- Bronchitis
- Dyspeptic complaints

Unproven Uses: Peptic discomforts, such as mild, spastic disorders of the gastrointestinal tract, feeling of fullness, flatulence; catarrh of the upper respiratory tract. Fennel honey is used for catarrh of the upper respiratory tract in children.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Allergic reactions following intake of Fennel have been only very rarely observed. Cross Sensitivity among patients with celery allergy appear to be possible.

Pregnancy: Preparations, excluding the drug itself and tea infusions are not to be administered during pregnancy.

Pediatric Use: Preparations, excluding the drug itself and tea infusions are not to be administered to small children.

DOSAGE

FENNEL OIL

Mode of Administration: Essential oil and galenic preparations for internal use.

Note: Diabetics must check the sugar content of available preparations.

Daily Dosage: 0.1 to 0.6 ml of Fennel oil

Duration of administration: Maximum of 2 weeks.

FENNEL SEED

Mode of Administration: Crushed or ground seeds for teas, tea-like products, as well as other galenic preparations for internal use.

Daily Dosage: 5 to 7 gm of drug

Fenugreek

Trigonella foenum-graecum

TRADE NAME

Fenugreek Seed (from various manufacturers) Premium Fenugreek Seed

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe, dried seeds.

Flower and Fruit: The 0.8 to 1.8 cm long flowers are solitary or in pairs in the leaf axils. They are almost sessile. The calyx tube is membranous and usually longer than the lanceolate tips. The corolla is usually pale yellow, occasionally darker or violet and about double the length of the calyx. The wings are about half as long as the standard and the carina is very obtuse, round and barely longer than the calyx. The fruit is a 2.5 to 10 cm long and 0.5 to 1 cm wide, erect, leaning, linear and appressed pubescent pod with a long lip. The 4 to 20 seeds are flattened, divided into 2 uneven halves by a deep groove, ovate to di-shaped. yellow-brown, or brown-red and very hard when dry.

Leaves, Stern and Root: The plant is an annual, 10 to 50 cm high herb with a long vertical taproot. The stem is sturdy, round, erect or decumbent and branched. The leaves are trifoliate and the petioles are 0.5 to 2 cm long. The leaflets are 1 to 3 cm long, obovate to oblong-lanceolate, obtusely deltoid to rounded. The stipules are fairly large, membranous, ovate, acute and more or less softly pubescent.

Habitat: The species is common all over the Mediterranean region as far as India and China and southward as far as Ethiopia. The main regions of cultivation are southern France, Turkey, northern Africa, India and China.

Production: Fenugreek consists of the ripe, dried seed of *Trigonella foenum-graecum*.

Other Names: Greek Hay Seed, Bird's Foot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages (25-45%, mannogalactans)

Proteins (25-30%)

Proteinase inhibitors

Steroid saponins (1.2-1.5%): including trigofenosides A to G (to some extent bitter), aglycones including diosgenin, yamogenin, gitogenin, smilagenin, tigogenin, yuccagenin

Steroid saponin-peptide ester: including foenugraecin

Sterols: chief constituents 24xi-ethyl-cholest-5-en-3beta-ole (65%), sterols that are to some extent esterated

Flavonoids: including isoorientin, isovitexin, orientin, orientin arabinoside, isoorientin arabinoside, saponaretin, vicenin-1, vincenin-2, vitexin

Trigonelline (caffearin, N-methylbetaine of the nicotinic acid, 0.4%)

Volatile oil (0.01%): aroma bearer 3-hydroxy-4,5-dimethyl-2(5H)-furanone

EFFECTS

Externally, the drug acts as an emollient. Internally, Fenugreek reduces blood sugar, but the mode of action is unclear. In addition, a lipid-lowering effect attributed to the saponin fraction has been proven as well as a hydrogogic effect. There is no indication of a lactation-promoting effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Inflammation of the skin

Unproven Uses: Internal uses include upper respiratory catarrh, diabetes, and to increase milk production. Externally, the drug is used as poultice for local inflammation, ulcers, and eczema.

Chinese Medicine: The drug is used to treat cold pain in the lower abdomen, impotence, and hernia (said to be due to cold 'chi').

Indian Medicine: The drug is used for fever, vomiting, anorexia, coughs, bronchitis, and colitis.

CONTRAINDICATIONS

The drug should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Sensitization is possible through repeated external administration of the drug.

Drug Interactions: Fenugreek has hypoglycemic effect. There is a potential for the herb to interact with hypoglycemic drugs that are used to treat diabetes resulting in an exaggerated hypoglycemic effect.

DOSAGE

Mode of Administration: Whole and powdered drug is available in the form of teas and compound preparations.

How Supplied:

Capsules — 575 mg, 610 mg, 626 mg

Preparation: To prepare a tea, leave 0.5 gm drug to steep in cold water for 3 hours, then strain; the tea may be sweetened with honey. A poultice is prepared as a thick paste made from the powdered seeds: add 50 gm of powdered drug to ¹/_U liter of boiling water for 5 minutes. To make a cold maceration, soak 0.5 gm of drug in cold water, then filter.

Daily Dose: The daily internal dose of the drug is 6 gm. One cup of the tea may be taken several times a day. For loss of appetite, take 2 gm of cut drug with fluid 3 times daily, before meals. The cold maceration can be drunk several times a day.

Fever Bark

Alstonia constricta

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark of the root and trunk.

Flower and Fruit: The flowers are creamy white and star-shaped.

Leaves, Stem and Root: *Alstonia* are evergreen trees, which grow to a height of 15 m. The leaves are glossy, oblong and petiolate. The tree has a 2 to 7 cm rusty-brown, rugose periderm, which is deeply fissured. The inner surface is yellowish brown and coarsely striated longitudinally, fracture fibrous.

Characteristics: The tree is a protected species in some countries. The taste is very bitter, the odor is slightly aromatic.

Habitat: *Alstonia constricta* is indigenous to Australia; *Alstonia scholaris* is indigenous to India and the Philippines.

Production: *Alstonia* bark is the trunk and branch bark of *Alstonia constricta*.

Other Names: Australian Quinine, Australian Febrifuge, *Alstonia* Bark, Devil Tree, Dita Bark, Pale Mara, Devil's Bit, Australian Fever Bush, Pali-Mara

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids: including reserpine, deserpidine, alstonine, tetrahydroalstonine, alstonidine, yohimbine

EFFECTS

The drug is said to be a febrifuge, antispasmodic and antihypertensive. The antihypertensive effect is due to the reserpine and echitamin content.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as a febrifuge and stimulant and for its reserpine content. In the past, it was used to treat rheumatism.

Chinese Medicine: In the Far East, Fever Bark is used for diarrhea and malaria. It has also been used as a uterine stimulant.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Due to the presence of pharmacologically active indole alkaloids of the beta-carboline type, side effects may resemble those of Rauwolfia. Symptoms of poisoning following the intake of higher dosages are conceivable.

DOSAGE

Mode of Administration: The forms available are powder, liquid extract, infusion and tincture. Up-to-date information on usage is not available.

Preparation: Fever Bark is available as an infusion, 1:20, a tincture, 1:8 or 1:10 and as a liquid extract, 1:1.

Daily Dosage: The average daily dose of the infusion is 15 to 20 ml; tincture, 2 to 4 ml; liquid extract, 4 to 8 ml.

Feverfew

Tanacetum parthenium

TRADE NAMES

Feverfew (available from numerous manufacturers), Feverfew Extract, Herbal Sure Feverfew, NuVeg Feverfew Leaf, Premium Feverfew Leaf, Feverfew Traditional Herb, Standardized Feverfew Extract, Feverfew Leaf, Mygrafew

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb of the plant.

Flower and Fruit: The 5 to 20 composite flower heads are in a dense corymb. The epicalyx has a diameter of 6 to 8 mm. The lingual florets are white and female. The ray florets are 2.5 to 7 mm. The achenes are 1.2 to 1.5 mm and 5- to 8-ribbed.

Leaves, Stem and Root: The plant is a strongly aromatic perennial. The leaves are pinnatisect to pinnatifid and yellowish-green. The basal and lower cauline leaves are more or less ovate with 3 to 7 oblong-elliptical to ovate segments, which are subpinnately divided. They are crenate or entire-margined.

Habitat: The plant originated in southeastern Europe and is now found all over Europe, Australia and North America.

Production: Feverfew leaves are the leaves of *Tanacetum parthenium*. The plant is cut before full flowering. It is dried in thin layers in the shade, at temperatures not exceeding 35° C.

Other Names: Featherfew, Featherfoil, Midsummer Daisy

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (0.75%): chief constituents are L-camphor, trans-chrysanthyl acetate, including, camphene, p-cymene, gamma-terpinene, D-germacrene, linalool, borneol, terpinenes-4-ol

Sesquiterpene lactones: especially parthenolide, and also 3-beta-hydroxy-parthenolide, costunolid, reynosin, 8-beta-hydroxy-reynosin, tanaparthin-alpha-peroxide, canin, artemican, secotanapartholide A

Flavonoids: including apigenin-7-0-glucuronide, chrysoeriol-7-0-glucuronide, luteolin-7-0-glucuronide, luteolin-7-0-glucoside, tanetin

Polyynes: presumably only in fresh plants

EFFECTS

Sesquiterpene lactones, especially parthenolide, are the active compounds in Feverfew (Groenewegen, 1986; Sumner, 1992). Parthenolide, although a key determinant of biological activity for *Tanacetum parthenium* leaf extracts, is not the sole pharmacologically active constituent (Brown, 1997). Other sesquiterpene lactones such as 3-beta-hydroxy-parthenolide, secotanapartholide A, canin and artemican, contain an alpha-methylene butyrolactone unit responsible for anti-secretory (anti-inflammatory) activity (Groenewegen, 1986). Physicochemical methods were used to measure parthenolide in several purported commercial Feverfew products. The results found a wide variation in parthenolide content

and in some products, partholide was not detected (Heptinstall, 1992).

ag Crude chloroform extracts of fresh Feverfew leaves (rich in sesquiterpene lactones) and of commercially available powdered leaves (lactone-free) produce a dose-dependent inhibition of thromboxane B2 and leukotriene B4 (eicosanoids) for an anti-inflammatory effect (Sumner, 1992). Anti-inflammatory properties of Feverfew also consist of inhibition of cellular phospholipases, which prevents release of arachidonic acid (Makheja, 1982). Parthenolide and chrysanthenyl acetate have also been shown to inhibit prostaglandin synthetase (Pugh, 1988). Extracts of Feverfew also inhibit granule secretion in blood platelets and polymorphonuclear leukocytes (Heptinstall, 1985).

