShield custom properties of a component. Currently the only one is ExtractAtBuild.
Component	ISComments	User Comments.
Control	ISWindowStyle	A 32-bit word that specifies non-MSI window styles to be applied to this control.
Control	ISControlId	A number used to represent the control ID of the Control. Used in Dialog export.
CustomAction	ISComments	Author's comments for this custom action.

Table 12-157 • Additions to Standard MSI Tables (cont.)

Table Name	Column Name	Description
Dialog	ISComments	Author's comments for this dialog.
Dialog	ISWindowStyle	A 32-bit word that specifies non-MSI window styles to be applied to this control. This is only used in Script Based Setups.
Dialog	ISResourceId	A Number that specifies the Dialog ID to be used in Dialog Export.
Directory	ISDescription	Description of the folder.
Feature	ISReleaseFlags	Release Flags that specify whether this feature will be built in a particular release.
Feature	ISComments	Comments.
File	ISBuildSourcePath	Full path, the category is of Text instead of Path because of potential use of path variables.
File	ISAttributes	This field contains the following attributes: • OverrideSystemAttributes (0x04) • OverrideSystemSize (0x08) • OverrideSystemVersion (0x10) • OverrideSystemLanguage (0x20) The UseSystemSettings(0x1) attribute is no longer used.
Icon	ISBuildSourcePath	Full path to the ICO or EXE file.
Icon	ISIconIndex	Optional icon index to be extracted.
InstallExecuteSequence	ISComments	Author's comments on this Sequence.
InstallUISequence	ISComments	Author's comments on this Sequence.
Patch	ISBuildSourcePath	Full path to patch header.
ProgId	ISAttributes	This is used to store InstallShield custom properties of a component, like ExtractIcon, etc.
Property	ISComments	User Comments.

Table 12-157 • Additions to Standard MSI Tables (cont.)

Table Name	Column Name	Description
Registry	ISAttributes	This is used to store InstallShield custom properties of a registry item. Currently the only one is Automatic.
Shortcut	ISComments	Author's comments on this shortcut.

QuickPatch Projects

A QuickPatch project is a specific type of Windows Installer–based project recommended for installation authors who want to ship small, single upgrades to their end users. Each QuickPatch project has its own set of views.

Patch Settings View

The Patch Settings view contains links to several views:

- **General Information View**—Enter information about your upgrade and the original installation. Specify which releases should be patched by the current project, and select which custom actions should be included.
- **Files View**—Add files to your patch, and specify file-patching options.
- **Registry View**—Specify which registry values should be changed or removed.
- **Path Variables View**—Make your patch easily portable between development systems with variable-based file linking.

Additional Tools View

The Additional Tools view contains a link to the Direct Editor. Use the Direct Editor to edit the database tables directly.

Patch Settings View

Project • *This information applies to QuickPatch projects.*

The Patch Settings view is available when you open or create a QuickPatch project. Use this view to configure your QuickPatch.

General Information

Enter information about your upgrade and the original installation. Specify which releases should be patched by the current project, and select which custom actions should be included.

Files

Add files to your patch, and specify file-patching options.

Registry

Specify which registry values should be changed or removed.

Path Variables

Make your patch easily portable between development systems with variable-based file linking.

General Information View

Project • *This information applies to QuickPatch projects.*

The General Information view contains basic information about your QuickPatch project. You can view and configure product properties, build settings, patch history, and custom actions in this view.

Product Properties

Project • *This information applies to QuickPatch projects.*

When you click Product Properties in the General Information view, InstallShield displays the following:

Table 12-158 • Settings for Product Properties

Setting	Description
Original Setup Path	This area shows the product name and the path to the original installation image. The path box is read-only.
Product Version	The Original setup version box shows the product version of the original installation. This box is read-only. In the QuickPatch Version box, you can change the product version for your QuickPatch project. Entry in this box is optional.
FlexNet Connect Integration	If FlexNet Connect was enabled in your original installation and if you designate custom version numbers that FlexNet Connect should use to identify your product (as opposed to using the standard version scheme that Windows Installer uses), type the new custom version number for your QuickPatch in this box.

Build Settings

Project • *This information applies to QuickPatch projects.*

When you click Build Settings in the General Information view, InstallShield displays the following tabs:

- Common
- Identification
- Digital Signature
- Advanced

Common Tab

Project • *This information applies to QuickPatch projects.*

When you click Build Settings in the General Information view, InstallShield displays several tabs. The Common tab exposes frequently used build settings for a QuickPatch:

Build Location

Specify where you want your patch file built or browse for an existing folder.

Launcher Settings

In this area, you can configure the following launcher settings:

Table 12-159 • Configurable Launcher Settings

Setting	Description
Create Update.exe	If you want to create an `Update.exe` update launcher for the current QuickPatch package, select this check box. To learn when an `Update.exe` update launcher is required, see Patching Considerations.
Include Windows Installer 3.1 engine	Select this check box to include the Windows Installer 3.1 engine with your patch package.
Include .NET Framework	Select this check box to include the .NET Framework with your patch package.

Patch Uninstallation

Select the **Allow Patch to be Uninstalled (Requires Windows Installer 3.0)** check box if you would like the QuickPatch to be uninstallable without having to uninstall and reinstall the entire application and other QuickPatch packages. Note that uninstallation of QuickPatch packages works only under certain conditions. For example, versions of Windows Installer earlier than version 3.0 cannot remove just the QuickPatch from an application. For more information, see Removing Patches in the Windows Installer help.

Identification Tab

Project • *This information applies to QuickPatch projects.*

When you click Build Settings in the General Information view of a QuickPatch project, InstallShield displays several tabs. The Identification tab exposes settings for display strings. The display strings are used to populate information about the patch in Add or Remove Programs. It is also used by the Windows Installer 3.0 (and later) APIs that interrogate and catalog patches applied to a target machine.

Note • *Patch metadata is stored directly in the patch (.msp) file and not in any of the .msi packages. The .msp file contents are not localizable. Therefore, string entries are not available for any of the metadata settings below.*

Table 12-160 • Identification Tab Settings

Setting	Description
Display name	Specify the name of your patch.
Support URL	Specify the uniform resource locator (URL) that you would like your customers to visit for technical support.
Description	Specify a brief description of your patch.
Manufacturer name	Specify the name of the application's manufacturer.
Target product name	Specify the name of the application or the target application suite.
Classification	Specify the category of upgrade. Examples include Critical Update, Hotfix, and Service Pack.

Digital Signature Tab

Project • *This information applies to QuickPatch projects.*

When you click Build Settings in the General Information view of a QuickPatch project, InstallShield displays several tabs. The Digital Signature tab is where you specify settings if you want to digitally sign your patch.

Note • *With QuickPatch projects, you can digitally sign the patch package and the `Update.exe` file. If you want to digitally sign individual files—such as your application's executable files—in your QuickPatch package, you must manually sign them and then add them to your project. You can use `Signcode.exe` or `SignTool.exe` to manually sign your files. For more information, see Digital Signing and Security.*

Table 12-161 • Settings in the Digital Signature Tab

Setting	Description
Sign the patch package	Select this check box if you would like to digitally sign your patch package.
Sign update.exe	Select this check box if you would like to digitally sign the `Update.exe` file.
URL	Type a fully qualified URL—for example, **http://www.mydomain.com**. This URL is used in your digital certificate to link to a location you would like end users to visit in order to learn more about your product, organization, or company.
Software publishing credentials file	Specify the location of your digital certificate file (.spc or .pfx) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location. If you specify an .spc file, you must also specify a .pvk file.
Corresponding private key file	If you are using an .spc file, you must also specify the location of your private key file (.pvk) provided by a certification authority. You can type the path to the file or use the Browse button to navigate to the file location.
Password	If your certificate requires a password, type the password in this box. InstallShield encrypts the password and stores it in your project (.ism) file.

Advanced Tab

Project • *This information applies to QuickPatch projects.*

When you click Build Settings in the General Information view, InstallShield displays several tabs. The Advanced tab exposes a comprehensive set of build settings that you can configure for a QuickPatch.

Build Location

In the Build Location area, you can configure the following settings.

Table 12-162 • Build Location Settings

Property	Description
Build Location	Specify where you want your patch file built or browse for an existing folder.
Create Update.exe	Specify whether you want to create an `Update.exe` update launcher for the current QuickPatch package. To learn when an `Update.exe` update launcher is required, see Patching Considerations.
List of Patch GUIDs to replace	To replace one or more earlier installed patches with the current QuickPatch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example: `{C86838C9-DEDC-4451-B96F-94AFB9460F15},{C8633E5B-AC44-45d8-B487-C68B3B1F60D6}` Setting this property is typically *not* required, even if you have several QuickPatch projects in the History. However, if your QuickPatch project does not overwrite files added in an earlier QuickPatch project, it may be necessary to set this property. If you do not know the GUID of a patch that you want to replace, click this property and then click the ellipsis button (...). Select the patch (.msp or .exe file), and InstallShield will add the corresponding GUID to this property.
Create new "UpgradedImage" folder	This setting enables you to build your QuickPatch package with an existing UpgradedImage folder. To use this option, you must have built this package at least once (so that an UpgradedImage folder exists). Setting this option to No builds the package from the existing UpgradedImage folder. This lets you tweak the .msi package in the UpgradedImage folder and use that .msi data in a QuickPatch project. Setting this option to Yes (the default setting) regenerates the .msi file in the UpgradedImage folder every time that the package is built.
Generate MsiPatchOldAssembly tables	Specify whether to automatically generate entries for the MsiPatchOldAssemblyFile and MsiPatchOldAssemblyName tables, which allow a patch package that is running under Windows Installer 3.0 and later to patch an assembly in the global assembly cache (GAC) without making a run-time request for the original installation source. For more information, see Patching Assemblies in the Global Assembly Cache.

Table 12-162 • Build Location Settings (cont.)

Property	Description
Create patch sequencing entry	Specify whether you want to use patch sequencing for your QuickPatch. A patch sequence accounts for obsolete patches, superseded patches, and patches that have already been applied to the product. The sequence specifies the order that Windows Installer version 3.0 and later should apply patches to an installed product, regardless of the order in which they are provided to the target machine. For versions of Windows Installer earlier than version 3.0, the patch sequence is ignored, and any patches are applied to the product in the order that they are provided to the target machine.
Streamline QuickPatch	Specify whether you want InstallShield to streamline the creation of your QuickPatch package to build as simple a package as possible. The default value is Yes. The goal of QuickPatch streamlining is to generate a QuickPatch package that has fewer new subfeatures and custom actions than a non-streamlined QuickPatch package. For example, if your QuickPatch project includes a new file or registry entry and InstallShield does not use QuickPatch streamlining, InstallShield creates a new subfeature for that file or registry entry. InstallShield also adds one or more prebuilt InstallShield custom actions to work around certain Windows Installer patch requirements. However, if InstallShield does use QuickPatch streamlining, the file or registry entry is added to an existing feature, and no special prebuilt InstallShield custom actions are required.  ***Note*** • *InstallShield cannot streamline the creation of a QuickPatch package in the following scenarios:* • *The QuickPatch package removes an installed file.* • *The QuickPatch package removes or renames a registry key.* • *The QuickPatch package targets a non-streamlined QuickPatch image. That is, you cannot use QuickPatch streamlining if you select the check box in the History area of the General Information view for a QuickPatch that did not use QuickPatch streamlining. If you try to build a streamlined QuickPatch that targets one or more non-streamlined QuickPatch images, InstallShield displays a build warning, and it does not use streamlining.*
Password Protect Launcher	To password-protect your QuickPatch package, select Yes, and then type a password for the Launcher Password setting. When you password-protect your QuickPatch package, any end user who wants to apply your QuickPatch must enter a case-sensitive password to launch your update. This setting is applicable only to QuickPatch packages that use an `Update.exe` file.

Table 12-162 • Build Location Settings (cont.)

Property	Description
Launcher Password	Type a password to protect your application. You must select Yes for the Password Protect Launcher setting to activate password protection. When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update. This setting is applicable only to patches that use an `Update.exe` file.

Windows Installer Engine

In this area, you can configure the following settings for the Windows Installer engine:

Table 12-163 • Windows Installer Engine Settings

Property	Description
Include Windows Installer 3.1 engine	Specify whether the Windows Installer engine should be included with your patch package.
Engine Location	Select one of the following options: • **Download Engine From The Web**—If the Windows Installer engine needs to be installed, it is downloaded at run time. • **Extract Engine From Update.exe**—The build streams the Windows Installer engine into the `Update.exe` file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required. • **Copy From Source Media**—The build copies the Windows Installer engine into the same directory as the Update.exe file.
Windows Installer 3.1 engine URL	Specify the URL for the location of the engine. This is the location that the `Update.exe` file uses at run time to download the engine. The default URL location is a live site maintained by Flexera Software for your convenience.

Microsoft .NET Framework

In this area, you can configure the following settings for the Microsoft .NET Framework:

Table 12-164 • Microsoft .NET Framework Settings

Property	Description
Include In Build	Specify whether to include the Microsoft .NET Framework in your patch.

Table 12-164 • Microsoft .NET Framework Settings (cont.)

Property	Description
Engine Location	Select one of the following options: • **Download Engine From The Web**—If the .NET Framework needs to be installed, it is downloaded at run time. • **Extract Engine From Update.exe**—The build streams the .NET Framework into the `Update.exe` file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required. • **Copy From Source Media**—The build copies the .NET Framework into the same directory as the `Update.exe` file.
Engine URL	Specify the URL for the location of the .NET Framework. This is the location that the `Update.exe` file uses at run time to download the .NET Framework. The default URL location is a live site maintained by Flexera Software for your convenience.

Update Launcher Settings

In this area, you can configure the following settings for the `Update.exe` launcher:

Table 12-165 • Update Launcher Settings for a Patch

Property	Description
Company Name	If you want to override the default company name for `Update.exe` with your company name, enter your company name. The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.
Product Name	If you want to override the default product name for `Update.exe` with your product name, enter your product name. The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.

Table 12-165 • Update Launcher Settings for a Patch (cont.)

Property	Description
Product Version	If you want to override the default product version for `Update.exe` with your product version, enter your product version. The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.
Description	If you want to override the default description for `Update.exe` with your own description, enter the appropriate description. The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.
Copyright	If you want to override the default copyright notice for `Update.exe` with your product's copyright notice, enter your product's copyright notice. The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the `Update.exe` file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.

Table 12-165 • Update Launcher Settings for a Patch (cont.)

Property	Description
Required Execution Level	Use the Required Execution Level setting to specify the minimum level required by your installation's `Update.exe` file for running the installation (the setup launcher, any InstallShield prerequisites, and the .msi file) on Windows Vista and later platforms. The available options are: • **Administrator**—`Update.exe` requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator. • **Highest Available**—`Update.exe` prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges. • **Invoker**—`Update.exe` does not require administrative privileges, and all users can run it without administrative privileges. `Update.exe` does not display any UAC messages prompting for credentials or for consent. • **Use Previous Setup Manifest**—The `Update.exe` manifest uses the same required execution level that was specified for the previous setup. This is the default option. For InstallScript MSI projects, and for Basic MSI projects if the Create Update.exe check box is selected, InstallShield embeds an application manifest in the `Update.exe` launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level. If the Create Update.exe check box is cleared for a Basic MSI project, InstallShield does not embed the Windows application manifest in an `Update.exe` launcher. For more information, see Minimizing the Number of User Account Control Prompts During Installation.
Icon	To use your own icon for the `Update.exe` file, specify the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable, or click the ellipsis button (...) to browse to the file from within the Change Icon dialog box. By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, **C:\Temp\MyLibrary.dll,2** indicates the icon with an index of 2, and **C:\Temp\MyLibrary.dll,-100** indicates the icon with a resource ID of 100. If you leave this setting blank, InstallShield uses a default icon for your `Update.exe` file.

History

Project • *This information applies to QuickPatch projects.*

The History item in the General Information explorer within the General Information view presents a synopsis of your QuickPatch project. It lists all of the associated releases, enabling you to specify which ones should be patched by the current QuickPatch project.

Custom Action

Project • *This information applies to QuickPatch projects.*

The Custom Action item in the General Information explorer within the General Information view lists the custom actions that are defined in the original installation project for which you are creating a patch. It enables you to specify which actions should be executed by the current QuickPatch project.

Files View

Project • *This information applies to QuickPatch projects.*

The Files view enables you to manage the files in your QuickPatch and also see version numbers, languages, and other information about the files in your original installation. All of the files in the Files To Patch and Original Setup Files explorers are listed by key file.

When you click a file in the Original Setup Files explorer, the file name, the destination, the version number, and other pertinent information are displayed in the right pane. You can drag and drop files from this explorer to the Files To Patch explorer, which shows all of the files that will be added, changed, or removed when your QuickPatch is applied to the original installation.

New File Settings

Project • *This information applies to QuickPatch projects.*

When you click a new file in the Files To Patch explorer within the Files view, you can configure the following settings:

File Settings

Table 12-166 • Settings in the File Settings Area

Setting	Description
Specify the file that you want to add to the patch setup	If you are modifying a file in the original installation, specify the latest version of the file that you want to be installed on the target system when the patch is applied.
Self-Registering	If the file that you are adding is a self-registering DLL or .ocx file, select this check box.  ***Note*** • *This option does not self-register .exe or .tlb files.*
Extract COM Information	If the file is a COM server and you want InstallShield to extract COM information from the file when the patch is built, select this check box.

Integration Settings

Select the file destination and the features that you want to associate with this file.

Note • *This install state binding requires feature association. When you add new data to your QuickPatch project, you must associate it with a feature. New data is installed only if the corresponding feature is installed.*

Modified/Deleted File Settings

Project • *This information applies to QuickPatch projects.*

When you click a file that you have added from your original installation to the Files To Patch explorer within the Files view, you can configure the following settings:

Updated File

Table 12-167 • Settings in the Updated File Area

Setting	Description
Specify the latest version of your file	If you are modifying a file in the original installation, specify the latest version of the file that you want to be installed on the target system when the patch is applied.
Overwrite Any Existing File	If you want to include the selected file in your patch as a whole file, rather than only the byte-level file differences of the file, you may want to consider selecting this check box. If you do so, InstallShield configures your patch so that Windows Installer ignores any actual version number of the selected file, and instead considers it be version 1.0.0.0 when it is determining whether to update the target system's file with the version in your QuickPatch package, or to leave the file as is. Selecting this check box for an unversioned file may be helpful to ensure that the file on the target system is always overwritten with the newer equivalent unversioned file in your QuickPatch package. According to Windows Installer file overwrite rules, a file of any version is maintained over an unversioned file. Therefore, if you select this check box, Windows Installer updates the unversioned file with the one in the QuickPatch package because it considers the file in the QuickPatch to be a versioned file.  ***Important*** • *According to Windows Installer file overwrite rules, the file with the highest version is maintained, even if the file already on the target system has a higher version than the one being installed. Therefore, if the file on the target system is a versioned file, you may want to avoid selecting this check box, since in some scenarios it could lead to the file on the target system not being updated. For example, if the file on the target system is version 1.1.0.0, the file in your QuickPatch project is version 2.0.0.0, and you select this check box, the file on the target system is not updated at run time. This occurs because even though the actual version number of the file in the QuickPatch package is newer than the one on the target system, Windows Installer considers the file in the QuickPatch to be 1.0.0.0, which would make it older than the file on the target system.*
Extract COM Information	If the file is a COM server and you want InstallShield to extract COM information from the file when the patch is built, select this check box. This check box is selected by default for patch files that contain COM information in the **Class** or **TypeLib** tables in the base .msi package.  ***Note*** • *When you specify an existing file that you want to patch, InstallShield automatically detects if the file is self-registering. If the original file was self-registering, the file in the patch is also set to self-register.*

Original File Information

The Original File Information area provides information about the original file in the original installation.

Component Information

The Component Information area provides file component information such as the component name and key file.

Check this box to have the patch delete this file from the setup

Select this check box to remove the file from the target machine when the patch is applied.

Registry View

Project • *This information applies to QuickPatch projects.*

The Registry view in a QuickPatch project provides a visual representation of what currently exists on a source machine and what you will patch on a destination/target system once your patch project is built and applied to the target system. The Destination computer's Registry view pane and the Destination computer's registry data pane are prepopulated with registry entries in the original installation.

Each item in the Destination computer's registry data pane appears next to an icon specific to the value type and the data's current condition. Icons for data values that have been modified have a turquoise pencil. Icons for new data values have a red star in the upper-right corner. Icons for registry values that will be deleted from the target system have a red X. See the following sample icons and descriptions below.

Table 12-168 • Icons in the Registry View of a QuickPatch Project

Icon	Description
	This icon represents a new DWORD value that will be added to the target system when the QuickPatch is applied.
	This icon represents a modified DWORD value that will be updated on the target system when the QuickPatch is applied.
	This icon represents an existing DWORD value on the target system from an earlier installation.
	This icon represents a DWORD value that exists on the target system but will be deleted when the QuickPatch project is applied.

InstallShield Prerequisite Editor Reference

Project • *The following project types include support for InstallShield prerequisites:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

All of these project types include support for the setup prerequisite type of InstallShield prerequisite. Basic MSI projects include support for the feature prerequisite type.

InstallShield also includes support for including InstallShield prerequisites as packages in Advanced UI and Suite/Advanced UI projects. For more information, see Including InstallShield Prerequisites (.prq) in an Advanced UI or Suite/Advanced UI Project.

An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. Some examples of InstallShield prerequisites that are included with InstallShield are Java Runtime Environment (JRE) and SQL Server Express Edition. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

Task: ***To open the InstallShield Prerequisite Editor:***

On the **Tools** menu, click **Prerequisite Editor**.

Task: ***To open an existing prerequisite in the InstallShield Prerequisite Editor, do one of the following:***

1. On the **File** menu, click **Open**. The **Open** dialog box opens.
2. Select the file by browsing and click **Open**.

The following tabs are associated with the InstallShield Prerequisite Editor:

- Properties
- Conditions
- Files to Include
- Application to Run
- Behavior
- Dependencies

Properties Tab

The Properties tab of the InstallShield Prerequisite Editor is where you specify general information about an InstallShield prerequisite.

Table 12-1 • Settings on the Properties Tab

Setting	Description
Unique identifier for InstallShield prerequisite	Type a unique file identifier for the InstallShield prerequisite or leave the default value as is. This could be the name of the prerequisite application or component, or a GUID. ***Note*** • *Every time you open the InstallShield Prerequisite Editor to create a new InstallShield prerequisite, a new GUID is generated and listed in this box.*
Alternate location to download .prq from if prerequisite files are being downloaded	If appropriate, type the alternate URL for your .prq file. For example: `http://www.mywebsite.com/MyPrq.prq` For more information, see Specifying an Alternate URL for a .prq File. ***Note*** • *InstallShield prerequisites do not have support for FTP URLs.*
Description	Type an overview of the prerequisite. This description is displayed under the Overview heading when you select a prerequisite in the Redistributables view.

Conditions Tab

The Conditions tab of the InstallShield Prerequisite Editor lets you define installation conditions that determine whether an InstallShield prerequisite already is installed on the target machine. Failure to do so causes problems because the target system behaves as if the InstallShield prerequisite was not properly installed. You can also create installation conditions that specify operating system, registry, or file requirements.

If a condition evaluates as true at run time, that condition is met. The InstallShield prerequisite is installed on the target machine if the following are true:

- The target machine meets any of the operating system conditions and all of the other conditions that are listed on the Conditions tab.
- For feature prerequisites only (that is, an InstallShield prerequisite that is associated with one or more features in the main installation)—The feature that contains the feature prerequisite must be installed. Thus, if the feature has a condition that is not met on the target system, or if the end user chooses not to install the feature, the feature is not installed. As a result, none of its associated feature prerequisites are installed, unless the feature prerequisites are also associated with other features that are installed.

Note • *Because installation of prerequisites such as Windows service packs is not supported, the operating system version information is not expected to change. Therefore, the operating system conditions are not considered in verifying whether a prerequisite was installed correctly.*

When you click the Add button on this tab, the Prerequisite Condition dialog box opens. This dialog box also opens when you select an existing condition on the Conditions tab and then click the Modify button.

Files to Include Tab

When you are creating a new InstallShield prerequisite, you must specify the installation files that should be included with the InstallShield prerequisite. You can also modify the list of files for an existing InstallShield prerequisite. The Files to Include tab of the InstallShield Prerequisite Editor is where you specify the files.

When you click the Add button or the Add Multiple Files button on this tab to specify an InstallShield prerequisite file or the Modify button to change the file, the New File dialog box opens.

When you click the **Set File(s) URL** button, the **Set File(s) URL** dialog box opens.

Note • *InstallShield prerequisites do not have support for FTP URLs.*

Application to Run Tab

The Application to Run tab of the InstallShield Prerequisite Editor is where you specify how an InstallShield prerequisite should be installed on the target machine.

Table 12-2 • Settings on the Application to Run Tab

Setting	Description
Specify the application you wish to launch	Select the file—typically a `Setup.exe` setup launcher or an .msi package—that should be launched on the target machine if the InstallShield prerequisite is installed. Only files that have been specified on the Files to Include tab are included in this list.  ***Project*** • *If you specify an .msi file and you indicate on the Behavior tab that the progress should be shown, the `Setup.exe` setup launcher captures progress messages and uses Windows Installer APIs instead of `MsiExec.exe` to launch the .msi package at run time.* If you specify any other file type, or if you specify an .msi file for which progress should not be shown, the `Setup.exe` setup launcher runs the file with either the open verb (for .msi and .exe files) or the default verb (for all other file types) at run time.

Table 12-2 • Settings on the Application to Run Tab (cont.)

Setting	Description
Requires Windows Installer engine and/or .NET Framework to be installed first	If the Windows Installer engine, the .NET Framework (`Dotnetfx.exe`), or both must be installed before this InstallShield prerequisite is installed, select this check box.  ***Note*** • *Selecting this check box does not add the Windows Installer engine or the .NET Framework to your installation. It only specifies that if they are included in the installation, they should be installed before this InstallShield prerequisite is installed. To include the Windows Installer engine or the .NET Framework with your installation, you must add them to your project. To learn how, see Adding Windows Installer Redistributables to Projects or Adding .NET Framework Redistributables to Projects.*
Specify the command line for the application	If applicable, type the command line for the file selected in the **Specify the application you wish to launch** list. Do not include the name of the file in this box. For information on command-line parameters that you can specify, see Specifying Command-Line Parameters for an InstallShield Prerequisite.  ***Note*** • *If a setup prerequisite is configured to be hidden (that is, it is not included in the setup prerequisite run-time dialog as one of the prerequisites that need to be installed), it is launched with its silent command-line parameters—not its standard command-line parameters. Therefore, if it is possible that the **The prerequisite should be hidden from the installation list** check box on the Behavior tab will be selected, specify command-line parameters in the **Specify the command line for the application when the setup is running in silent mode** box.*
Specify the command line for the application when the setup is running in silent mode	If applicable, type the appropriate command line. Do not include the name of the file in this box. For information on command-line parameters that you can specify, see Specifying Command-Line Parameters for an InstallShield Prerequisite.  ***Note*** • *Using the /s command-line parameter to launch an installation that includes an InstallShield prerequisite does not automatically run the prerequisite installation silently. You may also need to specify a valid silent command-line parameter for the InstallShield prerequisite in this **Specify the command line for the application when the setup is running in silent mode** setting on the Application to Run tab.*

Table 12-2 • Settings on the Application to Run Tab (cont.)

Setting	Description
Specify the return code (in decimal) the application returns if a reboot is required	If the selected InstallShield prerequisite application requires that the target machine be restarted after the application is installed, type the return code in this box. ***Tip*** • *If multiple return codes exist, list each one separated by a comma.* If you do not know the return codes for the file that you are launching as the InstallShield prerequisite, contact the author of the file. For more information on InstallShield prerequisites that require a restart, see Restarting a Target Machine for InstallShield Prerequisite Installations.

Behavior Tab

The Behavior tab of the InstallShield Prerequisite Editor is where you specify what should occur in certain scenarios.

Table 12-3 • Settings on the Behavior Tab

Setting	Description
The prerequisite requires administrative privileges	Select this check box if administrative privileges are required to install the InstallShield prerequisite or if the InstallShield prerequisite must be installed per machine. This check box is selected by default. ***Note*** • *InstallShield prerequisites that require administrative privileges may require that end users provide credentials or consent before installation can occur on Windows Vista and later systems. For more information, see Minimizing the Number of User Account Control Prompts During Installation.*
The prerequisite may be optionally skipped by the user	If the installation should display a message box that enables end users to choose whether to install the InstallShield prerequisite, select this check box. If end users should not be able to choose whether to install the InstallShield prerequisite, clear this check box.

Table 12-3 • Settings on the Behavior Tab (cont.)

Setting	Description
The prerequisite should be hidden from the installation list	If a target system needs one or more setup prerequisites to be installed, the setup prerequisite dialog is displayed at run time before the main installation runs. When an end user clicks the Install button on this dialog, the setup prerequisites are installed. If you want to include the current setup prerequisite in the list of setup prerequisites that are displayed in that dialog, clear this check box. If you do not want to include the current setup prerequisite in the list, select this check box. The setup prerequisite is hidden from the list of setup prerequisites, but it is still installed on the target system if needed.  ***Note*** • *Feature prerequisites are never listed in the setup prerequisite dialog at run time, regardless of whether the* ***The prerequisite should be hidden from the installation list*** *check box is selected or cleared. That is, if you add an InstallShield prerequisite to your project and associate it with a feature, that feature prerequisite is not listed in the setup prerequisite dialog that is displayed at run time before the main installation runs.* *Note that if a setup prerequisite or a feature prerequisite is marked as hidden, it is launched with its silent command-line parameters—not its standard command-line parameters. To learn more, see Specifying Command-Line Parameters for an InstallShield Prerequisite.*
Progress should be shown in the prerequisites window (raw MSI file only)	If you want the progress of the installation for the current InstallShield prerequisite to be displayed at run time, select this check box. The progress can be shown only if the InstallShield prerequisite installation is an .msi file; it cannot be shown if the file that the InstallShield prerequisite installation launches is a `Setup.exe` file. In addition, the installation that contains the prerequisite must be a Basic MSI or InstallScript MSI installation. If your InstallShield prerequisite installation is a `Setup.exe` file, this setting is ignored. In addition if the installation that contains the InstallShield prerequisite is an InstallScript installation, this setting is ignored.  ***Note*** • *If you select this check box so that progress can be shown, only some command-line parameters are supported. Command-line parameters are specified on the Application to Run tab of the InstallShield Prerequisite Editor. For more information, see Specifying Command-Line Parameters for an InstallShield Prerequisite.* *Also note that if you specify that the progress should be shown for a prerequisite that is an .msi package, the user interface of the prerequisite's .msi package is not displayed by default. If you want to override this behavior, you can specify `/qf` as a command-line parameter on the Application to Run tab.*

Table 12-3 • Settings on the Behavior Tab (cont.)

Setting	Description
If, after installing the prerequisite, the conditions still indicate it is required	If the conditions still indicate that the InstallShield prerequisite needs to be installed after the InstallShield prerequisite installation has been run, either of the following may be true: • The InstallShield prerequisite was not successfully installed. • The conditions that were specified for the InstallShield prerequisite were not accurate. For example, a condition may indicate that the InstallShield prerequisite needs to be installed if a particular file does not exist on the target machine. If the file is still missing even after the InstallShield prerequisite is installed, it is possible that the condition should not have been created. Specify the behavior that should occur if the conditions still indicate that the InstallShield prerequisite needs to be installed. The available options are: • **Abort the setup**—If your application should not be installed, select this option. • **Ask whether to continue the setup**—If the installation should display a message box that prompts the end user to specify whether the main installation should continue, select this option. • **Continue the setup**—If the installation should essentially ignore the InstallShield prerequisite's unmet condition and proceed to the next InstallShield prerequisite installation (if one is required) or the main installation, select this option.

Table 12-3 • Settings on the Behavior Tab (cont.)

Setting	Description
If the prerequisite requires a reboot	Installing an InstallShield prerequisite may require that the target machine be restarted, as described in Restarting a Target Machine for InstallShield Prerequisite Installations. Specify the behavior that should occur if the InstallShield prerequisite requires that a target machine be restarted. • **Exit and resume on reboot**—To end the InstallShield prerequisite installation, allow the InstallShield prerequisite to restart the target machine, and then continue the installation, select this option. • **Note it, fail to resume if the machine is rebooted, and reboot after the installation**—To note that the target machine should be restarted if it is required, to schedule the restart for the end of the main installation, but to exit if the target machine restarts after the InstallShield prerequisite installation, select this option. Thus, if it appears that a restart is required but you want to postpone it until the end of the main installation (or until a subsequent InstallShield prerequisite triggers a restart), select this option. At run time, the value of the Windows Installer property **ISSCHEDULEREBOOT** is set to 1 in the main installation when a restart is still pending. • **Ignore it, and fail to resume if machine is rebooted**—To continue the installation but end it if the target machine is restarted, select this option. Thus, if it appears that a restart is required but you want to try to skip it, select this option. • **Prompt the user only if no reboot is detected, but always reboot the machine and resume on reboot**—To prompt the end user to restart the target machine only if it appears that the target machine does not need to be restarted, select this option. The target machine is restarted if the end user agrees to allow it, and then the installation continues. • **Prompt the user to reboot the machine even if nothing is detected, and resume on reboot**—To prompt the end user to restart the target machine even if it appears that the target machine does not need to be restarted, select this option. The target machine is restarted if the end user agrees to allow it, and then the installation continues. • **Reboot the machine and resume on reboot**—To restart the target machine and then continue the installation, select this option.

Dependencies Tab

When you are creating a new InstallShield prerequisite or modifying an existing one, you can specify other InstallShield prerequisites (.prq files) on which this InstallShield prerequisite depends. The Dependencies tab of the InstallShield Prerequisite Editor is where you specify the dependencies.

When you click the Add button on this tab to add a dependency, the New Dependency dialog box opens.

Errors and Warnings

The following topics in the InstallShield Help Library provide information about errors and warnings that might occur when you are working with your installation.

Table 12-1 • List of Error and Warning Topics

Topic	Description
Build Errors and Warnings	Lists errors and warnings that might occur during the build process.
Media Build Errors and Warnings	Lists InstallScript compiler errors and warnings.
MSI/MSM Conversion Errors	Lists errors that might occur when you use the Open MSI/MSM Wizard to convert an installation package (.msi file) or merge module (.msm file) to an InstallShield project (.ism file).
Windows Installer Run-time Errors	Lists Windows Installer errors that might occur during run time. The errors are related to the built-in InstallShield custom actions that are added automatically to InstallShield projects to support some types of functionality.
Setup.exe Return Values and Run-Time Errors (InstallScript Projects)	Lists the errors that might occur when `Setup.exe` runs for InstallScript installations.
Setup.exe Return Values and Run-Time Errors (Basic MSI and InstallScript MSI Projects)	Lists the errors that might occur when `Setup.exe` runs for Basic MSI and InstallScript MSI installations.
Setup.exe Return Values and Run-Time Errors (Advanced UI and Suite/ Advanced UI Projects)	Lists return codes, errors, and logged status codes that might occur when an Advanced UI or Suite/Advanced UI `Setup.exe` installation is run.
Visual Studio Project Import Errors and Warnings	Lists the errors and warnings that might occur when you do any of the following: • Convert a Visual Studio setup project (.vdproj) to an InstallShield Basic MSI project (.ism). • Convert a Visual Studio merge module project (.vdproj) to an InstallShield Merge Module project (.ism). • Import a Visual Studio setup or merge module project (.vdproj) into an InstallShield Basic MSI or Merge Module project (.ism).
Upgrade Errors (Upgrading from InstallShield Professional)	Lists errors that might occur when you upgrade a project created with InstallShield Professional.

Table 12-1 • List of Error and Warning Topics (cont.)

Topic	Description
Upgrade Warnings (Upgrading from InstallShield Professional)	Lists warnings that might occur when you upgrade a project created with InstallShield Professional.
Upgrade Errors and Warnings (Upgrading from InstallShield—Windows Installer Edition)	Lists errors and warnings that might occur when you upgrade a project (.ism file) created with a version of InstallShield—Windows Installer Edition.
HRESULT Values for Windows Installer Run-time Errors	Provides descriptions for InstallShield custom HRESULT codes provided with Windows Installer errors 1904 and 1905.
DIFxAPI Errors (InstallScript Projects)	Describes each of the DIFxAPI errors that can be returned when DIFx driver functions are called.
"String PRODUCT_NAME was not found in string table" Error	Provides description of when this error can occur and what steps you should take to correct it.
InstallScript Error Information	Provides descriptions for InstallScript errors and warnings.
Virtualization Conversion Errors and Warnings	Lists errors and warnings that might occur during the build process when you are creating a virtual application.

In-depth articles about errors and warnings are available in the Knowledge Base.

Build Errors and Warnings

The following table contains a listing of errors and warnings that may occur during the build process.

Note • *You can find detailed information—including resolution information—on most InstallShield build errors and warnings in the Knowledge Base.*

For troubleshooting information about errors and warnings that may occur when you are building a virtual application, see Virtualization Conversion Errors and Warnings.

Table 12-2 • Build Errors and Warnings

Error or Warning Number	Message	Troubleshooting Information
-32000	Build canceled by the user.	This error occurs only when the build is terminated during the build process.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7337	Feature %1 has no associated packages.	If you build a release for a Suite/Advanced UI project or an Advanced UI project, and the project contains a feature that does not contain any packages, this build warning is displayed. To resolve this build warning, ensure that at least one package is associated with the feature. To learn more, see Associating a Package in an Advanced UI or Suite/Advanced UI Project with a Feature. If you intentionally are not including a package with the feature that is identified in the build warning, you can ignore this build warning.
-7336	Advanced UI projects do not have support for Events.	If you use the Professional edition of InstallShield to open a Suite/Advanced UI project that includes one or more actions in the Events view, InstallShield opens the project as an Advanced UI project, and it displays this build error at build time. Advanced UI projects do not have support for events. To resolve this build error, remove the actions from your project, or use the Premier edition of InstallShield to edit the project and build releases. To learn more, see Using Actions to Extend the Behavior of a Suite/Advanced UI Installation.
-7335	The project contains a reference to undefined Action '%1'.	If you add an action to your Suite/Advanced UI project, associate the action with a package in your project, and then delete part of the action from your project by editing the .issuite project file in a text editor, this error occurs at build time. To resolve this error, remove the action that is referenced in the build error from your .issuite file.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7334	The package '%1' includes references to Windows features, which are not supported in this edition of InstallShield. These references will not be included in the build.	If you use the Professional edition of InstallShield to open a Suite/Advanced UI project that includes support for enabling one or more Windows roles or features, InstallShield opens the project as an Advanced UI project, and it displays this build error at build time. Advanced UI projects do not have support for enabling Windows roles or features. To resolve this build error, remove the support for Windows roles and features from your project, or use the Premier edition of InstallShield to edit the project and build releases. To learn more, see Enabling Windows Roles and Features During a Suite/Advanced UI Installation.
-7329	Including IA64 %1 %2 in an x64 package.	This build warning occurs if the following conditions are true: • x64 is specified for the Template Summary setting. • The project includes an Itanium 64-bit file that the installation may transfer to target systems at run time. An x64 target system cannot run an Itanium 64-bit file. Depending on your requirements, you may want to replace the IA64 file with an x64 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on x64 systems, you may want to ignore this build warning.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7328	Including x64 %1 %2 in an IA64 package.	This build warning occurs if the following conditions are true: • IA64 is specified for the Template Summary setting. • The project includes an x64 file that the installation may transfer to target systems at run time. An Itanium 64-bit target system cannot run an x64 file. Depending on your requirements, you may want to replace the x64 file with an IA64 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on IA64 systems, you may want to ignore this build warning.
-7327	Including 64-bit %1 %2 in a strict 32-bit package.	This build warning occurs if the following conditions are true: • Intel is specified for the Template Summary setting. • Strict is selected for the Platform Validation setting. • The project includes an x64 file that the installation may transfer to target systems at run time. An x86 target system cannot run an x64 file. Depending on your requirements, you may want to replace the x64 file with an x86 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on x86 systems, you may want to ignore this build warning. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7326	Including 32-bit %1 %2 in a strict 64-bit package.	This build warning occurs if the following conditions are true: • An x64 architecture is specified for the Template Summary setting. • Strict is selected for the Platform Validation setting. • The project includes an x86 file that the installation may transfer to target systems at run time. In many cases, an x64 target system can run an x86 file. However, if the x64 system does not have 32-bit Windows-on-Windows (WOW64) support, it may not be able to run an x86 file. Depending on your requirements, you may want to replace the x86 file with an x64 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on x64 systems, you may want to ignore this build warning. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.
-7325	An unexpected error occurred validating the architecture for file %1.	This build error occurs if InstallShield cannot determine whether a file in the project is 32 bit or 64 bit when performing architecture validation. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.
-7324	%1 Custom Action %2 cannot call a function in native code %3.	This build error occurs if your project contains a managed-code custom action for a standard DLL file. To resolve this error, replace the custom action with a standard DLL custom action that calls a function in the DLL file. Otherwise, replace the DLL file with a .NET assembly that was written in managed code such as Visual Basic .NET or C#. For more information, see Calling a Public Method in a Managed Assembly.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7323	%1 Custom Action %2 cannot call a function in managed code %3.	This build error occurs if your project contains a standard DLL custom action for a .NET assembly file. To resolve this error, replace the custom action with a managed-code custom action that calls a public method in the .NET assembly. Otherwise, replace the .NET assembly with a standard DLL that was written in native code such as C++. For more information, see Calling Functions in Standard DLL Files.
-7322	IA64 %1 Custom Action %2 cannot execute in an x64 package.	This build warning occurs if the following conditions are true: • x64 is specified for the Template Summary setting. • The project contains a custom action file that targets Itanium 64-bit systems. An x64 target system cannot run an IA64 custom action. To learn more, see Using the Template Summary Property.
-7321	x64 %1 Custom Action %2 cannot execute in an IA64 package.	This build warning occurs if the following conditions are true: • IA64 is specified for the Template Summary setting. • The project contains a custom action file that targets x64 systems. An IA64 target system cannot run an x64 custom action. To learn more, see Using the Template Summary Property.
-7320	64-bit %1 Custom Action %2 must not be included in a strict 32-bit package.	This build error occurs if the following conditions are true: • Intel is specified for the Template Summary setting. • Strict is selected for the Platform Validation setting. • The project includes a 64-bit custom action file. Note that 64-bit DLL files cannot be run on 32-bit target systems. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7319	32-bit %1 Custom Action %2 must not be included in a strict 64-bit package.	This build error occurs if the following conditions are true: • x64 is specified for the Template Summary setting. • Strict is selected for the Platform Validation setting. • The project includes a 32-bit DLL custom action file. Note that 32-bit DLL files cannot be run on 64-bit target systems that do not have 32-bit Windows-on-Windows (WOW64) support. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.
-7318	InstallScript Custom Action %1 must not be included in a strict 64-bit package.	This build error occurs if the following conditions are true: • x64 is specified for the Template Summary setting. • Strict is selected for the Platform Validation setting. • The project includes an InstallScript custom action. Note that InstallScript custom actions cannot be run on 64-bit target systems that do not have 32-bit Windows-on-Windows (WOW64) support. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.
-7317	64-bit VBScript/JScript Custom Action %1 must not be included in a strict 32-bit package.	This build error occurs if the following conditions are true: • Intel is specified for the Template Summary setting. • Strict is selected for the Platform Validation setting. • The project includes a 64-bit VBScript or JScript custom action file. Note that 64-bit script files cannot be run on 32-bit target systems. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7316	32-bit VBScript/JScript Custom Action %1 must not be included in a strict 64-bit package.	This build error occurs if the following conditions are true: • x64 is specified for the Template Summary setting. • Strict is selected for the Platform Validation setting. • The project includes a 32-bit VBScript or JScript custom action file. Note that 32-bit script files cannot be run on 64-bit target systems that do not have 32-bit Windows-on-Windows (WOW64) support. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.
-7315	An unexpected error occurred validating the architecture for custom action %1.	This build error occurs if InstallShield cannot determine whether a custom action file in the project is 32 bit or 64 bit when performing architecture validation. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.
-7314	An unexpected error occurred validating the architecture for custom actions.	This build error occurs if InstallShield cannot determine whether a file in the project is 32 bit or 64 bit when performing architecture validation. For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.
-7313	Advanced UI projects do not have support for .appx packages.	If you open a Suite/Advanced UI project that includes an .appx package in the Professional edition of InstallShield, it is opened as an Advanced UI project, and it displays this build error at build time. Advanced UI projects do not have support for .appx packages. To resolve this build error, remove the .appx package from your project, or use the Premier edition of InstallShield to edit the project and build releases.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7312	The certificate file '%1' is selected for package '%2', but it is not included with this package's files. Either delete the file from the Certificate File setting, or add the file to the .appx package.	The versions of Windows that support .appx packages do not install a sideloading package unless they trust the source of the package. If you are using a custom certificate, such as the one that is generated in Visual Studio, the Suite/Advanced UI installation can make Windows trust the source of your package by adding the custom certificate to the certificate store of target systems. The Suite/Advanced UI installation does this if you include the .cer file in your sideloading package, and specify it in the Certificate File setting for the .appx package in the Packages view. If you specify a .cer file but do not include the file in your project, you may encounter this build warning at build time. To add the .cer file, find the .appx package in the Packages view, and expand its node in the view. Select the Packages Files node, and right-click the right-pane, and then click Add. InstallShield lets you browse to select the file that you want to add.
-7311	Unable to load manifest file for sideloading app package '%1'.	This build error occurs if you are trying to build a Suite/Advanced UI installation that includes a sideloading app package (.appx) but InstallShield cannot read the app package's manifest file. This may occur if you are trying to build on a Windows XP or Windows Server 2003 system. The ability to create and build a Suite/Advanced UI installation that includes a sideloading app package (.appx) requires Windows Vista or later or Windows Server 2008 or later on the machine that has InstallShield or the Standalone Build. To resolve this error, remove the .appx package from the Packages view, or build your release on Windows Vista or later or on Windows Server 2008 or later.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7309	No certificate file is selected in the Packages view for sideloading app '%1'.	If you include a sideloading app package (.appx) in a Suite/Advanced UI project but do not specify a certificate file for the package in the Certificate File setting in the Packages view, InstallShield generates this warning at build time. The versions of Windows that support .appx packages do not install a sideloading package unless they trust the source of the package. If you are using a custom certificate, such as the one that is generated in Visual Studio, the Suite/Advanced UI installation can make Windows trust the source of your package by adding the custom certificate to the certificate store of target systems. The Suite/Advanced UI installation does this if you include the .cer file in your sideloading package, and specify it in the Certificate File setting in the Packages view. To resolve this warning, consider using the Certificate File setting in the Packages view to specify the package's .cer file.
-7308	Suite/Advanced UI installations do not support sideloading app packages (.appx) that are built for only ARM processors.	This error occurs if you include an .appx package that targets the ARM processor architecture in a Suite/Advanced project. InstallShield does not have support for including that type of package in an installation. To resolve this error, use the Packages view remove the package that is listed in the error message from your project, and consider replacing it with a package that targets x86 or x64 systems, or that is neutral.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7295	Advanced UI projects do not have support for .exe primary packages.	InstallShield lets you add .exe packages as a primary package to a Suite/Advanced UI project, which is available in the Premier edition of InstallShield; however, InstallShield does not let you add .exe packages as primary packages to an Advanced UI project, which is available in the Professional edition of InstallShield. If you use the Professional edition of InstallShield to open a project that was created in the Premier edition, and if the project contains an .exe package as a primary package, this build error occurs. To resolve this build error, either use the Premier edition of InstallShield to build the release, or use the Packages view to remove the .exe package from the project. For more information about the differences between Advanced UI and Suite/Advanced UI projects, see Advanced UI Projects vs. Suite/Advanced UI Projects.
-7294	An Advanced UI project can include only one language.	A Suite/Advanced UI project, which is available in the Premier edition of InstallShield, includes support for multiple languages; however, an Advanced UI project, which is available in the Professional edition of InstallShield, includes support for only one. If you use the Professional edition of InstallShield to open a project that was created in the Premier edition, and if the project contains more than one language, this build error occurs. To resolve this build error, either use the Premier edition of InstallShield to build the release, or remove all but one language from the Setup Languages setting in the General Information view of the project. You may also need to remove all but one language from the UI Languages setting on the Build tab in the Releases view. For more information about the differences between Advanced UI and Suite/Advanced UI projects, see Advanced UI Projects vs. Suite/Advanced UI Projects.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7293	An Advanced UI project can include only one primary package.	A Suite/Advanced UI project, which is available in the Premier edition of InstallShield, includes support for multiple primary packages; however, an Advanced UI project, which is available in the Professional edition of InstallShield, includes support for only one. If you use the Professional edition of InstallShield to open a project that was created in the Premier edition, and if the project contains more than one primary package, this build error occurs. To resolve this build error, either use the Premier edition of InstallShield to build the release, or remove all but one primary package from the Packages view of the project. For more information about the differences between Advanced UI and Suite/Advanced UI projects, see Advanced UI Projects vs. Suite/Advanced UI Projects.
-7292	An update URL is set but this release is not configured to be digitally signed.	This build warning occurs if a URL is specified in the Update URL setting on the Setup.exe tab in the Releases view of the Advanced UI or Suite/Advanced UI project, but the release is not configured to be digitally signed. To resolve this warning, specify digital signature information on the Signing tab for the release in the Releases view. To learn more about updates, see Adding Support for Automatic Updates to an Advanced UI or Suite/Advanced UI Installation.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7291	An update URL is set but the project contains packages with files located on the source media.	This warning occurs if a URL is specified in the Update URL setting on the Setup.exe tab in the Releases view of the Advanced UI or Suite/Advanced UI project, but one or more packages in the Advanced UI or Suite/Advanced UI project is configured to be stored on the source media. If you are building a base Advanced UI or Suite/Advanced UI setup launcher, you can ignore this warning. If you are building the update Advanced UI or Suite/Advanced UI setup launcher that will be downloaded and launched when an earlier base setup launcher is run on a target system, change the run-time location of the packages in your project to either extracted from the setup launcher or downloaded from the Web. The update setup launcher cannot rely on packages that are stored on the source media. For more information, see Specifying a Run-Time Location for a Specific Package in an Advanced UI or Suite/Advanced UI Project. To learn more, see Adding Support for Automatic Updates to an Advanced UI or Suite/Advanced UI Installation.
-7277	InstallShield does not support using .pfx files to sign media header files (.hdr files).	InstallShield does not support using .pfx files to sign media header files (.hdr files), which are used for the One-Click Install type of installation for InstallScript projects. To resolve this build warning, consider one of the following alternatives for this type of installation: • Use .spc and .pvk files instead of a .pfx file for your digital signature. • Build a compressed installation, which would enable you to sign with a .pfx file. To learn more about digital signing, see Digital Signing and Security.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7256	To digitally sign a software identification tag file, .NET Framework 3.5 must be installed.	If your project is configured to include a software identification tag and if the release that you are building is configured to use a .pfx file to digitally sign your release, InstallShield attempts to digitally sign the tag that it creates at build time. If your build machine does not have .NET Framework 3.5, this build warning is displayed. To resolve this build warning, install .NET Framework 3.5 on your build machine.
-7255	Only .pfx files can be used to digitally sign a software identification tag file.	If your project is configured to include a software identification tag and if the release that you are building is configured to use an .spc file and a .pvk file to digitally sign your release, InstallShield generates this build warning. To resolve this build warning, switch from an .spc file and a .pvk file to a .pfx file. If you do not need to have a digitally signed tag, you can ignore this warning.
-7246	Package "%1" has an MSI Package condition in which an asterisk (*) is used as a placeholder for one of the condition's settings. InstallShield cannot substitute this placeholder because the appropriate .msi package could not be found.	In order for InstallShield to replace an asterisk in a condition with the appropriate information (such as the product code or product version) from a package in an Advanced UI or Suite/Advanced UI project, the package must be available at build time. To resolve this error, ensure that the package file is in the source location. If dynamic file linking is used for the package, ensure that the dynamic link filters are not excluding the package file from the build.
-7244	The project does not contain any primary packages. You may need to add a package, or select Primary in the Package Type setting for a package in the Packages view.	This error occurs if your Advanced UI or Suite/Advanced UI project does not contain any packages that are configured to be the primary package. To resolve this error if your project does not contain any packages, use the Packages view to add a package to your project. For more information, see Guidelines for Adding Packages to an Advanced UI or Suite/Advanced UI Project. If you already have a dependency package in your project and you want to make it a primary package, use the Package Type setting in the Packages view. To learn more, see Primary Packages vs. Dependency Packages in Advanced UI and Suite/Advanced UI Projects.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7243	The Detection Condition setting for package '%1' in the Packages view is empty. This type of condition evaluates whether the package is already installed on target systems.	The Detection Condition setting cannot be empty for an .exe type of package in an Advanced UI or Suite/Advanced UI project. For more information, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects.
-7240	Package '%1' is not associated with any features.	Each package that is included in the Packages view of an Advanced UI or Suite/Advanced UI project should be associated with one or more features. Otherwise, the package are not included in any releases that you build. For more information, see Associating a Package in an Advanced UI or Suite/Advanced UI Project with a Feature.
-7239	The target file '%1' that was selected for an operation's Target setting in the Packages view for package '%2' was not found in the project.	This error occurs if the target file for one of the packages in the Advanced UI or Suite/Advanced UI installation is missing at build time. To resolve this error, ensure that the target file is in the source location. If dynamic file linking is used for the package, ensure that the dynamic link filters are not excluding the target file from the build.
-7236	InstallShield could not create the software identification tag because the value for the %1 setting in the General Information view is invalid. Ensure that it does not contain any of the following characters: \ / : * ? " < > |	InstallShield uses the values that you enter for the Unique ID and Tag Creator ID settings as part of the name of the tag file (*TagCreatorID_UniqueID*.swidtag). Therefore, the ID that you enter must not contain any characters that are invalid for file names. To resolve this issue, enter a valid value in the setting that is mentioned in the warning message. For more information, see Including a Software Identification Tag for Your Product.
-7235	InstallShield could not create the software identification tag because the %1 setting in the General Information view is empty.	Creation of a software identification tag requires that several settings in the General Information view have values. To resolve this warning, enter the appropriate value in the setting that is mentioned in the warning message, or select No for the Use Software Identification Tag setting. For more information, see Including a Software Identification Tag for Your Product.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7234	InstallShield could not create the software identification tag because the template file `Swidtag.xml` could not be opened.	InstallShield uses the `Swidtag.xml` file, which is installed to one of the following locations, to build tag files: *`InstallShield Program Files folder`*`\Support\0409` *`InstallShield Program Files folder`*`\Support\0411` To resolve this issue, ensure that the `Swidtag.xml` file is present and not locked. For more information, see Including a Software Identification Tag for Your Product.
-7233	An invalid URL (%2) is specified in the Packages view for package %1.	This build error occurs if you selected Download From The Web for a package in the Packages view of an Advanced UI or Suite/Advanced UI project, but the URL setting under the Location setting is blank, or it contains an invalid URL. To resolve this error, enter a URL that starts with one of the following strings: • http:// • https:// • ftp://
-7225	The project does not contain any packages.	This build error occurs if try to build an Advanced UI or Suite/Advanced UI project that does not contain any packages. To resolve this error, use the Packages view to add a package to your project. For more information, see Guidelines for Adding Packages to an Advanced UI or Suite/Advanced UI Project.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7223	A Mode condition or a Detection condition is required for the Setup.exe to run correctly.	This build error occurs if your Advanced UI or Suite/Advanced UI project includes an .exe package but you have not configured the appropriate conditions for it yet. For information on adding detection conditions to a package in a project, see the following: • Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects • Guidelines for Defining Conditions in an Advanced UI or Suite/Advanced UI Project For information on how mode conditions are created, see Triggering Install Mode or Maintenance Mode of an Advanced UI or Suite/Advanced UI Installation.
-7222	No supported languages included in the media. You must select at least one supported language for the media.	This error occurs only when no supported language is selected in the media. To resolve this issue, ensure that at least one language is selected for the Language(s) setting in the Releases view.
-7220	InstallShield encountered an error while including a DIM reference.	This error occurs if your project includes a DIM reference, as shown in the DIM References view, but InstallShield cannot find the DIM project file (.dim). This might occur if the .dim file was moved to a different location or it was renamed, but the path or file name in the installation project that contains the DIM references has not been updated.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7218	Conflicts were detected building DIMs. In Table %1 Row %2, data files differ in the following columns: %3.	This warning occurs if InstallShield encounters a data conflict between the installation project that is open and one of its DIM references. In this warning message, %1 indicates the name of the table that contains the conflict, and %2 indicates the applicable row; %3 is in the following format: **ColumnName ("InstallationUnitValue" <> "InstallationProjectValue")** The table data for the DIM reference is available in the Direct Editor view of the DIM project. The table data for the installation is available in the Direct Editor view of the installation project. If a data conflict occurs, InstallShield uses either the installation project data or the DIM data; it depends on which value is selected in the Conflict Resolution setting on the Build Options tab in the DIM References view: • **Use Base Project Value**— If this value is selected, InstallShield uses the value that is in the installation project instead of the value that is in the DIM project. • **Use DIM Project Value**—If this value is selected, InstallShield uses the value that is in the DIM project instead of the value that is in the installation project. If the appropriate value is being used, you can ignore this warning message. If you want to use the value that is being overridden, you can either revise the value in that project, or change the value of the Conflict Resolution setting. Note, however, that if other conflicts occur for this DIM reference, changing the value of the Conflict Resolution setting may also change the resulting built values for those other conflicts. For more information, see Resolving Build-Time Conflicts Between a Basic MSI Project and a DIM Reference.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7216	This project includes InstallScript objects that are deprecated. These objects should be removed from the project. A prerequisite should be used instead where possible.	InstallScript objects have been deprecated in favor of InstallShield prerequisites. The recommended alternative for InstallScript objects is InstallShield prerequisites. You can use the InstallShield Prerequisite Editor to create your own InstallShield prerequisites. You can share these InstallShield prerequisites among InstallScript, InstallScript MSI, and Basic MSI projects. To learn more, see: • Defining InstallShield Prerequisites • Adding InstallShield Prerequisites, Merge Modules, and Objects to InstallScript Projects
-7215	Skipping build events. Build events are supported only in the Premier edition of InstallShield.	InstallShield lets you specify commands that you want to be run at various stages of the build process. This build event functionality is available in the Premier edition of InstallShield. For more information, see Specifying Commands that Run Before, During, and After Builds. If you try to use the Professional edition of InstallShield to build a release that includes build events, InstallShield ignores the build event settings and generates this warning. To resolve this warning, use the Premier edition of InstallShield to build the release.
-7214	Error loading table %1.	This error occurs if the table that is mentioned in the error message is missing from your project, or it is missing columns. To resolve this error, open the Direct Editor view, and look for the table that is mentioned in the error message. If it exists, compare the columns in the table with those in a new project, and add any missing tables. If the table does not exist, you can export it from a new project as an .idt file, and then import the .idt file into your existing project. For more information, see: • Exporting Tables from the Direct Editor • Importing Tables with the Direct Editor

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7211	Building a compressed Network Image Setup.exe. All other build types are not allowed in the evaluation mode of InstallShield.	If you are using InstallShield in evaluation mode (that is, you have not activated it), you can build compressed `Setup.exe` files, but no other release types. If you are creating a Windows Installer–based release, the .msi database is always embedded in the `Setup.exe` file. If you try to build an uncompressed release in evaluation mode, the uncompressed option is ignored, and InstallShield displays this build warning. Once you have activated InstallShield, the evaluation-mode limitations are removed.
-7209	The current Windows Installer package name includes Unicode characters that may cause a run-time error if a compressed Network Image Setup.exe is built.	This build warning occurs if the following conditions are true: • For the name of the .msi package, you include Unicode characters that are not supported by your build machine's ANSI code page. • You include a setup launcher (`Setup.exe` file) with your release. This warning occurs to inform you that when the Windows Installer package is extracted from `Setup.exe` to a temporary location on the target system, run-time error 1152 may occur. To resolve this warning, change the name of the .msi package so that it does not contain Unicode characters that are not supported by your machine's ANSI code page. To do so, you can use the MSI Package File Name setting on the General tab for a product configuration in the Releases view.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7208	The current location for this package includes Unicode characters that may cause a run-time error when Windows Installer tries to extract its .cab files.	This warning occurs if the following conditions are true: • The path for the release that InstallShield is building contains Unicode characters that are not supported by your build machine's ANSI code page. • You configure the release so that your product's program files are compressed into .cab files. You can ignore this warning if end users will launch your release from a location whose path does not contain Unicode characters that are not supported by your build machine's ANSI code page. If end users try to launch your installation from a path that contains Unicode characters that are not supported by the target system's ANSI code page, run-time error 1311 occurs when Windows Installer tries to extract the .cab files.
-7207	A package cannot contain both the MsiLockPermissionsEx and LockPermissions tables.	An installation should not contain both the **MsiLockPermissionsEx** table and the **LockPermissions** table. If you use the Permissions setting for a service, and the settings under it, you are configuring the **MsiLockPermissionsEx** table of the package. If Traditional Windows Installer handling is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the **LockPermissions** table of the package. For more information, see Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7201	The language '%1' is missing from this project but included in this release.	This build warning occurs if a language is selected in the UI Languages setting on the Build tab in the Releases view, but it is not also selected in the Setup Languages setting in the General Information view. This build warning is alerting you that the release will not include the specified run-time language. If you do not want to include the specified run-time language in your release, you can ignore this warning. If you do want to include the specified run-time language in your release, add the language to the Setup Languages setting.
-7187	The Find What setting for the %1 text replacement is not configured. This text replacement will not be performed.	You have added a replacement item to a replacement set in the Text File Changes view; however, the value for the Find What setting is blank. This setting must have a value; otherwise, the text file changes are not made at run time. For more information, see Specifying Search-and-Replace Criteria for a Text File Change.
-7186	The Include Files setting for the %1 text replacement set is not configured. None of the text replacements associated with this text replacement set will be performed.	You have added a replacement set in the Text File Changes view; however, the value for the Include Files setting is blank. This setting must have a value; otherwise, the text file changes are not made at run time. For more information, see Creating a Text File Reference.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7185	The %1 translation for string identifier %2 includes characters that are not available on code page %3.	This error occurs if both of the following conditions are true: • The string identifier value that you entered for the specified language contains characters that are not available in that language's code page. • You are building a language-specific (ANSI) database. To resolve this error, consider using the String Editor view to edit the value of the string identifier so that it uses characters from the appropriate code page. If you must use characters that are not available in the target language's code page, consider selecting Yes for the Build UTF-8 Database setting. Note, however, that this may result in user interface issues in some scenarios because the Windows Installer does not fully support UTF-8 databases. For more information, see the description of the Build UTF-8 Database setting.
-7184	The %1 column of the %2 table includes characters that are not available on code page %3: "%4"	This error occurs if both of the following conditions are true: • A table in the source project database contains characters that are not available in the code page for one or more target languages. • You are building a language-specific (ANSI) database. To resolve this error, consider changing the data that is described in the error message so that it uses characters from the appropriate code page. For example, if the error message mentions the **Shortcut** table, consider changing the string in the Shortcuts view. If you must use characters that are not available in the target language's code page, consider selecting Yes for the Build UTF-8 Database setting. Note, however, that this may result in user interface issues in some scenarios because the Windows Installer does not fully support UTF-8 databases. For more information, see the description of the Build UTF-8 Database setting.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7174	"%1" contains a reference to a string table entry '%2' that is not included in the project's string table.	In this warning message, %1 indicates the fully qualified path to an InstallScript file (.rul) in the project, and %2 indicates the string ID that is used in that .rul file but is not listed as one of the project's string entries. InstallShield displays this warning at build time for each string identifier that is found in the project's InstallScript file but not in the String Editor view. To see the line in the InstallScript code that has the string identifier, double-click the warning message that is displayed on the Tasks tab of the Output window at build time. The string identifier is preceded by the string constant operator (@). To resolve this build issue, ensure that the string identifier is defined in the String Editor view. In addition, ensure that the spelling of the string identifier in the InstallScript code matches that in the String Editor view.
-7143	Component %1 installs to a 64-bit folder but is not marked as a 64-bit component. This may result in an incorrect installation path for this component's files.	If a component is not configured to be 64 bit, Windows Installer may not install the component's files to the appropriate 64-bit location. To specify that a component is 64 bit, select Yes for the component's 64-Bit Component setting. For more information about the 64-Bit Component setting, as well as additional component settings, see Component Settings.
-7138	The Msi Command Line of the release currently being built contains REINSTALLMODE. The parameter appears to have the 'a' option which will force all files to be reinstalled, regardless of checksum or version.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7137	The %1 file that you selected for the Help File Path setting in the Custom Actions view for the %2 custom action does not contain any text.	Create a file that describes the intended behavior of the custom action that is mentioned in the warning. The file should be a text-based file such as a .txt, .htm, or .rtf file. Then in the Custom Actions and Sequences view (or the Custom Actions view), select the custom action and select the file that you created for the Help File Path setting. To learn more, see Documenting the Behavior of Custom Actions.
-7135	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-7128	Error embedding setup.exe.manifest.	This error occurs if there is a problem embedding the application manifest in the `Setup.exe` launcher. The application manifest specifies the minimum privilege level required by your installation's `Setup.exe` file for running the installation (the setup launcher, any InstallShield prerequisites, and the .msi file) on Windows Vista and later platforms. This error may occur if the template manifest file is missing from the InstallShield `Support` folder. It also may occur if the `Setup.exe` template is missing from the InstallShield `Redist\Language Independent\i386` folder. To resolve this error, try running a repair of InstallShield.
-7125	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-7124	Could not invoke MSBuild. Make sure that the .NET Framework %1 is installed at '%2' on the system. If you are running InstallShield from within Visual Studio, you must use Visual Studio 2005 or later.	If you use MSBuild to build Visual Studio solutions with InstallShield projects, you must have .NET Framework 3.5 or later on your machine. In addition, you must be using Visual Studio 2005 or later.
-7123	Internal build error	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7122	Error writing information to the source file for %1. Verify that the file is writeable, and\or that the file ISTemplate.manifest is not read only.	Check the Knowledge Base for information about this error, or request technical support.
-7121	The manifest file %1 does not contain COM information in at least one file element. Please ensure that all COM modules associated with the manifest are self-registering and verify that the self-registration process does not fail for each COM module.	Check the Knowledge Base for information about this error, or request technical support.
-7120	Error building table %1	Check the Knowledge Base for information about this error, or request technical support.
-7119	Could not locate a key file for component %1. Advertised shortcut %2 points to the key file of this component.	Check the Knowledge Base for information about this error, or request technical support.
-7118	The InstallScript Custom Action %1 cannot be sequenced in InstallUISequence for an InstallScript MSI project.	The User Interface sequence does not run in InstallScript MSI installations; the event-driven InstallScript code handles the user interface. To resolve this issue, do one of the following: • Schedule the InstallScript custom action for the Execute sequence. • Use InstallScript event–driven code instead of an InstallScript custom action.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7117	Custom Action %1 called from Standard dll and stored in Binary table cannot have deferred/ rollback/commit execution.	This error occurs if you try to call a deferred-, rollback-, or commit-execution custom action using a standard .dll. When you call a non-Windows Installer .dll (that is, one that does not have the MyFunc(MSIHANDLE) entry point), InstallShield does the following: • InstallShield creates a wrapper .dll with the standard Windows Installer entry point. • InstallShield stores your .dll plus the InstallShield wrapper .dll in the **Binary** table. When the custom action is called, Windows Installer calls the InstallShield wrapper .dll. This, in turn, extracts your .dll from the **Binary** table and calls the function that you specified. However, the InstallShield wrapper .dll does not have access to the **Binary** table during deferred, rollback, or commit custom actions, and thus it cannot extract and call into your .dll. To resolve this error, try one of the following options: • Create a new .dll that has a standard Windows Installer entry point and call it directly. • Use InstallScript code to do perform the same functionality if you do not want to write your own .dll. • Schedule your custom action to run in immediate mode instead of deferred, rollback, or commit mode.
-7116	Custom Action DLL %1 not found in release.	Check the Knowledge Base for information about this error, or request technical support.
-7113	Language support for %1 is not included in this edition.	This error appears if you try to enable too many languages in a project, building with more than two in a non-Premier edition. The build is successful (unless stop at first error is enabled), but the extra languages are not built. The first two qualified languages are built. %1 is replaced with the name of the language that is not included in this release. To resolve this error, use the Premier edition of InstallShield to build your release.
-7108	%s is too large to store in a CAB (2GB maximum).	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7107	The merge module %1 silently fails to install from a compressed build. Applying compression post-build may work properly.	Check the Knowledge Base for information about this error, or request technical support.
-7104	The destination of component %1 is the GlobalAssemblyCache. The component must contain a key file.	Check the Knowledge Base for information about this error, or request technical support.
-7101	This component %1 is shared between multiple features, which can create problems for features that are going to use MSI's Install On Demand technology.	Check the Knowledge Base for information about this error, or request technical support.
-7098	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-7097	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-7096	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-7095	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-7092	Missing binary entry ISSetup.dll	This error occurs if you build a project that includes an InstallScript custom action, but the InstallScript engine (`ISSetup.dll`) has been removed from the **Binary** table. To resolve this error, manually add a new entry called `ISSetup.dll` to the **Binary** table and browse to the following DLL: *`InstallShield Program Files Folder`*`\Redist\Language Independent\i386\ISSetup.dll`
-7088	Failed to load %1. This file needs to be loaded in order to build the associated custom object.	Verify that the file, %1, is in the System subfolder within the InstallShield Program Files folder.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7087	Custom objects cannot be included with your installation media due to an error creating the Windows Installer Object. In order to include custom objects, Windows Installer needs to be installed on the build system.	Verify that Windows Installer is installed properly on the build system.
-7086	The device driver installation framework is not currently available. The device driver feature will not be fully functional until an update has been provided. Please contact technical support for more details.	This error occurs when you build a release for a project in which you used the Device Driver Wizard to include a device driver package with your installation. The redistributable needed to install the device driver will be available in an update to InstallShield. Instructions for obtaining the update will be posted in an article for this build error in the Knowledge Base when the redistributable is available. To resolve the build error before you receive the redistributable, you can remove the device driver component in the Components view and then rebuild the release.
-7084	The VBScript Custom Action %1 does not point to a valid VBS file.	This warning message is displayed if you add a VBScript custom action to your installation but the file specified for the custom action is not a VBScript file. To resolve this error, select the appropriate type of file for the specified custom action in the Custom Actions and Sequences view (or the Custom Actions view).
-7083	Script '%s' is not associated with any connection.	Check the Knowledge Base for information about this error, or request technical support.
-7082	An error occurred while generating your Sql Script.	Check the Knowledge Base for information about this error, or request technical support.
-7080	An error occurred while testing the component to see if the device driver package scan at build property is set.	Check the Knowledge Base for information about this error, or request technical support.
-7079	An error occurred while getting the path to the device driver package.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7078	Unable to scan device driver package %1. The file is missing.	Check the Knowledge Base for information about this error, or request technical support.
-7077	An error occurred while scanning a device driver package.	Check the Knowledge Base for information about this error, or request technical support.
-7065	The MSI 3.1 Engine could not be found. You can download this using the Redistributable Downloader under the Tools menu, if it has been made available by Microsoft. We have included the 3.0 Engine in your built installation.	This message is displayed as a build error if version 3.1 of the Windows Installer engine was selected to be included but it was not found on the build machine. This message is displayed as a build warning if the version 3.1 or 2.0 best-fit option was selected but version 3.1 of the Windows Installer engine was not found on the build machine.
-7064	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-7063	The File %1 in Component %2 is being installed to the Windows Fonts folder, but there is no corresponding record in the Font table. The Font will not be registered properly on the target system.	To resolve this warning, open the Files and Folders view and remove the font mentioned in the message. Then re-add the font to the Fonts folder; InstallShield adds the corresponding record to the Font table automatically.
-7062	Refreshing the COM+ settings from the client machine. An error occurred while refreshing the COM+ settings from the client machine.	This build error occurs when an exception error has occurred with a COM+ application that is selected in the Component Services view. An option is provided to refresh the COM+ settings during the build process, and build error -7062 occurs when this option is selected and the refreshing process has failed. To resolve this error, you can open the Component Services view, select the COM+ application, and clear the Refresh the COM+ settings from the client machine at build check box on the Installation tab.
-7061	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7060	Due to licensing requirements, InstallShield requires that you provide the MSI 3.0 engine redistributable from the MSI 3.0 Beta. Please copy instmsi.exe from the MSI 3.0 Beta folder to \redist\Language Independent\i386\MSI3.0\instmsiw.exe.	Check the Knowledge Base for information about this error, or request technical support.
-7059	Unable to update the latest patch version property. As a result, future patches built from this project may not be sequenced properly. Make sure the project is not marked as read-only.	Check the Knowledge Base for information about this error, or request technical support.
-7058	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-7036	An error occurred while loading the primary application assembly.	Check the Knowledge Base for information about this error, or request technical support.
-7025	The COM+ component server file '%1' cannot be found on your system. The component '%2' will not be installed on the target system. You will need to install the component manually after your COM+ application is installed.	%1 refers to the COM+ DLL that is missing, and %2 refers to the ProgID. To resolve this warning, add the DLL to your system in the appropriate location, or remove the COM+ component from your project.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7024	To include J# in the build you must also include .NET.	J# requires the .NET Framework Redistributable Package, but it is not included in the installation. If you are sure that your end users already have the .NET Framework on their systems, you can ignore this warning message. However, if there is a chance that they will not have the .NET Framework, add it to your installation. If the .NET Framework is not on their systems, they might have trouble installing J# as part of your installation. For more information, see Adding .NET Framework Redistributables to Projects.
-7023	Internal build error.	This error occurs if a merge module such as MFC 7.1 is not configured correctly or it is corrupted. If you have more than one merge module in your project but you do not know which one is causing the error, you need to first identify the problematic merge module. You can do this by removing a merge module from your project and then building your release. If the error recurs, you have identified the problematic merge module. If not, remove a different merge module and then build. Once you have identified the merge module causing the error, try reinstalling it. If that does not resolve the error, contact the author to obtain the latest version.
-7015	Error copying setup.inx to media folder. Unexpected error.	This error occurs if Setup.inx, the compiled script file, cannot be copied to the Media folder located in the `\Media\\Disk Images\Disk 1` folder. This can occur if you are out of disk space or the file is locked.
-7014	Error copying setup.inx to media folder. Script is read-only.	This error occurs if Setup.inx, the compiled script file, is marked as read-only. To resolve this error, find the Setup.inx file, which is usually in the `\Media\\Disk Images\Disk 1` folder. Right-click this file and select Properties. Then clear the Read-only check box.
-7012	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-7011	%1 must have a strong name to be installed to the GlobalAssemblyCache.	You can install an assembly to the Global Assembly Cache only if it has a strong name. A strong name contains the assembly's simple text name, version number, culture information (if available), a public key, and a digital signature. Using strong-named assemblies in the Global Assembly Cache enables you to have multiple versions of an assembly with the same name but with different versions of .dll files. The assemblies stored in the Global Assembly Cache can be shared by different applications on a computer. To resolve this error message, you have two options. • Change the target destination for the assembly to a location other than the Global Assembly Cache if sharing that assembly with other applications is not explicitly required. Note that it is not necessary to install assemblies into the Global Assembly Cache to make them accessible to COM interop. • Select an assembly that has a strong name for installation to the Global Assembly Cache. Note that once an assembly is created, you cannot sign it with a strong name. You can sign an assembly with a strong name only when you create it.
-7001	During the last build, the .msi file was only partially built. In order to stream the script into the .msi file, you must have a complete .msi file. Build a complete .msi file by selecting "Build <ReleaseName>" from the Build menu.	When you cancel the build, a partially built .msi file exists. If you attempt to compile script into the partial .msi file, this error occurs. Select "Build <ReleaseName>" from the Build menu to build a complete .msi file.
-6654	The file %1 is not the key file of component %2. If you call a function in a standard DLL that is installed with the product and the action is scheduled as deferred, the DLL you are calling must be the component's key file.	Set the called DLL as the component's key file.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6653	The feature %1 in the installation contains more than 1600 components. There is a maximum limit of 1600 components per feature.	For more information, see ICE47 and FeatureComponents Table.
-6652	Could not create _isconfig.xml for use with InstallUtilLib.dll.	Check the Knowledge Base for information about this error, or request technical support.
-6651	The setup you are building contains more than 32,767 files. Automatically switching setup package to appropriate MSI schema.	This warning appears if your installation package contains more than 32,767 files. InstallShield automatically applies the large package schema. ***Caution*** • *There is an issue with patching if your package uses the large package schema. When you build the patch, the following error is triggered: "Can't Generate Primary Transform."*
-6647	Cannot move file from %1 to %2.	Check the Knowledge Base for information about this error, or request technical support.
-6646	The %1 property in the merge module %2 is set to NULL. This property cannot be NULL.	Check the Knowledge Base for information about this error, or request technical support.
-6645	%1 failed to load. Error: %2 Error Description: %3	Check the Knowledge Base for information about this error, or request technical support.
-6641	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6640	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6639	The merge module %1 requires one of the following merge modules also to be included in the setup: %2.	Check the Knowledge Base for information about this error, or request technical support.
-6638	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6637	Invalid registry data for component NewComponent1 while importing "*C:\RegTest\SingleSlash*\"=*dword:2* (where the information in italics represents the invalid data).	The invalid data in this example is the use of a single backslash instead of two backslashes. Another example would be an entry with *DWORD* in it instead of *dword*.
-6636	The file key %1 and %2 are found in the File table. Despite having different cases, the identical key names will cause an unexpected result when the files are installed on the target system. This occurs because the compressed files in the cabinet file are named using the file keys. To correct this issue, change one of the file keys to be unique in the cabinet file if you are building a compressed setup or a merge module. You can change the file key name in the Direct Editor view.	Check the Knowledge Base for information about this error, or request technical support.
-6635	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6634	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6633	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6632	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6631	InstallScript MSI projects do not have Multiple Instance support.	Check the Knowledge Base for information about this error, or request technical support.
-6630	The property InstanceId does not appear in the Property table.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6629	The value for the property InstanceId is not numeric.	Check the Knowledge Base for information about this error, or request technical support.
-6628	The value for the property InstanceId is duplicated with a value in the ISProductConfigurationInstance table.	Check the Knowledge Base for information about this error, or request technical support.
-6627	Component %1 has nonfile data but does not have InstanceId in its condition.	Check the Knowledge Base for information about this error, or request technical support.
-6626	Could not add instance transform %1 to substorage.	Check the Knowledge Base for information about this error, or request technical support.
-6625	Could not create instance transform %1.	Check the Knowledge Base for information about this error, or request technical support.
-6624	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6623	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6622	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6620	Could not open the reference package %1 for key synchronization.	Check the Knowledge Base for information about this error, or request technical support.
-6619	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6618	An error occurred while setting the key paths for dynamically created components.	Check the Knowledge Base for information about this error, or request technical support.
-6617	An Error occurred while adding the file '%1' to the synchronization maps.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6616	An error occurred while setting the key path for component %1.	Check the Knowledge Base for information about this error, or request technical support.
-6615	Could not update File.FileName for File %1.	Check the Knowledge Base for information about this error, or request technical support.
-6614	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6613	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6612	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6611	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6610	An error occurred determining if the dynamically linked file %1 is a modified file.	Check the Knowledge Base for information about this error, or request technical support.
-6609	An error occurred determining if the dynamically linked file %1 is a new file.	Check the Knowledge Base for information about this error, or request technical support.
-6608	Your splash screen will not be displayed during the installation because %1 is a compressed bitmap file. To display a splash screen, you must specify a uncompressed bitmap file.	Check the Knowledge Base for information about this error, or request technical support.
-6607	Your splash screen will not be displayed during the installation because %1 is not a bitmap file. To display a splash screen, you must specify a valid bitmap file.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6606	This setup has the same package code as the setup specified by minor upgrade item '%1'. The package codes must be unique.	Check the Knowledge Base for information about this error, or request technical support.
-6605	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6604	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6603	An error occurred while attempting to open the upgraded image %1.	Check the Knowledge Base for information about this error, or request technical support.
-6602	An error occurred while attempting to close the upgraded image %1.	Check the Knowledge Base for information about this error, or request technical support.
-6601	An error occurred while attempting to set the property %1 in the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.
-6600	An error occurred while attempting to retrieve the property %1 from the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.
-6599	An error occurred while creating the standard QuickPatch actions to the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.
-6598	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6597	An error occurred while attempting add ISQuickPatchHelper.dll to the binary table in the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6596	An error occurred while attempting to sequence the action %1 in the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.
-6595	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6594	An error occurred while attempting to determine the sequence number for the base action %1 in the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.
-6593	An error occurred while initializing file class wrapper for %1.	Check the Knowledge Base for information about this error, or request technical support.
-6592	An error occurred while attempting to determine how to process the file %1.	Check the Knowledge Base for information about this error, or request technical support.
-6591	An error occurred while attempting to make the settings required to patch the file %1.	Check the Knowledge Base for information about this error, or request technical support.
-6590	An error occurred while attempting to create the RemoveFile table entry for %1.	Check the Knowledge Base for information about this error, or request technical support.
-6589	An error occurred while attempting to attach the component '%1' to its designated features.	Check the Knowledge Base for information about this error, or request technical support.
-6588	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6587	An error occurred while generating a formatted file name for %1.	Check the Knowledge Base for information about this error, or request technical support.

