

The background is a light blue grid. A solid blue horizontal line is positioned near the top, and a solid blue vertical line is on the left side. They intersect at a small blue circle. Another solid blue horizontal line is near the bottom, and a solid blue vertical line is on the right side. They intersect at another small blue circle. The text is centered between these lines.

- Creating Drawings in SolidWorks

Drawing Views

- Multi-View Projection - The Glass Box
- Third Angle Projection
- Two View Drawings
- Line Types
- Section Views
- Auxiliary Views
- Detail Views
- Broken-Out Section Views
- Partial Views, Cropped Views

Drawing Views – Multiview Projection

- A view of an object is known technically as a ***projection***
- A projection is a view conceived to be drawn or *projected* on to a plane, known as the ***plane of projection***
- Multiview or *orthographic projection* is a system of views of an object formed by projectors from the object perpendicular to the desired plane of projection. Huh?

Drawing Views – Multiview Projection

- The projection of an object.
 - Perpendicular lines or *projectors* are drawn from all points on the edges or contours of the object to the plane of projection.
- Shown below is the projection of an object onto the frontal plane.

Drawing Views – Planes of projection

likewise,

- the top view is projected onto the *horizontal plane*
- the side view is projected onto the *profile plane*

Multiview Projection – The Glass Box

- Placing parallel planes to the principal planes forms a *glass box* (always observed from outside the box)
- To show views of a 3D object on a 2D piece of paper, it is necessary to unfold the planes such that they lie in the same plane
- All planes except the rear plane are hinged to the frontal plane, which is hinged to the left-side plane

Multiview Projection – The Glass Box

- By unfolding the box, six views of the object are possible.

Drawing Views – Third Angle Projection

MULTIVIEW AND SECTIONAL VIEW DRAWINGS

ASME Y14.3-2003

Fig. 4 Third Angle Projection Standard Arrangement of the Six Principal Orthographic Views

Multiview Projection – Proper number of Views

- It may not, be necessary to show all six views to completely describe the object.
- In fact, the minimum number of views is preferable.
- How many views are necessary to completely describe this plate?
 - 1?
 - 2?
 - 3?
 - 4?

Multiview Projection – Two View Drawings

- The answer is 2!