Major flavonol and flavone methyl ethers (tanetin) of the herb inhibit the major pathways of arachidonate metabolism in leukocytes (Williams, 1999).

fm Feverfew extract and parthenolide inhibit human blood aggregation and serotonin (5-HT) secretion by platelets (Groenewegen, 1990). The extract does this through neutralizing cellular sulfhydryl-affecting substances, which are properties of monocyte adherence (Krause, 1990). The chloroform extract of the Feverfew leaf contains an unidentified substance capable of producing a selective, open-channel block of voltage-dependent potassium channels, which results in an anti-spasmodic effect (Barsby, 1993). Feverfew extract inhibited anti-IgE-induced histamine release in a unique way, which concludes that Feverfew extract contains a novel type of mast cell inhibitor (Hayes, 1987).

CLINICAL TRIALS

ffr The efficacy of dried Feverfew leaves for migraine prophylaxis was assessed in a randomized, placebo-controlled, double-blind, cross-over study. The study consisted of 72 patients with classic or common migraine headaches for over 2 years. The effect of 1 capsule daily of Feverfew was determined by the use of diary cards and visual analogue scores. Duration of treatment was 4 months. After this time, Feverfew was associated with a reduction in number and severity of attacks in each 2-month period. The degree of vomiting was also reduced in the Feverfew treatment group. A significant improvement in the visual analogue scale was also observed in the Feverfew treatment group (Murphy, 1988).

Patients already taking Feverfew for migraine prophylaxis were randomized in a double-blind, placebo-controlled trial. The placebo groups had a significant increase in the frequency and severity of headache, nausea and vomiting with the emergence of untoward effects during the early months of treatment. There was no change in the frequency or severity of symptoms of migraine in the Feverfew

treatment group, thus suggesting that Feverfew may be taken prophylactically to prevent attacks of migraines (Johnson, 1985).

A double-blind, placebo-controlled study evaluated the use of dried chopped Feverfew (70-86 mg) in patients with symptomatic rheumatoid arthritis. There were 41 patients involved in the study, and they were observed during a 6-week period. Variables assessed in the study included stiffness, pain (visual analogue scale), grip strength, articular index, full blood count, erythrocyte sedimentation rate, urea, creatinine, C reactive protein, complement breakdown products, rheumatoid factor titre, immunoglobulins (IgG, IgA, IgM), functional capacity, and patient and observer global opinions. There were no important differences in clinical or laboratory variables between the groups during the study period (Patrick, 1989).

INDICATIONS AND USAGE

Feverfew is used mainly for migraine, arthritis, rheumatic diseases and allergies.

Unproven Uses: In folk medicine, Feverfew is used for cramps, as a tonic, a stimulant, a digestive agent and a blood purifier. Other uses in folk medicine include migraine prophylaxis, digestion problems, intestinal parasites and gynecological disorders. The herb is also used as a wash for inflammation and wounds, as a tranquilizer, an antiseptic, and following tooth extraction as a mouthwash. The infusion is used for dysmenorrhea. In post-natal care, Feverfew is used to reduce lochia. The drug is used externally as an antiseptic and insecticide.

CONTRAINDICATIONS

The herb is not to be used during pregnancy or during breastfeeding.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug has a high potential for sensitization via skin contact. Feverfew has been known to cross-react with Tansy, Yarrow, Marguerite, Aster, Sunflower, Laurel and Liverwort (Schmidt, 1986). A post-Feverfew syndrome has been reported in about 10% of migraine patients who abruptly stopped taking Feverfew. Rebound headaches, insomnia, muscle stiffness, joint pain, fatigue, nervousness and tension have occurred (Miller, 1998).

Gastrointestinal: Gastrointestinal irritation and abdominal pain or heartburn have been reported (Johnson, 1985; Murphy, 1988; O'Hara, 1998). Glossitis and stomatitis are significant problems if they do occur (Brown, 1996). The occurrence of glossitis and stomatitis with encapsulated products has not been shown to be more common than placebo (Johnson, 1985; Murphy, 1988).

Skin: There are reports of allergic dermatitis on exposure to the leaves and petals of Feverfew (Schmidt, 1986). Two elderly individuals suffering from acute recurrent photodermatitis were shown to be allergic to Feverfew (Mensing, 1985). Eczema was reported in greenhouse workers exposed to various members of the Compositae family, including Feverfew (Paulsen, 1998). A recent investigation does not support the theory of airborne sesquiterpine lactone-containing plant parts, or of direct release of sesquiterpine lactones from living plants as the only explanations for airborne Compositae dermatitis (Christensen, 1999).

Musculoskeletal: Feverfew contains sesquiterpenes (parthenolide and cynaropicrin), which have been shown to induce toxic and irreversible inhibition of smooth muscle contractility when there are high concentrations in the tissue (Hay, 1994).

Drug Interactions: Although reports are sketchy, and most involve animal subjects and *in vitro* research, there is a strong possibility that Feverfew may interact with thrombolytics, anticoagulants and platelet aggregation. The mechanism of action is believed to be inhibition of arachidonic acid, which is a precursor for prostaglandins that are involved in the clotting mechanism.

DOSAGE

Mode of Administration: Feverfew preparations are used both internally and externally.

How Supplied:

Capsules — 80 mg, 380 mg, 384 mg, 400 mg, 500 mg, 1000 mg

Tablets — 12mg (standardized to 600 meg sesuiterpine lactone content)

Preparation: To make an infusion, use 2 teaspoonfuls of the drug per cup, allow to draw for 15 minutes. To make a strong infusion, double the amount and allow to draw for 25 minutes.

Daily Dosage:

Capsules — 200 to 250 mg daily for the treatment of migraines; the usual standardization level is 0.2% parthenolide content (Brown, 1996). Freshly dried powdered Feverfew of 25 mg is approximately equal to 0.1 mg of sesquiterpine lactones (SL) (Mervyn, 1986).

Fresh leaf — 1 to 3 leaves (25 to 75 mg) once or twice daily has been recommended (Johnson et al, 1985; O'Hara, 1998).

Unproven uses — 3 cups of the infusion are taken per day. The stronger infusions are used for washes.

Storage: Store the herb in sealed containers.

Ficus carica

See Figs

Field Scabious

Knautia arvensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the leafy stem including the flower heads and the fresh aerial parts of the flowering plant.

Flower and Fruit: The flat-domed, composite flowers are on long, pubescent, glandular or non-glandular pedicles. The androgynous heads are 2 to 4 cm in diameter and contain 85 to 100 florets. The female capitula are smaller and contain 55 to 60 florets. The florets are blue-lilac, occasionally red-lilac or yellowish-white to pure white. The lateral florets are ray-like. The 2- to 3-rowed involucre bracts are lanceolate, compressed and long-haired. The edge of the calyx has 8 to 16 bristles. The corolla is fused and 4 tipped. There are 4 stamens and 1 inferior ovary. The fruit is a nutlet 5 to 6 mm long and about 2 mm wide. The fruit is thickly covered in vertical hairs.

Leaves, Stem and Root: The plant is perennial and 30 to 150 cm high. The rhizome is branched and has a strong taproot. The rhizome produces a flowering stem from the leaf rosette, which survives the winter. The stem is erect, lightly branched and has short gray hairs. The leaves are opposite, gray-green and matte. The lower ones are petioled, oblong and entire-margined. The upper leaves are sessile, pinnatisect and have lanceolate tips.

Habitat: The plant is found all over Europe except the Arctic. It is also found in the Caucasus and western Siberia.

Production: Field Scabious herb consists of the leafy stems and flower heads and also occasionally the root of *Knautia arvensis*.

Other Names: Devil's Bit, Seabridge

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins: knautioside (1.1-1.7%)

Steroids: sterols, including beta-sitosterol glucoside, knautiosides A and B

Iridoide monoterpenes: including dipsacane

Flavonoids: including leucanthoside, luteoloside

Tannins

EFFECTS

The drug is said to have an astringent, antiseptic, expectorant and even purgative effect. None of these effects have been proven.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for chronic skin diseases, eczema, anal fissures, pruritus ani, urticaria, scabies, favus, and for the cleansing and healing of ulcers. It is also used to treat coughs and throat complaints, as well as cystitis.

Homeopathic Uses: Field Scabious is used in homeopathic remedies to treat respiratory tract inflammations and poor digestion.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Decoction and infusion preparations are used both internally and externally.

Preparation: For preparation of the drug, use approximately 30 gm infusion or decoction, add to 1 liter of hot water, strain and cool.

Daily Dosage: For chronic eczema, add 4 teaspoonfuls to 2 glasses of water, leave to draw for 10 minutes and drink during the course of the day.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml s.c., acute: 3 times daily; chronic: once a day (HAB1).

Figs

Ficus carica

DESCRIPTION

Medicinal Parts: The medicinal parts are the fruit and the tree sap latex.

Flower and Fruit: In its known form, the fig is neither a fruit nor a flower. It is a hollow, fleshy receptacle enclosing numerous flowers, which are never exposed to sunlight, but nevertheless develop fully and produce seeds. The inflorescence is hidden in the body of the fruit. The edge of the pear-shaped receptacle is curved inwards forming an almost closed hollow space. The numerous fertile and sterile florets are on the inner surface. When it ripens, the receptacle

enlarges and the one-seeded fruit becomes embedded in it. It appears as a single purple-brown fruit.

- Leaves, Stem and Root:* Ficus carica is a deciduous, heavily branched tree growing to 4 m or more. The leaves are downy beneath and are 10 to 20 cm long, broad-ovate to orbicular with 3 to 5 deep lobes.

Habitat: Indigenous to Asia Minor, Syria and Iran. It is cultivated or grows wild in many subtropical regions.

Production: Figs consists of the dried fruits of Ficus carica.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Furanocoumarins: including psoralen, bergaptene

Fruit acids: citric acid, malic acid

Monosaccharides/oligosaccharides (approximately 50%), to some extent transformed into inverted sugar

Mucilages

Pectin

Vitamin B and C

EFFECTS

No information is available

INDICATIONS AND USAGE

Unproven Uses: Fig preparations are used as a laxative.