-6572	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6571	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6570	An error occurred while writing the property '%1' to the patch configuration properties file.	Check the Knowledge Base for information about this error, or request technical support.
-6569	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6568	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6567	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6566	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6565	An error occurred while writing the image family '%1' to the patch configuration properties file.	Check the Knowledge Base for information about this error, or request technical support.
-6564	An error occurred while deleting the target image '%1' from the patch configuration properties file.	Check the Knowledge Base for information about this error, or request technical support.
-6563	An error occurred while writing the target image '%1' to the patch configuration properties file.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6562	An error occurred while writing the upgraded image %1 to the patch configuration properties file.	Check the Knowledge Base for information about this error, or request technical support.
-6561	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6560	The stored package code of %1, does not match %2 which is in the referenced package %3. Modifying a referenced MSI package of a Quick Patch, invalidates all Quick Patches that reference that MSI package.	Check the Knowledge Base for information about this error, or request technical support.
-6558	The Custom Action %1 in the InstallExecuteSequence table is run from an installed file. To run the custom action successfully, you may need to have a condition that checks if the source file is installed locally.	To successfully run a custom action that is run from an installed file, you must ensure that the file is installed locally using a conditional statement: • If the custom action is sequenced before RemoveFiles—Run the action only if the component was installed locally. (?ComponentName=3) • If the custom action is sequenced between RemoveFiles and InstallFiles—Run the action only if the component was installed locally. Do not run the action on an uninstallation. (?ComponentName=3) AND NOT($ComponentName=2) • If the custom action is sequenced after InstallFiles—Run the action only if the component will be installed locally. ($ComponentName=3)  ***Note*** • *The ComponentName is the component that is associated with the source file.*
-6557	Unable to find the .NET Compact Framework for the given platform/processor combination from the `InstallShield Program File Folder\Support\NetCF.ini` file.	Ensure that the .NET Compact Framework is in the correct location.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6556	Error in including .NET Compact Framework .cab files in setup.	This error might occur for the following reasons: • The .NET Compact Framework files cannot be found in the locations specified in the InstallShield `Program Files Folder\Support\.NetCR.ini` file. • The CEDefault.ico file is not in the InstallShield `Program File Folder\Program\04xx` folder. • There is an error writing to the **ISCEInstall** table.
-6555	Unable to copy `InstallShield Program File Folder\Support\CFAppMgr.ini` file to a temporary location.	Make sure that `CFAppMgr.ini` file exists at the InstallShield `Program Files Folder\Support` folder. If this file does not exist, launch the InstallShield setup in repair mode. Remove any temporary files to create more disk space on the system.
-6553	Unable to find the .NET Compact Framework .cab file for the processor.	Open the InstallShield `Program Files Folder\Support\NetCF.ini` file and configure the .NET CF selection for this processor to resolve the issue.
-6552	The file key %1 of component %2 could not be synchronized with the previous package because that file key is already in use.	Check the Knowledge Base for information about this error, or request technical support.
-6551	The Name and Value columns are blank in the registry record Registry1 of Component NewComponent1. The Windows Installer will set the (Default) value of *HKEY_LOCAL_MACHINE\New Key* #1 to an empty string. If you would like to set the (Default) value to (Value Not Set), you need to set “Install if absent, Uninstall if present” for that key in the Registry view. If the key already exists on the Target machine, the (Default) value will not be changed.	This warning appears for every registry key you add to your project and do not manually set the default key. To set the (Default) value to (Value Not Set), you need to set “Install if absent, Uninstall if present” for that key in the Registry view.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6550	%1 is not a valid .NET assembly to be installed to the Global Assembly Cache (where %1 is replaced with a full file path).	Only valid assemblies can be installed to the Global Assembly Cache. Ensure that the file selected for installation is a valid assembly.
-6549	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6548	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6547	The file '%1' already exists in the setup. Please modify the existing file instead of inserting a new one otherwise this file may not uninstall properly.	Check the Knowledge Base for information about this error, or request technical support.
-6546	An error occurred while testing the new file '%1' for potential conflicts.	Check the Knowledge Base for information about this error, or request technical support.
-6545	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6544	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6543	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6542	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6541	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6540	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6539	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6538	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6537	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6536	An error occurred opening %1.	Check the Knowledge Base for information about this error, or request technical support.
-6535	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6534	An error occurred cloning the component %1.	Check the Knowledge Base for information about this error, or request technical support.
-6533	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6532	An error occurred setting the updated component name for file %1.	Check the Knowledge Base for information about this error, or request technical support.
-6530	Error processing setup [1] for Upgrade Item [2]. This does not appear to be a valid setup.	This error occurs when a minor upgrade entry exists in the Upgrades view of InstallShield, and the previous installation specified does not exist in the location indicated. See Knowledge Base article Q108525 for resolution information.
-6529	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6528	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6528	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

-6526	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6525	The custom action %1 in the InstallExecuteSequence table is run from an installed file. It must be sequenced after the %2 action. Ensure that the custom action is sequenced properly and that the base action exists in the sequence.	This error occurs when you have authored a custom action that runs from a file that is installed during your setup. The custom action must come after the InstallFiles action in the sequence. Otherwise the file will not exist on the target system when Windows Installer runs the custom action. The only exception to this is when you run this custom action on uninstallation. In that case, the file has already been installed so the custom action does not have to occur after InstallFiles.
-6524	The Custom Action %1 in the InstallExecuteSequence table is deferred and must be sequenced between %2 and %3. Ensure that the Custom Action is sequenced properly and that the base actions exist in the sequence.	Check the Knowledge Base for information about this error, or request technical support.
-6523	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6522	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6521	An error occurred setting the required attribute on the feature %1.	Check the Knowledge Base for information about this error, or request technical support.
-6520	An error occurred deleting the COM data for component %1.	Check the Knowledge Base for information about this error, or request technical support.
-6519	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6518	An error occurred deleting the file %1 from the SelfReg table.	Check the Knowledge Base for information about this error, or request technical support.
-6517	An error occurred adding the file %1 to the SelfReg table.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6506	The Msi Command Line Attribute of the release currently being built is setting the REINSTALL or REINSTALLMODE parameter. This will cause your setup to always run in Resume mode.	Check the Knowledge Base for information about this error, or request technical support.
-6504	The Latest Image %1 does not contain any Previous Images.	Check the Knowledge Base for information about this error, or request technical support.
-6501	An error occurred building the ISDLLWrapper table. Component %1 is not found in the Component table.	Check the Knowledge Base for information about this error, or request technical support.
-6500	An error occurred building the ISDLLWrapper table. The File %1 is not found in the File table.	Check the Knowledge Base for information about this error, or request technical support.
-6499	The Shallow folder structure setting should not be used with multi-disk releases.	You can configure the Shallow Folder Structure setting on the Build tab of the Releases view. If error -6499 appears, select No for the Shallow Folder Structure setting so it will create a regular build folder structure.
-6497	Patch Creation Warning: %1.	Check the Knowledge Base for information about this error, or request technical support.
-6496	The file hash for the unversioned file '%1' does not differ from that of the previous version. This file will not be updated.	Check the Knowledge Base for information about this error, or request technical support.
-6495	The version for file '%1' only differs past the third version element. It must differ within the first three elements of the version string.	Check the Knowledge Base for information about this error, or request technical support.
-6494	The new file for file '%1' has the same version as the file that exists in the setup. This file will not be updated.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6493	The new file for file '%1' has a lower version than the file that exists in the setup. This file will not be updated.	Check the Knowledge Base for information about this error, or request technical support.
-6492	The file '%1' has no associated feature selected. This setting is required for adding new files.	Check the Knowledge Base for information about this error, or request technical support.
-6491	The new file path '%1' does not exist for file '%2'.	Check the Knowledge Base for information about this error, or request technical support.
-6490	Unable to set Just-In-Time compilation at install time because the Component %1 is configured to install to the Global Assembly Cache.	Check the Knowledge Base for information about this error, or request technical support.
-6489	Unable to set Installer Class because the Component %1 is configured to install to the Global Assembly Cache.	Check the Knowledge Base for information about this error, or request technical support.
-6487	The latest image %1 does not contain any previous images.	This error occurs if a latest image in the Patch Design view does not have at least one previous image. A latest image must have at least one previous image to create a patch.
-6486	The CAB files will not be digitally signed because the version of MSI.DLL is less than 2.0.	Check the Knowledge Base for information about this error, or request technical support.
-6485	The MsiFileHash table will not be built because the version of MSI.DLL is less than 2.0.	Check the Knowledge Base for information about this error, or request technical support.
-6584	The External File key '%1' does not exist in the Upgraded Image '%2'.	Check the Knowledge Base for information about this error, or request technical support.
-6483	The External File reference '%1' does not exist.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6482	An error occurred while verifying an External File key.	Check the Knowledge Base for information about this error, or request technical support.
-6481	The Target Image '%1' does not exist.	Check the Knowledge Base for information about this error, or request technical support.
-6480	The Upgraded Image '%1' does not exist.	Check the Knowledge Base for information about this error, or request technical support.
-6479	Unable to resolve target path for Directory Id '%1'.	Check the Knowledge Base for information about this error, or request technical support.
-6478	FON files must have a Font Title. Font %1 in component %2.	Check the Knowledge Base for information about this error, or request technical support.
-6477	An error occurred while adding the remove registry entry for the key '%1' and Value '%2'.	Check the Knowledge Base for information about this error, or request technical support.
-6476	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6475	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6474	An error occurred while processing the registry value modifications made to the project.	Check the Knowledge Base for information about this error, or request technical support.
-6473	An error occurred while preparing to delete the value '%1' from the key '%2'.	Check the Knowledge Base for information about this error, or request technical support.
-6472	An error occurred while deleting the value '%1' from key '%2' for all features.	Check the Knowledge Base for information about this error, or request technical support.
-6471	An error occurred while deleting the value '%1' from key '%2' for feature '%3'.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6470	An error occurred while processing the registry key modifications made to the project.	Check the Knowledge Base for information about this error, or request technical support.
-6469	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6468	An error occurred while making the settings to modify the registry key '%1' to '%2' for all features.	Check the Knowledge Base for information about this error, or request technical support.
-6467	An error occurred while making the settings to modify the registry key '%1' to '%2' for feature '%3'.	Check the Knowledge Base for information about this error, or request technical support.
-6466	Error in populating the CE setup info into the desktop setup.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`
-6465	Error in creating the CE setup media from the .inf file.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`
-6464	Error in adding CE Setup DLLs info while creating the .inf file to build CE setup media.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`
-6463	Error in adding CE registry entries.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`
-6462	Error in adding CE file associations.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`
-6461	Error in adding CE shortcuts.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6460	Error in adding CE setup files.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`
-6459	Error in populating the information for the .inf file to build CE Setup media.	For additional information regarding this error, see the log file created in the following directory: `<Product Config>\<Release>\CEApps\<CE Project Name>`
-6458	An error occurred while creating an Additional File reference for the upgraded image '%1'.	Check the Knowledge Base for information about this error, or request technical support.
-6457	'Ignore Missing Files' is set on the target image '%1'. This cannot be set when using the 'Include Whole Files' option on the Upgraded Image.	Check the Knowledge Base for information about this error, or request technical support.
-6456	An unexpected error occurred while making the settings required to include whole files in the patch.	Check the Knowledge Base for information about this error, or request technical support.
-6455	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6454	Unable to create whole file patch for '%1'. An error occurred while attempting to rename the file.	Check the Knowledge Base for information about this error, or request technical support.
-6453	An error occurred while trying to rename the file '%1' back to its original file name '%2'.	Check the Knowledge Base for information about this error, or request technical support.
-6452	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6451	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6449	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6448	An error occurred while attempting to remove the file '%1' from the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.
-6447	An error occurred while deleting the file table entry for the file '%1'.	Check the Knowledge Base for information about this error, or request technical support.
-6446	An error occurred while deleting the component key for the upgraded image for the file '%1'.	Check the Knowledge Base for information about this error, or request technical support.
-6445	An error occurred while adding the file '%1' to the upgraded image.	Check the Knowledge Base for information about this error, or request technical support.
-6444	An error occurred while creating the new file entry for file key '%1'.	Check the Knowledge Base for information about this error, or request technical support.
-6443	An error occurred while creating a new component for the file key '%1'.	Check the Knowledge Base for information about this error, or request technical support.
-6442	Unable to create new feature off of the root feature '%1'.	Check the Knowledge Base for information about this error, or request technical support.
-6441	Unable to create feature component entry for feature '%1' and component '%2'.	Check the Knowledge Base for information about this error, or request technical support.
-6440	Unable to find feature '%s' while creating settings for new file.	Check the Knowledge Base for information about this error, or request technical support.
-6434	The setup '%1' specified by ISLatestRelease was built compressed. To use this variable you must build your setup uncompressed.	Check the Knowledge Base for information about this error, or request technical support.
-6433	An error occurred while setting the property %1.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6432	An error occurred while creating the configuration data Properties.	Check the Knowledge Base for information about this error, or request technical support.
-6431	An error occurred while creating configuration data for the Image Family %1.	Check the Knowledge Base for information about this error, or request technical support.
-6430	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6429	An error occurred while creating configuration data for the Target Image %1.	Check the Knowledge Base for information about this error, or request technical support.
-6428	An error occurred while creating configuration data for the Upgraded Image %1.	Check the Knowledge Base for information about this error, or request technical support.
-6427	The setup referred to by , '%1', does not exist.	Check the Knowledge Base for information about this error, or request technical support.
-6426	An error occurred while trying to resolve the variable .	Check the Knowledge Base for information about this error, or request technical support.
-6425	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6424	The project contains a Minor Upgrade item, however the current release does not use a setup launcher. You will have to specify the upgrade command line manually for this minor upgrade to function properly.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6423	The project contains a Minor Upgrade item that references the setup %1. However, the referenced setup can only be upgraded with a Major upgrade. Please use the Major Upgrade item or the automatic upgrade item.	Check the Knowledge Base for information about this error, or request technical support.
-6422	An error occurred while adding Major Upgrade settings for %1.	Check the Knowledge Base for information about this error, or request technical support.
-6421	An error occurred determining if the setup %1 is a major upgrade.	Check the Knowledge Base for information about this error, or request technical support.
-6420	The Upgrade Item setup [MSI name].msi is not found. Unable to create upgrade settings.	Ensure that the setup exists, that it is an .msi file, and that the name is correct.
-6419	An unexpected error occurred processing upgrade item %1.	Check the Knowledge Base for information about this error, or request technical support.
-6418	An unexpected error occurred while processing items to be upgraded.	Check the Knowledge Base for information about this error, or request technical support.
-6415	There was an error creating the patch package. Writing contents of log file '%1' to output window.	Check the Knowledge Base for information about this error, or request technical support.
-6414	An error occurred populating the file hash for the unversioned file %1.	Check the Knowledge Base for information about this error, or request technical support.
-6413	The patch creation process returned the error code %1.	Check the Knowledge Base for information about this error, or request technical support.
-6412	An error occurred while creating the patch package.	Check the Knowledge Base for information about this error, or request technical support.
-6411	An error occurred setting the file version for %1.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6410	An error occurred while attempting to copy the file %s to the release location.	Check the Knowledge Base for information about this error, or request technical support.
-6409	An error occurred while building the source path for file %1.	Check the Knowledge Base for information about this error, or request technical support.
-6408	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6407	An error occurred setting the PackageCode int he Updated Image.	Check the Knowledge Base for information about this error, or request technical support.
-6406	An error occurred setting the Product Version in the updated image.	Check the Knowledge Base for information about this error, or request technical support.
-6405	An error occurred while preparing the Upgraded Image.	Check the Knowledge Base for information about this error, or request technical support.
-6404	An error occurred preparing the Patch Configuration Properties file.	Check the Knowledge Base for information about this error, or request technical support.
-6403	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6402	An error occurred while preparing the release location for building.	Check the Knowledge Base for information about this error, or request technical support.
-6401	Unable to copy Original Setup file to release location.	Check the Knowledge Base for information about this error, or request technical support.
-6400	Unable to copy patch configuration properties template to release location.	Check the Knowledge Base for information about this error, or request technical support.
-6309	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6308	mscorsn.dll cannot be located on your system. You can set the path to mscorsn.dll using Tools | Options. The file is part of the Microsoft .NET Framework redistributable. %1.	Check the Knowledge Base for information about this error, or request technical support.
-6307	Unable to extract one or more files to '%1'. The file path is longer than the limit set by the operating system. Change the build location of the current release to a shorter path to resolve this issue.	Change the build location of the current release to a shorter path.
-6306	Port number specified for configuring IIS Virtual Directories is invalid.	Make sure that the TCP port number that is specified for the virtual directory in the Internet Information Services view is valid. To learn more, see Configuring the TCP Port and Site Numbers.
-6305	Could not load assembly "%1" because of : "%2".	Make sure that you are able to load the dependent file and that the assemblies are accessible according to the assembly binding rules. For more information, see “How the Runtime Locates Assemblies”, available in the .NET Framework SDK help or in MSDN.
-6304	Error validating with CUB file "%1".	Ensure that the CUB file is valid.
-6303	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-6302	InstallShield could not resolve Visual Studio .NET project output "%1" from component "%2". You need to build the project in Visual Studio .NET or by using the Visual Studio .NET command line: devenv /build ConfigName [/project ProjName] [/projectconfig ConfigName] SolutionName	Build the project in Microsoft Visual Studio or by using the Visual Studio command line.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6274	Setup.exe is not found in the Disk1 location: %1. Please make sure that the previous full build of your release was completed if you are running the Build Tables Only.	This error occurs when the setup attempts to get the stamp from Setup.exe, but Setup.exe does not exist in the Disk1 folder. This happens when you cancel a full build in the middle of the process, and then run the Build Tables Only option.
-6273	A VB Script custom action exists in the project, but the VBScriptRuntime Merge Module has not been included.	Use the Redistributables view to add the VBScriptRuntime merge module to your project.
-6271	File %1 not found. An error occurred building the MsiFileHash table record for this file. Verify that the file exists in the specified location.	Ensure that the identified file exists in the specified location.
-6270	The record %1 in the Icon table exceeds the limit of %2 characters. As a result, the build will be unable to persist the database.	Make sure that the record is at or under the limited number of characters.
-6269	An error occurred copying directory %1 to %2. Please ensure that the source directory's path is correct.	Check the source directory's path.
-6268	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-6267	An error occurred while extracting files from the cab file %1 to the location %2	Ensure that the location is accurate.
-6266	An error occurred while attempting to create and initialize the CAB extraction engine for %1	This error can occur when one or more files is not registered. Ensure that all files are registered.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6265	An error occurred building feature '%1'. This feature has the same name (with different case) as another feature in the project. Duplicate feature names are not allowed in InstallScript MSI projects. Rename one of the features to fix this error.	Remove or rename one of the features.
-6264	A record in the %1 table is using string ID '%2' for column '%3' but this string is blank and the column is not nullable.	Provide a string for use in the column.
-6263	The number of allowed InstallScript custom actions (1000) has been exceeded. Please remove some InstallScript custom actions and rebuild the setup.	This error appears when a Basic MSI, DIM, InstallScript MSI, or Merge Module project has more than 1,000 InstallScript custom actions. Use the Custom Actions and Sequences view (or the Custom Actions view) to remove InstallScript custom actions so that your project no longer exceeds the maximum number allowed.
-6262	The Directory table contains the entry %1. This identifier is reserved. Defining it in the Directory table will yield unpredictable results at run time. Use the Direct Editor to rename this directory identifier.	Go to the Directory table in the Direct Editor and rename the directory identifier.
-6260	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-6259	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-6258	An error occurred extracting digital signature information from file "%1". Make sure the digital signature information provided in the IDE is correct.	Ensure that the digital signature information is correct. You can access the digital signature information in the Releases view or in the Release Wizard's Digital Signature panel.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6257	The build engine has detected that PRODUCT_NAME has been defined in the string table. At run time, your setup will display this value as your Product Name instead of the Product Name values defined in the IDE.	This warning message occurs when the ID PRODUCT_NAME has been defined in the String Editor view. This string identifier overrides the Product Name values set in the General Information view or for the product configuration in the Releases view.
-6255	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-6254	An error occurred building the MsiFileHash table for File %1	Check the Knowledge Base for information about this error, or request technical support.
-6253	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-6252	Internal build error	Check the Knowledge Base for information about this error, or request technical support.
-6251	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6250	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6249	Component %1 is configured to install to the Global Assembly Cache but includes one or more subdirectories.	This error occurs when you are using a .NET Project Output that includes subdirectories. InstallShield does not currently support installing these files to the Global Assembly Cache. To avoid this error, change the directory for the component (for example, to INSTALLDIR), or statically add the files and configure them.
-6248	Could not find dependent file %1, or one of its dependencies of component %2	Use the "Build Tables & Refresh Files" option to build the release if the release location is in *<ISProjectDataFolder>* or *<ISProjectFolder>*. For more information, see "How the Run time Locates Assemblies", available in the .NET Framework SDK help or on MSDN.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6247	The .NET Framework redistributable %1 is not found on the system. %2	Check the Knowledge Base for information about this error, or request technical support. If you have the Visual Studio release candidate, you can copy dotnetfx.exe from Windows Component Update CD, in the dotnetframework directory, to `[ProgramFilesFolder]InstallShield\2013\Redist\0409\i386`.
-6246	Could not add dotnetfx.exe to the built image. If you are including .NET 1.1, make sure a core language is selected.	Check the Knowledge Base for information about this error, or request technical support.
-6245	One or more of the project's components contain .NET properties that require the .NET Framework. It is recommended that the release include the .NET Framework.	Consider adding the .NET Framework redistributable to your project. If the .NET Framework is not present on the target system at run time, the installation installs it. To learn more, see Adding .NET Framework Redistributables to Projects.
-6244	One or more of the project's components contain .NET properties that require the .NET Framework. However, the .NET Framework cannot be detected. %2	Check the Knowledge Base for information about this error, or request technical support. If you have the Visual Studio release candidate, you can copy dotnetfx.exe from Windows Component Update CD, in the dotnetframework directory, to `[ProgramFilesFolder]InstallShield\2013\Redist\0409\i386`.
-6243	InstallUtilLib.dll cannot be located on your system. This file is required for Installer custom actions. You can set the path to InstallUtilLib.dll using Tools | Options. The file is part of the Microsoft .NET Framework redistributable. %1	Set the path to InstallUtilLib.dll by selecting Options from the Tools menu and clicking the .NET tab.
-6242	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6241	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6240	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6239	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6238	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6237	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6236	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6235	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6234	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6233	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6232	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6231	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6230	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6229	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6228	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6227	.NET scan of Component %1 failed	Check the Knowledge Base for information about this error, or request technical support.
-6226	Opening Visual Studio .NET solution	Make sure that the solution exists at the location specified. To find the solution information, navigate to the InstallShield table in the Direct Editor and find the value for ISDotNetSolution. In addition, ensure that Visual Studio is installed on the build machine.
-6225	Resolving Visual Studio .NET project output "%1"	Make sure the project exists in the solution. To find the solution information, navigate to the InstallShield table in the Direct Editor and find the value for ISDotNetSolution. In addition, ensure that project has the specified output.
-6224	Processing merge module %1 of feature %2	Check the Knowledge Base for information about this error, or request technical support.
-6223	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6222	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6221	Could not resolve Visual Studio .NET project output "%1" from component %2	Make sure the project exists in the solution. To find the solution information, navigate to the InstallShield table in the Direct Editor and find the value for ISDotNetSolution. In addition, ensure that project has the specified output.
-6220	Dynamically acquired %1 data conflicts with static data associated with component %2. Overwriting with dynamic data.	This error occurs when manual entries made to the MsiAssembly and MsiAssemblyName tables conflict with .NET assembly properties that result from scanning. To eliminate this error, set the component's .NET Scan at Build property to None or delete the values that were manually added to the MsiAssembly and MsiAssemblyName tables.
-6219	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6218	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6217	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6216	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6215	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6214	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6213	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6212	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6211	Destination of Component %1 is GlobalAssemblyCache but key file is not a .NET assembly	Check the Knowledge Base for information about this error, or request technical support.
-6210	An error occurred building COM .NET Interop information for Component %1	InstallShield calls regasm.exe on the .NET .dll to create a .reg file. This should create a .reg file. Then, the .reg file is imported. If either of these steps fails, error -6210 occurs. Make sure that the component's key file is a .NET .dll and that the .NET assembly has "types to export".
-6209	Regasm.exe cannot be located on your system. This file is required to obtain .NET COM Interop information for Components. You can set the path to Regasm.exe using Tools | Options. The file is part of the Microsoft .NET Framework redistributable. %1	Set the path to Regasm.exe by selecting Options from the Tools menu and clicking the .NET tab.
-6208	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6207	An error occurred building Setup File %s.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6205	An error occurred building Component %1. The Component's destination directory %2 is not found in the directory table. Change the Component's destination to a valid location.	Check the Knowledge Base for information about this error, or request technical support.
-6204	An error occurred importing %1 for Component %2. Make sure the file exists in the specified location and that the file is a valid REG file.	Check the Knowledge Base for information about this error, or request technical support.
-6203	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

-6159	The data type for a column in a table in the source project is incompatible with that of the target database.	Use the Direct Editor to ensure the data type is correct in the specified column and table.
-6158	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6157	Target field in table is too small for data.	Use the Direct Editor to ensure the data can fit in the allocated table field.
-6156	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6155	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6154	Build canceled by the user.	This error occurs only when the build is terminated during the build process.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6153	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6152	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6151	Cannot save target database.	Check the Knowledge Base for information about this error, or request technical support.
-6150	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6149	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6148	Cannot insert record in the specified table.	Check the Knowledge Base for information about this error, or request technical support.
-6147	Cannot update the specified target field in the table.	Check the Knowledge Base for information about this error, or request technical support.
-6146	Cannot create new record in the specified table.	Check the Knowledge Base for information about this error, or request technical support.
-6145	Cannot retrieve value of the specified column in the table.	Check the Knowledge Base for information about this error, or request technical support.
-6144	Cannot open database view for table %1.	Check the Knowledge Base for information about this error, or request technical support.
-6143	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6142	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6141	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6140	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6139	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6138	Error compiling Setup.rul.	Setup.rul is required for the project. Check to ensure that this file is included in the project.
-6137	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6136	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6135	The specified feature is not associated with any Setup Type.	Associate the specified feature with a Setup Type.
-6134	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6133	An error occurred updating properties specified in the current Product Configuration.	Check the properties specified in the current Product Configuration to ensure they are valid.
-6132	Error Building the Storages table.	Use the Direct Editor to verify that the data in the table is correct.
-6131	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6130	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6129	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6128	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6127	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6126	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6125	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6124	Unknown Exception.	Check the Knowledge Base for information about this error, or request technical support.
-6123	Unknown Exception.	Check the Knowledge Base for information about this error, or request technical support.
-6122	No components are included in the build.	Ensure your build contains at least one component.
-6121	Error occurred copying built merge modules to the Modules folder.	Check the Knowledge Base for information about this error, or request technical support.
-6120	The Resource Linker failed to build the specified DLL.	Check the Knowledge Base for information about this error, or request technical support.
-6119	The resource linker could not be found.	Open the Options dialog, available from the Tools menu, and set a location to a Resource linker.
-6118	The Resource compiler failed to build the specified RES file required to link the DLL.	Check the Knowledge Base for information about this error, or request technical support.
-6117	The resource compiler could not be found.	Open the Options dialog, available from the Tools menu, and set a location to a Resource compiler.
-6116	Failed to export .rc file from project: %1.	Check the Knowledge Base for information about this error, or request technical support.
-6115	Unable to retrieve version information from ISSetup.dll.	This error may occur if the `ISSetup.dll` file in the following location is corrupted, or if it has been removed from the build machine. This file should be in the following location: `InstallShield Program Files Folder\redist\Language Independent\i386` To resolve this error, try running a repair of InstallShield.
-6114	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6113	An error occurred during the incremental build.	Check to ensure that a previous media was built before selecting "Build Tables Only" or "Build Tables and Refresh Files" and ensure the previous media was not deleted.
-6112	Error deleting a file streamed into Setup.exe.	Check the Knowledge Base for information about this error, or request technical support.
-6111	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6110	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6109	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6108	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6107	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6106	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6105	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6104	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6103	Unable to get system settings for the specified file.	Check the file to ensure it exists in the specified location.
-6102	Error searching for dynamic files matching "%1".	Make sure the dynamic file flag specified is valid.
-6101	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6100	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-6099	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6098	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6097	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6096	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6095	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6094	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6093	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6092	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6091	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-6090	The scrollable text file:'%1' specified for the Control:'%2' does not exist.	Check to make sure the text file exists in the specified location %1 will contain the full path to an .rtf file. If it is empty, the ISBuildSourcePath column for control %2 is empty. For Scrollable text controls, ISBuildSourcePath in the Control table should point to a valid file.
-6089	Both the Text and ISBuildSourcePath columns for Control:'%1' contain path information, the Text column will be used.	The Control %1 cannot have entries in both ISBuildSourcePath and the Text columns of the Control table. Go to the Direct Editor and remove the unused information in either ISBuildSourcePath or Text column.
-6088	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Error or Warning Number	Message	Troubleshooting Information
-5084	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5083	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5082	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5081	Could not write to setup.ini.	Check the Knowledge Base for information about this error, or request technical support.
-5080	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5079	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5078	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5077	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5076	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5075	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5074	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5073	The binary key %1 is missing.	Open the **Binary** table in the Direct Editor to verify that this entry exists.
-5072	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5071	Standard DLL Function syntax error.	Make sure you specify `void` if your function does not return anything. Click the ellipsis button (...) in the Function Signature field of the Custom Action to validate your signature.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-5070	Standard DLL Function Name syntax error.	Click the ellipsis button (...) in the Function Signature field of the Custom Action to validate your signature.
-5069	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5068	Standard DLL Function parameters syntax error.	Click the ellipsis button (...) in the Function Signature field of the Custom Action to validate your signature
-5066	Standard DLL Function return value syntax error.	Click the ellipsis button (...) in the Function Signature field of the Custom Action to validate your signature
-5065	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5064	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5063	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5062	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5061	The specified filename already exists.	Use the component's **Source Location** property to prevent this warning.
-5060	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5059	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5058	Could not obtain merge module dependencies.	Check the Knowledge Base for information about this error, or request technical support.
-5057	Could not obtain merge module catalog.	Check the Knowledge Base for information about this error, or request technical support.
-5056	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-5054	Could not determine the size of the file "%1".	Verify the file specified exists.
-5053	The file "%1" could not be found.	Verify the file specified exists.
-5052	Could not determine the free space on the volume %1.	Check the Knowledge Base for information about this error, or request technical support.
-5051	Could not remove the read-only attribute from the file "%1".	Check the Knowledge Base for information about this error, or request technical support.
-5050	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5049	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5048	Could not create the file "%1".	Check the Knowledge Base for information about this error, or request technical support.
-5047	Cannot create directory %1.	Check the Knowledge Base for information about this error, or request technical support.
-5046	Could not preserve previous Build Reports.	This build error occurs when a release exists, but the corresponding Report Files folder in the release folder does not exist. This scenario typically occurs if you manually delete the Report Files folder, but not the disk image folder. This scenario may also occur if you upgrade a project from an earlier version of InstallShield. To resolve this error, click the Open Release Folder button. InstallShield opens the current release's folder. Delete all of the files within the folder. Then rebuild the release.
-5045	Could not preserve previous Build Logs.	This build error occurs when a release exists, but the corresponding Log Files folder in the release folder does not exist. This scenario typically occurs if you manually delete the Log Files folder, but not the disk image folder. This scenario may also occur if you upgrade a project from an earlier version of InstallShield. To resolve this error, click the Open Release Folder button. InstallShield opens the current release's folder. Delete all of the files within the folder. Then rebuild the release.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-5044	Cannot delete directory %1.	Check the Knowledge Base for information about this error, or request technical support.
-5043	The volume does not exist.	Check in the Releases view to ensure the volume specified exists.
-5042	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5041	The string ID "%1" was used to specify a Component or Feature destination.	You cannot use a stringID for a destination. Find the component or feature using this string ID and change the destination using a directory identifier.
-5040	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5039	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5038	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5037	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5036	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5033	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5032	Error building ListView table.	Use the Direct Editor to verify that the data in the table is correct.
-5031	Error building ListBox table.	Use the Direct Editor to verify that the data in the table is correct.
-5030	Error building ComboBox table.	Use the Direct Editor to verify that the data in the table is correct.
-5029	Error building CheckBox table.	Use the Direct Editor to verify that the data in the table is correct.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-5028	Error building RadioButton table.	Use the Direct Editor to verify that the data in the table is correct.
-5027	Error building Control table.	Use the Direct Editor to verify that the data in the table is correct.
-5026	Error building Dialog table.	Use the Direct Editor to verify that the data in the table is correct.
-5025	Could not save package.	Check the Knowledge Base for information about this error, or request technical support.
-5024	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5023	Error building File table.	Use the Direct Editor to verify that the data in the table is correct.
-5022	Error building Feature table.	Use the Direct Editor to verify that the data in the table is correct.
-5021	Error building Component table.	Use the Direct Editor to verify that the data in the table is correct.
-5020	Error building Directory table.	Use the Direct Editor to verify that the data in the table is correct.
-5019	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5018	The logical disk does not contain any features.	Check the Knowledge Base for information about this error, or request technical support.
-5017	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5016	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5015	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-5014	An error occurred building icon "%1". The specified Icon key was not found in the Icon table.	See Knowledge Base article Q107116 for information about this error.
-5013	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5012	Invalid Feature_ value for %1.	Use the Direct Editor to open the specified table and ensure data in that table is valid.
-5011	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5010	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5009	The schema Summary Stream must be 200 or later.	Check the Knowledge Base for information about this error, or request technical support.
-5008	Intel64 must be specified in the template of the Summary Stream.	Check the Knowledge Base for information about this error, or request technical support.
-5007	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5006	Could not save "%1".	Check the Knowledge Base for information about this error, or request technical support.
-5005	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5004	Could not open the project with write access.	Check to make sure the project is not already open by the IDE.
-5003	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5002	Internal build error.	Check the Knowledge Base for information about this error, or request technical support.
-5001	Could not copy setup.ini.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-4701	An error occurred building the One-Click Install Web page.	Check the Knowledge Base for information about this error, or request technical support.
-4371	There were warnings compiling InstallScript.	Use the InstallScript Debugger to step through your InstallScript to identify problems.
-4370	There were errors compiling InstallScript.	Use the InstallScript Debugger to step through your InstallScript to identify problems.
-4354	The build was unable to extract COM information from a file in a component.	Ensure that the file is self-registering and verify that the self-registration process does not fail.
-4352	There is no key file for the specified component. A key file is required for dynamic COM extraction.	Specify the key file for the specified component from the Components view.
-4350	Dynamically acquired MIME text/scriptlet conflicts with static data associated with component %1. Overwriting with dynamic data.	This warning occurs when you add a COM server .dll file using the Component Wizard, which does static COM extraction, and then later change the component's COM Extract at Build setting to Yes. The dynamically extracted data conflicts with the static data in the .ism file. Ensure that the COM extraction setting is accurate.
-4349	Failed to build %1 information for dynamically extracted COM components.	Check the Knowledge Base for information about this error, or request technical support.
-4348	Failed to build %1 information for dynamically extracted COM components.	Check the Knowledge Base for information about this error, or request technical support.
-4347	Failed to build information for dynamically extracted COM components.	Check the Knowledge Base for information about this error, or request technical support.
-4346	Failed to build information for dynamically extracted COM components.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-4345	Failed to build information for dynamically extracted COM components.	Check the Knowledge Base for information about this error, or request technical support.
-4344	Failed to build information for dynamically extracted COM components.	Check the Knowledge Base for information about this error, or request technical support.
-4343	Failed to build information for dynamically extracted COM components.	Check the Knowledge Base for information about this error, or request technical support.
-4340	Failed to initialize COM extraction module.	Check the Knowledge Base for information about this error, or request technical support.
-4327	Could not write string ID "%1" to the InstallScript strings file.	This error pertains to projects containing InstallScript (either an InstallScript MSI project or a Basic MSI project with InstallScript custom actions). At build time, InstallShield creates an .ini file that contains all of the string entries in the project. In the error message, "%1" represents the line number in this .ini file that fails to get written. If the line number is 0, a general failure to create or write to the .ini file occurred. This might indicate that you are out of disk space.
-4303	An unexpected error occurred while synchronizing the file key in the specified component.	Check the Knowledge Base for information about this error, or request technical support.
-4302	A conflict was encountered while synchronizing file key %1 in component %2.	Check the Knowledge Base for information about this error, or request technical support.
-4301	Could not find the .msi file for key synchronization.	Check to ensure the specified MSI file exists.
-4093	Cannot copy source %1 to target %2	Ensure that the file exists, that there is enough disk space on the target location, and that you are able to copy to the location.
-4092	Error opening MSI database %1.	Check the Knowledge Base for information about this error, or request technical support.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-4075	File not found. An error occurred merging module '%1' for feature '%2'.	Verify that the merge module exists in the merge module search path. This error may occur if an installation project that contained an InstallScript MSI object was upgrade to InstallShield 2013, which no longer supports InstallScript MSI objects. If this is the case, remove that objects from your project through the Redistributables view. You can upgrade the InstallScript MSI object to InstallShield 2013, which will convert it to a merge module project. Then you can add that merge module to your installation project.
-4072	Error retrieving the dependencies for %1.	Check the Knowledge Base for information about this error, or request technical support.
-4006	Cannot delete file.	Ensure the specified file exists and is not set to read-only.
-3876	Ignoring invalid template %1 in the Summary Stream.	InstallShield generates this warning if the Template Summary setting contains an invalid entry. To learn about how to enter valid values, see Using the Template Summary Property.
-3851	Error building the specified table.	Use the Direct Editor to open the specified table and ensure data in that table is valid.
-3713	The function block must be in the form "Module::Function".	Change the function block to follow the form "Module::Function".
-3204	Cannot extract icon with specified index from the file specified for the icon.	Ensure the file containing the icon exists, and the index number is present in the file.
-3138	The Patch Configuration specified does not exist in the project. Please verify that the Patch Configuration exists and that the spelling and character case match.	When using the BuildPatchConfiguration method on the IPWiProject object, this error might occur.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-3114	Application path %1 does not contain destination of associated component %2.	This error occurs when an application path entry was created in the Advanced Settings section of the Components view, but no application path was specified. To correct this, set the application path entry. Because an application path is also a registry entry, this error might occur if a registry path like the following one is created, but it is missing the path entry: HKEY_LOCAL_MACHINE\Microsoft\Windows\CurrentVersion\App Paths To correct this, specify a path entry.
-3028	An error occurred replacing string IDs in the specified table.	A required string ID was left blank in the specified table. Provide a string ID.
-3016	Failed to add Binary table %1 to package.	Check the Knowledge Base for information about this error, or request technical support.
-2200	Could not overwrite file.	Ensure the specified file is not read-only.
-1531	The size specified for the disk is too small for the feature.	Using the Release Wizard, change the Media Format to a larger size.
-1530	The size specified for the disk is too small for the file.	Using the Release Wizard, change the Media Format to a larger size.
-1527	No files are included in the project.	This warning occurs when you have not included any files in your project. Use the Files and Folders view to add files into your project to avoid this error.
-1505	Could not add the CAB file to the MSI package.	Check the Knowledge Base for information about this error, or request technical support.
-1501	Could not compress "%1" into "%2".	Ensure that IsCmdBld.exe is executed in the relative directory. You can do this by locating the files specified in the error message and launching IsCmdBld.exe within their directory.
-1119	The specified CUB file does not exist.	Ensure that the CUB file name is spelled correctly.

Table 12-2 • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
-1027	Failed signing %1.	Check the digital signature information (digital keys and password) provided for the current release.
-1024	File not found. Cannot stream the file into the Binary table.	Ensure the specified file exists.
-1015	Cannot copy source '%1' to target %2.	Check the Knowledge Base for information about this error, or request technical support.
-1014	Cannot rename a directory.	Windows Explorer or a DOS prompt may be pointing to a subfolder of the release output folder (Disk1) or to the Interm folder, locking it. Change the current directory. Close any open files in the Disk1 folder. Close Msidb.exe if it is open.
-1013	The specified file is being used by another program.	Close the application that is currently using the file and re-run the build process.
-1009	Insufficient disk space or the target drive cannot be located.	Increase disk space on the build target, or select a new target for the build. If the target drive cannot be located, select a new target, or ensure permissions are set correctly for the target drive.
-1007	Cannot copy source %1 to target %2	Ensure that the file exists, that there is enough disk space on the target location, and that you are able to copy to the location.
-1005	Could not compress %1 into %2 (where %1 is the full path to a file and %2 is the name of a .cab file).	This error could occur when you are building a compressed setup and run out of disk space or temporary space on the machine. Another reason that this error might occur is due to an internal error occurred with the CAB APIs. Contact technical support for more information.
-1001	Error opening MSI database.	Check the Knowledge Base for information about this error, or request technical support.
-1000	Invalid product configuration. Failed to create directory.	Check the Knowledge Base for information about this error, or request technical support.

Media Build Errors and Warnings

Media build errors that occur before the build is generated are displayed in an error message dialog box; those that occur while the build is generated are displayed in the Output window and are recorded in the log file.

Table 12-3 • Media Build Errors and Warnings

Error or Warning Number	Message
118	Could not find CAB file with file #number. The system cannot find the path specified.
129	Media too small. Could not fit filename on disk number.
-5000	File group 'file group name' contains a link to a non-existent file - 'filename'.
-5006	'EnterPassword' dialog resource not found in resource library filename.
-5020	The built media files could not be uploaded to the site URL. The URL could not be parsed.
-5021	The built media files could not be copied to the folder 'path'.
-5032	Failed to sign the self-extracting executable file.
-5050	The font data could not be read from the project file. The 'Font' table may be missing from the project.
-5051	Unable to create font data file: 'data file path and name'
-7040	No features included in the media.
-7041	Could not create instance of CABEngine. CABEngine component might not be installed or registered properly. You may need to reinstall InstallShield.
-7043	Could not open the following media for the differential build - "path to media header file"
-7044	Product Version is not specified in the **Project Settings** property sheet.
-7045	File could not be found - "InstallShield `Program Files Folder\Redistributable\Compressed Files\Language Independent\OS Independent\Corecomp.ini`"
-7126	Not enough free disk space.
-7127	The Disk Images directory is use by another program.
-7273	PVK file invalid.

Table 12-3 • Media Build Errors and Warnings (cont.)

Error or Warning Number	Message
-7274	SPC file invalid.
-7275	Certificate invalid.
-7276	Certificate expired.
-7380	Build canceled by the user.
-9008	Failed saving object property.

Error 118

Message

`Could not find CAB file with file #number. The system cannot find the path specified.`

Troubleshooting Information

This error occurs when you build an already built media and one of the cabinet files that was previously created no longer exists.

If you encounter this error, rebuild the media.

Error 129

Message

`Media too small. Could not fit filename on disk number.`

Troubleshooting Information

This error can occur for any of the following reasons:

- Total size of files required to be on one disk is greater than selected disk size.
- An installation requires that certain files reside on the first disk, including the files placed in the Support Files view (such as Setup.bmp and License.txt) and Data1.cab. Also, an installation requires that certain files be compressed in Data1.cab, including the following:
  - files needed by the objects you have included in your setup
  - resource files for each language your installation supports
  - the file for the dialog box skin you selected

If your installation includes a large skin, setup files, or objects—or a large number of support files, objects, or languages—the total size of files required to be on the first disk can be greater than the disk size you selected in the Release Wizard's Media Type panel.

To avoid this error and complete the build successfully, you must either remove the skin or some support files or objects from your project, reduce the size of some support files or choose a skin with a smaller file, or select a larger disk size.

If the error message specifies a disk other than disk 1, some of the files in your components may be too large to fit on the disk even when they have been compressed. In this case, you must either remove the large files, reduce their size, or select a larger disk size.

- There is not enough space on your drives.

To create the installation's cabinet files, the release builder requires space in the system's temporary folder and in the build location. To avoid this error, make sure you have enough free space on the drive on which the system's temporary folder resides and the drive on which you have specified the build location.

You can find the system's temporary folder by typing in the word "set" at a DOS prompt. The temporary folder is identified by the value of the environment variable TEMP. You can find the build location by looking at the Release Wizard's General Options panel's Advanced dialog box or the Release view's Release Location property.

- There is not enough virtual memory.

On Windows NT, this error can be caused by a lack of free virtual memory rather than a lack of free hard disk space. For information, visit Knowledge Base article Q102757.

Warning -5000

Message

Component '*component name*' contains a link to a non-existent file - '*filename*'

Troubleshooting Information

The indicated component contains a link to the indicated file, which cannot be found. Remove the file from the component, or if you have renamed or moved the file, restore it to the indicated name and location.

Warning -5006

Message

'EnterPassword' dialog resource not found in resource library *filename*.

Troubleshooting Information

You have selected the Show Password dialog during setup initialization option in the Release Wizard's Password panel or the Show Password Dialog property in the Releases view, but one or more copies of `_Isres.dll` do not contain a resource template for this dialog box. (A separate instance of this warning is displayed for each copy of `_Isres.dll` that does not contain the resource template.) To fix this problem, you must use the Premier edition of InstallShield.

Warning -5020

Message

```
The built media files could not be uploaded to the site URL. The URL could not be parsed.
```

Troubleshooting Information

Verify that the URL you specified in the Release view's FTP Host Address property exists.

Warning -5021

Message

```
The built media files could not be copied to the folder 'path'.
```

Troubleshooting Information

You have selected the Copy the built media files to the folder option in the Release Wizard's Postbuild Options panel or the Copy to Folder property in the Release view; the built media files could not be copied to the folder that you specified with that option. Make sure that the path you specified exists and is writable.

Warning -5032

Message

```
Failed to sign the self-extracting executable file.
```

Troubleshooting Information

The build failed to sign the self-extracting executable file as specified in the Release Wizard's Digital Signature panel or the Release view's Sign Media property. Among the possible causes of this error are an invalid or missing private key file.

Warning -5050

Message

```
The font data could not be read from the project file. The 'Font' table may be missing from the
    project.
```

Troubleshooting Information

Check the Direct Editor to see if a Font table is included in your project. If it is not, and you cannot use source control software to roll back to a version of your project that did include that table, try deleting the font files from your project and then re-including them.

Warning -5051

Message

`Unable to create font data file: 'data file path and name'`

Troubleshooting Information

Make sure that the specified path exists and is writable, and that a read-only file of the same name does not already exist at the same location.

Error -7040

Message

`No features included in the media.`

Description

Your specified media does not contain any features. All media builds must include at least one feature.

Troubleshooting Information

Make sure that you have created at least one feature in the Features view.

Error -7041

Message

```
Could not create instance of CABEngine. CABEngine component might not be installed or registered
    properly. You may need to reinstall InstallShield.
```

Troubleshooting Information

To resolve the problem, manually register the file MediaBuild40.dll (in the `InstallShield\MediaBuild` folder of your build machine's common files folder) using Regsvr32.exe (in the Windows system folder), using a DOS command line like the following:

```
Regsvr32.exe "C:\Program Files\Common Files\InstallShield\MediaBuild\MediaBuild40.dll"
```

Error -7043

Message

`Could not open the following media for the differential build - "path to media header file"`

Troubleshooting Information

The message refers to a media header file that you specified in the Differential Media list box in the Release Wizard's Update panel. This error can be caused by any of the following conditions:

- The file does not exist.
- The file is corrupted.
- The file is an incompatible media, for example, a media built by InstallShield Professional 5.x.

Error -7044

Message

Product Version is not specified in the Product Properties view.

Troubleshooting Information

You must specify a non-null value in the Product Version setting in the General Information view.

Error -7045

Message

File could not be found - "*path*\Corecomp.ini"

Troubleshooting Information

`Corecomp.ini` could not be found in the indicated location. If you have renamed or moved `Corecomp.ini`, place a copy in the indicated location with the file name `Corecomp.ini`. If you cannot restore `Corecomp.ini` in this way, run a repair of InstallShield.

Error -7126

Message

`Unable to build the setup.`

Description

There is not enough free disk space to build the setup.

Troubleshooting Information

The Media Wizard requires space in the system's temporary folder.Make sure you have enough free space on this drive, as well as in the build location.

Error -7127

Message

`The Disk Images directory is use by another program.`

Troubleshooting Information

This error can occur for any of the following reasons:

- The Disk Images or Disk1 folder that you are trying to build to may be open in Windows Explorer or DOS. Open a different folder in the Windows Explorer or DOS window, or close the window, and then rerun the media builder.
- The Disk Images or Disk1 folder is read-only. Right-click the folder in Windows Explorer and click Properties. If the folder is marked as read-only, uncheck the read-only check box and then rerun the media builder.
- A folder named bldback exists under the folder where the media is being built to. If such a folder exists, delete it, and then rerun the media builder.

Error -7273

Message

```
PVK file invalid.
```

Troubleshooting Information

The private key file that you specified (using the Release Wizard's Digital Signature panel, the Release view's Sign Media property, or the Isign.exe utility) when digitally signing your release or package is invalid. Specify a valid private key file and build again.

Error -7274

Message

```
SPC file invalid.
```

Troubleshooting Information

The software publishing credentials file that you specified (using the Release Wizard's Digital Signature panel, the Release view's Sign Media property, or the Isign.exe utility) when digitally signing your release or package is invalid. Specify a valid software publishing credentials file and build again.

Error -7275

Message

```
Certificate invalid.
```

Troubleshooting Information

Your software publisher certificate—as identified by the software publishing credentials file that you specified (using the Release Wizard's Digital Signature panel, the Release view's Sign Media property, or the Isign.exe utility) when digitally signing your release or package—is invalid. Specify a valid software publisher certificate and build again.

Error -7276

Message

```
Certificate expired.
```

Troubleshooting Information

Your software publisher certificate—as identified by the software publishing credentials file that you specified (using the Release Wizard's Digital Signature panel, the Release view's Sign Media property, or the Isign.exe utility) when digitally signing your release or package—is expired. Specify a current software publisher certificate and build again.

Error -7380

Message

```
Build canceled by the user.
```

Description

The build has been canceled by the user.

Troubleshooting Information

The user canceled the build process by clicking the Cancel button.

Error -9008

Message

```
Failed saving object property.
```

Troubleshooting Information

This error can occur if an object in the project is corrupted (for example, is missing Isrt.dll).

MSI/MSM Conversion Errors

The table below provides troubleshooting tips for each error that could be encountered while converting an installation package (.msi file) or merge module (.msm file) in the Open MSI/MSM Wizard.

The wizard also returns errors from accessing Windows Installer databases. For more information on those errors, see Build Errors and Warnings. You might receive undocumented, internal errors if the source .msi or .msm package is invalid.

Tip • *Before launching the Open MSI/MSM Wizard, validate the package with Orca or Msival2.exe, both part of the Microsoft Windows Installer Platform SDK.*

Table 12-4 • MSI and MSM Conversion Errors

Error Number	Message	Troubleshooting Tips
-6000	Unable to open file	The path to the .msi or .msm file might be invalid. The file might be open or in use by another program. The file might have been corrupted or might not be a valid Windows Installer database.
-6001	Unsupported database schema	The Open MSI/MSM Wizard supports databases compatible with schema 30 or later only. To determine the schema of the .msi or .msm file, open it in Orca and on the **View** menu, click **Summary Information**. In some cases, you can work around this error simply by changing the **Schema** field in the **Edit Summary Information** dialog box.
-7000	Could not create record	If the record already exists, the wizard will not create a duplicate entry found in the file.
-7001 **-7002** **-7004**	Foreign key invalid	The wizard could not create a record because the record referenced by a foreign key in the .msi or .msm database was invalid or missing.
-7005	Unable to set string property	The Open MSI/MSM Wizard could not set a string value, probably because the field was a duplicate in the database file. This error might have resulted from an earlier failure to create a record (error -7000, -7001, -7002, or -7004).
-7006	Unable to set integer property	The Open MSI/MSM Wizard could not set an integer value, probably because the field was a duplicate in the database. This error might have resulted from an earlier failure to create a record (error -7000, -7001, -7002, or -7004).

Table 12-4 • MSI and MSM Conversion Errors (cont.)

Error Number	Message	Troubleshooting Tips
-7008	Unable to set property	The Open MSI/MSM Wizard could not set a value, probably because the field was a duplicate in the database. This error might have resulted from an earlier failure to create a record (error -7000, -7001, -7002, or -7004).
-7009	Unable to create binary file	The wizard could not extract a binary file, an icon, or an .rtf file from the file and copy it to the new project location. Delete any existing file in the extraction directory. Ensure there is enough disk space and that you have the appropriate write privileges for the extraction directory.
-7010	Output path for cab extraction does not exist	The wizard could not extract a .cab file using the path specified. Instead of typing the output path for the .cab file, click **Browse** to select the path and then launch the wizard again.
-7011	Cannot delete temporary .cab file	Unable to delete the temporary .cab file after extracting it from the installation package or merge module.
1001	Invalid source MSI database path	Ensure that the path to the .msi database is valid.
1017	End user aborted process	Allow the conversion process to complete.
100001	Unexpected error	The error message lists the function and table name associated with the error.
100002	Unable to extract file from the cabinet	Verify that the source is a valid .msi or .msm database.
200001	No output path was specified	This warning appears if the converter needs to extract binary files from the database tables or cabinet files, but an invalid output path was specified in the Data File Location box on the **File Locations** panel of the Open MSI/MSI Wizard.

Internal Errors

The following are internal errors. They should not be encountered when importing a valid .msi or .msm database. Before launching the Open MSI/MSM Wizard, validate the package with Orca or Msival2.exe, both part of the Microsoft Windows Installer Platform SDK.

The error message will display the database table, field, and value for which the conversion failed.

Table 12-5 • Internal Errors

Error Number	Message	Troubleshooting Tips
1002	Invalid target database path	Verify that your default project location path is valid. To verify the path, on the **Tools** menu, click **Options**. The default project location path is specified on the File **Locations** tab.
1003	Failed to open the source MSI/MSM database	Ensure that the database is not locked or open in another application.
1004	Failed to open the target database	Ensure that the project file is not locked or open in another application. Verify that your default project location path is valid. To verify the path, on the **Tools** menu, click **Options**. The default project location path is specified on the File **Locations** tab.
1006	Failed to obtain table list for the source or target MSI/MSM database	Verify that the source is a valid .msi or .msm database.
1007	Failed to obtain a field	This is generally caused by failure of the MsiRecordGetXXX API. Verify that the source is a valid Windows Installer database.
1009	MsiCreateRecord failure	Ensure that the project file is not locked or open in another application.
1010	Failed to update a field	This is generally caused by failure of the MsiRecordSetXXX API. Ensure that the project file is not locked or open in another application.
1011	Failed to insert a record into a table	Ensure that the project file is not locked or open in another application.

Table 12-5 • Internal Errors (cont.)

Error Number	Message	Troubleshooting Tips
1012	Failed to extract binary data from the source MSI/ MSM database	Delete any existing file in the extraction directory. Ensure that there is enough disk space and that you have the appropriate write privileges in the output path specified in the **Data File Location** box on the **File Locations** panel of the Open MSI/ MSI wizard.
1013	Failed to stream a file into the target database	Ensure that the project file is not locked or open in another application.
1014	MsiDatabaseCommit failed	Ensure that the project file is not locked or open in another application.
5001	Failed to resolve a field value	This is generally caused by an unexpected database schema. See troubleshooting notes for error -6001.
5002	Incompatible field type between source and target MSI database	Verify that the source is a valid .msi or .msm database.

Windows Installer Run-time Errors

Project • *This information applies to the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

The following table contains a listing of Windows Installer errors that may occur during run time of an installation. The errors are related to the built-in InstallShield custom actions that are added automatically to InstallShield projects to support different functionality. For a list of the custom actions, see InstallShield Custom Action Reference.

Tip • *You can find detailed information—including resolution information—on some of the run-time errors in the Knowledge Base.*

Table 12-6 • Windows Installer Run-time Errors

Error Number	Message	Troubleshooting Information
27500	This setup requires Internet Information Server 4.0 or higher for configuring IIS Virtual Roots. Please make sure that you have IIS 4.0 or higher.	This error may occur if your project contains IIS data that you configured in the Internet Information Services view. If you encounter this error, ensure that the target system has IIS 4.0 or later.
27501	This setup requires Administrator privileges for configuring IIS Virtual Roots.	This error may occur if your project contains IIS data that you configured in the Internet Information Services view. This error occurs if you do not have administrator privileges for configuring IIS virtual directories, but you are running an installation that configures IIS virtual directories.
27502	Could not connect to [2] '[3]'. [4]	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the installation was unable to connect to the specified database server.
27503	Error while retrieving version information from the specified database server.	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if you specified the minimum version requirement for a database server on the Requirements tab for a SQL connection in the SQL Scripts view, but the installation could not determine what version of the database server exists on the target system.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27504	The specified database server does not meet the version requirements.	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the target system does not meet the minimum version requirements for a database server that is selected on the Requirements tab for a SQL connection in the SQL Scripts view. Note that in this scenario, this error occurs only if the **Allow installation to continue when minimum requirements are not met** check box on this tab is cleared.
27505	Fail to open a SQL script file.	This error may occur if your project contains a SQL script that you configured in the SQL Scripts view, and the run time fails to extract the SQL script file from the .msi package.
27506	Error while executing a SQL script.	This error may occur if your project contains a SQL script that you configured in the SQL Scripts view. This error occurs if the target database server encounters a SQL scripting error. To resolve this error, check the SQL script in your project and make any necessary changes.
27507	Browsing for SQL Servers requires that ODBC32.dll be installed and registered.	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. To prevent this error from occurring, add the InstallShield prerequisite for MDAC to your installation project.
27508	Error installing COM+ application [2]. [3]	This error may occur if your project contains a COM+ application that you configured in the Component Services view. This error occurs if there are missing dependencies for COM+ component DLLs or incorrect settings for your COM+ application. To resolve this error, add the dependencies to your project or check the COM+ application in your project and make any necessary changes.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27509	Error uninstalling COM+ application [2]. [3]	This error may occur if your project contains a COM+ application that you configured in the Component Services view. This error occurs if the run time fails to delete the COM+ application from the system.
27510	Error installing COM+ application [2]. Could not load Microsoft(R) .NET class libraries. Registering .NET serviced components requires that Microsoft(R) .NET Framework be installed.	This error may occur if your project contains a COM+ application that you configured in the Component Services view. To prevent this error from occurring, consider adding the .NET Framework to your project. To learn how, see Adding .NET Framework Redistributables to Projects. As an alternative, you can use the Installation Requirements page in the Project Assistant to add a .NET Framework requirement to your project. If a target system does not have the appropriate version of the .NET Framework, the installation displays an error message, and the product is not installed.
27511	Could not execute SQL script file [2]. Connection not open: [3]	This error may occur if your project contains a SQL script that you configured in the SQL Scripts view. This error occurs if the connection is disconnected before the installation runs the SQL script.
27514	This installation requires a Microsoft SQL Server. The specified server '[3]' is a Microsoft SQL Server Desktop Engine or SQL Server Express.	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the target system has Microsoft SQL Server Desktop Engine or Microsoft SQL Server Express, and if the following check boxes are cleared on the Requirements tab for a SQL connection in the SQL Scripts view: • Allow installation to Microsoft SQL Server Desktop Engine/SQL Server Express • Allow installation to continue when minimum requirements are not met

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27515	Error retrieving schema version from [2] '[3]'. Database: '[4]'. [5]	This error may occur if your project contains a SQL script that you configured in the SQL Scripts view, and if a version is specified in the Schema Version setting on the General tab for that SQL script. This error occurs if the target database server encounters a SQL script error when the run time attempts to retrieve the current schema version from the **InstallShield** table.
27516	Error writing schema version to [2] '[3]'. Database: '[4]'. [5]	This error may occur if your project contains a SQL script that you configured in the SQL Scripts view, and if a version is specified in the Schema Version setting on the General tab for that SQL script. This error occurs if the target database server encounters a SQL script error when the run time attempts to write a schema version to the **InstallShield** table.
27517	This installation requires Administrator privileges for installing COM+ applications. Log on as an administrator and then retry this installation.	This error may occur if your project contains a COM+ application that you configured in the Component Services view. This error occurs if you do not have administrator privileges for installing COM+ applications, but you are running an installation that includes COM+ applications.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27519	Error updating XML file [2]. [3]	This error may occur if your project contains XML references that you configured in the XML File Changes view. This error occurs if MSXML fails to save the target XML file. The [3] parameter refers to the error code that MSXML returned. Possible error codes are: • **XML_BAD_ENCODING**—The XML file contains a character that is not part of the specified encoding, which is defined on the Advanced tab for an XML file in the XML File Changes view. • **E_INVALIDARG**—The XML file does not have a valid file name. • **E_ACCESSDENIED**—A file system error occurred. • **E_OUTOFMEMORY**—The XML file could not be saved. Other values that can occur indicate that a file system error occurred.
27520	Error opening XML file [2]. [3]	This error may occur if your project contains XML references that you configured in the XML File Changes view. This error occurs if MSXML fails to load the target XML file. The [3] parameter refers to the error code that MSXML returned. A possible error codes is: • **S_FALSE**—The XML file load failed.
27521	This setup requires MSXML 3.0 or higher for configuring XML files. Please make sure that you have version 3.0 or higher.	This error may occur if your project contains XML references that you configured in the XML File Changes view. To prevent this error from occurring, consider using the Redistributables view to add an InstallShield prerequisite or merge module for MSXML to your project.
27524	Error loading NetApi32.DLL. The ISNetApi.dll needs to have NetApi32.DLL properly loaded and requires an NT based operating system.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if `NetApi32.dll` cannot be loaded on the target system.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27525	Server not found. Verify that the specified server exists. The server name can not be empty.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you do not enter an existing domain or server name on the LogonInfoNameAndServer dialog or the LogonInformation dialog.
27526	Unspecified error from ISNetApi.dll.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if an unexpected error is returned from a function in `NetApi32.dll`.
27527	The buffer is too small.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if the run time cannot allocate the amount of memory that is required for retrieving a list of all servers that are visible in a domain.
27528	Access denied. Check administrative rights.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if the user does not have access to the Windows user account information that is being configured.
27529	Invalid computer.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if the computer name that was entered is invalid.
27531	Unhandled exception.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if one of the function calls in `NetApi32.dll` throws an exception.
27532	Invalid user name for this server or domain.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you specify a user name that does not exist on a domain in the LogonInformation dialog or the LogonInfoNameAndServer dialog.
27533	The case-sensitive passwords do not match.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you enter different passwords in the Password setting and the Confirm Password setting on the LogonInfoCreateUser dialog.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27534	The list is empty.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if the LogonInfoListServers dialog needs to be displayed but no servers are found.
27535	Access violation.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if a memory access violation is encountered when information about user accounts or servers is retrieved and being processed.
27536	Error getting group.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if the installation encounters an error when retrieving information about a group account.
27537	Error adding user to group. Verify that the group exists for this domain or server.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you try adding membership of a user account to a group but the account type is invalid, the member is already a member of the group, or the member does not exist.
27538	Error creating user.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if the installation encounters a problem when creating the user account or adding the user to a group.
27539	ERROR_NETAPI_ERROR_NOT_PRIMARY returned from NetAPI.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you are trying to add a user account, give an existing user account membership, or delete a user account, but the operation is allowed only on the primary domain controller of the domain.
27540	The specified user already exists.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you are trying to create a new user account but the user account already exists.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27541	The specified group already exists.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you are trying to create a new user account but the group already exists.
27542	Invalid password. Verify that the password is in accordance with your network password policy.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you are creating a new user account but the password that you specified does not meet the password requirements that were established for the network. To resolve this error, enter an appropriate password.
27543	Invalid name.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you are giving an existing user account membership in a group, or if you are deleting a user account, but the user name that you specified could not be found.
27544	Invalid group.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you are giving a user account membership in a group, but the group that you specified does not exist.
27545	The user name can not be empty and must be in the format DOMAIN\Username.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if you are configuring a user account but you did not enter valid information for the User Name setting.
27546	Error loading or creating INI file in the user TEMP directory.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if there is a problem opening or creating a configuration .ini file that the InstallShield custom actions use for the creation or configuration of a Windows user account.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27548	Error deleting INI file containing new user information from the user's TEMP directory.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if there is a problem deleting the configuration .ini file that the InstallShield custom actions use for the creation or configuration of a Windows user account.
27549	Error getting the primary domain controller (PDC).	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if the domain controller for the specified domain could not be found.
27550	Every field must have a value in order to create a user.	This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if one of the settings on the LogonInfoCreateUser dialog is left blank.
27551	ODBC driver for [2] not found. This is required to connect to [2] database servers.	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the ODBC driver that is associated with the SQL connection does not exist on the target system. To prevent this error from occurring, consider creating an InstallShield prerequisite that installs the driver, and add the prerequisite to your project.
27552	Error creating database [4]. Server: [2] [3]. [5]	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view, and if the Create Catalog If Absent check box on the General tab for the connection is selected. This error occurs if the target database server encounters a SQL scripting error when creating the database catalog that is specified in the Catalog Name setting on the General tab for a SQL connection in the SQL Scripts view.

Table 12-6 • Windows Installer Run-time Errors (cont.)

Error Number	Message	Troubleshooting Information
27553	Error connecting to database [4]. Server: [2] [3]. [5]	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the target database server encounters a SQL scripting error when connecting to the database catalog that is specified in the Catalog Name setting on the General tab for a SQL connection in the SQL Scripts view.
27554	Error attempting to open connection [2]. No valid database metadata associated with this connection.	This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the connection is associated with no valid database metadata. To prevent this error from occurring, check the **ISSQLConnectionDBServer** table in the Direct Editor view, and make any necessary changes.
27555	Error attempting to apply permissions to object '[2]'. System error: [3] ([4])	This error may occur if you used the custom InstallShield handling for securing files, folders, or registry keys in your project. To learn more about this functionality, see Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment.

Setup.exe Return Values and Run-Time Errors (InstallScript Projects)

Project • *This information applies to InstallScript projects.*

`Setup.exe` may produce error messages if it cannot start properly. In most cases, you will encounter these messages when a severe error occurs. Rarely will your end users see these messages.

You can capture these return values when you call the **CreateProcess** API to launch `Setup.exe`, or use a batch file to launch `Setup.exe`.

When you get an error message, it appears in a message box. Every error message has a number. These are InstallScript system error messages, and there is no way to suppress them in your script. The following table describes each of these error messages:

Table 12-7 • Run-time Errors and Return Values for InstallScript Projects

Error/Return Value	Description
3010	The installation required a restart but the installation is not initiating the restart. In this case, the installation completed with BATCH_INSTALL set to a non-zero value, but the **System** function was not called. Note that `Setup.exe` returns this value only if the installation was successful and was not cancelled (that is, the installation did not end via the abort keyword). Otherwise, the appropriate error value or ISERR_SETUP_CANCELED is returned. The constant for this return value is ERROR_SUCCESS_REBOOT_REQUIRED.
1641	This return value occurs if the installation itself is restarting the machine because the **System** function was called—typically as a result of the **SdFinishReboot** function calling **System** internally. Note that `Setup.exe` returns this value only if the installation was successful and was not cancelled (that is, the installation did not end via the abort keyword). Otherwise, the appropriate error value or ISERR_SETUP_CANCELED is returned. The constant for this return value is ERROR_SUCCESS_REBOOT_INITIATED.
0	The installation exited with the exit keyword.
0x80042000	The installation exited with the abort keyword because the end user canceled the installation. The constant for this return value is ISERR_SETUP_CANCELED.
0x80040708	Unable to create required engine components. Check whether you have appropriate privileges to create COM components.  ***Note*** • *This error message may include an additional error number and error string indicating more specific error information returned by the operating system.*
-5001	Generic error
-5002	Failed reading media header.
-5003	Failed installing kernel.
-5004	Failed starting kernel.
-5005	Failed opening CAB.

Table 12-7 • Run-time Errors and Return Values for InstallScript Projects (cont.)

Error/Return Value	Description
-5006	Failed installing support.
-5007	Failed setting text substitution.
-5008	Failed initializing installation information.
-5009	Failed getting installation driver.
-5010	Failed initializing properties.
-5011	Failed running installation driver.
-5012	Failed uninstalling support.
-5013	Failed to extract file from setup boot file.
-5014	Failed to download file (occurs only when saving installation files during an Internet installation).
-5017	Could not clone the installation.
-6001	Failed starting the setup launcher.
-6002	Failed finding the setup launcher.
-6003	Failed loading the setup launcher.
-6004	Failed verifying the signature of setup launcher.
-6005	Failed installing the setup launcher to proper location.
-6006	Failed extracting setup launcher.

Typically, any time one of the error messages in the previous table is displayed, it is accompanied by one of the HRESULT values in the following table. These HRESULT values provide additional information about the cause of the error.

Table 12-8 • HRESULT Values Associated with Setup.exe Run-time Errors

HRESULT	Meaning
0x80041F40	Cannot find corecomp.in.i
0x80041F41	corecomp.ini is empty or corrupted.

Table 12-8 • HRESULT Values Associated with Setup.exe Run-time Errors (cont.)

HRESULT	Meaning
0x80041F42	Cannot load the .dll file inIsCoGetClassObject.
0x80042328	Media is not signed.
0x80042329	Certificate is invalid.
0x8004232A	Digital signature is invalid.
0x8004232B	Space is insufficient.
0x80042A94	The specified opType's main opsequence is not present in the log, such as when an old file is opened with the new engine, and the new (engine) code tries to get an opsequence for the newly introduced opType.
0x80042A95	Failed to (re)construct a feature log's full ID.
0x80042A96	A log operation was attempted without opening the log file.
0x80042A97	Internal opsequence structure initialization failed.
0x80042A98	General failure in Opsequence::GetNext
0x80042A99	General failure in Opsequence::Pop
0x80042A9A	General failure in Opsequence::insert_sequencetuple
0x80042A9B	General failure in Opsequence::delete_sequencetuple
0x80042A9C	Property initialization failure - could occur when setting/getting a property in the LogDB or Feature object.

Setup.exe Return Values and Run-Time Errors (Basic MSI and InstallScript MSI Projects)

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Note that project-specific differences are explained where applicable.

The table below lists the errors that might occur when `Setup.exe` from a Basic MSI or InstallScript MSI project is run. For `Setup.exe` errors that might occur for an InstallScript project, see Setup.exe Return Values and Run-Time Errors (InstallScript Projects).

You can capture these return values when you call the **CreateProcess** API to launch `Setup.exe`, or use a batch file to launch `Setup.exe`.

Note • *If an error occurs on a non-English system, the error strings may not be displayed in English.*

Table 12-9 • Setup.exe Run-time Errors and Return Values

Error or Status Number	Message	Troubleshooting Tips
-4	Invalid command line.	 ***Project*** • *This is applicable to InstallScript MSI projects.* Verify that a valid command line is passed to `Setup.exe`.
-3	The installation exited because the end user canceled the installation.	 ***Project*** • *This is applicable to InstallScript MSI projects.*
-1	General error.	 ***Project*** • *This is applicable to InstallScript MSI projects.*
0	Program terminated successfully.	Not applicable.
401	String variable is not large enough for string. InstallShield was attempting to copy a text string into a string variable. The text string was larger than the length declared for that string variable.	Check the declared length of the string variable. Increase the length to the maximum allowed value.
1150	Setup has detected an incompatible version of Windows. Click OK and relaunch the setup on Windows 95, Windows NT 4.0, or later.	Windows Installer is compatible with NT 4.0 and later, and Windows 9x and later. Check your version of Windows and upgrade if necessary.

Table 12-9 • Setup.exe Run-time Errors and Return Values (cont.)

Error or Status Number	Message	Troubleshooting Tips
1151	Error writing to the temporary location	To write to the temporary location, the environment variable TEMP must be set. Verify that the Temp folder exists and has enough disk space to accommodate the setup. If there are files in the Temp folder, delete them and rerun Setup.exe.
1152	Error extracting <file name> to the temporary location	Check to see that you are able to write to the Temp folder (see errors above). If the Temp folder is valid, there may be corrupted files in the setup. Check the files to ensure none are corrupted and rerun Setup.exe.
1153	Error reading setup initialization file	The Setup.ini file must be located in the same folder as Setup.exe. If not, move Setup.ini to that location.
1154	Installer not found in <path>	Windows Installer may not have been properly installed, or you may have an older version. Reinstall if necessary.
1155	File <file name> not found	Make sure the .msi file exists. If so, make sure it is located in the same folder as `Setup.exe`. You may not see the .msi file if you chose to compress it into `Setup.exe`.
1156	Internal error in Windows Installer	Windows Installer was unsuccessfully installed. Run the `InstMsiW.exe` file (for Windows NT and 2000) or `InstMsiA.exe` (for Windows 9x) to reinstall.
1157	Failed to launch Msiexec.exe.	Make sure you distribute the correct version of Windows Installer for the target platform. Check the syntax on your Msiexec.exe command-line arguments.
1158	Error populating strings.	Verify that all strings in Setup.ini and any language-specific INI files in the Disk1 folder (such as 0x0409.ini) are valid.
1201	Setup needs <amount> KB free space in <folder>. Please free up some space and try again.	There is insufficient disk space in your target location. Please make sure there is at least 10 MB of free space in the drive where the setup is set to install.

Table 12-9 • Setup.exe Run-time Errors and Return Values (cont.)

Error or Status Number	Message	Troubleshooting Tips
1202	You do not have sufficient privileges to complete this installation for all users of the machine. Log on as an administrator and then retry this installation.	In Windows NT 4.0 and 2000, you must have administrative rights to complete this installation.
1203	Invalid command-line parameters.	Double-check the command-line statement used to launch Setup.exe.
1208	ANSI code page for <language> is not installed on the system and therefore setup cannot run in the selected language. Run the setup and select another language.	Run the setup and select another language.
1603	General Windows Installer engine error. Increase DiskSpace requirement in Setup.ini and try again.	 ***Project*** • *This is applicable to Basic MSI projects.* Reinstall Windows Installer.
1611	Unable to extract the file <filename>.	This error occurs when a file compressed inside `Setup.exe` cannot be extracted. Verify that there is sufficient disk space available in the Temp folder (or, if not, in the Windows or WinNT folder), and that Setup can write to those folders.
1614	An error occurred while downloading the file <filename>.	If the URL is incorrect, click **Cancel** and enter the correct URL. If the URL is correct, verify that an active Internet connection is available.
1621	Failed to verify signature of file <filename>.	The file was downloaded, but the signature could not be verified. The file might be corrupted, it might have been signed by a different company than originally signed it, or it might not be signed. Verify that the file Wintrust.dll exists on the target system.
1627	Unable to save file: <filename>.	Ensure that the specified file does not already exist, and that the target system has sufficient hard drive space.

Table 12-9 • Setup.exe Run-time Errors and Return Values (cont.)