Drawing Views – Sectional Views

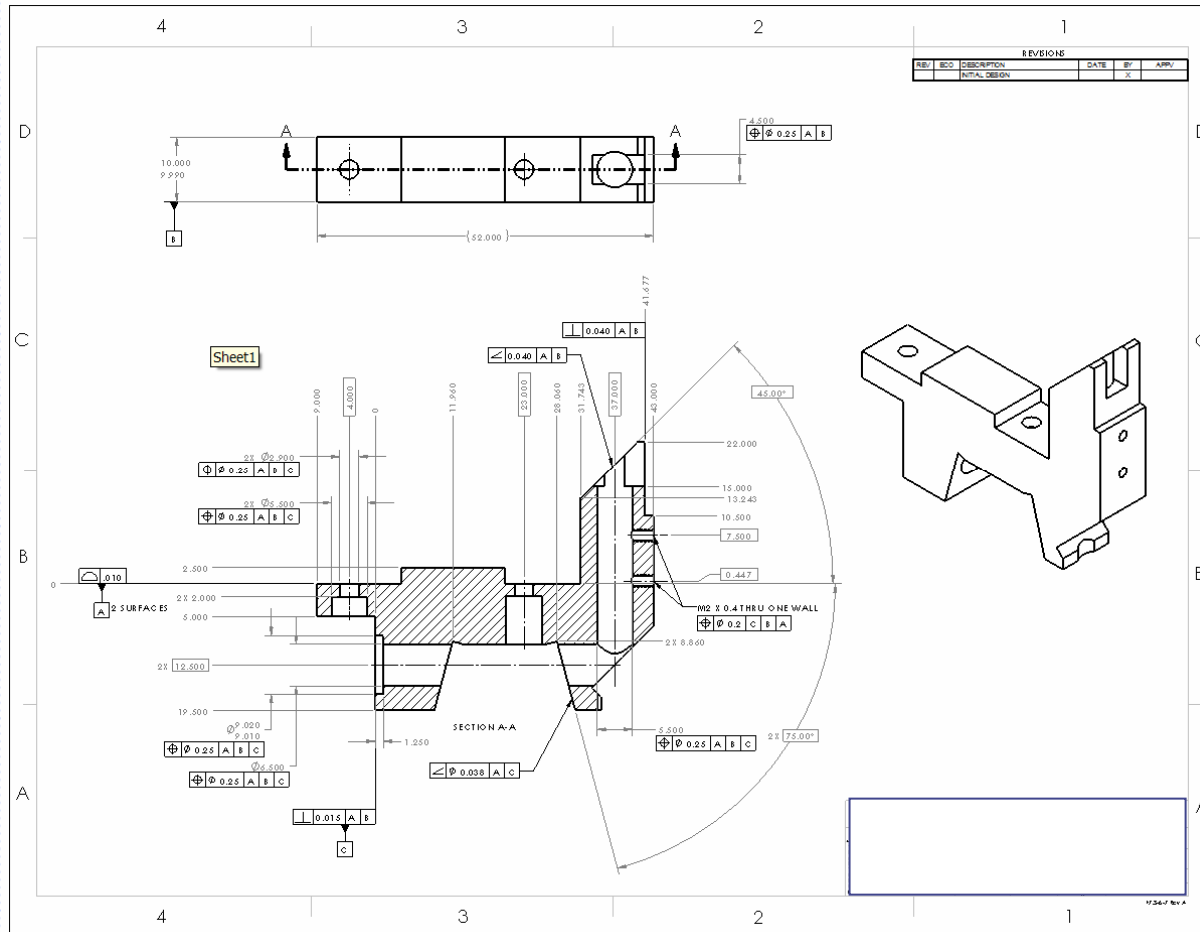

- We have covered the basic method of representing an object by projecting views. This allows us to see the external features of an object.
- Often times it is necessary to view the internal features, this is accomplished by slicing through the object and producing a *sectional or section view*

Section view is always placed BEHIND arrows

Drawing Views – Sectional Views

Sectional views are extremely useful in minimizing the number of projected views. How many views does this object require?

Drawing Views – Sectional Views

Section views provide clear and unambiguous representation of internal features

Drawing Views – Sectional Views

Section views can reduced the number of views of many axisymmetric parts to a single view

Drawing Views – Auxiliary Views

- Inclined planes and oblique (neither parallel nor perpendicular) lines appear foreshortened when projected to the principle planes of projection.
- To obtain a true size view, *auxiliary* views are created using similar techniques as for creating standard views, unfolding about an axis...

Drawing Views – Detail Views

When there is a great disparity between feature size, or views are overcrowded with dimensions, a *detail view* can be used to capture the feature(s) of interest and display them in a *removed view of greater scale*.

Detail View Designated by an Enclosed circle and labeled.

Removed And scaled

Labeled and scale noted

Drawing Views – Broken-Out Section

Broken-out Section views are essentially partial section views with out the section arrow. Often times they are used to expose a feature of interest while eliminating the need to create another view.

What is wrong with this drawing?

The auxiliary view is NOT behind
The view arrows!

Broken out
Section – No label
necessary

Sheet1

Drawing Views – Partial Views

Partial views are removed views and are established in a similar manner as section views, that is they *require view arrows to establish viewing direction*. However, they do not have to section an entire object, rather can simply display a partial view of a projection at a larger scale if desired.

What is wrong with this drawing?

Nothing!

Partial Section Line w/Labeled Arrows

Removed partial section view
Labeled and scale noted

Spring 2006

Drawing Views – Cropped Views

Cropped views reduce the size of a view such that only necessary information is displayed. Cropped views also maximize the sheet area by reducing view size.

Drawing Standards

- ASME responsible for mechanical drawing standards
 - Sheet Formats
 - Line Types
 - Dimensioning Rules and Schemes