Chinese Medicine: In China, figs are used for dysentery and enteritis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

«

Figwort

Scrophularia nodosa

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried herb harvested before flowering, the herb with the root, and the root alone.

Flower and Fruit: The reddish-brown or greenish-yellow flowers are in terminal panicles. The calyx has 5 segments, with ovate, narrow-tunicate margined cusps. The corolla is a bilabiate, swollen, almost globular tube. The upper lip is divided into 2 and the lower lip is 3-lobed with revolute lobes. There are 4 stamens and 1 superior ovary. The fruit is an ovate, many-seeded, and pointed green capsule.

Leaves, Stem and Root: The perennial plant grows from 50 to 100 cm high. The root capitula have ovate, tuberous nodes. The stem is erect, sharply quadrangular, often purple, glabrous, and has a row of hairs at the nodes. The leaves are crossed opposite, dark green, oblong, double serrate and often cordate at the base.

Habitat: The plant is indigenous to Europe, central Asia, and North America.

Other Names: Throatwort, Carpenter's Square, Kernel wort, Heal-All Scrofula Plant, Rosenoble

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoides: including monoterpenes

Flavonoids: including among others, diosmin

Tannins

Saponins

EFFECTS

Figwort has a diuretic and mildly laxative effect. (No new research is available.)

INDICATIONS AND USAGE

Unproven Uses: External uses as folk remedies have included skin rashes, venereal warts, hemorrhoids, lacrimation and earache. According to English sources, the plant was used as a remedy for rabies.

Homeopathic Uses: The drug is used for low resistance, chronic tonsillitis, and tonsillar hypertony as well as for lymphedema.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: Homeopathic preparations of the mother tincture are derived from the whole Figwort plant in dilutions.

Homeopathic Dosage: 15 to 20 drops to be taken orally 3 times daily. Scrophularia nodosa can be administered by injection for long-term treatment

Filipendula ulmaria

See Meadowsweet

Fish Berry

Anamirta cocculus

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the ripe, dried fruit.

Flower and Fruit: The plant's petiolate inflorescences are panicle-like, 16 to 40 cm long and usually inserted in the stem. Male flowers are occasionally axillary. The two outer petals are smaller and about 1 mm long. The inner ones are whitish or yellowish-green, broad-elliptoid, 2 to 3 mm long, in 2 alternating, triple whorls and are imbricate. The synandria are formed from a short-stemmed, globose cluster

of about 30 to 35 anthers. The pollen is round and tricolporate. The female flowers have 3 tepals as well as small staminoids. The 3 or 4 carpels are set sideways on a central, erect fruit axis that becomes conically oblong when the fruit ripens. The style is inserted in the side and the stigma is turned back. The drupes are globose to reniform, 9 to 11 mm long, glabrous, and sit on the short, spreading branches of the fruit axis. The fruit is about 1 cm long, blackish, and contains a horseshoe-shaped seed.

Leaves, Stem and Root: Anamirta cocculus are hardy, woody lianas with ash-gray to straw-yellow striped bark. The leaves are ovate to cordate. The leaf blade is 16 to 28 cm long and 10 to 24 cm wide and coriaceous. The main veins are arranged in palmate fashion at the base with parallel secondary veins. The 6 to 18 cm petiole is thickened at both ends.

Characteristics: The fruit shell is tasteless, the seed is bitter and oily.

Habitat: The plant grows in India, Sri Lanka and Malaysia.

Production: Fish Berry seeds are the fruit of the false myrtle Anamirta cocculus. They are collected in the wild and sun-dried after harvesting.

Other Names: Levant Nut, Crow Killer, Fish Killer, Indian Berry, Cocculus Indicus

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpens: picrotoxin, a mixture of picrotoxinine and its by product picrotin, picrotoxin acid methyl ester

Isoquinoline alkaloids: menispermene, paramenispermene

Fatty oil

EFFECTS

The effect of the drug is due to the picrotoxin content. Picrotoxin paralyzes presynaptic blocking mechanisms and, like strychnine, has an analeptic effect in low doses. The central ends of the parasympathetic nerves are stimulated, as is the medulla oblongata. Breathing frequency is initially increased and subsequently decreased. The pulse slows due to the stimulation of the vagus and an increase in blood pressure. Central nervous system-stimulated vomiting along with an increase in perspiration and saliva are probably also due to the action of picrotoxin.

INDICATIONS AND USAGE

Unproven Uses: In the past, the drug was used as an insecticide in powder form for scabies. Its use against skin parasites and lice, while not substantiated, seems plausible. It was also used in cases of barbituric acid poisoning. In more recent times, it has been used in the treatment of peripheral and vestibular nystagmus, and in both long and short-term

therapy for peripherally based dizziness as well as travel sickness.

Indian Medicine: The seeds have been used externally in India and on the Malaysian archipelago for gout, skin diseases and parasites. The tender leaves are used as a contracting agent for the womb after birth.

Homeopathic Uses: The drug is used for nervous exhaustion, attacks of dizziness, cramps, paralysis, dysmenorrhea and occipital headaches. Efficacy has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is very poisonous. Mild poisonings cause headache, dizziness, nausea, coordination disturbances, general depression and spastic twitching.

OVERDOSAGE

With high dosages, the symptoms above are followed by frequent vomiting, sleepiness and tonic-clonic spasms. Death follows, often not until days later, through asphyxiation and heart failure. Two to three *Cocculus* kernels can be fatal.

Treatment consists of inducing vomiting and/or gastric lavage, purging with sodium sulphate, instillation of activated charcoal and forced diuresis. The spasms should be suppressed with diazepam, but only as much as is absolutely necessary. In case of fever, the patient should be wrapped in ice packs, administered high-caloric infusions and possibly given oxygen respiration. Phenothiazines and analeptics should be avoided.

DOSAGE

Mode of Administration: In combination preparations.

How Supplied: Commercial preparations include ampules, drops and tablets.

Preparation: Liquid extract is prepared using a 1:1 ratio of the drug and 90% ethanol. A mixture of the extract and coconut oil is prepared using a ratio of 1:8.

Tincture: 1:10 tincture: 70% ethanol

Unguetum cocculi: 125 g extract plus 650 g coconut oil plus 50 g beeswax and 250 g paraffin

Picrotoxin extraction is made using special procedures; maximum yield 1.5%

Daily Dosage: One to 5 mg can be taken by healthy patients who do not experience side effects. For peripheral states of dizziness: 1 mg to 5 mg (picrotoxin) slow intravenous infusion. As a long-term treatment: 1 mg suppositories for 3 weeks.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (for acute conditions), or 1 ml twice a week sc or ointment 1 or 2 times daily for chronic conditions.

Storage: Because they are poisonous, preparations should be secured in tightly closed containers, protected from light and unauthorized access.

Flax

Linum usitatissimum

TRADE NAMES

Bio flax, Flaxseed Oil, New Energy

DESCRIPTION

Medicinal Parts: The medicinal parts are the stem as a sterile linen thread, the oil extracted from the seeds, the dry ripe seeds, the linseed cakes and the fresh flowering plant.

Flower and Fruit: The flowers are panicle-like loose cymes on long peduncles in the leaf axils of the upper part of the stem. They have 5 ovate, acuminate, finely ciliate sepals and 5 obovate petals, which are sky blue and longer than the sepals. There are 5 stamens fused at the base and 1 ovary. The fruit is an almost globular, 6 to 8 mm long capsule on an erect or slightly bent stem. The seeds are flat, brown and glossy.

Leaves, Stem and Root: The plant is an annual and grows from 20 to 150 cm high. The root is short, fusiform and light yellow. The stem is unbranched, erect or ascending in shon

curves. The leaves are smooth edged, gray-green, sessile and almost awn-like acuminate.

Characteristics: The plant flowers only in the morning.

Habitat: The plant is cultivated in temperate and tropical regions the world over.

Production: Flaxseed consists of the dried, ripe seed of the collective variations of *Linum usitatissimum* as well as its preparations. The various cultivars of *Linum usitatissimum* are equally acceptable for the indications listed. The plant is cultivated. The ripe seeds are recovered from the capsules by threshing. The oil contained within the seeds is perishable. Processing of the seeds should take place by cold pressing at a temperature below 40° C.

Not to be Confused With: *Lolium temulentum* and weed seeds.

Other Names: Flaxseed, Lint Bells, Winterlien, Linseed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages (3-10%, in the epidermis, high swelling capacity): including arabinoxylans, galactans, rhamnogalacturonans

Cyanogenic glycosides (0.05-0.1%): linustatin and neolinustatin (yielding under optimal conditions 30-50 mg HCN per 100 gm)

Fatty oil (30-45%): chief fatty acids linolenic acid (40-70%), linoleic acid (10-25%), oleic acid (13-30%)

Proteins (20-27%)

Lignans: secoisolariciresinol-diglucoside

Phenylpropane derivatives: including among others, linositamarine

EFFECTS

The bulk material and mucins (swelling agent and mucilage) are responsible for the laxative effect.

In animal experiments a reduction of cholesterol levels in the liver was observed (due to the unsaturated fatty acids). A blood sugar lowering effect was also proven. The antitumoral effect is attributed to the lignans (lignans are antimycotic, anti-oxidative and anti-estrogenic).

Toxic principle: there is a discussion on the toxic effect of the cyanogenic glycosides in the drug which may cause prussic acid poisoning in humans. However, neither high single doses nor chronic intake of linseed have caused any signs of poisoning in humans.

INDICATIONS AND USAGE

Approved by Commission E:

- Constipation

- Inflammation of the skin

Unproven Uses: Internally, Flax is used for irritable colon, diverticulitis and as mucilage for gastritis and enteritis. A decoction is used for bladder catarrh and inflammation, gastritis.

Externally, Flaxseed is used for removing foreign bodies from the eye. A single Flaxseed is moistened and placed under the eyelid, the foreign body should stick to the mucous secretion of the seed; as cataplasm for local skin inflammation.

Indian Medicine: Flax is used in India as a tea for coughs, bronchial conditions, urethritis, diarrhea and gonorrhea; externally for skin infections. The seeds are also used in Indian veterinary medicine.