Error or Status Number	Message	Troubleshooting Tips
1628	Failed to complete script based install.	 ***Project*** • *This is applicable to InstallScript MSI projects.*
1629	Invalid command line.	Double-check the command-line statement used to launch Setup.exe.
1641	The installation was successful and it required a restart.	 ***Project*** • *This is applicable to InstallScript MSI projects.* If the Windows Installer engine returns ERROR_SUCCESS (0), the `Setup.exe` file may return ERROR_SUCCESS_REBOOT_INITIATED (1641). This return value occurs if the installation itself is restarting the machine because the **System** function was called—typically as a result of the **SdFinishReboot** function calling **System** internally.
1670	Unable to load module [1], Error Code: [2]	[1] is the full path to the .dll file that the installation is attempting to load (`ISSetup.dll` in all cases). [2] is the Windows error returned from **LoadLibrary()**. This error occurs if `ISSetup.dll` is not in the Disk1 folder. It also may occur if `ISSetup.dll` is compressed in `Setup.exe` if a compressed media is being built. To resolve this error, try rebuilding the release.
1700	An error occurred initializing the InstallScript engine.	 ***Project*** • *This is applicable to InstallScript MSI projects.* This error indicates that a problem occurred when the InstallScript engine was being loaded.

Table 12-9 • Setup.exe Run-time Errors and Return Values (cont.)

Error or Status Number	Message	Troubleshooting Tips
1701	Unable to extract InstallScript engine support files to temp location.	***Project*** • *This is applicable to InstallScript MSI projects.* This error occurs if one or more files could not be extracted from the `ISSetup.dll` file to a temporary directory. To troubleshoot this error, create a Windows Installer log file to obtain more information. The log file has the corresponding Windows error number and other diagnostic information that may help troubleshoot this issue.
1919	Error configuring ODBC data source. Verify that the file exists and that you can access it.	Machines running Windows 95 do not have the ODBC core. You need to install MDAC before installing any package with an ODBC driver.
3010	The installation was successful and a restart is required to complete the installation.	***Project*** • *This is applicable to InstallScript MSI projects.* If the Windows Installer engine returns ERROR_SUCCESS (0), the `Setup.exe` file may return ERROR_SUCCESS_REBOOT_REQUIRED (3010). This indicates that installation required a restart but the installation is not initiating the restart. In this case, the installation completed with BATCH_INSTALL set to a non-zero value, but the **System** function was not called.

Setup.exe Return Values and Run-Time Errors (Advanced UI and Suite/Advanced UI Projects)

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

***Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The table below lists the errors that might occur when an end user runs an Advanced UI or Suite/Advanced UI `Setup.exe` installation. The Type of Code column in this table indicates the following information:

- **Exit code only**—The installation status is returned by the Advanced UI or Suite/Advanced UI `Setup.exe` file.
- **Error code/exit code**—The installation status is processed for evaluated error conditions, and the status is returned by the Advanced UI or Suite/Advanced UI `Setup.exe` file.
- **Logged only**—The installation status is logged when debug logging is enabled. (Debug logging is enabled when the `/debuglog` command-line parameter is passed to the Advanced UI or Suite/Advanced UI `Setup.exe` file to launch the Advanced UI or Suite/Advanced UI installation. For more information on command-line parameters, see Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters.)

***Note** • Some of the error messages may be displayed before any string entries are available to the running Advanced UI or Suite/Advanced UI `Setup.exe` file. Therefore, in such cases (for example, Setup.xml is missing, another instance of the Advanced UI or Suite/Advanced UI installation is already running, or condition validation failed), those particular resulting error messages are displayed in English. Other errors that occur before language selection are typically displayed in the default setup language.*

Table 12-10 • Setup.exe Run-time Errors and Return Values

Status Code	Type of Code	Message	Troubleshooting Tips
0x80040701	**Exit code only**	Failed to read or initialize setup state information; missing SuiteId attribute on setup.xml setup element. Contact your vendor for assistance.	The value of the SuiteID attribute in the `Setup.xml` file indicates the Suite GUID, as defined in the General Information view of the project. If this GUID is somehow removed from the `Setup.xml` file, this error may occur at run time. To resolve this error, try rebuilding the Advanced UI or Suite/ Advanced UI installation.
0x80040702	**Exit code only**	No UI DLL was loaded and initialized, possibly due to a missing UI resource. Contact your vendor for assistance.	This exit code occurs if the UIResource definition in the project or the `Setup.xml` file is missing or invalid (for example, for a corrupted project).

Table 12-10 • Setup.exe Run-time Errors and Return Values (cont.)

Status Code	Type of Code	Message	Troubleshooting Tips
0x80040705	**Exit/error code**	MD5 check failed for the current file to be staged. The file may be corrupted.	An Advanced UI or Suite/Advanced UI installation uses MD5 checks the integrity of the packages in the Advanced UI or Suite/Advanced UI installation. If the MD5 check fails, this error occurs. To resolve this error, try rebuilding the Advanced UI or Suite/Advanced UI installation.
0x80040706	**Exit code only**	No setup.xml file was found in the running suite setup. Contact your vendor for assistance.	This status code occurs if the `Setup.xml` resource could not be found.
0x80040707	**Logged only**	Failed to extract a file that is necessary to run this setup. Contact your vendor for assistance.	The log includes this status code if a resource that is listed in the Resources section of the `Setup.xml` file could not be extracted from the running Advanced UI or Suite/Advanced UI `Setup.exe` file. Check for build errors and the Support Files view for missing resources, and add them as needed.
0x80040708	**Logged only**	Failed to copy or download a file that is necessary to run this setup. Contact your vendor for assistance.	The log includes this status code if a resource that is listed in the Resources section of the `Setup.xml` file could not be copied or downloaded. Check for build errors and the Support Files view for missing resources, and add them as needed.
0x80040709	**Error code only**	Failed to extract a file while staging. Either the file is not present in the stream or the file could not be written to the target machine.	This error occurs if the Advanced UI or Suite/Advanced UI installation fails to stage a file that is streamed into the Advanced UI or Suite/Advanced UI `Setup.exe` file. Either the installation is corrupted or the file was missing at build time.

Table 12-10 • Setup.exe Run-time Errors and Return Values (cont.)

Status Code	Type of Code	Message	Troubleshooting Tips
0x8004070A	**Exit/error code**	The setup password is incorrect or was not entered. The setup cannot proceed.	The Setup.exe tab for a release in the Releases view of an Advanced UI or Suite/Advanced UI project lets you specify whether you want to password protect the setup launcher; if you do, you can also specify the password that end users need to enter in order to run the installation. This error occurs if there is no prompt for a password from the user interface during the preinstall phases of the installation. This can occur if a custom UI DLL is used and the end user tries to avoid the password prompt. This can also occur if an end user launches a password-protected Advanced UI or Suite/Advanced UI installation silently from the command line but does not include a password on the command line.
0x8004070B	**Exit/error code**	The setup command line is invalid. The setup cannot proceed.	This error occurs if you pass an invalid command-line parameter to the Advanced UI or Suite/Advanced UI `Setup.exe` file while launching it from the command line. For a list of valid command-line parameters, see Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters.
0x8004070C	**Exit/error code**	The setup could not start in a temporary folder. Contact your vendor for assistance.	This error occurs if the Temp folder on the target system is full. To resolve this error, consider freeing space in the Temp folder.

Table 12-10 • Setup.exe Run-time Errors and Return Values (cont.)

Status Code	Type of Code	Message	Troubleshooting Tips
0x8004070D	**Exit/error code**	The destination folder that was entered for a staging-only operation could not be created.	When you are running an Advanced UI or Suite/Advanced UI installation with the `/stage_only` command-line parameter, the Advanced UI or Suite/Advanced UI installation attempts to copy its packages to a directory that is specified by the user. The directory must exist; if it does not, the installation encounters this error. To resolve this error, ensure that the path that you specify on the BrowseStageFolder wizard page exists. If it does not, create it and then rerun the installation.
0x8004070E	**Exit/error code**	An unknown failure occurred attempting to cache a file from either a remote server or a local path. Contact your vendor for assistance.	If the file is located on a Web server, ensure that it is available on the machine where the installation is encountering this error. If the file is located on source media, ensure that the source media is available and valid. Check a debug log for any additional information that might be available.

Table 12-10 • Setup.exe Run-time Errors and Return Values (cont.)

Status Code	Type of Code	Message	Troubleshooting Tips
0x8007007f	**Error code only**	The specified procedure could not be found.	This error is system error 127. This error may occur if the Advanced UI or Suite/Advanced UI installation is run on a system that does not meet the minimum requirements for Windows Installer: • To run an Advanced UI or Suite/Advanced UI installation on a target system, the target system must have Windows Installer 3.1 or later. To avoid this error on these systems, you may want to create an exit condition that prevents the entire Advanced UI or Suite/Advanced UI installation from running on systems that do not have Windows Installer 4.5 or later. To learn more, see Defining Exit Conditions for an Advanced UI or Suite/Advanced UI Installation.

Table 12-10 • Setup.exe Run-time Errors and Return Values (cont.)

Status Code	Type of Code	Message	Troubleshooting Tips
0x8007007f (cont.)			• If the Advanced UI or Suite/Advanced UI installation contains packages that run with transaction processing, the target system must have Windows Installer 4.5 or later. To avoid this error on these systems, you may want to create an eligibility condition for each package in the transaction to prevent the Advanced UI or Suite/Advanced UI installation from launching those packages on systems that have earlier versions of Windows Installer. For more information, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects. This error may also occur if the Advanced UI or Suite/Advanced UI installation has trouble installing an InstallScript package because the package was built in InstallShield 2012 or earlier. For more information, see Adding an InstallScript Package to an Advanced UI or Suite/Advanced UI Project. In addition, this error may occur if there is a problem with an Advanced UI or Suite/Advanced UI extension condition. If your project includes an extension condition, check to ensure that the DLL for the extension condition has the proper exported entry points.

Visual Studio Project Import Errors and Warnings

This table lists the errors and warnings that might occur when you do any of the following:

- Convert a Visual Studio setup project (.vdproj) to an InstallShield Basic MSI project (.ism).
- Convert a Visual Studio merge module project (.vdproj) to an InstallShield Merge Module project (.ism).
- Import a Visual Studio setup or merge module project (.vdproj) into an InstallShield Basic MSI or Merge Module project (.ism).

Table 12-11 • Visual Studio Project Import Errors and Warnings

Error or Warning Number	Message	Troubleshooting Tips
-9000	An unknown exception occurred.	Check the Knowledge Base for information about this error, or request technical support.
-9001	An unknown COM exception occurred.	Check the Knowledge Base for information about this error, or request technical support.
-9002	An error occurred while loading the project %1.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9003	An error occurred while creating the project %1.	This error occurs if InstallShield cannot create a Basic MSI project from the Visual Studio setup project or a Merge Module project from the Visual Studio merge module project. InstallShield tries to create the project in the same folder that contains the Visual Studio project file (.vdproj). To resolve this error, see if the folder that contains the Visual Studio project file is read-only, and change it to writable.
-9004	An error occurred while saving the project %1.	This error occurs if InstallShield cannot create a Basic MSI project from the Visual Studio setup project or a Merge Module project from the Visual Studio merge module project. InstallShield tries to save the project in the same folder that contains the Visual Studio project file (.vdproj). To resolve this error, see if the folder that contains the Visual Studio project file is read-only, and change it to writable.
-9005	An error occurred while converting the project.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9006	An error occurred while determining the project type.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9007	An error occurred while parsing the section '%1'.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9008	No open brace found for the section %1 under %2.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9009	No close brace found for the section %1 under %2.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9010	An invalid entry %1 found in the section %1 under %2.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9011	An error occurred while adding the property %1 to the section %2.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9012	An error occurred while adding the section %1 to the section %2.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9013	The section %1 does not exist.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9014	An error occurred while converting the product properties.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9015	An error occurred while converting the files.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9016	The file type %1 is invalid. The file %2 was not converted.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9017	An error occurred while converting the file %1. Type: %2	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9018	An error occurred while converting the features.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9019	An error occurred while converting the feature %1.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9020	An error occurred while converting the folders.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9021	An error occurred while converting the folder %1. Type: %2	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9022	The folder type %1 is invalid. The folder %2 was not converted.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9023	An error occurred while converting the custom actions.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9024	An error occurred while converting the custom action %1. Type: %2	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9025	The custom action type %1 is invalid. The custom action %2 was not converted.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9026	A component for the source file %1 of the custom action %2 was not found.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9027	An error occurred while converting the file types.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9028	An error occurred while converting the file extension %1. Type: %2	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9029	The file extension type %1 is invalid. The file extension %2 was not converted.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9030	An error occurred while converting the verb %1. Type: %2	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9031	The verb type %1 is invalid. The verb %2 was not converted.	This error may occur if the Visual Studio project file is corrupted or if InstallShield cannot correctly read the Visual Studio project file. To resolve this error, request technical support.
-9032	A command is not specified for the file extension %1. The file extension was not converted.	This warning occurs if the Command property for the specified file type was left blank in the File Types Editor in Visual Studio. The warning alerts you that InstallShield could not configure the file extension during the conversion process. To resolve this issue, specify a command for the file type in Visual Studio, and then convert the Visual Studio setup project to an InstallShield project. Otherwise, you can add and configure the file extension in the File Types area of the Components view in InstallShield.
-9033	A component for the command %1 of the file extension %2 not found. The file extension was not converted.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9034	An error occurred while converting the registries.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9035	An error occurred while converting the registry key %1. Type: %2	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9036	The registry key type %1 is invalid. The registry key %2 was not converted.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9037	An error occurred while converting the registry value %1. Type: %2	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9038	The registry value type %1 is invalid. The registry value %2 was not converted.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9039	An error occurred while converting the shortcuts.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9040	An error occurred while converting the shortcut %1. Type: %2	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9041	The shortcut type %1 is invalid. The shortcut %2 was not converted.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9042	The shortcut target %1 is invalid. The shortcut %2 was not converted.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9043	An error occurred while converting the launch conditions.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9044	An error occurred while converting the launch condition %1. Type: %2	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9045	The launch condition type %1 is invalid. The launch condition %2 was not converted.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9046	An error occurred while converting the locators.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9047	An error occurred while converting the locator %1. Type: %2	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9048	The locator type %1 is invalid. The locator %2 was not converted.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9049	An error occurred while converting the product icon.	This error may occur if the Visual Studio setup or merge module project file is corrupted or if InstallShield cannot correctly read the Visual Studio setup project file. To resolve this error, request technical support.
-9050	The project language '%1' is not installed in InstallShield. The language was not converted.	This warning occurs if you convert a Visual Studio project that includes support for a language, but InstallShield does not have built-in support for that language.  ***Edition*** • *The Premier edition of InstallShield includes multilanguage support, but the Professional edition does not.*

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9052	File type '%1' specifies no extensions. The file type was not converted.	This warning occurs if the Extensions property for the specified file type was left blank in the File Types Editor in Visual Studio. The warning alerts you that InstallShield could not configure the file extension during the import or conversion process. To resolve this issue, specify one or more file extensions for the file type in Visual Studio, and then convert or import the Visual Studio project into an InstallShield project. Otherwise, you can add and configure the file extension in the Advanced Settings area of the Components view in InstallShield after you have converted or imported the Visual Studio project.
-9053	Launch condition '%1' specifies no conditions. The launch condition was not converted.	This warning occurs if the Condition property for the specified launch condition was left blank in the Launch Conditions Editor in Visual Studio. The warning alerts you that InstallShield could not configure the launch condition during the import or conversion process. To resolve this issue, specify a condition in Visual Studio, and then convert or import the Visual Studio project into an InstallShield project. Otherwise, you can add and configure the launch condition in the General Information view in InstallShield after you have converted or imported the Visual Studio project.
-9054	File search '%1' specifies no file names. The file search was not converted.	This warning occurs if the FileName property for the specified file search was left blank in the Launch Conditions Editor in Visual Studio. The warning alerts you that InstallShield could not configure the file search during the import or conversion process. To resolve this issue, specify the file name for the file search in Visual Studio, and then convert or import the Visual Studio project into an InstallShield project. Otherwise, you can add and configure the file search in the System Search view in InstallShield after you have converted or imported the Visual Studio project.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9055	Feature '%1' already exists in the InstallShield project. The feature was not converted.	This warning occurs if you have a Visual Studio project that contains a particular feature and you import that project into an InstallShield project that already contains that feature. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once.
-9056	Directory '%1' already exists in the InstallShield project. The folder '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular folder and you import that project into an InstallShield project that already contains that folder. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Files and Folders view to ensure that the folder that is identified in the warning message is not missing from your InstallShield project.
-9057	File key '%1' already exists in the InstallShield project. The file '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a file that is associated with a particular file key and you import that project into an InstallShield project that already contains a file with that same file key. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Files area of the Components view to ensure that the file that is identified in the warning message is not missing from your InstallShield project. Note that the Direct Editor view shows the file key that is associated with each file in your project. The file keys are the primary keys of the **File** table in the .msi database; the **File** table cannot contain duplicate file keys.
-9058	Shortcut key '%1' already exists in the InstallShield project. The shortcut '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a shortcut that is associated with a particular shortcut key and you import that project into an InstallShield project that already contains a shortcut with that same shortcut key. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Shortcuts view to ensure that the shortcut that is identified in the warning message is not missing from your InstallShield project.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9059	Extension '%1' already exists in the InstallShield project. The file type '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular file extension and you import that project into an InstallShield project that already contains that same file extension. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Advanced Settings area of the Components view to ensure that the file extension that is identified in the warning message is not missing from your InstallShield project.
-9060	Registry key '%1' already exists in the InstallShield project. The registry entry 'Key: %2 Value: %3 Data: %4' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular registry entry and you import that project into an InstallShield project that already contains that same registry entry. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Registry view to ensure that the registry entry that is identified in the warning message is not missing from your InstallShield project.
-9061	Custom action '%1' already exists in the InstallShield project. The custom action named '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular custom action and you import that project into an InstallShield project that already contains a custom action with that same name. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Custom Actions and Sequences view to ensure that the custom action that is identified in the warning message is not missing from your InstallShield project.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9062	Launch condition '%1' already exists in the InstallShield project. The launch condition named '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular launch condition and you import that project into an InstallShield project that already contains a launch condition with that same name. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Install Condition setting in the General Information view to ensure that the launch condition that is identified in the warning message is not missing from your InstallShield project.
-9063	RegLocator '%1' already exists in the InstallShield project. The registry search '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular registry search and you import that project into an InstallShield project that already contains a registry search with that same name. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the System Search view to ensure that the registry search that is identified in the warning message is not missing from your InstallShield project.
-9064	DrLocator '%1' already exists in the InstallShield project. The file search '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular file or folder search and you import that project into an InstallShield project that already contains a file or folder search with that same name. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the System Search view to ensure that the file or folder search that is identified in the warning message is not missing from your InstallShield project.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9065	CompLocator '%1' already exists in the InstallShield project. The Windows Installer search '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a particular file or folder search and you import that project into an InstallShield project that already contains a file or folder search with that same name. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the System Search view to ensure that the file or folder search that is identified in the warning message is not missing from your InstallShield project.
-9070	An error occurred while converting the prerequisites.	This error occurs if you import a Visual Studio setup project that contains a prerequisite but InstallShield encounters a problem when trying to map the Visual Studio prerequisite to an equivalent InstallShield prerequisite. To resolve this error, request technical support, or consider creating an InstallShield prerequisite that installs the required redistributable, and add that InstallShield prerequisite to your project. For more information, see Defining InstallShield Prerequisites and Working with InstallShield Prerequisites that Are Included in Installation Projects.
-9071	InstallShield has no equivalent InstallShield prerequisite for '%1'. The prerequisite was not converted.	This warning occurs if you import a Visual Studio setup project that contains a prerequisite but InstallShield does not have an equivalent InstallShield prerequisite. To resolve this warning, consider creating an InstallShield prerequisite that installs the required redistributable, and add that InstallShield prerequisite to your project. For more information, see Defining InstallShield Prerequisites and Working with InstallShield Prerequisites that Are Included in Installation Projects.
-9074	An error occurred while converting the project outputs.	This error occurs if you convert a Visual Studio setup or merge module project that contains one or more project outputs but InstallShield encounters a problem when incorporating the project outputs into the InstallShield project. To resolve this error, request technical support.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9075	An error occurred while converting the project output %1. Type: %2	This error occurs if you convert a Visual Studio setup or merge module project that contains one or more project outputs but InstallShield encounters a problem when incorporating the project outputs into the InstallShield project. To resolve this error, request technical support.
-9076	The project output type %1 is invalid. The project output %2 was not converted.	This error occurs if you convert a Visual Studio setup or merge module project that contains one or more project outputs but one of the project outputs is invalid. To resolve this error, review the project output in your Visual Studio project, and try to resolve any issues with it. Then convert the Visual Studio project to an InstallShield project.
-9077	File key '%1' already exists in the InstallShield project. The project output '%2' was not converted.	This warning occurs if you have a Visual Studio project that contains a project output that has a file that is associated with a particular file key, and you import that project into an InstallShield project that already contains a file with that same file key. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Files and Folders view to ensure that the file that is identified in the warning message is not missing from your InstallShield project. Note that the Direct Editor view shows the file key that is associated with each file in your project. The file keys are the primary keys of the **File** table in the .msi database; the **File** table cannot contain duplicate file keys.
-9078	The InstallShield project is not in a Visual Studio solution. The project output '%1' was not converted.	This error occurs if your InstallShield project is open in InstallShield, but not from within Visual Studio, and you try to import a Visual Studio project that contains project outputs into the InstallShield project. To resolve this error, open your InstallShield project from within Visual Studio, and then import the Visual Studio project into it.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9079	The Visual Studio project '%1' could not be found in the current Visual Studio solution. The project output '%2' was not converted.	If you want to import into an InstallShield project a Visual Studio setup or merge module project that contains a project output, the Visual Studio project must be in the same solution as all of its project dependencies. Otherwise, this error occurs when you try to import the Visual Studio project. To resolve this error, ensure that your InstallShield project is in the same Visual Studio solution that contains the Visual Studio setup or merge module project that you are importing. In addition, ensure that the solution also includes all of the other Visual Studio projects that are dependencies of the Visual Studio setup or merge module project. Then you can import the Visual Studio setup or merge module project into your InstallShield project.
-9080	The project output group '%1' could not be found in the Visual Studio project '%2'. The project output '%3' was not converted.	This error occurs if you convert a Visual Studio setup or merge module project that contains a project output group but InstallShield encounters a problem when incorporating a project output of that group into the InstallShield project. To resolve this error, request technical support.
-9081	File '%1' is specified to be excluded from a setup or merge module. The file was not converted.	This warning occurs if you import into an InstallShield project a Visual Studio setup or merge module project that contains a file whose Exclude property is set to True. If you want the specified file to be excluded from your InstallShield project, you can ignore this warning. If you want the specified file to be included in your InstallShield project, you can use the Files and Folders view in InstallShield to add it. For more information, see Adding Files Through the Files Explorer.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9082	Project output '%1' is specified to be excluded from a setup or merge module. The project output was not converted.	This warning occurs if you import into an InstallShield project a Visual Studio setup or merge module project that contains a file in a project output, and True is selected for the Exclude property of that file. If you want the specified file to be excluded from your InstallShield project, you can ignore this warning. If you want the specified file to be included in your InstallShield project, you can use the Files and Folders view in InstallShield to add it. For more information, see Adding References to Visual Studio Solutions.
-9083	Visual Studio default launch conditions are not supported in InstallShield. The launch condition named '%1' was not converted.	This warning occurs if you import into InstallShield project a Visual Studio setup or merge module project that contains a default launch condition. If you want the specified launch condition to be excluded from your InstallShield project, you can ignore this warning. If you want to add a launch condition to your InstallShield project to check the target system for the default launch condition that Visual Studio added to the original project, you can use the System Search view in InstallShield to add it. For more information, see Adding a System Search.
-9086	MinDate '%1' for the file search named '%2' is not valid. The MinDate property was not converted.	This warning occurs if you attempt to import or convert a Visual Studio setup that has a file search with an invalid value for the MinDate property. To resolve this warning: 1. Open the **System Search** view in InstallShield. 2. Right-click the file search and then click **Modify**. The **System Search Wizard** opens. 3. On the second panel of this wizard, click the **Details** button. The **File Details** dialog box opens. 4. Enter the appropriate details.

Table 12-11 • Visual Studio Project Import Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-9087	MaxDate '%1' for the file search named '%2' is not valid. The MaxDate property was not converted.	This warning occurs if you attempt to import or convert a Visual Studio setup that has a file search with an invalid value for the MaxDate property. To resolve this warning: 1. Open the **System Search** view in InstallShield. 2. Right-click the file search and then click **Modify**. The **System Search Wizard** opens. 3. On the second panel of this wizard, click the **Details** button. The **File Details** dialog box opens. 4. Enter the appropriate details.
-9088	InstallShield does not have support for converting Visual Studio Web Setup projects into InstallShield projects.	This error occurs if you attempt to import or convert a Visual Studio Web setup project in InstallShield, since InstallShield does not have support for this conversion. If you encounter this type of error, consider creating a new project in InstallShield and using the Internet Information Services view to manage an IIS Web site on a target system.
-9089	InstallShield does not have support for converting Visual Studio CAB projects into InstallShield projects.	This error occurs if you attempt to import or convert a Visual Studio CAB setup project in InstallShield, since InstallShield does not have support for this conversion.
-9090	The Visual Studio project type could not be identified. Therefore, the project was not converted.	This error occurs if you attempt to attempt to import or convert a Visual Studio project type that InstallShield could not identify.
-10000	Conversion canceled by user.	This error occurs if you cancel the conversion process before it finishes.

Upgrade Errors (Upgrading from InstallShield Professional)

This table provides tips for troubleshooting errors that may occur when you upgrade a project (.ism file) created with InstallShield Professional to InstallShield.

Table 12-12 • Tips for Troubleshooting Upgrade Errors

Error Number	Message	Troubleshooting Tips
-61	Could not extract the InstallShield Professional project version. Version 5.5 is assumed.	Make sure the project you are trying to convert is InstallShield Professional version 5.5 or later. If your setup was created using an earlier version of InstallShield Professional, visit the Support Web site for help.
-62	Could not find key LanguageSupport under section [Language] in file <FileName>	The languages your InstallShield Professional setup support could not be determined. You need to define the supported languages manually.
-63	Could not find key ProductName under section [Data] in file <FileName>	The name of your InstallShield Professional project could not be determined. You need to enter this information manually in the Subject field of the Summary Information Stream.
-64	Could not find key Author under section [Data] in file <FileName>	The name of the InstallShield Professional setup could not be determined. You need to manually enter this information in the Author field of the Summary Information Stream.
-65	Could not find key Version under section [Data] in file <FileName>	The version of your setup project could not be determined. You must manually enter this information in the Product Version setting of the General Information view.
-66	Could not find key HomeUrl under section [Data] in file <FileName>	The URL for your application could not be determined. You need to enter this information in one or all of the following settings in the General Information view: Publisher/Product URL, Support URL, and Product Update URL.
-67	Could not find key CompanyName under section [Data] in file <FileName>	Your Company Name could not be read from the InstallShield Professional project file. You need to manually enter this information in the Publisher setting in the General Information view.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-68	Could not find key InstallationGuid under section [Data] in file <FileName>	The GUID of your installation could not be determined. A new GUID has been created for you in the Product Code setting in the General Information view. If you have the original GUID for your setup, you can overwrite the new GUID generated for you.
-69	Could not find key CurrentFileGroupDef under section [Data] in file <FileName>	A reference to your project's file groups could not be found. Verify your InstallShield Professional's file group settings, save your project, and try upgrading your project again.
-70	Could not find key CurrentComponentDef under section [Data] in file <FileName>	A reference to your project's components could not be found. Verify your InstallShield Professional project's component settings, save your project, and try upgrading your project again.
-79	Could not find key Platforms under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-80	Could not find key Password under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-81	Warning: The Copyright, Department, Email, and Summary settings are not used. Warning: The Descriptions.txt, Instructions.txt, and Notes.txt files are not used. Warning: Use the Source Control option in the Project menu to add your project to source control.	The your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore these warnings.
-82	Could not find key RunDebug under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-241	Could not find key SELFREGISTERING under section <FileGroupName> in file <FileName>	Error determining if your file groups are self-registering. By default, your new components created from this file group are not marked as self-registering. You can change this setting in the property page for the appropriate component.
-242	Could not find key TARGET under section <FileGroupName> in file <FileName>	The Target directory of one of your file groups could not be determined. The component or components created from this file group point to <INSTALLDIR> by default. You can change this setting in the appropriate component's Destination property.
-243	Could not find key LANGUAGE under section <FileGroupName> in file <FileName>	The target languages for one of your file groups could not be determined. The component created from this file group will be language independent. You can change this setting in the appropriate component's Languages property.
-244	Could not find key FOLDER under section [DYNAMIC] in file <FileName>	A reference to your dynamic file links could not be found for one of your file groups. As a result, none of the files referenced by that dynamic link were migrated. You can either open your InstallShield Professional project and verify your dynamic link settings, or manually add these files to your new project.
-245	Could not find key INCLUDESUBDIR under section [DYNAMIC] in file <FileName>	It could not be determined if subfolders were to be included as part of your dynamic link for one of your file groups. As a result, no subfolders are included in your new project. You can either open your InstallShield Professional project and verify your dynamic link settings, or manually add these files to your new project.
-246	Could not find key WILDCARD under section [DYNAMIC] in file <FileName>	The wildcards you specified for one of your dynamic links could not be read. As a result, all files included in the dynamic link's specified directory were added to your setup. You can either open your InstallShield Professional project and verify your dynamic link settings, or manually remove unwanted files from your new project.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-247	Could not find key FILETYPE under section <SectionName> in file <Path>\Default.fdf	It could not be determined if one of your file groups was marked as shared. As a result, the components created from that file group are not marked as shared. To change this setting, change the appropriate component's Shared property to *Yes*.
-252	Could not find key Folder under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-281	Error opening file <Path>\Default.fdf	A reference to your file groups could not be found. Verify your file group settings in your InstallShield Professional project, save, and open your project in InstallShield 2013 again.
-282	Error Opening file: <FileName>	The upgrade could not locate one of your file groups. Therefore, no files associated with that file group were added to your setup. Verify your file group settings in your InstallShield Professional project, save, and open your project in InstallShield 2013 again.
-283	Could not find section [FILEGROUPS] in file <Path>\Default.fdf	A reference to your file groups could not be found. Verify your file group settings in your InstallShield Professional project, save, and open your project in InstallShield 2013 again.
-284	Could not find section <SectionName> in file <Path>\Default.fdf	One of your file groups could not be found. As a result, none of the files associated with that file group were added to your project. Verify your file group settings in your InstallShield Professional project, save, and open your project in InstallShield 2013 again.
-285	Could not find key FILETYPE under section <SectionName> in file <Path>\Default.fdf	InstallShield could not determine if the files for one of your file groups was linked to dynamically or statically. As a result, none of that file group's files were added to your setup. Verify your file group settings in your InstallShield Professional project, save, and open your project in InstallShield again.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-286	Could not find section [DYNAMIC] in file <FileName>	InstallShield could not determine if the files for one of your file groups was linked to dynamically or statically. As a result, none of that file group's files were added to your setup. Verify your file group settings in your InstallShield Professional, save, and open your project in InstallShield again.
-301	Could not find key DESCRIPTION under section <SectionName> in file <Path>\Default.cdf	The Description property for one of your components could not be read. Enter this information manually in the Description property for the feature created from your component.
-302	Could not find key DISPLAYTEXT under section <SectionName> in file <Path>\Default.cdf	The display name for one of your components could not be read. Enter this information manually in the **Display Name** property for the feature created from your component.
-303	Could not find key COMMENT under section <SectionName> in file <Path>\Default.cdf	The comments for one of your component could not be found. Enter this information manually in the **Comments** property of the appropriate component.
-306	Could not find key <KeyName> under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-341	Error Opening file: <Path<\Default.cdf	There was an error importing your components. As a result, no features were created. Verify the component settings in your InstallShield Professional, save, and open your project in InstallShield again.
-342	Could not find section [COMPONENTS] in file <Path>\Default.cdf	There was an error importing your components. As a result, no features were created. Verify the component settings in your InstallShield Professional project, save, and open your project in InstallShield again.
-343	Could not find section <SectionName> in file <Path>\Default.cdf	There was an error importing one of your components. As a result, that component was not migrated. Verify the component settings in your InstallShield Professional project, save, and open your project in InstallShield again.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-401	Error opening file <Path>\Default.reg	The registry information associated with your InstallShield Professional project could not be read. As a result, no registry information was migrated. Verify the registry settings in your InstallShield Professional project, save, and open your project in InstallShield again.
-402	Could not find section [DATA] in file <Path>\Default.re	The registry information associated with your InstallShield Professional project could not be read. As a result, no registry information was migrated. Verify the registry settings in your InstallShield Professional project, save, and open your project in InstallShield again.
-403	Could not find section <SectionName> in file <Path>\Default.re	A portion of your registry information could not be read. As a result, that registry data was not migrated. Verify the registry settings in your InstallShield Professional project, save, and open your project in InstallShield again.
-404	Could not find section <SectionName> in file <Path>\Default.re	A portion of your registry information could not be read. As a result, that registry data was not migrated. Verify the registry settings in your InstallShield Professional project, save, and open your project in InstallShield again.
-421	Could not find key TARGET under section <SectionName> in file <Path>\Default.shl	The target for one of your shortcuts could not be determined. Manually enter this information in the Target property of the appropriate shortcut.
-422	Could not find key ICONFILE under section <SectionName> in file <Path>\Default.shl	The icon for one of your shortcuts could not be determined. Manually enter this information in the Icon File property of the appropriate shortcut.
-423	Could not find key ICONINDEX under section <SectionName> in file <Path>\Default.shl	The icon index for one of your shortcuts could not be determined. Manually enter this information in the Icon Index property of the appropriate shortcut.
-424	Could not find key DISPLAYTEXT under section <SectionName> in file <Path>\Default.shl	The shortcut text for one of your shortcuts could not be determined. Manually enter this information in the Display Name property of the appropriate shortcut.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-425	Could not find key PARAMETERS under section <SectionName> in file <Path>\Default.shl	The arguments for one of your shortcuts could not be determined. Manually enter this information in the Arguments property of the appropriate shortcut.
-426	Could not find key SHORTCUTKEY under section <SectionName> in file <Path>\Default.shl	The shortcut key for one of your shortcuts could not be determined. Manually enter this information in the Hot Key property of the appropriate shortcut.
-427	Could not find key STARTIN under section <SectionName> in file <Path>\Default.shl	The start in directory for one of your shortcuts could not be determined. Manually enter this information in the Working Directory property for the appropriate shortcut.
-428	Could not find key COMMENTS under section <SectionName> in file <Path>\Default.shl	The comments for one of your shortcuts could not be read. Manually enter this information in the Comments property for the appropriate shortcut.
-429	Could not find key RUN under section <SectionName> in file <Path>\Default.shl	The Run property of one of your shortcuts could not be read. This property will be set to Normal by default in the appropriate shortcut's Run property.
-430	Could not find key Typeunder section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-431	Could not find key Uninstall under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-432	Could not find key DisplayText under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-433	Could not find key Shared under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-434	Could not find key Replace under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-435	Could not find key InternetShortcut under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-440	Could not find key EngineBinding under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-441	Could not find key UpdateMode under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-442	Could not find key UpdateService under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-443	Could not find key LogFile under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-461	Error opening file <Path>\Default.shl	The shell object information associated with your InstallShield Professional project could not be read. As a result, no shortcuts were created. Verify that the shell object settings in your InstallShield Professional project, save, and open the project in InstallShield again.
-462	Could not find section [DATA] in file <Path>\Default.shl	The shell object information associated with your InstallShield Professional project could not be read. As a result, no shortcuts were created. Verify that the shell object settings in your InstallShield Professional project, save, and open the project in InstallShield again.
-463	Could not find key <KeyName> under section [DATA] in file <Path>\Default.shl	One of your shortcuts could not be migrated. Manually create this shortcut in the Shortcuts explorer.
-464	Could not find section <SectionName> in file <Path>\Default.shl	One of your shortcuts could not be migrated. Manually create this shortcut in the Shortcuts explorer.

Table 12-12 • Tips for Troubleshooting Upgrade Errors (cont.)

Error Number	Message	Troubleshooting Tips
-471	Could not find section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.
-500	Could not find key <KeyName> under section <SectionName> in file <.ipr file>.	If your project was created with a version of InstallShield Professional earlier than InstallShield Professional 7.0, you can ignore this warning.

Upgrade Warnings (Upgrading from InstallShield Professional)

Because of the differences in architecture between InstallShield Professional and InstallShield 2013, upgrading your installation project might involve some manual adjustment.

If you need to manually adjust settings within your project, a warning appears in the Output window after your project is upgraded. Refer to the associated help topic to learn what you need to do. (cont.)

Table 12-13 • Upgrade Warnings

Warning Number	Message
-289	File link does not exist for a dynamically linked file.
-305	The **Include In Build** property for the InstallShield Professional component could not be directly migrated.
-480	The Shared attribute can be set for only the key file of a component.
-481	The Shared attribute can be set for only the key file of a component. A dynamically linked file cannot be a key file.
-486	Shortcut icons must be linked to at design time.
-487	In InstallShield 2013, installation of files is done according to file versioning rules.
-488	An obsolete event was encountered in your script.
-495	The ODBC core is not installed by default. If you need this functionality in your setup project, navigate to the Redistributables view and select the MDAC merge module.

Upgrade Warning 289: File Link Does Not Exist for Dynamically Linked File

In InstallShield Professional, dynamically linking to your source files allows you to add the contents of complete folders and subfolders to your setup without hard-coding paths or file names. If you add files to the source folder or remove files, the list of included files was dynamically updates when you build your release.

Upgrading to InstallShield 2013

When you upgrade an InstallShield Professional project to InstallShield 2013, and include a file via dynamic file linking that does not exist, Upgrade Warning 289 appears. The warning informs you that a file link has been created, but the file does not exist.

Upgrade Warning -305: Include In Build Property for the InstallShield Professional Component Could Not Be Directly Migrated

If a component in your InstallShield Professional project had its **Include In Build** property set to No, the corresponding feature will have its Release Flags property set to EXCLUDEFROMBUILD. To exclude the feature from your setup, you need to manually set a release flag in the Releases view or the Filtering Settings panel of the Release Wizard.

Note • *Because the release flag in the **Releases** view indicates which features to include in the setup, the flag you specify in the **Releases** view must be something other than EXCLUDEFROMBUILD.*

Upgrade Warning -480: Incrementing the Shared .dll Reference Count for Files in a File Group

In InstallShield Professional versions 6.x and earlier, setting the shared property for a file group resulted in incrementing the shared .dll reference count for *all* files in that file group on installation. This upgrade migrates this setting to the shared attribute of the component created, in InstallShield 2013, for this file group.

Shared .dll Reference Count Behavior

In InstallShield 2013, setting the shared attribute of a component results in incrementing of the shared .dll reference count of *only* the key file for that component. By definition, there can be only one key file per component. In order to increment the shared reference count for multiple files, each file requires its own component and the file must be the key file in that component.

Note • *For .exe, .dll, and .ocx files, you can use the Component Wizard to quickly create components for large numbers of files.*

In InstallShield 2013, even if a file is not marked as shared, if a shared .dll reference count already exists for a file, it is automatically incremented by the installation of that file and decremented by the uninstallation of that file.

Additionally, reference counts are maintained for components based on the component GUID (or Component Code property). Therefore, the shared property of a component is useful only where there might be file sharing with legacy installations, or if other components with differing component GUIDs install this file.

Upgrade Warning -481: Incrementing the Shared DLL Reference Count for Dynamically Linked Files in a File Group

In InstallShield Professional version 6.x and previous, setting the shared property for a file group which contained a dynamic file link resulted in incrementing the shared DLL reference count for *all* files in that file group on installation—regardless of the file link type. This upgrade migrates this setting to the shared attribute of the component created, in InstallShield 2013, for this file group.

Shared DLL Reference Count Behavior

In InstallShield 2013, setting the shared attribute of a component results in incrementing of the shared DLL reference count of *only* the key file for that component. Because dynamically linked files cannot be used as key files, the shared reference count is not incremented for any of the component's files.

A component can have only one key file. Therefore, in order to increment the shared reference count for multiple files, each file must be in its own component and the file must be the component's key file. Files must be statically linked if you want the reference count to increment the shared DLL reference count for each file.

Note • *For EXE, DLL and OCX files, you can use the Component Wizard to quickly create components for large numbers of files.*

In InstallShield 2013—even if a file is not marked as shared—if a shared DLL reference count already exists for a file, it is automatically incremented by the installation of that file and decremented by the uninstallation of that file.

Additionally, reference counts are maintained for components based on the component GUID (or Component Code property). Therefore, the shared property of a component is useful only where there might be file sharing with legacy installations, or if other components with differing component GUIDs install this file.

Upgrade Warning -486: Specifying Shortcut Icons

Shortcut Creation in InstallShield Professional

In InstallShield Professional version 6.x and earlier, shortcut icons were authored from the target machine's perspective. For example, if the shortcut's icon was installed to <TARGETDIR>\MyIcon.ico, that was the qualified path specified for the shortcut icon. At run time, the shortcut creation process would bind to the icon on the target machine.

Shortcut Creation

In InstallShield 2013, shortcut icons must be linked to at design time. Instead of specifying a path on the target machine as the icon file, the project file must specify a path on the build machine as the icon file. The build engine then creates a separate *stream* for your icon in the installation. The installation then uses that stream at run time during its icon creation process. This means that the setup no longer has to install the icon it is using for its shortcuts.

When upgrading your InstallShield Professional projects, InstallShield 2013 attempts to match the target icon path with a file that exists in your setup project. If unable to do so, this warning is displayed.

Correcting the Path to the Shortcut Icon

Tip • *To correct the shortcut icon path:*

1. Go to the **Shortcuts** view in the IDE and click the shortcut specified in the warning message.
2. In the **Icon File** property field, browse to the icon file.

Note • *Shortcut icons are required in InstallShield 2013. If an icon is not specified, the build engine uses the first icon index of the shortcut's target file as the shortcut icon.*

Upgrade Warning -487: Overwriting Files Upon Installation

Installing Files Based on the File Group's Overwrite Property

In InstallShield Professional version 6.x and earlier, you had the ability to set overwrite properties for individual file groups. One file group could install files based on date, while another installed files only if the file version is older than the file version on the target machine.

Installing Files Based on File Versioning Rules

InstallShield 2013 uses a methodology called file versioning rules to determine which files need to be installed on the target machine. The only option at the component level to override file versioning rules is to set the Never Overwrite property to Yes.

File Versioning Alternatives

Although the default file versioning rules are satisfactory for most applications, there might be cases where an application's requirements necessitate that you control the rules used to decide if a file should be overwritten. To this end, there are a couple of alternatives to file versioning that can be used either individually or in conjunction with each other to modify file versioning rules.

REINSTALLMODE

The REINSTALLMODE technique for overriding file versioning rules is a global mechanism for establishing custom versioning rules. Using this technique affects versioning rules for all files in the installation.

Task: ***To use the REINSTALLMODE property:***

1. Open the **Property Manager**.
2. Create a property called REINSTALLMODE.
3. Set the value of this property based on the option codes specified for the REINSTALLMODE property.

The installer reads this property at install time and uses its settings to override file versioning. This setting is also used by the installer during a reinstallation or repair of the application.

Companion Files

The companion files technique for overriding file versioning rules enables you to configure a file so that it installs based on the installation of a companion file. This technique is useful when it makes sense to bind the installation states of several files together.

For example, you can bind a non-versioned user data file to a versioned .exe file. If the .exe is not installed, the user data is not installed.

Upgrade Warning -488: Obsolete Event Encountered in Script File

An obsolete event was encountered in your script file. While most InstallShield Professional script events are supported in InstallShield 2013, there are some that are not available.

Events With Comparable Functionality

- **OnInstallingFile**
- **OnUninstallingFile**

These two events have been replaced with the **OnInstallFilesActionBefore** and **OnInstallFilesActionAfter**. These events are called in Install, Uninstall, and Maintenance modes.

The **OnInstallFilesActionBefore** event is called when the installation is preparing to add or remove files from the target machine based on the Action state of the component containing those files. On uninstall, all related actions that require the source file have already been performed—such as removing any shortcuts to the file and unregistering the file's COM data.

The **OnInstallFilesActionAfter** event is called when the installation has finished adding or removing files from the target machine. On Install, the related install actions for a file have yet to be performed, such as the registration of NT Services and creation of ODBC entries.

Note *• When using the* ***OnInstallFilesActionBefore*** *and* ***OnInstallFilesActionAfter*** *events, you can use the Windows Installer API function* ***MsiGetComponentState*** *to determine the action state of a component.*

Event with Partial Support

The **OnSelfRegistrationError** event is called if you are using the **XCopyFile** function to copy your application files to the source media.

Unsupported Events

The following events are not supported in InstallShield 2013:

- **OnFileReadOnly**
- **OnFileLocked**
- **OnNextDisk**
- **OnRemovingSharedFile**
- **OnFileError**
- **OnInternetError**
- **OnMD5Error**

Upgrade Warning 495: ODBC Core Not Installed by Default

The ODBC core is not installed by default. If this is required by your setup project, select the MDAC merge module from the Redistributables view.

MDAC Prerequisite for ODBC Installation

Although InstallShield Professional provided an object that installed the ODBC core as well as ODBC drivers, InstallShield 2013 does not directly support this functionality. Because Microsoft requires you to install ODBC as a subset of MDAC, the Windows Installer does not support direct installation of the ODBC core.

Upgrade Errors and Warnings (Upgrading from InstallShield—Windows Installer Edition)

This table provides tips for troubleshooting errors and warnings that may occur when you upgrade a project (.ism file) created using a version of InstallShield—Windows Installer Edition to InstallShield.

Table 12-14 • Upgrade Errors and Warnings

Error or Warning Number	Message	Troubleshooting Tips
-100	This error occurs if you are upgrading a project that has a registry value set as a keypath for a component.	You cannot set a registry value as a keypath for a component. To avoid this error, remove that keypath from the component and attempt the upgrade again.

Table 12-14 • Upgrade Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-201	This error occurs if your project contains a component with duplicate file names in it. The upgrader keeps only one of these files and deletes the rest.	To avoid this problem, make sure that you do not have duplicate file names within the same component.
-2007 **-2011** **-2121** **-2122**	These errors occur if the upgrader cannot read information from the old table structure, or it cannot write information to the new table structure.	Once the file has been upgraded, you need to navigate to the areas that failed and reinsert your settings.
-6020	The scripting billboard is no longer supported in the Basic MSI project. This property is not being upgraded.	To add support for this property after your project is upgraded, you can convert your project to an InstallScript MSI project and add your billboards in the Support Files/Billboards view.
-6021	The path variable cannot contain apostrophes, which are invalid characters. The name is being changed.	To build your project successfully, update all references to this path variable after the project is upgraded.
-6022	Could not open the MSI file specified in a custom action. The source property is not being converted.	To build your project successfully, enter the product code of the MSI file in the custom action's Source property after the project is upgraded.
-6023	The necessary code page is not installed on your system. The associated string table values are not being upgraded correctly.	Install the appropriate code page prior to project upgrade.
-6026	This error occurs if you have a user-defined path variable in your InstallShield—Windows Installer Edition project that is the same as a predefined path variable in InstallShield.	To upgrade successfully, remove the user-defined path variable in the InstallShield—Windows Installer Edition project and upgrade your project to InstallShield. After upgrading, open your project in InstallShield and create a new path variable that is equivalent to the user-defined path variable. Update all references in the InstallShield project.

Table 12-14 • Upgrade Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Tips
-6031	The property name "sOldPropertyName" contains invalid characters. The name is being changed to "sNewPropertyName." To build your project successfully, update all references to that property name after your project is upgraded.	After your project upgrades, change all references to the old property name to the new property name.

HRESULT Values for Windows Installer Run-time Errors

ISRegSrv.dll is the InstallShield DLL that is called from custom actions to register and unregister self-registering files on the target system. The DLL displays the Windows Installer run-time error 1904 or 1905 when it fails for particular reasons.

- 1904: Module [2] failed to register. HRESULT [3].
- 1905: Module [2] failed to unregister. HRESULT [3].

[3] could be one of InstallShield's custom HRESULTs.

Table 12-15 • HRESULT Values for Windows Installer Run-time Errors

HRESULT	Description
-2147220475	Invalid file extension as a self-register file.
-2147220474	Executable file extension, but not actually an executable.
-2147220473	Generic registration failure.
-2147220472	Generic unregistration failure.

DIFxAPI Errors (InstallScript Projects)

This table lists DIFxAPI errors that can be returned calling DIFx driver functions. If the return value from a DIFx driver function is a Win32 error (a positive return value), ISERR_WIN_BASE is added to the error so that it is less than ISERR_SUCCESS. For the most updated documentation on Win32 errors, see the MSDN Library.

Table 12-16 • DIFxAPI Errors (InstallScript)

Return Value	Description
ISERR_ISERVICE_NOT_ENABLED	Indicates that DIFx support has not been enabled or was disabled using Disable(SERVICE_DIFX_*)). For information on enabling DIFx support, see Installing Device Drivers.
ISERR_WIN_BASE + ERROR_INVALID_FUNCTION	Indicates that the difxapi.dll was not found (in SUPPORTDIR) or that an exported function could not be found. Verify that you have enabled DIFx support in your project.
ERROR_DEPENDENT_APPLICATIONS_EXIST	The function removed an association between the driver package and the specified application but the function did not uninstall the driver package because other applications are associated with the driver package.
ISERR_WIN_BASE + ERROR_ALREADY_EXISTS	The driver package is already preinstalled and was not preinstalled again.
ISERR_WIN_BASE + ERROR_INSUFFICIENT_BUFFER	The pDestInfPath buffer is not large enough to retrieve the requested .inf file path.
ISERR_WIN_BASE + ERROR_FILE_NOT_FOUND	The specified .inf file was not found.
ERROR_DRIVER_PACKAGE_NOT_IN_STORE	An .inf file does not exist in the driver store that corresponds to the .inf file specified by DriverPackageInfPath.
ISERR_WIN_BASE + ERROR_NO_MORE_ITEMS	This error code applies only if the DRIVER_PACKAGE_ONLY_IF_DEVICE_PRESENT constant is specified but the DRIVER_PACKAGE_FORCE constant is not specified. In this case, the function did not preinstall the specified driver package because, although the specified driver package matched devices in the device tree, the driver already installed for each such device is a better match for the device than the specified driver package. This applies to present and nonpresent devices.

Table 12-16 • DIFxAPI Errors (InstallScript) (cont.)

Return Value	Description
ERROR_NO_SUCH_DEVINST	This error code applies only if the DRIVER_PACKAGE_ONLY_IF_DEVICE_PRESENT constant is specified. The function did not preinstall the specified driver package because the driver package does not match a device in the device tree. This applies to present and nonpresent devices.
ERROR_NO_DEVICE_ID	The driver package does not specify a hardware ID or compatible ID that is supported by the current platform.
ERROR_MISSING_FILE	The function did not preinstall the driver package because files referenced by the .inf file could not be found.
ISERR_WIN_BASE + ERROR_CANNOT_MAKE	The function did not preinstall the driver package.
TRUST_E_NOSIGNATURE	The driver package is not signed.
CERT_E_EXPIRED	The certificate used to sign the driver package is expired.
CERT_E_WRONG_USAGE	The certificate for the driver package is not valid for the requested usage. If the driver package does not have a valid WHQL signature, the function returns this error code in the following two situations • In response to a driver signing dialog box, the user chose not to install the driver package. • The DRIVER_PACKAGE_SILENT constant is specified.
CRYPT_E_FILE_ERROR	The catalog file for the driver package was not found, or possibly, some other error occurred when the function attempted to verify the driver package signature.
ERROR_INVALID_CATALOG_DATA	The catalog file for the driver package is not valid or was not found.
ERROR_SIGNATURE_OSATTRIBUTE_MISMATCH	The certificate is not valid for the current Windows version or it is expired.
ISERR_WIN_BASE + ERROR_SHARING_VIOLATION	A component of drive package in the driver store is locked by a thread or process. This can occur, if a process or thread, other than the thread or process being called, is currently accessing the same driver package.
ISERR_WIN_BASE + ERROR_ACCESS_DENIED	Only members of the Administrators group can access this functionality.

Table 12-16 • DIFxAPI Errors (InstallScript) (cont.)

Return Value	Description
ISERR_WIN_BASE + ERROR_BAD_ENVIRONMENT	The Windows version on which this call was made does not support this operation.
ISERR_WIN_BASE + ERROR_INVALID_PARAMETER	A supplied parameter is not valid.
ISERR_WIN_BASE + ERROR_INVALID_NAME	The specified .inf file path is not valid.
ISERR_WIN_BASE + ERROR_FILENAME_EXCED_RANGE	The length, in characters, of the specified .inf file path is greater than the maximum supported length.
ISERR_WIN_BASE + ERROR_CANT_ACCESS_FILE	The driver package files could not be preinstalled because the specified .inf file is in the system .inf file directory.
ISERR_WIN_BASE + ERROR_OUTOFMEMORY	Available system memory was insufficient to preinstall the driver package.
ERROR_UNSUPPORTED_TYPE	The driver package type is not supported.
ERROR_IN_WOW64	The 32 bit version DIFxAPI does not work on Win64 systems. A 64-bit version of DIFxAPI is required.
ERROR_INSTALL_FAILURE	The installation failed.
ISERR_WIN_BASE + ERROR_INVALID_FUNCTION	The driver package is not for a Plug and Play (PnP) function driver.

"String PRODUCT_NAME was not found in string table" Error

While converting an InstallScript MSI project to an InstallScript project, you may encounter this error when your setup project does not run during the conversion. You should verify if *SHELL_OBJECT_FOLDER = @PRODUCT_NAME;* is in your script.

Note • *Setting SHELL_OBJECT_FOLDER in OnFirstUIBefore is not necessary. If you have the following line in your script, you should delete it:*

```
SHELL_OBJECT_FOLDER = @PRODUCT_NAME;"
```

InstallScript Error Information

The InstallScript compiler displays error messages in the Output window. This window, which is normally positioned near the bottom of the main window, has a Compile tab. If the Output window is not present, on the View menu in InstallShield, click Output.

The following types of error messages are displayed to identify errors in your setup script:

Table 12-17 • Error Message Types

Error Message Type	Range
Warnings	C7501 through C7503
Syntax and Compiler Errors	C8001 through C8522
Fatal Errors	F8501 through F8519
Internal Errors	C9001

InstallScript Syntax or Compiler Errors

Syntax errors prevent the file Setup.inx from being created and cause the compiler to display one of the error messages in the list below. A single syntax error can cause the compiler to generate more than one error message. The first error message is triggered by the syntax error. The others are triggered because the compiler is not able to resolve the statement or statements that follow the error.

Tip • *If your script generates more than one syntax error, correct the first one in the list and then recompile. By correcting the first error, you might eliminate one or more of the others.*

Table 12-18 • InstallScript Syntax or Compiler Errors

Error Number	Message
C8001	multiple main programs defined
C8002	function name expected
C8003	function has no prototype declaration
C8004	identifier already declared
C8005	function was declared as DLL function
C8006	missing '(' after function name

Table 12-18 • InstallScript Syntax or Compiler Errors (cont.)

Error Number	Message
C8007	comma expected
C8008	identifier expected
C8009	too many parameters
C8010	missing right parenthesis
C8011	missing 'begin' at start of function
C8012	semicolon expected
C8013	unexpected end of source file
C8014	identifier already defined
C8015	member name already defined
C8016	undefined label:
C8017	expected typedef (struct) name
C8018	typedef object illegal in this context
C8019	expected type declaration
C8020	parameter list expected
C8021	missing 'begin' after 'typedef'
C8022	comma or semicolon expected
C8023	right bracket expected
C8024	invalid array/string size
C8025	undefined identifier
C8026	invalid use of identifier
C8027	missing operand
C8028	unresolved operator
C8031	uncalled function

Table 12-18 • InstallScript Syntax or Compiler Errors (cont.)

Error Number	Message
C8032	missing member reference
C8033	unsubscripted array
C8034	missing expression
C8035	statement label required
C8036	too many arguments
C8037	variable required
C8038	numeric value required
C8039	string value required
C8040	incomplete argument list
C8042	string or array type required
C8043	typedef pointer type required
C8044	typedef type required
C8045	member name not found
C8046	numeric variable required
C8047	can only take address of variable
C8048	macro name missing
C8049	missing expression for #if/#elif
C8050	invalid expression for #if/#elif
C8051	missing end of string literal
C8052	macro expansion text too large
C8053	identifier not a #define macro
C8054	include file name missing
C8055	#elif not preceded by #if

Table 12-18 • InstallScript Syntax or Compiler Errors (cont.)

Error Number	Message
C8057	#else not preceded by #if
C8058	#endif not preceded by #if
C8059	unrecognized preprocessor command
C8062	constant operand required
C8063	input line too long
C8064	unterminated comment
C8065	string literal exceeds 255 characters
C8066	missing #endif statement at end of file
C8067	integer constant too large
C8068	unrecognized character encountered
C8069	preprocessor command must be first on line
C8070	string constant expected
C8071	colon expected
C8072	'elseif' cannot follow 'else'
C8073	missing 'then' keyword
C8074	'else' clause already encountered
C8075	'default' label already encountered
C8076	multiple case labels for statement
C8077	label already defined
C8078	label illegal in this 'for' loop
C8079	invalid statement
C8080	missing arguments for function
C8081	invalid result for assignment

Table 12-18 • InstallScript Syntax or Compiler Errors (cont.)

Error Number	Message
C8082	missing '(' after switch
C8083	missing ')' after switch
C8084	missing 'case' after switch
C8085	missing '='
C8086	missing 'to' or 'downto'
C8087	cannot return value from program
C8088	not inside if statement
C8089	not inside for statement
C8090	not inside repeat statement
C8091	not inside while statement
C8092	function called but not defined
C8093	size required for string in typedef
C8097	syntax error
C8098	missing '.name' after DLL name
C8099	DLL function name expected
C8100	function not defined for this DLL
C8101	must specify DLL for this function
C8112	typedef includes instance of self
C8113	local variables cannot be external
C8114	preprocessor user define error
C8126	'text' : string variable required
C8127	label illegal within try/catch/endcatch
C8128	goto illegal within try/catch/endcatch

Table 12-18 • InstallScript Syntax or Compiler Errors (cont.)

Error Number	Message
C8522	Access is denied.

Error C8001

Message

```
'program' : multiple main programs defined
```

Description

The keyword program was encountered after the main program block.

Troubleshooting Tips

A script can contain only one main program block—beginning with the keyword program and ending with the keyword endprogram. Restructure your script to use only one main program block.

If your script consists of multiple source files, this error message occurs if more than one of those source files contains a main program block.

Error C8002

Message

```
'text' : function name expected
```

Description

The compiler expected to encounter a function name at the location indicated by *text*.

Troubleshooting Information

Check for a missing or mistyped function name before a parameter list.

Check for missing semicolons in preceding lines.

Error C8003

Message

```
'name' : function has no prototype declaration
```

Description

The function specified by *name* has not been declared in a prototype statement.

Troubleshooting Information

If the function has not been declared, insert a prototype statement before the current block (main program or function definition).

If the function has been declared ahead of the current block, compare the function declaration in the prototype statement with the function header in the function definition. Be sure the spelling of the function name is identical in both places and that the number and types of parameters matches.

If the function has been declared later in the script, move the declaration before the current block.

Error C8004

Message

```
'name' : identifier already declared
```

Description

The identifier specified by *name* has already been declared in the current block. Identifiers can be declared only once in the same block.

Troubleshooting Information

Examine the main program block or function block where the error occurred to find the first declaration of the identifier. If the second declaration is simply a duplicate of the first, delete it. If you intended the second declaration to be a different variable than the first, rename the identifier in the second declaration and update all statements in the script that reference it.

If you cannot find a previous declaration of the variable, you may be declaring an identifier whose name is reserved in InstallScript. Reserved words are syntax colored in the script editor.

Error C8005

Message

```
'name' : function was declared as DLL function
```

Description

The function definition for the function specified by *name* is invalid because that function has been declared in a prototype statement as a DLL function.

Troubleshooting Information

If the function is not a DLL function, remove the DLL file name from the function prototype.

If the name of the user-defined function conflicts with the DLL function name, rename the user-defined function and update all statements in the script that reference it. Be sure the user-defined function has been declared in a prototype statement.

Error C8006

Message

```
'text' : missing '(' after function name
```

Description

The compiler expected to find the opening parenthesis that follows a function name in a function definition; the character or characters indicated by *text* were encountered instead.

Troubleshooting Information

Check that the function's parameter list is enclosed within parentheses. If the function takes no parameters, the parentheses will be empty.

Verify that only space characters come between the function name and its parameter list.

Error C8007

Message

```
'text' : comma expected
```

Description

The character or characters specified by *text* were encountered at a location where a comma was expected.

Troubleshooting Information

If the error occurred in a function declaration, then a comma required to separate parameter declarations is probably missing.

If the error occurred in a function call, then a comma required to separate parameters is probably missing.

Error C8008

Message

```
'text' : identifier expected
```

Description

The character or characters specified by *text* were encountered at a location where an identifier was expected.

Troubleshooting Information

If this error occurs in a variable declaration, check that the data type is followed by an identifier, with no intervening punctuation; check that the identifier contains only allowable characters.

If this error occurs in a function call, check that each pair of argument is delimited by one and only one comma.

Error C8009

Message

```
'text' : too many parameters
```

Description

The character or characters specified by *text* were encountered in a function call parameter list that contains more parameters than have been declared for the function.

Troubleshooting Information

To identify the argument or arguments that do not belong in the function call, compare the number and types of arguments in the function call to the number and types of parameters declared for that function.

Error C8010

Message

```
'text' : too many parameters
```

Description

The character or characters specified by *text* were encountered at a location where a right parenthesis was expected.

Troubleshooting Information

This error is usually triggered when the right parentheses is missing from the parameter list of a function header in a function definition.

Error C8011

Message

```
'end' : missing 'begin' at start of function
```

Description

The keyword begin is missing in a function declaration.

Troubleshooting Information

Insert the keyword begin before the first statement in the function. Local variable declarations should appear between the function header and the keyword begin. The function header itself should not be terminated with a semicolon.

Error C8012

Message

```
'text' : semicolon expected
```

Description

The character or characters specified by *text* were encountered at a location where a semicolon was expected.

Troubleshooting Information

Insert a semicolon to terminate the statement that appears just before the error location.

Error C8013

Message

```
unexpected end of source file
```

Description

The compiler reached the end of the source file without encountering the keyword required to close the current program or function block.

Troubleshooting Tips

- If your script contains function definitions, check that each function definition is terminated with the keyword end and a semicolon.
- Check that typedef blocks are closed with an end statement.
- Check that all flow control blocks are correctly closed.
- Check that all #if, #ifdef, and #ifndef statements have a matching #endif statement.

Error C8014

Message

```
'name' : identifier already defined
```

Description

The identifier specified by *name* has already been declared in the structure.

Troubleshooting Information

Examine the script and any scripts included before the error location to find the first declaration of the identifier. If the second declaration is simply a duplicate of the first, delete it. If you intended the second declaration to create a different identifier than the first, rename the identifier in the second declaration and update all statements in the script that reference it.

Error C8015

Message

```
'name' : member name already defined
```

Description

The member identified by *name* has already been declared in the structure.

Troubleshooting Information

Examine the structure in which the error occurred to find the first declaration of the member. If the second declaration is simply a duplicate of the first, delete it. If you intended the second declaration to be a different member than the first, rename the member in the second declaration and update all statements in the script that reference it.

Error C8016

Message

```
'name' : undefined label:
```

Description

The identifier specified by *name* is used in a goto statement to reference a label that has not been defined.

Troubleshooting Information

The error is located in the block directly above the error location. Find the goto statement that references name. If the goto statement is in a program block, it must reference a label that has been defined in the program block. If the goto statement is in a function definition, it must reference a label that has been defined in that function definition. Determine where you want control to flow and define the label at that location.

Error C8017

Message

```
'text' : expected typedef (struct) name
```

Description

The character or characters specified by *text* were encountered at a location where a typedef declaration was expected.

Troubleshooting Information

Check that a data type has been specified for the variable being declared. Verify that the reserved word for that data type is spelled correctly and is in all upper case.

If more than one variable is declared for that data type, check that the individual identifier names are separated by commas and not some other punctuation mark.

Verify that the data declaration is terminated with a semicolon.

If the error occurs in a function prototype that declares a pointer to a structure as a parameter, check that the structure has been declared ahead of the function prototype.

Error C8018

Message

```
'text' : typedef object illegal in this context
```

Description

The structure type specified by *text* was encountered at a location where it is not allowed.

Troubleshooting Information

This error occurs in a function prototype that declares a structure type as one of its parameters. This is not allowed. Instead, declare the parameter as a pointer to a structure by following the name of the structure type with the keyword POINTER, as shown below:

```
typedef RECT
 begin
     SHORT sX;
     SHORT sY;
 end;

 RECT Rectangle;
 RECT POINTER pRect;

 prototype SizeRectangle(RECT POINTER);
```

Error C8019

Message

```
'text' : expected type declaration
```

Description

The character or characters specified by *text* were encountered at a location where a data declaration was expected.

Troubleshooting Information

This error generally occurs when a semicolon is missing at the end of a data declaration in a line ahead of the error location. It also occurs in a function definition when the function header is terminated with a semicolon.

Error C8020

Message

```
'text' : parameter list expected
```

Description

The character or characters specified by *text* were encountered immediately after a prototype declaration for which there was no parameter list.

Troubleshooting Information

Specify the parameter list for the function above the error location. If the function takes no parameters, specify an empty list by placing opening and closing parenthesis after the function name.

Error C8021

Message

```
'text' : missing 'begin' after 'typedef'
```

Description

The character or characters specified by *text* were encountered in a typedef statement where the keyword begin was expected. In a typedef statement, the keyword begin must follow the structure name.

Troubleshooting Information

Insert the keyword begin after the structure name, with no intervening punctuation.

Error C8022

Message

```
'text' : comma or semicolon expected
```

Description

The character or characters specified by *text* were encountered at a location where a comma or semicolon was expected.

Troubleshooting Information

If this error occurs near a data declaration, check that the identifier is valid and that the data declaration is terminated with a semicolon. If two or more identifiers are being declared in the same statement, verify that they are delimited by commas.

Error C8023

Message

```
'text' : right bracket expected
```

Description

The character or characters specified by *text* were encountered at a location where a right bracket was expected.

Troubleshooting Information

This error occurs when the closing right bracket is missing from a reference to an array.

Error C8024

Message

```
'text' : invalid array/string size
```

Description

The character or characters specified by *text* may not be used to declare the size of a string or array.

Troubleshooting Information

If the size indicator is a constant, verify that it is spelled correctly.

Verify that the size of the array is greater than 0.

Error C8025

Message

```
'text' : undefined identifier
```

Description

The identifier specified by *text* has not been declared.

Troubleshooting Information

All identifiers in a script must be declared before they can be referenced in the main program block or in a function block. Check that the identifier has been declared. if it has, check that spelling used in the declaration matches the spelling of the identifier at the error location.

Note • *Your script might be calling an unsupported function. See Unsupported Functions for more information.*

"'INSTALLDIR': undefined identifier" when Compiling After Conversion

Error C8025 specifies that the identifier (INSTALLDIR in this case) has not been declared. All identifiers in a script must be declared before they can be referenced in the main program block or in a function block.

Note • *The exact error message for error C8025 is not a specific error. It is issued to anything undefined.*

As part of the changes that take place during the conversion process (from InstallScript MSI to an InstallScript project), INSTALLDIR should have been changed to TARGETDIR throughout various IDE elements. Error C8025 occurs when the value of TARGETDIR is not set in your script.

Therefore, the value of TARGETDIR must be set in your script, as it is by default in the **OnFirstUIBefore** event handler function.

You can use the following code to set TARGETDIR:

```
if ( ALLUSERS ) then
    TARGETDIR = PROGRAMFILES ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
else
    TARGETDIR = FOLDER_APPDATA ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
```

Error C8026

Message

```
'text' : invalid use of identifier
```

Description

The identifier specified by *text* is being used incorrectly in a statement.

Troubleshooting Information

This error message can be triggered by a number of errors, such as the use of a structure type name, rather than the structure name, in an operation. Examine the statement at the error location and check that all identifiers in the statement are being used correctly.

Error C8027

Message

```
missing operand
```

Description

The compiler was unable to find the operand that was expected after an operator.

Troubleshooting Information

This error message may be displayed when the compiler encounters an incomplete statement ending with an operator at the end of the source file.

Error C8028

Message

```
'text' : unresolved operator
```

Description

The character or characters specified by *text* were encountered after an expression that could not be resolved.

Troubleshooting Information

This error occurs when an operand is missing from an expression. Examine each operator in the expression and make sure that each one has the operands it requires.

Error C8031

Message

```
'text' : uncalled function
```

Description

The character or characters specified by *text* were encountered after a function name, where the opening parenthesis of the argument list was expected.

This error occurs in statements in which the result of a function call is assigned to a variable. The message is triggered by an error in the argument list that follows the function name.

Troubleshooting Information

Check that the argument list is delimited from the function name by an opening parenthesis.

If the argument list was not specified, insert it after the function name; when calling a function that takes no parameters, place empty set of opening and closing parentheses after the function name.

Error C8032

Message

```
'text' : missing member reference
```

Description

The character or characters specified by *text* were encountered at a location were a member name was expected.

Troubleshooting Information

The line of code at the error location references a structure rather than a member of a structure. Determine which member of the structure you intended to reference and insert that member name. Remember to use the member operator to delimit the structure name and the member name.

Error C8033

Message

```
'text' : unsubscripted array
```

Description

The identifier that precedes the character or characters specified by *text* is an unsubscripted array variable. InstallScript does not allow references to a complete array structure. You must reference elements in the array individually.

Troubleshooting Information

Determine which element of the array you want to reference and indicate its position in the array with a subscript. The subscript must be placed within square brackets and positioned immediately after the array name.

Error C8034

Message

```
'text' : missing expression
```

Description

The character or characters specified by *text* were encountered at a location were an expression was expected.

Troubleshooting Information

This error generally occurs in an assignment statement when the value to be assigned is missing. Insert an expression to the right of the assignment operator.

If the error occurs in a statement that references a constant, verify that the definition of that constant includes both the constant name and a value.

Error C8035

Message

```
'text' : statement label required
```

Description

The character or characters specified by *text* were encountered after the keyword goto, where a label is required.

Troubleshooting Information

Add a label after the keyword goto or delete the goto statement.

Error C8036

Message

```
'name' : too many arguments
```

Description

The function specified by *name* is being called with too many arguments.

Troubleshooting Information

Compare the arguments in the function call with the parameter list in the declaration for that function. Delete the argument or arguments in the function call that are not defined in the declaration.

Error C8037

Message

```
'text' : variable required
```

Description

The constant, literal value or structure member specified by *text* is being passed as an argument in a parameter position that requires a variable.

Troubleshooting Information

Declare a variable of the type required for the parameter; assign the constant or literal value to that variable; then pass the variable instead of the constant or literal value.

InstallShield does not allow a structure member to be passed by reference. Declare a variable of the same type as the structure member; assign the value of the structure member to the new variable; then pass the variable instead. When the function returns, assign the value of variable to the structure member.

Error C8038

Message

```
'text' : numeric value required
```

Description

The non-numeric argument specified by *text* was passed in a parameter position requiring a numeric argument.

Troubleshooting Information

Make sure all arguments passed are of the correct data types for the parameter positions they occupy. Also make sure no arguments are missing.

Error C8039

Message

```
'value' : string value required
```

Description

The number specified by *value* was encountered in an expression, statement, or function argument that requires string data.

Troubleshooting Information

In a string operation, check that all operands and operators are compatible with string data.

In an assignment statement, verify that the value you are assigning to a string variable is itself a string.

In a function call, be sure that you are not passing non-string data in a parameter position that requires a string.

Error C8040

Message

```
'name' : incomplete argument list
```

Description

One or more arguments are missing in the call to the function specified by *name*.

Troubleshooting Information

To identify the missing argument, compare the number and types of arguments in the function call to the number and types of parameters for that function.

If all of the arguments are present, check that they are delimited by commas.

Error C8042

Message

```
'[' : string or array type required
```

Description

The identifier to the left of the bracket must be a string or array type.

Troubleshooting Information

This error occurs when you specify an index value for a variable that is not a string or array. Examine the identifier to the left of the bracket. If it is not a string or array, delete the index value or declare the variable as a string or array.

Error C8043

Message

```
'text' : typedef pointer type required
```

Description

The character or characters specified by *text* can be used only with a pointer to a structure.

Troubleshooting Information

A common reason for this error is the use of a structure pointer operator between a structure name and a member name. The structure pointer operator can be used only to specify the member of a record that is referenced with a pointer to a structure. Replace the structure pointer operator with a member operator.

Error C8044

Message

```
'text' : typedef type required
```

Description

The character or characters specified by *text* can be used only with a structure that has been declared in a typedef statement.

Troubleshooting Information

A common reason for this error is the use of a member operator between a pointer to a structure and a member name. The member operator can be used only to specify the member of a structure that is referenced with a structure name. Replace the member operator with a structure pointer operator.

Error C8045

Message

```
'name' : member name not found
```

Description

The member specified by *name* does not exist in the structure you are referencing.

Troubleshooting Information

Check the structure definition for the specified member.

Check the spelling of the member name.

Error C8046

Message

```
numeric variable required
```

Description

A non-numeric argument was passed in a parameter position requiring a numeric variable.

Troubleshooting Information

Replace the argument with a numeric variable.

Error C8047

Message

```
'&' : can only take address of variable
```

Description

The compiler encountered an address operation on a constant or literal.

Troubleshooting Information

The address operator (&) can be used only with a variable.

Error C8048

Message

```
macro name missing
```

Description

The #define statement at the error location has no macro name.

Troubleshooting Information

Insert a macro name after the #define preprocessor directive and before the macro value.

Error C8049

Message

```
missing expression for #if/#elif
```

Description

The #if or #elif preprocessor directive is not followed by a valid expression to determine the flow of compilation.

Troubleshooting Information

This error message is triggered if an expression has not been specified after an #if or #elif keyword. It can also be triggered if an invalid expression follows one of those directives.

Error C8050

Message

```
'text' : invalid expression for #if/#elif
```

Description

The character or characters specified by *text* are invalid in the expression following the #if or #elif preprocessor command.

Troubleshooting Information

This error message is triggered if an invalid expression after an #if or #elif keyword.

Error C8051

Message

```
missing end of string literal
```

Description

The string literal in a #define statement has no closing quotation mark.

Troubleshooting Information

Look for a #define statement above the line on which the error was detected. For a string constant, enclose the literal in opening and closing quotation marks. Numeric constants should not be enclosed within quotation marks.

Error C8052

Message

```
macro expansion text too large
```

Description

The text specified for the identifier in a #define statement exceeds 256 characters.

Troubleshooting Information

Either shorten the string specified for that identifier or divide the text into two or more shorter strings and specify each in a #define statement. Then concatenate the strings in your program.

Error C8053

Message

```
'name' : identifier not a #define macro
```

Description

The identifier specified by *name,* which is used in an #undef statement, has not been defined.

Troubleshooting Information

Check the spelling of the identifier specified by *name*.

Error C8054

Message

```
include file name missing
```

Description

The preprocessor directive #include does not specify the name of the file to include.

Troubleshooting Information

Specify the name of a source file you want to include or delete the preprocessor directive.

Error C8055

Message

```
#elif not preceded by #if
```

Description

The compiler encountered an #elif directive that was not preceded by an #if directive.

Troubleshooting Information

Examine the statements that precede the error location and restructure the conditional compile directives to start with an #if directive.

Error C8057

Message

```
#else not preceded by #if
```

Description

The compiler encountered an #else directive that was not preceded by an #if directive.

Troubleshooting Information

Examine the statements that precede the error location and restructure the conditional compile directives to start with an #if directive.

Error C8058

Message

```
#endif not preceded by #if
```

Description

The compiler encountered an #endif directive that was not preceded by an #if directive.

Troubleshooting Information

Examine the statements that precede the error location and restructure the conditional compile directives to start with an #if directive.

Error C8059

Message

```
'text' : unrecognized preprocessor command
```

Description

The character or characters specified by *text* and preceded by the symbol # is not recognized as a preprocessor command.

Troubleshooting Information

Verify that the preprocessor command is valid in an InstallShield script and that it is spelled correctly.

Error C8062

Message

```
'text' : constant operand required
```

Description

The character or characters specified by *text* were encountered in a statement where a constant was expected.

Troubleshooting Information

This error message is triggered in a switch...endswitch block when the keyword case is not followed by a constant or literal.

Error C8063

Message

```
input line too long
```

Description

A source code line exceeds 1,024 characters.

Troubleshooting Information

Divide the line into two or more lines.

Error C8064

Message

```
unterminated comment
```

Description

The comment that begins at the error location is not terminated.

Troubleshooting Information

Find the end of the comment. Insert comment termination characters or correct the comment termination characters if they were entered incorrectly.

Error C8065

Message

```
string literal exceeds 255 characters
```

Description

The string literal at the error location has more than 255 characters.

Troubleshooting Information

Divide the string literal into two or more string literals and concatenate them.

Error C8066

Message

```
missing #endif statement at end of file
```

Description

An #if directive that appears in the script does not have a corresponding #endif directive.

Troubleshooting Information

Examine the preprocessor directives in your script. Make sure that all #if directives have a corresponding #endif directive.

Error C8067

Message

```
'number' : integer constant too large
```

Description

The value specified by *number* is too large for the number variable.

Troubleshooting Information

The valid range of NUMBER data is -2,147,483,648 and +2,147,483,647. If you specify a value in the range +2,147,483,647 to +4,294,967,295, that value will overflow and the result will be a negative number. If the value is greater than 4,294,967,299, this error message will be displayed.

Error C8068

Message

```
'char' : unrecognized character encountered
```

Description

The character specified by *char* was not recognized by the compiler.

Troubleshooting Information

Certain characters, such as “$” and “{,” are not recognized by the compiler.

Error C8069

Message

```
'#' : preprocessor command must be first on line
```

Description

The preprocessor directive identified by the symbol # was encountered at a location where it is not allowed. A preprocessor directive must be the first keyword in any line where it appears.