Drawing Standards - ASME

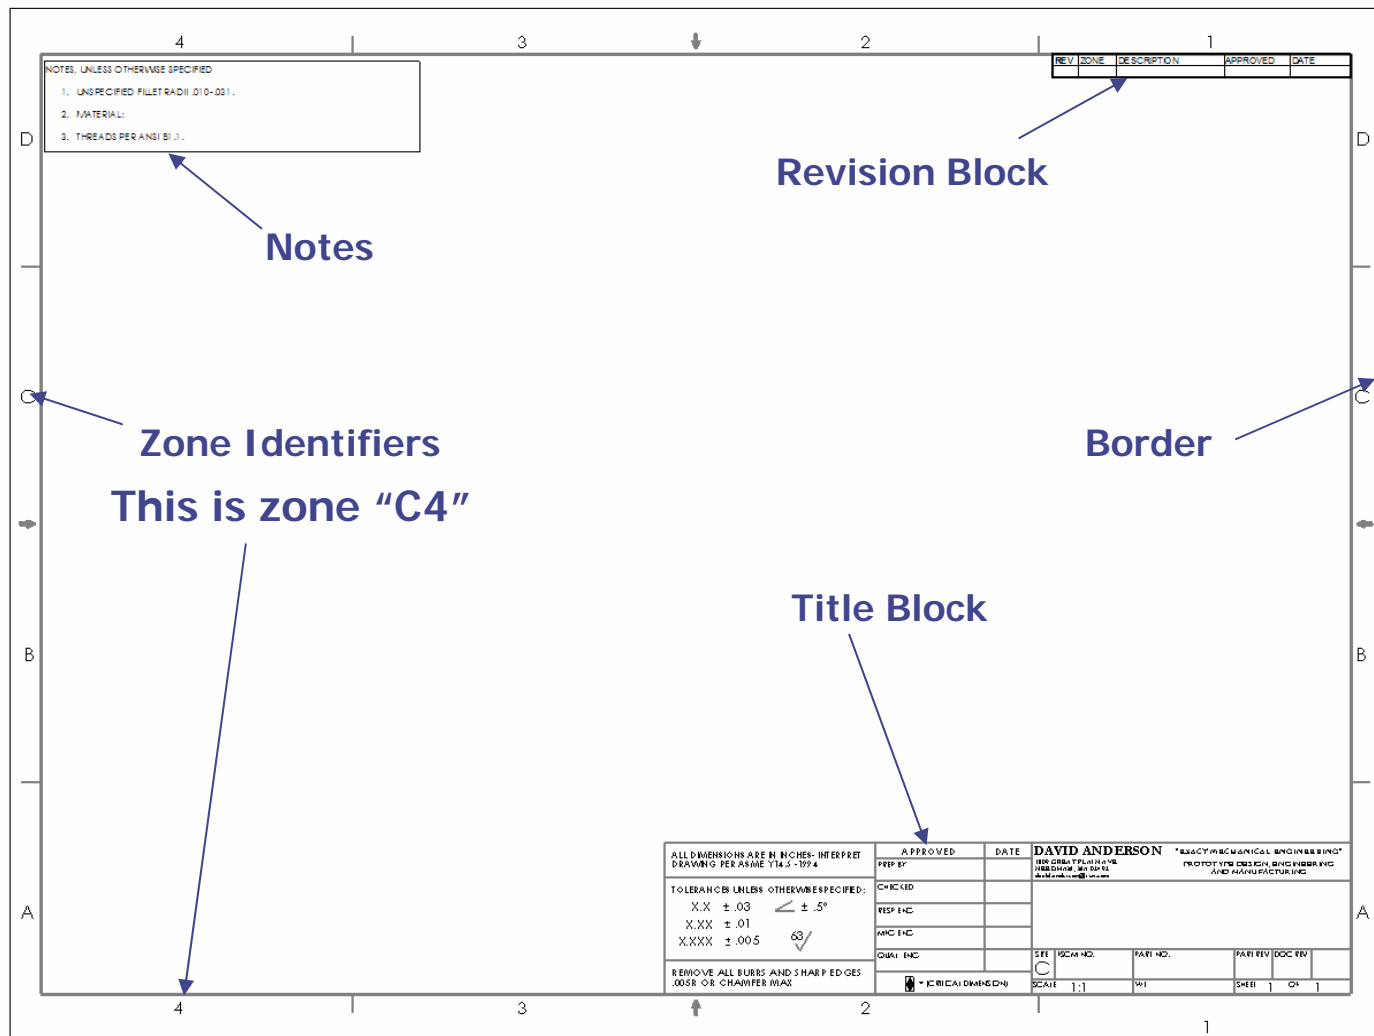

- There exists standards and practices for creating technical drawings of mechanical parts and assemblies. The governing agency responsible for setting the standards is ASME. There are a number of documents published by ASME that cover various aspects of mechanical drawings, here are a few of them...
- ASME Y14.100 -2004 Engineering Drawing Practices
- ASME Y14.4M - 1989 Pictorial Drawing
- ASME Y14.3M – Multi and Sectional View Drawings
- ASME Y14.1 - 1995 Decimal Inch Drawing Sheet Size and Format
- ASME Y14.5M – 1994 Geometric Dimensioning and Tolerancing
- ASME Y14.13M - 1981 Mechanical Spring Representation
- It is important to follow these standards to ensure your drawings are interpreted correctly by others.
- **Always consult the standard when in doubt!**