CONTRAINDICATIONS

Flaxseed is contraindicated in the following conditions: ileus, stricture of the esophagus and in the gastrointestinal area, acute inflammatory illnesses of the intestine, of the esophagus and of the stomach entrance.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The use of large quantities of the drug as a laxative with too little fluid intake can lead to an ileus. The cyanogenic glycosides present no danger with the intake of therapeutic dosages; the glycosides are broken down only to a limited extent in the body. An elevation in the concentration of cyanide ions and of the detoxification product thiocyanic acid in the blood could not be demonstrated.

It is recommended that if flaxseed is taken for inflammatory bowel conditions, that the flaxseed be preswollen before use (Bisset & Wichtl, 1994).

Drug Interactions: The absorption of other drugs taken simultaneously may be delayed.

Food Interactions: The absorption of Flaxseed oil is facilitated when taken with food.

DOSAGE

Mode of Administration: Internally, the cracked or coarsely ground seed, in which only the cuticle and mucilage epidermis are damaged is used. Linseed gruel and other galenic preparations are also available for internal use. Externally, as linseed meal or linseed expellent.

How Supplied:

Capsules — 1000 mg, 1300 mg

Oil

Seeds (whole or crushed)

Powder

Preparation: To prepare a demulcent for use in gastritis and enteritis, allow 5 to 10 gm of whole seeds to stand in cold water for 20 to 30 minutes, then pour off the liquid (Bisset & Wichtl, 1994).

Daily Dosage:

Constipation — 1 dessertspoon of whole or bruised (not ground) seed with at least 150 ml of liquid 2 to 3 times daily.

Lower Cholesterol — 35 to 50 gm daily of the crushed seeds. May be incorporated into muffins or breads (Arjmandi et al, 1998).

Decrease platelet aggregation — 1 to 2 tablespoonfuls flaxseed oil daily (Allman et al, 1995).

Gastritis and enteritis — 2 to 4 tablespoons of milled linseed prepared as recommended above (the seeds should not be taken in the dry state, should be pre-hydrated.)

External — 30 to 50 gm Flaxseed flour for a hot moist cataplasm or compress.

Storage: Flaxseed oil must be processed and stored properly (see "Production" above). Flaxseed meal is less vulnerable to rancidity when exposed to light and heat than the processed oil. The seeds should be protected from light and stored in a sealed container. The oil should also be protected from light and should be refrigerated.

Foeniculum vulgare

See *Fennel*

Fool's Parsley

Aethusa cynapium

DESCRIPTION

Medicinal Parts: The medicinal parts are the entire fresh plant and the dried aerial parts (herb).

Flower and Fruit: The plant has white long-stemmed umbels with many florets and no involucre. The calyx has 5 fused sepals. There are 5 white, sometimes reddish, obcordate, irregular petals. The flowers have 5 stamens and a 2-valved ovate ovary. The fruit is a 3 to 5 mm wide, globose schizocarp, straw yellow when ripe with red-brown stripes; it opens easily. Each section has 5 triangular ribs with 1 or 2 oil grooves in the hollow and 2 in the joints.

Leaves, Stem and Root: The plant is a leafy, 60 cm high annual or biennial plant. The root is thin, spindle-shaped and whitish. The stem is erect, round, grooved, hollow, glabrous and usually forked with a bluish bloom, which rubs off when handled. The leaves are glossy, dark green above and light green beneath. Leaflets are serrate with a triangular outline and double to treble pinnatifid. They give off an unpleasant garlic odor when rubbed.

Characteristics: The plant is poisonous. The plant can be mistaken for Parsley because of its similar appearance, but the plant is poisonous and can have fatal consequences. This similarity has resulted in its being given the name Fool's Parsley. It also bears a resemblance to Hemlock, though it is not as poisonous.

Habitat: The plant is indigenous to northern and central Europe, introduced into North America; cultivated and used as an ornamental plant for meadows in southern Germany.

Not to be Confused With: Young garden parsley is very similar. However, it differs in the glossiness of the underside surface of the leaf and pungent, burning, garlic-like smell of the leaves when rubbed.

Other Names: Dog Poison, Fool's-Cicely, Small Hemlock, Dog Parsley, Lesser Hemlock

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Polyynes: (only in freshly-harvested leaves) including aethusin, aethusanol A, aethusanol B

Flavone glycosides: including rutoside, narcissine, camphor oil-3-glucorhamnoside

Ascorbic acid

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Fool's Parsley has been used for gastrointestinal complaints in children, infantile cholera, summer diarrhea and convulsions.

Homeopathic Uses: *Aethusa cynapium* is used for milk intolerance in children, pylorus cramp, acute diarrhea with vomiting and poor concentration (HAB1).

PRECAUTIONS AND ADVERSE REACTIONS

Fool's Parsley is considered a toxic plant. The older literature contains descriptions of poisonings, sometimes fatal, occurring as a result of confusing garden parsley with the freshly harvested drug. Probably, however, these had to do with poisonings by spotted hemlock. Caution should nevertheless be exercised.

DOSAGE

Mode of Administration: The juice of the fresh drug is used in poultices; also available as alcoholic extracts.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules, 1 to 3 times daily; injection solution 1 ml twice weekly sc (HAB1).

Forget-Me-Not

Myosotis arvensis

DESCRIPTION

Medicinal Parts: The medicinal part is the flowering plant.

Flower and Fruit: The blue flowers are in leafless racemes. The calyx is fused and leaf-like with 5 tips. The corolla is shaped like a stemmed plate, has 5 tips, and is glabrous with yellow scales in the tube. The tube is enclosed in the calyx. There are 5 stamens and a 4-valvular ovary. The fruit stems are twice as long as the calyx and stand out. The calyx is closed when the fruit ripens. The fruit is composed of 4 nutlets.

Leaves, Stem and Root: The plant is leafy and grows from 15 to 40 cm high. The stem is erect or ascendent and pubescent. The leaves are alternate. The lower leaves are petiolate and oblong-obovate, the upper ones sessile and lanceolate to lanceolate-oblong.

Habitat: The plant grows in Europe.

Production: Forget-Me-Not is the flowering plant *Myosotis arvensis*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrrolizidine alkaloids

Caffeic acid derivatives: rosmarinic acid

#

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Forget-Me-Not is used in the treatment of respiratory disorders and nose bleeds.

PRECAUTIONS AND ADVERSE REACTIONS

Hepatotoxicity and carcinogenicity are possible consequences when taken internally, due to the presence of pyrrolizidine alkaloids with 1,2-unsaturated necic parent substances. Therefore, the drug should not be taken internally.

DOSAGE

Mode of Administration: The herb is administered ground and as an extract for external use.

LITERATURE

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Frangula

See *Strawberry*

Frangula

Rhamnus frangula

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried bark of the trunk and branches and the fresh bark of the trunk and branches.

Flower and Fruit: The flowers are in 2 to 10 axillary blossomed cymes on pedicles that are 1 to 3 times as long. The flowers are greenish white, infundibular, 3 to 4 mm long with 5 sepals and 5 petals, which are initially pubescent. The sepals are 3 mm long, oblong-triangular and acute. The petals are whitish, erect and stemmed. The petals enclose the stamens. The stamens are somewhat shorter than the petals and have large anthers and short filaments. The fruit is a globular, initially green, later red when ripe. The black-purple drupe is about 8 cm wide containing 2 to 3 seeds. The seeds are wide, flat triangular-lentil-shaped with a longer, very narrow groove.

Leaves, Stem and Root: The plant is a thornless, 1 to 3 m high bush or a 7 m high weedy tree. The branches are piled on the boughs and densely foliated. The bark is initially green later gray-brown and covered in gray-white lenticles. The leaf buds are pubescent. The leaves are thin, soft when young later becoming stiffer. They are broadly elliptical to obovate and about 3.5 to 5 cm long. The leaves are usually entire-margined and pubescent on the ribs of the under surface.

Characteristics: The heartwood is bright yellow-red. The odor is somewhat foul and the taste is disgustingly bitter.

Habitat: The plant is indigenous to all of Europe, Western Asia, Asia Minor and the Caucasus; it has spread to the wild in North America.

Production: Frangula bark consists of the dried bark of the trunks and branches of *Rhamnus frangula*. The bark is peeled in May and June, then either dried and stored for 1 year to dry or heated for 1 hour at 100° C.

Other Names: Buckthorn, Frangula, Alder Buckthorn, Black Alder, Dog Wood, Black Dogwood, Black Alder Tree, European Black Alder, Black Alder Dogwood, Arrow Wood, European Buckthorn, Persian Berries, Alder Dogwood

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (4 to 6%): anthranoids, chief components glucofrangulin A, glucofrangulin A-diacetate (estered at rhamnose remnant), as well as frangulin A, frangulin C

Naphthalene derivatives: naphthoquinones

Peptide alkaloids (traces): including frangulanine

EFFECTS

The bark contains anthracene derivatives and their aglycones which have an anti-absorptive and hydrogogic effect. The anthracene derivatives induce active secretion of electrolytes and water in the intestinal lumina and inhibit the absorption of electrolytes and water from the colon by stimulating propulsive contractions. This results in accelerated intestinal passage time. In this manner, the increased water and subsequent volume of the intestinal content raise pressure and stimulate intestinal peristalsis.

INDICATIONS AND USAGE

Approved by Commission E:

- Constipation

Unproven Uses: Frangula bark is used to ease bowel evacuation in the case of anal fissures, hemorrhoids and after rectal-anal surgery. It may also be used in preparation for exploratory surgery of the gastrointestinal tract.

Homeopathic Uses: Rhamnus frangula is used for weak digestion with a tendency to diarrhea.

CONTRAINDICATIONS

The drug is not to be used with intestinal obstruction, acute inflammatory intestinal diseases, appendicitis or with children under 12 years of age. The drug is not to be administered during pregnancy or while nursing.

PRECAUTIONS AND ADVERSE REACTIONS

General: Long-term use leads to loss of electrolytes, especially potassium ions. This may lead to hyperaldosteronism, inhibition of intestinal motility and enhancement of the effect of cardioactive steroids, which may lead to arrhythmias. Nephropathies, edema and accelerated bone deterioration are possible after long term use.