Troubleshooting Information

The symbol # is reserved to identify preprocessor directives. It has no other valid use in InstallScript. Examine the line that produced the error. If the symbol # appears in an identifier, rename that identifier there and everywhere else in the script where it is referenced.

Error C8070

Message

```
'text' : string constant expected
```

Description

The character or characters specified by *text* were encountered in a statement where a string constant was expected.

Troubleshooting Information

This error message is triggered in a switch...endswitch block when the keyword case is not followed by a string constant. In a switch...endswitch block, the constants specified in the case statements must be the same data type as the variable or expression result specified in the switch statement.

Error C8071

Message

```
colon expected
```

Description

The compiler expected a colon in the statement.

Troubleshooting Information

This error occurs in a switch statement when the constant after the keyword case is not followed by a colon. Insert a colon between the constants and the statements for that case.

Error C8072

Message

```
'elseif' : 'elseif' cannot follow 'else'
```

Description

The keyword elseif was encountered after an else statement in an if...endif block.

Troubleshooting Information

The keyword elseif cannot be used in an if...endif block after an else statement. Restructure the if...endif block to avoid this error.

Error C8073

Message

```
'text' : missing 'then' keyword
```

Description

The character or characters specified by text were encountered in an if block where the keyword then was expected.

Troubleshooting Information

Locate the if statement that immediately precedes the error location. Insert the keyword then after the conditional expression that follows the keyword if.

Error C8074

Message

```
'else' : 'else' clause already encountered
```

Description

Two else statements were encountered in an if...endif block.

Troubleshooting Information

An if...endif block can include only one else branch. If you require multiple conditional branching, use an if...endif block that includes elseif statements or a switch...endswitch block instead.

Error C8075

Message

```
'text' : 'default' label already encountered
```

Description

A second default case was encountered in a switch...endswitch statement.

Troubleshooting Information

A switch...endswitch statement can include only one instance of the keyword default to specify a default case. Restructure the switch....endswitch statement to eliminate one of the default cases.

In some versions of InstallShield, this error message is displayed when multiple case labels are encountered in a switch block.

Error C8076

Message

```
'case' : multiple case labels for statement
```

Description

The compiler encountered the keyword case where it expected to find the statement or statements to be executed for the last defined case.

Troubleshooting Information

The case statement that immediately precedes the character or characters specified by *text* is incomplete. It may be missing a terminating semicolon.

In some versions of InstallShield, this error message is displayed when more than one default statement is encountered in a switch block.

Error C8077

Message

```
'name' : label already defined
```

Description

The label indicated by *name* has already been used in the main program block or function.

Troubleshooting Information

Each label in the program block or in a function block must be unique.

Error C8078

Message

```
label illegal in this 'for' loop
```

Description

You cannot define a label within a for statement.

Troubleshooting Tips

Examine the statement at the error location. Modify your code so that a label is no longer defined within the for statement.

Error C8079

Message

```
'text' : invalid statement
```

Description

The statement at the location indicated by *text* specifies a process that is not allowed or is invalid in the current context.

Troubleshooting Tips

Examine the statement at the error location. Verify that the process is valid. Examples of invalid statements are assignment statements with a constant or an arithmetic operation on the left side of the assignment operator and an end statement directly below a label.

If the statement at the error location is valid, examine statement blocks (such as record declarations, control statements and function definitions) in the lines above the error location. Verify that each statement block is terminated with the correct keyword.

Error C8080

Message

```
'text' : missing arguments for function
```

Description

The character or characters specified by *text* were encountered after a function call where an argument list was expected.

Troubleshooting Information

Determine which arguments are required by the function and revise the call to include a complete argument list within parentheses.

Error C8081

Message

```
'text' : invalid result for assignment
```

Description

The character or characters specified by *text* cannot be assigned the value specified by the assignment statement.

Troubleshooting Information

This error occurs when you attempt to assign a value to a structure. InstallScript does not allow direct assignment to a structure. You must assign a value to each member of the structure individually.

Error C8082

Message

```
'text' : missing '(' after switch
```

Description

The character or characters specified by *text* were encountered in a switch...endswitch block at a location where a left parenthesis was expected.

Troubleshooting Information

Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

Error C8083

Message

```
'text' : missing ')' after switch
```

Description

The character or characters specified by *text* were encountered in a switch...endswitch block at a location where a right parenthesis was expected.

Troubleshooting Information

Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

Error C8084

Message

```
'text' : missing 'case' after switch
```

Description

The character or characters specified by *text* were encountered in a switch...endswitch block at a location where a case statement was expected.

Troubleshooting Information

This error will occur if the switch statement is terminated with a semicolon or is not followed immediately by a case statement.

Error C8085

Message

```
'text' : missing '='
```

Description

The character or characters specified by *text* were encountered in a for...endfor block at a location where an equal sign was expected.

Troubleshooting Information

This error occurs when the equal sign is missing in the expression that follows the keyword for. Examine the for statement at which the error occurred and verify that the expression that follows the keyword for is structured correctly.

Error C8086

Message

```
'text' : missing 'to' or 'downto'
```

Description

The character or characters specified by *text* were encountered in a for...endfor block at a location where an equal sign was expected.

Troubleshooting Information

This error occurs when the keyword to or downto is missing in a for statement.

Error C8087

Message

```
cannot return value from program
```

Description

The main program block contains a return statement. You cannot return a value from a program.

Troubleshooting Information

Remove the return statement from the program block.

Error C8088

Message

```
'endif' : not inside if statement
```

Description

The keyword endif could not be matched to a previous if statement.

Troubleshooting Information

Examine the if...endif block at the error location. Verify that the keyword endif has a corresponding if statement. This error is often triggered after an earlier error in an if...endif block.

Error C8089

Message

```
'endfor' : not inside for statement
```

Description

The keyword endfor could not be matched to a previous for statement.

Troubleshooting Information

Examine the for...endfor block at the error location. Verify that the keyword endfor has a corresponding for statement. This error is often triggered after an earlier error in a for...endfor block.

Error C8090

Message

```
'until' : not inside repeat statement
```

Description

The keyword until could not be matched to a previous repeat statement.

Troubleshooting Information

Examine the repeat...until block at the error location. Verify that the keyword until has a corresponding repeat statement. This error is often triggered after an earlier error in a repeat...until block.

Error C8091

Message

```
'endwhile' : not inside while statement
```

Description

The keyword endwhile could not be matched to a previous while statement.

Troubleshooting Information

Examine the while...endwhile block at the error location. Verify that the keyword endwhile has a corresponding while statement. This error is often triggered after an earlier error in a while...endwhile block.

Error C8092

Message

```
'name' : function called but not defined
```

Description

The function specified by *name* has been prototyped and called in the body of the script, but it has not been defined.

Troubleshooting Information

This error can occur if the function name is not spelled identically in the prototype, the function call and the function definition. It can also occur if the function definition appears in a file that should have been included (with an #include statement) but was not.

Error C8093

Message

```
'name' : size required for string in typedef
```

Description

The identifier specified by *name* is a string that has been defined as a member in a typedef block, but it does not include a size specification.

Troubleshooting Information

Specify the size of all STRING declarations in a structure—InstallScript's autosizing feature does not work in typedef statements.

Error C8097

Message

```
'text' :syntax error
```

Description

The character or characters specified by *text* triggered an unclassified syntax error.

Troubleshooting Information

This error message is triggered for syntax errors for which there is not a specific error message.

Error C8098

Message

```
'text' : missing '.name' after DLL name
```

Description

The character or characters specified by *text* were encountered after a DLL file name, where a function in the DLL file was expected.

Troubleshooting Information

When calling a function from a DLL, specify the function name, not the DLL file name.

Error C8099

Message

```
'text' : DLL function name expected
```

Description

The character or characters specified by *text* were encountered after a DLL file name, where a function in the DLL file was expected.

Troubleshooting Information

This error occurs when the function name specified with a DLL file name has not been declared in a prototype statement. Verify that this function has been prototyped; if it has, check the spelling of the function name.

Error C8100

Message

```
'name' : function not defined for this DLL
```

Description

The function specified by *name* has not been prototyped for the DLL whose name precedes it.

Troubleshooting Information

This error occurs when you have prototyped functions from two or more DLLs and then called one of those functions with the wrong DLL name.

Error C8101

Message

```
'name' : must specify DLL for this function
```

Description

The function specified by *name* was prototyped twice from two different DLLs.

Troubleshooting Information

When calling functions with identical names from two or more DLLs, you must qualify the function name by prefixing it with the DLL name followed by a period, as in the example below:

```
    prototype MYDLL.UsefulFunction(INT, POINTER);
    prototype YOURDLL.UsefulFunction(INT, POINTER);

    export prototype MyFunc(HWND);

function MyFunc(hMSI)
    NUMBER nValue;
    POINTER psvString;
begin
    MYDLL.UsefulFunction(nValue, psvString);
end;
```

Error C8112

Message

```
'name' : typedef includes instance of self
```

Description

The data type of the member specified by *name* is invalid. A typedef cannot contain a member that is an instance of itself.

Troubleshooting Information

Restructure your typedefs to avoid this error.

Error C8113

Message

```
'external' : local variables cannot be external
```

Description

The keyword external was encountered in data declaration within a function block.

Troubleshooting Information

Data that is local to a function cannot be declared external.

Error C8114

Message

```
'text' : preprocessor user define error
```

Description

This message is triggered by an #error directive.

Error C8115

Project • *This information applies to InstallScript projects.*

Message

```
'function name' : return type mismatch with prototype
```

Description

This message occurs when the return type of a script-defined function (the data type of the value returned by the function) is not the same in the function definition as it is in the function declaration. Note that if you do not explicitly specify a return type, the return type is assumed to be NUMBER.

Error C8126

Project • *This information applies to InstallScript projects.*

Message

```
'text' : string variable required
```

Description

The character or characters specified by *text* were encountered at a location where a string declaration was expected.

Troubleshooting Information

To declare an array other than a character array (that is, a string), use parentheses rather than brackets; for example:

```
NUMBER nArray(3);
```

Error C8127

Message

```
label illegal within try/catch/endcatch
```

Description

You cannot define a label within a try...catch...endcatch statement.

Troubleshooting Tips

Examine the statement at the error location. Modify your code so that a label is no longer defined within the try...catch...endcatch statement.

Error C8128

Message

```
goto illegal within try/catch/endcatch
```

Description

You cannot use a goto statement within a try...catch...endcatch statement.

Troubleshooting Tips

Examine the statement at the error location. Modify your code so that a goto statement is no longer used within the try...catch...endcatch statement.

Error C8522

Project • *This information applies to InstallScript projects.*

Message

```
Access is denied.
```

Description

InstallShield could not open the specified file.

Troubleshooting Information

This error message may occur because the specified file is read-only. In the Windows Explorer, locate the file and check its properties.

InstallScript Fatal Errors

Fatal errors are those that prevent the compilation from continuing. They are caused by missing include files, incorrectly specified file names, disk I/O errors, and insufficient system resources; the compiler also has certain built-in limitations, such as the limit on include files, that will trigger a fatal error if exceeded.

Table 12-19 • InstallScript Fatal Errors

Error	Message
F8501	I/O error on action file
F8502	I/O error on debug file
F8503	Can’t open script input file
F8504	Can’t open .inx output file
F8505	Can’t open .dbg debug file
F8506	out of memory

Table 12-19 • InstallScript Fatal Errors (cont.)

Error	Message
F8508	too many macro expansions in line
F8509	invalid delimiter for include file name
F8510	missing delimiter for include file name
F8511	can't open include file
F8512	include file plus path is too large
F8513	too many nested #include files
F8514	#if statements too deeply nested
F8515	macro expansion buffer overflow
F8516	maximum error count reached
F8517	too many include files
F8518	I/O error on link file
F8519	user define fatal error

Error F8501

Message

```
I/O error on action file
```

Description

An error occurred when InstallShield attempted to access an intermediate file created during compilation.

Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the action file; that file has the extension .obs). Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The action file may be damaged. Rename it or delete it from the Scripts folder; then compile again.

- If the action file is in a shared folder on a file server, verify that you have network rights to write to that folder.
- If an action file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8502

Message

```
I/O error on debug file
```

Description

An error occurred when InstallShield attempted to access an intermediate file created during compilation.

Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the debug file; that file has the extension .dbg). Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The debug file may be damaged. Rename it or delete it from the Scripts folder; then compile again.
  - If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If a .dbg file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8503

Message

```
Can't open script input file
```

Description

The compiler was unable to open the script file specified.

Troubleshooting Information

Verify the location and name of the file. You may have misspelled the file name or specified an incorrect path.

Error F8504

Message

```
Can't open .inx output file
```

Description

The compiler was unable to create the file for the compiled script.

Troubleshooting Information

This error is generated if InstallShield cannot create or recreate the .inx file. Under normal circumstances, the following problems can cause this error:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - If the target file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If an .inx file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8505

Message

```
Can't open .dbg debug file
```

Description

The compiler was unable to create the debug file. This file contains the information required to run the script with the debugger.

Troubleshooting Information

The following problems will cause this error:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again.

If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:

- If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
- If a .dbg file exists from a previous compilation, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8506

Message

```
Out of memory
```

Description

The compiler was unable to allocate sufficient memory to complete the compilation.

Troubleshooting Information

Close any other applications that are open; then compile again. If the problem persists, restart Windows; then load InstallShield and compile again.

Error F8508

Message

```
too many macro expansions in line
```

Description

The specified line contains too many macros; the maximum number of macros per line is 100.

Troubleshooting Information

Reduce the number of macros on the line by breaking the line into two or more lines.

Error F8509

Message

```
invalid delimiter for include file name
```

Description

The file name specified after the preprocessor directive #include is missing the initial quotation mark or angled bracket (<).

Troubleshooting Information

File names specified with the preprocessor directive #include must be enclosed by quotation marks (“file name”) or angled brackets (<file name>). Insert a quotation mark or opening angled bracket before the file name. Note that if you insert an initial quotation mark, the file name must be followed by a closing quotation mark; if you insert an opening angled bracket, the file name must be followed by a closing angled bracket (>).

Error F8510

Message

```
missing delimiter for include file name
```

Description

The file name specified after the preprocessor directive #include is missing the closing quotation mark or angled bracket (<).

Troubleshooting Information

File names specified with the preprocessor directive #include must be enclosed by quotation marks (“file name”) or angled brackets (<file name>). Insert a quotation mark or closing angled bracket after the file name. Note that if the file name has an opening quotation mark, you must insert a quotation mark after the file name; if the file name has an opening angled bracket, you must insert a closing angled bracket (>).

Error F8511

Message

```
cannot open include file
```

Description

The compiler was unable to find or open a file that has been included in the script.

Troubleshooting Tips

The following problems can cause this error:

- The file name in an #include statement is misspelled.
- A file name in an #include statement is specified without a full path, but the file cannot be found in the source directory.
- You do not have rights to open files on the network drive where the file resides.
- The file is damaged.

Error F8512

Message

```
include file plus path is too large
```

Description

The path specified in an #include statement exceeds the maximum length of 256 characters

Troubleshooting Information

Move the included files to a folder that can be referenced with a path whose length is less than 256 characters.

Error F8513

Message

```
too many nested #include files
```

Description

InstallScript allows nesting of include files up to a maximum of 8 levels. This limit has been exceeded.

Troubleshooting Information

Reduce the number of nested levels.

Error F8514

Message

```
#if statements too deeply nested
```

Description

InstallScript allows nesting of #if statements up to a maximum of 10 levels. This limit has been exceeded.

Troubleshooting Information

Reduce the number of nested levels.

Error F8515

Message

```
macro expansion buffer overflow
```

Description

The expansion of macros in the error line exceeds the maximum of 1024 characters.

Troubleshooting Information

Restructure your code to eliminate this error.

Error F8516

Message

```
maximum error count reached
```

Description

The maximum number of errors specified on the Compile/Link tab of the Settings dialog box has been reached.

Troubleshooting Information

For more information about the Compile/Link tab of the Settings dialog box, see Compile/Link Tab.

Error F8517

Message

```
too many include files
```

Description

The maximum number of include was exceeded.

Troubleshooting Information

A setup script can include no more that 100 source files. Combine two or more source files to bring the total number down to 100.

Error F8518

Message

```
I/O error on link file
```

Description

An error occurred when InstallShield attempted to write to the link file.

Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the link file (.ino).

This error might be caused by the following:

- The disk is full. Create more available disk space by deleting unwanted files and then recompile.
- The link file is damaged. Rename it or delete it from Scripts folder and then recompile.

Error F8519

Message

```
user define fatal error
```

Description

This message is triggered by an #error directive.

InstallScript Internal Errors

An internal error may occur if syntax errors exist.

C9001 internal error

Error C9001

Message

```
'text' : internal error
```

Description

The character or characters specified by *text* triggered an unclassified syntax error.

Troubleshooting Information

This error message is triggered by syntax errors for which there is not a specific error message.

InstallScript Warnings

The compiler issues warning messages to alert you to irregularities in the script that may result in inefficiencies or run-time errors.

Caution • *Warnings do not interrupt script compilation unless "Warnings as errors" is selected in the Compiler Settings dialog, or if the number of warnings exceeds the maximum specified. The default maximum value is 50.*

Table 12-20 • InstallScript Warnings

Warning Number	Message
C7501	macro redefinition
C7502	string/array size exceeds recommended limit
C7503	function defined but never called

Table 12-20 • InstallScript Warnings (cont.)

Warning Number	Message
C7505	typedef definition differs from previous

Warning C7501

Message

```
'name' : macro redefinition
```

Description

The identifier specified by *name* has already been used in a #define statement.

Troubleshooting Information

If the second definition is simply a duplicate of the first, delete it. If you intended the second definition to be different from the first, rename the identifier in the second definition and update all statements in the script that reference it.

Warning C7502

Message

```
'size' : string/array size exceeds recommended limit
```

Description

The numeric value specified by *size* indicates the size of a string or array that is larger than InstallScript's recommended maximum.

Troubleshooting Information

To avoid unexpected effects, reduce the size of the array.

Warning C7503

Message

```
'name' : function defined but never called
```

Description

The function specified by *name* is not called in your setup.

Troubleshooting Information

To reduce the size of your setup, remove the unused function from your script.

Warning C7505

Message

```
'name' : typedef definition differs from previous
```

Description

The data structure specified by *name* is defined in multiple library files (.obl files).

Troubleshooting Information

If the definitions are simply duplicates, delete all but one. If you intended the definitions to be different, rename the data structures to have unique names and update all statements in the script that reference them.

Virtualization Conversion Errors and Warnings

When you are converting a Windows Installer package to a virtual application, errors and warnings may occur. Some of the errors and warnings are applicable to any type of package virtualization, and others are specific to the virtualization solution for which you are preparing packages.

Error -9000: Unknown Exception

The following table documents this message:

Table 12-1 • Error -9000: Unknown Exception

Category	Description
Type:	Error
Message:	`An unknown exception occurred.`
Cause:	This is an unexpected internal error.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9001: Unknown COM

The following table documents this message:

Table 12-2 • Error -9001: Unknown COM

Category	Description
Type:	Error
Message:	`Internal error.`
Resolution:	Contact InstallShield Technical Support.

Error -9002: Error Opening Package

The following table documents this message:

Table 12-3 • Error -9002: Error Opening Package

Category	Description
Type:	Error

Table 12-3 • Error -9002: Error Opening Package

Category	Description
Message:	`An error occurred when opening the package.`
Cause:	This is an unexpected internal error when reading the Windows Installer package.
Resolution:	Check to make sure that the package is accessible to the user. If the error persists and the package is on a network share, copy the package locally (to avoid any network connection issues) and try again. If this does not solve the problem, perform these additional investigational steps and then contact InstallShield Technical Support.

Error -9003: Error Saving Package

The following table documents this message:

Table 12-4 • Error -9003: Error Saving Package

Category	Description
Type:	Error
Message:	`An error occurred when saving the package.`
Cause:	This is an unexpected internal error when trying to save the Citrix profile.
Resolution:	Check to see if the user has proper access to the location the profile is being built to. If this does not solve the problem, perform these additional investigational steps and then contact InstallShield Technical Support.

Error -9004: Process Cancelled By User

The following table documents this message:

Table 12-5 • Error -9004: Process Cancelled By User

Category	Description
Type:	Error
Message:	`Process cancelled by user.`
Cause:	The user clicked the **Cancel** button to stop the build.

Table 12-5 • Error -9004: Process Cancelled By User

Category	Description
Resolution:	Restart the build process.

Error -9005: Error Creating Temporary Folder

The following table documents this message:

Table 12-6 • Error -9005: Error Creating Temporary Folder

Category	Description
Type:	Error
Message:	`An error occurred while creating a temporary folder`
Cause:	You encounter this error when the user does not have permission to write to `C:\TMP`, or the drive is out of disk space.
Resolution:	Obtain write access to `C:\TMP`, and free some disk space on the drive, and then rebuild the profile.

Error -9006: Error Decompressing Package

The following table documents this message:

Table 12-7 • Error -9006: Error Decompressing Package

Category	Description
Type:	Error
Message:	`An error occurred while decompressing the package 'PackageName'.`
Cause:	You encounter this error when the package is a compressed Windows Installer package (`.msi`) and errors were generated when InstallShield attempted to perform an administrative installation to extract the files.
Resolution:	When this error occurred, you should have also received a return error code from Windows Installer. Look up that error code in the Windows Installer Help Library to determine the cause of the problem. If you did not receive a return error code from Windows Installer, this error could have been caused by the package not being authored properly. In the Windows Installer package, check to see if the **AdminExecuteSequence** table was defined. If that table is missing, the package cannot be decompressed.

Error -9007: File With Extension Not Found

The following table documents this message:

Table 12-8 • Error -9007: File With Extension Not Found

Category	Description
Type:	Error
Message:	`No file found with the extension 'ComponentKeyName'.`
Cause:	This is an unexpected error that occurred when file extensions were being processed.
Resolution:	Check to make sure that the executable for the file extension exists and that it is set as the key file in its component.

Error -9008: Error Extracting Icon

The following table documents this message:

Table 12-9 • Error -9008: Error Extracting Icon

Category	Description
Type:	Error
Message:	`An error occurred while extracting the icon 'IconKeyName'`
Cause:	This is an unexpected error that occurred when an icon listed in the **Icon** table was being extracted.
Resolution:	Verify that the **Icon** entry in the **Icon** table is valid. If necessary, replace it with a valid icon.

Error -9009: Unknown Provider

The following table documents this message:

Table 12-10 • Error -9009: Unknown Provider

Category	Description
Type:	Error
Message:	`The specified provider is unknown 'ProviderName'.`
Cause:	This is an unexpected internal error.

Table 12-10 • Error -9009: Unknown Provider

Category	Description
Resolution:	Invalid data may have been modified via the Direct Editor causing this error. Delete the **Release** you are building, and then create a new one and rebuild.

Error -9010: Invalid Target File Name

The following table documents this message:

Table 12-11 • Error -9010: Invalid Target File Name

Category	Description
Type:	Error
Message:	`The target file name is invalid. 'FileName'`
Cause:	This is an unexpected internal error.
Resolution:	Invalid data may have been modified via the Direct Editor causing this error. Verify the **Name** field on the Citrix Assistant / ThinApp Assistant **Profile Information** page and make sure the name does not contain any invalid file name characters.

Error -9011: Error Reading MSI Table

The following table documents this message:

Table 12-12 • Error -9011: Error Reading MSI Table

Category	Description
Type:	Error
Message:	`Unexpected error reading MSI table 'TableName'`
Cause:	This is an unexpected error that occurred when the specified Windows Installer table was being processed.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9012: Unexpected Error in Method

The following table documents this message:

Table 12-13 • Error -9012: Unexpected Error in Method

Category	Description
Type:	Error
Message:	`Unexpected error in method 'MethodName'`
Cause:	This is an unexpected internal error.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9013: Type Library Not Found

The following table documents this message:

Table 12-14 • Error -9013: Type Library Not Found

Category	Description
Type:	Error
Message:	`Type library not found: 'TypeLibraryName'`
Cause:	You encounter this error when a type library file was not found when trying to extract COM information.
Resolution:	Check to see if the type library file exists in the proper location when building the profile. If this does not resolve the problem, perform these additional investigational steps and then contact InstallShield Technical Support.

Error -9014: ShellExecute Failed

The following table documents this message:

Table 12-15 • Error -9014: ShellExecute Failed

Category	Description
Type:	Error
Message:	`ShellExecute failed: 'CommandLine'`

Table 12-15 • Error -9014: ShellExecute Failed

Category	Description
Cause:	You encounter this error when the specified command line failed to launch a process.
Resolution:	Check to see if the executable file name shown is a valid file and that the user has the proper access rights to run it. If this does not resolve the problem, perform these additional investigational steps and then contact InstallShield Technical Support.

Error -9015: Unable to Determine Full Path for Driver

The following table documents this message:

Table 12-16 • Error -9015: Unable to Determine Full Path for Driver

Category	Description
Type:	Warning
Message:	`Unable to determine the full path for driver 'DriverName'`
Cause:	You encounter this error when a driver referenced in the **ODBCDataSource** table is not being installed by the package.
Resolution:	This error can be resolved in one of two ways: **Editing the Windows Installer Package** 1. Edit the package in InstallShield using Direct Edit mode. 2. Navigate to the **ISVirtualPackage** table. 3. Create an entry as follows to identify the full path of the missing driver: **Name**: `<DriverName> Description` **Value**: `Path to Driver` **Manually Installing the Driver** Install the missing driver on your machine and then rebuild the Citrix profile.

Warning -9016: Contents of Table Ignored

The following table documents this message:

Table 12-17 • Warning -9016: Contents of Table Ignored

Category	Description
Type:	Warning
Message:	`Contents of table 'TableName' will be ignored`
Cause:	This error message identifies a known limitation of Citrix conversion.
Resolution:	If the contents of the table is deemed critical, repackage the application, and then rebuild the Citrix profile.

Warning -9017: .NET 1.x Assembly Not Supported

The following table documents this message:

Table 12-18 • Warning -9017: .NET 1.x Assembly Not Supported

Category	Description
Type:	Warning
Message:	`Assembly 'AssemblyName' is a .NET 1.x assembly and will not be converted correctly. Only .NET 2.0/3.0 assemblies are currently supported. You may wish to repackage this package first.`
Cause:	You encounter this error when attempting to convert a package containing a .NET 1.x assembly. Only .NET 2.0/3.0 assemblies are currently supported.
Resolution:	Repackage the application, and then rebuild the Citrix profile.

Warning -9018: Custom Actions Ignored

The following table documents this message:

Table 12-19 • Warning -9018: Custom Actions Ignored

Category	Description
Type:	Warning
Message:	`Custom action 'CustomActionName' will be ignored.`

Table 12-19 • Warning -9018: Custom Actions Ignored

Category	Description
Cause:	When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile.  ***Note*** • *When a custom action that does not modify the system or perform any part of the installation (such as a predefined custom action or a Type 19 custom action) is encountered, no message is generated. If a Type 51 custom action is encountered (which sets a property from a formatted text string), it is automatically resolved. If a Type 35 custom action is encountered, it is resolved only if it is referenced in the* ***Directory*** *table.*
Resolution:	The resolution that you should perform depends upon the purpose of the custom action: • If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning. • If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue. To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application.  ***To repackage a Windows Installer package to capture custom action functionality:*** 1. Use the Repackaging Wizard to repackage this application. The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project. 2. Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action.

Warning -9019: Conditionalized Components

The following table documents this message:

Table 12-20 • Warning -9019: Conditionalized Components

Category	Description
Type:	Warning
Message:	`There exist one or more conditionalized components which may not be converted correctly`

Table 12-20 • Warning -9019: Conditionalized Components

Category	Description
Cause:	This warning is generated when attempting to convert conditionalized components because conditions on components are not evaluated. As a result, InstallShield includes the component in the virtual package.
Resolution:	If you do not want to include the component in the virtual package, modify your .msi package or your project file to exclude that component. Then rebuild the virtual application. If you do want the virtual package to contain this component, you can ignore this warning.

Error -9020: Directory With Null Parent

The following table documents this message:

Table 12-21 • Error -9020: Directory With Null Parent

Category	Description
Type:	Error
Message:	`Directory 'DirectoryName' has a null parent and will be ignored.`
Cause:	This error occurs if a directory table entry (other than `TARGETDIR`) is null.
Resolution:	Evaluate the ThinApp application to see if it works. If it does not work properly, you may want to consider repackaging the package.

Error -9021: Unable to Extract COM Data

The following table documents this message:

Table 12-22 • Error -9021: Unable to Extract COM Data

Category	Description
Type:	Error
Message:	`Unable to extract COM data for 'FileName'`
Cause:	This Windows Installer package has an entry in the **TypeLib** or **SelfReg** table that contains COM data that InstallShield cannot convert to application data. Depending upon which file cannot be COM extracted, it is possible that this application will still work properly in Citrix XenApp isolation environment if you repackage this Windows Installer package with COM table mapping turned off. COM data is stored in the Windows Registry. So, if you repackage this Windows Installer package, the capture process will be able to obtain all of this data because it captures all modifications to the Registry and does not have to rely on COM extraction.
Resolution:	To resolve this issue, you need to repackage your Windows Installer package with COM table mapping turned off.

Error -9022: Complus Table

The following table documents this message:

Table 12-23 • Error -9022: Complus Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'Complus'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **Complus** table. During the conversion process, the **Complus** table is not read.
Resolution:	The **Complus** table contains information needed to install COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support *installing* COM+ services. Therefore, this application cannot be deployed on Citrix XenApp.

Error -9024: FileSFPCatalog

The following table documents this message:

Table 12-24 • Error -9024: FileSFPCatalog

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'FileSFPCatalog'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **FileSFPCatalog** table. During the conversion process, the **FileSFPCatalog** table is not read.
Resolution:	The **FileSFPCatalog** table associates specified files with the catalog files used by system file protection. If this file is necessary for the function of the application, you need to use Repackager to repackage the application.

Warning -9026: LaunchCondition Table

The following table documents this message:

Table 12-25 • Warning -9026: LaunchCondition Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'LaunchCondition'.`
Cause:	You encounter this warning when the Windows Installer package that you are converting includes a **LaunchCondition** table. During the conversion process, the **LaunchCondition** table is not read.

Table 12-25 • Warning -9026: LaunchCondition Table

Category	Description
Resolution:	The **LaunchCondition** table contains a list of conditions that all must be satisfied for the installation to begin. For example, if an application requires Windows XP to run, Windows XP is listed in the **LaunchCondition** table. Because this table is not read, no check is performed. Therefore, when a user on an operating system other than Windows XP launches this Citrix profile, the application may not function properly. To resolve this issue, perform one of the following tasks: • **Option 1: Set Requirements on the Profile Requirements Page**—If the launch conditions only include operating system, service pack, and language requirements, open this package in the Citrix Assistant, and set those Operating System and Language requirements on the **Profile Requirements** page. Then deploy this application as a Citrix profile. • **Option 2: Determine if Launch Conditions are Met**—Review the launch conditions listed in the table, and determine if the desktops in your enterprise meet those requirements. If all of the desktops meet those requirements, you can deploy this application as a Citrix profile. If the desktops do not meet those requirements (such as having Internet Explorer 6.0 instead of 7.0), upgrade those desktops to meet these requirements, and then deploy this application as a Citrix profile.

Warning -9027: LockPermissions Table

The following table documents this message:

Table 12-26 • Warning -9027: LockPermissions Table

Category	Description
Type	Warning
Message:	`The conversion process does not support data in the MSI table 'LockPermissions'.`
Cause:	You encounter this warning when the Windows Installer package that you are converting includes a **LockPermissions** table. During the conversion process, the **LockPermissions** table is not read.
Resolution:	The **LockPermissions** table is used to secure individual portions of your application (files, registry keys, and created folders) in a locked-down environment. Citrix does not support permissions on files, registry keys, or created folders. You cannot modify permissions on any of the application's ACLs (access control lists). Because users will have full permissions when running this application in the isolation environment, this warning will not result in any problems.

Error -9028: MoveFile Table

The following table documents this message.

Table 12-27 • Error -9028: MoveFile Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'MoveFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **MoveFile** table. During the conversion process, the **MoveFile** table is not read.
Resolution:	This **MoveFile** table contains a list of files to be moved or copied from a specified source directory to a specified destination directory. Because this table is not read, you need to do one of the following to resolve this issue: • **Option 1: Edit the Windows Installer Package**—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the **MoveFile** table by installing additional files in the specified directories. • **Option 2: Repackage the Application**—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package. • **Option 3: Write a Pre-Launch Script**—Write a pre-launch script that performs the file moving operations identified in the **MoveFile** table upon application launch.

Error -9029: MsiDriverPackages Table

The following table documents this message:

Table 12-28 • Error -9029: MsiDriverPackages Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'MsiDriverPackages'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **MsiDriverPackages** table. During the conversion process, the **MsiDriverPackages** table is not read.

Table 12-28 • Error -9029: MsiDriverPackages Table

Category	Description
Resolution:	The **MsiDriverPackages** table includes one record for each driver package component in the application. Citrix XenApp does not support any type of driver. For example, when installing a printer, you can install the printer software within the isolation environment, but not the printer drivers. Therefore, to resolve this issue, you need to install any required drivers outside of the isolation environment on the user desktop machines.

Warning -9030: ODBCTranslator Table

The following table documents this message:

Table 12-29 • Warning -9030: ODBCTranslator Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'ODBCTranslator'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ODBCTranslator** table. During the conversion process, the **ODBCTranslator** table is not read.
Resolution:	The **ODBCTranslator** table lists the ODBC translators belonging to the installation. ODBC translators translate one form of raw data into another form that can be used with a specific database type. Ignoring the **ODBCTranslator** table should not prevent your application from functioning properly. However, if it does, you need to use Repackager to repackage the application.

Warning -9031: RemoveFile Table

The following table documents this message:

Table 12-30 • Warning -9031: RemoveFile Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'RemoveFile'.`

Table 12-30 • Warning -9031: RemoveFile Table

Category	Description
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **RemoveFile** table. During the conversion process, the **RemoveFile** table is not read. This warning is displayed only if the application installation removes files during install (not uninstall).
Resolution:	The **RemoveFile** table contains a list of files to be removed. If this file removal requirement is just a clean-up step, that does not impact the function of the application, you do not need to address this issue. However, if the existence of the files listed in the **RemoveFile** table prevents the application from functioning, you need to set the isolation option of the files to **Ignore** so that they are not visible to the isolation environment. The **Ignore** option directs the isolation environment to always look for the file on the system (ignoring the one inside the isolation environment).

Warning -9032: RemoveIniFile Table

The following table documents this message:

Table 12-31 • Warning -9032: RemoveIniFile Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'RemoveIniFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **RemoveIniFile** table. During the conversion process, the **RemoveIniFile** table is not read.
Resolution:	The **RemoveIniFile** table contains the information an application needs to delete from a `.ini` file. If the removal of this entry is necessary for the function of the application, you need to use Repackager to repackage the application.

Warning -9033: RemoveRegistry Table

The following table documents this message:

Table 12-32 • Warning -9033: RemoveRegistry Table

Category	Description
Type:	Warning

Table 12-32 • Warning -9033: RemoveRegistry Table

Category	Description
Message:	`The conversion process does not support data in the MSI table 'RemoveRegistry'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **RemoveRegistry** table. During the conversion process, the **RemoveRegistry** table is not read.
Resolution:	The **RemoveRegistry** table contains the registry information the application needs to delete from the system registry. If this removal requirement is just a clean-up step, that does not impact the function of the application, you do not need to address this issue. However, if the existence of the registry keys listed in the **RemoveRegistry** table prevents the application from functioning, you need to set the isolation option of the registry keys to **Ignore** so that they are not visible to the isolation environment. The **Ignore** option directs the isolation environment to always look for the registry key on the system (ignoring the one inside the isolation environment).

Error -9036: ISCEInstall Table

The following table documents this message:

Table 12-33 • Error -9036: ISCEInstall Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISCEInstall'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISCEInstall** table. During the conversion process, the **ISCEInstall** table is not read.
Resolution:	The **ISCEInstall** table is used to install Windows mobile applications. The conversion of mobile applications to Citrix profiles is not supported.

Error -9037: ISComPlusApplication Table

The following table documents this message:

Table 12-34 • Error -9037: ISComPlusApplication Table

Category	Description
Type:	Error

Table 12-34 • Error -9037: ISComPlusApplication Table

Category	Description
Message:	`The conversion process does not support data in the MSI table 'ISComPlusApplication'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISComPlusApplication** table. During the conversion process, the **ISComPlusApplication** table is not read.
Resolution:	The **ISComPlusApplication** table contains information about COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support *installing* COM+ services. Therefore, this application cannot be deployed on Citrix XenApp.

Error -9038: ISPalmApp Table

The following table documents this message:

Table 12-35 • Error -9038: ISPalmApp Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISPalmApp'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISPalmApp** table. During the conversion process, the **ISPalmApp** table is not read.
Resolution:	The **ISPalmApp** table is used to install Palm mobile applications. The conversion of mobile applications to Citrix profiles is not supported.

Error -9039: ISSQLScriptFile Table

The following table documents this message:

Table 12-36 • Error -9039: ISSQLScriptFile Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISSQLScriptFile'.`

Table 12-36 • Error -9039: ISSQLScriptFile Table

Category	Description
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISSQLScriptFile** table. During the conversion process, the **ISSQLScriptFile** table is not read.
Resolution:	The **ISSQLScriptFile** table lists SQL scripts. When a Windows Installer package is installed, it can run an SQL script to update a database. An application running as a Citrix profile cannot update a database. To resolve this issue, you need to update the database prior to using the converted Citrix profile using one of the following methods: • Use scripts to update the database manually. • Update it by running the Windows Installer installation on one of the machines in your network that has access to that database.

Error -9040: ISVRoot Table

The following table documents this message:

Table 12-37 • Error -9040: ISVRoot Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISVRoot'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISVRoot** table. During the conversion process, the **ISVRoot** table is not read.
Resolution:	The **ISVRoot** table installs a Web site. An application running as a Citrix profile in an isolation environment cannot create a Web site. Therefore, creating Citrix profiles for applications that create Web sites during installation is not supported.

Error -9041: ISXmlFile Table

The following table documents this message:

Table 12-38 • Error -9041: ISXmlFile Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISXmlFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISXmlFile** table. During the conversion process, the **ISXmlFile** table is not read.
Resolution:	The **ISXmlFile** table modifies XML files. If the modification of XML files is required in order for this application to operate properly, you need to use Repackager to repackage this application.

Error -9051: Package Decompression Canceled

The following table documents this message:

Table 12-39 • Error -9051: Package Decompression Canceled

Category	Description
Type:	Error
Message:	`Package decompression canceled by the user`
Cause:	The user cancelled the process of decompression of compressed MSI packages.

Error -9100: CreateInstance of Package Object Failed

The following table documents this message:

Table 12-40 • Error -9100: CreateInstance of Package Object Failed

Category	Description
Type:	Error
Message:	`CreateInstance of the Citrix package object failed.`
Cause:	Unexpected internal error.

Table 12-40 • Error -9100: CreateInstance of Package Object Failed

Category	Description
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9101: Create Operation of Package Object Failed

The following table documents this message:

Table 12-41 • Error -9101: Create Operation of Package Object Failed

Category	Description
Type:	Error
Message:	`Create operation on Citrix package object failed 'ObjectName'.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9102: Failed to Write Header Information

The following table documents this message:

Table 12-42 • Error -9102: Failed to Write Header Information

Category	Description
Type:	Error
Message:	`Failed to write package header information.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9103: Citrix Finalization Failed

The following table documents this message:

Table 12-43 • Error -9103: Citrix Finalization Failed

Category	Description
Type:	Error
Message:	`Citrix Finalization Failed`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9104: Citrix Save Failed

The following table documents this message:

Table 12-44 • Error -9104: Citrix Save Failed

Category	Description
Type:	Error
Message:	`Citrix Save Failed`
Cause:	Unexpected internal error. This error may sometimes occur when the profile is to be digitally signed.
Resolution:	Deselect the option to digitally sign the Citrix profile and then rebuild it.

Error -9105: Error Initializing Citrix Writer

The following table documents this message:

Table 12-45 • Error -9105: Error Initializing Citrix Writer

Category	Description
Type:	Error
Message:	`Unexpected error initializing Citrix writer`
Cause:	Unexpected internal error.

Table 12-45 • Error -9105: Error Initializing Citrix Writer

Category	Description
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9106: Error Initializing Citrix Package

The following table documents this message:

Table 12-46 • Error -9106: Error Initializing Citrix Package

Category	Description
Type:	Error
Message:	`Unexpected error initializing Citrix package`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9107: Error Writing Citrix File Entries

The following table documents this message:

Table 12-47 • Error -9107: Error Writing Citrix File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix file entries.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9108: Error Determining Source File Path

The following table documents this message:

Table 12-48 • Error -9108: Error Determining Source File Path

Category	Description
Type:	Error
Message:	`Unexpected error determining source file path for 'FileName'`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9109: Error Writing Citrix Folder Entries

The following table documents this message:

Table 12-49 • Error -9109: Error Writing Citrix Folder Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix folder entries`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9110: Error Writing Citrix Registry Entries

The following table documents this message:

Table 12-50 • Error -9110: Error Writing Citrix Registry Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix registry entries`
Cause:	Unexpected internal error.

Table 12-50 • Error -9110: Error Writing Citrix Registry Entries

Category	Description
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact InstallShield Technical Support.

Error -9113: Error Writing Citrix INI File Entries

The following table documents this message:

Table 12-51 • Error -9113: Error Writing Citrix INI File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix INI file entries`
Cause:	Unexpected internal error.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9114: Error Writing Citrix Shortcuts

The following table documents this message:

Table 12-52 • Error -9114: Error Writing Citrix Shortcuts

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix shortcuts`
Cause:	A catastrophic error has occurred while writing shortcuts to the profile.
Resolution:	Verify that shortcuts point to a valid file. Try to narrow down issue by only keeping one shortcut and then try to rebuild.

Error -9115: Error Saving Citrix Profile

The following table documents this message:

Table 12-53 • Error -9115: Error Saving Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error saving Citrix profile`
Cause:	A catastrophic error has occurred while saving the Citrix profile.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9116: Error Creating Empty Citrix Profile

The following table documents this message:

Table 12-54 • Error -9116: Error Creating Empty Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error creating empty Citrix profile`
Cause:	InstallShield is unable to create a new internal instance of a Citrix profile.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9117: Error Creating Intermediate Folder

The following table documents this message:

Table 12-55 • Error -9117: Error Creating Intermediate Folder

Category	Description
Type:	Error
Message:	`Unexpected error creating intermediate folder`
Cause:	InstallShield is unable to create the intermediate folder used for the build. This error could occur if the user does not have permission to write to `C:\TMP`.

Table 12-55 • Error -9117: Error Creating Intermediate Folder

Category	Description
Resolution:	Obtain write access to `C:\TMP` and then rebuild the profile.

Error -9118: Error Initializing Citrix Profile

The following table documents this message:

Table 12-56 • Error -9118: Error Initializing Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error initializing Citrix profile.`
Cause:	The initial values on the new profile could not be set.
Resolution:	Check the package name, description, version, and security settings for any possible causes.

Error -9119: Error Creating Default Target in Citrix Profile

The following table documents this message:

Table 12-57 • Error -9119: Error Creating Default Target in Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error creating default target in Citrix profile`
Cause:	Initial target in the new profile could not be created.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9120: Error Deleting File From Profile

The following table documents this message:

Table 12-58 • Error -9120: Error Deleting File From Profile

Category	Description
Type:	Error

Table 12-58 • Error -9120: Error Deleting File From Profile

Category	Description
Message:	`Unexpected error deleting file 'FileName' from profile`
Cause:	Specified file could not be deleted from profile.
Resolution:	Check to see if the file exists and if the user has access rights to the file. If that did not resolve the problem, perform these additional investigational steps and then contact InstallShield Technical Support.

Error -9121: Failed to Copy File into Citrix Profile

The following table documents this message:

Table 12-59 • Error -9121: Failed to Copy File into Citrix Profile

Category	Description
Type:	Error
Message:	`Failed to copy file into Citrix profile. Error: 'Name' File: 'Name'`
Cause:	Specified file could not be copied into profile.
Resolution:	Check to see if the file exists and if the user has access rights to the file. Also, when this error occurred, you should have also received a return error code from Windows Installer. Look up that error code in the Windows Installer Help Library to determine the cause of the problem.

Error -9122: Target Does Not Exist in Citrix Profile

The following table documents this message:

Table 12-60 • Error -9122: Target Does Not Exist in Citrix Profile

Category	Description
Type:	Warning
Message:	`The target for shortcut 'ShortcutName' does not exist in the Citrix profile. Excluding shortcut.`
Cause:	Actual file that shortcut points to is not included in the package.

Table 12-60 • Error -9122: Target Does Not Exist in Citrix Profile

Category	Description
Resolution:	Exclude the shortcut by clearing the selection on the Citrix Assistant **Profile Shortcuts** page, and then rebuild the profile.

Error -9124: No Shortcuts Created for this Profile

The following table documents this message:

Table 12-61 • Error -9124: No Shortcuts Created for this Profile

Category	Description
Type:	Error
Message:	`No shortcuts were created for this profile`
Cause:	A Citrix profile must include at least one valid shortcut.
Resolution:	Add a shortcut on the Citrix Assistant **Profile Shortcuts** page, and then rebuild the profile.

Error -9125: Error Writing Citrix File Type Associations

The following table documents this message:

Table 12-62 • Error -9125: Error Writing Citrix File Type Associations

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix file type associations`
Cause:	Unable to write file type associations.
Resolution:	Perform preliminary investigational steps and then contact InstallShield Technical Support.

Error -9126: Failed to Sign Profile Using Certificate

The following table documents this message:

Table 12-63 • Error -9126: Failed to Sign Profile Using Certificate

Category	Description
Type:	Error
Message:	`Failed to sign the profile using the supplied certificate`
Cause:	The certificate that is being used in invalid.
Resolution:	Obtain a valid certificate and rebuild the profile.

Error -9127: Could Not Create Script Execution

The following table documents this message:

Table 12-64 • Error -9127: Could Not Create Script Execution

Category	Description
Type:	Error
Message:	`Could not create script execution for 'ScriptName'`
Cause:	The specified script contains invalid data.
Resolution:	On the Citrix Assistant **Build Settings** page, delete the script from the profile, re-add it, and then rebuild the profile. If you are still having problems, perform these additional investigational steps and then contact InstallShield Technical Support.

Warning -9128: Duplicate Shortcut

The following table documents this message:

Table 12-65 • Warning -9128: Duplicate Shortcut

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists in the profile. Excluding duplicate shortcut.`

Table 12-65 • Warning -9128: Duplicate Shortcut

Category	Description
Cause:	There are multiple shortcuts defined in this profile that refer to different Start Menu locations or to other locations in the package.
Resolution:	These shortcuts are not needed. On the Citrix Assistant **Profile Shortcuts** page, unselect these shortcuts, and then rebuild the profile.

Warning -9129: Duplicate Shortcut Names

The following table documents this message:

Table 12-66 • Warning -9129: Duplicate Shortcut Names

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists in the profile, but with different command line parameters. A new unique shortcut 'NewShortcutName(1)' will be created in the profile.`
Cause:	There are two shortcuts defined in this profile that have the same name, even though they have different command line parameters.
Resolution:	On the Citrix Assistant **Profile Shortcuts** page, rename one of these shortcuts and then rebuild the profile.

Warning -9130: Duplicate Shortcut Targets

The following table documents this message:

Table 12-67 • Warning -9130: Duplicate Shortcut Targets

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists in the profile, but with different target. A new unique shortcut 'NewShortcutName(1)' will be created in the profile.`
Cause:	There are two shortcuts defined in this profile that have the same name, even though they have different targets.
Resolution:	On the Citrix Assistant **Profile Shortcuts** page, rename one of these shortcuts and then rebuild the profile.

Warning -9131: Unable to Resolve Installer Variable

The following table documents this message:

Table 12-68 • Warning -9131: Unable to Resolve Installer Variable

Category	Description
Type:	Warning
Message:	`Unable to resolve an installer variable in the string 'StringName'`
Cause:	Not all Windows Installer variables can be resolved at build time. This can result in errors if your application requires a specific value.
Resolution:	Repackage this application and rebuild the profile, or use a constant value in the Windows Installer package.

Warning -9132: 16 Color Shortcut Icon Not Found

The following table documents this message:

Table 12-69 • Warning -9132: 16 Color Shortcut Icon Not Found

Category	Description
Type:	Warning
Message:	`No 16 color icon found for 'ShortcutName' shortcut. Shortcut icon may look distorted when published.`
Cause:	The icon used for this shortcut does not contain a 16-color image. Since Citrix currently does not support images with a higher number of colors, this icon may look distorted when shown and published in Citrix XenApp.
Resolution:	You can modify the shortcut to use a different icon or add a 16-color image to the one currently used.

Warning -9133: Shortcut Icon Not Found

The following table documents this message:

Table 12-70 • Warning -9133: Shortcut Icon Not Found

Category	Description
Type:	Warning

Table 12-70 • Warning -9133: Shortcut Icon Not Found

Category	Description
Message:	`No icon found for 'ShortcutName' shortcut. Using generic Windows application icon instead.`
Cause:	If no icon can be loaded for this shortcut, the generic Windows application icon is used. This can happen if the file used is corrupt or if extracting an image from it is not possible.
Resolution:	Modify the shortcut to use a different icon.

Warning -9134: Failure to Extract Icon from Executable

The following table documents this message:

Table 12-71 • Warning -9134: Failure to Extract Icon from Executable

Category	Description
Type:	Warning
Message:	`Failed to extract icon from executable 'filename'. Make sure the executable is not corrupt.`
Cause:	A corrupt icon file may cause this warning.
Resolution:	Modify the shortcut to use a different icon.

Error -9135: Shortcut Target is 16-Bit

The following table documents this message:

Table 12-72 • Error -9135: Shortcut Target is 16-Bit

Category	Description
Type:	Error
Message:	`The target for shortcut 'ShortcutName' is 16-bit. This application may not function properly in the Citrix Isolation Environment.`
Cause:	The file this shortcut points to is a 16-bit application.
Resolution:	Replace file with a newer 32-bit version. Can also test and see if the application works properly in the Citrix environment.

Warning -9136: Some Files May Not Be Decompressed

The following table documents this message:

Table 12-73 • Warning -9136: Some Files May Not Be Decompressed

Category	Description
Type:	Warning
Message:	`Some files may not be decompressed from this package because it contains features with a default install level of 0.`
Cause:	When installing a compressed Windows Installer package, the build engine runs an administrative installation of it to decompress it. One limitation of an administrative installation is that it does not decompress a file if the feature it is contained in has a default install level of **0**. If there are any files in any components contained within those features, InstallShield will generate an error when it attempts to copy those files into the Citrix profile, because they will not exist in the source location.
Resolution:	To resolve this issue, edit the Windows Installer package and set the default install level of that feature to something other than **0**.

Warning -9137: Destination Directory Cannot Be Found

The following table documents this message:

Table 12-74 • Warning -9137: Destination Directory Cannot Be Found

Category	Description
Type:	Warning
Message:	`The destination directory for the 'FileName' file cannot be found. You should consider Repackaging this application before proceeding with the conversion process.`
Cause:	This is an internal error.
Resolution:	Contact InstallShield Technical Support.

Warning -9138: Ignoring a DuplicateFile Table Entry

The following table documents this message:

Table 12-75 • Warning -9138: Ignoring a DuplicateFile Table Entry

Category	Description
Type:	Warning
Message:	`Ignoring a DuplicateFile table entry because unable to resolve the property used for the DestFolder: 'INVALIDPATH'`
Cause:	You might encounter this error when the Windows Installer package that you are converting includes one or more entries in the **DuplicateFile** table, and a property that is used in the DestFolder column for one of those entries in the **DuplicateFile** table cannot be resolved. For example, if the destination for a duplicate file is set by a custom action, that destination cannot be resolved during the conversion.
Resolution:	The **DuplicateFile** table contains a list of files that need to be duplicated during installation, either to a different directory than the original file or to the same directory but with a different name. Because a destination in this table cannot be resolved, you need to do one of the following to resolve this issue: • **Option 1: Edit the Windows Installer Package**—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the problematic entry in the **DuplicateFile** table by including any additional copies of that file. • **Option 2: Repackage the Application**—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package. • **Option 3: Write a Pre-Launch Script**—Write a pre-launch script that—upon application launch—performs the file copy operations for the problematic entry in the **DuplicateFile** table.

Warning -9150: Warning Building Windows Installer Package

The following table documents this message:

Table 12-76 • Warning -9150: Warning Building Windows Installer Package

Category	Description
Type:	Warning
Message:	`Warning building Windows Installer package: Warning number and message.`
Cause:	This warning indicates that InstallShield encountered a build warning when it built the new Basic MSI project and releases for the App-V application that you are creating.

Table 12-76 • Warning -9150: Warning Building Windows Installer Package (cont.)

Category	Description
Resolution:	You may need to resolve the warning in the Basic MSI project that InstallShield created in the App-VPackage subfolder when you built the App-V application. However, note that InstallShield overwrites the Basic MSI project each time that you rebuild the App-V application.

Error -9151: Error Building Windows Installer Package

The following table documents this message:

Table 12-77 • Error -9150: Error Building Windows Installer Package

Category	Description
Type:	Error
Message:	`Error building Windows Installer package: Error number and message.`
Cause:	This error indicates that InstallShield encountered a build error when it built the new Basic MSI project and releases for the App-V application that you are creating.
Resolution:	You may need to resolve the error in the Basic MSI project that InstallShield created in the App-VPackage subfolder when you built the App-V application. However, note that InstallShield overwrites the Basic MSI project each time that you rebuild the App-V application.

Error -9200: ThinApp Must Be Installed

The following table documents this message:

Table 12-78 • Error -9200: ThinApp Must Be Installed

Category	Description
Type:	Error
Message:	`A licensed or demo version of ThinApp must be installed on this machine in order to successfully build ThinApp applications. (www.vmware.com)`
Cause:	ThinApp is not installed.
Resolution:	Install ThinApp.

Warning -9201: Extension for Shortcut Files Must Be ".exe"

The following table documents this message:

Table 12-79 • Warning -9201: Extension for Shortcut Files Must Be ".exe"

Category	Description
Type:	Warning
Message:	`The extension for the target for shortcut 'ShortcutName' is not '.exe'. Excluding shortcut.`
Cause:	Shortcuts that do not have a filename extension of `.exe` are excluded.
Resolution:	No action is required.

Error -9202: No Applications Were Created

The following table documents this message:

Table 12-80 • Error -9202: No Applications Were Created

Category	Description
Type:	Error
Message:	`No applications were created.`
Cause:	Either the Windows Installer package had no shortcuts or all shortcuts were excluded.
Resolution:	Make sure that the source Windows Installer `.msi` package has at least one shortcut to an `.exe` file.

Error -9203: ThinApp Tool is Missing

The following table documents this message:

Table 12-81 • Error -9203: ThinApp Tool is Missing

Category	Description
Type:	Error
Message:	`ThinApp: 'ToolName' was not found`
Cause:	One of the ThinApp tools required to build a ThinApp application was not found.

Table 12-81 • Error -9203: ThinApp Tool is Missing

Category	Description
Resolution:	Reinstall ThinApp.

Error -9204: Duplicate Shortcut

The following table documents this message:

Table 12-82 • Error -9204: Duplicate Shortcut

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists. Excluding duplicate shortcut.`
Cause:	The source package has two shortcuts that both point to the same `.exe` target.
Resolution:	No action is required.

Error -9205: Identically Named Shortcut Already Exists, But With Different Parameters

The following table documents this message:

Table 12-83 • Error -9205: Identically Named Shortcut Already Exists, But With Different Command Line Parameters

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists, but with different command line parameters. A new, unique shortcut will be created.`
Cause:	Two shortcuts in the package differed in arguments only.
Resolution:	No action is required.

Error -9206: Identically Named Shortcut Already Exists, But With a Different Target

The following table documents this message:

Table 12-84 • Error -9206: Identically Named Shortcut Already Exists, But With a Different Target

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists, but with a different target. A new, unique shortcut will be created.`
Cause:	Two shortcuts differed in the target pointed to only.
Resolution:	No action is required.

Error -9207: Error During Build Process (vregtool.exe)

The following table documents this message:

Table 12-85 • Error -9207: Error During Build Process (vregtool.exe)

Category	Description
Type:	Error
Message:	`An error occurred during the ThinApp build process (vregtool.exe).`
Cause:	An unexpected error occurred while running the vregtool.exe step of the ThinApp build process.
Resolution:	The cause of this error may be discernible by the progress messages that were displayed just before this error occurred. Also, make sure none of the files/folders in the build folder hierarchy are locked.

Error -9208: Error Occurred During Build Process (vftool.exe)

The following table documents this message:

Table 12-86 • Error -9208: Error Occurred During Build Process (vftool.exe)

Category	Description
Type:	Error

Table 12-86 • Error -9208: Error Occurred During Build Process (vftool.exe)

Category	Description
Message:	`An error occurred during the ThinApp build process (vftool.exe)`
Cause:	An unexpected error occurred while running the `vftool.exe` step of the ThinApp build process.
Resolution:	The cause of this error may be discernible by the progress messages that were displayed just before this error occurred. Also, make sure none of the files/folders in the build folder hierarchy are locked.

Error -9209: Error Occurred During Build Process (tlink.exe)

The following table documents this message:

Table 12-87 • Error -9209: Error Occurred During Build Process (tlink.exe)

Category	Description
Type:	Error
Message:	`An error occurred during the ThinApp build process (tlink.exe)`
Cause:	An unexpected error occurred while running the tlink.exe step of the ThinApp build process.
Resolution:	The cause of this error may be discernible by the progress messages that were displayed just before this error occurred. Also, make sure none of the files/folders of the build folder hierarchy are locked.

Error -9300: Unhandled Exception During AdviseFile Operation

The following table documents this message:

Table 12-88 • Error -9300: Unhandled Exception During AdviseFile Operation

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the AdviseFile operation for rule 'RuleName'`
Resolution:	Contact InstallShield Technical Support.

Error -9301: Unhandled Exception During AdviseRegistry Operation

The following table documents this message:

Table 12-89 • Error -9301: Unhandled Exception During AdviseRegistry Operation

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the AdviseRegistry operation for rule 'RuleName'`
Resolution:	Contact InstallShield Technical Support.

Error -9302: Unhandled Exception During Command Action

The following table documents this message:

Table 12-90 • Error -9302: Unhandled Exception During Command Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the command action with the description 'CommandActionName'`
Resolution:	Contact InstallShield Technical Support.

Error -9303: Unhandled Exception During Alter File Action

The following table documents this message:

Table 12-91 • Error -9303: Unhandled Exception During Alter File Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the alter file action with the description 'FileName'`
Resolution:	Contact InstallShield Technical Support.

Error -9304: Unhandled Exception During Alter Registry Action

The following table documents this message:

Table 12-92 • Error -9304: Unhandled Exception During Alter Registry Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the alter registry action with the description 'RegistryName'`
Resolution:	Contact InstallShield Technical Support.

Error -9305: Unhandled Exception During Create Action

The following table documents this message:

Table 12-93 • Error -9305: Unhandled Exception During Create Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the create action with the description 'CreateName'`
Resolution:	Contact InstallShield Technical Support.

Error -9306: Unhandled Exception During Execution of Rules Engine

The following table documents this message:

Table 12-94 • Error -9306: Unhandled Exception During Execution of Rules Engine

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the execution of the rules engine.`
Resolution:	Contact InstallShield Technical Support.

Error -9401: Error Initializing App-V Writer

The following table documents this message:

Table 12-95 • Error -9401: Error Initializing App-V Writer

Category	Description
Type:	Error
Message:	`Unexpected error initializing App-V writer.`
Resolution:	Contact InstallShield Technical Support.

Error -9402: Error Initializing App-V Package

The following table documents this message:

Table 12-96 • Error -9402: Error Initializing App-V Package

Category	Description
Type:	Error
Message:	`Unexpected error initializing App-V package.`
Resolution:	Contact InstallShield Technical Support.

Error -9403: Error Writing App-V File Entries

The following table documents this message:

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V file entries.`
Resolution:	Contact InstallShield Technical Support.

Error -9404: Error Writing App-V Folder Entries

The following table documents this message:

Table 12-98 • Error -9404: Error Writing App-V Folder Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V folder entries`
Resolution:	Contact InstallShield Technical Support.

Error -9405: Error Writing App-V Registry Entries

The following table documents this message:

Table 12-99 • Error -9405: Error Writing App-V Registry Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V registry entries.`
Resolution:	Contact InstallShield Technical Support.

Error -9406: Error Writing App-V INI File Entries

The following table documents this message:

Table 12-100 • Error -9406: Error Writing App-V INI File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V INI file entries.`
Resolution:	Contact InstallShield Technical Support.

Error -9407: Error Writing App-V Shortcuts

The following table documents this message:

Table 12-101 • Error -9407: Error Writing App-V Shortcuts

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V shortcuts.`
Resolution:	Contact InstallShield Technical Support.

Error -9408: Error Writing App-V File Type Data

The following table documents this message:

Table 12-102 • Error -9408: Error Writing App-V File Type Data

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V file type data.`
Resolution:	Contact InstallShield Technical Support.

Error -9409: Error Saving App-V Data

The following table documents this message:

Table 12-103 • Error -9409: Error Saving App-V Data

Category	Description
Type:	Error
Message:	`Unexpected error saving App-V data.`
Resolution:	Contact InstallShield Technical Support.

Error -9410: Error Determining Source File Path

The following table documents this message:

Table 12-104 • Error -9410: Error Determining Source File Path

Category	Description
Type:	Error
Message:	`Unexpected error determining source file path for 'FileName'.`
Cause:	The installation location of a file, which is determined by some run time property, cannot be determined by the App-V virtual converter.
Resolution:	Locate the file in InstallShield and provide a known directory.

Error -9411: OSD File Template Could Not Be Extracted

The following table documents this message:

Table 12-105 • Error -9411: OSD File Template Could Not Be Extracted

Category	Description
Type:	Error
Message:	`The Microsoft App-V OSD file template could not be extracted. The OSD file generation will not operate properly.`
Resolution:	Contact InstallShield Technical Support.

Error -9412: OSD File Could Not Be Saved

The following table documents this message:

Table 12-106 • Error -9412: OSD File Could Not Be Saved

Category	Description
Type:	Error
Message:	`The Microsoft App-V OSD file could not be saved. The OSD file generation will not operate properly.`
Resolution:	Contact InstallShield Technical Support.

Error -9413: App-V OSD Save

The following table documents this message:

Table 12-107 • Error -4313: App-V OSD Save

Category	Description
Type:	Error
Message:	`The Microsoft App-V OSD file could not be saved. The OSD file generation will not operate properly.`
Resolution:	Contact InstallShield Technical Support.

Warning -9414: Local App-V Application Specified as a Dependency of the Primary Application

The following table documents this message:

Table 12-108 • Warning -9414: Local App-V Application Specified as a Dependency of the Primary Application

Category	Description
Type:	Warning
Message:	`A local App-V application was specified as a dependency of the primary application. The primary application may not run correctly if it is relocated to a different location.`
Cause:	The user specified a dependent App-V application that is either on the local drive or on a mapped drive. This is determined by examining the HREF attribute of the CODEBASE tag in the dependency application's OSD file.
Resolution:	Dependency applications should be referenced by a portable mechanism using either a non-FILE protocol or by using a network URL.

Error -9415: Dependency Application Was Not Found

The following table documents this message:

Table 12-109 • Error -9415: Dependency Application Was Not Found

Category	Description
Type:	Error

Table 12-109 • Error -9415: Dependency Application Was Not Found

Category	Description
Message:	`Dependency application was not found: 'ApplicationName'.`
Cause:	A specified App-V dependency application file was not found.
Resolution:	Check the path of the specified App-V dependency application.

Warning -9416: Invalid Primary Application Directory

The following table documents this message:

Table 12-110 • Warning -9416: Invalid Primary Application Directory

Category	Description
Type:	Error
Message:	`The specified Primary Application Directory, 'DirectoryName', does not exist.`
Cause:	This may be caused if the directories specified in the Windows Installer package have changed after a valid Primary Application Directory was specified.
Resolution:	Specify a valid Primary Application Directory using the supplied browse folder in InstallShield.

Error -9417: Dependency Application's OSD File Contains an Invalid HREF Value

The following table documents this message:

Table 12-111 • Error -9417: Dependency Application's OSD File Contains an Invalid HREF Value

Category	Description
Type:	Error
Message:	`Dependency application OSD file contains an invalid value for the HREF field of the CODEBASE tag: 'HREF_Field_Value'`
Cause:	The CODEBASE tag of the dependency application's OSD file may have an empty or non-existent HREF attribute.
Resolution:	Make sure that the CODEBASE tag of the dependency application's OSD file has a valid HREF attribute.

Error -9418: Error While Privatizing Side-By-Side Assemblies

The following table documents this message:

Table 12-112 • Error -9418: Error While Privatizing Side-By-Side Assemblies

Category	Description
Type:	Error
Message:	`An error occurred while privatizing Side-By-Side assemblies.`
Cause:	When converting to an App-V package, files installed to the win32 Sxs assembly cache need to be privatized so that the App-V runtime can find them. This error occurs if there was an unexpected failure in that process.
Resolution:	Contact InstallShield Technical Support.

Error -9419: Error Inserting Watermark

The following table documents this message:

Table 12-113 • Error -9419: Error Inserting Watermark

Category	Description
Type:	Error
Message:	`An error has occurred inserting the evaluation watermark into the App-V Package.`
Resolution:	Contact InstallShield Technical Support.

Error -9424: Building an App-V 5.x Package

The following table documents this message:

Table 12-114 • Error -9424: Building an App-V 5.x Package

Category	Description
Type:	Error
Message:	`Skipping conversion to Microsoft App-V 5. The minimum operating system requirement for building App-V 5 packages is Windows 8 or Windows Server 2012.`

Table 12-114 • Error -9424: Building an App-V 5.x Package (cont.)

Category	Description
Resolution:	Although you can configure settings for an App-V 5.x package on any version of Windows that InstallShield supports, building an App-V 5.x package from within InstallShield requires Windows 8 or Windows Server 2012.

Warning -9500: Shortcut Missing

The following table documents this message:

Table 12-115 • Warning -9500: Shortcut Missing

Category	Description
Type:	Warning
Message:	`The target for shortcut 'FileName' does not exist. Excluding shortcut.`
Cause:	The target file of a shortcut in the project does not exist.
Resolution:	Repackage this application and then rebuild the virtual package.

Error -10000: Process Cancelled By User

The following table documents this message:

Table 12-116 • Error -10000: Process Cancelled By User

Category	Description
Type:	Error
Message:	`Process cancelled by user.`
Cause:	User clicked **Cancel** to cancel the profile conversion process.

Warning -10001: Suite File Missing

The following table documents this message:

Table 12-117 • Warning -10001: Suite File Missing

Category	Description
Type:	Warning
Message:	`The suite MSI file 'FileName' is missing and will be excluded from the conversion.`
Cause:	An MSI file that is part of a suite conversion was not found.
Resolution:	Make sure the input file for the suite conversion process exists.

Warning -10002: Suite File is Duplicate

The following table documents this message:

Table 12-118 • Warning -10002: Suite File is Duplicate

Category	Description
Type:	Warning
Message:	`The suite MSI file 'FileName' appears to be the same as the main MSI file and we will exclude this file from the conversion process.`
Cause:	A suite conversion was attempted where the main Windows Installer file (.msi) and one of the additional Windows Installer files specified were the same.
Resolution:	Specify unique Windows Installer files as part of the suite conversion process.

Warning -10003: Application File Missing

The following table documents this message:

Table 12-119 • Warning -10003: Application File Missing

Category	Description
Type:	Error
Message:	`Application file not found 'ApplicationName'`

Table 12-119 • Warning -10003: Application File Missing

Category	Description
Cause:	A file referenced by the installation was not found by the App-V virtual converter. It is likely that the file reference is broken in the installation.
Resolution:	Use InstallShield to locate the file in the installation and either fix the link or delete it.

Warning -10004: INI File Missing

The following table documents this message:

Table 12-120 • Warning: -10004: INI File Missing

Category	Description
Type:	Error
Message:	`INI file not found 'INI_File_Name'.`
Resolution:	Contact InstallShield Technical Support.

Fix 11000: Excluding TCPIP Registry Entries

The following table documents this message:

Table 12-121 • Fix 11000: Excluding TCPIP Registry Entries

Category	Description
Type:	Fix
Message:	`Excluding TCPIP registry entries from the Citrix profile.`
Action:	All TCPIP registry entries will be excluded from the Citrix profile.

Fatal Error 11001: Fail on VMware

The following table documents this message:

Table 12-122 • Fatal Error 11001: Fail on VMware

Category	Description
Type:	Fatal
Message:	`VMware cannot be virtualized.`
Cause:	Conversion will fail when the application being virtualized is VMware.
Action:	This error message is displayed: `VMware cannot be virtualized.`

Warning 11003: Control Panel Applet - Citrix

The following table documents this message:

Table 12-123 • Warning 11003: Control Panel Applet - Citrix

Category	Description
Type:	Warning
Message:	`The Control Panel Applet [AppletName] will not appear in Control Panel.`
Action:	A warning is displayed when the application contains a Control Panel applet.

Fix 11004: Control Panel Applet - ThinApp

The following table documents this message:

Table 12-124 • Fix 11004: Control Panel Applet - ThinApp

Category	Description
Type:	Fix
Message:	`Generating shortcut for the Control Panel Applet located at 'DirectoryPath'`
Action:	A default shortcut is created for ThinApp Control Panel applets.

Fatal Error 11005: QuickTime 7.4.1 Causes Fatal Error

The following table documents this message:

Table 12-125 • Error 11005: QuickTime 7.4.1 Causes Fatal Error

Category	Description
Type:	Fatal Error
Message:	`QuickTime 7.4.1 is known to have errors when running from a virtual package. Use QuickTime 7.4.5 instead.`
Cause:	QuickTime 7.4.1 cannot be virtualized correctly.
Resolution:	Obtain QuickTime 7.4.5 and repeat the conversion process.

Fix 11006: Adobe Distiller Exclude AdobePDFSettings

The following table documents this message:

Table 12-126 • Fix 11006: Adobe Distiller Exclude AdobePDFSettings

Category	Description
Type:	Fix
Message:	`Excluding the registry key Software\Adobe\Acrobat Distiller\AdobePDFSettings. Adobe Distiller will recreate these settings on first use.`
Action:	The AdobePDFSettings registry settings are excluded.

Fix 11007: Exclude URL Shortcut

The following table documents this message:

Table 12-127 • Fix 11007: Adobe Distiller Exclude AdobePDFSettings

Category	Description
Type:	Fix
Message:	`Excluding shortcut to .URL file. App-V does not launch these files properly.`
Action:	The shortcut to the .URL file is excluded.

Steps to Take Before Calling Technical Support

Before contacting InstallShield Technical Support, perform the following steps to attempt to clearly identify the problem you are having:

- **Check package**—To determine if this error is caused by a problem with the specific package you are converting, try to build a Citrix profile of a simple package that contains only one file.
- **Check machine and OS**—To determine if this error is caused by a configuration on a particular machine or operating system, attempt to build this Citrix profile on another machine or operating system.
- **Check individual files**—To determine if this is error limited to a specific item, find out if removing or excluding a particular item will build error free.

Application Features Requiring Pre- or Post-Conversion Actions

Some application features are ignored when creating a Citrix profile. Therefore, some additional pre- or post-conversion actions must be taken in order for the virtual application to work.

One action you could take to try to include ignored features in a virtual application is to first repackage the application using the Repackaging Wizard that is included with Repackager, and then convert the repackaged application to a virtual package.

***Edition** • Repackager is included with AdminStudio.*

The following table lists the application features which require additional, manual conversion steps:

Table 12-128 • Application Features Ignored During Profile Conversion

Windows Installer Feature	Manual Conversion Steps
User-Defined Custom Actions	When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. For user-defined custom actions, a warning message is generated. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile. The resolution that you should perform depends upon the purpose of the custom action: • If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning. • If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue. To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application, by performing the following steps.  ***To successfully convert a package with user-defined custom actions:*** 1. Use the Repackaging Wizard to repackage this application.The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project. 2. Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action.
Services	Citrix XenApp does not support any type of services. Therefore, to resolve this issue, you need to install any required services outside of the isolation environment on the user desktop machines.  ***To successfully convert a package with services:*** 1. If you have an application and a service bundled in the same Windows Installer package, you need to create a separate Windows Installer package containing just the service. 2. Install the service on each of the user desktop machines. The Citrix profile of this application should now be able to run in an isolation environment on machines that already have the service installed.

Table 12-128 • Application Features Ignored During Profile Conversion

Windows Installer Feature	Manual Conversion Steps
COM+	While Citrix XenApp supports communicating with COM+ applications, it does not support *installing* COM+ services. Therefore, an application that contains COM+ services cannot be deployed on Citrix XenApp.

Automation Interface

The InstallShield Help Library explains how to use the InstallShield interface to author all elements of your installation and then build a release. For advanced developers, InstallShield exposes a COM interface that allows you to perform many of the same tasks from a program, such as a Visual Basic executable, or a script, such as a VBScript file in Windows Scripting Host. By calling methods, setting properties, accessing collections, and so on, through the automation interface, you can open a project and modify its features and component data in many of the same ways that you would in the InstallShield interface.

The highest-level object in the automation interface is the ISWiProject Object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

Note • *The automation interface affects a project only at design time and not run time.*

Automation Objects

Each InstallShield automation object represents an installation element such as a feature, a component, or a file. This section describes each of the InstallShield automation objects.

The highest-level object in the automation interface is the ISWiProject Object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

ISWiProject Object

Project • *This information does not apply to QuickPatch projects.*

ISWiProject contains the interface for opening, closing, and saving an InstallShield project (.ism) file. When InstallShield is installed on your system, you can instantiate a copy of ISWiProject with the following VB and VBScript syntax:

```
Set m_ISWiProject = CreateObject("IswiAuto20.ISWiProject")
```

To open an installation project, call the OpenProject method, as follows:

```
' Build path to the .ism file
strFile = "C:\InstallShield 2013 Projects\Test.ism"
m_ISWiProject.OpenProject strFile
```

Important • *If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file. Otherwise, you may encounter an error when you instantiate a copy of ISWiProject, or any other object. For more information, see Using the Automation Interface on a 64-Bit System.*

Build Status Events

The ISWiProject object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. The following table lists the ISWiProject Object members. Remember that some methods, properties, and collections are only available for a particular project type.

Members

Table 12-1 • ISWiProject Object Members

Name	Project	Type	Description
ActiveLanguage	All	Read-Write Property	Gets or sets the default language of the project. Specify a single language as a language ID. The automation interface uses the default language whenever you get or set a localizable property, such as ISWiShortcut's DisplayName. In InstallShield, localizable properties must use a string entry. If the property has a string identifier, the string that you enter for the property becomes the string entry's value for the default language.
AddAdvancedFile	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Method	Creates an advanced file with the specified name and (optionally) in the specified disk image in the current project.
AddAutomaticUpgradeEntry	Basic MSI, InstallScript MSI	Method	Creates a new ISWiAutomaticUpgradeEntry item and returns a handle to that object.
AddComponent	All	Method	Creates an ISWiComponent object in the current project.
AddCustomAction	Basic MSI, InstallScript MSI	Method	Creates an ISWiCustomAction object in the current project.
AddFeature	All	Method	Creates an ISWiFeature object in the current project.
AddLanguage	All	Method	Adds a language to the current project.
AddPathVariable	All	Method	Adds a path variable to the current project.
AddProductConfig	Basic MSI, InstallScript MSI	Method	Creates an ISWiProductConfig object in the current project.
AddProperty	Basic MSI, InstallScript MSI	Method	Creates a new ISWiProperty item and returns a handle to that object.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
AddSetupFile	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Method	Creates a support file with the specified name in the current project.
AddSetupType	InstallScript, InstallScript Object	Method	Creates a setup type with the specified name in the current project.
AddSqlServerConnection	All	Method	Adds a new server connection to the current project.
AddUpgradeTableEntry	Basic MSI, InstallScript MSI	Method	Creates a new ISWiUpgradeTableEntry item and returns a handle to that object.
AdminExecuteSequence	Basic MSI, InstallScript MSI	Read-only Property	Returns an ISWiSequence collection representing the Administration Execute sequence in the current project.
AdminUISequence	Basic MSI, InstallScript MSI	Read-only Property	Returns an ISWiSequence collection representing the Administration User Interface sequence in the current project.
AdvtExecuteSequence	Basic MSI, InstallScript MSI	Read-only Property	Returns an ISWiSequence collection representing the Advertisement Execute sequence in the current project.
AdvtUISequence	Basic MSI, InstallScript MSI	Read-only Property	Returns an ISWiSequence collection representing the Advertisement User Interface sequence in the current project. (Note that validation rule ICE78 requires the Advertisement User Interface sequence to be empty. For more information, see ICEs.)
BuildPatchConfiguration	Basic MSI, InstallScript MSI	Method	Calling this method builds the patch configuration identified by the strPatchConfiguration variable. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting 'Build Patch'.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
BuildPCPFile	Basic MSI, InstallScript MSI	Method	Builds a patch package based on a .pcp file.
CloseProject	All	Method	Closes an InstallShield installation project.
CompanyName	Basic MSI, InstallScript, InstallScript MSI	Read-Write Property	Specifies the company name.  ***Project*** • *In Basic MSI and InstallScript MSI projects, this property corresponds with the Publisher setting in the General Information view.* *In InstallScript projects, this property corresponds with the Company Name setting in the General Information view.*
CompanyPhone	Basic MSI, InstallScript, InstallScript MSI	Read-Write Property	Specifies the phone number that you would like end users to call for technical support. This phone number is displayed on the Support Information dialog of Add or Remove Programs. This property corresponds with the Support Phone Number setting in the General Information view.
CompanyURL	Basic MSI, InstallScript, InstallScript MSI	Read-Write Property	Specifies the URL that you would like end users to visit for technical support. This URL is used as a hyperlink on the Support Information dialog of Add or Remove Programs. This property corresponds with the Publisher/Product URL setting in the General Information view.
CreatePatch	Basic MSI, InstallScript MSI	Method	 ***Caution*** • *The CreatePatch method is deprecated for new development. It has been replaced with the BuildPCPFile and BuildPatchConfiguration methods.*
CreateProject	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Method	Creates a new project file (.ism).