Drawing Standards – Sheet Formats

- There exist standardized sheet formats for creating engineering drawings.
- American National Standard
 - A - 8.5" x 11"
 - B – 11" x 17"
 - C – 17" x 22"
 - D – 22" x 34"
 - E – 34" x 44"
- International Standard ISO (mm)
 - A4 – 210 x 297
 - A3 – 297 x 420
 - A2 – 420 x 594
 - A1 – 594 x 841
 - A0 – 841 x 1189

Drawing Standards – Sheet Format

Example C-Size

Drawing Standards – Sheet Formats

8 7

NOTES, UNLESS OTHERWISE SPECIFIED

1. UNSPECIFIED FILLET RADII .025-0.50.
2. MATERIAL: 416 SS FULL HARD. FOR EXPEDITING PURPOSES, PART COULD BE MACHINED FROM 416 ½ HARD ROUND AVAILABLE FROM FRY STEEL 800-423-6651. IT IS IMPORTANT TO NOTE THAT DURING ASSEMBLY, BRINELLING OF THE PRECISION "VEES" IS LIKELY USING THE SOFTER MATERIAL.
3. THREADS PER ANSI B18.3.1.

Drawing Standards - Line Types

- There exist many line types here are but a few...

Visible Line

Hidden Line

Section Line

Center Line

Dim & Extension

Leaders

Cutting Plane
Viewing Plane

Leaders

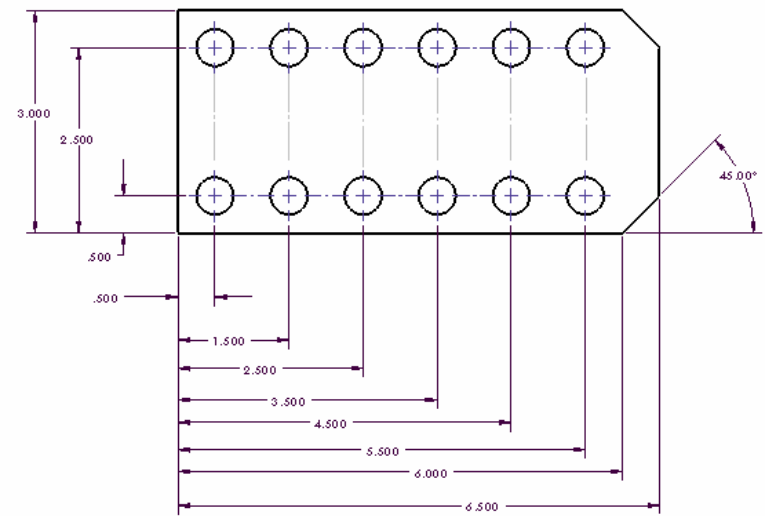

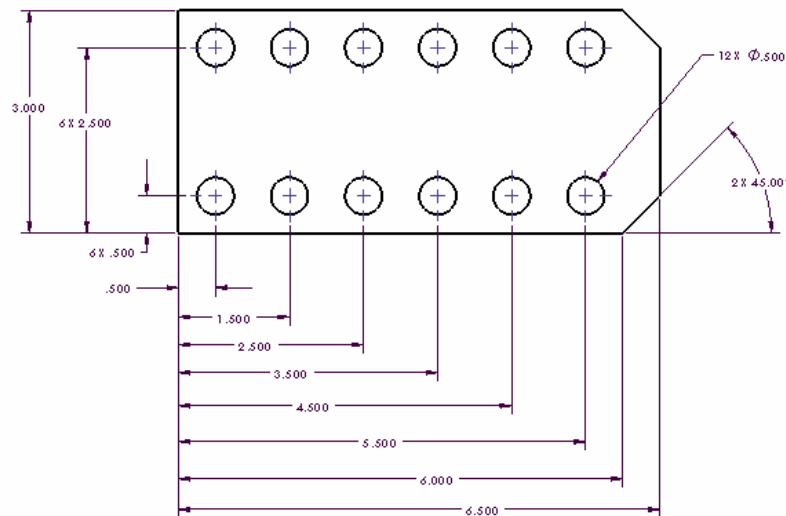

Drawing Standards - Dimensions

- There exist a number of dimension types
 - Linear
 - Coordinate Dimensions
 - Coordinate without dimension lines (Ordinate)
 - Angular
 - Radial/Diametrical
 - Tabular
 - Dimension Placement