The question of an increased incidence of carcinoma of the colon following long-term administration of anthracene drugs has not yet been fully clarified. Recent studies show no definite connection between the administration of anthracene drugs and the frequency of carcinoma of the colon.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Vomiting and spasmodic gastrointestinal complaints could occur as side effects to the drug's purgative effect or with overdoses.

DOSAGE

Mode of Administration: Frangula Bark is available in solid pharmaceutical form and in commercial compounded preparations for oral intake. It is also available parenterally for homeopathic use.

Preparations:

Tea — scald 2 gm finely cut drug and strain after 15 minutes. The drug may also be left to steep in cold water for 12 hours.

Dry extract — percolation of 100 gm bark with methanol, after 1 day 400 gm to 500 gm percolate are extracted. The liquids (percolate and pressed juice) are left to stand for 8 days at 2 to 8° C before being filtered and dried. The glucofrangulin content must be stabilized at 15 to 17%.

Daily Dosage: 20 mg to 180 mg hydroxy-anthracene derivatives

Tea — 1 cup mornings and evenings

The correct dosage for each individual is the smallest dosage necessary to maintain a soft stool. Frangula bark should not be used continuously for more than 1 or 2 weeks.

Homeopathic Dosage: from D3: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1)

Storage: Frangula may be stored for at least 1 year if protected from light and moisture.

Frankincense

Boswellia carteri

DESCRIPTION

Medicinal Parts: The medicinal part of the tree is the resin gum exuded when incisions are made in the bark of the trunk.

Flower and Fruit: The flowers are solitary on short stalks and single axillary inflorescences. The calyx is small, 5-toothed and perennial. The corolla has 5 elongated petals, and there are 5 stamens. The long anthers fall early. The fruit is a capsule divided into 3 parts with a seed in each section. The seeds are surrounded by a wide membranous leaf.

Leaves, Stem and Root: *Boswellia carteri* is a richly foliated tree whose leaves alternate unevenly on the branches to the tips. The 10 pairs and one leaflet are short-stalked, elongated, blunt, serrate, finely pubescent and mostly alternate. The base of the leaf is a fleshy cup-shaped disc that is larger than the corolla. The plant grows on few roots, which appear to be fused with the stony soil via an inert mass.

Habitat: *Boswellia carteri* is found in Somalia and parts of Saudi Arabia.

Production: (Indian) Frankincense or Olibanum is the hardened gum resin of *Boswellia carteri*, which exudes when incisions are made in the trunk. It is collected after being allowed to harden in the open air for about three weeks.

Not to be Confused With: The exuded gum resin of the trunk of *Boswellia serrata* also is called Frankincense or Olibanum.

Other Names: Olibanum

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (5-9%): chief components 1-octyl acetate (share 60%), 1-octanol (share 12.7%), including as well alpha-pinene (3.5%), incensol (2.7%)

Resins (60%): components including among others alpha-boswellic acid, beta-boswellic acid, methyl ester of 3-acetyl-pVboswellic acid

Mucilages (12-20%)

EFFECTS

Externally, Frankincense can cause mild irritation of the skin. Internally, it is a mild carminative.

INDICATIONS AND USAGE

The drug is considered obsolete for medicinal use because its mode of action has not been documented. In vitro, the alpha and beta boswellic acids showed antimicrobial activity and inhibited the complementary system. The mucin, triterpene and essential oil content make application for respiratory conditions and its use for wounds seem plausible.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is considered obsolete, even though no health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: The Frankincense resin is obtained by tapping the bark and leaving the exudate for about three months, during which time it hardens slightly, allowing the resin to be collected.

Fraxinus ornus

See Manna

French Tarragon

Artemisia dracunculus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts of the plant.

Flower and Fruit: The flowers are drooping, almost globular and 2 to 3 mm across. They are whitish, later reddish, and clustered in loose panicles. The sepals of the epicalyx are oblong-elliptic and mostly green; the inner ones are ovate with a broad membranous edge. The ray florets are female. The disc florets are androgynous and infertile. The corolla is yellow with a glabrous receptacle.

Leaves, Stem and Root: The plant is a glabrous, 60- to 120-cm high herbaceous perennial. There are numerous stems,

which are bushily branched with flowering branches at the top. The leaves are simple, lanceolate-linear, 2 to 10 cm by 2 to 10 mm, thorn-tipped, entire or slightly serrate, and somewhat glossy.

Characteristics: The odor is aromatic and intense.

Habitat: The plant is indigenous to Germany, Russia and southern Europe.

Production: French Tarragon leaves or herbs are picked when in bloom and carefully dried.

Other Names: Little Dragon, Mugwort, Estragon

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil of complex, variety-specific composition (0.25-3.1%): chavicol methyl ether dominates in German species, accompanied by ocimene, myrcene, alpha-pinene, beta-pinene, camphene, limonene, linalool

Flavonoids: including quercetin and patuletin glycosides

Hydroxycoumarins: including herniarin, scopoletin

hocoumarins: including artemidin

Polyynes

EFFECTS

The essential oil of the drug is an appetite stimulant.

INDICATIONS AND USAGE

Unproven Uses: French Tarragon is used as an appetite stimulant.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Both the fresh and dried plant is used, mostly as a culinary herb.

Fringetree

Chionanthus virginicus

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root or tree bark.

Flower and Fruit: The tree bears long peduncles of white, snowdrop-like flowers with fringed petals the same size as magnolia flowers. The flowers are androgynous, but on some stalks the flowers are almost exclusively male or female. The calyx is short and consists of four parts. The four petals are fused at the base. They are initially green but turn snow white and extend about 2.5 cm. Two stamens are enclosed in the short tube. The fruit is 1.5 to 2 cm across, dark blue to black, and oval and with a hard stone.

Leaves, Stem and Root: Fringetree is a deciduous shrub or tree up to 10 m tall. The leaves are smooth or downy, oblong or oval, 7.5 to 20 cm long and opposite. The root bark is about 3 mm thick and consists of irregular, quilled pieces up to about 8 cm long. The exterior of the bark is dull brown with concave scars. The inner surface is smooth and buff colored. The fracture is short and dense with projecting bundles of stone cells.

Characteristics: Fringetree is almost odorless and very bitter. The bark is so dense that, unlike most other barks, it sinks in water.

Habitat: Fringetree grows in the central and southern U.S. and also in eastern Asia.

Production: Fringetree root bark is the root bark of *Chionanthus virginicus*.

Other Names: Gray Beard Tree, Old Man's Beard, Poison Ash, Snowflower, White Fringe, *Chionanthus*, Snowdrop Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Lignane glycosides: phillyrin (chionanthine)

Saponins

EFFECTS

Fringetree, because of its saponin content, is said to have hepatic, cholagogue, diuretic and tonic effect.

INDICATIONS AND USAGE

Unproven Uses: Fringetree is used in treatment of the liver and gallbladder conditions (including gallstones). North American folk uses include jaundice, hepatatrophy, wounds and ulcers.

Homeopathic Uses: Although mention is made of significant homeopathic use, no details are given.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Liquid extract and preparations are administered internally.

Frostwort

Helianthemum canadense

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The plant flowers twice each season, once early and again near the end. The first flowers are flat with large, bright yellow petals. The second flowers are in terminal clusters.

Leaves, Stem and Root: The plant is a perennial that grows 3 to 6 cm high and has a simple, erect and sparsely branched white stem. The few branches are slender and purplish-green with opposite leaves and leaf scars. The leaves are linear, up to 1.5 cm long, grayish-green and downy.

Characteristics: The taste is astringent and bitter. The plant is odorless.

Habitat: Frostwort is indigenous to the eastern U.S., but is now also found in Europe.

Production: Frostwort is the aerial part of *Helianthemum canadense*.

Other Names: Frost Plant, Frostweed, Rock-Rose, Sun Rose

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins

Glycoside: helianthinin

The constituents of the drug have not been fully investigated.

EFFECTS

Frostwort is astringent and tonic.

INDICATIONS AND USAGE

The herb is used internally for digestive disorders and externally for ulcers.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Frostwort is administered as a liquid extract.

Fucus vesiculosus

See Bladderwrack

Fumaria officinalis

See Fumitory

Fumitory

Fumaria officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried herb and the aerial parts of the fresh flowering plant.

Flower and Fruit: The short pedicled flowers are in erect, dense, terminal racemes opposite the leaves and are 5 to 8 mm long. The outer petals are rounded at the front and are

crimson to pink. But like the inner petals they are dark-red to black at the tip and have a green keel. The fruit, which appears in the flowering season, is nut-like, globular, slightly flattened at the side, green and has a dent in the top.

Leaves, Stem and Root: The plant is 10 to 50 cm high and has a tender, erect, angular, branched, hollow and glabrous stem which, like the leaves, is bluish green. The leaves are alternate and divided into 3-pinnate sections. They are petiolate, double pinnate, soft with petioled palmate or pinnatifid pinna.

Characteristics: The herb has a bitter, salty taste.

Habitat: The plant is indigenous to the Mediterranean region to northern Africa and in all of Europe and Siberia. The herb has been introduced into North and South America.

Production: Common Fumitory herb consists of the dried, above ground parts of *Fumaria officinalis*, gathered during the flowering season.

Not to be Confused With: The very similar species *F. vaillantii* and *F. schleicheri*.

Other Names: Earth Smoke, Hedge Fumitory, Beggary, Fumus, Vapor, Wax Dolls

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including rutin

Hydroxycinnamic acid derivatives: including caffeoylmalic acid

Isoquinoline alkaloids: some of them include -

Protoberberine-type: including (-)-scoulerine

Protopine-type: including protopine; main alkaloid

Spirobenzylisoquinoline-type: fumaricine, (+)-fumariline

Indenobenzazepine-type: including fumaritine, fumarofine

Organic acids: fumaric acid

EFFECTS

Fumitory has a light, antispasmodic effect on the bile ducts and the gastrointestinal tract. It is also amphicholeretic.

INDICATIONS AND USAGE

Approved by Commission E:

- Liver and gallbladder complaints

Spastic discomfort in the area of the gallbladder and bile ducts, as well as the gastrointestinal tract.

Unproven Uses: In folk medicine, the herb has been used for skin diseases, constipation, cystitis, arteriosclerosis, rheuma-

tism, arthritis, as a blood purifier, hypoglycemia and for infections.

Homeopathic Uses: for chronic, itching eczema resulting from liver disease.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Comminuted drug and its galenic preparations for internal use.