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
DeleteAdvancedFile	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Method	Deletes the specified advanced file from the current project.
DeleteComponent	All	Method	Deletes the specified component from the project.
DeleteCustomAction	Basic MSI, InstallScript MSI	Method	Deletes an ISWiCustomAction object in the current project.
DeleteMergeModule	Basic MSI, InstallScript MSI	Method	Deletes a merge module from the current project.
DeletePathVariable	All	Method	Deletes a path variable from the current project.
DeleteProductConfig	Basic MSI, InstallScript MSI	Method	Deletes an ISWiProductConfig object from the current project.
DeleteProperty	Basic MSI, InstallScript MSI	Method	Deletes a property from the Property table.
DeleteSetupFile	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Method	Deletes the specified support file from the current project.
DeleteSetupType	InstallScript, InstallScript Object	Method	Deletes the specified setup type from the current project.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
DeleteSQLConnection	All	Method	Remove a SQL Server connection from the current project.
DeselectLanguage	All	Method	Deselects a language from the current project.
DotNetFrameworkPath	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the path to the Microsoft .NET Framework. This parameter is optional.
EnableSwidtag	Basic MSI	Read-Write Property	Enables or disables the creation of a software identification tag for an installation. Following is sample code that disables tag creation: `pProject.EnableSwidtag = False` For more information about software tagging, see Including a Software Identification Tag for Your Product.
ExportProject	All	Method	Causes the .ism file to use the XML representation, which is better suited for source code integration.
ExportStrings	All	Method	Exports string entries to a text file.
GenerateGUID	All	Method	Generates a new, unique GUID as a string.
ImportProject	All	Method	Converts an .isv file (a text file kept in a source code integration program) to an InstallShield .ism project file.  ***Note*** • *The .isv file format has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.*
ImportStrings	All	Method	Imports string entries from a text file.
INSTALLDIR	Basic MSI, InstallScript MSI	Read-Write Property	Sets the INSTALLDIR property for the project. A typical value is "[ProgramFilesFolder]CompanyName\ProductName".
InstallExecuteSequence	Basic MSI, InstallScript MSI	Read-only Property	Returns an ISWiSequence collection representing the Installation Execute sequence in the current project.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
InstallUISequence	Basic MSI, InstallScript MSI	Read-only Property	Returns an ISWiSequence collection representing the Installation User Interface sequence in the current project.
ISWiAdvancedFiles	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Collection	Contains every advanced file (as an ISWiAdvancedFile object) in your project.
ISWiAutomaticUpgradeEntries	Basic MSI, InstallScript MSI	Collection	Returns a collection of ISWiAutomaticUpgradeEntry items. This collection presents a list of Automatic Upgrade Items as they are defined in the IDE.
ISWiComponents	All	Collection	Contains all of the components in this project.
ISWiCustomActions	Basic MSI, InstallScript MSI	Collection	Contains all of the custom actions in this project.
ISWiFeatures	All	Collection	Contains all features' names and their components.
ISWiLanguages	All	Collection	Contains all of the languages included in the current project.
ISWiPathVariables	All	Collection	Contains all of the path variables that are associated with the current project.
ISWiProductConfigs	All	Collection	Contains all of the product configurations in this project.
ISWiProperties	Basic MSI, InstallScript MSI	Collection	Contains all of the Windows Installer properties in this project.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
ISWiSetupFiles	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Collection	Contains every support file (as an ISWiSetupFile object) in your project.
ISWiSetupTypes	InstallScript, InstallScript Object	Collection	Contains every setup type (as an ISWiSetupType object) in your project.
ISWiSISProperties	Basic MSI, InstallScript MSI	Collection	Contains all of the Summary Information Stream properties in this project.
ISWiSQLConnections	All	Collection	Contains all of the SQL Server connections in the current project.
ISWiUpgradeTableEntries	Basic MSI, InstallScript MSI	Collection	Returns a collection of ISWiUpgradeTableEntry items. This collection presents a list of static major upgrade items, as defined in the IDE.
MergeModuleSearchPath	Basic MSI, InstallScript MSI	Read-Write Property	Specifies one or more comma-delimited folders that contain the merge module (.msm) files referenced by your project.  ***Note*** • *If you plan to use the ISWiRelease.Build method, you should set this property.*
MinimumTargetDotNetVersion	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the minimum version of the .NET Framework that the installation requires on the target system. This parameter is optional. The default is the latest version of the .NET Framework the InstallShield interface supports.
MinimumTargetMSIVersion	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Specifies the minimum version of Windows Installer that the installation requires on the target system. This parameter is optional. The default is the latest version of Windows Installer that the InstallShield interface supports.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
ModuleID and ModuleIDGUID	Merge Module	Read-Write String Properties	These properties are used only with merge module projects. Every merge module has a record in the **ModuleSignature** table. The **ModuleID** field of the **ModuleSignature** table is composed of two sections: ModuleID.ModuleIDGUID. For example, • IDID.019880FB_04F2_4D4B_99C9_9A0A12185229The ModuleID property gets or sets *IDID*. • The ModuleIDGUID property gets or sets *019880FB_04F2_4D4B_99C9_9A0A12185229*.
OnUpgrade	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the value for the Small/Minor/Upgrade Settings options on the Common tab in the Upgrades view. This property lets you specify whether you want end users to be prompted before proceeding with the upgrade. A `Setup.exe` setup launcher is required for this functionality. Available options are: • **eouPrompt (1)**— Prompt. • **eouUpgrade (2)**—Do not prompt the end user; just install the upgrade. • **eouNoOp (0)**—Disable any prompts. Your installation should detect the upgrade scenario and run the installation in upgrade mode.
OpenProject	All	Method	Opens an InstallShield installation project (.ism file). This method fails if the project is open in the InstallShield user interface.
PackageCode	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the package code as a string GUID. The GUID must be surrounded by braces—{12345678-1234-1234-1234-1234567890AB}, for example.
ProductCode	All	Read-Write Property	Gets or sets the product code as a string GUID. The GUID must be surrounded by braces—{12345678-1234-1234-1234-1234567890AB}, for example. This property is not available for merge module projects.
ProductName	All	Read-Write Property	Gets or sets the product name.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
ProductVersion	All	Read-Write Property	Contains the version number of the project as a string.
RemoveFeature	All	Method	Deletes a feature from the project.
SaveProject	All	Method	Saves an InstallShield installation project.
SelfRegistrationMethod	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Specifies the self-registration method that should be used for files that are designated as self-registering. Valid options are: • **esrISSelfReg (0)**—Use the InstallShield self-registration table (ISSelfReg) for all self-registering files. • **esrSelfReg (1)**—Use the Windows Installer self-registration table (SelfReg) for all self-registering files.
SkipUpgradeValidators	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Enables you to skip the upgrade validators that normally run at the end of the build.

Table 12-1 • ISWiProject Object Members (cont.)

Name	Project	Type	Description
SwidtagProperty	Basic MSI	Read-Write Property	Gets or sets value for the software identification tag settings in the General Information view. This property takes one of the following options for the first parameter: • **eswtpUniqueId (0)**—This parameter specifies the value for the Unique ID setting in the General Information view. • **eswtpTagCreatorName (2)**—This parameter specifies the value for the Tag Creator setting in the General Information view. • **eswtpTagCreatorRegid (3)**—This parameter specifies the value for the Tag Creator ID setting in the General Information view. • **eswtpSfwCreatorName (4)**—This parameter specifies the value for the Software Creator setting in the General Information view. • **eswtpSfwCreatorRegid (5)**—This parameter specifies the value for the Software Creator ID setting in the General Information view. • **eswtpSfwLicensorName (6)**—This parameter specifies the value for the Software Licensor setting in the General Information view. • **eswtpSfwLicensorRegid (7)**—This parameter specifies the value for the Software Licensor ID setting in the General Information view. • **eswtpEntitlementRequired (8)**—This parameter specifies whether your product requires users to have a corresponding software entitlement in order for software reconciliation to be considered successful. Following is sample code that uses this property: `pProject.SwidtagProperty(eswtpTagCreatorRegid) = "regid.1986-12.com.mycompany"`
UpgradeCode	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the Upgrade Code property as a string GUID. The GUID must be surrounded by braces—{12345678-1234-1234-1234-1234567890AB}, for example. This property is not available for merge module projects.
UseXMLProject Format	All	Boolean Read-Write Property	Specifies whether the project file should use the XML file format.

AddAdvancedFile Method

Project • *The AddAdvancedFile method applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The AddAdvancedFile method creates an advanced file object with the specified name and (optionally) in the specified disk image in the current project. The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

Set pAdvancedFile = pProj.AddAdvancedFile ("C:\My Files\MyLastDiskFile.ext", edtLastDisk)

pProj.SaveProject
pProj.CloseProject
```

Syntax

```
AddAdvancedFile (FileName As String, Optional DiskType As ISWiDiskType = edtDisk1) As
ISWiAdvancedFile
```

Parameters

Table 12-2 • AddAdvancedFile Method Parameters

Parameter	Description
FileName	Pass the fully qualified filename for the advanced file that you want to add.
DiskType	This optional parameter specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values. • **edtDisk1** (1)—Add the advanced file to the Disk 1 folder. This is the default value for this optional parameter. • **edtLastDisk** (-1—Add the advanced file to the Last Disk folder. • **edtOther** (0)—Add the advanced file to the Other folder.

Applies To

- ISWiProject

AddAutomaticUpgradeEntry Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the AddAutomaticUpgradeEntry method to create a new IswiAutomaticUpgradeEntry item and return a handle to that object.

Syntax

```
AddAutomaticUpgradeEntry()
```

Example

```
'################################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'################################################
set pProject = CreateObject("IswiAuto20.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-
21.ism")

'################################################
'To create a new entry

dim pAutoEntry
set pAutoEntry = pProject.AddAutomaticUpgradeEntry()

pAutoEntry.Name ="AutoEntry"
pAutoEntry.ReleaseFlags = "AutoFlag"
pAutoEntry.UpgradedSetupPath = "AutoPath"

'################################################
'To find and delete an existing entry

set pAutoEntry = nothing
set pAutoEntry = pProject.IswiAutoUpgradeEntries("AutoEntry")
pAutoEntry.Delete

pProject.SaveProject
pProject.CloseProject
```

Applies To

ISWiProject

AddComponent Method

The AddComponent method creates a component object with the specified name in the current project. The following Visual Basic lines demonstrate this method:

```
Dim pComponent As ISWiComponent
Set pComponent = m_pProject.AddComponent ("New_Component")
```

When the component is added, a GUID is automatically generated for it (see the GUID property for ISWiComponent). After you have added the component, you can set its other properties and associate it with a feature.

Syntax

```
AddComponent (ComponentKey As String) As ISWiComponent
```

Parameters

Table 12-3 • AddComponent Method Parameters

Parameter	Description
ComponentKey	The component key is the same as the name of the component that is displayed in the Setup Design views. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. ComponentKey must be unique among your project's component names. Component names are case sensitive.

Applies To

- ISWiProject

AddCustomAction Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the AddCustomAction method to add a custom action to the current project. To insert a custom action into a sequence, use the InsertCustomAction method.

Syntax

```
AddCustomAction (CustomActionKey As String) as ISWiCustomAction
```

Parameters

Table 12-4 • AddCustomAction Method Parameters

Parameter	Description
CustomActionKey	The string name of the custom action you want to create.

Applies To

- ISWiProject

AddFeature Method

The AddFeature method creates a feature with the specified name. AddFeature is a member of ISWiProject. The new feature is added to the current project as a top-level feature, but when this method is a member of an ISWiFeature object, the new feature is added as a subfeature of the current feature.

The feature is created with the same default properties that new features have when you add them in the IDE.

The following Visual Basic lines demonstrate calling AddFeature to add a feature, a subfeature, and then associate an existing component with the subfeature:

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism"

Dim pFeat1, pFeat2 As ISWiFeature
Dim sFeat1Name, sFeat2Name As String

sFeat1Name = "ParentFeature"
sFeat2Name = "SubFeature"

' Add the feature ParentFeature, then SubFeature under ParentFeature
Set pFeat1 = pProject.AddFeature(sFeat1Name)
Set pFeat2 = pFeat1.AddFeature(sFeat2Name)

Dim pComp
Dim sCompName As String

' Add the existing component NewComponent1 to SubFeature
sCompName = "NewComponent1"
Set pComp = pProject.ISWiComponents.Item(sCompName)
pFeat2.AttachComponent pComp

pProject.SaveProject
pProject.CloseProject
```

After you have added the feature, you can set its other properties and associate components with it.

Syntax

```
AddFeature (FeatureKey As String) As ISWiFeature
```

Parameters

Table 12-5 • AddFeature Method Parameters

Parameter	Description
FeatureKey	The feature key is the same as the name of the feature that is displayed in the Setup Design views. The name becomes the index for the new ISWiFeature object. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. FeatureKey must be unique among your project's feature names. Feature names are case sensitive.

Applies To

- ISWiProject
- ISWiFeature

AddLanguage Method

Call the AddLanguage method to add a language to the current project. Using this method is similar to adding a language in the General Information view in InstallShield. You can set the properties of the new language with the ISWiLanguage object.

Syntax

```
AddLanguage (LangId As String)
```

Parameters

Table 12-6 • AddLanguage Method Parameters

Parameter	Description
LangId	Pass the language ID (as a string) that you want to add to the current project. For example: `oProject.AddLanguage "1035"`

Applies To

- ISWiProject

AddPathVariable Method

Call the AddPathVariable method to add a path variable to your project. Using this method is similar to adding a path variable from the Path Variables view in InstallShield. You can set the properties of the new path variable with the ISWiPathVariable object.

Important • *Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.*

Syntax

```
AddPathVariable (sName As String) As ISWiPathVariable
```

Parameters

Table 12-7 • AddPathVariable Method Parameters

Parameter	Description
sName	Specifies the name of the path variable.

Applies To

- ISWiProject

AddProductConfig Method

Project • *This information does not apply to the following project types:*

- *InstallScript*

- *InstallScript Object*

Call the AddProductConfig method to add a product configuration to your project. Using this method is similar to adding a product configuration with the Release Wizard or the Releases view of the IDE. You can set the properties of the new product configuration with the ISWiProductConfig object.

Syntax

```
AddProductConfig (ProductConfigKey As String) As ISWiProductConfig
```

Parameters

Table 12-8 • AddProductConfig Method Parameters

Parameter	Description
ProductConfigKey	Holds the name of your new product configuration.

Applies To

- ISWiProject

AddProperty Method

Project • *The AddProperty method applies to the following project types.*

- *Basic MSI*
- *InstallScript MSI*

The AddProperty method creates a Windows Installer property with the specified name in the current project.

Syntax

```
AddProperty (Name As String) As ISWiProperty
```

Parameters

Table 12-9 • AddProperty Method Parameters

Parameter	Description
Name	Pass the name for the Windows Installer property that you want to add.

Example

The following Visual Basic lines demonstrate the AddProperty method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto17.ISWiProject")
```

```
pProj.OpenProject "C:\MySetups\Project1.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProj.AddProperty ("MYPROP")
pProperty.Value = "MyPropValue"

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

AddSetupFile Method

Project • *The AddSetupFile method applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The AddSetupFile method creates a support file with the specified name in the current project.

Syntax

```
AddSetupFile (FileName As String) As ISWiSetupFile
```

Parameters

Table 12-10 • AddSetupFile Method Parameters

Parameter	Description
FileName	Pass the fully qualified file name for the support file that you want to add.

Example

The following Visual Basic lines demonstrate the AddSetupFile method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.AddSetupFile ("C:\My Files\MySupportFile.ext")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

AddSetupType Method

Project • *This information does not apply to Basic MSI projects.*

The AddSetupType method creates a setup type with the specified name in the current project.

Syntax

```
AddSetupType (Name As String) As ISWiSetupType
```

Parameters

Table 12-11 • AddSetupType Method Parameters

Parameter	Description
Name	Pass the name for the setup type that you want to add. The name should be the text that you want to use as the display name. The automation interface automatically generates a valid primary key for the new setup type based on the name that you specify for this parameter.

Example

The following Visual Basic lines demonstrate the AddSetupType method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.AddSetupType ("Client Setup - Save Space")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

AddSQLServerConnection Method

Call the AddSQLServerConnection method to add a new server connection to your project.

Syntax

```
Function AddSQLServerConnection(strConnectionName As String) As ISWiSQLConnection
```

Parameters

Table 12-12 • AddSQLServerConnection Method Parameters

Parameter	Description
ConnectionName	Specify the name of the new connection you want to establish.

Return Values

This method returns ISWiSQLConnection object.

Applies To

- ISWiProject

AddUpgradeTableEntry Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the AddUpgradeTableEntry method to create a new ISWiUpgradeTableEntry item and return a handle to that object.

Syntax

```
AddUpgradeTableEntry()
```

Example

```
'################################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'################################################
set pProject = CreateObject("IswiAuto20.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-
21.ism")

'################################################
'To create a new entry

dim pTableEntry
set pTableEntry = pProject.AddUpgradeTableEntry()
```

```
pTableEntry.UpgradeCode ="{12345678-1234-1234-1234-123456789012}"
pTableEntry.VersionMin = "1.0"
pTableEntry.VersionMax = "2.0"
pTableEntry.Language = "0"
pTableEntry.Remove = ""
pTableEntry.ActionProperty = "ACTIONPROP_AUTOMATION"
pTableEntry.Attributes = 5

'##########################################
'To find and delete an existing entry

set pTableEntry =pProject.IswiUpgradeTableEntries("{12345678-1234-1234-1234-123456789012}")
pTableEntry.Delete

pProject.SaveProject
pProject.CloseProject
```

Applies To

- ISWiProject

BuildPatchConfiguration Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call BuildPatchConfiguration to build the patch configuration identified by the strPatchConfiguration parameter. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting Build a Patch.

Syntax

```
BuildPatchConfiguration (strPatchConfigName as string)
```

Parameters

Table 12-13 • BuildPatchConfiguration Method Parameters

Parameter	Description
strPatchConfigName	Enter the fully qualified path to your project.

Properties

Table 12-14 • Properties Associated with BuildPatchConfiguration Method

Property	Description
PatchConfigErrorCount	Include the error count associated with a particular build.
PatchConfigWarningCount	Include the warning count associated with a particular build.

Example

```
'Create the project object
dim pProject
set pProject = CreateObject("IswiAuto20.ISWiProject")

'Call the OpenProject method
'########################################################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'########################################################################
'pProject.OpenProject("\Your project.ism")

pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-
21.ism")

'Call the OpenProject method
'###############################################################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PATCH CONFIGURATION NAME
'###############################################################################

pProject.BuildPatchConfiguration "Config1"

MsgBox "Patch Congifuration Config1 build with " & _
     pProject.PatchConfigErrorCount & " Errors and " & _
     pProject.PatchConfigWarningCount & " Warnings"
```

Applies To

- ISWiProject

BuildPCPFile Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

The BuildPCPFile method builds a patch package (.msp) file based on the settings in a patch creation properties (.pcp) file.

You do not need to have a project open in order to create a patch.

Syntax

```
BuildPCPFile (strPCPFile As String, strPatchFile As String, strLogFile As String, bCreateUpdateExe
As Boolean) As Long
```

Parameters

Table 12-15 • BuildPCPFile Method Parameters

Parameter	Description
strPCPFile	Specify the fully qualified path to a .pcp file. You can create or modify a .pcp file through the Patch Design view.
strPatchFile	Specify the fully qualified path for the .msp file you want to create. Any existing file with this name is overwritten. The file cannot be created if the directory you provided does not exist.
strLogFile	Specify the fully qualified path to the .log file that records this method's status and success in creating the patch package. If the file exists, the current status is appended to it.
bCreateUpdateExe	Set this option to True to have the package wrapped in an executable that applies the patch.

Return Values

BuildPCPFile() returns the result returned by the Windows Installer function UiCreatePatchPackage.

The BuildPCPFile method builds a patch package (.msp) file based on the settings in a patch creation properties (.pcp) file.

You do not need to have a project open in order to create a patch.

Applies To

- ISWiProject

CloseProject Method

Call CloseProject to close the .ism file you opened with OpenProject.

Syntax

```
CloseProject ()
```

Return Values

CloseProject always returns 0.

Applies To

- ISWiProject

CreatePatch Method

Caution • *This method is deprecated for new development and has been replaced with the BuildPCPFile and BuildPatchConfiguration methods. To facilitate backward compatibility with existing build scripts, the CreatePatch method calls the BuildPCPFile method.*

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Syntax

```
CreatePatch()
```

Applies To

- ISWiProject

CreateProject Method

The CreateProject method creates a new InstallShield project file (.ism) for a Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, or Merge Module project; it create a new InstallShield DIM project file (.dim) for DIM projects.

Syntax

```
CreateProject (strISWiProjectFile As String, ByVal projectType As ISWiProjectType)
```

Parameters

Table 12-16 • CreateProject Method Parameters

Parameter	Description
strISWiProjectFile	Enter the fully qualified path to the .ism file that you want to create. Include the full file name.
projectType	Specify what type of project you want to create. Valid values are: • **eptMsi (1)**—Creates a Basic MSI project. • **eptScript (–1)**—Creates an InstallScript MSI project. • **eptPro (9)**—Creates an InstallScript project. • **eptProObj (10)**—Creates an InstallScript Object project. • **eptMsm (2)**—Creates a Merge Module project. • **eptDim (15)**—Creates a DIM project.

Example

The following sample code creates a Basic MSI project called `TestProject.ism`.

```
Dim pProject As ISWiAuto20.ISWiProject
Set pProject = CreateObject("ISWiAuto20.ISWiProject")

Dim sProjectName As String
sProjectName = "C:\InstallShield 2013 Projects\TestProject.ism"

pProject.CreateProject sProjectName, eptMsi

pProject.OpenProject sProjectName, False

pProject.CloseProject
```

Applies To

- ISWiProject

DeleteAdvancedFile Method

Project • *The DeleteAdvancedFile method applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The DeleteAdvancedFile method deletes the specified advanced file from the current project.

Syntax

```
DeleteAdvancedFile (pAdvancedFile As ISWiAdvancedFile) As Long
```

Parameters

Table 12-17 • DeleteAdvancedFile Method Parameters

Parameter	Description
pAdvancedFile	Specify the advanced file object to be deleted.

Example

The following Visual Basic lines demonstrate the DeleteAdvancedFile method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

Set pAdvancedFile = pProj.ISWiAdvancedFiles.Item(1)
pProj.DeleteAdvancedFile pAdvancedFile

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

DeleteComponent Method

Call DeleteComponent to delete a component in the project. Similar to deleting a component in the Setup Design views, DeleteComponent both removes a component from its feature and permanently deletes it from the project.

Syntax

```
DeleteComponent (Component As ISWiComponent)
```

Parameters

Table 12-18 • DeleteComponent Method Parameters

Parameter	Description
Component	Specify the ISWiComponent object that the method will delete.

Example

You can use the following lines to delete all components that are associated with the feature FeatureName1:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

Dim pFeat As ISWiFeature
Dim pComp As ISWiComponent

Set pFeat = pProj.ISWiFeatures.Item("FeatureName1")

For Each pComp In pFeat.ISWiComponents
    pProj.DeleteComponent pComp
Next

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

DeleteCustomAction Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the DeleteCustomAction method to completely delete a custom action from the current project.

Syntax

```
DeleteCustomAction (CustomAction As ISWiCustomAction)
```

Parameters

Table 12-19 • DeleteCustomAction Method Parameters

Parameter	Description
CustomAction	Pass the ISWiCustomAction object you want to delete from the current project.

Applies To

- ISWiProject

DeleteMergeModule Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the DeleteMergeModule method to completely delete a merge module from the current project.

Syntax

```
DeleteMergeModule (FileName As String)
```

Parameters

Table 12-20 • DeleteMergeModule Method Parameters

Parameter	Description
FileName	Pass the fully qualified file name for the merge module (.msm) file that you want to delete from the project.

Applies To

- ISWiProject Object

DeletePathVariable Method

Call the DeletePathVariable method to delete a path variable from your project. Using this method is similar to deleting a path variable from the Path Variables view in InstallShield.

Important • *Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.*

Syntax

```
DeletePathVariable (pPathVar ISWiPathVariable) As Long
```

Parameters

Table 12-21 • DeletePathVariable Method Parameters

Parameter	Description
pPathVar	Pass the ISWiPathVariable object for the path variable that you want to delete.

Applies To

- ISWiProject

DeleteProductConfig Method

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the DeleteProductConfig method to delete a product configuration from your project. Using this method is similar to deleting a product configuration in the Releases view of the IDE.

Syntax

```
DeleteProductConfig (ProductConfig As ISWiProductConfig)
```

Parameters

Table 12-22 • DeleteProductConfig Method Parameters

Parameter	Description
ProductConfigKey	Pass the name of the product configuration that you want to delete.

Applies To

- ISWiProject

DeleteProperty Method

Project • *This information does not apply to the following project types:*

- *InstallScript*

- *InstallScript Object*

Call the DeleteProperty method to delete a property from the Property table. The function returns 0 if successful.

Syntax

```
Public Function DeleteProperty(ByVal pProperty As ISWiProperty) As Long
```

Parameters

Table 12-23 • DeleteProperty Method Parameters

Parameter	Description
Property	Pass the name of the property you want to delete.

Example

```
Dim proj As IswiAuto20.ISWiProject
Set proj = New IswiAuto20.ISWiProject
proj.OpenProject "c:\mysetups\your project name-3.ism"
Dim pProp As IswiAuto20.ISWiProperty
Set pProp = proj.ISWiProperties.Item(1)
```

Applies To

- ISWiProject

DeleteSetupFile Method

Project • *The DeleteSetupFile method applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The DeleteSetupFile method deletes the specified support file from the current project.

Syntax

```
DeleteSetupFile (pSetupFile As ISWiSetupFile) As Long
```

Parameters

Table 12-24 • DeleteSetupFile Method Parameters

Parameter	Description
pSetupFile	The support file object to be deleted.

Example

The following Visual Basic lines demonstrate the DeleteSetupFile method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.ISWiSetupFiles.Item(1)
pProj.DeleteSetupFile pSetupFile

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

DeleteSetupType Method

Project • *This information does not apply to Basic MSI projects.*

The DeleteSetupType method deletes the specified setup type from the current project.

Syntax

```
DeleteSetupType (pSetupType As ISWiSetupType) As Long
```

Parameters

Table 12-25 • DeleteSetupType Method Parameters

Parameter	Description
pSetupType	The setup type object to be deleted.

Example

The following Visual Basic lines demonstrate the DeleteSetupType method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.ISWiSetupTypes.Item(1)
pProj.DeleteSetupType pSetupType

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

DeleteSQLConnection Method

Call the DeleteSQLConnection method to remove a SQL Server Connection from the project.

Syntax

```
Function DeleteSQLConnection(Connection As ISWiSQLConnection) As Long
```

Parameters

Table 12-26 • DeleteSQLConnection Method Parameters

Parameter	Description
Connection	Specify the connection you want to remove from the project.

Applies To

- ISWiProject

DeselectLanguage Method

Call the DeselectLanguage method to deselect a language from the current project.

Syntax

```
DeselectLanguage (LangId As String)
```

Parameters

Table 12-27 • DeselectLanguage Method Parameters

Parameter	Description
LangId	Pass the language ID you want to deselect in a string, as in oProject.DeleteLanguage "1036".

Applies To

- ISWiProject

ExportProject Method

Call ExportProject to convert an .ism file to XML format before checking it into a source code control program.

Note • *When a project file format is converted to either XML or binary format, the project file extension remains *.ism.*

Note • *The .isv file format has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.*

Syntax

```
ExportProject (strISWiTextProjectFile As String, Optional strISWiProjectFile As String) As Long
```

Parameters

Table 12-28 • ExportProject Method Parameters

Parameter	Description
strISWiTextProjectFile	Enter the fully qualified path to the .isv file.
strISWiProjectFile	Enter the fully qualified path to the .ism file. This parameter is optional only if the .ism file is already open.

Applies To

- ISWiProject

ExportStrings Method

Call ExportStrings to copy all or a portion of the string entries for a specific language to a tab-delimited Unicode text file (.txt). You can provide the .txt file to a translator who can update the file with translated text. After it has been translated, you can import the translated string entries into your project by calling the ImportStrings method.

Syntax

```
ExportStrings (strfile As String, dTimeStamp As Date, sLang As String) As Boolean
```

Parameters

Table 12-29 • `ExportStrings Method Parameters`

Parameter	Description
strfile	Enter the fully qualified path to the text file that will contain the exported strings. If the file exists, the automation interface overwrites it. ExportStrings creates a Unicode file.
dTimeStamp	All string entries have a date and time that they were last modified. This timestamp is useful if you want to give the translator only the string entries that are new or have been modified since the last round of translations. To export only the string entries that have been modified since a specific date, specify the earliest date for the string entries you want to export. The automation interface exports the string entries that have changed on or since that date. To export all of the entries for the specified language, enter the number 0.
sLang	Specify the identifier for the language whose string entries you want to export to the text file.

Applies To

- ISWiProject

GenerateGUID Method

The ProjectGenerateGUID method generates a new, unique GUID as a string.

Applies To

- ISWiProject

ImportProject Method

Note • *This method has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.*

Call ImportProject to convert an .isv file to an .ism file. If you access your project from a source code control program, InstallShield saves it as a text (.isv) file. However, OpenProject and ISCmdBld.exe both require a standard InstallShield project (.ism) file.

Later, you can call ExportProject to convert the .ism file back to an .isv file before checking it in to your source control program.

ImportProject fails if the project is already open in the automation interface or in InstallShield.

Syntax

```
ImportProject (strISWiProjectFile As String, strISWiTextProjectFile As String) As Long
```

Parameters

Table 12-30 • ImportProject Method Parameters

Parameter	Description
strISWiProjectFile	Enter the fully qualified path to the resulting .ism file.
strISWiTextProjectFile	Enter the fully qualified path to the .isv file.
Error Codes	1007—The project file is already opened. 1009—Could not import the project. 1012—The .isv file is missing.

Applies To

- ISWiProject

ImportStrings Method

Call ImportStrings to import the contents of a tab-delimited text file (.txt) into the project for a specific language. This method is useful when you have exported the entries to a text file and had them translated.

Syntax

```
ImportStrings (strfile As String, sLang As Integer, Optional Enum eiType, Optional strLogFile As
String) As Boolean
```

Parameters

Table 12-31 • ImportStrings Method Parameters

Parameter	Description
strfile	Enter the fully qualified path to the text file that contains the string entries that you want to import.
sLang	Specify the identifier for the language whose string entries you want to import to the project.
eiType	Specify how you want to handle conflicts when importing string entries: • **eiIgnore (0)**—Do not replace the string entry's value if it already exists in the project for the specified language. • **eiOverwrite (1)**—Replace the project's existing string entry with the one in the text file. This is the default value for this optional parameter.
strLogFile	Specify the fully qualified path to the log file that should contain the status and success of importing the string entries. The log file records any conflicts in importing string entries and lists any improperly formatted, hence unusable, entries. If the log file exists, it is overwritten.  ***Note*** • *This parameter is optional.*

Applies To

- ISWiProject

OpenProject Method

Project • *This information does not apply to QuickPatch projects.*

Call OpenProject with the fully qualified path to your InstallShield project (.ism) file to be able to modify it. This method is equivalent to loading a project in the IDE.

Note • *The ISWiProject.OpenProject method fails if the project is open in the InstallShield user interface.*

Syntax

```
OpenProject (strISWiProjectFile As String, Optional ByVal bReadOnly As Boolean) As Long
```

Parameters

Table 12-32 • OpenProject Method Parameters

Parameter	Description
strISWiProjectFile	Enter the fully qualified path to the .ism file.
bReadOnly	Determines whether the project is opened with write privileges. True opens the project as a read-only file. The default value for this optional parameter is False.

Return Values and Errors

Table 12-33 • OpenProject Method Return Values and Errors

Return Value	Description
0	Project successfully opened.
1	Project opened, but is locked by some other process.
2	Attempted to open project for write access, but project opened in read-only mode.
3	There was a problem creating the merge module catalog. Verify that the merge module search path is correct (via the File Locations tab of the Options dialog box or using `-o` for the Standalone Build), verify that no merge modules on the merge module path are corrupt, or self-register `IsMMUpdater2.dll`.
Error Code 1100	Unable to open file: %1. Ensure that the file is a valid InstallShield project.
Error Code 1101	Unable to open file: %1. This project was created using a previous version of InstallShield Developer, InstallShield–Windows Installer or InstallShield Express.
Error Code 1102	Unable to open file: %1. This project was created using InstallShield Professional or InstallShield Express 2.xx.

Table 12-33 • OpenProject Method Return Values and Errors (cont.)

Return Value	Description
Error Code 1103	Unable to open file: %1. The project was created using a more recent version of InstallShield Developer or the project has been updated to a more recent version of InstallShield, InstallShield DevStudio, or InstallShield Developer.

Applies To

- ISWiProject

RemoveFeature Method

The RemoveFeature method permanently deletes a feature from the current project.

Syntax

```
RemoveFeature (Feature As ISWiFeature) As Long
```

Parameters

Table 12-34 • RemoveFeature Method Parameters

Parameter	Description
Feature	The item in ISWiFeatures you want to remove.

Example

The following code fragment opens a project, deletes the feature named NewFeature1, and then saves and closes the project:

```
Dim pProj As ISWiProject
Dim pFeat As ISWiFeature

Set pProj = New ISWiProject
pProj.OpenProject "C:\Test\SampleProject.ism"

Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat

pProj.SaveProject
pProj.CloseProject
```

When RemoveFeature is a member of ISWiFeature, it cannot be used to delete the current feature. However, you can call it to delete a subfeature, such as the first subfeature under NewFeature1 in the following example:

```
Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat.Features(1)
```

Applies To

- ISWiProject
- ISWiFeature

SaveProject Method

Call SaveProject to save any changes you have made to your .ism file through the automation interface.

Syntax

```
SaveProject ()
```

Return Values and Errors

Table 12-35 • SaveProject Method Values

Return Value	Description
ERROR_SUCCESS (0)	Project is saved.
Error Code 1104	Unable to save file: %1. The project is open in read-only mode or is being used by another process.

Applies To

- ISWiProject

ISWiAdvancedFile Object

Project • *The ISWiAdvancedFile object applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

ISWiAdvancedFile represents an advanced file belonging to your project. The advanced file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one added by calling AddAdvancedFile.

Use the project's ISWiAdvancedFiles collection to access a specific advanced file. You must specify either an index number or the file key for the Item property of ISWiAdvancedFiles.

The file key is visible in the IDE only as the first entry in the Direct Editor view's ISDisk1 table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

For Each pAdvancedFile In pProj.ISWiAdvancedFiles
    If UCase(pAdvancedFile.BuildSourcePath) = "C:\MY FILES\MYADVANCEDFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file `C:\My Files\MyAdvancedFile`.ext is found among the project's setup files, the For loop ends, and pAdvancedFile holds a copy of the ISWiAdvancedFile object for `C:\My Files\MyAdvancedFile.ext`.

Members

Table 12-36 • ISWiAdvancedFile Object Members

Name	Type	Description
Name	Read-Only Property	Stores the file key of the advanced file. See the description of ISWiFile above for more information about the file key.
BuildSourcePath	Read-Write Property	Stores the advanced file's fully qualified source filename. Any path variables are resolved to the actual path.
Disk	Read-Write Property	This enumerated integer property specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values: • **edtDisk1 (1)**—Specifies the Disk 1 folder. • **edtLastDisk (-1)**—Specifies the Last Disk folder. • **edtOther (0)**—Specifies the Other folder.

Applies To

- ISWiProject

ISWiAutomaticUpgradeEntry Object

The ISWiAutomaticUpgradeEntry object represents an automatic upgrade item in the Upgrades view of the InstallShield interface.

Members

Table 12-37 • ISWiAutomaticUpgradeEntry Object Members

Name	Type	Description
Delete	Method	Deletes the AutomaticUpgradeEntry from the project file.
Name	Read-Write Property	Sets the name of the upgrade item as displayed in the IDE.
UpgradedSetupPath	Read-Write Property	Sets the path to the MSI package that needs to be upgraded. The build engine will create the settings required to upgrade this setup.
ReleaseFlag	Read-Write Property	Configure this upgrade entry to only be built into the setup when a certain release flag has been set.

Applies To

- ISWiProject

Delete Method

Call this method to delete the ISWiAutomaticUpgradeEntry from the project file.

Syntax

```
Delete()
```

Applies To

- ISWiAutomaticUpgradeEntry

ISWiCustomAction Object

Project • *This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

ISWiCustomAction represents a custom action in the Custom Actions and Sequences view (or the Custom Actions view) of InstallShield. You can retrieve a custom action by specifying an item in the ISWiCustomActions collection.

Members

Table 12-38 • ISWiCustomAction Object Members

Property	Type	Description
ActionType	Read-Write Property	Holds the numeric custom action type. For more information, see Custom Action Type Overview.
Comment	Read-Write Property	An optional comment for the custom action.
Name	Read-Write Property	The name of the custom action.
Source	Read-Write Property	Specifies the source of the custom action. See Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View) for the required Source property for different types of custom actions.
SourceEx	Write-Only Property	Sets a custom action source property, same as the Source property. SourceEx replaces the existing binary record for the new path when you change a source that is stored in the Binary table. If other custom actions use the path, their path is also updated. Source creates a new binary record when other custom actions use the path. Only the path in the custom action is updated.
Target	Read-Write Property	Specifies the target of the custom action. See Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View) for the required Target property for different types of custom actions.

Applies To

- ISWiProject

ISWiComponent Object

ISWiComponent represents a component in the InstallShield user interface. You can retrieve a component by specifying an item in the ISWiComponents collection. The component can be one created in the IDE or as a result of calling AddComponent.

Many component attributes are available in the automation interface through this object's methods and properties. Refer to the following table to see which methods, properties, and collections are available for your project type.

Members

Table 12-39 • ISWiComponent Object Members

Name	Project	Type	Description
AddComponent SubFolder	InstallScript, InstallScript Object	Method	Adds a subfolder to the current ISWiComponent.
AddDynamicFile Linking	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Method	Adds a dynamic file link to the current component.
AddEnvironment Var	Basic MSI, InstallScript MSI, Merge Module	Method	Adds an environment variable to the current component.
AddFile	All	Method	Adds a file to the current component.
Attrib64BitComponent	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Set this property to True to have the component registered as 64-bit. Setting this property to False causes the component to be registered as 32-bit. If the component is 64-bit and is replacing a 32-bit component, be sure to provide a new GUID via the GUID property. Note that 64-bit support requires version 2.0 of the Windows Installer service.
Comments	All	Read-Write Property	Gets or sets the comments for this component.
Compressed	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the component's Compressed property, which specifies whether to compress the component's files (True) or leave them uncompressed (False) when the files are stored in a cabinet file by the release builder.
Condition	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Contains any condition associated with the component.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
Destination	All	Read-Write Property	Gets or sets the component's destination. The following formats are valid: • (Windows Installer based projects only:) [INSTALLDIR] • (Windows Installer based projects only:) [ProgramFilesFolder]Subfolder • (InstallScript projects only:) <TARGETDIR> • (InstallScript projects only:) <WINDIR>\Subfolder • C:\FolderName  ***Important*** • *Setting the Destination property for the ISWiComponent object resets the object's SourceLocation property. Therefore, any code that sets the SourceLocation property should be placed after any code that sets the Destination property.*
DeviceDriverFlags	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property is no longer supported.
DeviceDriverFlagsEx	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property enables you to specify the flag settings for device drivers and run-time options directly from the automation layer.
DeviceDriverSetRedist	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property sets the .dll used at run time for all device driver installations.
DeviceDriverUse64BitRedist	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property is no longer supported.
DeviceDriverUseLocalizedRedist	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property is no longer supported.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
Difference	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the component's Difference property, which specifies whether to accept (True) or override (False) the default behavior of the media builder when building a differential media—which is to exclude a file in this component from the differential media if the same file (with the same date and time, size, and attributes) exists in each of the specified comparison media.
DotNetApplicationFile	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	To install your assembly as private, set this attribute to the FileKey of the file that contains your assembly. If this property is set to NULL, your assembly will be installed to the Global Assembly Cache.
DotNetAssembly	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the component's .NET Assembly property, which specifies whether the component's files are installed as local .NET assemblies (True) or not installed as assemblies (False).
DotNetCOMInterop	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Set this to True if your .NET assembly needs to be available from COM calls.
DotNetInstallerClass	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Set this to True if your assembly implements methods from the .NET Installer namespace.
DotNetInstallerClassArgCommit	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property allows you to specify argument lists for the Installer class when the Commit method is called.
DotNetInstallerClassArgInstall	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property allows you to specify the argument lists for the Install execution context for the Installer class.
DotNetInstallerClassArgRollback	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property allows you to specify argument lists for the Installer class when the Rollback method is called.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
DotNetInstallerClassArgUninstall	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property allows you to specify the argument lists for the Uninstall execution context for the Installer class.
DotNetPrecompile	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	If this property is set to True, at installation the setup creates a native image from the .NET assembly and installs it to the native image cache on the target system. This allows the assembly to load and execute faster, because it restores code and data structures from the native image cache rather than from just-in-time (JIT) compilation.
DotNetScanAtBuild	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	This property instructs the build engine on how to handle your assembly. Set it to one of the following values: • **ednbNone (0)**—Build does nothing. • **ednbProps (1)**—Build scans your assembly for properties. • **ednbDepAndProps (2)**—Build scans your assembly for properties and dependencies.
ExtractAtBuild	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the component's COM Extract at Build setting. Possible values are True and False.
FTPLocation	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the component's FTP Location property, which specifies an FTP location for the component.
GUID	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Holds a string GUID, also known as the Component Code property, surrounded by braces—{12345678-1234-1234-1234-1234567890AB}, for example.
HTTPLocation	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the component's HTTP Location property, which specifies an HTTP location for the component.
ImportINIFile	All	Method	Imports INI files from the automation layer.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
ImportRegFile	All	Method	Merges the contents of a REG file with the registry data for this component.
IsDeviceDriver	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	If this Boolean property is true, the key file for this component is a device driver package; if the property is false, the key file is not a device driver package.
IsPlatformSelected	InstallScript, InstallScript Object	Read-Write Property	In conjunction with the PlatformSuiteCheck property, gets or sets the component's Platform Suite(s) property, which specifies to what platform suites, if any, the component is specific. Use the following constants to set this property: • epsMSBackOffice = 32 (&H20) • epsMSSmallBusinessServer = 256 (&H100) • epsMSSmallBusinessServerWithRestrictiveLiscenses = 512 (&H200) • epsTerminalServices = 16 (&H10) • epsWin2kAdvSvrOrWinDotNetEnterpriseServer = 128 (&H80) • epsWin2kOrWinDotNetDatacenterServer = 64 (&H40) • epsWinServer = 4 • epsWinWorkstation = 8 • epsWinXPHome = 2 • epsWinXPPro = 1 • epsArchIa64 = 1024 (&H400) • epsArchAmd64 = 2048 (&H800) • epsArchIntel32 = 4096 (&H1000) • epsWinServer2003R2 = 8192 (&H2000) For example: `pFeature.IsPlatformSelected(epsWinXPHome) = True`
ISWiComponentSubFolders	InstallScript, InstallScript Object	Collection	Contains all of the subfolders associated with this component.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
ISWiDynamicFileLinkings	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Collection	Contains all of the dynamic file links that are associated with a specified component.
ISWiEnvironmentVars	Basic MSI, InstallScript MSI, Merge Module	Collection	Contains all of the environment variables that are associated with this component.
ISWiFiles	All	Collection	Contains all of the files associated with this component.
ISWiFolders	All	Collection	Contains all of the folders associated with this component.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
KeyPath	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	***Note*** • *ISWiComponent.KeyPathType must be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order.* Contains the file or registry entry that serves as this component's key path. The exact type is indicated by the KeyPathType property, below. When the key path is a key file, it contains the file key. You can view this value in the Key column of a component's file list, but be aware that file keys are subject to change when the files are dynamically linked. The file key is the same as the Name property of an ISWiFile object. When the key path is a registry value, there is a specially formatted string that contains the registry key. The path to the registry key is enclosed in square brackets and separated from the value name with a vertical bar (or pipe character). For example, the following lines set the key path for the component m_MyComponent to the value MyName under HKEY_LOCAL_MACHINE\Software\MyCompany\Settings: `m_MyComponent.KeyPathType = kptRegistry` `m_MyComponent.KeyPath = "[HKEY_LOCAL_MACHINE\Software\MyCompany\Settings]|MyName"` A file cannot serve as the key file if it is dynamically linked.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
KeyPathType	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	ISWiComponent.KeyPathType *must* be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order.Stores a value that points to the precise type of key path contained in the KeyPath property. Specify one of the following types: • kptRegistry (1) • kptFile (2) • kptFolder (3) • kptODBC (4) Note that the automation interface can set the key path type only to kptRegistry or kptFile, but the other values are possible return values if you are reading the current key path type.
Miscellaneous	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the component's Miscellaneous property, which associates a text string with the component.
Name	All	Read-Only Property	Component name of the current item in the collection.
NeverOverwrite	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Instructs the installer whether to replace an existing component. Specify True to leave the existing component or False to replace it.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
OSFilter	InstallScript, InstallScript MSI, InstallScript Object	Read-Write Property	Gets or sets the component's Operating Systems setting. If the target machine's operating system does not match one of the operating systems that are specified for this setting, the component is not installed. By default, components are operating system independent, meaning that none of the component's data are specific to certain operating systems. Use the following constants to set this property: • eosOSIndepedent = 0 • eosWin95 = &H10 (16) • eosWin98 = &H40 (64) • eosWinMe = &H80 (128) • eosWinNT4 = &H10000 (65536) • eosWin2000 = &H100000 (1048576) • eosWinXP = &H400000 (4194304) • eosWinServer2003 = &H800000 (8388608) • eosWinVista = &H1000000 (16777216)—These constants are for Windows Vista and Windows Server 2008. • eosWin7 = &H2000000 (33554432)—These constants are for Windows 7 and Windows Server 2008 R2. • eosWin8 = &H4000000 (67108864)—These constants are for Windows 8 and Windows Server 2012. • eosAll = &7D100D0 (131137744) You can specify multiple platforms; for example, **eosWin7 Or eosWinServer2008 Or eosWinVista Or eosWinServer2003**. ***Tip*** • *Use this property with the IsPlatformSelected property to distinguish between Windows Vista and Windows Server 2008, or between Windows 7 and Windows Server 2008 R2, or between Windows 8 and Windows Server 2012.*

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
OverwriteMainOptions	InstallScript, InstallScript Object	Read-Write Property	In conjunction with the OverwriteSubOptionsVersion and OverwriteSubOptionsDate properties, gets or sets the component's Overwrite property, which specifies whether the component's files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Use the following constants to set this property: • **ecomoAlways (0)**—Files on the target system are always overwritten. • **ecomoByDate (1)**—Files on the target system are conditionally overwritten based on date/time stamp as specified by the OverwriteSubOptionsDate property. • **ecomoByVersion (2)**—Files on the target system are conditionally overwritten based on version number as specified by the OverwriteSubOptionsVersion property. • **ecomoByVersionThenDate (3)**—Files on the target system are conditionally overwritten based on version number or, if the file on your distribution media and the file on the target system have the same version number or if neither file has a version number, by date/time stamp as specified by the OverwriteSubOptionsVersion and OverwriteSubOptionsDate properties. • **ecomoNever (4)**—Files on the target system are never overwritten.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
OverwriteSubOptionsDate	InstallScript, InstallScript Object	Read-Write Property	In conjunction with the OverwriteMainOptions and OverwriteSubOptionsVersion properties, gets or sets the component's Overwrite property, which specifies whether the component's files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Ignored if OverwriteMainOptions is set to ecomoAlways, ecomoByVersion, or ecomoNever. Use the following constants to set this property: • **ecomsoNewer (0)**—A file on the target system is overwritten if the file on your distribution media has a more recent date and time stamp. • **ecomsoNewerOrSame (1)**—A file on the target system is overwritten if the file on your distribution media has a more recent or the same date and time stamp. • **ecomsoOlder (2)**—A file on the target system is overwritten if the file on your distribution media has a less recent date and time stamp.
OverwriteSubOptionsVersion	InstallScript, InstallScript Object	Read-Write Property	In conjunction with the OverwriteMainOptions and OverwriteSubOptionsDate properties, gets or sets the component's Overwrite property, which specifies whether the component's files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Ignored if OverwriteMainOptions is set to ecomoAlways, ecomoByDate, or ecomoNever. Use the following constants to set this property: • **ecomsoNewer (0)**—A file on the target system is overwritten if the file on your distribution media has a higher version number. • **ecomsoNewerOrSame (1)**—A file on the target system is overwritten if the file on your distribution media has a higher or the same version number. • **ecomsoOlder (2)**—A file on the target system is overwritten if the file on your distribution media has a lower version number.
Permanent	All	Read-Write Property	This property corresponds to the Permanent component property in the IDE. Set Permanent to True to make sure the component is never removed; False otherwise.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
PlatformSuiteCheck	InstallScript, InstallScript Object	Read-Write Property	In conjunction with the IsPlatformSelected property, gets or sets the component's Platform Suite(s) property, which specifies to what platform suites, if any, the component is specific. Use the following constants to set this property: • **ecpscAll (0)**—The setup installs the component's files only if all of the suites that are specified by the IsPlatformSelected property exist on the target system. • **ecpscAtLeastOne (1)**—The setup installs the component's files only if at least one of the suites that are specified by the IsPlatformSelected property exist on the target system. • **ecpscSuiteIndependent (2)**—Installation of the component's files does not depend on the target system's suite.
PotentiallyLocked	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the component's Potentially Locked property, which specifies whether already-installed versions of the component's files may be locked—that is, in use by another application—during setup.
RegFileToMergeAtBuild	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Provides the complete path to a .reg file to have it merged with the component's registry entries at build time.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
RegistrationType	Basic MSI, InstallScript MSI, Merge Module	Property	The following options are available for determining the source of the registration information for this component: • **rgtNone (0)**—InstallShield will not dynamically extract the data or mark the component as self-registering, but any information in the COM Registration advanced setting will be registered. • **rgtSelfReg (-1)**—The files in this component will have their self-registration routines invoked by the installer. • **rgtExtractAtBuild (-2)**—Dynamically extracts COM registration information when you build a release. Because the Registration Type property has been removed from the component views in the IDE, setting the RegistrationType property in the automation interface has the following effects: • Using rgtNone sets the component's COM Extract at Build property to No. • Using rgtSelfReg sets the component's COM Extract at Build property to No, and sets each file in the component to use self-registration. • Using rgtExtractAtBuild sets the component's COM Extract at Build property to Yes, and sets each file in the component not to use self-registration.
RemoteInstallation	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Use one of the following options to install the component's files locally or leave them on the distribution medium: • **rfsLocal (0)**—Installs the files to the folder stored in the component's Destination property. • **rfsSource (1)**—Leaves the files on the distribution medium. • **rfsOptional (2)**—The component follows the feature's property.
RemoveComponentSubFolder	InstallScript, InstallScript Object	Method	Removes a subfolder to the current ISWiComponent.

Table 12-39 • ISWiComponent Object Members (cont.)

Name	Project	Type	Description
RemoveDynamicFileLinking	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Method	Removes a dynamic file link from the current component.
RemoveEnvironmentVar	Basic MSI, InstallScript MSI, Merge Module	Method	Removes an environment variable from the current component.
RemoveFile	All	Method	Removes a file from the current component.
SelfRegister	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the component's Self-Register property, which specifies whether the component's files are self-registering.
SharedDLLRefCount	All	Read-Write Property	True indicates that the installer should increment a reference count for each file in this component when it is installed, False otherwise.
SourceLocation	All	Read-Write Property	Provides the name of a folder in the compressed setup package or in the release location where this component's files are stored when you build a release. This property is identical to a component's Source Location setting in InstallShield. ***Important*** • *Setting the Destination property for the ISWiComponent object resets the object's SourceLocation property. Therefore, any code that sets the SourceLocation property should be placed after any code that sets the Destination property.*
Transitive	All	Read-Write Property	Set this property to True to have the installer re-evaluate the condition when this component is reinstalled, False otherwise.

Applies To

- ISWiFeature

AddComponentSubFolder Method

Project • *The AddComponentSubFolder method applies to the following project types:*

- *InstallScript*
- *InstallScript Object*

The AddComponentSubFolder method adds a component subfolder to the current component or component subfolder.

Syntax

```
AddComponentSubFolder (Name As String) As ISWiComponentSubFolder
```

Parameters

Table 12-40 • AddComponentSubFolder Method

Parameter	Description
Name	Pass the name for the subfolder that you want to add.

Example

The following Visual Basic lines demonstrate the AddComponentSubFolder method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.AddComponentSubFolder("MyCompSubFolder")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent
- ISWiComponentSubFolder

AddDynamicFileLinking Method

Project • *The information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

Call AddDynamicFileLinking to add a dynamic file link to a specified component. All of the files that are in the folder that you specify are automatically incorporated into your installation.

Project • *In Basic MSI, InstallScript MSI, and Merge Module projects, all new dynamic file links that you add use the best practice method of component creation by default. For more information, see Determining the Appropriate Component Creation Method for Dynamically Linked Files.*

Syntax

```
AddDynamicFileLinking (sSourceFolder As String) As ISWiDynamicFileLinking
```

Parameters

Table 12-41 • AddDynamicFileLinking Method Parameters

Parameter	Description
sSourceFolder	Pass the fully qualified path to the folder that contains the files that you want to be dynamically linked.

Example

The following Visual Basic example adds a dynamic link to **MyDynamicFiles** to the component **MyComponent**:

```
m_ISWiFeature.ISWiComponents("MyComponent").AddDynamicFileLinking "C:\Build 141\MyDynamicFiles"
```

All of the files in the **MyDynamicFiles** folder are added to the project. The folder is scanned before every build, and any new or changed files are automatically incorporated into your project.

Applies To

- ISWiComponent

AddEnvironmentVar Method

Project • *The AddEnvironmentVar method applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

Call AddEnvironmentVar to add an environment variable to a component.

Syntax

```
AddEnvironmentVar (sName As String) As ISWiEnvironmentVar
```

Parameters

Table 12-42 • AddEnvironmentVar Method Parameters

Parameter	Description
sName	Specifies the name of the environment variable.

Example

The following Visual Basic example adds the environment variable **MyEnvironment** to the component **MyComponent**:

```
m_ISWiFeature.ISWiComponents("MyComponent").AddEnvironmentVar "MyEnvironment"
```

Applies To

- ISWiComponent

AddFile Method

Call AddFile to add a file to a specified component or, in InstallScript projects, a component subfolder. The files added with this method have static file links, similar to adding files in the IDE.

Syntax

```
AddFile (FileName As String) As ISWiFile
```

Parameters

Table 12-43 • AddFile Method Parameters

Parameter	Description
FileName	Pass the fully qualified file name for the individual file that you want to add to this component or component subfolder.

Example

The following Visual Basic example adds the file MyFile.exe to the component MyComponent:

```
m_ISWiFeature.ISWiComponents("MyComponent").AddFile "C:\Build 141\MyFile.exe"
```

Applies To

- ISWiComponent
- ISWiComponentSubFolder

DeviceDriverFlagsEx Property

Project • *The DeviceDriverFlagsEx property applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The DeviceDriverFlagsEx property enables you to specify the flag settings for device drivers and runtime options directly from the automation layer. You can pass the following property values to this property. Pass more than one value by using OR.

Table 12-44 • DeviceDriverFlagsEx Property Values

Value	Definition
0	Not set (default).
1	To replace any existing driver for the device with this driver, pass this property value to the DeviceDriverFlagsEx property. If you do not pass this property and a driver already exists for the device, your driver is not installed.
2	To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, pass this property value.

Table 12-44 • DeviceDriverFlagsEx Property Values (cont.)

Value	Definition
4	If you pass this property value to the DeviceDriverFlagsEx property, the installation creates an Add or Remove Programs entry for the device driver only; the installation does not create an additional entry for the installation itself. DIFxApp does not support this feature on Windows Vista and later.
8	By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, pass this value to the DeviceDriverFlagsEx property.
16	By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, pass this value to the DeviceDriverFlagsEx property. If you do pass this value, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.  ***Caution*** • *Pass this value only if you can verify that the driver's binary files are not required by any other driver package or application.*
Other value	Invalid. This is a fatal installation error. DIFxApp does not install the component and uninstalls any components in the same installation package that were installed before this component.

Applies to

- ISWiComponent

DeviceDriverSetRedist Property

Project • *The DeviceDriverSetRedist property applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The DeviceDriverSetRedist property sets the custom action runtime .dll used for all device driver installations in the project. This property takes the following values:

- **eddr32Bit**—Specifies that the device drivers in this project target 32 bit machines and that the installation uses runtime dialogs for English only.
- **eddf32BitLocalized**—Specifies that the device drivers in this project target 32 bit machines and that the installation includes all localized installation runtime dialogs.

- **eddf64Bit**—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation uses runtime dialogs for English only.
- **eddf64BitLocalized**—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation includes all localized installation runtime dialogs.
- **eddf64BitAMD**—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation uses runtime dialogs for English only.
- **eddf64BitAMDLocalized**—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation includes all localized installation runtime dialogs.

The English runtime .dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, use one of the English-only values (not one of the localized values).

If you use one of the localized values, the installation uses a runtime .dll that includes dialogs and text for the following languages:

- Arabic (Saudi Arabia)
- Spanish - Modern Sort (Spain)
- Norwegian (Bokmål) (Norway)
- Chinese (People's ROC)
- Finnish (Finland)
- Dutch (Netherlands)
- Chinese (Taiwan)
- French (France)
- Polish (Poland)
- Czech (Czech Republic)
- Hebrew (Israel)
- Portuguese (Brazil)
- Danish (Denmark)
- Hungarian (Hungary)
- Portuguese (Portugal)
- German (Germany)
- Italian (Italy)
- Russian (Russia)
- Greek (Greece)
- Japanese (Japan)
- Swedish (Sweden)

- English (United States)
- Korean (Korea)
- Turkish (Turkey)

Applies to

- ISWiComponent

ImportINIFile Method

Call the ImportINIFile method to import INI files from the automation layer.

Syntax

```
ImportINIFile(INIFile As String, [DirectoryID As String])
```

Parameters

Table 12-45 • ImportINIFile Method Parameters

Parameter	Description
INIFile	This represents the full path to the INI file that needs to be imported.
DirectoryID	The directory must be a valid MSI Directory identifier such as INSTALLDIR. The directory is optional if you do not specify it. InstallShield will use the component directory.

Applies To

- ISWiComponent

ImportRegFile Method

Call the ImportRegFile method to import the contents of a registry (REG) file into the registry data for a specified component. This method mimics manually importing a REG file in the IDE.

Syntax

```
ImportRegFile (RegFile As String, Optional OverWrite As Boolean)
```

Parameters

Table 12-46 • ImportRegFile Method Parameters

Parameter	Description
RegFile	Specify the fully qualified path to the REG file that you want to import.
OverWrite	Choose one of the following options for instructing ImportRegFile how you want to handle conflicts when merging registry data: True—If a value exists in the component's registry data, overwrite it with the value from the REG file. False—If a value in the REG file is already present in the component's registry data, do not import that value. The default value for this optional parameter is True.

Applies To

- ISWiComponent

RemoveComponentSubFolder Method

Project • *The RemoveComponentSubFolder method applies to the following project types:*

- *InstallScript*
- *InstallScript Object*

The RemoveComponentSubFolder method removes the specified component subfolder from the current component or component subfolder.

Syntax

```
RemoveComponentSubFolder (pComponentSubFolder As ISWiComponentSubFolder) As Long
```

Parameters

Table 12-47 • RemoveComponentSubFolder Method Parameters

Parameter	Description
pComponentSubFolder	Pass the subfolder object that you want to remove.

Example

The following Visual Basic lines demonstrate the RemoveComponentSubFolder method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponent.RemoveComponentSubFolder pComponentSubFolder

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent
- ISWiComponentSubFolder

RemoveDynamicFileLinking Method

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

Call RemoveDynamicFileLinking to remove a dynamic file link from the current component.

Syntax

```
RemoveDynamicFileLinking (pSourceFolder As ISWiDynamicFileLinking) As Long
```

Parameters

Table 12-48 • RemoveDynamicFileLinking Method Parameters

Parameter	Description
pSourceFolder	Pass the ISWiDynamicFileLinking object to specify a dynamic file link that you want to remove from the project.

Applies To

- ISWiComponent

RemoveEnvironmentVar Method

Project • *The RemoveEnvironmentVar method applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

Call RemoveEnvironmentVar to remove an environment from a specified component.

Syntax

```
RemoveEnvironmentVar (sName As ISWiRemoveEnvironmentVar) As Long
```

Parameters

Table 12-49 • RemoveEnvironmentVar Method Parameters

Parameter	Description
sName	Pass the ISWiEnvironmentVar object to specify an environment variable that you want to remove.

Applies To

- ISWiComponent

RemoveFile Method

Call RemoveFile to remove a file from a specified component.

Syntax

```
RemoveFile (pFile As ISWiFile) As Long
```

Parameters

Table 12-50 • RemoveFile Method Parameters

Parameter	Description
pFile	Pass the ISWiFile object you want to remove.

Applies To

- ISWiComponent

ISWiComponentSubFolder Object

Project • *The ISWiComponentSubFolder object applies to the following project types:*

- *InstallScript*
- *InstallScript Object*

The ISWiComponentSubFolder object represents a component subfolder belonging to the current component or component subfolder. The component subfolder can be an existing one from the InstallShield user interface's Components view or one added by calling AddComponentSubFolder.

Use the project's ISWiComponentSubFolders collection to access a specific component subfolder. You must specify either an index number or the component subfolder name for the Item property of ISWiComponentSubFolders.

Members

Table 12-51 • ISWiComponentSubFolder Object Members

Name	Type	Description
AddComponentSubFolder	Method	Adds a subfolder to the component subfolder.
AddFile	Method	Adds a file to the component subfolder.
DeleteFile	Method	Deletes a file from the component subfolder.
ISWiComponentSubFolders	Collection	Contains all of the subsubfolders associated with this component subfolders.
ISWiFiles	Collection	Contains all of the files associated with this component subfolder.
Name	Read-Only Property	Stores the name of the component subfolder.
RemoveComponentSubFolder	Method	Removes a subfolder from the component subfolder.

Example

The following Visual Basic code illustrates the use of the ISWiComponentSubFolder object:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponentSubFolder.AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent

DeleteFile Method

Project • *The DeleteFile method applies to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call DeleteFile to delete a file from a specified component subfolder. The files added with this method have static file links, similar to adding files in the IDE.

Syntax

```
DeleteFile (pFile As ISWiFile) As Long
```

Parameters

Table 12-52 • DeleteFile Method Parameters

Parameter	Description
pFile	Pass the file object that you want to delete.

Example

The following Visual Basic example deletes a file from the component subfolder MyCompSubFolder:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder
Dim pFile As ISWiFile

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
Set pFile = pComponentSubFolder.ISWiFiles.Item("MyFile.ext")
pComponentSubFolder.DeleteFile pFile

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponentSubFolder

ISWiCondition Object

ISWiCondition is a subset of the ISWiFeature object. This object allows you to get and set conditional logic for any of your project's features.

Members

Table 12-53 • ISWiCondition Object Members

Name	Type	Description
Condition	Read-Write Property	Gets or sets any conditions that are associated with this feature.
Level	Read-Write Property	Gets or sets the install level assigned to the feature when the condition evaluates to TRUE.

Applies To

- ISWiFeature

ISWiDynamicFileLinking Object

Project • *The ISWiDynamicFileLinking object applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

ISWiDynamicFileLinking represents a dynamic file link that belongs to a component. The dynamic file link can be an existing one from the InstallShield user interface or one added by calling AddDynamicFileLinking.

Members

Table 12-54 • ISWiDynamicFileLinking Object Members

Name	Project	Type	Description
CreateBestPracticeComponents	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	To use the best practice method of component creation for your dynamically linked files, set this property to True. To use the one-component-per-directory method of component creation, set this property to False. For detailed information about the two methods, see Determining the Appropriate Component Creation Method for Dynamically Linked Files.
DynamicSubfolders	All	Read-Write Property	Set this property to True to include all subfolders that are available in SourceFolder.
ExcludeFiles	All	Read-Write Property	Specify the file types that you want to exclude. Enter the file extension preceded by an asterisk (*). Separate multiple entries with a comma.
IncludeFiles	All	Read-Write Property	Specify the file types that you want to include. Enter the file extension preceded by an asterisk (*). Separate multiple entries with a comma.
SelfRegister	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Set this property to True to self-register every file in the dynamically linked folder. If the Attrib64BitComponent property of the component is set to True, the installation performs 64-bit self-registration on the target system. For more information, see Targeting 64-Bit Operating Systems.
SourceFolder	All	Read-Write Property	Specifies the fully qualified path to the folder whose contents should be dynamically linked.

Applies To

- ISWiComponent

ISWiEnvironmentVar Object

Project • *The ISWiEnvironmentVar object applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

ISWiEnvironmentVar represents an environment variable that belongs to a component. The file can be an existing one from the InstallShield user interface or one added by calling AddEnvironmentVar.

Members

Table 12-55 • ISWiEnvironmentVar Object Members

Name	Type	Description
EnvType	Read-Write Property	This enumerated integer property specifies whether the environment variable name refers to a system or user environment variable: • **evtSystem**—Creates, modifies, or removes the specified system environment variable. • **evtUser**—Creates, modifies, or removes the environment variable from the user's environment. The specified environment variable is available only to the end user who is logged on at the time of installation.
Key	Read-Only Property	Stores the key of the **Environment** table.
Name	Read-Write Property	Retrieves or sets the name of the environment variable.
OnInstall	Read-Write Property	This enumerated integer property retrieves or sets the action that you want to occur when the associated feature is installed to the target system: • **evoiSet**—In conjunction with the Placement property, sets the value of an existing environment variable. This option creates the environment variable if it does not already exist on the target system, and then it sets it during installation. If the environment variable exists on the target system, it is set during the installation. • **evoiCreate**—Creates the specified environment variable on the target system if it does not already exist, and it sets the variable's value. • **evoiRemove**—Removes the specified environment variable from the target system.
OnUninstall	Read-Write Property	This enumerated integer property specifies whether this environment variable should be removed from the target system when the associated feature is uninstalled: • **evouRemove**—Removes the environment variable or its appended value from the target system if the associated feature is uninstalled. If the value of the OnInstall property is Create, the Remove value for OnUninstall removes the entire environment variable. If the value of the OnInstall property is Set, the Remove value for OnUninstall removes only the value that was appended to the variable's value. • **evouLeave**—Leaves the environment variable or its appended value on the target system if the associated feature is uninstalled.

Table 12-55 • ISWiEnvironmentVar Object Members (cont.)

Name	Type	Description
Placement	Read-Write Property	This enumerated integer property retrieves or sets the placement of the value in the Value field relative to the specified environment variable's existing value: • **evpAppend**—Appends the value indicated in the Value property to the end of the specified environment variable's existing value. • **evpPrefix**—Adds the value indicated in the Value property to the beginning of the specified environment variable's existing value. • **evpReplace**—Replaces the value of the specified environment variable with the value indicated in the Value property.
Value	Read-Write Property	Retrieves or sets the path or value for this environment variable.

Applies To

- ISWiComponent

ISWiFeature Object

ISWiFeature represents a feature in the InstallShield user interface. You can retrieve a feature by specifying an item in the ISWiFeatures collection.

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. Refer to the following table to see which methods, properties, and collections are available for your project type.

Members

Table 12-56 • ISWiFeature Object Members

Name	Project	Type	Description
AddCondition	Basic MSI, InstallScript MSI	Method	Adds a condition to the current ISWiFeature.
AddFeature	All	Method	Creates an ISWiFeature object as a subfeature of the current ISWiFeature.
AddMergeModule	Basic MSI, InstallScript MSI	Method	Associates a merge module with the current feature.
AddObject	InstallScript	Method	Adds an InstallScript object to the current ISWiFeature.
Advertise	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the Advertisement property for the current feature. Use the following constants to set this property: • **eaAllow (1)**—Use this option to enable advertisement on this feature. Although advertisement is allowed, it is not the default option when the setup is run. • **eaFavor (2)**—Use this option to have the feature advertised by default. Your end users can always change the advertisement option for a feature in Custom Setup dialog. • **eaDisallow (3)**—Use this option if you do not want to allow advertising for this feature. Your end users will not be able to choose to have a feature advertised in the Custom Setup dialog. • **eaDisableIfNotSupported (4)**—Advertisement only works on systems with Internet Explorer 4.01 or higher. If the target system does not meet this criteria, advertising is turned off. If the target system can support advertisement, advertising is allowed.
AttachComponent	All	Method	Associates a component with the current feature.
CDRomFolder	InstallScript	Read-Write Property	Gets or sets the feature's CD-ROM Folder property, which specifies the folder in the disk image in which the feature is placed if the feature's check box is checked in the Release wizard's Custom Media Layout panel.

Table 12-56 • ISWiFeature Object Members (cont.)

Name	Project	Type	Description
Comments	All	Read-Write Property	Gets or sets the comments associated with this feature.
DeleteCondition	Basic MSI, InstallScript MSI	Method	Deletes a condition associated with the current feature.
Description	All	Read-Write Property	Gets or sets the description for this feature.
DescriptionID	All	Read-Write Property	Gets or sets the string identifier for this feature's description.  ***Note*** • *To set this property, the string entry must exist and you must know the string identifier.*
Destination	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the default destination of this feature.
Display	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the Display property for this feature. Use the following constants to set this property: • **edtVisibleAndCollapsed (0)**—Means that the feature is displayed in the Custom Setup dialog with its subfeatures collapsed by default. • **edtVisibleAndExpanded (1)**—Means that the feature is displayed in the Custom Setup dialog with its subfeatures expanded by default. • **edtNotVisible (2)**—Means that the feature is not displayed to the end user in the Custom Setup dialog.
DisplayName	All	Read-Write Property	Gets or sets the display name of this feature.
DisplayNameID	All	Read-Write Property	Gets or sets the string identifier for this feature's display name.  ***Note*** • *To set this property, the string entry must exist and you must know the string identifier.*

Table 12-56 • ISWiFeature Object Members (cont.)

Name	Project	Type	Description
Encryption	InstallScript	Read-Write Property	Gets or sets the feature's Encryption property, which specifies whether the files for the feature will be encrypted by the release builder. This property is a Boolean.
Features	All	Read-Only Property	This property contains an ISWiFeatures collection of all this feature's immediate subfeatures, if any.
FTPLocation	All	Read-Write Property	Gets or sets the feature's FTP Location property, which specifies an FTP location for the feature.
HTTPLocation	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the feature's HTTP Location property, which specifies an HTTP location for the feature.
IncludeInBuild	InstallScript	Read-Write Property	Gets or sets the feature's Include In Build property, which specifies whether the feature should be included in your distribution media. This property is a Boolean.
GUID	InstallScript	Read-Write Property	Gets or sets the feature's GUID property, which identifies the feature in the setup's log file; if you change a feature's GUID in an update setup, the setup engine treats it as a new feature rather than an update to an existing feature.
InstallLevel	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the install level of this feature.
ISWiComponents	All	Collection	Contains all of the components associated with the current feature.
ISWiConditions	Basic MSI, InstallScript MSI	Collection	Contains all of the conditions associated with the current feature.
ISWiObjects	InstallScript	Collection	Contains all of the InstallScript objects associated with the current feature.
Miscellaneous	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the feature's Miscellaneous property, which associates a text string with the feature.

Table 12-56 • ISWiFeature Object Members (cont.)

Name	Project	Type	Description
Name	All	Read-Only Property	Feature name of the current element in the collection.
Need	InstallScript	Read-Write Property	Gets or sets the feature's File Need property, which specifies whether a warning, a severe warning, or no warning should be given to end users who deselect the feature. Use the following constants to set this property: • **efnCritical (0)**—Use this option for features that your setup does not allow end users to deselect. • **efnHighlyRecommended (1)**—Use this option to advise end users that the feature should be installed. • **efnStandard (2)**—Use this option to let end users deselect the feature with no message issued.
OnInstalled	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the feature's OnInstalled property, which specifies the function to be executed just after the feature is installed.
OnInstalling	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the feature's OnInstalling property, which specifies the function to be executed just before the feature is installed.
OnUninstalled	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the feature's OnUninstalled property, which specifies the function to be executed just after the feature is uninstalled.
OnUninstalling	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the feature's OnUninstalling property, which specifies the function to be executed just before the feature is uninstalled.
Password	InstallScript	Read-Write Property	Gets or sets the feature's Password property, which specifies a password for the feature.
ReleaseFlags	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the release flags attached to this feature. Separate multiple flags with a comma. You can specify which release flags you want to use to filter the project's features in the ReleaseFlags property of ISWiRelease.

Table 12-56 • ISWiFeature Object Members (cont.)

Name	Project	Type	Description
RemoteInstallation	Basic MSI, InstallScript MSI	Read-Write Property	Retrieves or sets the feature's Remote Installation property. Use the following constants to set this property: • **efrLocal (0)**—Means that all of the feature's files are installed onto the target system. • **efrSource (1)**—Causes the files belonging to this feature to run directly from the source medium, such as a CD-ROM or network server. • **efrFollowParent (2)**—Gives a subfeature the Remote Installation property of its parent feature.
RemoveComponent	All	Method	Removes a component from this feature.
RemoveFeature	All	Method	Deletes the specified feature from the project.
RemoveMergeModule	Basic MSI, InstallScript MSI	Method	Removes a merge module from the current feature.
RemoveObject	InstallScript	Method	Removes an InstallScript object from the current ISWiFeature.
Required	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the feature's Required property. This property is a Boolean.
RequiredFeatures	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets a comma-delimited string that lists the names of the features that are specified in the current feature's Required Features property.

Table 12-56 • ISWiFeature Object Members (cont.)

Name	Project	Type	Description
SetupTypeStatus	InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the selection status of the feature in the setup type that is specified in the property's argument. Use the following constants to set this property: • **estSelected (10)**—The feature is selected. • **estDeselected (11)**—The feature is not selected. In the following Visual Basic code snippet, the Help_Files feature is not selected for the Compact setup type. `Set pFeature = pProject.ISWiFeatures.Item("Help_Files")` `Set pSetupType = pProject.ISWiSetupTypes.Item("Compact")` `pFeature.SetupTypeStatus(pSetupType) = 11`
StatusText	InstallScript	Read-Write Property	Gets or sets the feature's Status Text property, which specifies the text that end users see in the uppermost line of the progress indicator during the transfer of this feature.
Visible	InstallScript	Read-Write Property	Gets or sets the feature's Visible property, which specifies whether the feature will be visible in feature dialog boxes during the installation. This property is a Boolean.

Applies To

- ISWiProject

AddCondition Method

Project • *This method does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the AddCondition method to add a condition to the current feature.

Syntax

```
AddCondition (sKey As String) As ISWiCondition
```

Parameters

Table 12-57 • AddCondition Method Parameters

Parameter	Description
sKey	Pass the string version of the condition you want to attach to the current feature.

Applies To

- ISWiFeature

AddMergeModule Method

Project • *This method dose not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the AddMergeModule method to associate a merge module with the current feature. This method is similar to adding a merge module to a feature in the Redistributables view.

Syntax

```
AddMergeModule (FileName As String)
```

Parameters

Table 12-58 • AddMergeModule Method Parameters

Parameter	Description
FileName	Pass the fully qualified file name for the merge module (.msm) file that you want to associate with this feature.

Applies To

- ISWiFeature

AddObject Method

Project • *This method does not apply to Basic MSI projects.*

The AddObject method adds an InstallScript object with the specified moniker to the current feature.

Syntax

```
AddObject (Moniker As String) As ISWiObject
```

Parameters

Table 12-59 • AddObject Method Parameters

Parameter	Description
Moniker	Pass the moniker for the InstallScript object that you want to add. To get an InstallScript object's moniker, create a new Professional project in the IDE and add the InstallScript object to a feature, then go to the Direct Editor view's ISFeatureExtended table and see the Moniker column.

Example

The following Visual Basic lines demonstrate the AddObject method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.AddObject ("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiFeature

AttachComponent Method

Call the AttachComponent method to associate a component with the current feature. The component must exist (created manually in the IDE or by calling AddComponent) before you can associate it with a feature.

Syntax

```
AttachComponent (Component As ISWiComponent)
```

Parameters

Table 12-60 • AttachComponent Method Parameters

Parameter	Description
Component	Provide the ISWiComponent object that represents the component you want to associate with this feature.

Applies To

- ISWiFeature

DeleteCondition Method

Project • *This method does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

Call the DeleteCondition method to delete a condition from the current feature.

Syntax

```
DeleteCondition (pCondition As ISWiCondition)
```

Parameters

Table 12-61 • DeleteCondition Method Parameters

Parameter	Description
pCondition	The ISWiCondition object representing the condition you want to delete.

Applies To

- ISWiFeature

RemoveComponent Method

Call RemoveComponent to remove a component from a specified feature. Similar to removing a component in the Setup Design views, RemoveComponent disassociates a component from its feature, but it does not permanently delete it from the project.

Syntax

```
RemoveComponent (pComponent As ISWiComponent) As Boolean
```

Parameters

Table 12-62 • RemoveComponent Method Parameters

Parameter	Description
pComponent	Enter the ISWiComponent object that you want to remove.

Applies To

- ISWiFeature

RemoveMergeModule Method

Call the RemoveMergeModule method to remove a merge module from only the current feature. (To delete a merge module from the project, call the DeleteMergeModule method.)

Syntax

```
RemoveMergeModule (FileName As String)
```

Parameters

Table 12-63 • RemoveMergeModule Method Parameters

Parameter	Description
FileName	Pass the fully qualified file name for the merge module (.msm) file that you want to remove from this feature.

Applies To

- ISWiFeature

RemoveObject Method

Project • *This method does not apply to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

The RemoveObject method removes the specified InstallScript object from the current feature.