Drawing Standards – Coordinate

Are these 2 drawings the same?

YES!

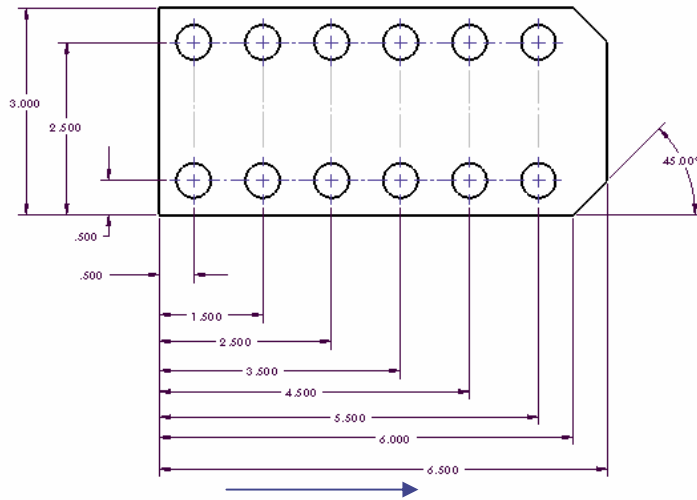

Which one would you rather detail?

Which one would you rather make?

Drawing Standards – Coordinate

Are these 2 drawings the same?

NO!

The hole-to-tolerance increases
The hole to edge tolerance is constant

The hole-to-tolerance is constant
The hole to edge tolerance increases

Drawing Standards – Ordinate

Are these 2 drawings the same?

YES!

Which one would you rather detail?

Which one would you rather make?

Drawing Standards – Proper Dimension Placement

Drawing Standards – Dimensioning Rules

1. All CAPS!
2. All Decimals
3. Select a front view that best describes the part
4. Remove hidden lines always, unless absolutely necessary
5. Do not duplicate dimensions
6. Do not dimension to hidden lines
7. Place dims between views if possible
8. No dims allowed on body of part. Offset .38" inch from object outline
9. Place all dims for feature in one view if possible
10. Dim lines cannot cross dim lines
11. Dim lines should not cross extension lines
12. Extension lines can cross extension lines
13. Center marks in view(s) only where feature is dimensioned only
14. Centerlines in view(s) where feature is dimensioned

Drawing Standards – Bolt Holes

Poor practice,
dims should all
be horizontal

Drawing Standards – Hole Tables

2X .500 X 45.00°

Best Practices/Basic Rules

1. **All CAPS!**
2. **All Decimals**
3. **Select a front view that best describes the part**
4. **Remove hidden lines unless absolutely necessary to describe the shape of the object**
5. **Consider datums and dimensioning scheme based on**
 1. **Feature relationship**
 2. **Manufacturability and inspection**
 3. **Reduce math for machinist**
6. **Do not duplicate dimensions, use reference dims if necessary to duplicate**
7. **Do not dimension to hidden lines**
8. **Place dims between views if possible**
9. **No dims on body of part. Offset .38" inch from object outline**
10. **Place all dims for same feature in one view if possible**
11. **Dim lines cannot cross dim lines**
12. **Dim lines should not cross extension lines**
13. **Extension lines can cross extension lines**
14. **Use center marks in view(s) only where feature is dimensioned**
15. **Use centerlines and center marks in views only if feature is being dimensioned or referenced otherwise omit.**
16. **When multiples of the same feature exists in a view, dimension only one of the features and label the dim as "NumberX" DIM meaning that the feature exists in that view "Number" times. For example, "4X .250" implies that in the view, there exists 4 like dimensions for the dimensioned feature**
17. **Minimize use of centerlines between holes etc, they add little value and clutter the object being drawn.**