Preparation: To prepare an infusion, pour boiling water over 2 to 3 gm drug and strain after 20 minutes.

Daily Dosage: 6 gm of drug. Infusions for gallbladder complaints, drink 1 warm cup 30 minutes before meals.

Pressed juice—2 to 3 teaspoons (2.4 to 3.5 gm drug) daily as a cold or hot infusion.

Grated fresh plant—1 teaspoon 3 times daily (about 50% plant material).

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34).

Storage: Protect from light and moisture.

Galanthus nivalis

See Snowdrop

Galbanum

Ferula gummosa

DESCRIPTION

Medicinal Parts: The medicinal part is the oily gum-resin.

Two types of Galbanum are used: Levant or Soft Galbanum is more viscous and often contains small root pieces. Persian or Hard Galbanum sometimes contains pieces of stem and is friable in texture.

Flower and Fruit: The plant bears yellowish-white flowers in a few flat umbels. The fruit is thin and flat. The seeds are glossy.

Leaves, Stem and Root: Ferula gummosa is a perennial plant with a firm, smooth and hollow stem that grows up to 1.75 m tall. The leaflets are glossy, ovate, wedge-shaped and have sharply serrate margins.

Characteristics: The gum-resin occurs in translucent, yellowish or bluish-green masses of tears. Soft Galbanum (Levant) is more viscous and may contain small pieces of root. Hard Galbanum (Persian) is friable and may contain pieces of stem. The odor is similar to musk or turpentine.

Habitat: The plant is found in central Asia, Iran, the Mediterranean region and also at the Cape of Good Hope.

Production: Galbanum is the resin from the roots and trunk of Ferula gummosa and other related varieties. The exuding resin is collected from the pith without wounding the plant.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Resinous substances (60%): chiefly galbaresenic acid and galbanic acid

Mucilages (40%)

Volatile oil (10-20%): including among others, alpha-pinenes, beta-pinenes, myrcene, cadinenes, guaiazulene, aroma bearer undecatriene

EFFECTS

The drug acts as stimulant, expectorant, and vulnerary. In vitro an antimicrobial effect has been proven.

INDICATIONS AND USAGE

Unproven Uses: Internally, Galbanum is used for digestive disorders and flatulence; externally it is used in the treatment of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Preparations for internal and external use.

Gambir

Uncaria species

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and young shoots of the plant.

Flower and Fruit: The flowers are single or in loose, globose inflorescences. The flowers are fused and grow in fives. The corolla is funnel-shaped, the 2-part ovary is inferior. The fruit is a loculicidal capsule opening on 2 sides. The seeds are long-winged at both ends.

Leaves, Stem and Root: This woody liana or climbing shrub has leaves that are opposite and short-petiolate. Young branches are 4-sided or orbicular and have pairs of stipules. Using *Uncaria gambir* as a prototype, the calyx is 5-tipped, the corolla light purple. The leaves are 6 to 11 mm long with a 1 to 2 cm long petiole, coriaceous, lanceolate to oval, entire, pubescent at the veins. After the leaf-axillary flower branches drop, a barbed tendril, which is 1 to 2 cm long and woody, is formed.

Habitat: Indonesia and Malaysia

Production: Yellow catechu is the dried aqueous extract of the leaves and young shoots of *Uncaria gambir*. Cultivated stock is harvested, then the leaves and shoots are boiled with water to form a decoction that is pressed and evaporated to the consistency of syrup. The resulting lumps are dried in the sun.

Not to be Confused With: Acacia

Other Names: Yellow Catechu

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Catechin tannins (20 to 50%): among them gambirines A1 to A3 (astringently active flavanol dimers)

Flavanols (10 to 50%): particularly (+)-catechin, gambirines B1 to B3 (dimers)

Indole alkaloids of the beta-carboline type (presumably only traces in the drug): including gambirtanine, dihydro-gambirtanine

EFFECTS

The drug is astringent in effect because of the tannins it contains, which are also said to exhibit antibacterial and algicidal efficacy. The flavonoid fraction (cyanidanol = (+)-catechin) is said to be hepatoprotective in effect.

INDICATIONS AND USAGE

Unproven Uses: Catechu tincture is used in folk medicine for diarrhea, nausea and gastrointestinal disturbances. Decoction is used for ulcers of the stomach and oral mucosa, and also asthma. The effect for diarrhea appears plausible because of the tannin content.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and powdered drug for internal use.

Preparation: Tincture: 200 g drug (pounded), 50 g cut cinnamon to 1 liter 45% ethanol, macerated (BP88)

Daily Dosage: 0.5 to 2 g drug; Catechu Tincture: 2.5 to 5 ml

Gamboge

Garcinia hanburyi

DESCRIPTION

Medicinal Parts: The medicinal part of the tree is the resin extracted from the plant.

Leaves, Stem and Root: The tree grows to about 15 m and has a diameter of about 30 cm. The bark is usually in the form of cylindrical sticks, deep orange-brown and opaque. The transverse fracture is smooth and almost conchoidal.

Characteristics: The taste is innocuous at first, then becomes very acrid and causes an unpleasant stinging sensation shortly after being placed in the mouth. The powder is highly sternutatory.

Habitat: The plant is indigenous to Indochina and Sri Lanka.

Production: Gamboge is the gum-resin from the trunk of *Garcinia hanburyi* harvested from trees that are at least ten years old.

Other Names: Camboge, Gutta Cambodia, Gutta Gamba, Gummigutta, Tom Rong, Gambodia

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Resins (70-75%): consisting mainly of yellow or red-colored benzophenones and xanthenes, including morellic acid, isomorellic acid, alpha-gambogic acid (alpha-guttic acid)

Mucilages (25-30%)

EFFECTS

The drug's mucilage content produces a strong laxative effect. The beta gutteriferine component acts as a strong irritant to intestinal mucous membranes and also exhibits antimicrobial properties.

INDICATIONS AND USAGE

Unproven Uses: Gamboge is used for the treatment of digestive disorders, in particular constipation, and is used in combination with other laxatives.

PRECAUTIONS AND ADVERSE REACTIONS

As little as 0.2 g of the drug can lead to abdominal pain and vomiting.

OVERDOSAGE

Fatalities have been observed with administration of 4 g.

DOSAGE

No information is available in the literature.

Garden Cress

Lepidium sativum

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh or dried herb harvested during or shortly after the flowering season.

Flower and Fruit: The racemes are terminal or axillary. The sepals are elliptical, 1 to 1.5 mm long and bristly downy. The petals are longer than the calyx, white or reddish, oblong-spatulate and indistinctly stemmed. The anthers are often violet. The fruit is a compressed, orbicular-ovate, 5 to 6 mm long, clearly winged small pod on an erect stem. The seeds are ovate, almost smooth and red-brown.

Leaves, Stem and Root: Garden Cress is a 20 to 40 cm high herb with a glabrous bluish bloom. The stem is erect, round and branched. The leaves are light green and thin. The basal leaves are usually lyrate-pinnatesect. The lower cauline leaves are usually doubly or singly pinnatesect. All leaves have dentate to prickly segments.

Characteristics: Garden Cress has a radish-like taste. The seeds have a slimy skin and swell in water.

Habitat: The herb is grown worldwide.

Production: Garden Cress is the fresh plant (aerial part) of *Lepidium sativum*, harvested during the flowering season or shortly afterward. The fresh herb has a spicy odor. It is rarely dried, either naturally or artificially, since the fresh plant is used most often.

Not to be Confused With: Adulterations rarely occur, since it is usually cultivated.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FRESH FOLIAGE

Glucosinolates: chief components glucotropaeolin, yielding benzyl isothiocyanate (benzyl mustard oil) and its autolysis products (including benzyl cyanide, 3-phenyl propionitrile, benzaldehyde) when the plant is bruised

Ascorbic acid (vitamin C, 37%)

COMPOUNDS: IN THE SEEDS

Glucosinolates (3.5 to 5.3%): glucotropeolin

Cucurbitacins

Cardiac steroids (cardenolides)

EFFECTS

The antibacterial action of Garden Cress has been demonstrated in various tests. It was completely inhibitory in the case of 3 microorganisms, although the antibacterial characteristics depended largely on the age of the plants used. An antiviral effect against the encephalitis virus *Columbia SH*, was demonstrated in tests on mice. Its diuretic action has not been proven through experiments.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for coughs, vitamin C deficiency, constipation, poor immunity and as a diuretic.

%

*

W

Indian Medicine: Garden Cress is used for vitamin C deficiency, liver disease, asthma, hemorrhoids and as an abortifacient.

PRECAUTIONS AND ADVERSE REACTIONS

/• No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The mustard oil contained in Garden Cress can cause skin blisters and necrosis in higher concentrations. It is sometimes misused as an abortifacient because the internal administration of mustard oil causes severe anemia of the internal organs.

DOSAGE

Mode of Administration: Garden Cress is administered as a freshly cut herb in oral preparations.

Garlic

Allium sativum

TRADE NAMES

Garlic (available from numerous manufacturers), Garlicin, Garlique, Garlic Oil, Garlic Power, Triple Garlic, High Potency Garlic Oil, Garlic Odorless, Chinese Tian Shan Garlic, Deodorized Garlic, Kyolic Reserve Aged Garlic Extract, Odor Free Concentrated Garlic, Aged Garlic Extract, Kyolic Hi-Po Formula, High Alicin Garlic, Standardized Garlic, Natural Garlic Oil

DESCRIPTION

Medicinal Parts: The medicinal parts are the whole fresh bulb, the dried bulb and the oil of garlic.

Flower and Fruit: The plant consists of a cluster of long flowers where the floral axis terminates in a single flower and contains few florets (small flowers or buds). There are numerous 1 cm deciduous bulbs capable of producing new

plants, which shed simultaneously. The flowers usually remain in bud form and often do not produce any seed. The petals are reddish or greenish-white and longer than the stamens. The anthers of the middle stamens are spread at the base and have fan-shaped tips.

Leaves, Stem and Root: *Allium sativum* is a perennial plant that grows 25 to 70 cm high. The plant contains an erect, rigid or curved stem, which is leafy in the middle. The leaves are flat, 4 to 25 mm, straight and broad, with a wedge-shaped tip; they can be rough or smooth-edged. The sheath, or lower part of the leaf surrounding the stem, is pointed and longer than the flower cluster. The garlic bulb is usually a compound bulb, and the secondary bulbs are oval in shape. The bulb skin color is either silky white or green.