Syntax

```
RemoveObject (Object As ISWiObject) As Long
```

Parameters

Table 12-64 • RemoveObject Method Parameters

Parameter	Description
Object	The InstallScript object to be deleted.

Example

The following Visual Basic lines demonstrate the RemoveObject method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item("Help_Files")
Set pObject = pFeature.ISWiObjects.Item(1)
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiFeature

ISWiFile Object

ISWiFile represents a file belonging to a component or, in InstallScript projects, a component subfolder in your project. The file can be an existing one from the InstallShield user interface or one added by calling AddFile.

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. Note that some methods, properties, and collections are available for specific project types.

Use the component's ISWiFiles collection to access a specific file. You must specify either an index number or the file key for the Item property of ISWiFiles. The file key is visible in the **File** column of the **File** table in the Director Editor view of InstallShield. In Basic MSI and InstallScript MSI projects, it is also listed under the **Key** column in a component's file list.

Unfortunately, you might not know the file key, or it might have been reassigned if the files are dynamically linked to the component. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```
Dim m_pFile As ISWiFile

For Each m_pFile In m_pComponent.ISWiFiles
    If UCase(m_pFile.DisplayName) = "MYFILE.EXE" Then
        Exit For
    End If
Next
```

If the file name MyFile.exe is found among the component's files, the For loop ends, and m_pFile holds a copy of the ISWiFile object for MyFile.exe.

Members

Table 12-65 • ISWiFile Object Members

Name	Project	Type	Description
Attributes	Basic MSI, InstallScript MSI	Property (Deprecated)	This property is no longer supported. Use the Hidden, ReadOnly, System, and Vital properties instead.
CompanionFile	All	Read-Write Property	Reserved for future use.
DisplayName	All	Read-Write Property	The standard name of the file. Be sure that case of this entry matches the case of the file name if you plan on distributing your package via the Internet, since some Web servers are case sensitive. The name cannot contain any characters that are not valid for Windows folders and file names. If the file has both a long and a short file name (see ShortName, below), only the long name is used in the display name. You cannot modify this property if the files are dynamically linked.
DynamicFile	Basic MSI, InstallScript, InstallScript MSI	Read-Only Property	This property is True if the file's source is linked to the component dynamically, or False if it is linked statically.
FontTitle	Basic MSI, InstallScript MSI	Read-Write Property	Retrieves or sets the Font Title file attribute as a string. You cannot modify this property if the files are dynamically linked.
FullPath	All	Read-Write Property	Stores the fully qualified path (including the file name) of the file's source location. Any path variables are resolved to the actual path. You cannot modify this property if the files are dynamically linked.
Hidden	All	Read-Write Property	True if a file has the Hidden attribute set. This property is ignored if OverrideSystemAttributes is set to False. You cannot modify this property if the files are dynamically linked.

Table 12-65 • ISWiFile Object Members (cont.)

Name	Project	Type	Description
Languages	Basic MSI, InstallScript MSI	Read-Write Property	This property should contain a string of all of the file's language IDs, in decimal and separated by commas. The following line identifies the file as English and German: m_pFile.Languages = "1031,1033" This property is ignored if OverrideSystemLanguage is set to True. You cannot modify this property if the files are dynamically linked.
Modified	Basic MSI, InstallScript MSI	Read-Write Property	Retrieves the file's Modified file attribute. Reserved for future use.
Name	Basic MSI, InstallScript MSI	Read-Write Property	Retrieves or sets a file key. See the description of ISWiFile above for more information about the file key. You cannot modify this property if the files are dynamically linked.
OverrideSystemAttributes	Basic MSI, InstallScript MSI	Read-Write Property	To override the development system's settings for all of the file attributes, such as Hidden, ReadOnly, Vital, and System, set this property to True. If you set this property to False, the Hidden, ReadOnly, Vital, and System properties are ignored. You cannot modify this property if the files are dynamically linked.
OverrideSystemLanguage	Basic MSI, InstallScript MSI	Read-Write Property	To override the language of the file on the development system, set this property to True. If you set this property to False, the Languages property is ignored. You cannot modify this property if the files are dynamically linked.
OverrideSystemSize	Basic MSI, InstallScript MSI	Read-Write Property	To override the size of the file on the development system, set this property to True. If you set this property to False, the Size property is ignored. You cannot modify this property if the files are dynamically linked.

Table 12-65 • ISWiFile Object Members (cont.)

Name	Project	Type	Description
OverrideSystemVersion	Basic MSI, InstallScript MSI	Read-Write Property	To override the version of the file version on the development system, set this property to True. If you set this property to False, the Version property is ignored. You cannot modify this property if the files are dynamically linked.
ReadOnly	All	Read-Write Property	Retrieves or sets the Read-only file attribute. Set this property to True to mark a file as read-only. Leave it undefined or set it to False to mark a file as read-write. This property is ignored if OverrideSystemAttributes is set to False. You cannot modify this property if the files are dynamically linked.
SelfRegister	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the Self-Register file attribute. Set this property to True to mark a file as self-registering. You cannot modify this property if the files are dynamically linked.
ShortName	All	Read-Write Property	Gets or sets the file's short name. Your files must have corresponding short names in case the Windows Installer property SHORTFILENAMES is set because the distribution medium cannot handle long file names. Only the short file names are used when you deselect “Use long file names” in the Advanced Settings panel of the Release wizard. By default, the build process will generate short names for your files, and therefore reading the current value of a file's ShortName property will return an empty string. However, if you explicitly set a file's ShortName property, the build process will use the short name you specify, and reading the ShortName value will return the short name you specified. You cannot modify this property if the files are dynamically linked.

Table 12-65 • ISWiFile Object Members (cont.)

Name	Project	Type	Description
Size	Basic MSI, InstallScript MSI	Read-Write Property	Contains the size of the file, in bytes, as a Long. If you are setting this property, OverrideSystemSize must first be set to True. Otherwise, InstallShield uses the actual size of the file. You cannot modify this property if the files are dynamically linked.
System	All	Read-Write Property	Retrieves or sets the System file attribute. Set this property to True if the file is a system file. This property is ignored if OverrideSystemAttributes is set to False. You cannot modify this property if the files are dynamically linked.
UseSystemSettings	Basic MSI, InstallScript MSI	Property (Obsolete)	This property is no longer supported. Use the OverrideSystemAttributes, OverrideSystemSize, OverrideSystemVersion, and OverrideSystemLanguage properties instead.
Version	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to the version of the file that you are including in the setup. To specify a companion file, this property can also be set to the Name property of another ISWiFile object, provided. To learn more about companion files, see Companion Files. This property is ignored if OverrideSystemVersion is set to False. You cannot modify this property if the files are dynamically linked.
Vital	Basic MSI, InstallScript MSI	Read-Write Property	Retrieves or sets the Vital file attribute. Set this property to True to mark this file as vital. You cannot modify this property if the files are dynamically linked.

ISWiFolder Object

ISWiFolder represents a program folder in a component's Shortcuts explorer in the InstallShield user interface. You can retrieve a folder by specifying an item in the ISWiFolders collection.

Many folder attributes are available in the automation interface through this object's methods and properties. Refer to the following table to learn which methods, properties, and collections are available for your project type.

Members

Table 12-66 • ISWiFolder Object Members

Name	Type	Description
AddShortcut	Method	Adds a shortcut object to the current folder object.
AddSubFolder	Method	Creates another program folder under the current one.
DeleteShortcut	Method	Deletes the specified shortcut from the current folder object.
DeleteSubFolder	Method	Deletes the specified subfolder from the current one.
Description	Read-Write Property	Contains any descriptive text you have entered for the folder.
DisplayName	Read-Write Property	Retrieves or sets the name displayed for a folder.
ISWiShortcuts	Collection	Contains every shortcut under the current program folder.
Name	Read-Write Property	Retrieves the key name of the folder. This is the name that is displayed in the Shortcuts view in the InstallShield user interface. It is not the same as the DisplayName property.
SharedFolder	Read-Write Property	This Boolean property retrieves or sets the Shared property of the folder, which specifies whether the folder is always removed from the system (False) or is removed only if it has no subfolders or files that were not created by the setup (True).
SubFolders	Collection	Contains an ISWiFolders collection of each program folder directly under the current folder as laid out in the Shortcuts explorer. See ISWiFolders Collection for an example of using this property to retrieve a subfolder. ***Note*** • *This property does not apply to the following project types:* • *Basic MSI* • *InstallScript MSI*

Applies To

- ISWiComponent

AddShortcut Method

Call AddShortcut to create a shortcut under the current program folder.

Syntax

```
AddShortcut (Name As String) As ISWiShortcut
```

Parameters

Table 12-67 • AddShortcut Method Parameters

Parameter	Description
Name	Enter the name you want to give the shortcut in the Shortcuts explorer.

Applies To

- ISWiFolder

AddSubFolder Method

Call the AddSubFolder method to create a program folder directly under the current ISWiFolder object.

Syntax

```
AddSubFolder (Name As String) As ISWiFolder
```

Parameters

Table 12-68 • AddSubFolder Method Parameters

Parameter	Description
Name	Enter the name you want to give the program folder in the Shortcuts explorer.

Applies To

- ISWiFolder

DeleteShortcut Method

Call DeleteShortcut to create a shortcut from the current folder.

Syntax

```
DeleteShortcut (Name As String) As ISWiShortcut
```

Parameters

Table 12-69 • DeleteShortcut Method Parameters

Parameter	Description
Name	Specify the name of the shortcut that you want to delete.

Applies To

- ISWiFolder

DeleteSubFolder Method

Call the DeleteSubFolder method to delete the specified subfolder from the current ISWiFolder object.

Syntax

```
DeleteSubFolder (Name As String) As ISWiFolder
```

Parameters

Table 12-70 • DeleteSubFolder Method Parameters

Parameter	Description
Name	Specify the name of the subfolder that you want to delete.

Applies To

- ISWiFolder

ISWiLanguage Object

ISWiLanguage represents a language whose string entries are included in the current project.

Edition • *Support for multilanguage installations is available with InstallShield Premier Edition.*

Members

Table 12-71 • ISWiLanguage Object Members

Name	Type	Description
AddStringEntry	Method	Add a new string entry and return ISWiStringEntry.
DeleteStringEntry	Method	Delete a string entry from the current language.
Id	Read-Only Property	Stores the language identifier of the current language.
IsIncluded	Read-Write Property	Set this property to True to include the language in the project.
ISWiStringEntries	Read-Only Property	Return the ISWiStringEntries collection for the current language.
Name	Read-Only Property	Stores the name of the current language.

Applies To

- ISWiProject

AddStringEntry Method

Call AddStringEntry to add a new string entry to a language and return ISWiStringEntry.

Syntax

```
AddStringEntry (sLangId) As ISWiStringEntry
```

Parameter

Table 12-72 • AddStringEntry Method Parameter

Parameter	Description
sLangId	Pass the language identifier that should contain the string entry.

Applies To

- ISWiLanguage

DeleteStringEntry Method

Call DeleteStringEntry to delete a string entry to a language.

Syntax

```
DeleteStringEntry (pLangId As ISWiStringEntry)
```

Parameter

Table 12-73 • DeleteStringEntry Method Parameter

Parameter	Description
sLangId	Pass an ISWiStringEntry object to specify a string entry that you want to remove from the project.

Applies To

- ISWiLanguage

ISWiObject Object

Project • *The ISWiObject object applies to the following project types:*

- *InstallScript*
- *InstallScript Object*

The ISWiObject object represents an InstallScript object belonging to your project. The InstallScript object can be an existing one from the InstallShield user interface's Objects view or one added by calling AddObject.

Use the project's ISWiObjects collection to access a specific InstallScript object. You must specify either an index number or the moniker for the Item property of ISWiObjects. The moniker is visible in the IDE only as the Moniker in the Direct Editor view's **ISFeatureExtended** table.

Members

None.

Example

The following Visual Basic code illustrates the use of the ISWiObject:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject
```

```
Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiFeature

ISWiPathVariable Object

ISWiPathVariable represents a path variable that is included in the current project. The path variable can be an existing one that was created from the Path Variables view in InstallShield, or one that was added by calling the AddPathVariable method.

Important • *Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.*

Members

Table 12-74 • ISWiPathVariable Object Members

Name	Type	Description
Name	Read-Write Property	Retrieves or sets the name of the path variable.
Value	Read-Write Property	Retrieves or sets the value of the path variable. **For Standard Path Variables** For standard variables, enter the directory to which you would like your variable to point.  ***Note*** *• You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called* `MyRoot` *with a value of* `C:\`*, you can refer to it in a path variable definition for another variable, such as* `Games`*. The actual path for the* `Games` *variable might be* `C:\Programs\GameFiles`*, but you can define* `Games` *as* `<MyRoot>\Programs\GameFiles`*. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining* `Games` *as* `<MyRoot>\Programs\<Games>` *actually results in* `Games` *defined as* `C:\Programs\<Games>`*.*
Value (cont.)		**For Registry Path Variables** Enter the complete registry key, with the final “subkey” being the name of the value whose data contains the folder. For example, define *MyRegVar* as follows: `HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue` Assume that TestKey has the following subkey and values: `[HKEY_LOCAL_MACHINE\SOFTWARE\TestKey]` `@="C:\\MyPath1"` `"TestValue"="C:\\MyPath2"` `[HKEY_LOCAL_MACHINE\Software\TestKey\TestValue]` `@="C:\\MyPath3"` Even though HKEY_LOCAL_MACHINE\SOFTWARE\TestKey has a subkey called TestValue, *MyRegVar* points to the value TestValue, and the current value will be `C:\MyPath2`. (Note, however, that if a value named TestValue does not exist, InstallShield reads the default value (`C:\MyPath3`) of the subkey HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue.) **For Environment Path Variables** For environment path variables, enter the name of the variable as it appears on the Environment dialog box.

Table 12-74 • ISWiPathVariable Object Members (cont.)

Name	Type	Description
TestValue	Read-Write Property	Retrieves or sets the test value of the path variable.
PathVarType	Read-Write Property	This enumerated integer property specifies the type of the path variable. Select one of the following options: • **epvtPreDefined**—Predefined path variables are variables that are set to certain standard Windows directories. These variables cannot be renamed or modified, but they can be used in your installation project to point to predefined directories. • **epvtCustom**—Custom path variables are sometimes referred to as *standard path variables* or *user-defined variables*. These variable types are native to InstallShield. That is, they do not rely upon outside resources, as do registry or environment variables. • **epvtEnvironment**—Environment path variables are based on the values of your system's environment variables. You can set an environment path variable to an existing environment variable. • **epvtRegistry**—Registry path variables enable you to define your own variables based on the default value of a specified registry key. The registry key must already be present when you set a path variable to the value of the key.

Applies To

- ISWiProject

ISWiProductConfig Object

ISWiProductConfig represents a product configuration in the Releases view of the InstallShield user interface. You can retrieve a configuration by specifying an item in the ISWiProductConfigs collection.

Project • *In an InstallScript project and an InstallScript Object project, there is only one element in ISWiProductConfigs, which is named "Media". Only some of the members of ISWiProductConfig apply to InstallScript and InstallScript Object projects.*

Members

Table 12-75 • ISWiProductConfig Object Members

Name	Project	Type	Description
AddRelease	All	Method	Adds a release to the current product configuration.
ArchitectureValidation	Basic MSI, Merge Module	Read-Write Property	Set this property to one of the following values to indicate what type of build-time architecture validation you want to perform: • **epvtLenient (0)**—Lenient architecture validation, which is the default type of validation, does not trigger build errors or warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or the custom action files that are being included in the release. • **epvtStrict (1)**—Strict validation may trigger build errors and warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or custom action files that are being included in the release. The value of this property also influences whether InstallShield includes 32-bit or 64-bit versions of the built-in InstallShield custom action DLLs. To learn more, see Selecting the Appropriate Type of Architecture Validation for Builds.
ConfigFlags	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma.
DeleteRelease	All	Method	Deletes the specified release from the current product configuration.

Table 12-75 • ISWiProductConfig Object Members (cont.)

Name	Project	Type	Description
GeneratePackageCode	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Set this property to True to generate a new package code for every release you build under this product configuration. If this property is not specified or set to False, then the existing package code under the product configuration is used. However, the Summary Information Stream's package code is used if you have not specified one here.
ISWiReleases	All	Collection	Contains all of the releases belonging to this product configuration.
MSIPackageFileName	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the value of the MSI Package File Name setting of the current product configuration.
Name	All	Read-Only Property	Returns the name of the current product configuration.
PackageCode	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets a string GUID for the package code that is built into this product configuration's releases. Neither the package code you enter in this property nor the Summary Information Stream's package code is used if you set the GeneratePackageCode property, above, to True.
ProductCode	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets a string GUID for the product code that is built into this product configuration's releases.  ***Note*** • *The GUID must be surrounded by braces{12345678-1234-1234-1234-1234567890AB}, for example.*
ProductName	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the product name that is built into this product configuration's releases.
ProductVersion	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets a string that contains the product's version number, which overrides the Product Version property for every release you build under this product configuration.

Table 12-75 • ISWiProductConfig Object Members (cont.)

Name	Project	Type	Description
SetupFileName	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the value of the Setup File Name setting for the current product configuration.
UpgradeCode	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the resulting setup package's Upgrade Code property.

Applies To

- ISWiProject

AddRelease Method

Call the AddRelease method to add a release to the current product configuration. Using this method is similar to creating a release in the Release Wizard or the Releases view of the IDE.

Syntax

```
AddRelease (ReleaseKey As String) As ISWiRelease
```

Parameters

Table 12-76 • AddRelease Method Parameters

Parameter	Description
ReleaseKey	Pass the name of the release you would like to create in the current product configuration.

Applies To

- ISWiProductConfig

DeleteRelease Method

Call the DeleteRelease method to delete a release from the current product configuration. Using this method is similar to deleting a release in the Releases view of the IDE.

Syntax

```
DeleteRelease (Release As ISWiRelease)
```

Parameters

Table 12-77 • DeleteRelease Method Parameters

Parameter	Description
ReleaseKey	Pass the name of the release you want to delete from the current product configuration.

Applies To

- ISWiProductConfig

MSIPackageFileName Property

The MSIPackageFileName property is a read-write property which is used for .msi, .cab, and .pdf files generated at build time. If this property field is blank, then the product name is used.

The string parameter associated with this property is the new MSI file name.

Applies to

- ISWiProductConfig

SetupFileName Property

The SetupFileName property is a read-write property which is used for .exe files generated at build time. If this property field is blank, then the file will be called setup.exe.

The string parameter associated with this property is the new setup file name.

Applies to

- ISWiProductConfig

ISWiProperty Object

Project • *The ISWiProperty object applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

ISWiProperty represents a Windows Installer property in the Property Manager of the InstallShield user interface. You can retrieve a property by specifying an item in the ISWiProperties collection.

Members

Table 12-78 • ISWiProperty Object

Name	Type	Description
Comments	Read-Write Property	Gets or sets the comments associated with the Windows Installer property.
Name	Read-Only Property	Contains the name of the property.
Value	Read-Write Property	Gets or sets the property's value.

Example

The following example sets the property ApplicationUsers to “OnlyCurrentUser,” which means that the option “Only for me” is selected by default in the CustomerInformation dialog:

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\ISWiProperties.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProject.ISWiProperties.Item("ApplicationUsers")

pProperty.Value = "OnlyCurrentUser"
pProperty.Comments = "Make ""Only for me"" the default radio button " & _
                     "in the CustomerInformation dialog."

pProject.SaveProject
```

Applies To

- ISWiProject

ISWiRelease Object

ISWiRelease represents a release in the InstallShield user interface. You can retrieve a release by specifying an item in the ISWiReleases collection. The release can be one created in the Release Wizard, the Release view, or at the command line.

Many feature properties and attributes are available in the automation interface through this object’s methods, properties, and collections.

Members

Table 12-79 • ISWiRelease Object Members

Name	Project	Type	Description
BatchFileName	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Execute Batch File property, which specifies the filename of a batch file or executable file to execute after the release build is complete.
BrowsersToSupport	Basic MSI, InstallScript MSI	Read-Write Property	This property indicates which browsers a One-Click installation will support. Specify the following value: • **eocitbIE (0)**—Internet Explorer This property applies only to One-Click Web releases.
Build	All	Method	Builds the current release. This is a full and complete build.
BuildErrorCount	All	Read-Only Property	After the Build method is run on the ISWiRelease object, BuildErrorCount contains the number of errors that occurred while the build process was running.
BuildLocation	All	Read-Write Property	Gets or sets a string that determines the release location.
BuildTablesOnly	Basic MSI, InstallScript MSI	Method	Builds only the .msi tables of the current release.
BuildTablesRefreshFiles	All	Method	Rebuilds your .msi file and updates the **Files** table, including any new or changed files in your setup.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
BuildUTF8Database	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	If you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding, set this Boolean property to True. The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system. However, some scenarios result in user interface issues. For example, if an end user specifies the `/qb` command-line option or uninstalls the product from Add or Remove Programs, Windows Installer uses very small fonts to display the user interface text in a UTF-8 database. If you set this property to True, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages.
BuildWarningCount	All	Read-Only Property	After the Build method is run on the ISWiRelease object, BuildWarningCount contains the number of warnings that occurred while the build process was running.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
CabCompressionType	Basic MSI, InstallScript MSI	Read-Write Property	If the Compressed property is set to True, you can use this CabCompressionType property to specify the type of compression that InstallShield should use when building this release's .cab files. Available options are: • **ecctLZX (3)**—InstallShield uses LZX compression to compress your product's data files into .cab files. This option results in the smallest .cab files; however, it also takes the most time to extract the data from these .cab files at run time. • **ecctMSZIP (1)**—InstallShield uses MSZIP compression to compress your product's data files into .cab files. • **ecctNone (0)**—InstallShield does not use any compression when creating the .cab files.  ***Important*** • *Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select the LZX option, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.*
CachePath	Basic MSI, InstallScript MSI	Read-Write Property	Specifies where cached installation files should be stored on the end user's system. Use a hard-coded value such as **C:\CachedFiles**. This property is used only if the CacheWebDownload property for the current build is set to True.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
CacheWebDownload	Basic MSI, InstallScript MSI	Read-Write Property	Specifies whether the installation files for the current build should be cached on the target system. Set this to True to cache the installation files on the target system for use with application maintenance and repair. Use the CachePath property to indicate where the cached files should be stored on the end user's system. This property is used only if the WebType property for the current build is set to ewtOneExe (2) (one executable).
CertificatePassword	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Write-Only Property	Indicates the password for the .pvk file or the .pfx file for digital signatures. Setting this property is the equivalent of setting the **Digital certificate file** setting on the Signing tab for a release in the Releases view.
CertificateURL	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	Indicates the URL used in your digital certificate to link to a location end users can visit to learn more about your product, organization, or company. Use a fully qualified URL—for example, **http://www.mydomain.com**.
Compressed	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True if you want all of the package's files compressed into the .msi file or Setup.exe, if selected. A value of False means that your application files are placed uncompressed in subfolders of the release location. Unlike the flexibility available in the Release Wizard's Custom Compression Settings panel, this property either compresses all or none of the files in the release.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
CompressScript	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the release's Compress Script property, which specifies whether the compiled script file (.inx file) is placed in a cabinet file (True) or is placed uncompressed in the Disk1 disk image folder (False).
CopyToFolder	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Copy To Folder property, which specifies a folder location to which to copy the release's disk image folders after the release build is complete. Existing folders with the same names as copied folders are overwritten but no folders are deleted.
CorrespondingPrivateKey	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	Specifies the location of your .pvk (private key) file provided by a certification authority. Use the path to the file. If you are using an .spc file, you must also specify the location of your .pvk.
CreateAutorunINF	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to create an `Autorun.inf` file at the root of your release location.
CreatePDF	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to generate a Package Definition (.pdf) file for your setup, False otherwise.
CubFile	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the name of the validation module (.cub file) that InstallShield uses to validate the built release.
DefaultLang	All	Read-Write Property	Gets or sets a string with the decimal value of the language ID of the default language for this release.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
DelayMSIEngineReboot	Basic MSI, InstallScript MSI	Read-Write Property	Specifies whether you want to postpone any reboot associated with installing or updating the Windows Installer engine on the target system until after your installation has completed. Set this to True to postpone the reboot, if one is necessary. Set this to False to allow the system to reboot, if necessary, immediately after the Windows Installer engine has been installed or updated and before performing your installation. This option requires Windows Installer version 2.0.
DisplayDotNetOptionDialog	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True if you want the installation to display the .NET option message box at run time. This message box allows the end user to specify whether to install the .NET Framework. Set this property to False if the installation should not allow end users to determine whether they want to install the .NET Framework.  ***Note*** • *This property does not determine whether your installation includes the .NET Framework, only whether the end user has a choice to install it.*
DistributeAfterBuild	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Set this to True if you want the build engine to automatically distribute the current release after each build to the location that you specify for the DistributeLoc or DistributeToURLLoc properties.  ***Note*** • *When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.*

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
DistributeLoc	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	If you want to be able to automatically distribute your release to a folder, specify the location for this property. The DistributeAfterBuild property must be set to True. Note that existing folders with the same names as copied folders are overwritten, but no folders are deleted. If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.  ***Note*** • *When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.*
DistributeToURL Loc	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	If you want to be able to automatically distribute your release to an FTP server, specify the FTP URL for the location for this property. The DistributeAfterBuild property must be set to True.  ***Note*** • *If you need to distribute your release to a path outside the FTP default folder, use a double slash (//). For example, to distribute your release to a root-level folder called* ***myproduct****, where the URL of the FTP server is* ***ftp://ftp.mydomain.com****, enter* `ftp://ftp.mydomain.com//myproduct` *for the FTP location.* *When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.*
DistributeToURL Password	Basic MSI, InstallScript MSI, Merge Module	Write-Only Property	If a password is required to upload to the FTP location that you are specifying, specify the password for this property.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
DistributeToURL UserName	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	If a user name is required to upload to the FTP location that you are specifying, specify the user name for this property.
DotNetBaseLanguage	Basic MSI, InstallScript MSI	Read-Write Property	Set the language of the user interface of the .NET framework installation. If you set DotNetVersion to '1', then you must set this property.
DotNetBuildConfiguration	Basic MSI, InstallScript MSI	Read-Write Property	Set this to the active release name in your corresponding .NET Project file. Typical values would be *Release* and *Debug*.
DotNetDelayReboot	Basic MSI, InstallScript MSI	Read-Write Property	Specifies whether you want to postpone any reboot associated with installing or updating the .NET Framework on the target system until after your installation has completed. Set this property to True to delay any prompts to reboot until after the installation is finished.  ***Note*** • *The .NET Framework may not function until after the target system is restarted. Therefore, it is strongly recommended that you set this property to False if the .NET Framework is used during the installation.*
DotNetFrameworkLocation	Basic MSI, InstallScript MSI	Read-Write Property	Set this to one of the following values to indicate how you want to package the .NET Framework redistributable into your installation: • **eelSourceMedia (0)**—Leaves the .NET Framework run time on the root of the source media. • **eelSetupExe (1)**—Extracts the .NET Framework from Setup.exe at run time. • **eelWeb (2)**—Downloads the .NET Framework run time from a default URL or a URL specified with the DotNetFrameworkURL property, described below. • **eelDotNetNone (3)**—Does not include the .NET Framework in the setup.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
DotNetFrameworkURL	Basic MSI, InstallScript MSI	Read-Write Property	If DotNetFrameworkLocation is set to eelWeb (2), this property allows you to override the default location of dotnetfx.exe on the Internet.
DotNetFxCmdLine	Basic MSI, InstallScript MSI	Read-Write Property	Set the command line that you want to pass to the setup inside of the .NET 1.1 redistributable (dotnetfx.exe).
DotNetLanguagePacks	Basic MSI, InstallScript MSI	Read-Write Property	Specify the language identifiers representing the additional .NET 1.1 language packs that you want to install.
DotNetLanguagePackCmdLine	Basic MSI, InstallScript MSI	Read-Write Property	Set the command line that you want to pass to the setup inside the .NET 1.1 language pack redistributables (langpack.exe).
DotNetUI	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True if you want to the user interface (UI) from the .NET Framework installation displayed at run time.
DotNetVersion	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to 1 if you want to ship .NET 1.1.
EnableDifference	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the release's Differential Media property, which specifies whether the current release (the release that is selected in the Releases view) is a differential release—that is, a release that contains only those files that were absent from one or more of a specified set of existing releases—or a full release, which contains all your product's files, so that your product can be installed on a system on which no version of your product is currently installed.
EnableLangDlg	All	Read-Write Property	Set this property to True to display the Language Dialog from Setup.exe.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
ExpirationDate	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets an expiration date (ISWiDate) for `Setup.exe`. If this property is set, end users cannot launch the `Setup.exe` file on or after the specified date. Following is sample Visual Basic code that sets the expiration date to December 30, 2012. `ISWiDate date` `date.wYear = 2012` `date.wMonth = 12` `date.wDay = 30` `pISWiRelease.ExpirationDate = date` If you use this property to get or set an expiration date, you can use the ExpirationMessage property to get or set the message that you want to be displayed at run time when an end user tries to launch `Setup.exe` on or after the expiration date.
ExpirationMessage	Basic MSI, InstallScript MSI	Read-Write Property	If you use the ExpirationDate property to set an expiration date, you can use the ExpirationMessage property to get or set the message that you want to be displayed at run time when an end user tries to launch `Setup.exe` on or after the expiration date. Following is sample Visual Basic code that sets an expiration message. `pISWiRelease.ExpirationMessage = "This setup expired on %s. The setup will now exit."`
FilterLangs	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to filter language-specific components according to your settings in the SupportedLangsData property, below.
FTPFolder	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's FTP Site Folder property, which specifies the folder on the FTP server to which you want to copy the disk image folders. This property is applicable only if the FTPHostAddress property is not empty.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
FTPHostAddress	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's FTP Host Address property, which specifies the Uniform Resource Locator (URL) of an FTP server to which the build process should upload the disk image folders. Leave this property empty if you do not want this release uploaded to an FTP server.
FTPPassword	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's FTP Site Password property, which specifies the password for the user name that you enter in the FTPUserName property. This property is applicable only if the FTPHostAddress property is not empty.
FTPUserName	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's FTP Site User Name property, which specifies the user name with which you want to gain access to the FTP server. This property is applicable only if the FTPHostAddress property is not empty.
GenerateFileHashValues	Basic MSI, InstallScript MSI	Read-Write Property	Indicates whether you want to populate the MsiFileHash table for every unversioned file in your build. Set this to True to populate the MsiFileHash table for every unversioned file in your build. Set this to False if you do not want to populate the MsiFileHash table. If this property is set to False, InstallShield builds any entries that are found in the project's MsiFileHash table (populated using the Direct Editor). If you have already populated the MsiFileHash table for a particular file, the build uses that information instead of generating the information at build time.
GenerateOneClickInstall	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to create a One-Click Install. If this property is set to True, you must specify file names in the OneClickHTMLBaseName and OneClickCabJarBaseName properties for this release. This property is ignored unless the release's Media Format property is set to Web via the Release Wizard's Media Type panel.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
IFTWCabSizeInKb	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the size, in kilobytes, of the cabinet (.cab) files built for the Web media type. Specify the value 0 (zero) to build a separate cabinet file for each component. This property is used only if the WebType property for the current release is set to ewtIFTW (1) (Install From The Web).
InitDlgProductName	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Init Dialog Product Name property, which specifies the product name to display in the setup initialization dialog box. If you leave this property empty, the product name that you specify in the General Information view.
JSharpCmdLine	Basic MSI, InstallScript MSI	Read-Write Property	Specify a command-line parameter to pass to vjredist.exe. Consult Microsoft Support for valid command-line parameters.
JSharpOptionDlg	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to display the J# Option dialog, which asks whether the end user wants to install the J# redistributable. If .NET 1.1 is also included in the setup, the dialog states that .NET 1.1 will also be installed.
JSharpOptionalIfSilent	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to install the J# redistributable even if the J# Option dialog cannot be displayed (for example, if the installation is run silently).
JSharpRedistLocation	Basic MSI, InstallScript MSI	Read-Write Property	Set this to one of the following values to indicate how you want to package the J# redistributable into your setup. • **eelSourceMedia (0)**—Leaves the J# redistributable on the root of the source media. • **eelSetupExe (1)**—Extracts the J# redistributable from Setup.exe at run time. • **eelWeb (2)**—Downloads the J# redistributable from a default URL or a URL specified with the DotNetFrameworkURL property. • **eelDotNetNone (3)**—Does not include the J# redistributable in the setup.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
KeepUnusedDirectories	Basic MSI, InstallScript MSI, Merge Module	Read-Write Property	Specify whether you want InstallShield to remove unused directories from the **Directory** table of the .msi file when you build this release. Available options are: • **False**—If a directory that is listed in the Directory column of the **Directory** table is not referenced in any known location in the .msi file, InstallShield removes it from the **Directory** table of the .msi file that it creates at build time. For Basic MSI and InstallScript MSI projects, this occurs after any merge modules are merged, but only directories that are present in the .msi file are removed; therefore, if a merge module contains new unused directories in its **Directory** table, the new unused directories are added to the installation. • **True**—InstallShield does not remove any directories from the **Directory** table of the .msi file that it creates at build time. The default value is False.  ***Note*** • *Under some conditions, predefined directories cannot be resolved, causing an installation to fail. Removing unused directories from the **Directory** table enables you to avoid unnecessary failures. Therefore, it is recommended that you do not keep unused directories.*
LauncherCopyright	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the copyright information for the Properties dialog box of the `Setup.exe` file. You must set the UseMyVersionInfo property to True to override the default copyright information. To learn more, see Customizing File Properties for the Setup Launcher.
LauncherFileDescription	Basic MSI, InstallScript, InstallScript MSI	Read-Write Property	Specifies the file description for the Properties dialog box of the `Setup.exe` file. You must set the UseMyVersionInfo property to True to override the default file description. To learn more, see Customizing File Properties for the Setup Launcher.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
LauncherPassword	Basic MSI, InstallScript MSI	Read-Write Property	Specifies a password to protect your application. You must set the PasswordProtectLauncher property to True to activate password protection. This property is applicable only to releases that meet the following criteria: • Single-file Setup.exe • Compressed files • Network image media type
MediaType	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Read-Only Property	Gets the type of distribution media for the release. Possible values are: • 0—CD-ROM • 1—Network image • 2—Custom • 3—DVD • 4—Web • 5—144 MB floppy disk • 6—InstallScript Object
MSI30EngineURL	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets the uniform resource locator (URL) for the location of the engine. This is the location that the installation file uses at run time to download the engine.
MsiEngineLocation	Basic MSI, InstallScript MSI	Read-Write Property	Specifies where the MSI engine installers should be located. Set this property to one of the following: • **eelSourceMedia (0)**—Copy from the source media. Leaves the MSI engine installers you selected on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into Setup.exe. • **eelSetupExe (1)**—Extract engine from Setup.exe. • **eelWeb (2)**—Download engine from the Web. If you use this setting, be sure to set the MSI30EngineURL property to appropriate Web locations.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
Name	All	Read-Only Property	Name of the current release.
ObjDiffOptions	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Object Difference property, which specifies the conditions for including InstallShield objects in your differential release. Use the following constants to set this property: • **eodoAll (0)**—The differential release will include all objects that would be included in the equivalent full update release. • **eodoExcludeAll (1)**—The differential release will not include any objects. • **eodoIncludeIfChanged (2)**—The differential release will include those objects that would be included in the equivalent full update release and that are not found in, or are different from, the corresponding object in at least one of the comparison releases. This property is applicable only if the EnableDifference property is set to True.
OneClickCabJarBaseName	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the base file name for the cabinet (.cab) file generated by the build process for a One-Click installation. The ".cab" extension is appended to the name you specify here. The generated file (or files) will be created in the Disk1 folder for the current release. This property is used only if the GenerateOneClickInstall property for the current build is set to True.
OneClickHTMLBaseName	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the base file name of the HTML file generated by the build process. The ".htm" extension is appended to the base name you specify, and the generated file is created in the Disk1 folder of the current release location. This property is used only if the GenerateOneClickInstall property for the current build is set to True.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
OptimizeSize	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the level of compression to use in your release's cabinet files. Setting this property to True generally decreases the size of your compressed files, but the build process may take more time to complete. This property is used only if your release compresses some or all of its files.
OSFilter	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Platform(s) setting, which specifies the operating systems that you want this release to support. If the platform specified for a component does not match one of the platforms that is selected for this property, the component is not included in the release. Use the following constants to set this property: • eosOSIndepedent = 0 • eosWin95 = &H10 (16) • eosWin98 = &H40 (64) • eosWinMe = &H80 (128) • eosWinNT4 = &H10000 (65536) • eosWin2000 = &H100000 (1048576) • eosWinXP = &H400000 (4194304) • eosWinServer2003 = &H800000 (8388608) • eosWinVista = &H1000000 (16777216)—These constants are for Windows Vista and Windows Server 2008. • eosWin7 = &H2000000 (33554432)—These constants are for Windows 7 and Windows Server 2008 R2. • eosWin8 = &H4000000 (67108864)—These constants are for Windows 8 and Windows Server 2012. • eosAll = &7D100D0 (131137744) You can specify multiple platforms; for example, **eosWin7 Or eosWinServer2008 Or eosWinVista Or eosWinServer2003**.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
PasswordProtectLauncher	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to password-protect your setup. Specify a password in the LauncherPassword property. This property is applicable only to releases that meet the following criteria: • Single-file Setup.exe • Compressed files • Network image media type
PathVariableOverrides	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	Gets or sets the value of a path variable in your project for the specified release. If this property is used to set the value of a path variable, it overrides any value that is set in the Path Variables view. Note that you can use this variable to get or override user-defined path variables, environment variables, and registry variables that are configured in the Path Variables view; however, you cannot override predefined path variables such as *<WindowsFolder>*. Following is sample Visual Basic code that overrides the value of a path variable called PathVar1: `pISWiRelease.PathVariableOverrides = "PathVar1=C:\Test1" + vbCrLf + "PathVar2=C:\test2"` To learn more about path variables, see Using Path Variables.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
PostbuildEvent	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the command that you want to be run after InstallShield has built and signed the release. When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds. Following is sample Visual Basic code that sets two commands: `pISWiRelease.PostbuildEvent = "Event1" + vbCrLf + "Event2"` At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.  ***Edition*** • *This property is available in the Premier edition of InstallShield.*

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
PrebuildEvent	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the command that you want to be run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release. When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds. Following is sample Visual Basic code that sets two commands: `pISWiRelease.PrebuildEvent = "Event1" + vbCrLf + "Event2"` At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.  ***Edition*** • *This property is available in the Premier edition of InstallShield.*

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
PrecompressionEvent	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the command that you want to be run after InstallShield has built the .msi package and the .cab files (if your product's data files are to be stored in .cab files). Note that this event occurs after .cab files are streamed into the .msi package, but before the .msi package has been digitally signed and streamed into the `Setup.exe` file. When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds. Following is sample Visual Basic code that sets two commands: `pISWiRelease.PrecompressionEvent = "Event1" + vbCrLf + "Event2"` At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.  ***Edition*** • *This property is available in the Premier edition of InstallShield.*
PreProcessorDefines	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Compiler Preprocessor Defines setting, which specifies any preprocessor variable definitions.
PreviousPackage	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the fully qualified path to a previous release (.msi file) to minimize the size of future patch packages.
ReleaseFlags	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
RequiredExecutionLevel	Basic MSI, InstallScript, InstallScript MSI	Read-Write Property	Gets or sets the minimum level required by your installation's `Setup.exe` file for running the installation (the setup launcher, any InstallShield prerequisites, and the .msi file) on Windows Vista and later platforms. The available options are: • **eRelAsInvoker (0)**—`Setup.exe` does not require administrative privileges, and all users can run it without administrative privileges. `Setup.exe` does not display any UAC messages prompting for credentials or for consent. This is the default option for Basic MSI projects. • **eRelAsHighestAvail (1)**—`Setup.exe` prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges. This is the default option for InstallScript and InstallScript MSI projects. • **eRelAsAdmin (2)**—`Setup.exe` requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator. For more information, see Minimizing the Number of User Account Control Prompts During Installation.
SetupCmdLine	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Setup Command Line property, which specifies any command line parameters you want to pass to Setup.exe when the setup is launched.
SetupEXE	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to create a `Setup.exe` setup launcher for the current release. The SetupEXE property and the TargetOS property correspond with the Setup Launcher setting on the Setup.exe tab in the Releases view. To learn about scenarios that require a setup launcher, see Creating a Setup Launcher.
ShallowFolderStructure	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to create the .msi file and related files directly in the Release Location without any of the subfolders.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
ShowPasswordDlg	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets the release's Show Password Dialog property, which specifies whether to execute the password-checking code in the OnCheckMediaPassword event handler function's default code. This property is applicable only if you specify a non-null password in the Media Password property.
SignFiles	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	If you want to sign any of the files in your release, set this Boolean property to True and then use the SignFilesInclude and SignFilesExclude properties to indicate which files should be signed.  ***Windows Logo*** • *All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.*
SignFilesExclude	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	Specify any files and file patterns that you do not want to be digitally signed at build time. Note the following guidelines: • To indicate a wild-card character, use an asterisk (*). For example, if you do not want to sign any .drv files, specify the following: ***.drv** Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to avoid signing any files that match a certain pattern. • Put each file and each file pattern on its own line, with each separated by a carriage return. • Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify ***.exe** for the SignFilesInclude property and the SignFilesExclude property, InstallShield does not sign any .exe files.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
SignFilesInclude	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	Specify the files and file patterns that you want to be digitally signed at build time. Note the following guidelines: • To indicate a wild-card character, use an asterisk (*). For example, if you want to sign all .exe files, specify the following: ***.exe** Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern. • Put each file and each file pattern on its own line, with each separated by a carriage return. • Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify ***.exe** for the SignFilesInclude property and the SignFilesExclude property, InstallShield does not sign any .exe files.
SignFilesInPlace	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	Specify whether you want InstallShield to sign your original files or just the files that are built into the release: • **False**—InstallShield signs a temporary copy of each file and then uses that signed temporary copy to build a release. Note that with this behavior, InstallShield will not modify or sign your original files. • **True**—If you want InstallShield to sign your original files, set this property to True. The default value of this property is set to False. The benefit of specifying True for a Basic MSI or InstallScript MSI project is that it helps create one patch that updates both compressed and uncompressed versions of a release that contains originally unsigned files.
SignLauncher	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to digitally sign your `Setup.exe` file.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
SignMedia	This varies. (To learn more, see SignMedia.)	Read-Write Property	Set this property to indicate whether to digitally sign your media, and if so, which files should be signed.
SignSignedFiles	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	If any of the files in your project are already digitally signed, specify whether you want InstallShield to replace those existing digital signatures with the digital signature that you specify through the SoftwarePublishingCredentials property: • **True**—Use the digital signature information that you are providing through the SoftwarePublishingCredentials property instead of any existing digital signature information that is already included with the file. • **False**—Leave the existing digital signature information intact for any files that are already signed. This is the default value. Note that this affects only files that meet the requirements that are specified in the SignFilesInclude and SignFilesExclude properties.
SingleEXEFileName	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Single Exe File Name property, which specifies the filename (including extension) of a self-extracting executable file that runs the setup. If the property's value is null, no self-extracting executable is created.
SingleEXEIconName	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Single Exe Icon File property, which specifies the fully qualified name of the file from which the executable's icon is taken at build time. If the property's value is null, a default icon is used.
SkinName	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Specify Skin property, which specifies the dialog box skin that is applied to this release. This property is applicable only if the UseProjectSkin property is set to True.
SmallInitializationDialog	All	Read-Write Property	Set this property to display a small initialization dialog when the end user runs this release.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
SoftwarePublishingCredentials	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Read-Write Property	Specifies the location of your digital certificate file (.spc or .pfx) provided by a certification authority. If you specify an .spc file for this property, you must also specify a .pvk file for the CorrespondingPrivateKey property.
SupportedLangsData	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets a list of language IDs that determines which components are included in the release. Only language-independent components and components of the specified languages are built into the release if the FilterLangs property is set to True. Use the decimal value of the language ID and separate multiple language with a comma.
SupportedLangsUI	All	Read-Write Property	Gets or sets a comma-delimited string of decimal language IDs that determines the release languages.
SupportedVersions	InstallScript, InstallScript Object	Read-Write Property	Gets or sets the release's Supported Version(s) property, which specifies a semicolon-delimited list of version numbers (for example, 1.2.3;1.2.4) of the earlier versions of your product to which this release can be applied as an update. If you leave this field blank, the setup can be run on a system on which any earlier version, or no version, of your product is currently installed. This property is applicable only if the EnableDifference property is set to False.
SuppressLauncherWarning	Basic MSI, InstallScript MSI	Read-Write Property	If the Windows Installer service cannot be installed or updated on a target system, the setup program displays a warning if this property is set to False. Set this to True to suppress the warning. This property applies only if you create a `Setup.exe` to launch your package.

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
TargetOS	Basic MSI, InstallScript MSI	Read-Write Property	Gets or sets a value that determines which platform version of Windows Installer should be included in the release. Specify one of the following values: • **osNone (0)**—Do not include Windows Installer. • **osWin9x (1)**—Include only the Windows 9x version of `InstMsi.exe`. • **osWinNT (2)**—Include only the Windows NT version of `InstMsi.exe`. • **os9xNT (3)**—Include both the Windows NT and Windows 9x versions of `InstMsi.exe`. The SetupEXE property and the TargetOS property correspond with the Setup Launcher setting on the Setup.exe tab in the Releases view.  ***Note*** • *This setting applies to redistributables for Windows Installer 3.1 and earlier. For information on Windows Installer 4.5 redistributables, see Adding Windows Installer Redistributables to Projects. Note that Windows Installer 4.0 is not available as a redistributable.*
URLForYourFiles	Basic MSI, InstallScript MSI	Read-Write Property	Specifies the directory from where your data cabinet files will be downloaded. This property accepts a URL in the form **http://www.yourcompany.com/download**. This property is used only if the WebType property for the current release is set to ewtDownloader (0) (Downloader) or ewtIFTW (1) (Install from the Web).
UseMyVersionInfo	Basic MSI, InstallScript MSI	Read-Write Property	Set this property to True to override the default InstallShield copyright information for Setup.exe. You can specify your copyright information in the LauncherCopyright property. This property is applicable only to releases that meet the following criteria: • Single-file Setup.exe • Compressed files • Network image media type

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
UsePathVariableTestValues	All	Read-Write Property	If you used test values for any of your path variables, set this property to True to set those variables to their actual values at this time.
UseProjectSkin	InstallScript, InstallScript Object	Read-Write Property	This Boolean property gets or sets whether the release's Specify Skin property is set to Use Project Setting, which uses the skin that is selected in the Dialogs view's Skins folder.
WebCreateDefaultPage	InstallScript	Read-Write Property	This Boolean property gets or sets the release's Create Default Web Page setting, which specifies whether InstallShield should create a default Web page (.htm file) and place it in the Disk1 folder.
WebPageUrl	InstallScript	Read-Write Property	Gets or sets the release's Web Page URL setting, which specifies the location of the Web page that should be launched if you click the Run From Web command on the Build menu in InstallShield: If nothing is entered for this property, InstallShield creates a `Setup.htm` file at build time and places it in the Disk1 folder. If you do enter a URL for this property, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the `Setup.htm` file is **http://www.mypages.com/setup/Setup.htm**, enter the following as the Web page URL: `http://www.mypages.com/setup` When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (**http://www.mypages.com/setup/Setup.htm**, in the aforementioned example).

Table 12-79 • ISWiRelease Object Members (cont.)

Name	Project	Type	Description
WebType	Basic MSI, InstallScript MSI	Read-Write Property	Indicates the configuration of your Web installation setup package. Set this property to one of the following: • **ewtDownloader (0)**—Downloader. Builds this release as a combination of Setup.exe and your MSI package, where the end user downloads and launches Setup.exe, which in turn downloads and runs the MSI database, which contains all of your files. • **ewtIFTW (1)**—Install from the Web. Builds this release as a combination of Setup.exe, your MSI database, and external cabinet (.cab) files. The end user downloads and runs Setup.exe, which in turn downloads and runs the MSI database. Based on the end user's setup type and feature selections, only the requested CAB files are downloaded and installed to minimize download time. Application maintenance and repair use the URL specified in the URLForYourFiles property as the installation source. • **ewtOneExe (2)**—One executable. Builds this release as a single self-extracting Setup.exe. This setting is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note that the entire installation package is downloaded, so the download time is greater than the ewtIFTW (1) (Install from the Web) setting.
WrapMSIIntoCab	Basic MSI, InstallScript MSI	Read-Write Property	Specifies whether to place the release's MSI database inside a cabinet (.cab) file. This property applies only if the WebType property for the current release is set to ewtDownloader (0) (Downloader).

Example

The following lines of Visual Basic demonstrate opening a project and showing a message box of several of a release's properties:

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\Commercial.ism", True

Dim pProdConfig As ISWiProductConfig
Set pProdConfig = pProject.ISWiProductConfigs.Item("Version 1")
' In an InstallScript project, there is only one element
' in ISWiProductConfigs, which is named "Media".

Dim pRelease As ISWiRelease
Set pRelease = pProdConfig.ISWiReleases.Item("NewRelease1")

Dim sProps As String
sProps = pRelease.Name & " has these properties:" & vbNewLine
sProps = sProps & "Build Location: " & pRelease.BuildLocation & vbNewLine
sProps = sProps & "Compressed: " & pRelease.Compressed & vbNewLine
sProps = sProps & "Default Language: " & pRelease.DefaultLang & vbNewLine
sProps = sProps & "Setup.exe: " & pRelease.SetupEXE

MsgBox sProps

pProject.CloseProject
```

Build Status Events

The ISWiRelease object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.

Build Method

Call the Build method to build the current release. This is a full and complete rebuild of your release.

Syntax

```
Build()
```

Applies To

- ISWiRelease

BuildTablesOnly Method

Call the BuildTablesOnly method to build only the MSI tables of the current release.

Note • *If you have not built this setup already, a new .msi file is created, but no files are added to your setup. If you have built your setup already, the .msi file is updated when all the tables are built, but no files are transferred.*

Syntax

```
BuildTablesOnly ()
```

Applies To

- ISWiRelease

BuildTablesRefreshFiles Method

Call the BuildTablesOnly method to rebuild your MSI file and update the Files table, including any new or changed files in your setup.

Note • *Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the setup, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image.*

Syntax

```
BuildTablesRefreshFiles ()
```

Applies To

- ISWiRelease

CubFile Property

CubFile is a read-write property which you must specify prior to ISWiRelease.Build. This is a build option which is the same as building a release at the command line using `ISCmdBld.exe`.

The string parameter associated with this property is .cub file name.

Applies to

- ISWiRelease

SignMedia Property

The ISWiRelease.SignMedia property enables you to indicate whether to digitally sign your media, and if so, which files should be signed.

The following table lists the four states that can be assigned or retrieved from the ISWiRelease.SignMedia property.

Table 12-80 • ISWiRelease.SignMedia Property Values

Return Value	Type	Description
esBoth (3)	Read-Write Property	For Basic MSI and InstallScript MSI projects: Sign the Windows Installer package (.msi file) and `Setup.exe`. For InstallScript projects: Sign both the media header file (`Data1.hdr`) and `Setup.exe`.
esMsi (2)	Read-Write Property	For Basic MSI, InstallScript MSI and Merge Module projects: Digitally sign only the Windows Installer package (.msi file or .msm file). For InstallScript projects: Sign the media header file (`Data1.hdr`).
esNone (4)	Read-Write Property	For Basic MSI, InstallScript, and InstallScript MSI projects: None of the media files (`Setup.exe`, Windows Installer package, or the header file) are signed at build time.
esSetupExe (1)	Read-Write Property	For Basic MSI, InstallScript, and InstallScript MSI projects: Digitally sign only `Setup.exe`.

ISWiSequenceRecord Object

Project • *The ISWiSequenceRecord object applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

ISWiSequenceRecord represents an action in the Custom Actions and Sequences view of the InstallShield user interface.

Members

Table 12-81 • ISWiSequenceRecord Object Members

Name	Type	Description
Name	Read-Write Property	Holds the string name of the specified action.
Comment	Read-Write Property	Gets or sets comments for the specified action.
Condition	Read-Write Property	Gets or sets the condition for the specified action.
Sequence	Read-Write Property	Gets or sets the sequence number for the specified action.

Example

The following VBScript code displays the sequence number of the LaunchConditions action in the project's Installation User Interface sequence.

```
Set oISM = CreateObject("IswiAuto20.ISWiProject")

oISM.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only

Set oSequenceRecord = oISM.InstallUISequence("LaunchConditions")

MsgBox "LaunchConditions is at sequence number " & oSequenceRecord.Sequence

oISM.CloseProject
```

Applies To

- ISWiSequence

ISWiSetupFile Object

Project • *The ISWiSetupFile object applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

ISWiSetupFile represents a support file belonging to your project. The support file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one added by calling AddSetupFile.

Use the project's ISWiSetupFiles collection to access a specific support file. You must specify either an index number or the file key for the Item property of ISWiSetupFiles.

Members

Table 12-82 • ISWiSetupFile Object Members

Name	Type	Description
FileName	Read-Only Property	Stores the file name of the support file (without the path).
Path	Read-Only Property	Stores the fully qualified path (including the file name) of the support file's source location. Any path variables are resolved to the actual path.
Language	Read-Write Property	This property should contain a string of the support file's language ID in decimal notation. The following line identifies the support file as English: `m_pFile.Language = "1033"`
Splash	Read-Write Property	This Boolean property specifies whether this support file is a splash screen (True) or not (False).

Example

The file key is visible in the IDE only as the first entry in the Direct Editor view's **ISSetupFile** table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

For Each pSetupFile In pProj.ISWiSetupFiles
    If UCase(pSetupFile.FileName) = "MYSUPPORTFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file name MySupportFile.ext is found among the project's setup files, the For loop ends, and pSetupFile holds a copy of the ISWiSetupFile object for MySupportFile.ext.

ISWiSetupType Object

Project • *This object does not apply to Basic MSI projects.*

ISWiSetupType represents a setup type belonging to your project. The setup type can be an existing one from the Setup Types view in the InstallShield user interface or one added by calling AddSetupType.

Use the project's ISWiSetupTypes collection to access a specific setup type. You must specify either an index number or the setup type name for the Item property of ISWiSetupFiles. The setup type name is visible in the IDE in the Setup Types view's tree control.

Members

Table 12-83 • ISWiSetupType Object Members

Name	Type	Description
Name	Read-Only Property	Stores the name of the setup type.
Description	Read-Write Property	This string property specifies the setup type's description. (This description is displayed to end users during the installation process only if you call SdSetupTypeEx in your script.)
DisplayName	Read-Write Property	This string property specifies the name of this setup type as you would like it displayed to your users.

Example

The following Visual Basic code illustrates how you would set a property for a specific setup type:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.ISWiSetupTypes("CSSaveSpace")
pSetupType.DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```

ISWiShellProperty Object

The ISWiShellProperty object represents a shortcut property that you want the Windows Shell to set. The properties that the Shell can set are defined in `propkey.h`, which is part of the Windows SDK.

Members

Table 12-84 • ISWiShellProperty Object Members

Name	Type	Description
Name	Read-Write Property	Retrieves or sets the primary key name for a Shell property that is specified in the **MsiShortcutProperty** table.
PropertyName	Read-Write Property	Retrieves or sets a Shell property. The properties are defined in `propkey.h`, which is part of the Windows SDK. PropertyName typically consists of a GUID and a property ID; for example: **{9F4C2855-9F79-4B39-A8D0-E1D42DE1D5F3}, 9**
PropertyValue	Read-Write Property	Retrieves or sets a string value for the property.

ISWiShortcut Object

The ISWiShortcut object represents a shortcut in the Shortcuts explorer. The shortcut can be an existing item in an ISWiShortcuts collection or one you just created by calling AddShortcut.

Use this object's properties to set the shortcut's attributes in much the same manner as you would in the IDE.

Members

Table 12-85 • ISWiShortcut Object Members

Name	Project	Type	Description
AddShellProperty	Basic MSI, InstallScript MSI, Merge Module	Method	Adds a Shell property for the current shortcut object.
Arguments	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets the command-line arguments that will be passed to the target file. You can substitute "%1" for the file name. The following statement might launch the target file in silent mode: `m_pShortcut.Arguments = "-s"`
DeleteShellProperty	Basic MSI, InstallScript MSI, Merge Module	Method	Deletes the specified Shell property from the current shortcut object.
Description	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Contains any descriptive text you have entered for this shortcut. The description is displayed as a tooltip. If this property uses a string entry, Description gives you the value for the string entry identified by the ActiveLanguage property of ISWiProject.
DisplayName	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Contains the display name you have entered for this shortcut. This name is a localizable value that will be used for the shortcut's name when it is installed instead of the name that identifies the shortcut in the Shortcuts explorer. If this property uses a string entry, DisplayName gives you the value for the string identified by the ActiveLanguage property of ISWiProject.

Table 12-85 • ISWiShortcut Object Members (cont.)

Name	Project	Type	Description
DoNotHighlightAsNew	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets a Boolean property that indicates whether the shortcut is configured to be highlighted on the Start menu as new after end users install the product. This has the same effect as clearing the **Highlight newly installed programs** check box in the Customize Start Menu dialog box for an individual item on a target system. To prevent the Start menu shortcut from being highlighted as newly installed, set this Boolean property to True. To enable the shortcut to be highlighted, set this Boolean property to False. For more information about this highlight functionality, see Preventing a Shortcut on the Start Menu from Being Highlighted as Newly Installed.
EnableWin8StartPin	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets a Boolean property that indicates whether the shortcut is configured to be pinned by default to the Start screen on Windows 8 target systems. To pin the shortcut by default, set this Boolean property to True. To disable pinning, set this Boolean property to False. For more information about this pinning functionality, see Specifying Whether a Shortcut Should Be Pinned to the Windows 8 Start Screen.
HotKey	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Stores the accelerator key for this shortcut as a Long.

Table 12-85 • ISWiShortcut Object Members (cont.)

Name	Project	Type	Description
IconFile	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Enter the fully qualified path to the file that contains the icon for this shortcut. You must specify either an executable file that contains the icon resource or an .ico file. (Windows Installer based projects only:) If you leave this property blank, the key file of the component will automatically be set as the shortcut's icon. Because Windows Installer requires a separate icon when the component is advertised, InstallShield extracts the icon from the executable you specify. You must set the IconIndex property if there is more than one icon resource in the executable.
IconIndex	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Contains the index for the specified icon as a Long if there is more than one icon resource in IconFile. A nonnegative integer refers to the order of the icon resources in the executable. For example, 0 is for the first icon in the file, 1 for the second, 2 for the third, and so on. Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.
InternetShortcut	InstallScript	Read-Write Property	Gets or sets the Internet Shortcut property for this shortcut, which specifies whether the shortcut is an Internet shortcut that points to the Uniform Resource Locator (URL) specified in the shortcut's Target property. This property is Boolean.
ISWiShellProperties	Basic MSI, InstallScript MSI, Merge Module	Collection	Contains all of the Shell properties for the current shortcut object.
Name	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Only Property	Retrieves the name of the shortcut. This is the same name that appears in the Shortcuts explorer; do not confuse it with the shortcut's Display Name property.

Table 12-85 • ISWiShortcut Object Members (cont.)

Name	Project	Type	Description
PreventPinning	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Gets or sets a Boolean property that indicates whether you want the context menu commands for pinning a shortcut to the taskbar and to the Start menu to be displayed after end users install your product. To hide the context menu commands for pinning the shortcut to the taskbar or Start menu, set this Boolean property to True. To display the context menu commands and allowing pinning, set this Boolean property to False. For more information about this pinning functionality, see Specifying Whether End Users Should Be Able to Pin a Shortcut to the Taskbar or Start Menu.
ReplaceExistingIfFound	InstallScript	Read-Write Property	Gets or sets the Replace Existing (If Found) setting for this shortcut, which specifies whether the shortcut should replace an already existing shortcut with the same display name in the same location on the target system. This property is Boolean.
ShowCmd	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Specify one of the following options for determining what mode the file is opened with: • **scNormal (1)**—The program launches in a normal-sized window. • **scMaximized (3)**—The program launches in full-screen view. • **scMinNoActive (7)**—The program launches in a minimized window, visible only on the taskbar.

Table 12-85 • ISWiShortcut Object Members (cont.)

Name	Project	Type	Description
Target	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Provide the path and file name for this shortcut's target file. Instead of hard-coding a path, you can use a Windows Installer directory property in square brackets—for example, [INSTALLDIR]MyApp.exe—or, in an InstallScript project, a system variable in angle brackets—<TARGETDIR>\MyApp.exe. (Windows Installer based projects only:) If you leave this property blank, the key file of this component will automatically be set as the shortcut's target.
Uninstall	InstallScript	Read-Write Property	Gets or sets the Uninstall property for this shortcut, which specifies whether the shortcut is removed when the application is uninstalled. This property is Boolean.
UserType	InstallScript	Read-Write Property	Gets or sets the Type property for this shortcut, which specifies whether you want the shortcut to appear in the list of personal shortcuts for the user installing your application, in the list of shortcuts that are common to all users, or if you would like the setup to decide automatically based on the value of the ALLUSERS system variable. Specify one of the following options for determining what mode the file is opened with: • **estAutomatic (0)**—The shortcut appears in the list of common shortcuts if ALLUSERS is non-zero, or in the list of personal shortcuts if ALLUSERS is FALSE. • **estCommon (1)**—The shortcut appears in the list of shortcuts that are common to all users. • **estPersonal (2)**—The shortcut appears in the list of personal shortcuts for the user installing your application.

Table 12-85 • ISWiShortcut Object Members (cont.)

Name	Project	Type	Description
WorkingDirectory	Basic MSI, InstallScript, InstallScript MSI, Merge Module	Read-Write Property	Specify the string that becomes the shortcut's "start in" folder. Instead of hard-coding a path, you can use a Windows Installer directory property in square brackets—for example, [INSTALLDIR]MyApp.exe—or, in an InstallScript project, a system variable in angle brackets—<TARGETDIR>\MyApp.exe.

Applies To

- ISWiFolder

AddShellProperty Method

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The AddShellProperty method adds a Shell property for the current shortcut object. The properties that the Shell can set are defined in `propkey.h`, which is part of the Windows SDK.

For more information on setting Shell properties for a shortcut, see Setting Custom Shell Properties.

Syntax

```
Function AddShellProperty (sName As String) As ISWiShellProperty
```

Parameters

Table 12-86 • AddShellProperty Method Parameters

Parameter	Description
sName	Pass a string to specify the name of a Shell property that you want to add to the shortcut.

Return Values

The AddShellProperty method returns an ISWiShellProperty object.

Example

The following sample VBScript snippet adds a Shell property to a shortcut:

```
Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.AddShellProperty("MyShellProperty")
```

Applies To

- ISWiShortcut

DeleteShellProperty Method

Project • *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The DeleteShellProperty method deletes the specified Shell property from the current shortcut object.

For more information on setting Shell properties for a shortcut, see Setting Custom Shell Properties.

Syntax

```
DeleteShellProperty (pShellProp As ISWiShellProperty) As Long
```

Parameters

Table 12-87 • DeleteShellProperty Method Parameters

Parameter	Description
pShellProp	Pass the ISWiShellProperty object to specify a Shell property that you want to remove from a shortcut.

Example

The following sample VBScript snippet deletes all of the Shell properties from a shortcut:

```
Dim pShellProperty As ISWiShellProperty
    For Each pShellProperty In pShortcut.ISWiShellProperties
       pShortcut.DeleteShellProperty pShellProperty
    Next
```

Applies To

- ISWiShortcut

ISWiSISProperty Object

Project • *The ISWiSISProperty object applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

ISWiSISProperty represents a property in the Summary Information Stream. You can retrieve a property by specifying an item in the ISWiSISProperties collection. The following Summary Information Stream property names are supported:

- Title
- Subject
- Author
- Keywords
- PackageCode
- TemplateSummary
- Comments
- Schema

Several of these properties use string entries, as required by InstallShield. In that case, they contain the value for the string identified by the ActiveLanguage property of ISWiProject.

Members

Table 12-88 • ISWiSISProperty Object Members

Name	Type	Description
Name	Read-Only Property	Contains the property's name. Must be one of the existing Summary Information Stream properties listed above.
Value	Read-Write Property	Gets or sets the property's value. If this property uses a string entry, Value gives you the value for the string identified by the ActiveLanguage property of ISWiProject.

Example

The following VBScript example sets the property Title to **Windows Installer Setup Package**:

```
Option Explicit

Dim pProject
Set pProject = CreateObject ("IswiAuto20.ISWiProject")

pProject.OpenProject "C:\MySetups\SampleProject.ism"

Dim pTitle, sTitle
sTitle = "Windows Installer Setup Package"

Set pTitle = pProject.ISWiSISProperties.Item("Title")
pTitle.Value = sTitle

pProject.SaveProject
pProject.CloseProject
```

Applies To

- ISWiProject

ISWiSQLConnection Object

ISWiSQLConnection represents a SQL Server connection in the SQL Scripts view of the InstallShield interface. You can retrieve an ISWiSQLConnection object by using the ISWiSQLConnections collection.

Members

Table 12-89 • ISWiSQLConnection Object Members

Name	Type	Description
AddSQLRequirement	Method	Call the AddSQLRequirement method to target specific server versions and determine whether the SQL Server meets your application's minimum requirements.
AddSQLScript	Method	Call the AddSQLScript method to add a new script file to a SQL connection. ***Note*** *• The AddSQLScript method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3. If you have multiple SQL script files in your project, it may be difficult to distinguish one from the other with this naming convention. Therefore, if you want to be able to specify the key, use the AddSQLScriptEx method.*
AddSQLScriptEx	Method	Call the AddSQLScriptEx method to add a new script file to a SQL connection, and generate a valid name from the passed string.
Authentication	Read-Write Property	This string gets or sets the authentication mode when connecting to a SQL Server.
Comments	Read-Write Property	This string property gets or sets any internal comments you want to include within your installation project.
Database	Read-Write Property	This string gets or sets the database name. At runtime, the installation uses this as the default database for installing the SQL script files contained in this connection. This value can be a property. Using a property allows you to dynamically set the name of this database at runtime.
DeleteSQLScript	Method	Call the DeleteSQLScript method to remove a SQL script file from a SQL Connection in the InstallShield interface.
GetDatabaseServer	Method	The GetDatabaseServer method returns an ISWiSQLDatabaseServer object.
InsertSQLScript	Method	Call the InsertSQLScript method to insert an existing script file to a SQL Connection in the InstallShield interface.
Name	Read-Write Property	This string property gets or sets the connection name. Type an internal name used to uniquely identify this connection in the setup project.

Table 12-89 • ISWiSQLConnection Object Members (cont.)

Name	Type	Description
Order	Read-Write Property	This integer property gets or sets the connection order.
Password	Read-Write Property	This string gets or sets the password when you choose to connect to a server using SQL Server authentication.
RemoveSQLRequirement	Method	Removes a specified SQL requirement from the target product.
SelectDatabaseServer(Name As String) As Boolean	Read-Write Property	This string gets or sets the selected database server name. At runtime, the installation will establish a connection and perform specified requirement checks on the designated database servers based on the sequence of the servers as they are listed.
Server	Read-Write Property	This string gets or sets the server name. At runtime, the installation uses this server name to connect to a SQL Server. This server will be used to install the SQL scripts contained within this connection. This value can be a property. Using a property allows you to dynamically set the name of this server at runtime. You must use the [Property] notation.
UserName	Read-Write Property	This string gets or sets the user name when you choose to connect to a server using SQL Server authentication.

Applies To

- ISWiProject

AddSQLRequirement Method

The AddSQLRequirement adds a SQL requirement to the target product and returns an ISWiSQLRequirement object.

Syntax

```
Function AddSQLRequirement() As ISWiSQLRequirement
```

Return Values

This method returns ISWiSQLRequirement object.

Applies To

- ISWiSQLConnection

AddSQLScript Method

Call the AddSQLScript method to add a new script file to a SQL connection.

Note • *The AddSQLScript method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3. If you have multiple SQL script files in your project, it may be difficult to distinguish one from the other with this naming convention. Therefore, if you want to be able to specify the key, use the AddSQLScriptEx method.*

Syntax

```
Function AddSQLScript() As ISWiSQLScript
```

Return Values

This method returns an ISWiSQLScript object.

Applies To

- ISWiSQLConnection

AddSQLScriptEx Method

Call the AddSQLScriptEx method to add an ISSQLScriptFile entry to a SQL connection. This method generates a valid name from the passed string. The method ensures that the name of the entry that is being added to the ISSQLScriptFile table is unique and less than 47 characters in length.

Syntax

```
Function AddSQLScriptEx (ByVal sCandidateName As String) As ISWiSQLScript
```

Parameters

Table 12-90 • AddSQLScriptEx Method Parameters

Parameter	Description
sCandidateName	Specifies the name of the script that you want to add to the SQL connection. Note that file names may contain invalid characters or may be too long for the key. However, if you pass a file name in this parameter, the AddSQLScriptEx method creates an entry with a valid key that is based on the file name; the result is the same as if you had added the SQL script to a connection in the SQL Scripts view. If you specify an empty string (""), the AddSQLScriptEx method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3—the same as if the AddSQLScript method was used to add the ISSQLScriptFile entry.

Return Values

This method returns an ISWiSQLScript object.

Applies To

- ISWiSQLConnection

DeleteSQLScript Method

Call the DeleteSQLScript method to remove a SQL script file from a SQL Connection in the InstallShield interface.

Syntax

```
Function DeleteSQLScript(Script As ISWiSQLScript) As Long
```

Parameters

Table 12-91 • DeleteSQLScript Method Parameters

Parameter	Description
Script	Specifies the name of the script you want to remove from the SQL connection in the InstallShield interface.

Applies To

- ISWiSQLConnection

GetDatabaseServer Method

Call the GetDatabaseServer method to return an ISWiSQLDatabaseServer object.

Syntax

```
Sub SetPredefinedRequirement(RHS As ISWiSQLServerVersion)
```

Return Values

This method returns the ISWiSQLDatabaseServer object.

Applies To

- ISWiSQLConnection

InsertSQLScript Method

Call the InsertSQLScript method to insert an existing script file to a SQL Connection in the InstallShield interface.

Syntax

```
Function InsertSQLScript(strScriptPath As String) As ISWiSQLScript
```

Parameters

Table 12-92 • InsertSQLScript Method Parameters

Parameter	Description
strScriptPath	Specifies the path to the script file you want to insert under the SQL Connection in the InstallShield interface.

Return Values

This method returns ISWiSQLScript object.

Applies To

- ISWiSQLConnection
- ISWiSQLDatabaseServer

RemoveSQLRequirement Method

The RemoveSQLRequirement method removes a specified SQL requirement from the target product.

Applies To

- ISWiSQLConnection

ISWiSQLDatabaseServer Object

ISWiSQLDatabaseServer represents a database server that you can choose to target by version requirements at run time. You can retrieve an ISWiSQLDatabaseServer object by using the ISWiSQLDatabaseServers collection.

Members

Table 12-93 • ISWiSQLDatabaseServer Object Members

Name	Type	Description
InsertSQLScript	Method	Call the InsertSQLScript method to insert an existing script file to a SQL Connection in the InstallShield interface.
ISWiSQLRequirements	Collection	Returns the collection of ISWiSQLRequirements associated with this connection.
ISWiSQLScripts	Collection	Returns the collection of ISWiSQLScripts associated with this connection.
Name	Read-Write Property	This string property gets or sets the connection name for the database server.
Order	Read-Write Property	This integer property gets or sets the connection order.
Password	Read-Write Property	This string gets or sets the password when you choose to connect to a server using SQL Server authentication.
SelectDatabaseServer(Name As String) As Boolean	Read-Write Property	This string gets or sets the selected database server name. At runtime, the installation will establish a connection and perform specified requirement checks on the designated database servers based on the sequence of the servers as they are listed.
Server	Read-Write Property	This string gets or sets the server name. At runtime, the installation uses this server name to connect to a SQL Server. This server will be used to install the SQL scripts contained within this connection. This value can be a property. Using a property allows you to dynamically set the name of this server at runtime. You must use the [Property] notation.
UserName	Read-Write Property	This string gets or sets the user name when you choose to connect to a server using SQL Server authentication.

Applies To

- ISWiSQLConnection

ISWiSQLReplace Object

ISWiSQLReplace allows you to get and set properties in the Text Replacement tab associated with a script file in the InstallShield interface. You can retrieve an ISWiSQLReplace object using the ISWiSQLReplaces collection.

Members

Table 12-94 • ISWiSQLReplace Object Members

Name	Type	Description
Name	Read-Write Property	This string property gets or sets the name of the SQL Script Replacement object.
Search	Read-Write Property	This string property gets or sets the text string you want to find.
Replace	Read-Write Property	This string property gets or sets the text string with which you want to replace the existing string during text replacement.
MatchWholeWord	Read-Write Property	This is a Boolean property. During installation, this property helps identify only whole-word matches.
MatchCase	Read-Write Property	This is a Boolean property. During installation, this property indicates that the case for words found during text replacement must match.
ReplaceOnce	Read-Write Property	This is a Boolean property. During installation, this property indicates that the string you want to search and replace with a different string should be replaced only once.
PreserveCase	Read-Write Property	This is a Boolean property. During installation, this property indicates that case should be preserved during text replacement.

Applies To

- ISWiSQLScript

ISWiSQLRequirement Object

ISWiSQLRequirement represents the requirements property tab for a new SQL connection in the InstallShield interface. You can retrieve the ISWiSQLRequirement object using the ISWiSQLRequirements collection.

Members

Table 12-95 • ISWiSQLRequirement Object Members

Name	Type	Description
AnyGreaterServicePack	Read-Write Property	This is a Boolean property. Gets or sets a limit on the ServicePackLevel requirement.
AnyGreaterVersion	Read-Write Property	This is a Boolean property. Gets or sets a limit on the MajorVersion requirement.
Disable	Read-Write Property	This Boolean property disables the SQL requirement.
MajorVersion	Read-Write Property	This string property gets or sets the MajorVersion requirement.
Name	Read-Write Property	This string property gets or sets the name of the SQL Requirement object, which is necessary for determining which SQL Server versions are supported for a connection.
ServicePackLevel	Read-Write Property	This string property gets or sets the ServicePackLevel requirement.
SetPredefinedRequirement	Method	Configures the requirement from a set of predefined values which the installation author determines.

Applies To

- ISWiSQLConnection

SetPredefinedRequirement Method

Call the SetPredefinedRequirement method to specify requirements for adding a SQL connection to your installation project.

Syntax

```
Sub SetPredefinedRequirement(RHS As ISWiSQLServerVersion)
```

Constants

The following is a list of constants associated with the ISWiSQLServerVersion object type.

- essv2K
- essv2Ksp1

- essv2Ksp2
- essv2Ksp3
- essv65
- essv65sp1
- essv65sp2
- essv65sp3
- essv65sp4
- essv65sp5
- essv65sp5a
- essv65sp5aUpdate
- essv7
- essv7sp1
- essv7sp2
- essv7sp3
- essv7sp4

Return Values

This method returns the ISWiSQLRequirement object.

Applies To

- ISWiSQLRequirement

ISWiSQLScript Object

ISWiSQLScript represents a SQL script file in the SQL Scripts explorer of the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScript object by using the ISWiSQLScripts collection.

Members

Table 12-96 • ISWiSQLScript Object Members

Name	Type	Description
AddSQLScriptError	Method	Creates and returns ISWiSQLScriptError objects.
AddSQLScriptReplacement	Method	Creates and returns ISWiSQLReplace objects.
Comments	Read-Write Property	This string property gets or sets any internal comments you want to include within your installation project. You can enter any notes regarding the script. These notes will be saved and used only within the installation project.
Component	Read-Write Property	This string property gets or sets the name of the component which is associated with the feature that is associated with the SQL script object.
Condition	Read-Write Property	 ***Project*** • *This property is available for the following project types:* • *Basic MSI* • *InstallScript MSI* This property specifies the condition that is evaluated at run time to determine whether the SQL script should be run during installation or uninstallation. If the condition evaluates to true, the script is run. This property corresponds with the condition that is entered in the Script Condition area of the Runtime tab for a SQL script in the SQL Scripts view.
DeleteSQLReplace	Method	Deletes an ISWiSQLReplace object.
DeleteSQLScriptError	Method	Deletes an ISWiSQLScriptError object.
ErrorHandling	Read-Write Property	Gets or sets one of the following values. • **esehAbort (2)**—On error, abort the installation. • **esehGotoNextScript (0)**—On error, go to the next script. • **esehGotoNextStatement (1)**—On error, go to the next statement.

Table 12-96 • ISWiSQLScript Object Members (cont.)

Name	Type	Description
FullPath	Read-Write Property	This string property gets or sets the path of the .sql file associated with the SQL script object you want to execute by the installation.
InstallText	Read-Write Property	This string property gets or sets the status text when a script is run during install. This status text appears in the status message, which is displayed to the end-user while the script is running.
ISWiSQLScriptErrors	Read-Only Property	Returns the collection of ISWiSQLScriptErrors that are associated with this SQL script.
Name	Read-Write Property	This string property gets or sets the name of the SQL script object that you want to execute by the installation.
Order	Read-Write Property	This integer property gets or sets the order of execution of the script file.
RunOnInstall	Read-Write Property	This Boolean property specifies whether to schedule the execution of the SQL script during installation.
RunOnLogon	Read-Write Property	This Boolean property specifies whether to run the selected SQL script during login. This property corresponds with the Run Script During Login check box on the Runtime tab for a SQL script in the SQL Scripts view.
RunOnRollback	Read-Write Property	This Boolean property specifies whether to schedule the execution of the SQL script during rollback. This property corresponds with the Run Script During Rollback check box on the Runtime tab for a SQL script in the SQL Scripts view.
RunOnUninstall	Read-Write Property	This Boolean property specifies whether to schedule the execution of the SQL script during uninstallation.
UninstallText	Read-Write Property	This string property gets or sets the status text when a script is run during uninstall. This status text appears in the status message, which is displayed to the end-user while the script is running.
Version	Read-Write Property	This property gets or sets the version number for the SQL script file. For more information, see Specifying a Version Number for a SQL Script File.

AddSQLScriptError Method

Call the AddSQLScriptError method to add a custom error handling entry to a SQL script.

Syntax

```
Function AddSQLScriptError()
```

Return Values

This method returns an ISWiSQLScriptError object.

Applies To

- ISWiSQLScript

AddSQLScriptReplacement Method

Call the AddSQLScriptReplacement method to specify a string and replace it with a different string in a SQL script file.

Syntax

```
Function AddSQLScriptReplacement() As ISWiSQLReplace
```

Return Values

This method returns the ISWiSQLReplace object.

Applies To

- ISWiSQLScript

DeleteSQLReplace Method

Call the DeleteSQLReplace method to remove a text replacement entry that you have added.

Syntax

```
Function DeleteSQLReplace(Replace As ISWiSQLReplace) As Long
```

Applies To

- ISWiSQLScript

DeleteSQLScriptError Method

Call the DeleteSQLScriptError method to remove a custom error handling entry that you have added.

Syntax

```
Function DeleteSQLScriptError(ByVal pScriptError As ISWiSQLScriptError)
```

Applies To

- ISWiSQLScript

ISWiSQLScriptError Object

ISWiSQLScriptError represents a custom error handling entry for a SQL script file in the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScriptError object by using the ISWiSQLScriptErrors collection.

Members

Table 12-97 • ISWiSQLScriptError Object Members

Name	Type	Description
ErrorHandling	Read-Write Property	Gets or sets one of the following values. • **esehAbort (2)**—On error, abort the installation. • **esehGotoNextScript (0)**—On error, go to the next script. • **esehGotoNextStatement (1)**—On error, go to the next statement.
ErrorNumber	Read-Write Property	Gets or sets a numeric value that indicates the SQL error number for which you want to customize error handling.

ISWiStringEntry Object

ISWiStringEntry represents a string entry that is included in the current language.

Members

Table 12-98 • ISWiStringEntry Object Members

Name	Type	Description
Id	Read-Write Property	Retrieves and stores the string entry's identifier.
Value	Read-Write Property	Retrieves and stores the value of the string entry.
Comment	Read-Write Property	Retrieves and stores comments for the string entry.

Applies To

- ISWiLanguage

ISWiUpgradeTableEntry Object

Project • *The ISWiUpgradeTableEntry object applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

ISWiUpgradeTableEntry represents an upgrade item in the Upgrades view of InstallShield. You can retrieve an upgrade item by specifying an item in the ISWiUpgradeTableEntries collection.

Members

Table 12-99 • ISWiUpgradeTableEntry Object Members

Name	Type	Description
Delete	Method	Deletes the StaticUpgradeEntry from the project file.
DisplayName	Read-Write Property	Gets or sets the name of the upgrade entry. This is the internal name that is displayed for an upgrade item in the Upgrades view.
UpgradeCode	Read-Write Property	Gets or sets the upgrade table entry's Upgrade Code. The upgrade code is a GUID representing a related set of products. It is used in the Upgrade Table to search for related versions of the product that are already installed.
VersionMin	Read-Write Property	Specifies the lower bound of the range of product versions detected by FindRelatedProducts.
VersionMax	Read-Write Property	Specifies the upper boundary of the range of product versions detected by FindRelatedProducts.
Language	Read-Write Property	Specifies the set of languages detected by FindRelatedProducts. Enter a list of numeric language identifiers (LANGID) separated by commas.
Attributes	Read-Write Property	Contains the bit flags specifying attributes of the Upgrade table.
Remove	Read-Write Property	The formatted string entered for this property must evaluate to a comma-delimited list of feature names.
ActionProperty	Read-Write Property	When the FindRelatedProducts action detects a related product installed on the system, it appends the product code to the property specified in this field.

Applies To

- ISWiProject

Delete Method

Project • *The Delete method applies to the following project types:*

- *Basic MSI*

- *InstallScript MSI*

Call the Delete method to remove the StaticUpgradeEntry from the project file.

Syntax

```
Delete()
```

Applies To

- ISWiUpgradeTableEntry

Automation Collections

Each InstallShield automation collection is a set of objects. For example, the ISWiFeature collection is a set of ISWiFeature objects in the current project. This section describes each of the InstallShield automation collections.

ISWiAdvancedFiles Collection

Project • *The ISWiAdvancedFiles collection applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

ISWiSAdvancedFiles is a collection that contains every advanced file (as an ISWiAdvancedFile object) in your project. For example, the following Visual Basic code illustrates how you would set a property for a specific advanced file:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiAdvancedFiles(1).Disk = edtOther

pProj.SaveProject
pProj.CloseProject
```

Members

Table 12-100 • ISWiAdvancedFiles Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of advanced files in the ISWiAdvancedFiles collection.
Item	Read-Only Property	Provide the index number or name of the advanced file to retrieve the ISWiAdvancedFile object. For example, the following statements create references to the first advanced file in the collection and the advanced file named CSSaveSpace: `Set pSetupFile1 = pProj.ISWiAdvancedFiles.Item(1)` `Set pSetupFile2 = pProj.ISWiAdvancedFiles.Item("CSSaveSpace")` `Item is the default property for ISWiAdvancedFiles, which means that pProj.ISWiAdvancedFiles.Item("CSSaveSpace") is equivalent to pProj.ISWiAdvancedFiles("CSSaveSpace").`

Applies To

- ISWiProject

ISWiAutomaticUpgradeEntries Collection

Project • *This collection does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

ISWiAutomaticUpgradeEntries returns a collection of ISWiAutomaticUpgradeEntry items as they are defined in the IDE.