Habitat: Central to southern Asia is considered the region of origin; garlic has been introduced to the Mediterranean with cultivation worldwide.

Production: Garlic bulbs, either fresh or carefully dried, consist of the main bulb with several secondary bulbs (cloves). Garlic may be harvested in September and October when the leaves and bulbs are dry.

Other Names: Poor Man's Treacle, Clove Garlic, Common Garlic, *Allium*, Stinking Rose

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alliins (alkylcysteine sulfoxides): in particular allylalliin, propenyl alliin and methylalliin (including their gamma-glutamyl conjugates. Once cut, the alliin in the freshly harvested bulbs is converted to allicin (diallyl-disulphide-mono-S-oxide). Bulbs that have been dried and then re-moistened, ferment into alliaceous oils. These oils are oligosulfides, ajoens (dialkyl-trithlaalkane-monoxides) and vinyl dithiins.

Fructosans (polysaccharides)

Saponins

EFFECTS

The alliin in the drug is antimicrobial, lipid-reducing, anti-oxidative and fibrinolytic. The antibacterial, antimycotic and lipid-reducing effects have been well-documented. Inhibition of thrombocyte aggregation, increased bleeding time and clotting time, and enhancement of fibrinolytic activity have been demonstrated in clinical trials.

A study of the lipid-lowering effect with isolated hepatocytes suggest that garlic extracts are responsible for early inhibition of sterol synthesis due to their sulfur-containing compounds. Alliin, the main sulfur-containing compound of garlic, when converted to allicin, exerts inhibitory effects on

key enzymes in cholesterol biosynthesis, including HMG CoA reductase (Gebhardt, 1993; Gebhardt, 1996).

Garlic tablets studied *in vitro* were found to enhance natural killer (NK) cells, which are an important part of the immune system in fighting cancers, viruses and certain bacteria. Antioxidative effects of garlic, determined by an increase in intracellular glutathione (GSH) levels, are responsible for decreasing poor cellular function and premature aging. Antiviral activity was also noted *in vitro* with garlic tablets (See, 1999).

Ajoen is the antithrombotic compound that inhibits fibrinogen receptors on platelets (Robbers, 1996). The allicin and oligosulfides in garlic oil have antiplatelet activity through inhibition of adenosine diphosphate, collagen and beta-thromboglobulin release after collagen stimulation. The compounds also exert antithrombotic effects through inhibition of platelet thromboxane formation (Bordia, 1998; Legnani 1993).

CLINICAL TRIALS

A randomized, placebo-controlled, double-blind study involving 42 outpatients was conducted over a 12-week period to assess the effects of standardized garlic powder tablets on serum lipids and lipoproteins, glucose and blood pressure. Standardized garlic powder administered 900 mg daily produced a significantly greater reduction in serum total cholesterol (262 \pm 34mg/dL to 247 \pm 40mg/dL with garlic compared to 276 \pm 34mg/dL to 274 \pm 29mg/dL with placebo). Low-density lipoprotein cholesterol (LDL-C) was significantly reduced with garlic treatment by 11% compared to 3% with placebo treatment. No significant change was demonstrated in high-density lipoprotein cholesterol, triglycerides, serum glucose, blood pressure and other monitored parameters (Jain, 1993).

The lipid-lowering effect of garlic powder tablets was tested by administering a dose of 900 mg daily (equivalent to approximately 2.7 grams or 1 clove of fresh garlic daily) to 28 outpatients with hypercholesterolemia. After 12 weeks of treatment, there were no significant lipid or lipoprotein changes in either the placebo- or garlic-treated groups (Isaacsohn, 1998).

A 5 mg dose of steam distilled garlic oil was administered twice daily to 25 outpatients with moderate hypercholesterolemia in a randomized, double-blind, placebo-controlled trial. The hypocholesterolemic effect of garlic oil was determined after a 12-week period. The commercial garlic oil preparation did not have a significant effect on serum lipoproteins, cholesterol absorption or cholesterol synthesis (Berthold, 1998).

Note: There are contradicting results regarding the lipid-lowering effect of garlic, which may be attributed to lack of manufacturing standardization of the products used in the studies. The fresh garlic may contain higher amounts of the active ingredient, allicin, which is inactivated upon cooking.

INDICATIONS AND USAGE

Approved by Commission E:

- Arteriosclerosis
- Hypertension
- Raised levels of cholesterol

Garlic is used internally as an adjuvant to dietetic measures for elevated lipid levels. The herb is also used for prevention of age-related vascular changes and arteriosclerosis.

Unproven Uses: In folk medicine, garlic is utilized internally for inflammatory respiratory conditions, whooping cough and bronchitis. Garlic is also used for gastrointestinal ailments, particularly digestive disorders with flatulence and gastrointestinal spasms. Other uses consist of menstrual pains, treatment of diabetes, and as a tonic for diverse illnesses and debilities. Externally, garlic is used for corns, warts, calluses, otitis, muscle pain, neuralgia, arthritis and sciatica.

Indian Medicine: Garlic is used in bronchitis, constipation, joint pain and fever.

Homeopathic Uses: Garlic is used in conditions such as inflammation of the upper respiratory tract, digestive complaints and muscle rheumatism in the lumbar region.

PRECAUTIONS AND ADVERSE REACTIONS

General: Adverse effects such as headache, myalgia, fatigue and vertigo have been seen with therapeutic doses of garlic (Holzgartner, 1992).

Allergic Reactions: Frequent contact with the drug may result in allergic reactions such as contact dermatitis and asthma (Asero, 1998; Lee, 1991).

Burns: Garlic associated partial thickness burns and necrosis have been reported in several case studies in which the herb remained in contact with the skin for a minimum of 6 to 18 hours (Roberge, 1997; Garty, 1993; Parish, 1987).

Gastrointestinal: Abdominal discomfort, nausea, vomiting, diarrhea and a feeling of fullness have occurred with garlic therapy (Holzgartner, 1992; Berthold, 1998)

Hematologic: A significant decrease in hematocrit values and plasma viscosity have been associated with the administration of garlic powder (Jung, 1991). There has been risk of postoperative bleeding with TURP (trans-urethral resection of prostate) or mammoplasty surgery (Burnham, 1995;

German, 1995). Also, spontaneous spinal epidural hematoma has been reported with garlic (Rose, 1990).

Hypersensitivity: Occupational asthma induced by inhalation and ingestion of garlic⁵ has been observed (Lybarger, 1982).

if Ocular: The alliin, S-alkyl cysteine sulfoxide, which decomposes into a variety of thiosulfates and polysulfides via allinase upon extraction (crushing), produces a lacrimation effect (Augusti, 1996).

Olfactory: Garlic therapy is associated with body odor or halitosis (Berthold, 1998).

Nursing: Not to be used while nursing.

Drug Interactions: Concomitant use of garlic with anticoagulants such as Coumadin and antiplatelets such as aspirin and dipyridamole could increase the risk of bleeding due to the effect of garlic on platelet aggregation and fibrinogen. (Agerwal, 1996; Bordia, 1998; Legnani, 1993; Newall, 1996; Robbers, 1996). NSAID's, such as indomethacin, could increase bleeding time by decreasing platelet aggregation (Agerwal, 1996; Bordia, 1998; Legnani, 1993).

^ DOSAGE

Mode of Administration: The minced bulb and preparations are for internal use and external treatment. Garlic oil maceration or garlic oil resulting from steam distillation is widely available.

How Supplied:

Capsules — 3 mg, 100 mg, 270 mg (total allicin 5000 meg), 300 mg, 500 mg, 580 mg (total allicin 3 mg), 600 mg (total allicin 2500 meg or standardized to 500 meg allicin), 1000 mg, 1500 mg, 5000 mg

Dried powder

Oil macerations

Tablets — 300 mg, 400 mg (total allicin 3 mg), 500 mg, 600 mg (total allicin 5000 meg), 810 mg

Preparation: Garlic oil maceration — Bulbs are homogenized and stirred in fatty oil (1:1) for 48 hours, then filtered.

£. Solid garlic extract — An extraction of the chopped bulbs with ethanol or methanol is allowed to evaporate.

Aqueous extract — Fresh bulbs are macerated in cold water (1:1).

Fermented garlic — The minced drug is soaked over a long duration in a water-ethanol mixture, volatile agents escape, and the garlic becomes odorless. Steam distillations and tinctures are also possible.

Daily Dosage:

General — The average daily dose is 4 gm of fresh garlic or 8 mg of essential oil. One fresh garlic clove, 1 to 2 times daily.

Arteriosclerosis — Daily doses of 600-800 mg of garlic powder and dried garlic have been shown to be effective (Harenberg, 1988; Kiesewetter, 1991).

Hyperlipidemia — A total daily dose of 600-900 mg of garlic powder (standardized to 1.3% of alliin content) has been shown effective (Holzgartner, 1992; Isaacsohn, 1998; Mader, 1990; Simons, 1995).

Hypertension — The effective dose is garlic powder taken 200-300 mg three times daily (Auer, 1990; Sigagy, 1994).

External — Fresh garlic applied to the skin as an antimicrobial dressing should not be left for more than a few hours due to case reports of burns (Garty, 1993; Parish, 1987; Roberge, 1997).

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 times daily sc; ointment 1 to 2 times daily (HAB1)

Storage: Garlic should be hung in plaits in a dry place.

German Chamomile

Matricaria Recutita

TRADE NAMES

Chamomile Flowers (available from numerous manufacturers), Standardized Chamomile Extract, Wild Chamomile, **Kid** Chamomile

DESCRIPTION

Medicinal Parts: The medicinal parts consist of the entire flowering herb or only the flowers.

Flower and Fruit: The flower heads are terminal and long-pediced. The flower is white with a yellow center. The margin flowers are obtuse with a tunicate margin. The ray florets are white, linguiform, female and 3-toothed. The disc

florets are tubular, androgynous, 5-toothed, with a hollow receptacle.

Leaves, Stem and Root: The plant is a 20 to 40 cm high herb with an erect, glabrous stem, which is branched above. The leaves are 2 to 3 pinnatisect and have a narrow thorny tip.