Members

Table 12-101 • ISWiAutomaticUpgradeEntries Collection Members

Property	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiAutomaticUpgradeEntries collection.
Item	Read-Only Property	Provide the index number or upgrade code in order to retrieve the ISWiAutomaticUpgradeEntries items. Item is the default property for ISWiAutomaticUpgradeEntries, which means that m_ISWiProject.ISWiAutomaticUpgradeEntries.Item("12345678-1234-1234-1234-123456789012") is equivalent to m_ISWiProject.ISWiAutomaticUpgradeEntries("12345678-1234-1234-1234-123456789012").

Example

```
Dim m_ISWiProj As ISWiProject
Dim m_AutomaticUpgradeEntries As ISWiAutomaticUpgradeEntries

Set m_ISWiProj = New ISWiProject
m_ISWiProj.OpenProject "C:\mysetups\build 34.ism"

For Each m_AutomaticUpgradeEntries In m_ISWiProject.ISWiAutomaticUpgradeEntries
    m_AutomaticUpgradeEntries.Name = "Upgrade Msi Item1"
Next

m_ISWiProj.SaveProject

m_ISWiProj.CloseProject
```

The following line illustrates how to access a particular automatic upgrade entry:

```
Set m_AutomaticUpgradeEntries = ISWiProject.ISWiAutomaticUpgradeEntries ("Upgrade Msi Item1")
```

Applies To

- ISWiProject

ISWiComponents Collection

This collection contains all of the components associated with a specified feature. ISWiComponents provides an interface for enumerating all of the components in a feature. When ISWiComponents is a member of ISWiProject, it contains all of the components in the project, not just those belonging to a specified feature.

For example, the following Visual Basic code opens a project, loops through each component in the feature NewFeature1, sets the RemoteInstallation property for each component to run from source, and finally saves and closes the project.

```
Dim m_ISWiProj As ISWiProject
Dim m_Feature As ISWiFeature
Dim m_Comp As ISWiComponent

Set m_ISWiProj = CreateObject("IswiAuto17.ISWiProject")
m_ISWiProj.OpenProject "C:\mysetups\build 34.ism"

Set m_Feature = m_ISWiProj.ISWiFeatures("NewFeature1")

If Not m_Feature Is Nothing Then
  For Each m_Comp In m_Feature.ISWiComponents
      m_Comp.RemoteInstallation = rfsSource
  Next
EndIf

m_ISWiProj.SaveProject
m_ISWiProj.CloseProject
```

The following line illustrates how to access a particular component:

```
Set m_Comp = m_ISWiProj.ISWiFeatures("MyFeature").ISWiComponents("MyComponent")
```

Table 12-102 •

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiComponents collection.
Item	Read-Only Property	Provide the index number or name of the component in order to retrieve the ISWiComponent object. The name of the component is case sensitive—for example, “Help_Files” and “Help_files” are two different components. Item is the default property for ISWiComponents, which means that m_ISWiFeature.ISWiComponents.Item("Help_Files") is equivalent to m_ISWiFeature.ISWiComponents("Help_Files").

Applies To

- ISWiFeature
- ISWiProject

ISWiComponentSubFolders Collection

Project *• The ISWiComponentSubFolders collection applies to the following project types:*

- *InstallScript*
- *InstallScript Object*

ISWiComponentSubFolders is a collection that contains every component subfolder (as an ISWiComponentSubFolder object) in the current component or component subfolder. For example, the following Visual Basic code illustrates how you would apply a method to a specific component subfolder:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
```

```
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder").AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject
```

Members

Table 12-103 • ISWiComponentSubFolders Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of component subfolders in the ISWiComponentSubFolders collection.
Item	Read-Only Property	Provide the index number or name of the component subfolder to retrieve the ISWiComponentSubFolder object. For example, the following statements create references to the first component subfolder in the collection and the component subfolder named MyCompSubFolder: `Set pComponentSubFolder1 = pProj.ISWiComponentSubFolders.Item(1)` `Set pComponentSubFolder2 = pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder")` Item is the default property for ISWiComponentSubFolders, which means that pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder") is equivalent to pFeature.ISWiComponentSubFolders("MyCompSubFolder").

Applies To

- ISWiComponent
- ISWiComponentSubFolder

ISWiConditions Collection

This collection contains all of the conditions associated with a specified feature. ISWiConditions provides an interface for enumerating all of the conditions in a feature.

Members

Table 12-104 •

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiConditions collection.
Item	Read-Only Property	Provide the index number of the condition in order to retrieve the ISWiCondition object. Item is the default property for ISWiConditions, which means that m_ISWiFeature.ISWiConditions .Item(2) is equivalent to m_ISWiFeature.ISWiConditions (2).

Applies To

- ISWiFeature

ISWiCustomActions Collection

Project *• This information does not apply to the following project types:*

- *InstallScript*
- *InstallScript Object*

This collection contains all of the custom actions in the current project.

The VBScript example below displays a string with each custom action in the project:

```
Set pProject = CreateObject("IswiAuto20.ISWiProject")
pProject.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only

sNames = "This project contains the following custom actions:" & vbNewLine

iCount = pProject.ISWiCustomActions.Count
```

```
For i = 1 to iCount
    sNames = sNames & vbTab & pProject.ISWiCustomActions(i).Name & vbNewLine
Next

pProject.CloseProject

MsgBox sNames
```

Members

Table 12-105 • ISWiCustomActions Collection Members

Name	Type	Description
Count	Read-Only Property	Returns the number of elements in the ISWiCustomActions collection.
Item	Read-Only Property	Provide the index number or name of the custom action in order to retrieve the ISWiCustomAction object. The name of the custom action is case sensitive—for example, “MyAction” and “myAction” are two different actions. Item is the default property for ISWiCustomActions, which means that pProject.ISWiCustomActions.Item("Action1") is equivalent to pProject.ISWiCustomActions("Action 1").

Applies To

- ISWiProject

ISWiDynamicFileLinkings Collection

Project • *The ISWiDynamicFileLinkings collection applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

The ISWiDynamicFileLinkings collection contains all of the dynamic file links that are associated with a specified component.

Members

Table 12-106 • ISWiDynamicFileLinkings Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of dynamic file links in the ISWiDynamicFileLinkings collection.
Item	Read-Only Property	Provide the index number or name of the dynamically linked folder to retrieve the ISWiDynamicFileLinking object.

Applies To

- ISWiComponent

ISWiEnvironmentVars Collection

Project • *The ISWiEnvironmentVars collection applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The ISWiEnvironmentVars collection contains all of the environment variables that are associated with a specified component.

Members

Table 12-107 • ISWiEnvironmentVars Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiEnvironmentVars collection.
Item	Read-Only Property	Provide the index number or name of the environment variable to retrieve the ISWiEnvironmentVar object.

Applies To

- ISWiComponent

ISWiFeatures Collection

ISWiFeatures is a collection that contains every feature (as an ISWiFeature object) in your project. For example, the following Visual Basic code builds a string with all of the features and components in your project:

```
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent

For Each pFeature In m_ISWiProject.ISWiFeatures
    ' Add feature to string
    strProject = strProject & "Feature: " & pFeature.Name & vbNewLine
    strProject = strProject & "Components: "
    For Each pComponent In pFeature.ISWiComponents
        ' Add feature's components to string
        strProject = strProject & pComponent.Name & " "
    Next
    strProject = strProject & vbNewLine
Next
```

When ISWiFeatures is a member of ISWiProject, it contains all of the top-level features in the project. To retrieve a collection of subfolders, access the Features property of the ISWiFeature object. The result is an ISWiFeatures collection that contains the immediate subfeatures of the current top-level feature. Repeat for further levels of subfolders.

Members

Table 12-108 • Members of ISWiFeatures Collection

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiFeatures collection.
Item	Read-Only Property	Provide the index number or name of the feature to retrieve the ISWiFeature object. For example, the following statements create a copy of the first item in the collection and of the feature named Help_Files: `Set pFeat1 = m_ISWiProject.ISWiFeatures.Item(1)` `Set pFeat2 = m_ISWiProject.ISWiFeatures.Item("Help_Files")` The name of the feature is case sensitive—for example, “Help_Files” and “Help_files” are two different features. Item is the default property for ISWiFeatures, which means that m_ISWiProject.ISWiFeatures.Item("Help_Files") is equivalent to m_ISWiProject.ISWiFeatures("Help_Files").

Applies To

- ISWiProject

ISWiFiles Collection

The ISWiFiles collection contains all of the files associated with a specified component or, in InstallScript projects, a component subfolder. ISWiFiles contains several read-write properties that allow you to set component properties and file attributes as you would in the IDE.

The following Visual Basic code illustrates how you would set a property for a specific file in a component. For the purposes of this example, assume that the variable m_oMyComp already has a reference to a component.

```
m_oMYComp.ISWiFiles("F1028_MyFile.dll").Hidden = True
```

Members

Table 12-109 • ISWiFiles Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiFiles collection.
Item	Read-Only Property	Provide the index number or file key of the file in order to retrieve the ISWiFile object. You cannot use the file name; you must specify the file key. You can view this value in the Direct Editor view (in the File column of the **File** table) or, in Windows Installer–based projects, the Key column of a component's file list. Be aware that file keys are subject to change when the files are dynamically linked. Item is the default property for ISWiComponents, which means that m_ISWiComponent.ISWiFiles.Item("F1036_MyFile.exe") is equivalent to m_ISWiComponent.ISWiFiles("F1036_MyFile.exe").

Applies To

- ISWiComponent

ISWiFolders Collection

ISWiFolders contains every program folder belonging to a specified component.

At minimum, each component has the default folders listed below in its ISWiFolders collection. In addition, you could have added a predefined folder to the Shortcuts explorer by right-clicking on Shortcuts and choosing “Show Folder.”

- [TaskBarFolder]
- [SendToFolder]
- [DesktopFolder]

The following code demonstrates accessing the ISWiFolder object that represents the taskbar:

```
Dim m_pFolder As ISWiFolder
Set m_pFolder = m_pComponent.ISWiFolders("[TaskBarFolder]")
```

The taskbar, in turn, has subfolders of its own. These subfolders are contained in its SubFolders property, which is itself an ISWiFolders collection. Continuing the example above, you can now create a copy of the object for the Start menu, which is a subfolder of the taskbar in the Shortcuts explorer:

```
Set m_pFolder = m_pFolder.SubFolders("[StartMenuFolder]")
```

We can go ever farther with this example and get a copy of the folder MyProgFolder under the Programs menu:

```
Set m_pFolder = m_pFolder.SubFolders("[ProgramMenuFolder]").SubFolders("MyProgFolder")
```

Members

Table 12-110 • ISWiFolders Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiFolders collection.
Item	Read-Only Property	Provide the index number or name of the folder in order to retrieve the ISWiFolder object. Item is the default property for ISWiFolders, which means that m_ISWiComponent.ISWiFolders.Item("[DesktopFolder]") is equivalent to m_ISWiComponent.ISWiFolders("[DesktopFolder]").

Applies To

- ISWiComponent

ISWiLanguages Collection

The ISWiLanguages collection contains all of the languages that are included in the current project.

Edition • *Support for multilanguage installations is available with InstallShield Premier Edition.*

Members

Table 12-111 • ISWiLanguages Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of languages in the ISWiLanguages collection.
Item	Read-Only Property	Provide the index number or name of the language to retrieve the ISWiLanguage object.

Applies To

- ISWiProject

ISWiObjects Collection

Project • *The ISWiObjects collection applies to the following project types:*

- *InstallScript*
- *InstallScript Object*

ISWiObjects is a collection that contains every InstallScript object (as an ISWiObject object) in your project. The following Visual Basic code illustrates the use of this collection:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

Members

Table 12-112 • ISWiObjects Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of InstallScript objects in the ISWiObjects collection.
Item	Read-Only Property	Provide the index number or moniker of the InstallScript object to retrieve the ISWiObject object. (To get an InstallScript object's moniker, create a new Professional project in the IDE and add the InstallScript object to a feature, then go to the Direct Editor view's ISFeatureExtended table and see the Moniker column.) For example, the following statements create references to the first InstallScript object in the collection and the InstallScript object with moniker @ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9: `Set pObject1 = pProj.ISWiObjects.Item(1)` `Set pObject2 = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")` Item is the default property for ISWiObjects, which means that pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9") is equivalent to pFeature.ISWiObjects("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9").

Applies To

- ISWiFeature

ISWiPathVariables Collection

The ISWiPathVariables collection contains all of the path variables that are associated with the current project. You can add a path variable with the AddPathVariable method and delete a path variable with the DeletePathVariable method.

The following VBScript code retrieves a list of every path variable in the project and displays the path variables in a message box:

```
Option Explicit
  Dim pProject
  Set pProject = CreateObject ("ISWiAuto20.ISWiProject")

  pProject.OpenProject "C:\MySetups\ISWiPathVariables.ism", True

  Dim sPathVars
  Dim pPathVar

  For Each pPathVar In pProject.ISWiPathVariables
      sPathVars = sPathVars & pPathVar.Name & ": " & pPathVar.Value & vbNewLine
  Next

  WScript.Echo sPathVars
  pProject.CloseProject
```

The following line illustrates how to access a particular path variable:

```
Set pPathVar = pProject.ISWiPathVariables.Item("MyPathVar")
```

Important • *Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.*

Members

Table 12-113 • ISWiPathVariables Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of path variables in the ISWiPathVariables collection.
Item	Read-Only Property	Provide the index number or name of the path variable to retrieve the ISWiPathVariable object.

Applies To

- ISWiProject

ISWiProductConfigs Collection

The ISWiProductConfigs collection contains all of the product configurations in the current project.

The VBScript example below simply displays a string with each product configuration in the project:

```
Dim pProject
Set pProject = CreateObject ("IswiAuto20.ISWiProject")
pProject.OpenProject "C:\MySetups\Vegetarian.ism", True

Dim sNames
sNames = "This project contains the following product configurations: " & vbNewLine & vbTab

Dim pProductConfigs
For Each pProductConfigs In pProject.ISWiProductConfigs
    sNames = sNames & pProductConfigs.Name & vbNewLine & vbTab
Next

pProject.CloseProject

WScript.Echo sNames
```

The following line illustrates how to access a particular product configuration:

```
Set pProdConfig = pISWiProj.ISWiProductConfigs.Item("Version 1.1")
```

Project • *In InstallScript and InstallScript Object projects, there is only one element in ISWiProductConfigs which is named "Media".*

Members

Table 12-114 • ISWiProductConfigs Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiProductConfigs collection.
Item	Read-Only Property	Provide the index number or name of the product configuration in order to retrieve the ISWiProductConfig object. The name of the product configurations is case sensitive—“Product One” and “Product one” are two different configurations. Item is the default property for ISWiProductConfigs, which means that pProject.ISWiProductConfigs.Item("Version 1") is equivalent to pProject.ISWiProductConfigs("Version 1").

Applies To

- ISWiProject

ISWiProperties Collection

Project • *The ISWiProperties collection applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The ISWiProperties collection contains all of the Windows Installer properties in the current project. This interface is similar to the Property Manager. You can add a property with the AddProperty method and delete a property with the DeleteProperty method.

The VBScript code below retrieves a list of every property in the project and displays them in a message box:

```
Option Explicit

Dim pProject
Set pProject = CreateObject ("ISWiAuto20.ISWiProject")

pProject.OpenProject "C:\MySetups\ISWiProperties.ism", True

Dim sProps
Dim pProp

For Each pProp In pProject.ISWiProperties
    sProps = sProps & pProp.Name & ": " & pProp.Value & "  // " & _
             pProp.Comments & vbNewLine
Next

WScript.Echo sProps

pProject.CloseProject
```

Members

Table 12-115 • ISWiProperties Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiProperties collection.
Item	Read-Only Property	Provide the index number or name of the property in order to retrieve the ISWiProperty object. The name of the property is case sensitive—"UpgradeCode" and "Upgradecode" are two different properties. Item is the default property for ISWiProperties, which means that pISWiProject.ISWiProperties.Item("UpgradeCode") is equivalent to pISWiProject.ISWiProperties("UpgradeCode").

Applies To

- ISWiProject

ISWiReleases Collection

This collection contains all of the releases belonging to the current product configuration.

The following line illustrates how to access a particular ISWiRelease object:

```
Set pRelease = pProject.ISWiProductConfigs("Version 1").ISWiReleases("NewRelease1")
' In an InstallScript project, there is only one element
' in ISWiProductConfigs, which is named "Media".
```

Members

Table 12-116 • ISWiReleases Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiReleases collection.
Item	Read-Only Property	Provide the index number or name of the release in order to retrieve the ISWiRelease object. The name of the release is case sensitive—"NewRelease1" and "Newrelease1" are two different releases. Item is the default property for ISWiReleases, which means that m_ISWiBldLbl.ISWiReleases.Item("NewRelease1") is equivalent to m_ISWiBldLbl.ISWiReleases("NewRelease1").

Applies To

- ISWiProductConfig

ISWiSequence Collection

Project • *The ISWiSequence collection is available for the following project types:*

- *Basic MSI*

- *InstallScript MSI*

The ISWiSequence collection is a virtual collection that contains all of the actions of the current project, sorted by sequence number.

The VBScript example below displays a string with each action name and sequence number in the project's Installation User Interface sequence:

```
Dim pProject
Set pProject = CreateObject("IswiAuto20.ISWiProject")
pProject.OpenProject "C:\MySetups\YourProject.ism", True ' open read-only

Dim sNames
sNames = "The Installation UI sequence contains the following actions:" & vbNewLine & vbTab

For i = 1 to pProject.InstallUISequence.Count
    sNames = sNames & pProject.InstallUISequence.Item(i).Name & " " & _
             pProject.InstallExecuteSequence.Item(i).Sequence & vbNewLine & vbTab
Next

pProject.CloseProject

MsgBox sNames
```

Members

Table 12-117 • ISWiSequence Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSequence collection.
InsertCustomAction	Method	Use this method to insert a custom action into the selected sequence. This method returns an ISWiSequenceRecord object.
Item	Read-Only Property	Provide the index number or name of an action in order to retrieve its ISWiSequenceRecord object. The name of the action is case sensitive. That is, “ThisAction” and “thisAction” are two different actions. Item is the default property for ISWiSequence, which means that pProject.InstallUISequence.Item("ThisAction") is equivalent to pProject.InstallUISequence("ThisAction").
RemoveSequenceRecord	Method	Use this method to remove an item from a sequence in the project.

Applies To

- ISWiProject

InsertCustomAction Method

Project • *The InsertCustomAction method applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Call the InsertCustomAction method to insert a custom action into one of the project’s sequences.

Syntax

```
InsertCustomAction (CustomAction As ISWiCustomAction, Comment As String, Condition as String,
SequenceNumber as Long) as ISWiSequenceRecord
```

Parameters

Table 12-118 • InsertCustomAction Method Parameters

Parameter	Description
CustomAction	The custom action you want to create.
Comment	An optional string comment about your custom action.
Condition	An optional string condition for your custom action.
SequenceNumber	The numeric sequence number for your custom action.

Return Values

The InsertCustomAction method returns an ISWiSequenceRecord object.

Applies To

- ISWiSequence

RemoveSequenceRecord Method

Project • *The RemoveSequenceRecord method applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

Call the RemoveSequenceRecord method to remove an item from a sequence in the current project.

Syntax

```
(sName As String) As Long
```

Parameters

Table 12-119 • RemoveSequenceRecord Method Parameters

Parameter	Description
sName	Pass an ISWiSequenceRecord object to specify a sequence record that you want to remove from the project.

Return Values

Table 12-120 • RemoveSequenceRecord Method Values

Return Value	Description
0	The item was successfully removed from a sequence.
1	The item was not removed from a sequence.

Applies To

- ISWiSequence

ISWiSetupFiles Collection

Project • *The ISWiSetupFiles collection applies to the following project types.*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

ISWiSetupFiles is a collection that contains every support file (as an ISWiSetupFile object) in your project. For example, the following Visual Basic code illustrates how you would set a property for a specific support file:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupFiles(1).Splash = True

pProj.SaveProject
pProj.CloseProject
```

Members

Table 12-121 • ISWiSetupFiles Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of support files in the ISWiSetupFiles collection.
Item	Read-Only Property	Provide the index number or name of the support file to retrieve the ISWiSetupFile object. For example, the following statements create references to the first support file in the collection and the support file named MySupportFile.bmp: `Set pSetupFile1 = pProj.ISWiSetupFiles.Item(1)` `Set pSetupFile2 = pProj.ISWiSetupFiles.Item("MySupportFile.bmp")` Item is the default property for ISWiSetupFiles, which means that pProj.ISWiSetupFiles.Item("MySupportFile.bmp") is equivalent to pProj.ISWiSetupFiles("MySupportFile.bmp").

Applies To

- ISWiProject

ISWiSetupTypes Collection

Project • *This object does not apply to Basic MSI projects.*

ISWiSetupTypes is a collection that contains every setup type (as an ISWiSetupType object) in your project. For example, the following Visual Basic code illustrates how you would set a property for a specific setup type:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAuto20.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupTypes("CSSaveSpace").DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```

Members

Table 12-122 • ISWiSetupTypes Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of setup types in the ISWiSetupTypes collection.
Item	Read-Only Property	Provide the index number or name of the setup type to retrieve the ISWiSetupType object. For example, the following statements create references to the first setup type in the collection and the setup type named CSSaveSpace: `Set pSetupFile1 = pProj.ISWiSetupTypes.Item(1)` `Set pSetupFile2 = pProj.ISWiSetupTypes.Item("CSSaveSpace")` Item is the default property for ISWiSetupTypes, which means that pProj.ISWiSetupTypes.Item("CSSaveSpace") is equivalent to pProj.ISWiSetupTypes("CSSaveSpace").

Applies To

- ISWiProject

ISWiShellProperties Collection

ISWiShellProperties is a collection of all of the Shell properties for a specified ISWiShortcut object.

Members

Table 12-123 • ISWiShellProperties Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiShellProperties collection.
Item	Read-Only Property	Provide the index number or name of the Shell property in order to retrieve the ISWiShellProperty object.

Example

The following sample VBScript snippet retrieves the ISWiShellProperty object for the primary key MyShellProperty from the ISWiShellProperties collection:

```
Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.ISWiShellProperties("MyShellProperty")
```

Applies To

- ISWiShortcut

ISWiShortcuts Collection

ISWiShortcuts contains every shortcut belonging to a specified ISWiFolder object.

The following example makes a copy of the shortcut named MyShortcut under the program folder contained in m_pFolder:

```
Dim m_pShortcut As ISWiShortcut
Set m_pShortcut = m_pFolder.ISWiShortcuts("MyShortcut")
```

Members

Table 12-124 • ISWiShortcuts Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiShortcuts collection.
Item	Read-Only Property	Provide the index number or name of the shortcut in order to retrieve the ISWiShortcut object. Item is the default property for ISWiShortcuts, which means that m_pFolder.ISWiShortcuts.Item("MyShortcut") is equivalent to m_pFolder.ISWiShortcuts("MyShortcut").

Applies To

- ISWiFolder

ISWiSISProperties Collection

Project • *The ISWiSISProperties collection applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

This collection contains all of the values for the Summary Information Stream settings in the current project. By accessing an element in this collection, you can set all of the Summary Information Stream settings in the General Information view.

The following Visual Basic code reads every Summary Information Stream setting in your project and displays each setting and its value.

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism", True

Dim sSISProps As String
sSISProps = "This package's Summary Information Stream has the following " & _
            pProject.ISWiSISProperties.Count & " properties:"

Dim pSISProp As ISWiSISProperty
For Each pSISProp In pProject.ISWiSISProperties
    sSISProps = sSISProps & vbNewLine & vbTab & _
                pSISProp.Name & ": " & pSISProp.Value
Next

MsgBox sSISProps

pProject.CloseProject
```

Members

Table 12-125 • ISWiSISProperties Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSISProperties collection. Since the Summary Information Stream contains seven items at present, Count always has a value of 7.
Item	Read-Only Property	Provide the index number or name of the property in order to retrieve the ISWiSISProperty object. The name of the property is case sensitive—"TemplateSummary" and "Templatesummary" are two different properties. Item is the default property for ISWiSISProperties, which means that pISWiProject.ISWiSISProperties.Item("Subject") is equivalent to pISWiProject.ISWiSISProperties("Subject").

Applies To

- ISWiProject

ISWiSQLConnections Collection

This collection contains all of the SQL Server connections in the current project.

Members

Table 12-126 • ISWiSQLConnections Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSQLConnections collection.
Item	Read-Only Property	Provide the index number or name of the connection in order to retrieve the ISWiSQLConnection object. The name of the connection is case sensitive—"SQLConnection" and "SQLconnection" are two different items. Item is the default property for ISWiSQLConnections, which means that pISWiProject.ISWiSQLConnections.Item("SQLConnection") is equivalent to pISWiProject.ISWiSQLConnections("SQLConnection").

Applies To

- ISWiProject

ISWiSQLDatabaseServers Collection

This collection contains all the database servers that you can choose to target by version requirements at run time.

Members

Table 12-127 • ISWiSQLDatabaseServers Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSQLDatabaseServers collection.
Item	Read-Only Property	Provide the index number or name of the property in order to retrieve the ISWiSQLDatabaseServer object. The name of the database server is case sensitive—"SQLDatabaseServer" and "SQLDatabaseserver" are two different items. Item is the default property for ISWiSQLDatabaseServers, which means that pISWiSQLConnection.ISWiSQLDatabaseServers.Item("SQLDatabaseServer") is equivalent to pISWiSQLConnection.ISWiSQLDatabaseServers("SQLDatabaseServer").

Applies To

- ISWiSQLConnection

ISWiSQLReplaces Collection

This collection contains all the ISWiSQLReplace objects in the current project.

Members

Table 12-128 • ISWiSQLReplaces Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSQLReplaces collection.
Item	Read-Only Property	Provide the index number or name of the property in order to retrieve the ISWiSQLReplace object. The name of the collection is case sensitive—"SQLReplaces" and "SQLreplaces" are different. Item is the default property for ISWiSQLReplaces, which means that pISWiSQLScript.ISWiSQLReplaces.Item("SQLReplace") is equivalent to pISWiSQLScript.ISWiSQLReplaces("SQLReplace").

Applies To

- ISWiSQLScript

ISWiSQLRequirements Collection

ISWiSQLRequirements returns a collection of all ISWiSQLRequirement objects associated with the database server.

Members

Table 12-129 • ISWiSQLRequirements Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSQLRequirements collection.
Item	Read-Only Property	Provide the index number or name of the property in order to retrieve the ISWiSQLRequirement object. The name of the property is case sensitive—"SQLRequirements" and "SQLrequirements" are different. Item is the default property for ISWiSQLRequirements, which means that pISWiSQLConnection.ISWiSQLRequirements.Item("SQLRequirement") is equivalent to pISWiSQLConnection.ISWiSQLRequirements("SQLRequirement").

Applies To

- ISWiSQLConnection

ISWiSQLScriptErrors Collection

This collection contains all of the custom SQL script error handling entries for the ISWiSQLScriptError object.

Members

Table 12-130 • ISWiSQLScriptErrors Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSQLScriptErrors collection.
Item	Read-Only Property	Provide the index number or name of the property in order to retrieve the ISWiSQLScriptError object.

Applies To

- ISWiSQLScript

ISWiSQLScripts Collection

This collection contains all the SQL scripts in the SQL Connection.

Members

Table 12-131 • ISWiSQLScripts Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiSQLScripts collection.
Item	Read-Only Property	Provide the index number or name of the property in order to retrieve the ISWiSQLScript object. The name of the script is case sensitive—"SQLScript" and "SQLscript" are two different items. Item is the default property for ISWiSQLScripts, which means that pISWiSQLConnection.ISWiSQLScripts.Item("SQLScript") is equivalent to pISWiSQLConnection.ISWiSQLScripts("SQLScript").

Applies To

- ISWiSQLConnection

ISWiStringEntries Collection

The ISWiStringEntries collection contains all of the string entries in the current language.

Members

Table 12-132 • ISWiStringEntries Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of string entries in the ISWiStringEntries collection.
Item	Read-Only Property	Provide the index number or name of the string entry to retrieve the ISWiStringEntry object.

Applies To

- ISWiLanguage

ISWiUpgradeTableEntries Collection

Project • *The ISWiUpgradeTableEntries collection applies to the following project types:*

- *Basic MSI*
- *InstallScript MSI*

This collection contains all the static major upgrade items, as they are defined in the Upgrades view as well as the **Upgrade** table in the Direct Editor.

Members

Table 12-133 • ISWiUpgradeTableEntries Collection Members

Name	Type	Description
Count	Read-Only Property	Use this property to return the total number of elements in the ISWiUpgradeTableEntries collection.
Item	Read-Only Property	Provide the index number or upgrade code in order to retrieve the ISWiUpgradeTableEntries items. Item is the default property for ISWiUpgradeTableEntries, which means that m_ISWiProject.ISWiUpgradeTableEntries.Item("12345678-1234-1234-1234-123456789012") is equivalent to m_ISWiProject.ISWiUpgradeTableEntries("12345678-1234-1234-1234-123456789012").

Example

```
Dim oProj As ISWiProject
Dim oUpgradeItem As ISWiUpgradeTableEntry

Set oProj = New ISWiProject
oProj.OpenProject "C:\MySetup.ism"

For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    oUpgradeItem.Language = "1033"
Next

oProj.SaveProject
oProj.CloseProject
```

To target a specific item, replace the For Each loop in the above code with this code:

```
For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    If oUpgradeItem.UpgradeCode = "{12345678-1234-1234-1234-123456789012}" Then
```

```
        oUpgradeItem.Language = "1033"
    End If
Next
```

Applies To

- ISWiProject

InstallShield Custom Action Reference

This section describes each of the built-in InstallShield custom actions that are added automatically to InstallShield projects to support different functionality.

Windows Logo • *If you are applying for the Windows logo, the intended behavior of each custom action in your installation must be documented. This does not apply to custom action types 19 (displays an error, returns failure, and ends the installation), 35 (sets the installation directory), or 51 (sets a property). ISICE10 validates that each custom action is documented.*

_serial_verifyCA_isx

Decreases the value of the property **SERIALNUMVALRETRYLIMIT** by 1.

_serial_verifyCA_isx_helper

Decreases the value of the property **SERIALNUMVALRETRYLIMIT** by 1.

caDRMInstall.7666F65F_B819_451E_A75D_50EDB655640D

Reads the .ini file from caDRMInstall.7666F65F_B819_451E_A75D_50EDB655640D.

Calls the wrapped application's Service Installer DLL (IsSvcInst<FileName>.dll) to install the InstallShield Licensing Service.

This is a Windows Installer DLL custom action. The name of the DLL file is `DRMInstallerMSI.dll`, and its entry point is DRMInstallMSI.

This action is part of the InstallShield Trialware Service Installer merge module.

caDRMSetup.7666F65F_B819_451E_A75D_50EDB655640D

Extracts information from the **ISDRMFile** table to an .ini file to be used by caDRMInstall.7666F65F_B819_451E_A75D_50EDB655640D for trialware functionality.

This is a Windows Installer DLL custom action. The name of the DLL file is `DRMInstallerMSI.dll`, and its entry point is DRMSetupMSI.

This action is part of the InstallShield Trialware Service Installer merge module.

caDRMUninstall.7666F65F_B819_451E_A75D_50EDB655640D

Calls the wrapped trialware application to deactivate the license on the current machine.

This is a Windows Installer DLL custom action. The name of the DLL file is `DRMInstallerMSI.dll`, and its entry point is DRMUnInstallMSI.

This action is part of the InstallShield Trialware Service Installer merge module.

caDRMUninstallSetup.7666F65F_B819_451E_A75D_50EDB655640D

Extracts information from the **ISDRMFile** table to an .ini file to be used by caDRMUninstall.7666F65F_B819_451E_A75D_50EDB655640D for trialware functionality.

This is a Windows Installer DLL custom action. The name of the DLL file is `DRMInstallerMSI.dll`, and its entry point is DRMUninstallSetupMSI.

This action is part of the InstallShield Trialware Service Installer merge module.

CheckForProductUpdates

Uses FlexNet Connect to check for product updates.

This custom action launches an executable file called `Agent.exe`, and it passes the following:

```
/au[ProductCode] /EndOfInstall
```

CheckForProductUpdatesOnReboot

Uses FlexNet Connect to check for product updates on reboot.

This custom action launches an executable file called `Agent.exe`, and it passes the following:

```
/au[ProductCode] /EndOfInstall /Reboot
```

DLLWrapCleanup

Standard DLL wrapper that cleans extracted data.

This is a Windows Installer DLL custom action. The name of the DLL file is `dllwrap.dll`, and its entry point is DLLWrapCleanup.

DLLWrapStartup

Standard DLL wrapper that extracts data that describes calls.

This is a DLL custom action. The name of the DLL file is `dllwrap.dll`, and its entry point is DLLWrapStartup.

ISChainPackageCommit

Removes extracted files from a multi-package transaction.

ISChainPackagePrepare

Prepares and extracts files for a multi-package transaction.

ISChainPackageRollback

Removes extracted files from a multi-package transaction.

ISComponentServiceCosting

Extracts information from the **ISComPlusApplication** table and saves it in a temporary file for COM+ applications.

This is a Windows Installer DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is ISComponentServiceCosting.

ISComponentServiceFinalize

Commits COM+ applications during installation and uninstallation.

This is a Windows Installer DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is ISComponentServiceFinalize.

ISComponentServiceInstall

Installs COM+ applications during an installation.

This is a DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is ISComponentServiceInstall.

ISComponentServiceRollback

Rolls back COM+ applications during a failed installation or uninstallation.

This is a DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is ISComponentServiceRollback.

ISComponentServiceUninstall

Removes COM+ applications during uninstallation.

This is a DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is ISComponentServiceUninstall.

ISIISCleanup

Removes temporary files and registry entries for an IIS installation.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is ISIISCleanup.

ISIISCosting

Creates a list of actions in a temporary file for an IIS installation. Sets the **CustomActionData** property for other IIS actions.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is ISIISCosting.

ISIISInstall

Creates Web sites, applications, virtual directories, and other items for an IIS installation.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is ISIISInstall.

ISIISRollback

Removes Web sites, applications, virtual directories, and other items during rollback for IIS.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll` and its entry point is ISIISRollback.

ISIISUninstall

Removes Web sites, applications, virtual directories, and other items during uninstallation for IIS.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is ISIISUninstall.

ISInstallPrerequisites

Launches the installation of prerequisites that are associated with features.

This is a DLL custom action. The name of the DLL file is `PrqLaunch.dll`, and its entry point is InstallPrerequisites.

ISJITCompileActionAtInstall

Precompiles .NET assemblies at installation time.

This custom action launches a Microsoft executable file called `ngen.exe`.

ISJITCompileActionAtUnInstall

Deletes a precompiled .NET assemblies at uninstallation time.

This custom action launches a Microsoft executable file called `ngen.exe`.

ISLockPermissionsCost

Sets the **CustomActionData** property for the ISLockPermissionsInstall action.

This is a DLL custom action. The name of the DLL file is `ISLockPermissions.dll`, and its entry point is ISLockPermissionsCostAction.

ISLockPermissionsInstall

Sets permissions when the product is installed.

This is a DLL custom action. The name of the DLL file is `ISLockPermissions.dll`, and its entry point is ISLockPermissionsInstallAction.

ISNetApiInstall

Creates users and groups from an .ini file.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetApiInstall.

ISNetApiRollback

Rolls back changes for users and groups.

This is a DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetApiRollback.

ISNetCreateIniForOneUser

Extracts operations to a temporary file for users and groups.

This is a DLL custom action called `ISNetAPI.dll`.

ISNetDeleteIniFile

Cleans up temporary files for users and groups.

This is a DLL custom action called `ISNetAPI.dll`.

ISNetGetGroups

Puts groups into a combo box.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetGetGroups.

ISNetGetServers

Puts a list of servers into a combo box.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetGetServers.

ISNetGetUsers

Puts a list of users into a combo box.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetGetUsers.

ISNetSetLogonName

Stores the user, group, and server properties that were entered in the LogonInformation dialogs.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetSetLogonName.

ISNetValidateLogonName

Verifies that a valid user name, server, and password combination were entered in the LogonInformation dialogs.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetValidateLogonName.

ISNetValidateNewUserInformation

Stores the user, group, and server properties that were entered in the LogonInformation dialogs.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is ISNetValidateNewUserInformation.

ISNetworkSharesCosting

Extracts information from the **ISNetworkShares** table and saves it in a temporary file for network sharing.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is ISNetworkSharesCosting.

ISNetworkSharesFinalize

Cleans up temporary files for configuring network shares.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is ISNetworkSharesFinalize.

ISNetworkSharesInstall

Configures network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is ISNetworkSharesInstall.

ISNetworkSharesRollback

Rolls back network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is ISNetworkSharesRollback.

ISNetworkSharesUninstall

Removes network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is ISNetworkSharesUninstall.

ISPowerShellCleanup

Removes temporary files for PowerShell scripts.

This is a DLL custom action. The name of the DLL is `PowerShellWrap.dll`, and its entry point is ISPowerShellCleanup.

ISPowerShellStartup

Extracts PowerShell scripts to a temp directory.

This is a DLL custom action. The name of the DLL is `PowerShellWrap.dll`, and its entry point is ISPowerShellStartup.

ISPrint

Prints the contents of a ScrollableText control on a dialog.

This is a Windows Installer DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is PrintScrollableText.

ISQuickPatchFinalize

Cleans shared reference counts for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is ISQuickPatchFinalize.

ISQuickPatchFixShortcut

Reinstalls shortcuts for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is ISQuickPatchFixShortcut.

ISQuickPatchHelper

Applies clean feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is ISQuickPatchHelper.

ISQuickPatchInit

Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is ISQuickPatchInit.

ISQuickPatchInit9X

Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is ISQuickPatchInit9X.

ISQuickPatchInit9X2

Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is ISQuickPatchInit9X2.

ISRunSetupTypeAddLocalEvent

Runs the AddLocal events that are associated with the Next button on the SetupType dialog. This action needs to be called when the installation does not display the SetupType dialog.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISXExpHlp.dll`, and its entry point is RunSetupTypeAddLocalEvent.

ISSearchReplaceCosting

Creates a temporary file that has a list of changes that need to be made in text files.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is ISSearchReplaceCosting.

ISSearchReplaceFinalize

Cleans up temporary files for text file changes.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is ISSearchReplaceFinalize.

ISSearchReplaceInstall

Applies text file changes when the product is installed.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is ISSearchReplaceInstall.

ISSearchReplaceRollback

Rolls back text file changes and cleans up temporary files for text file changes.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is ISSearchReplaceRollback.

ISSearchReplaceUninstall

Applies text file changes when the product is uninstalled.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is ISSearchReplaceUninstall.

ISSelfRegisterCosting

Extracts operations to a temporary file for self-registration.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISSelfRegisterCosting.

ISSelfRegisterFiles

Registers self-registering files.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISSelfRegisterFiles.

ISSelfRegisterFinalize

Cleans up temporary file from self-registration.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISSelfRegisterFinalize.

ISSetAllUsers

Sets **ALLUSERS** per upgrade or initial installation requirements.

This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is SetAllUsers.

ISSetTARGETDIR

Sets TARGETDIR to **[INSTALLDIR]**.

This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is SetTARGETDIR.

ISSetupFilesCleanup

Cleans up the temp directory of support files.

This is a DLL custom action. The name of the DLL file is `SFHelper.dll`, and its entry point is SFCleanupEx.

ISSetupFilesExtract

Extracts support files to a temp directory.

This is a DLL custom action. The name of the DLL file is `SFHelper.dll`, and its entry point is SFStartupEx.

ISSQLQueryDatabases

Finds database catalogs that are available on a specified database server.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLQueryDatabases.

ISSQLServerCosting

Extracts operations to a temporary file for SQL scripts.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerCosting.

ISSQLServerFilteredList

Finds available servers for SQL scripts.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerFilteredList.

ISSQLServerFinalize

Cleans up temporary files and the state for SQL scripts.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerFinalize.

ISSQLServerInitialize

Adds property names for SQL login password to **MsiHiddenProperties**.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerInitialize.

ISSQLServerInstall

Runs SQL scripts during an installation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerInstall.

ISSQLServerList

Finds available servers.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerList.

ISSQLServerRemoveLoginInfo

Removes SQL database login credentials from the Windows registry during an uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerRemoveLoginInfo.

ISSQLServerRollback

Runs SQL scripts during a failed installation or uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerRollback.

ISSQLServerRollbackLoginInfo

During a failed installation or uninstallation, rolls back SQL database login credentials that are stored in the Windows registry.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerRollbackLoginInfo.

ISSQLServerUninstall

Runs SQL scripts during an uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerUninstall.

ISSQLServerValidate

Tests server connections.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerValidate.

ISSQLServerWriteLoginInfo

Writes SQL database login credentials to the Windows registry during an installation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerWriteLoginInfo.

ISUnSelfRegisterFiles

Unregisters self-registering files.

This is a DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISUnSelfRegisterFiles.

ISVerifyScriptingRuntime

Verifies that an InstallScript MSI installation was launched using `Setup.exe`, and if not, it displays the message contained in the property STANDARD_USE_SETUPEXE. This custom action is included in all InstallScript MSI projects, and it is scheduled for the beginning of the User Interface sequence.

Note • *The ISVerifyScriptingRuntime custom action is called in an InstallScript MSI installation in which the InstallScript UI style is the traditional style (which uses the InstallScript engine as an external UI handler). It is not called for the new style (which uses the InstallScript engine as an embedded UI handler).*

To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.

ISXmlAppSearch

Performs a system search for XML: finds file, performs XPath queries, and stores the results in properties. Driven by the **ISXmlLocator** table.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlAppSearch.

ISXmlCosting

Extracts operations to a temporary file for XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlCosting.

ISXmlFinalize

Cleans up temporary files for XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlFinalize.

ISXmlInstall

Applies XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlInstall.

ISXmlRollback

Rolls back XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlRollback.

ISXmlUnInstall

Uninstalls XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlUnInstall.

LaunchProgramFileFromSetupCompleteSuccess

Launches an executable file at the end of an installation.

This is a Windows Installer DLL custom action. The name of the DLL file is `SerialNumCAHelper.dll`, and its entry point is LaunchProgram.

LaunchReadmeFileFromSetupCompleteSuccess

Launches a readme file at the end of an installation.

This is a Windows Installer DLL custom action. The name of the DLL file is `SerialNumCAHelper.dll`, and its entry point is LaunchReadMe.

setAllUsersProfile2K

Initializes the ALLUSERSPROFILE directory identifier for Windows 2000 or later.

SetAllUsersProfileNT

Initializes the ALLUSERSPROFILE directory identifier for Windows NT 4.

SetARPINSTALLLOCATION

Sets the value of the **ARPINSTALLLOCATION** property to the fully qualified path for the application's primary folder.

setUserProfileNT

Initializes the USERPROFILE directory indentifier.

ShowMsiLog

Displays the Windows Installer log file in Notepad if the end user selects the **Show the Windows Installer log** check box in the SetupCompleteSuccess, SetupCompleteError, or SetupInterrupted dialogs and then clicks Finish. This works only with Windows Installer 4.0 and later.

Command-Line Tools

In addition to its graphical user interface, InstallShield provides several command-line programs that you can use during build time, for instance, as part of a batch process, or during run time to customize the behavior of your installation.

Authoring-Time Programs

Table 12-1 • Descriptions of Authoring-Time Programs

Task	Program
Scan an IIS Web site and record its settings so that you can import them into an InstallShield project	iisscan.exe

Build-Time Programs

Table 12-2 • Descriptions of Build-Time Programs

Task	Program
Compile an InstallScript file (.rul)	Compile.exe
Build a release; if applicable, also compile the InstallScript	ISCmdBld.exe
Build a release (available for legacy InstallScript projects)	ISBuild.exe
Build a release (InstallScript self-extracting executable files)	ReleasePackager.exe

Run-Time Programs

Table 12-3 • Descriptions of Run-Time Programs

Task	Program
Run a Setup.exe installation and pass command-line parameters (Basic MSI, InstallScript, and InstallScript MSI projects)	Setup.exe
Run a Setup.exe installation and pass command-line parameters (Advanced UI and Suite/Advanced UI projects)	Setup.exe
Run an installation (InstallScript projects)	Setup.exe (InstallScript projects)
Run an .msi package	MsiExec.exe
Run a patch package (Windows Installer-based projects) and pass command-line parameters	Update.exe

Compile.exe

InstallShield includes a command-line compiler that you can invoke from the Command Prompt window or from a DOS batch file. This program, called `Compile.exe`, is in the following folder:

InstallShield Program Files Folder\System

Note • *When you build a release from the command line using* `ISCmdBld.exe`*, the build engine automatically compiles your script; therefore, you do not need to use* `Compile.exe` *directly unless you want to use compiler options that are different from those specified for the project in InstallShield. For more information, see ISCmdBld.exe.*

Syntax

```
Compile script_file [iswi_obl_file] [isrt_obl_file] [ifx_obl_file] switches
```

You can pass any or all of your command-line parameters to `Compile.exe` in the form of a command file. To specify a command file to `Compile.exe`, use the following syntax:

```
Compile @command_file
```

In this example, *command_file* is the name of a text file, including any extension. You can specify an absolute or relative path with the file name.

You can specify all or part of the command line in a command file. You can use more than one command file in a Compile command. `Compile.exe` accepts the command file's input as if it were specified in that location on the command line.

In the command file, each parameter must begin and end on the same line—you cannot use the backslash (\) to combine a parameter across two lines. In the command file, arguments can be separated by spaces or tabs (as on the command line) and by newline (\n) characters.

Parameters

The following parameters are available for use with the compiler.

Table 12-4 • Command-Line Parameters for Compile.exe

Parameter	Description
script_file	Specifies the name of the setup script. Note the following: • The file name can include a drive designation and an absolute or relative path. If the file name is unqualified, the compiler will search for the script in the current directory of the current drive. • If the specified setup script uses #include directives to include other files in the setup, and if the file names specified by #include statements do not include a path, you must specify the location of those files with the -i switch unless they reside in the current directory. Note that included files may themselves specify #include directives; be sure the -i switch specifies a search path that can be used to find all included source files. • Long path and file names must be enclosed in double quotation marks. • By default, the setup script created as part of a new InstallShield project is named setup.rul.

Table 12-4 • Command-Line Parameters for Compile.exe (cont.)

Parameter	Description
isrt_obl_file	Specifies the name of the library file `Isrt.obl`. It is not necessary to include the full path for the library file, as long as the path is identified with the `-libpath` switch. `Isrt.obl` is in the following directory: *`InstallShield Program Files Folder`*`\Script\Isrt\Lib` This parameter is required unless you are using the `-c` or `-l` switch.
ifx_obl_file	 ***Project*** • *This parameter applies to InstallScript projects.* Specifies the name of the library file `Ifx.obl`. It is not necessary to include the full path for the library file, as long as the path is identified with the `-libpath` switch. `Ifx.obl` is in the following directory: *`InstallShield Program Files Folder`*`\Script\Ifx\Lib` This parameter is required unless you are using the `-c` or `-l` switch.
iswi_obl_file	 ***Project*** • *This parameter applies to the following project types:* • *Basic MSI* • *InstallScript MSI* Specifies the name of the library file `Iswi.obl`. It is not necessary to include the full path for the library file, as long as the path is identified with the `-libpath` switch. `Iswi.obl` is in the following directory: *`InstallShield Program Files Folder`*`\Script\Iswi\Lib` This parameter is required unless you are using the `-c` or `-l` switch.

Table 12-4 • Command-Line Parameters for Compile.exe (cont.)

Parameter	Description
ifxobject_obl_file	 ***Project*** • *This parameter applies to InstallScript Object projects.* Specifies the name of the library file `Ifxobject.obl`. It is not necessary to include the full path for the library file, as long as the path is identified with the `-libpath` switch. `Ifxobject.obl` is in the following directory: *`InstallShield Program Files Folder`*\Script\Ifx\Lib This parameter is required unless you are using the `-c` or `-l` switch.

Switches

You can pass the following switches to the compiler. If you are not specifying the full path to the script files and library files, you must specify the location of the folders that contain those files by using the `-i` and `-libpath` switches (as noted in the `-i` and `-libpath` descriptions below). All of the other switches are optional.

Table 12-5 • Switches for Compile.exe

Switch	Description
/d or -d<variable name=preprocessor define>	Provides a preprocessor definition that is applicable to your InstallScript. Following is an example: `Compile.exe -dVARIABLENAME=Value` The variable name must be a valid InstallScript identifier; the value must be a constant. No space is permitted between the switch and the expression or within the expression. If you reference the preprocessor in InstallScript, use either of the following formats: • #ifdef VARIABLENAME • #if VARIABLENAME=Value That is, for #ifdef statements, you can use just the value name. For #if statements, use a name=value pair. This parameter is optional.  ***Note*** • *It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:* • On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu • For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view *If you define a preprocessor in either of these areas in InstallShield and then you use the `-d` command-line parameter to define the same preprocessor, `Compile.exe` displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting.*
/e or -e	Specifies the maximum number of error messages. The default value is 50. When the maximum number of error messages has been generated, compilation stops.
/g or -g	Specifies that a debugging information file should be produced. This file is given the name of the installation and extension .dbg.

Table 12-5 • Switches for Compile.exe (cont.)

Switch	Description
/gi or -gi	Specifies that debugging information should be included in the compiled script file, so a debugging information file is not needed. This option makes the compiled script larger and the installation slower, and makes it easier for others to reverse engineer your code, so it should typically not be used when creating your final installation for distribution to end users.
/i or -i<search path>	Specifies a search path—a list of paths, each separated by a semicolon—that identifies the directories to search for source files that have been included in the main installation's InstallScript code through #include statements. Long path names must be enclosed in double quotation marks.  ***Project*** • *For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders:* • *InstallShield Program Files Folder\Script\Ifx\Include* • *InstallShield Program Files Folder\Script\Isrt\Include* *For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders:* • *InstallShield Program Files Folder\Script\Iswi\Include* • *InstallShield Program Files Folder\Script\Isrt\Include* *The aforementioned directories contain the script header files for built-in InstallScript functionality. If you do not specify these folders, compiler errors occur.*
/libpath or -libpath<path>	Specifies a single path that identifies a directory to search for libraries such as `Ifx.obl`, `Isrt.obl`, or a custom library file. To specify multiple directories, use the `-libpath` switch multiple times. Long path names must be enclosed in double quotation marks.  ***Project*** • *For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):* • *InstallShield Program Files Folder\Script\Ifx\Lib* • *InstallShield Program Files Folder\Script\Isrt\Lib* *For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):* • *InstallShield Program Files Folder\Script\Iswi\Lib* • *InstallShield Program Files Folder\Script\Isrt\Lib* *The aforementioned directories contain the libraries that define the built-in InstallScript functions. If you do not specify these folders or the full paths with the library names, compiler errors occur.*

Table 12-5 • Switches for Compile.exe (cont.)

Switch	Description
/o or -o<compiled script file name>	Specifies the file name to assign to the compiled script. Note the following: • The file name can include a drive designation and an absolute or relative path. If a path is not specified, the compiler will store the compiled script in the current directory. • If this parameter is not specified, the compiled script is given the name of the script file and the extension .inx and is stored in the current directory. • Long path and file names must be enclosed in double quotation marks.
/q or -q	Suppresses the output of the copyright message and version information.
/v or -v	Sets the warning level to one of the following values: • **0**—Displays no warning messages. • **1**—Displays any system warning message that InstallShield is unable to handle. • **2**—Displays Level 1 messages, plus a message if string length exceeds the limit. • **3**—Displays all warning messages. This is the default setting.
/w or -w	Specifies the maximum number of warning messages. The default value is 50. When the maximum number of warning messages has been generated, compilation stops.

Additional Information

- When specifying file names, you can use either short or long file names; however, long file names must be enclosed within double quotation marks.
- If you specify a relative path to a file name (for example `..\..\My Functions`), that path must be relative to the current directory of the current drive at the time that you invoke the compiler.

Examples

Sample Command Line for an InstallScript Project

The following command line for an InstallScript project compiles the `Setup.rul` script file that is located in the `C:\InstallShield 2013 Projects\My InstallScript Project\script files` folder:

```
"C:\Program Files\InstallShield\2013\System\Compile.exe"
"C:\InstallShield 2013 Projects\My InstallScript Project\script files\setup.rul"
ifx.obl
isrt.obl
-libpath"C:\Program Files\InstallShield\2013\Script\Ifx\Lib"
-libpath"C:\Program Files\InstallShield\2013\Script\Isrt\Lib"
-i"C:\Program Files\InstallShield\2013\Script\Ifx\Include"
-i"C:\Program Files\InstallShield\2013\Script\Isrt\Include"
```

```
-i"C:\InstallShield 2013 Projects\My InstallScript Project\script files"
```

Sample Command Line for an InstallScript MSI or Basic MSI Project

The following command line for an InstallScript MSI or Basic MSI project compiles the `Setup.rul` script file that is located in the `C:\InstallShield 2013 Projects\My New Project\script files` folder:

```
"C:\Program Files\InstallShield\2013\System\Compile.exe"
"C:\InstallShield 2013 Projects\My New Project\script files\setup.rul"
ISWI.obl
isrt.obl
-libpath"C:\Program Files\InstallShield\2013\Script\Iswi\Lib"
-libpath"C:\Program Files\InstallShield\2013\Script\Isrt\Lib"
-i"C:\Program Files\InstallShield\2013\Script\Ifx\Include"
-i"C:\Program Files\InstallShield\2013\Script\Isrt\Include"
-i"C:\InstallShield 2013 Projects\My New Project\script files"
```

ISCmdBld.exe

You can build a release from the command line using `ISCmdBld.exe` for Windows Installer–based projects and for InstallScript projects. If your project includes InstallScript, `ISCmdBld.exe` also compiles it before building the release.

Syntax

The following statement illustrates running `ISCmdBld.exe` to build the release **Othello Beta**:

```
ISCmdBld.exe -p "C:\InstallShield 2013 Projects\My Othello Project\Othello.ism" -r "Othello Beta" -c
    COMP -a "Build 245"
```

The first parameter in the example above, starting with `-p`, is the path to the .ism file that you would like to build. Next, `-r Othello Beta` is the name of the release. The parameter `-c COMP` specifies that you would like your package to be compressed into one file. Finally, `-a "Build 245"` points to the specific product configuration.

If a command-line build completes without any errors, InstallShield sets the environment variable ERRORLEVEL to 0. If an error occurs during a command-line build, ERRORLEVEL is set to 1. If ERRORLEVEL is set to any other value, this typically indicates an invalid parameter was passed to `ISCmdBld.exe`, and the specific cause of the error is displayed in the Command Prompt window in which `ISCmdBld.exe` was running.

Command-Line Parameters

Project • *Some of the `ISCmdBld.exe` command-line parameters are applicable to only certain project types.*

Table 12-6 • ISCmdBld.exe Command-Line Parameters

Parameter	Project Type	Description
-a <product configuration>	Basic MSI, InstallScript MSI, Merge Module	This parameter specifies the product configuration for the release. If it does not exist, it is created. Although this parameter is not required, you should include it if you are including the parameter for the release name.
-b <build location>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	The fully qualified path to the folder where you want the output folders and files to be placed. UNC paths are acceptable. The built installation's files will be located in the Disk Images\Disk1 subfolder of the location that you specify. This parameter is optional. If it is left unspecified, the build will place the build package and files in the directory specified in the File Locations tab of the Options dialog box. Enclose long file names in quotation marks.
-c <release configuration>	Basic MSI, InstallScript MSI	This parameter enables you to specify whether your release is compressed into one file or remains uncompressed in multiple files. The valid arguments for this parameter are COMP and UNCOMP. To specify that your release be compressed into one file, use the COMP argument. If you do not want your release compressed, use the UNCOMP argument. If the parameter is omitted for a release that already exists, the configuration is based on what was specified in the InstallShield interface. If the parameter is omitted for a new release, the files remain uncompressed.

Table 12-6 • ISCmdBld.exe Command-Line Parameters (cont.)

Parameter	Project Type	Description
-d <variable name=preprocessor define>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Use this parameter to provide a preprocessor definition that is applicable to your InstallScript. To specify more than one preprocessor definition, separate each with a comma, as in the following example: `ISCmdBld.exe -d VARIABLENAME1=Value1,VARIABLENAME2=Value2` If you reference the preprocessor in InstallScript, use either of the following formats: • #ifdef VARIABLENAME • #if VARIABLENAME=Value That is, for #ifdef statements, you can use just the value name. For #if statements, use a name=value pair. This parameter is optional.  ***Note*** • *It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:* • On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu • For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view *If you define a preprocessor in either of these areas in InstallShield and then you use the `-d` command-line parameter to define the same preprocessor, `ISCmdBld.exe` displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting.*
-e <Y/N>	Basic MSI, InstallScript MSI, Merge Module	For installation projects, this parameter specifies whether you want to create a `Setup.exe` file along with your installation. Specify `-e Y` to build `Setup.exe` or `-e N` to just create an installation. For merge module projects, the meaning of `-e` is different from installation projects. Specifying `-e n` will cause the merge module to be built and then copied to the merge modules folder. Specifying `-e Y` will cause the merge module to only be built but not copied to the merge modules folder.
-f <release flags>	Advanced UI, Basic MSI, InstallScript MSI, Suite/ Advanced UI	Use this parameter to specify any release flags that you would like to include in your release. Separate multiple flags with commas.

Table 12-6 • ISCmdBld.exe Command-Line Parameters (cont.)

Parameter	Project Type	Description
-g <minimum target MSI version>	Basic MSI, InstallScript MSI, Merge Module	Use this parameter to specify the minimum version of Windows Installer that the installation requires on the target machine —for example, `2.0.2600.0`. This parameter is optional. The default is the latest version of Windows Installer that the InstallShield interface supports.
-h	Basic MSI, InstallScript MSI	To skip the upgrade validators at the end of the build, use this parameter.
-i <.ini file path>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Instead of passing all of your parameters on the command line, you can include them all in an initialization (.ini) file and call that file from the command line. For more information, see Passing Command-Line Build Parameters in an .ini File. Absolute and relative paths are acceptable. Enclose long file names in quotation marks.
-j <minimum target Microsoft .NET Framework version>	Basic MSI, InstallScript MSI	This parameter specifies the minimum version of the .NET Framework that the installation requires on the target machine—for example, 1.0.3705.2. This parameter is optional. The default is the latest version of the .NET Framework that the InstallShield interface supports.
-l <path variable>="new path"	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	Use this parameter to override a path variable that has been specified in the Path Variables view. You can specify this parameter multiple times, once for each path variable override. For example: `ISCmdBld.exe -l VariableName="C:\Path" -l VariableName2="C:\Path2"`

Table 12-6 • ISCmdBld.exe Command-Line Parameters (cont.)

Parameter	Project Type	Description
-m <.cub file name>	Basic MSI, InstallScript MSI, Merge Module	Use this parameter if you want to validate the installation or merge module package after it is built. Pass the path of the .cub file name with this parameter. Absolute and relative paths are acceptable. To use multiple .cub files, separate each path with a semicolon (;). Enclose long file names in quotation marks. For example, in the following command line, the `-m` parameter indicates that validation should be performed with the InstallShield Validation Suite for Windows 7 (`ISWin7.cub`) and the Full MSI Validation Suite (`darice.cub`): `ISCmdBld.exe -m "..\Support\Validation\ISWin7.cub;..\Support\Validation\darice.cub"`
-n	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Specify this parameter if you do not want `Setup.rul` to be compiled as part of the build process. Note that if you are building from the command line and specifying an .ini file with the build settings, you can specify the following in the `[Project]` section of the .ini file, instead of adding the `-n` command line build flag: `[Project]` `CompileScript=No` Like the command-line build flag, this CompileScript keyword helps you specify whether `Setup.rul` should be compiled as part of the build process. ***Note*** • *The -n parameter cannot be used with the -q3 parameter.*
-o <merge module search path>	Basic MSI, InstallScript, InstallScript MSI	This parameter specifies one or more comma-delimited folders that contain the merge module files (.msm) that are referenced by your project. InstallShield provides additional ways for specifying the folders that contain merge modules. For more information, see Specifying the Directories that Contain Merge Modules.

Table 12-6 • ISCmdBld.exe Command-Line Parameters (cont.)

Parameter	Project Type	Description
-p <project location>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	Pass the path to the project (.ism) file. This path can be fully qualified, relative, or just the file name. If only the project file name is passed, the file is retrieved relative to the current working directory. For example: `ISCmdBld.exe -p "C:\InstallShield 2013 Projects\MyProject1\MyProject1.ism"` UNC paths are also acceptable. Enclose long file names in quotation marks. This is the only required parameter.
-patch_config <patch configuration>	Basic MSI, InstallScript MSI	Use this parameter to build a standard patch. Pass the name of the patch configuration in the Patch Design view that you want to build. For example, the following command line builds the patch configuration called **Version 1.2** in the **MyProject1.ism** project: `ISCmdBld.exe -p "C:\InstallShield 2013 Projects\MyProject1\MyProject1.ism" -patch_config "Version 1.2"`
-prqpath <InstallShield prerequisite search path>	Basic MSI, InstallScript, InstallScript MSI	This parameter specifies one or more comma-delimited folders that contain the InstallShield prerequisite files (.prq) that are referenced by your project. InstallShield provides additional ways for specifying the folders that contain InstallShield prerequisite files. For more information, see Specifying the Directories that Contain InstallShield Prerequisites.
-q1	Basic MSI, InstallScript MSI, Merge Module	Builds only the Windows Installer tables for your release. If you have not built this installation already, a new .msi file is created, but no files are added to your installation. If you have built your installation already, the .msi file is updated when all the tables are built, but, again no files are transferred. Ideally, this option is to be used to test the user interface of your installation.  ***Note*** • *The -q1 parameter cannot be used with the -q2 or -q3 parameters.*

Table 12-6 • ISCmdBld.exe Command-Line Parameters (cont.)

Parameter	Project Type	Description
-q2	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	For Basic MSI, InstallScript MSI, and Merge Module projects: Builds the Windows Installer tables and refreshes files. This option rebuilds your .msi file and updates the **Files** table, including any new or changed files in your installation. Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the installation, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image. For InstallScript and InstallScript Object projects: Rebuilds only those portions of the release that have changed since the last build. If this parameter is not used, the entire file media library is rebuilt. ***Note*** • *The -q2 parameter cannot be used with the -q1 or -q3 parameters.*
-q3	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Compiles only `Setup.rul`. For Basic MSI projects, this parameter also streams `ISSetup.dll` into the **Binary** table of the .msi package, if one was previously built. ***Note*** • *The -q3 parameter cannot be used with the -q2 or -q3, or -n parameters.* ***Note*** • *This parameter does not upgrade the project. If your project was created with InstallShield Developer 8 or earlier, you should upgrade it to the latest version of InstallShield before using -q3. For example, use -u to upgrade.*
-r <release name>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	The release name as specified in the Releases view. You can use an existing release name or create a new one. Although this parameter is not required, you should include it if you are including -a, the parameter for product configurations.

Table 12-6 • ISCmdBld.exe Command-Line Parameters (cont.)

Parameter	Project Type	Description
-s	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	This parameter enables you to build your release in silent mode. Silent builds are useful if you want to run the build without displaying any errors or warning messages. This parameter is optional.
-t <Microsoft .NET Framework path>	Basic MSI, InstallScript MSI	`Regasm.exe` and `InstallUtilLib.dll` are utilities that are included with each version of the .NET Framework. This parameter specifies the path for the directory that contains the installed 32-bit version of these files that you want to use at build time for releases that include .NET installer classes and COM interop. This is not the path to .NET Framework redistributable files.  ***Note*** • *If you are using InstallShield on a 64-bit system, `ISCmdBld.exe` determines the location of the corresponding 64-bit version of the .NET Framework based on the path that you specify for this parameter, and `ISCmdBld.exe` uses the 64-bit location of `Regasm.exe` and `InstallUtilLib.dll` when appropriate.*
-u	Basic MSI	This parameter enables you to upgrade—but not build—your release. You can use this parameter to upgrade an installation project that you created using InstallShield—Windows Installer Edition version 2.03 or earlier.
-v	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	This parameter enables you to create a verbose build log file that may be useful if Flexera Software Support is helping you troubleshoot an issue with your installation.
-w	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	This parameter treats warnings that occur during the build process as errors. Each warning increments the error count by one.

Table 12-6 • ISCmdBld.exe Command-Line Parameters (cont.)

Parameter	Project Type	Description
-x	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	If you want the build to stop when it encounters an error, use the `-x` parameter. If you want the build to stop when it encounters a warning, use this parameter in conjunction with the `-w` parameter.
-y <product version>	Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/ Advanced UI	This parameter enables you to specify a product version from the command line. This is especially helpful if you want to increment the build version (the third field) of the product version. For example, to set the product version to 1.0.5: `ISCmdBld.exe -y "1.0.5"` For information on valid product version numbers, see Specifying the Product Version. This parameter is optional.
-z <property name=property value>	Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/ Advanced UI	In Basic MSI, InstallScript MSI, and Merge Module projects, this parameter enables you to override the value of a Windows Installer property. In Advanced UI and Suite/Advanced UI projects, this parameter enables you to override the value of an Advanced UI or Suite/Advanced UI property. For example, to set the value of the property called **PropertyName** to **PropertyValue**, use the following command line: `IsCmdBld.exe -z PropertyName=PropertyValue` If you want to set the value to a string that includes one or more spaces, use quotation marks; for example, to set the value of the property called **PropertyName** to **My Property Value**, use the following command line: `IsCmdBld.exe -z "PropertyName=My Property Value"` If you specify a property that does not exist in the **Property** table, InstallShield creates the property in the installation that it builds. If you specify both the `-y` parameter to override the product version, and the `-z` parameter to override the **ProductVersion** property, InstallShield uses the value specified for the `-y` parameter. This parameter is optional.

ISBuild.exe

Project • *This information applies to InstallScript projects.*

`ISBuild.exe` is a command-line tool that is available for legacy InstallScript projects. The following parameters are associated with `ISBuild.exe`:

Table 12-7 • Command-Line Parameters for ISBuld.exe

Parameter	Description
-p ‹project file›	This specifies the fully qualified path and file name of the project file. By default, the project file is in the following location: `C:\InstallShield 2013 Projects\`*`Project Name`*`\`*`Project File`* This parameter should be enclosed in quotation marks.
-m ‹media name›	This specifies the media name for the media that will be built. This parameter should be enclosed in quotation marks.
-b ‹build location›	This specifies the fully qualified path to the folder where you want the output folders and files to be placed. This parameter is optional.
-s	This runs `ISBuild.exe` in silent mode. This parameter is optional.
-r	This indicates that the media should refresh the build. The default is a complete rebuild. This parameter is optional.

IISscan.exe

Edition • *The ability to import IIS data into an InstallShield project is available only in the Premier edition of InstallShield.*

The IIS scanner (`IISscan.exe`) is a tool that scans an IIS Web site and records the values of the settings that you can configure in the Internet Information Services view in InstallShield. `IISscan.exe` creates an XML file that contains all of the values. You can use this XML file to import the values into the Internet Information Services view. Then you can modify the settings as needed.

When you use `IISscan.exe` to scan a Web site, you must place the `IISscan.exe` file on the machine that contains the IIS Web site.

Note • *IISscan.exe requires administrative privileges. Therefore, you may need to launch it from an elevated Command Prompt window.*

IISscan.exe is installed in the following location:

InstallShield Program Files Folder\System\iisscan.exe

Syntax

```
iisscan.exe -website "Site Name" -outfile "C:\PathToFile\FileName.xml"
```

Parameters

Table 12-8 • Command-Line Parameters for IISscan.exe

Parameter	Description
-website	Specify the name of the Web site on the IIS server that you want to scan.
-outfile	Specify the full path and name of the XML file that you want the scanner to create. This parameter is optional. If you do not pass this parameter, the IIS scanner records the IIS settings in a file called iisscan.xml in the same directory that contains the IIS scanner.

Tip • *InstallShield lets you configure filters if you want to prevent certain IIS data—such as Web sites, applications, virtual directories, application pool, or any of their settings—from ever being imported into the Internet Information Services view. To learn more, see Filtering IIS Data When Importing a Web Site and Its Settings into an InstallShield Project.*

ReleasePackager.exe

Project • *This information applies to InstallScript projects.*

Use ReleasePackager.exe to build a self-extracting executable file from the command line. This can be useful if you are building from a batch file.

Syntax

```
ReleasePackager.exe "disk_images_folder" "package_file" ["icon_file" [icon_index]]
```

Parameters

Table 12-9 • Command-Line Parameters for ReleasePackager.exe

Parameter	Description
disk_images_folder	This optional parameter specifies the folder that contains the disk images to be incorporated in the self-extracting executable file. A typical value is: `C:\InstallShield 2013 Projects\ProjectName\Media\Releasename\Disk Images`
package_file	This parameter specifies the fully qualified name of the self-extracting executable file. A typical value is: `C:\InstallShield 2013 Projects\Projectname\Media\Releasename\Package\Packagename.exe`
icon_file	This optional parameter specifies the fully qualified name of the file that contains the icon you want to use for your self-extracting executable file.
icon_index	This optional parameter specifies the numeric index of the icon from *`icon_file`* that you want to use for your self-extracting executable file. If you do not specify an index, the icon at index 0 is used.
-s	This optional parameter is available for running `ReleasePackager.exe` in silent mode. To pass this parameter to `ReleasePackager.exe`, the syntax is as follows: `ReleasePackager.exe "disk_images_folder" "package_file" ["icon_file" [icon_index]] -s` Note that the `-s` parameter must be specified after the other parameters. If you do not want to specify an icon file or icon index, you must specify the default values of a null string ("") for the icon file and 0 for the icon index.

Example

```
ReleasePackager.exe "C:\InstallShield 2013 Projects\My Project\Media\My Release\Disk Images"
    "C:\InstallShield 2013 Projects\My Project\Media\My Release\Package\MyPackage.exe"
    "C:\My Icon Files\MyIcons.dll" 2 -s
```

MsiExec.exe Command-Line Parameters

`MsiExec.exe` is the executable program of the Windows Installer used to interpret installation packages and install products on target systems. After you build your release, you can install your Windows Installer package (.msi) from the command line.

Your Windows Installer package can be accessed from the folder that contains your built release. The default location is as follows:

`C:\InstallShield 2013 Projects\`*`ProjectName`*`\`*`ReleaseName`*`\DiskImages\Disk1\`*`ProductName`*`.msi`

After building a release of your product, you can install it from the command line:

```
msiexec /i "C:\InstallShield 2013 Projects\ProjectName\ReleaseName\DiskImages\Disk1\ProductName.msi"
```

The table below provides a detailed description of `MsiExec.exe` command-line parameters.

Table 12-10 • MsiExec.exe Command-Line Parameters

Parameter	Description
/i <package> or <product code>	Use this format to install the product Othello: `msiexec /i "C:\InstallShield 2013 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello Beta.msi"` Product Code refers to the GUID that is automatically generated in the Product Code property of your product's project view.
/f [p|o|e|d|c|a|u|m|s|v] <package> or <product code>	Installing with the `/f` option will repair or reinstall missing or corrupted files. For example, to force a reinstall of all files, use the following syntax: `msiexec /fa "C:\InstallShield 2013 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello Beta.msi"` Use the aforementioned syntax in conjunction with the following flags: • `p` reinstalls a file if it is missing • `o` reinstalls a file if it is missing or if an older version of the file is present on the user's system • `e` reinstalls a file if it is missing or if an equivalent or older version of the file is present on the user's system • `c` reinstalls a file if it is missing or if the stored checksum of the installed file does not match the new file's value • `a` forces a reinstall of all files • `u` or `m` rewrite all required user registry entries • `s` overwrites any existing shortcuts • `v` runs your application from the source and re-caches the local installation package
/a <package>	The `/a` option allows users with administrator privileges to install a product onto the network.

Table 12-10 • MsiExec.exe Command-Line Parameters (cont.)

Parameter	Description
/x <package> or <product code>	The `/x` option uninstalls a product. ***Project*** *• For InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler): If you try to uninstall the product through the command line using the statement* `Msiexec.exe /x {ProductCode}`*, the uninstallation may be successful. However, the Windows Installer displays an error dialog near the end of the uninstallation. The error dialog indicates that the Windows Installer service could not be accessed.* *To perform an uninstallation from the command line in this scenario, the current recommended method is to use one of the following:* `msiexec.exe /i {ProductCode} REMOVE=ALL` `msiexec.exe /x {ProductCode} /qn` *This is not necessary if your InstallScript MSI project is using the traditional style for the InstallScript UI (which uses the InstallScript engine as an external UI handler).* *To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.*
/j [u|m] <package> **/j [u|m] <package> /t <transform list>** **/j [u|m] <package> /g** **/j <language ID>**	Building with the `/j` <package> option advertises the components of your application on the end user's computer • `u` advertises components only to the current user • `m` advertises components to all users of the computer • `g` specifies language ID • `t` applies a transform to your advertised product Transforms allow the synchronization of applications across different languages. For example, if you upgrade the English version of your product, you could apply a transform to automatically upgrade the French version of your product.

Table 12-10 • MsiExec.exe Command-Line Parameters (cont.)

Parameter	Description
/**L[i|w|e|a|r|u|c|m|o|p|v|x|+|!|*] <log file>**	Use the `/L` option to specify the path to the log file. Optionally include one or more of the following flags to indicate which information to record in the log file: • `i` logs status messages. • `w` logs non-fatal warning messages. • `e` logs any error messages. • `a` logs the commencement of action sequences. • `r` logs action-specific records. • `u` logs user requests. • `c` logs initial user interface parameters. • `m` logs out-of-memory messages. • `o` logs out-of-disk-space messages. • `p` logs all of the properties and their values at the end of the installation. • `v` logs verbose output. • `x` logs extra debugging information. • `+` appends the information to an existing log file. • `!` flushes each line to the log. • `*` is a wild-card character that enables you to log all information (excluding the verbose output that `v` provides and the extra debugging information that `x` provides). For example, to generate a log file that logs everything verbosely, use the following: `/L*v "C:\MyLogFiles\package.log"`
/p <patch package>	Use the `/p` option to apply a patch to an installed product. To patch an installed administrative image, combine this option with `/a` as shown: `/p PatchPackage /a Package`

Table 12-10 • MsiExec.exe Command-Line Parameters (cont.)

Parameter	Description
/q [n|b|r|f]	The /q option is used to set the user interface level in conjunction with the following flags: • q or qn creates no user interface • qb creates a basic user interface The following user interface settings display a modal dialog box at the end of installation: • qr displays a reduced user interface • qf displays a full user interface • qn+ displays no user interface • qb+ displays a basic user interface
/? or /h	Either command displays Windows Installer copyright information
/y <file name>	This command calls the DllRegisterServer entry-point function of the DLL or OCX file specified in <file name>.
/z <file name>	This command calls the DllUnregisterServer entry-point function of the DLL or OCX file specified in <file name>.
/n {product code}	The /n <product code> option is available for patches that are created in the Patch Design view for Basic MSI projects that support the installation of multiple instances of a product. Use the /n option with the /p option to specify the product code of the instance to which you want to apply a patch. For example: `msiexec /p mypatch.msp /n {00000001-0002-0000-0000-624474736554}`
TRANSFORMS	Use the TRANSFORMS command-line parameter to specify any transforms that you would like applied to your base package. Your transform command-line call might look something like this: `msiexec /i "C:\InstallShield 2013 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello.msi" TRANSFORMS="New Transform 1.mst"` You can separate multiple transforms with a semicolon. Because of this, it is recommended that you do not use semicolons in the name of your transform because the Windows Installer service will interpret those incorrectly.

Table 12-10 • MsiExec.exe Command-Line Parameters (cont.)

Parameter	Description
Properties	All public properties can be set or modified from the command line. Public properties are distinguished from private properties by the fact that they are in all capital letters. For example, COMPANYNAME is a public property. To set a property from the command line, use the following syntax: *PROPERTY=VALUE*. If you wanted to change the value of COMPANYNAME, you would enter: `msiexec /i "C:\InstallShield 2013 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello.msi" COMPANYNAME="My Software Company"`

For information on passing `MsiExec.exe` command-line parameters through `Setup.exe`, see Setup.exe and Update.exe Command-Line Parameters.

Setup.exe and Update.exe Command-Line Parameters

`Setup.exe` can accept a number of command-line parameters. `Update.exe` (available only for Basic MSI and InstallScript MSI projects) accepts nearly all of the same command-line parameters. Using these parameters, end users can specify such data as the language that the installation should run in and whether to launch `Setup.exe` silently. For Basic MSI and InstallScript MSI, end users can also pass parameters through `Setup.exe` to the included .msi file.

Note • *Command-line options that require a parameter must be specified with no space between the option and its parameter. For example,* ***Setup.exe /v"ALLUSERS=2"*** *is valid, while* ***Setup.exe /v "ALLUSERS=2"*** *is not. Quotation marks around an option's parameter are required only if the parameter contains spaces. If a path within a parameter contains spaces, you may need to use quotation marks within quotation marks, as in the following example:*

Setup.exe /v"INSTALLDIR=\"c:\My Files\""

Project • *Some of the command-line options apply to only certain project types. Project-specific information is listed for each option.*

Built-In Command-Line Parameters

This section describes valid command-line parameters for `Setup.exe`. The parameters are organized into the following categories:

- Silent Installations

- Special Installation Modes
- Passing Data to the Installation
- Download and Cache Locations (Basic MSI and InstallScript MSI Projects)
- Debugging
- SMS Data
- Miscellaneous

Silent Installations

Table 12-11 • Parameters for Silent Installations

Parameter	Project Type	Description
/p"password"	Basic MSI, InstallScript MSI	If you configured the password-related settings for your release on the Setup.exe tab in the Releases view, the end user must specify the password with the /p option when running the installation silently. A typical command is as follows: `Setup.exe /s /p"password"`
/r	InstallScript, InstallScript MSI	Use this command line to run the installation in record mode. In order to run an InstallScript MSI or InstallScript installation in silent mode, you must first run `Setup.exe` with the `/r` option to generate a response file, which stores information about the data entered and options selected by the user at run time. Launching an InstallScript MSI or InstallScript installation with the `/r` parameter displays all the run-time dialogs and stores the data in a file called Setup.iss, created inside the system's Windows folder. To specify an alternative response file name and location, use the `/f1` option, described below. Basic MSI projects do not create or use a response file for silent installations.

Table 12-11 • Parameters for Silent Installations (cont.)

Parameter	Project Type	Description
/s	Basic MSI, InstallScript, InstallScript MSI	For an InstallScript MSI or InstallScript project, the command `Setup.exe /s` runs the installation in silent mode, by default based on the responses contained in a response file called `Setup.iss` in the same directory. (Response files are created by running `Setup.exe` with the `/r` option.) To specify an alternative file name or location of the response file, use the /f1 option. The command `Setup.exe /s` also suppresses the `Setup.exe` initialization dialog for a Basic MSI installation, but it does not read a response file. To run a Basic MSI installation silently, use the following command line: `Setup.exe /s /v/qn` To specify the values of public properties for a silent Basic MSI installation, you can use a command such as the following one: `Setup.exe /s /v"/qn INSTALLDIR=D:\Destination"` ***Note*** • *Using this command-line parameter to launch an installation that includes an InstallShield prerequisite does not automatically run the prerequisite installation silently. You may also need to specify a valid silent command-line parameter for the InstallShield prerequisite in the* ***Specify the command line for the application when the setup is running in silent mode*** *setting on the Application to Run tab in the InstallShield Prerequisite Editor.* *For more information, see Specifying Command-Line Parameters for an InstallShield Prerequisite.*
/f1	InstallScript, InstallScript MSI	Using the `/f1` option enables you to specify where the response file is (or where it should be created) and what its name is, as in the following example: `Setup.exe /s /f1"C:\Temp\Setup.iss"` Specify an absolute path; using a relative path gives unpredictable results. The `/f1` option is available both when creating a response file (with the `/r` option) and when using a response file (with the `/s` option).

Table 12-11 • Parameters for Silent Installations (cont.)

Parameter	Project Type	Description
/f2	InstallScript, InstallScript MSI	When running an InstallScript MSI or InstallScript installation in silent mode (using the `/s` option), the log file Setup.log is by default created in the same directory and with the same name (except for the extension) as the response file. The `/f2` option enables you to specify an alternative log file location and file name, as in the following example: `Setup.exe /s /f2"C:\Setup.log"` Specify an absolute path; using a relative path gives unpredictable results.

Special Installation Modes

Table 12-12 • Parameters for Special Installation Modes

Parameter	Project Type	Description
/a	Basic MSI, InstallScript MSI	 ***Note*** • *The /a parameter does not work with `Update.exe`. `Update.exe` launches a patch that accesses and modifies an existing cached .msi file on the system, and an administrative installation does not cache the .msi file.* The /a option causes `Setup.exe` to perform an administrative installation. An administrative installation copies (and uncompresses) your data files to a directory that is specified by the user, but it does not create shortcuts, register COM servers, or create an uninstallation log.  ***Tip*** • *If an installation contains InstallShield prerequisites and you want to extract them from `Setup.exe`, add a path after the `/a` parameter to extract the prerequisites to that location. A sample command is `Setup.exe /a"C:\temp"`.*
/j	Basic MSI, InstallScript MSI	The `/j` option causes `Setup.exe` to perform an advertised installation. An advertised installation creates shortcuts, registers COM servers, and registers file types, but does not install your product's files until the user invokes one of these "entry points."
/x	Basic MSI, InstallScript MSI	The `/x` option causes `Setup.exe` to uninstall a previously installed product.
/uninst	InstallScript, InstallScript MSI (if the InstallScript user interface (UI) style is the traditional style, which uses the InstallScript engine as an external UI handler)	 ***Important*** • *This parameter does not apply to InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler). To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.* The `/uninst` option causes `Setup.exe` to execute only the event handler function OnUninstall, whose default code uninstalls the previously installed product.

Table 12-12 • Parameters for Special Installation Modes (cont.)

Parameter	Project Type	Description
/**removeonly**	InstallScript, InstallScript MSI	The `/removeonly` option sets the REMOVEONLY system variable equal to a non-zero value. The default code for the OnMaintUIBefore event handler function conditionally displays the **SdWelcomeMaint** dialog, depending on the value of REMOVEONLY.
/**instance=<InstanceId>**	Basic MSI	The `/instance=<InstanceId>` option—which is available for Basic MSI projects that support the installation of multiple instances of a product—lets you specify which instance you want to install, update, or uninstall. <*InstanceId*> represents the value of the **InstanceId** property that identifies the instance. Whenever you use this option and include a valid **InstanceId** value, the installation suppresses the instance selection dialog. For example, the following sample command line installs the instance that has 2 as the value of the **InstanceId** property: `Setup.exe /instance=2` Use *default* to identify the instance that is installed by the base installation package, as in the following example: `Setup.exe /instance=default` To specify the instance that you want to uninstall, include the /x option with the `/instance=<InstanceId>` option. For more information, see Naming an Instance and Run-Time Behavior for Installing Multiple Instances of a Product.

Passing Data to the Installation

Table 12-13 • Parameters for Passing Data to the Installation

Parameter	Project Type	Description
/v	Basic MSI, InstallScript MSI	Use the `/v` option to pass command-line options and values of public properties through to `Msiexec.exe`. If you want to pass more than one argument to `Msiexec.exe`, you can use the `/v` option multiple times at the command line, once for each argument. For example: `Setup.exe /v"/l*v c:\test.log" /v"MYPROPERTY1=value1" /v"/qb"` As an alternative, you can pass multiple arguments through the `/v` option as in the following example: `Setup.exe /v"/l*v c:\test.log MYPROPERTY1=value1 /qb"`  ***Note*** • *If you pass the `/v` parameter at the command prompt when launching `Setup.exe`, any parameters that are specified for the CmdLine keyname in `Setup.ini` are ignored. To learn more, see Setup.ini.*
/ v"ISSCRIPTCMDLINE=\" <Option1> <Option2>\""	Basic MSI projects that have InstallScript custom actions	This option specifies command-line parameters to be passed to the script. Any property supported by InstallScript MSI (where appropriate) can be specified. (The most common ones are `/d` and `/z`.) For example, the following indicates that you want to debug the script, and that the *CMDLINE* variable should contain **TEST**. `Setup.exe /v"ISSCRIPTCMDLINE=\"-d -zTEST\""` Note that as shown above, when you want to specify that a double quote character is not a delimiter for the command line but a delimiter for the property, use **\"**. Note also that as with any public Windows Installer property, this property should be specified with all uppercase letters.
/z	InstallScript MSI	The `/z` option is used to pass data to the InstallScript system variable CMDLINE, as in the following example: `Setup.exe /z"My Custom Data"` When this command line is used, the variable *CMDLINE* contains the string **My Custom Data**.

Download and Cache Locations (Basic MSI and InstallScript MSI Projects)

Table 12-14 • Parameters for Download and Cache Locations

Parameter	Project Type	Description
/ua **/uw**	Basic MSI, InstallScript MSI	In the Release Wizard, you can specify download locations for the Windows Installer installers `InstMsiA.exe` and `InstMsiW.exe`. A user can specify an alternative URL at run time using the `/ua` option (for the `InstMsiA.exe` location) and `/uw` option (for the `InstMsiW.exe` location), as in the following example: `Setup.exe /uw"http://www.otherlocation.com/engines"` The file name is not necessary.  ***Note*** • *You must specify the full URL with the parameters.*
/um	Basic MSI, InstallScript MSI	In the Release Wizard, for a Web Downloader build, you can specify a download location for your .msi database. A user can specify an alternative URL using the `/um` option, as in the following example: `Setup.exe /um"http://www.otherlocation.com/packages/product.msi"`  ***Note*** • *You must specify the full URL with the parameter.*
/b	Basic MSI, InstallScript MSI	In the Release Wizard, for a Downloader build, you can specify whether to cache the contents of a compressed package on the local system. With the `/b` option, the user can specify the directory in which to cache the installation files, as in the following example: `Setup.exe /b"C:\CacheDirectory"`  ***Note*** • *You must specify the full URL with the parameter.*

Debugging

Table 12-15 • Parameters for Debugging

Parameter	Project Type	Description
/d	Basic MSI projects with InstallScript custom actions, InstallScript, InstallScript MSI	For an InstallScript project, running the command `Setup.exe /d` runs the installation program with the InstallScript Debugger. ***Note*** • *Debugging InstallScript code requires the debug-information file `Setup.dbg` to be available. In addition, in order to debug an installation on a system other than your development machine, you need to copy certain files from your development machine to the debugging machine. To learn more, see Debugging an Installation on Any Computer.* For a Basic MSI project, the following command runs your InstallScript custom actions in the InstallScript Debugger: `Setup.exe /v"ISSCRIPTDEBUG=1 ISSCRIPTDEBUGPATH=\"path-to-Setup.dbg\""`
/debuglog	Basic MSI, InstallScript MSI	The `/debuglog` parameter lets you generate a log file for `Setup.exe`. To generate a log named `InstallShield.log` in the same directory as the `Setup.exe` file, pass just the command-line parameter. Note that this does not work if the `Setup.exe` file is in a read-only location. For example: `setup.exe /debuglog` To specify the name and location of the log file, pass the path and name, as in the following example: `Setup.exe /debuglog"C:\PathToLog\setupexe.log"` To generate a log file for the feature prerequisites in the installation, use the `/v` parameter to set the **ISDEBUGLOG** property to the full path and file name for the log file, as follows: `Setup.exe /debuglog"C:\PathToSetupLogFile\setup.log" /v"ISDEBUGLOG=prereq.log"` You can use directory properties and environment variables in the path for the feature prerequisite log file.

SMS Data

Table 12-16 • Parameters for SMS Data

Parameter	Project Type	Description
/m	InstallScript, InstallScript MSI	The `/m` option causes `Setup.exe` to generate an SMS Management Information Format (.mif) file. Following is a typical command: `Setup.exe /m"SampleApp"` Including the ".mif" file extension is not necessary.
/m1	InstallScript, InstallScript MSI	Using the `/m1` parameter (along with `/m`) enables you to specify a serial number to be written to the .mif file. A typical command is as follows: `Setup.exe /m"SampleApp" /m1"1234-5678"`
/m2	InstallScript, InstallScript MSI	Using the `/m2` parameter (along with `/m`) enables you to specify a locale string to be written to the .mif file. A typical command is as follows: `Setup.exe /m"SampleApp" /m2"ENU"`

Miscellaneous

Table 12-17 • Parameters for Miscellaneous

Parameter	Project Type	Description
/delayedstart:<number of seconds>	InstallScript	Specifies the amount of time (in seconds) by which initialization of the installation is delayed after `Setup.exe` is launched.  ***Note*** • *Using the -delayedstart option is recommended when manually launching an additional installation after reboot (for example, by using the RunOnce key). The delay allows the operation system to initialize completely; this prevents the problems—such as Remote Procedure Call (RPC) errors—that can occur if an installation initializes before the operating system has initialized completely. The recommended delay length is 30 seconds.* *Note that this option is not needed when the installation starts automatically after reboot (for example, due to a call to* ***SdFinishReboot*** *before reboot).*

Table 12-17 • Parameters for Miscellaneous (cont.)

Parameter	Project Type	Description
/runfromtemp	Basic MSI, InstallScript, InstallScript MSI	This parameter allows the setup author to always clone the setup and run it from the temporary directory, even if the setup does not meet the conditions for running from the temporary directory. This parameter is ignored if the setup is a self-extracting executable file (.exe).
/clone_wait	InstallScript	This parameter indicates that the original setup should wait for the cloned setup process to complete before exiting.
/extract_all:<path>	InstallScript	Specifies that a self-extracting package's files should not be run but simply extracted to the location that is specified by <path>.
/h	Basic MSI, InstallScript MSI	The build engine automatically creates an installation that supports `Setup.exe` cloning in cases where cloning is required (for example, multi-disk installations). If you need to do this manually, pass `/h` to `Setup.exe` and it will clone itself to a temporary location and run from that location.

Table 12-17 • Parameters for Miscellaneous (cont.)

Parameter	Project Type	Description
/hide_progress	Basic MSI, InstallScript, InstallScript MSI	Suppresses the display of any small and standard progress dialogs that might be shown during initialization. The small progress dialog is usually used for installations that display a splash screen during initialization, since a standard-size progress dialog does not leave any space for the splash screen. Specifying the `/hide_progress` option hides the small progress dialog for those installations, so end users would see just the splash screen without any progress indication.  ***Note*** • *For InstallScript installations: If you specify `/hide_progress` and include a splash screen in your InstallScript installation, the length of time that the splash screen is displayed depends on whether `SmallProgress=Y` or `SmallProgress=N` is specified in `Setup.ini`.* • *If `SmallProgress=Y` is specified, the splash screen is shown for as long as the progress dialog would have been displayed if `/hide_progress` was not specified.* • *If `SmallProgress=N` is specified, the splash screen is shown for the length of time specified in the SplashTime key; thus, using `/hide_progress` and `SmallProgress=Y` at the same time is not recommended.* *For InstallScript MSI installations: If you include a splash screen, the installation automatically switches to the small progress dialog, and the splash screen is shown only during the time that the progress dialog is displayed. Note that this is true even if `/hide_progress` is specified. Therefore, it is recommended that you avoid using `/hide_progress` with a splash screen in InstallScript MSI installations.*
/hide_splash	InstallScript, InstallScript MSI	Suppresses the display of the splash screen if one is included.
/hide_usd	InstallScript	Suppresses display of the dialog that is displayed by an update-enabled installation to let the end user select which instance of your product will be updated. This dialog is displayed by default when an update-enabled installation detects multiple previous instances. When this command-line option is used and an update-enabled installation detects multiple previous instances, the installation creates a new instance.

Table 12-17 • Parameters for Miscellaneous (cont.)

Parameter	Project Type	Description
/ig{InstanceGUID}	InstallScript	Specifies the value of the system variable INSTANCE_GUID; for example, -ig{722C7440-B317-4B3B-AECA-0199EA4E7CDB}. If this option is not used, the installation automatically assigns a value to INSTANCE_GUID (for multi-instance installations, this value is a newly generated GUID; for standard installations, this value is the same as the value of PRODUCT_GUID). This option is useful if you have created an installation launcher—that is, a custom application that runs before your installation does to perform pre-setup tasks, such as determining the instance GUID that you want to use for the installation. Do not specify anything other than a valid GUID with this option.
/ **installfromweb"PathToDisk1Files"**	InstallScript	This option is similar to the media_path option except that this option forces the installation to behave like a launched One-Click Install installation, even if the path to the media files is not a URL. Use this option if you are launching the installation from a Web page manually. In addition, this option is added automatically if the built-in `Setup.ocx` file is used to launch the installation.
/ **media_path"PathToDisk1Files"**	InstallScript	This option indicates that the installation should look for the Disk1 files in the location that is specified. Note that only the `Setup.exe` file needs to be in the original launch location; the installation obtains all other required files from the specified location (including `Setup.exe`, which must be present in the media location). You can specify a URL as the path to the media files; in this case, the installation behaves like a launched One-Click Install installation, which always shows the security dialog. To learn more about the behavior of One-Click Install installations, see One-Click Install Installations in InstallScript Projects.

Table 12-17 • Parameters for Miscellaneous (cont.)

Parameter	Project Type	Description
/**L***<LanguageID>*	Basic MSI, InstallScript, InstallScript MSI	This option indicates that the installation should run in the specified language as specified. You can specify the language ID as either a hexadecimal or decimal number. If you specify the hexadecimal number, be sure to proceed the value with **0x**. For example, the following commands indicate that the installation should be run in German: `Setup.exe -L0x0407` `Setup.exe -L1031` Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language dialog (if enabled) is automatically suppressed.
/**w**	Basic MSI, InstallScript MSI	For a Basic MSI project, the `/w` option forces `Setup.exe` to wait until the installation is complete before exiting.  ***Note*** • *If you are using the `/w` option in a batch file, you may want to precede the entire Setup.exe command-line option with `start /WAIT`. A properly formatted example of this usage is as follows:* `start /WAIT setup.exe /w`
/**SMS**	InstallScript MSI	For an InstallScript MSI project, `Setup.exe` automatically waits for the installation to finish before exiting, so this option (used by earlier versions of InstallShield Professional) is no longer necessary.

User-Defined Command-Line Parameters

Project • *This information about user-defined command-line parameters applies to InstallScript projects.*

For user-defined command-line parameters in InstallScript MSI projects, use the `-z` command-line parameter that is described above.

Along with the command-line parameters that are listed above, `-bd`, `-f`, and `-zi` are command-line parameters that are reserved for use in InstallScript projects. User redefinition of these command-line parameters, either uppercase or lowercase, can cause errors.

You can define your own command-line arguments, which are copied to the system variable CMDLINE as at run time. Like predefined command-line parameters, you can pass custom arguments directly to `Setup.exe`, place them in `Setup.ini`, or (for testing purposes while you are using the InstallShield IDE) place them in the Settings dialog box, which is displayed when you click Settings on the Build menu in InstallShield.

Note • *`Setup.exe` initializes correctly even on systems with more than 256 MB of memory and always stays in memory until the setup is complete. Due to the nature of DOS, when you launch `Setup.exe` from the command line, a DOS prompt is quickly returned although `Setup.exe` is still in memory.*

Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters

Project • *This information applies to the following project types:*

- *Advanced UI*
- *Suite/Advanced UI*

Edition • *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The `Setup.exe` setup launcher for Advanced UI and Suite/Advanced UI installations can accept a number of command-line parameters. Note that passing undefined parameters or invalid property definitions results in an invalid command-line error.

Table 12-18 • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers

Parameter	Description
/debuglog **/debuglog"PathToLog"**	The `/debuglog` parameter lets you generate a log file for `Setup.exe`. To generate a log named `InstallShield.log` in the same directory as the `Setup.exe` file, pass just the command-line parameter. Note that this does not work if the `Setup.exe` file is in a read-only location. For example: `Setup.exe /debuglog` To specify the name and location of the log file, pass the path and name, as in the following example: `Setup.exe /debuglog"C:\PathToLog\setupexe.log"` For more information, see Troubleshooting Issues with an Advanced UI or Suite/Advanced UI Installation.

Table 12-18 • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers (cont.)

Parameter	Description
/language:LCID	The `/language` parameter indicates that the installation should run in the specified language as specified. Specify the language ID as a decimal number. For example, to indicate that the installation should be run in German, pass the language ID as follows: `Setup.exe /language:1031` Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language wizard page (if enabled) is automatically suppressed.
/log **/log"PathToPackageLog"** **/log:"PathToPackageLog"**	The `/log` parameter lets you generate a log file for each package in the Advanced UI or Suite/Advanced UI installation for which logging is enabled. To generate package log files in a particular folder, pass the folder path with the `/log` parameter to the Advanced UI or Suite/Advanced UI `Setup.exe` file. You can optionally separate the `/log` parameter and the path with a colon. For example, both of the following command lines generate a log file in the `PathToLogFiles` folder: `Setup.exe /log"C:\PathToLogFiles"` `Setup.exe /log:"C:\PathToLogFiles"` Note that the path to the log file location must already exist. To generate package log files in the %TEMP% directory, leave out the path. For example: `Setup.exe /log` Note that logging must be enabled for a package, and the package's logging-related settings (which vary, depending on whether the package is an .msi package, an .msp package, some other type of package) must be configured in the Packages view. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation.
/password:*MyPassword*	If you configured the password-related settings for your release on the Setup.exe tab in the Releases view, the end user must specify the password with the /password parameter at run time during a silent installation. A typical command is as follows: `Setup.exe /silent /password:`*`MyPassword`*

Table 12-18 • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers (cont.)

Parameter	Description
PropertyName=Value **/PropertyName:Value** **PropertyName=**	You can pass properties to the Advanced UI or Suite/Advanced UI installation in more than one way. Following are examples: `Setup.exe MyPropertyName=MyPropertyValue` `Setup.exe /MyPropertyName:MyPropertyValue` To clear the value of a property, even if it is set by the Advanced UI or Suite/Advanced UI `Setup.xml` file, use the following syntax: `Setup.exe MyPropertyName=` The following properties have special meaning to the Advanced UI or Suite/Advanced UI installation when they are passed on the command line: • **ISFeatureInstall**—This property provides a comma-delimited list of feature names that are to be installed with the current installation operation. It is intended for a silent first-time installation. • **ISFeatureRemove**—This property provides a comma-delimited list of feature names that are to be removed with the current installation operation. It is intended for maintenance installations. For more information, see Advanced UI and Suite/Advanced UI Property Reference.
/remove	The `/remove` parameter uninstalls the packages that are currently installed on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation. This option also removes the Advanced UI or Suite/Advanced UI installation's entry in Add or Remove Programs if the maintenance condition in the Advanced UI or Suite/Advanced UI `Setup.xml` file is false.
/repair	The `/repair` parameter repairs the packages that are currently on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation.
/silent	The `/silent` parameter runs the installation without a user interface.

Table 12-18 • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers (cont.)

Parameter	Description
/**stage_only**	The `/stage_only` parameter runs the staging part of the Advanced UI or Suite/Advanced UI installation, in which the Advanced UI or Suite/Advanced UI installation copies its packages to a directory that is specified by the user on the BrowseStageFolder wizard page. If any of the packages are compressed into the Advanced UI or Suite/Advanced UI `Setup.exe` file, the `/stage_only` option also extracts the packages from the `Setup.exe` file before copying them to the staging directory. In addition, if any of the packages are located on the Web, the `/stage_only` option downloads the packages and adds them to the staging directory. Note that this option does not run the packages in the Advanced UI or Suite/Advanced UI installation. Furthermore, it does not uncompress any of the packages. Thus, if you are creating a patch for an Advanced UI or Suite/Advanced UI installation and you need to generate an uncompressed .msi package for a package in your Advanced UI or Suite/Advanced UI installation, for example, use the stage-only option. Then perform an administrative installation for the .msi package.  ***Tip*** • *The* ***ISRootStagePath*** *property stores the path to the folder that contains the copied files. To specify a default value for this property, set this property from the command line while passing the /stage_only parameter, as shown in the following example:* *`Setup.exe /stage_only ISRootStagePath="C:\MyStagingArea"`*

For information on how to specify command lines that you want an Advanced UI or Suite/Advanced UI installation to use when launching one of its packages, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Setup.exe (InstallScript Projects)

`Setup.exe` is the main installation executable file; it performs installation initialization and launches the installation engine to execute the installation on the target system.

When you create and build a release, `Setup.exe` and other setup engine redistributable files are placed in the Disk1 folder. You must ship these files on Disk1 of your distribution media.

Note • *You can rename `Setup.exe` to any valid file name, such as* ***Install.exe****. Note that for the installation to be launched by another installation using the* ***DoInstall*** *function, the launched installation's `Setup.ini` file must have the new file name in the [Startup] section's LauncherName key.*

You can pass command-line options directly to `Setup.exe`, or you can place them in `Setup.ini`. For testing purposes, while you are using InstallShield, you can pass command-line options to `Setup.exe` through the Run/Debug tab of the Settings dialog box, which is displayed when you click Settings on the Build menu.

Note • *A self-extracting executable file accepts any command-line parameter that `Setup.exe` accepts.*

For a list of supported parameters, see Setup.exe and Update.exe Command-Line Parameters.

13

Frequently Asked Questions

This section lists common questions (sorted by topic) and provides links to answers. Where the techniques or steps to perform a specific task are different in different project types, answers for each project type are displayed.

Project Types

- Which project type should I use?
- How do I convert my project to a different project type?
  - Why do I get “error C8025 ‘INSTALLDIR’: undefined identifier” when compiling my script after conversion?
  - Why do I get the following error: “String PRODUCT_NAME was not found in string table”?

Files and Folders

- What is the difference between INSTALLDIR and TARGETDIR?
- How does Windows Installer determine whether to overwrite an existing file?
- How do I register a COM server?
- How do I install, start, stop, delete, uninstall, or configure a Windows service?
- How do I create an empty folder?
- How do I set a key file for a dynamic file link?
- What happens if I put more than one executable file in the same component?

Features and Components

- How do I conditionally select a feature?
- How do I conditionally hide a feature?
- Why should I use uppercase directory identifiers when setting component destinations?
- How do I change the value in the Link To column for a component?

Redistributables

- How do I add the Windows Installer to my project?
- How do I add the .NET Framework to my project?

Shortcuts

- How do I create an Internet shortcut?
- How do I create a shortcut to a folder?

Registry

- How do I read data from the registry?
- How do I write a property's value to the registry?

InstallScript

- How do I find out what sort of built-in functions are available in the InstallScript language?
- What is the maximum number of statements that I can use in a compiled script file? What other limits exist for InstallScript?

INI Files

- How do I read data from an .ini file?
- How do I get all key names from an .ini file?

Properties

- How do I get or set a Windows Installer property in InstallScript?
- Why does my deferred custom action show a blank value for a Windows Installer property?

Conditions

- How do I detect administrator privileges?
- How do I detect a first-time installation?
- How do I call a function only during the installation sequence?
- How do I detect if the user has selected a specific feature?
- How do I detect if the user is running a particular operating system?

End-User Interface

- How do I populate a list box at run time?
- How do I display a file browse dialog?
- How do I display a network browse dialog?

Custom Actions

- How do I search for a file on the end user's system?
- How do I launch my application after the installation is complete?
- How do I place a file in the .msi database and extract it during run time?
- How do I exit the installation from within a custom action?
- How can I use the INSTALLDIR variable after I have created a custom action that runs VBScript code?
- How can I change ODBC properties (like DBQ and SystemDB) through script?

SQL Scripts

- How do I override the default SQL run-time behavior?
- How can I control the execution of a SQL script based on certain conditions in an InstallScript project?
- How do I enforce a server-side installation in an InstallScript project?
- How do I enforce a SQL server-side installation in a Windows Installer-based project?
- How do I handle SQL run-time errors?
- How do I ensure that my SQL scripts run only against a full of SQL Server?

Building Releases

- How do I build my release from the command line?
- How do I change project settings from the command line?

Deployment

- How do users run my installation in silent mode?

Uninstallation

- How do I remove files that were created by my product?
- How do I remove registry data created by my product?

Answers to many other questions are available in the Knowledge Base.

Glossary

Term	Definition
.bin file	A binary file that is executable on UNIX platforms. Application files usually have a `.bin` extension.
.bmp file	A bitmap file of an image represented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.
.cab file	See cabinet file.
.command file	A command file that is executable on Mac OS X platforms. Application files usually have a `.command` extension.
.cub file	A validation module that stores and provides access to custom actions for internal consistency evaluators (ICEs). See also custom action and internal consistency evaluator.
.exe file	An executable binary file on Windows platforms. Application files usually have an `.exe` file extension.
.gif file	A graphics interchange format file supported on the Web. This type of file is in a bit-mapped graphics file format used for displaying bitmap images. These files use lossless compression, a method of compression in which no data is lost. This type of file supports up to 256 colors; it also supports transparency, where the background color can be set to transparent to let the color on the underlying page show through. This type of file format is more suitable than the `.jpg` file format for images with only a few distinct colors, such as line drawings.

Term	Definition
.idt file	An exported Windows Installer database table.
.ism file	The working file that InstallShield uses to store project information. When you build a release, InstallShield uses the `.ism` file to create an `.msi` file for distribution.
.jar file	A Java archive file that contains the classes, images, and sound files for an installation, zipped up into a single file.
.jpg file	Also known as JPEG, which is the abbreviation for Joint Photographic Experts Group, the original name of the committee that wrote the standard. This type of file is one of the image file formats supported on the Web. The file uses lossy compression, a type of compression in which color and grayscale continuous-tone images are compressed and some data is lost to eliminate redundant or unnecessary information. These images support 16 million colors and are best suited for photographs and complex graphics.
.mif file	A management information format file used to describe a hardware or software component.
.msi file	The Windows Installer installation package in its finished state. It includes installation resource files and can have compressed within it all of the application's data files. The `.msi` file is the one that is distributed to the end users and will interact with the Windows Installer service to install your application on their machines.
.msm file	The database file of a merge module. This type of file contains all of the installation properties and installation logic for the module. See also merge module.
.msp file	A Windows Installer patch file. This type of file consists of a summary information stream, transform substorages, and cabinet files. An `.msp` file contains at least one database transform that adds patching information to the database of its target installation package. The installer uses this patching information to apply the patch files that are stored in the cabinet files.
.mst file	A transform package. This type of file is a simplified Windows Installer database that contains the differences between two `.msi` databases. Transforms enable administrators to apply modified settings to a database when they are deploying an installation package. See also transform.
.NET	An operating system platform that Microsoft created for connecting information, people, systems, and devices. The .NET environment enables developers to build, create, and deploy their applications and Web services using whatever languages they prefer via the common language run time.

Term	Definition
.NET Compact Framework	A scaled-down version of the .NET Framework designed to run on resource-constrained devices, such as mobile devices. The .NET Compact Framework is currently available only for Pocket PC and Windows CE .NET devices, with support for more devices forthcoming.
.NET Framework	A programming infrastructure that Microsoft created for building, deploying, and running applications and services that use .NET technologies such as Web services. The .NET Framework consists of three main parts: the common language run time, a hierarchical set of unified class libraries, and a componentized version of Active Server Pages called ASP.NET.
.ocx file	An object linking and embedding (OLE) custom control file. This type of file is a cross-platform COM file that is called by an application to perform a function, such as the ability to resize windows.
.p12 file	A certificate file that conforms to public-key cryptography standard (PKCS) number 12, which specifies a portable format for securely storing or transporting a user's private keys, certificates, miscellaneous secrets, and other information.
.pcp file	A Windows Installer patch creation properties file.
.prq file	A prerequisite file that contains information about a base application or component that must be installed on the target machine before the main application can be installed. Including setup prerequisites in installation projects enables developers to chain multiple installer files together into a single executable file.
.reg file	See registry file.
.scm file	A ScreenCam movie file.
.wmf file	A Windows metafile format file. This type of graphics file is used to exchange graphics information between Microsoft Windows-based applications.
absolute path	An absolute path includes all of the information necessary to locate a file by starting at the root directory of a specified drive. For example, `C:\Program Files\InstallShield` is the absolute path to the InstallShield folder when it is installed on drive C.
accessibility	The capacity or tendency to be available to all people, including those with disabilities.
acquisition phase	The phase of the installation process during which the installer queries the database for instructions. The acquisition phase is followed by the execution phase.
action	A command that performs an operation at a particular point during the execution of an installation or uninstallation wizard. Developers of installation packages can use built-in standard actions and create their own custom actions. Actions may display progress to the end user or allow the end user to cancel the operation.

Term	Definition
active directory	A structure supported by Microsoft Windows 2000 that enables administrators to track and locate any object on a network. Active Directory is the directory service used in Windows 2000 Server for distributed computing environments.
active template library (ATL)	A set of classes for writing COM controls, resulting in smaller binaries than, for example, MFC.
ActiveX	A set of object-oriented programming technologies and tools. ActiveX enables developers to write applications so that other applications and the operating system can call them. ActiveX technology makes it possible to create interactive Web pages that look and behave like applications, rather than static pages.
administration	The act or process of managing something.
administration sequence	The list of actions that are executed when a user launches your installation with the `/a` command-line option. This is useful for network administrators who want to provide a common installation point on the network and prepare different installation criteria for multiple users. Each Administration sequence consists of a User Interface sequence and an Execute sequence.
administrative installation	Copies and uncompresses your data files to a directory specified by the user, but does not create shortcuts, register COM servers, or create an uninstallation log.
administrative privileges	The highest level of permission that can be granted to a computer user. Levels of permissions are necessary in networked environments to ensure system security and prevent damage to computer hardware and software. A user with administrative privileges can perform tasks such as install and uninstall software and change a computer's configurations. Administrative privileges usually pertain to Windows NT 4.0, 2000, or XP machines as opposed to Windows 95, 98, or ME machines.
advertised shortcut	A shortcut to a product or feature that is not installed until the first time that the end user launches the shortcut. At run time of an installation, if the end user selects the "This feature will be installed when required" option for the product or the feature containing the shortcut, the shortcut is created but the component's files are not installed until the end user launches the shortcut. The first time the shortcut is launched, the Windows Installer service installs the component's files and other data and then the shortcut launches the target file. Every time the shortcut is used from then on, it behaves like a normal shortcut.

Term	Definition
advertisement	A type of "just-in-time" installation in which features are not installed immediately during the installation process. Instead, they are installed on the fly when they are requested. When you enable feature advertisement, the feature is advertised, regardless of the mode in which the installation is running, as long as no other factors prevent it from being advertised. If you launch `MsiExec.exe` from the command line with the `/jm` option, the feature is advertised to the end user's machine. If you use the `/ju` function, the feature is advertised to the current end user. In the Custom Setup dialog, the end user can control which features are immediately installed and which are available later. The two types of advertising are assigning and publishing. See also assigning; publishing.
advertisement sequence	The advertisement sequence contains the list of actions that are executed when a user launches your installation with the `/j` command-line option. Validation rule ICE78 requires the advertisement user interface sequence to be empty.
advertising	The process of presenting to end users features that are not installed immediately during the installation process. Instead, these features are installed on the fly when they are requested. See also advertisement.
AlwaysInstallElevated	A user policy that can be configured for Windows platforms under the following registry keys: HKEY_LOCAL_MACHINE\Software\Polices\Microsoft\Windows\Installer and HKEY_CURRENT_USER\Software\Polices\Microsoft\Windows\Installer. To install a package with elevated (system) privileges, set the `AlwaysInstallElevated` value under both of these registry keys to `1`.
American Standard Code for Information Interchange (ASCII)	The code that represents letters, numbers, punctuation marks, and other characters such as numbers, with each character assigned a value between 0 to 127. This code enables different types of computers and computer applications to exchange data.
animation	Multiple graphic images that are alternately changed and displayed at a specified number of frames per second to produce the illusion of movement.
API	See application programming interface.
app paths	The registry key that Windows uses to find your application and its `.dll` files if their locations are not already in the system's path. App paths entries can be set through the component's advanced settings.
application programming interface (API)	A set of routines that an application uses to communicate with the computer's operating system and that the operating system uses to make services available to the application.
ASCII	See American Standard Code for Information Interchange.

Term	Definition
assigning	A type of advertisement. If an administrator assigns an application to a machine, the installation program automatically runs the next time that the machine starts or restarts. If the administrator assigns an application to a user, the installation program places a shortcut on the Start menu of the user's machine. When the user selects the shortcut or launches a document associated with the assigned application, the application is installed.
asynchronous execution	A custom action that independently continues with the execution of its thread while the installer executes the main installation.
ATL	See active template library.
autonomic computing	A self-managed computing model named after, and patterned on, the human body's autonomic nervous system. An autonomic computing system would control the functioning of computer applications and systems without input from users, similar to the way that the human body's autonomic nervous system regulates and protects the body.
auto-repair	The automatic restoring of an application to its original state by the installer. A partial or complete application reinstallation might be required if any files associated with any feature are missing or corrupted.
basic UI	One level of the installer's internal user interface (UI) capabilities. Typically, installation packages that are built with the basic UI level display built-in modeless dialog that show progress messages and disc prompt messages. They do not display any authored dialogs.
billboards	Images, such as marketing messages, that can be displayed during installation.
Binary table	A table that holds the binary data for items such as bitmaps and icons. It also contains data for custom actions.
bitmap	A representation of an image presented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.
cabinet file	A single file that holds a number of compressed files. During installation of an application, the compressed files are decompressed and copied to your computer. Cabinet files are efficient because they save space and time when distributing software. A cabinet file usually has the file extension `.cab`. Missing or corrupt files may prevent installations from completing. It may be necessary to replace missing or corrupt operating system files or InstallShield files by extracting them from a cabinet file.

Term	Definition
cache	A cache (pronounced *cash*) is a temporary storage area for frequently accessed data. The purpose of caching is to store frequently used information in a location that is easy to access, resulting in a faster-running computer. There are two types of cache: memory cache and disc cache. Memory cache stores the data and the address of where the data is stored in main memory. Memory caching is useful because most applications access the same data repeatedly. Disc caching uses the main memory. It is used to hold information that has recently been requested from the hard disc or has previously been written to the hard disc. In general, installations usually use the disc cache. When data is read from or written to main memory, a copy is also saved in the memory cache. When data is called for, the computer first checks the memory cache, then the disc cache, and finally main memory.
caption	A text heading in a window. The windows caption is what users click and drag to position the active window on the screen.
CBT	See computer-based training.
CD	See compact disc.
CD browser	A graphical user interface that is launched when a CD is inserted in the drive. It is used to launch one or more applications on the CD.
CD-ROM	See compact disc read–only memory.
checksum	A calculated figure that is applied to data to test for possible corruption. The checksum is derived by sequentially combining bytes of data in the file in a systematic manner. After transmission or storage compression, the checksum calculation is performed again and the result is compared with the previous outcome. If the numbers do not match, this indicates that there is likely an error in the stored or transmitted data.
column	A vertical set of information.
COM	See component object model.
COM file	Binary software components containing reusable code that can be shared across products. A popular example of a COM file is a Microsoft Excel spreadsheet when it is embedded in a Word document. In this example, Excel acts as the COM server and Word acts as the client.
COM server	An executable file that exposes objects to other applications according to the Component Object Model (COM) specification. The types of objects exposed by a COM server may include ActiveX controls, ActiveX documents, Automation objects, or MTS components.

Term	Definition
COM+ file	An extended COM file. With regard to installations, COM+ adds greater support for building distributed components. For example, you can create appID keys and values in the registry and thereby configure various COM components to run remotely or with special privileges.
command	(1) An instruction given to a computer. (2) An instruction that the operating system executes from the command line or a Command Prompt window to perform a specific task. If errors occur during installation, you may, for example, need to execute commands to run utilities, search your computer's directories, or delete files.
command line	The area of the Command Prompt window in which commands are typed. A command line is used to pass commands to executable files (for example, `.exe`, `.bin`).
command prompt window	The Command Prompt window is the interface to MS-DOS. To access the Command Prompt window, click Run on the Start menu, and then type `command.com` in Windows 95, 98, and ME or `cmd.exe` in Windows NT, 2000, or XP. If errors occur during installation, you may need to open the Command Prompt window to enter commands to run utilities or search your computer's directories, for example.
command-line option	A command-line option is an argument to a command that changes how the command is executed. See also command.
commit execution	Execution of a Windows Installer action upon completion of the InstallFinalize action, which occurs when the installation has completed transferring files, registering COM servers, and creating shortcuts and registry entries.
committing databases	Accumulated changes made in a Windows Installer database. The changes are not reflected in the actual database until the database is committed, that is, until **MsiDatabaseCommit** is called.
compact disc (CD)	A disc used for electronically recording, storing, and playing back audio, video, and other information in digital form.
compact disc read-only memory (CD-ROM)	A type of compact disc that is only readable.
component	Elements of the application from the installation developer's perspective. Components are not visible to the end user. When the end user selects a feature for installation, the installer determines which components are associated with that feature, and then those components are installed. Components of an application would contain, for example, the executable binary files, data files, shortcuts, help system files, and registry entries.

Term	Definition
component object model (COM)	A Microsoft-developed software architecture that enables the creation of component-based applications. Component-based applications allow other components and other applications to use their features, adding functionality to these programs.
compress	Take one or more files and create a new file whose size is less than the total size of the original file(s) and from which the original file(s) can be re-created.
computer-based training (CBT)	Any instruction delivered by computer. CBTs often use graphics, sound, animation, and interaction to train people.
condition	A statement of logic that compares the value of a property to a fixed value or determines whether the property is defined. The condition must evaluate to true if the object, feature, component, action, or other item associated with the condition is to be installed or performed.
conditional installation	Installation of certain items only if certain conditions are met. For example, if an operating system condition is associated with the installation of an application, the application is installed on a target machine only if that target machine is running the specified operating system.
consume	What an installation does to a redistributable package such as a merge module or InstallShield object.
context menu	A context menu, also known as a right-click menu or a pop-up menu, opens when a user right-clicks an item on the desktop, in Windows Explorer, or in an application.
converted project	(1) A file that has been transformed from one type of file to another. (2) The Open MSI/MSM Wizard in InstallShield is a tool that converts `.msi` files and merge module (`.msm`) files to InstallShield installation projects (`.ism` files) that you can modify and build in InstallShield.
costing	File costing is the process that InstallShield uses to determine the total disc space that a current installation requires.
custom action	An action that is created by an installation author as opposed to a standard action that is built into a Windows installer. The action encapsulates a function performed during the installation, uninstallation, or maintenance of an application.
database	A discrete collection of data in a database management system (DBMS).
database function	A function that operates on a database.
database handle	A quantity that specifies a database when a database function is called.

Term	Definition
database management system (DBMS)	A set of applications that control the organization, storage, and retrieval of data for many users.
DBMS	See database management system.
DCOM	See distributed component object model.
DCOM file	Software components that are able to communicate across a network. DCOM, previously called network OLE, allows the components for a single application to be distributed across multiple networked computers.
decompress	The reverse process of compression, which minimizes the size of a file by removing its space characters. This process returns the file to its original state.
deferred execution	Execution of an installer action upon execution of the installation script.
dependency	A software object that is required by another software object.
dialog	Windows of information that display to the end user during installation and uninstallation. They enable the end user to interact with the operation by reading or specifying information. See also wizard.
dialog box	A window that displays within an application interface that enables users to enter information or specify commands.
differential release	A release that contains only those files that were absent from one or more of a specified set of existing releases. A differential release is used to update the versions of your product that were installed by those existing releases.
digital signing	To assure end users that the code within your application has not been tampered with or altered since publication, you can digitally sign your application. When you do so, end users are presented with a digital certificate when they download your product.
distributed component object model (DCOM)	An extension of the component object model (COM), a Microsoft-developed software architecture that enables the creation of component-based applications.
distribution media	A CD-ROM or other format of media deployed to users.
DLL	See dynamic link library.
drag	The act of selecting an item and moving it to another location.
dynamic link library (DLL)	A shared, code-base file containing functions that can be called from other applications.

Term	Definition
edit field object	An interactive object that lets the user enter text into a field.
elevated privileges	Privileges that are higher than standard privileges, and are usually temporarily. Privileges are permissions to perform certain actions on a system.
end user	The person who installs or uninstalls your product.
end user machine	The machine onto which an end user installs or from which uninstalls your product.
engine	A program that performs essential functions and coordinates the overall operation of other programs. Engines work behind the scenes. InstallShield uses the InstallScript engine (`ISScript.msi`) and the Windows Installer engine to drive installations. InstallShield also has its own proprietary engine called ikernel.
environment variable	A variable that can be accessed by multiple programs on the target system.
EXE media type	All of the installation and uninstallation files that are contained in a single, self-extracting file.
executable (.bin) file	A file that contains a program that can run on UNIX platforms.
executable (.exe) file	A file that contains a program that can run on Windows platforms.
execution phase	The phase during which an installer's actions are executed.
execution script	Installer actions for a Windows Installer installation. The execution script is generated during the acquisition phase of installation and executed during the execution phase.
expand	(1) To restore a compressed file to its original size. A compressed file is a single file that contains one or more other files, for example, a cabinet file. Compressed files are reduced in size, thus, saving space. (2) A DOS command used to restore compressed files. During an installation, missing or corrupted operating system files or InstallShield files may need to be expanded from a compressed file to enable the installation to complete.
extensible markup language (XML)	(1) A programming language that is essentially a simplified version of standard generalized markup language (SGML). It enables developers to create customized tags to organize and deliver content efficiently. (2) The format of the output of MultiPlatform projects. (3) Windows-based projects created in InstallShield can be converted to XML so that they can be saved in source code control software.

Term	Definition
extensible stylesheet language (XSL)	A language used to describe how XML information should be presented.
external user interface	The user interface developed by the author of an installation package. It does not use the internal user interface capabilities that are available with the installer.
extract	To remove, or decompress, a file from a compressed file, such as a cabinet file. A compressed file is a single file that contains one or more other files. Compressed files are reduced in size, thus, saving space. To use a file that has been compressed, it must first be “pulled out” of the compressed file. A command-line utility called `Extract.exe` can be used to extract files. During installation, missing or corrupted operating system files or InstallShield files may need to be extracted from a compressed file to enable the installation to complete.
false positive	A false positive is something that gives the appearance of being true by a test, but in reality is not. Most cases of false positives are found in anti-virus software. For example, anti-virus software may claim that it has found a virus in an InstallShield file, but in fact, this is not the case; their virus definitions need to be updated.
feature	Logical representations of the functionality of the product. For example, an installation could consist of a database, the main application files, and the help system files. Database, Application, and Help System would all be features of the product. Although features are visible to the end user, the actual files that comprise the features are within the components of the features. See also component.
file	An element of data storage in a file system.
file extension	The portion of a file name, following the final point, that indicates the kind of data stored in the file.
InstallShield scripting run time	See IDriver.exe.
formatted	When data has been divided or arranged for storage or display.
full update	An installation that installs an updated version of your product over an earlier version.
full user interface (UI)	One level of the installer’s internal user interface (UI) capabilities. Installation packages that are built with the full UI level can display both the modal and modeless dialogs that have been included in the internal UI.
gallery	A collection of available resources that can be shared.

Term	Definition
globally unique identifier (GUID)	A long string of numbers created by InstallShield to uniquely identify your product from others. Enter string GUIDs throughout InstallShield in the following format: {XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}.
GUI	Graphical user interface.
GUID	See globally unique identifier.
hard drive	The primary storage device on a computer. A hard drive contains disks on which data is read from and written to magnetically. The term “hard” differentiates the aluminum or glass disks used in a hard drive from floppy disks, which are made of plastic.
hotfix	A quick, important fix for a bug whose deployment cannot wait until the next release of the application. Most hotfixes are in the form of small patches and can be downloaded from the software vendor’s Web site.
HTML	See hypertext markup language.
hypertext markup language (HTML)	A language used to create Web pages with hyperlinks and markup for text formatting.
IAT	See import address table.
ICE	See Internal Consistency Evaluator.
IDE	See interactive development environment and integrated development environment.
IDriver.exe	The InstallShield scripting run-time engine. It is required on a computer to run some installations created with InstallShield. `IDriver.exe` is located in one or both of the following common file locations by default: `C:\Program Files\Common Files\InstallShield\Driver\7\Intel 32` or `C:\Program Files\Common Files\InstallShield\Driver\8\Intel 32`. Some installation error messages may reference `IDriver.exe`.
IE	See Internet Explorer.
ikernel.exe	The InstallShield engine. See also engine.
immediate execution	Installation phase terminology that generally refers to custom actions that are immediately executed when the installer builds the script in an InstallScript project.
import address table (IAT)	The table used to import `.dll` files or executable files.

Term	Definition
indirect build	A full build that creates references to the payload files only. This means that at installation time, the payload must be in the same place where it was at build time. For example, if your payload is on a network server, then the installation looks for the payload on that same network server.
install level	A feature's install level partly determines whether it is selected by default for installation. That value is compared to the Windows Installer property INSTALLLEVEL to determine which features are selected for installation: if a feature's install level property is less than or equal to the value of the INSTALLLEVEL, the feature will be installed.
installation	The transfer of a program and its constituent files, features, and components from source media to a target system. See also installation process.
installation package	One or more files that are used together to install or uninstall an application.
installation process	The entire process of installing the contents of a package or application onto a target computer. The installation process consists of the acquisition phase, the execution phase, and, if the installation attempt is not successful, rollback.
installation project	The entire collection of source files, dialogs, actions, and conditions that make up your installation and uninstallation while it is under construction.
installation sequence	The sequence in which an applications files are installed, acitons are executed, and dialogs display at run time. The installation sequence runs by default when the installation is launched, for example, by double-clicking the installation launcher.
installation type	A predefined group of features from which the end user can select to install or uninstall.
installation-on-demand	A Windows Installer capability that makes it possible to offer functionality to users and applications in the absence of the files themselves.
INSTALLDIR	A system variable that specifies the root destination directory for an installation.
installer	An installation and configuration service on a computer.
installer database	A database that contains all the necessary information for the installation of an application. It consists of many interrelated tables that together comprise a relational database of information necessary to install a group of applications.
installer function	The application programming interface called by an application to obtain installer services.

Term	Definition
installer package authoring tool	A third-party tool that lets users create installation packages.
installer properties	Variables that are used during the installation.
INSTALLLEVEL	Initial level at which features are selected “ON” for installation by default.
integrated development environment (IDE)	A software program’s interface. Also referred to as an interactive development environment.
interactive development environment (IDE)	A software program’s interface. Also referred to as an integrated development environment.
interface	The point at which independent systems communicate with each other. The user interface of an application often consists of toolbars, menus, buttons, windows, and other items.
Internal Consistency Evaluator (ICE)	Tests that can be run on a Windows Installer database (using Orca, Msival2, or the Premier or Professional editions of InstallShield) to warn about potential (or actual) authoring errors.
internal source files	Files that are included in the installation archive file.
internal user interface	Built-in capabilities of an installer that can be used to create a graphical user interface that is displayed to the end user during installation.
internet Explorer (IE)	The browser developed by Microsoft and distributed with their Windows operating systems.
ISM	See .ism file.
isolated application	An application that has been modified so that it always loads the versions of components, such as `.dll` files, with which it was originally developed and tested.
ISScript.msi	InstallScript engine installer. `ISScript.msi` installs the required files to run an installation. The InstallScript engine is also known as the InstallShield Scripting Run Time. InstallScript is a programming language used to create installations.
JAR	Acronym for Java archive file. See also .jar file.
Java Archive	See .jar file.
Java Native Interface (JNI)	A Java specification that enables Java code to call native code in a shared library. Native code in the JNI library can also invoke Java code through JNI.

Term	Definition
Java Virtual Machine (JVM)	A simulated computer that interprets Java programs compiled into bytecode. The Java programs are usually stored in `.class` files.
JNI	See Java Native Interface.
JPEG	See .jpg file.
JVM	See Java Virtual Machine.
KB	See knowledge base.
key file	A unique file for each component that Windows Installer uses to detect the component's presence. In order to create advanced component settings or shortcuts, a key file must be specified.
key path	A unique registry value for each component that Windows Installer uses to detect the component's presence. A component can have either a key file or a key path, but not both.
knowledge base (KB)	A collection of technical information, instructions, and articles that are beyond the scope of the software's help information. The Knowledge Base features tips, tricks, and techniques, answers to Frequently Asked Questions, and articles on both technical and design issues. Flexera Software posts periodic updates to the Knowledge Base Articles on its Web site (http://www.installshield.com).
left-click	The act of selecting the left button on a mouse.
library	A collection of similar objects that are stored for occasional use, such as programs in source code or object code form, data files, scripts, and templates. A program library is a collection of (usually) precompiled, reusable programming routines that a programmer can "call" when writing code.
load-ordering group	One service may require another service to already be running before it starts. For this reason, services need to be grouped and set to load in a specific order. Service load-ordering groups are listed under HKEY_LOCAL_MACHINE\System\CurrentControl Set\Control\ServiceGroupOrder. The service's Start Type property determines when it loads within its group.
localization	The process of adapting a product or service to a particular language and culture.
log database (LogDB)	A database that is on the target machine and contains a log of everything that was configured to be logged during installation and uninstallation.

Term	Definition
log file	File containing a record of the activity that occurred during a software process (such as an installation, a build, a download) on a computer workstation or Web server. For example, Web servers maintain log files listing every request made to the server, summarizing files that were copied; bytes that were transferred; or which pages, images, and files are requested. A build log file lists all features, setup types, merge modules, dynamic links, and files included in the build.
LogDB	See log database.
logging	The process of recording the activity of a software process (such as an installation, a build, or a download) in a log file.
macro	An instruction that represents a sequence of instructions.
maintenance mode	When a user runs an installation program a second (or later) time for a product already installed on their system, the installation runs in maintenance mode. Maintenance mode enables the user to modify feature selections from the first-time installation, repair the features already installed, or remove the entire program.
major upgrade	A comprehensive update of the product that warrants a change in the ProductCode property. A new product code is required if you want to have two versions of a product installed on the same machine.
managed application	An application is called a “managed application” if elevated (system) privileges are used to install the application.
MD	See media descriptor.
media descriptor (MD)	The semantics of an installable unit (IU). It provides a mapping of the elements in the deployment descriptor (DD) to some physical source for the data, which is usually files.
merge module (MM)	A package containing all of the logic and files needed to install distinct pieces of functionality such as run-time `.dll` files and virtual machines. Merge modules are built once and can be added to any installation project.
metafile	An image saved using the standard Windows metafile format. A metafile is a set of drawing instructions. Windows metafiles have a `.wmf` file extension.
MFC	See Microsoft Foundation Classes.
Microsoft Data Engine (MSDE)	A fully SQL Server–compatible data engine for building desktop and shared solutions. It provides an easy migration path to SQL Server 7.0. Solutions built with MSDE can be migrated to full SQL Server 7.0 without requiring a change in a single line of code.

Term	Definition
Microsoft Developer Network (MSDN)	A set of online and offline services designed to help developers write applications using Microsoft products and technologies.
Microsoft disc operating system (MS-DOS)	The first operating system created by Microsoft. MS-DOS is the underlying operating system of Windows 95, 98, and ME. Windows NT, 2000, and XP operating systems support existing DOS applications.
Microsoft Foundation Classes (MFC)	A huge set of C++ classes that developers can use to write Win32 applications. To run an application that uses MFC, the MFC engine has to be installed on a target system.
MIDI	See musical instrument digital interface.
migrating	The process of moving from the use of one operating environment to another that is, in most cases, thought to be a better one. For example, moving from Windows NT Server to Windows 2000 Server would be considered a migration because it involves ensuring that new features are exploited and that old settings do not require changing; it also involves taking steps to ensure that current applications continue to work in the new environment. Migration could also mean moving from Windows NT to a UNIX-based operating system (or the reverse). You can also migrate data from one kind of database to another kind of database. This usually requires converting the data into some common format that can be output from the old database and input into the new database. Migration is also used to refer simply to the process of moving data from one storage device to another.
MIME	See multipurpose internet mail extensions.
minor upgrade	An update to a product in which the changes made to the installation do not warrant a change in the Product Code.
MM	See merge module.
modal	Requires the user to interact with it before the application can continue, restricting the user's activities with other windows or dialog boxes. See also modeless.
modeless	Enables the user to interact with other windows and dialog boxes. See also modal.
MSDE	See Microsoft Data Engine.
MSDE named instance	A named instance of an installation of the Microsoft data engine (MSDE). See also named instance.

Term	Definition
MSDE object template	A base for the MSDE merge module. When you add the MSDE merge module to a Windows Installer project or an InstallScript project, the InstallShield application starts with a base file (or stub) for this merge module. You need to configure this merge module, and then the application can apply your settings to the base file.
MSDN	See Microsoft Developer Network.
MS-DOS	See Microsoft disc operating system.
MS-DOS prompt	The Microsoft Disc-Operating System (MS-DOS) prompt is the visual indicator in the Command Prompt window signaling that MS-DOS is ready to accept a new command. The default MS-DOS prompt is `C:>`, followed by a blinking cursor.
MSI	See .msi file.
MSM	See .msm file.
MSP	See .msp file.
MST	See .mst file.
multimedia	A collection of various media such as sound, video, graphics, and animation used together to convey a message.
multipurpose Internet mail extensions (MIME)	The standard used by Web servers to identify the files that they are sending to Web clients. The MIME standard is a way of specifying both the type of file being sent and the method that should be used to turn it back into its original form.
musical instrument digital interface (MIDI)	A protocol designed for recording and playing back music on digital synthesizers. Unlike `.wav` files, which are digital recordings of actual sound (voice or music), MIDI files simply define the instruments and notes that are to be played, and how they should be played. A synthesizer (generally part of a MIDI-capable sound board) on the end-user's system reads the MIDI instructions and plays the music. Since MIDI files contain only instructions and not the actual music, they are many times smaller than digital audio files of the same duration. MIDI files also use less processor power to play.
named instance	An instance is a complete and independent installation of SQL Server on a given server. One default instance and any number (up to 16) of named instances can be installed on a single server. Apart from the management tools and client connectivity components that are shared between instances, each instance is effectively standalone. Each instance has its own security, can be started and stopped independently, and can even be service packed independently of other instances on the same server.

Term	Definition
nested installation	A type of custom action that installs or removes another installation package (sometimes called the child product) from within a running installation (called the parent product).
network	A network is two or more computers connected together to share hardware, software, and information. During installation, it may be necessary to move installation files that are on a network to your computer's hard drive to install the software properly.
NT service	An application that is installed on Windows NT to run as a service, meaning that once it is installed, execution is automatic and transparent to any user, and a user does not have to log in for the service to start. NT manages services that are defined and described in the registry.
object	A package containing all of the logic and files needed to install distinct pieces of functionality.
One Really Cool Application (ORCA)	An external tool for editing Windows Installer files.
One-Click Install	With a One-Click Install installation, the end user can download an application with minimal effort and can begin using the application immediately. The installation is automatically downloaded, uncompressed, and then executed automatically, with minimal user input. End users are not asked to specify a download location, and they are not required to manually launch the installation.
operating system (OS)	The software that controls the operation of a computer and directs the processing of programs by assigning storage space in memory and controlling input and output functions.
ORCA	See One Really Cool Application.
OS	See operating system.
package	All of the files needed to run an installation, including the installation database file, your application's files (separate from the installation database file or compressed into it), and an executable file (which may have all of the above files compressed inside it).
package code	The globally unique identifier for an installation package. See also globally unique identifier (GUID).
panel	A window within a wizard that contains one or more related settings that an end user can configure. See also wizard.
parent/child installation	See nested installation.

Term	Definition
patch	A special type of installation package that contains just the bits and portions of the application that is necessary to either update the application's files and installation to a specific version or to fix a bug in an earlier version.
patch file	A patch package used for patching. A patch package (`.msp`) file contains the transforms and instructions necessary for upgrading one or more installed versions of a product. Windows Installer uses a patch package to patch local or administrative installations. A patch package does not include a database like a regular installation package. Instead it contains at minimum one database transform that adds patching information to the database of its target installation package. The installer uses this information to apply the patch files that are stored in the cabinet file stream of the patch package.
patching	The method of updating an installation that replaces only the bits being changed rather than the entire application. This means that end users can download a patch for a product that is much smaller than the entire product.
path	In a computer operating system, a path is the route through a file system to a particular file. A path name is the specification of that path. Each operating system has its own format for specifying a path name. The DOS, Windows, and OS/2 operating systems use the following format: `driveletter:directorynamesubdirectorynamefilename.suffix`. UNIX-based systems use the following format: `/directory/subdirectory/filename`.
path variable	A variable that represents a location that can be defined once in a central location so that it is not necessary to change every source file's path each time that the project is moved or the folder structure is changed. You can instead use path variables to define commonly used paths once, and they are used during the development of your installation project. These paths do not apply to the target machines where the application is being installed. Rather, they are used to link to source files that need to be included in your installation project. When the project is built, those links are evaluated and the files they point to are built into the installation package.
PKCS	See public-key cryptography standards.
platform	The operating system for which the installation program is intended. An installation technology may be limited to creating installations for a specific platform(s).
preview mode	Mode for viewing the design of the user interface, or the current appearance of dialog and billboards. *Preview mode* is a term used in Windows Installer.
product	The actual application to be installed or uninstalled.
product code	A string that uniquely identifies a product.
progress bar	The visual indication of the progress of an executable file.

Term	Definition
property	A value that has been placed on an object within an installation project that is used during installation or uninstallation by the installer or uninstaller.
public property	A global variable whose value is set by the end user or system administrator. A public property can be set or changed during installation through interaction with the user interface as well as by setting the property on the command line, by applying a transform, or by using a standard or custom action. Unlike private property values, the values of public properties can be changed. Public property names cannot contain lowercase letters.
public-key cryptography standards (PKCS)	Developed by RSA Security, Inc., these specifications standardize aspects of public-key cryptography that are not covered by existing standards bodies.
publishing	A type of advertising (“just-in-time” installation) in which no user-interface elements are created for the component during installation, but the component can still be installed through Add and Remove Programs of the Control Panel or when an installed component requests the published component from the installer.
qualified component	A method of single-level indirection that is similar to a pointer. Qualified components are primarily used to group components with parallel functionality into categories.
QuickPatch	A special type of patch package that contains just the bits and portions of the database necessary to update your application’s files and installation to a specific version. You can create a QuickPatch in InstallShield by using the QuickPatch type of project.
readme file	A text file that is included with the distribution of an application that contains important information. This information often pertains to the installation, uninstallation, or functionality that may not have been included in other product documentation.
red green blue (RGB)	The three colors of light that can be mixed to produce any other color. Colored images are often stored as a sequence of RGB triplets or as separate red, green, and blue overlays, though these are not the only possible representations. These three colors correspond to the three “guns” in a color cathode ray tube (CRT) and to the color receptors in the human eye.
redistributable	A merge module, object, or other file that may be legally distributed with an installation or application.
reduced user interface (UI)	The reduced UI level displays authored modeless dialogs, built-in modal error messages, and disc-prompt messages during installation. This UI level does not display any authored modal dialogs. This UI level uses the installer’s internal user interface capabilities. See also modal, modeless, and internal user interface.

Term	Definition
reference count	A tally that is incremented each time a shared file is installed. It is maintained under HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\SharedDLLs.
refresh build	This type of build only recompiles custom code. It can also perform single file replacement, meaning it can only rebuild and add or modify a single changed file without rebuilding the entire installation. This type of build is available for InstallScript projects only.
Regedt32.exe, Regedit.exe	The two versions of the Windows Registry Editor. The Registry Editor enables you to edit the entries in the registry. Regedt32 provides more functionality for editing the registry. If errors occur during installation, you may need to edit the registry to complete installation. `Regedt32.exe` and `Regedit.exe` have been merged in Windows XP computers, thus these two applications perform the same functionality in the new operating systems.
registry	A central database used by the Windows operating system to track the personal settings and the software and hardware installed on a computer. During installation, installation choices are written to the registry.
registry file	A text file of a predefined format that contains keys and values that can be merged into a registry.
reinstallation	When a product has been installed on a machine and its installation is run again, the installation reinstalls the product by overwriting its existing files, shortcuts, and registry entries.
relative path	A path that includes all of the information necessary to locate a file by starting at the current folder on the current drive, for example, `InstallShield\Support`. That folder can be located along that relative path only if it exists in the current directory.
release build	A full rebuild fit for releasing.
release notes	A file that is included with the distribution of an application. This file contains important information about the installation and uninstallation of the application. It can also contain information that may not have been included in other product documentation.
remote procedure call (RPC) stub	A small routine placed in a program that is used to request a service on another computer. RPC is a protocol, or agreed-upon format for transmitting data, that allows a program to request a service from a program located in another computer. The stub accepts the request from the program and forwards it to the remote procedure. When the procedure is complete, the stub receives the result and passes it back to the program that made the request.

Term	Definition
repair mode	In repair mode, the installation checks for any type of corruption, such as missing or damaged files, incorrect registry entries, and self-registering files. If the installation detects any corruption, it attempts to repair the problem. See also maintenance mode.
resiliency	The ability for the application to reinstall components as necessary. If a component is accidentally deleted or corrupted, Windows Installer technology enables the application to essentially repair itself.
restricted public property	A global variable for which the installation author can limit the ability to set or change it. Usually, only system administrators can manipulate restricted public properties. Restrictions are used to maintain a secure environment.
result set	The set of rows created by executing a SELECT statement.
RGB	See red green blue.
rich text format (RTF)	A Microsoft file format that contains special commands to indicate formatting information such as fonts and margins. RTF lets you exchange files between different word processors and operating systems.
rollback	The installation keeps track of all changes that are made during the installation process so that, if an error occurs and the installation is aborted, the changes will be "rolled back," that is, the machine will be restored to its original state.
row	A set of related columns that describe a specific entity, also known as a *record*.
RPC stub	See remote procedure call stub.
RTF	See rich text format.
run time	The time during which the installation interacts with the installer to install or uninstall your application on the target machine.
safe mode	Safe mode is a troubleshooting mode available in Windows 95, 98, ME, and 2000. When you start your computer in safe mode, only the operating system and mouse, keyboard, and display drivers are loaded. You may be able to start your computer in safe mode when it otherwise would not start at all. Safe mode lets you troubleshoot the operating system to determine what is not functioning properly.
schema	A description of the current structure of tables and views in a data source. The schema describes what columns are in each table, the data type of each column, and the relationships between tables.
SCM	See Service Control Manager.
SDK	See Software Development Kit.

Term	Definition
Section 508	A United States law that amended the Rehabilitation Act to require federal agencies to make their electronic and information technology accessible to people with disabilities. Section 508 was enacted to eliminate barriers in information technology, to make available new opportunities for people with disabilities, and to encourage development of technologies that will help achieve these goals. The law applies to all federal agencies when they develop, procure, maintain, or use electronic and information technology. Under Section 508, agencies must give disabled employees and members of the public access to information that is comparable to the access available to others.
security tool	A privacy tool that detects and eliminates destructive pests, such as Trojans, spyware, addware, and hacker tools on your computer. It complements anti-virus and firewall software, extending protection against non-viral malicious software that can evade the end user's existing security and invade privacy.
self-healing	See auto-repair.
self-registering file	A file that can enter information about itself in the Windows registry and remove that information upon uninstallation. Other types of files can be used without entering information into the registry. The installation of a self-registering file consists of installing the file to its desired location and then registering the file on your computer.
sequence	A collection of actions and dialogs that is executed sequentially in an installation project.
sequence tables	Tables that list the actions that control the installation process and specify their order of execution.
service	For Windows Installer–based or InstallScript-based projects, this is a program that runs in the background whenever a computer is running. Services perform tasks that do not require user interaction, such as software installation, process monitoring, file transfer, task scheduling, network management, and many more. In Win32, services are managed by the Service Control Manager.
Service Control Manager (SCM)	Maintains the system's database of services and exposes an interface for controlling these services.
service pack (SP)	An update to a software product that fixes existing problems and may provide product enhancements. The next version of a product incorporates all services packs previously released.
setup	See installation.
setup project	See installation project.
Setup.inx	The compiled script file. It is the object code that the installer engine executes.

Term	Definition
shortcut	A file that points to an application. Clicking the shortcut is a fast way to open the application. Shortcuts are usually placed on the desktop or on the Start menu. See also advertised shortcut.
silent installation	An installation that is run without a user interface or any end user intervention.
small update	A patch that upgrades a package where both the installed package and the most recent one have the same version number.
software development kit (SDK)	The documentation, samples, command-line compilers, debugging aids, utilities, and tools designed to enable developers to create applications and libraries that target a specific operating system. SDKs are usually provided by the manufacturer of the operating system.
source list	A list that specifies the locations where the installer searches for installation files. The entries in the source list can be network locations, URLs, or compact disks.
SP	See service pack.
splash screen	An image that is displayed to end users during the startup of a product installation. You can specify the image to be displayed, the length of time that it should display, and whether it contains localized images.
spyware	Any technology that aids in gathering information about a person or organization without their knowledge. On the Internet, spyware is programming that is put on someone's computer to secretly gather information about the user and relay it to advertisers or other interested parties. Spyware can be loaded on a computer as a software virus or as the result of installing a new program. Data collecting programs that are installed with the user's knowledge are not, properly speaking, spyware, if the user fully understands what data is being collected and with whom it is being shared.
SQL	See Structured Query Language.
SQL statement	A complete phrase in SQL that begins with a keyword and completely describes an action to be taken. For example, `SELECT * FROM Orders`.
standard action	An action that is built into an installation development software product. InstallShield products also support the creation and use of custom actions. See also action, custom action.
string table	A database that maintains the string IDs, values, and comments for all supported languages. These strings are used in dialogs and message boxes displayed to the end user at run time.
Structured Query Language (SQL)	A language used to work with databases.

Term	Definition
summary information stream	The properties such as title, author, package code, templates, summary, and schema that are defined for a Windows Installer package and are used by the installer to install the application.
synchronous execution	The opposite of asynchronous execution, where control of the process is not released until the entire process has completed.
system policy	The rules and regulations by which a system must abide.
system privileges	The system, programs, and functions available to each user.
table	A collection of rows of data.
TARGETDIR	In a Windows Installer–based installation, the TARGETDIR property specifies the root destination directory for the installation. In an InstallScript installation, the TARGETDIR system variable, by default, specifies the root destination directory for the installation.
Task Manager	A tool available on Windows platforms that provides information about the applications and processes running on your computer as well as your computer's performance. Prior to installation, you may need to use the Task Manager to end running applications and processes to prevent conflicts.
temp directory	A folder on your hard drive where the operating system or applications can temporarily store files while they are in use. When the application exits, the temporary files are deleted. It may be necessary to manually clean, or delete files from, the temp directory.
template	Something that establishes or serves as a pattern.
transform	A transform (`.mst`) file represents the differences between two installation databases. For example, network administrators may want to distribute different configurations of a product to the various departments in the company. As a result, you can create a transform for every configuration of the product, then apply the appropriate transform as needed.
transform error condition flags	A set of properties that are used to set the error conditions in a transform.
transform validation flags	The set of properties used to verify that a transform can be applied to the Windows Installer package.
tree node	A data structure that contains zero or more "child" nodes. Nodes are tree "roots". Tree nodes that do not have "children" are typically referred to as "leaves".
trees	Data that is structured like a tree.
UI	See user interface.

Term	Definition
uncompress	See decompress.
uniform/universal resource locator (URL)	Represents the location of a Web site or page.
uninstallation	The undoing of an installation. Uninstallation is the installation maintenance option that enables the end user to remove the product files and reverse any changes that were made to the machine made during installation.
uninstallation log file	A record of all uninstallation-related events that occurred during an installation. The log file is initialized at the beginning of the installation. If this log file becomes corrupted, it may result in an error during uninstallation.
unInstallShield	A component included in the Setup Wizard that uninstalls the product from the end user's PC.
unspanned CD/DVD media type	The payload is laid out in a CD/DVD archive, but no spanning across multiple media is used.
Update Manager (Windows or Java)	An optional Win32 or Java-based client application that can be used by end users to set their own update schedules, or to silence the update queries performed by the agent.
upgrade	A move from a lesser version of an application to a newer, usually improved version of an application.
upgrade code	The code required to install a newer version of existing software.
upgrading	The process of installing a newer version of existing software.
URL	See uniform/universal resource locator.
user interface (UI)	The user's access to the software.
user profile	Record of an individual end user's settings, such as shortcuts, favorites, and settings for application, display, and hardware. User profiles enable multiple users to share a single computer while maintaining their own preferences.
validation	The process of validating, that is, to confirm the true form of data.
value pack (VP)	An installation that upgrades the features and functions of an installed application.
variable	A value stored in the computer. Its value can be composed of any printable characters, numeric or text. Unlike a constant, whose value never changes, a variable's value can be changed at any time.

Term	Definition
volume	The total amount of space, in blocks, on one piece of media.
VP	See value pack.
Web installation	An installation that end users can access and run from a Web site.
Web site	A location on the World Wide Web.
WinDir	Stores the path to the executable file for Win16 on Win32 (WOW).
window	The area in which an open application appears on a screen.
Windows API	The Windows application programming interface (API), which provides the building blocks that are used by applications written for the Windows platform. Each API is a specific method prescribed by a computer operating system or by an application program. A programmer writing an application can make requests of the operating system or another application with the use of a Windows API. Each API has different system requirements to run properly.
Windows installation CD	The compact disc that contains the Windows operating system. If your computer manufacturer installed the operating system on your computer, the installation CD should have been included with your computer documentation. If you installed the Windows operating system on your computer, you used the installation CD to do so.
Windows Installer	(1) An installation and configuration service. It is based on a data-driven model and provides all installation data and instructions in a single, complete package. In the data-driven installation model, a master set of installation tables is created where every application resource (files, registry keys, and so on) is clearly tied to the component or feature it supports. The user selects the objects to install and where to install them, and the Windows Installer manages the procedural instructions. (2) Refers to the service, properties, and tables of an `.msi` package.
Windows Installer service	An operating system component that centrally manages application installation configuration and application uninstallation.
Windows NT service	See Windows service.
Windows service	Long-running executable applications that run in their own Windows sessions. For example, writing messages to an event log.
Windows system folder	Contains core operating system files, which are necessary to keep the computer running properly. Errors occurring during installation may be a result of missing or corrupt files contained in the System folder.

Term	Definition
wizard	(1) A program utility that works as an interactive guide by walking the user step-by-step through an unfamiliar task. (2) The InstallShield Wizard is the wizard that displays during the run time of an installation or uninstallation. It presents the end user with a flexible, predefined series of dialogs that walk them through the installation or uninstallation process.
wizard dialog	Dialogs that display to the end user during installation and uninstallation. They enable end users to interact with the operation by reading or specifying information.
wizard interface	Used by the end user to interact with a wizard at run time.
WYSIWYG	What you see is what you get.
XCopyFile	An InstallScript function that copies one or more files and subdirectories to a target directory, creating subdirectories on the target machine, if necessary.
XML	See extensible markup language.
XSL	See extensible stylesheet language.