Characteristic: The receptacle of the compound head of German Chamomile is hollow which distinguishes it from other types of chamomile.

Habitat: German Chamomile is indigenous to Europe and northwest Asia, naturalized in North America and elsewhere.

Production: German Chamomile consists of the fresh or dried flower heads of *Matricaria recutita* and their preparations.

Other Names: Pin Heads, Chamomilla, Chamomile, Single Chamomile, Hungarian Chamomile

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil {0.4-1.5%}: chief components (-)-alpha-bisabolol (levomenol), bisabolol oxide A, bisabolol oxide B, bisabolone oxide A, beta-trans-farnesene, trans-en-yne-dicycloether (polyene spiroether, adjoining cis-en-yn-dicycloether), chamazulene (blue in color, arising from the non-volatile proazulene matricin after steam distillation), spathulenol

Flavonoids: flavone glycosides: aglycones apigenin, luteolin, chrysoeriol, chief glycosides apigenin-7-O-glucoside, apigenin glucoside acetate, - flavonol glycosides, aglycones including quercetin, isorhamnetin, patuletin, for example rutin, hyperoside

Unbound, Highly Methoxylized Flavonoids: jaceidin, chrysospenol, chrysosplenin

Hydroxycoumarins: including umbelliferone, herniarin

Mucilages: (10% in the mucilage ribs, fructans) including rhamnogalacturonane

EFFECTS

Gastrointestinal Effects

The proteolytic activity of pepsin is reduced by (-)-alpha-bisabolol in the gastrointestinal tract (Isaac, 1975). The (-)-alpha-bisabolol exerts a protective effect from gastric toxicity produced by acetylsalicylic acid (Torrado, 1995).

Anti-Inflammatory Effects

Chamazulene exerts anti-inflammatory effects through inhibition of leukotriene B₄ formation (Safayhi, 1994). The en-yne dicycloether inhibits degranulation of mast cells to prevent histamine release (Miller, 1996). Apigenin, a flavonoid, effectively blocks intercellular adhesion molecule-1 upregulation and leukocyte adhesion in response to cyto-

kines. This activity is through a mechanism unrelated to free radical scavenging or leukocyte formation (Panes, 1996).

Antioxidant Effects

Chamazulene, a volatile oil, exerts antioxidant effects through inhibition of lipid peroxidation (Rekka, 1996). Chamazulene also blocks chemical peroxidation of arachidonic acid for antioxidant and anti-inflammatory effects (Safayhi, 1994).

Antineoplastic Effects

Apigenin applied topically has effects on skin tumorigenesis through inhibition of skin papillomas and a tendency to decrease the conversion of papillomas to carcinomas (Li, 1996; Wei, 1990). Apigenin inhibits UV-induced tumorigenesis when applied topically via G₂/M and G₁ cell-cycle arrest in keratinocytes (Lepley, 1996; Lepley, 1997). The chemoprevention mechanisms occur through inhibition of the mitotic kinase activity, perturbation of cyclin B₁ levels, and inhibition of protein kinase C (Lepley, 1996; Lin, 1997). Apigenin suppresses transcriptional activation of cyclooxygenase-2 and inducible nitric oxide synthase in macrophages, which is important for the prevention of carcinogenesis and inflammation (Liang, 1999).

Anxiolytic Effects

Flavonoids are CNS-active molecules and the chemical modification of the flavone nucleus dramatically increases the anxiolytic potency (Paladini, 1999). Apigenin is a ligand for the central benzodiazepine receptors exerting anxiolytic and slight sedative effects (Viola, 1995).

Miscellaneous Effects

Apigenin has been associated with an increase in atrial rate as a result of a reduction in noradrenaline uptake and a reduction in monoamine oxidase activity (Lorenzo, 1996). The herb exerts antibacterial and drying effects on weeping wound areas, which increase healing (Glowania, 1987). Chamomile oil has antimicrobial activity against some skin pathogens such as *Staphylococcus* and *Candida* species (Aggag, 1972).

CLINICAL TRIALS

A Phase III, double-blind, placebo-controlled trial evaluated chamomile mouthwash for prevention of 5-fluorouracil(5-FU) chemotherapy induced oral mucositis. There were 164 patients included in the study at the time of their first cycle of 5-FU based chemotherapy. All patients received oral cryotherapy for 30 minutes with each dose of 5-FU. Chamomile mouthwash was administered three times daily for 14 days in the treatment group. Stomatitis scores determined by health care providers and by patients suggested no difference of

stomatitis between the chamomile and placebo-treatment group (Fidler, 1996).

The efficacy of Kamillosan cream (topical chamomile cream) was compared to steroidal (0.25% hydrocortisone, 0.75% fluocortin butyl ester) and non-steroidal (5% bufexamac) dermatologic agents for the maintenance therapy of eczematous disease. There were 161 patients suffering from inflammatory dermatoses on hands, forearms, and lower legs included in the study. The patients had initially been treated with 0.1% difluocortolone valerate. The Kamillosan cream was slightly less effective as 0.25% hydrocortisone and superior to 5% bufexarnac and 0.75% fluocortin butyl ester (Aertgeerts, 1985).

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis
- Fevers and colds
- Inflammation of the skin
- Inflammation of the mouth and pharynx
- Tendency to infection
- Wounds and burns

Chamomile is used internally for inflammatory diseases of the gastrointestinal tract associated with gastrointestinal spasms, irritation of the oral pharyngeal mucous membrane and upper respiratory tract. Externally, the drug is used for skin and mucous membrane inflammations, pulpitis, gingivitis, respiratory catarrh, and ano-genital inflammation.

Unproven Uses: In Folk medicine, the herb is used internally for diarrhea and flatulence. The herb is used externally for furuncles, hemorrhoids, abscesses, and acne.

Homeopathic Uses: The herb is used for inflammation and cramps in the gastrointestinal tract, teething symptoms, severe pain, inflammation of the upper respiratory tract, and dysmenorrhea.

CONTRAINDICATIONS

Chamomile should not be taken by anyone with a known allergy to its components or other members of the Compositae family (eg, arnica, yarrow, feverfew, tansy, artemesia) (Hausen, 1996). A case report indicates chamomile may precipitate severe anaphylactic reactions in patients with hay fever and bronchial asthma caused by a variety of pollens (grass, olive, and mugwort) (Subiza, 1989).

PRECAUTIONS AND ADVERSE REACTIONS

Anaphylactic Reactions: Ingestion of chamomile-tea infusion has precipitated an anaphylactic reaction in an 8 year old male with hay fever and bronchial asthma caused by a variety of pollens (Subiza, 1989).

Contact Dermatitis: Chamomile, a Compositae plant, is associated with allergic contact dermatitis (Hausen, 1996; Pereira, 1997; Rodriguez-Serna, 1998).

Allergic Conjunctivitis: Chamomile tea eye washing to treat ocular reactions has induced allergic conjunctivitis with lid angioedema (Subiza, 1990).

Drug Interactions:

Coumarin Anticoagulants — Due to the content of hydroxycoumarins in chamomile, there may be an additive effect when taken with warfarin.

Alcohol/Benzodiazepines — Chamomile has weak anxiolytic properties at benzodiazepine receptor sites, thus concomitant use of alcohol and benzodiazepines should be avoided.

DOSAGE

Mode of Administration: Liquid and solid preparations are available for external and internal application.

How Supplied:

Capsule — 125 mg, 350 mg, 354 mg

Liquid — 1:4

Oil — 100%

Preparation: An infusion for internal use is prepared by pouring boiling water (150 ml) over 3 gm of chamomile, cover for 5 to 10 minutes and strain. (1 teaspoonful = 1 gm drug).

An infusion for external poultice application is prepared by pouring one and one-half cups of hot water over 2 dessertspoons of the drug, cover, leave to draw for 15 minutes and then strain. Ointments and gels are available in strengths of 3 to 10%.

Daily Dosage: An internal single dose is approximately 3 gm as an infusion. Liquid extract 1-4 ml or 1 cup of freshly made tea is administered 3-4 times daily. Externally as a bath additive, 50 gm is added to 1 Liter of water or 6 gm of drug for a steam bath. Washes and gargles may be administered several times a day.

Homeopathic Dosage: Internally, the herb is given as 5-10 drops, 1 tablet, or 5-10 globules. Externally, dilute 1 dessertspoon with 250 ml water and use 2-3 times daily in poultices or washes (HAB1).

German Ipecac

Cynanchum vincetoxicum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaves or rhizome with the attached roots.

Flower and Fruit: The plant has small white flowers in peduncled cymes, 5 sepals and a wheel-shaped corolla. There is a 5-lobed secondary corolla. There are 5 stamens whose anthers are fused to a 5-sectioned wreath. The 2 superior ovaries have a common stigma. The fruit is a 5 cm long, glabrous, striped, clavate follicle. The seeds have silky tufts of hair.

Leaves, Stem and Root: The plant grows from 30 to 100 cm. The underground creeping rhizome has heavily branched runners. The stem is unbranched, thin and erect. The leaves are opposite, short petioled, ovate to oblong and entire-margined.

Characteristics: The fresh rhizome has an intensive odor. The taste is sweet, then bitter-hot. It is poisonous.

Habitat: The plant is indigenous to Europe.

Production: German Ipecac herb and rhizome are the leaves and rhizome (including attached roots) of *Cynanchum vincetoxicum*. The subterranean rhizome, including parts of the roots, are dug up in autumn, cleaned and quickly dried at temperatures of up to 50° C.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponin-like 15-oxasteroide glycosides (mixture termed vincetoxin): aglycones including hirsundigenin, anhydrohirsundigenin, vincetogenin

Isoquinoline alkaloids: including tylophorine

EFFECTS

The drug has diuretic, diaphoretic, digestive and emmenagogic effects. The alkaloids have an antitumoral effect, and the chloroform extract has an antimicrobial effect.

INDICATIONS AND USAGE

Unproven Uses: The drug was formerly used as a diuretic, diaphoretic and emetic, and for the treatment of kidney complaints, edema, the plague, snake bite and dysmenorrhea. Today, it is used in the treatment of digestive and kidney disorders and for dysmenorrhea. The poultices heal swellings

and bruising. The drug can also be found in homeopathic preparations.

PRECAUTIONS AND ADVERSE REACTIONS

According to older scientific literature, "vincetoxin" in high dosages causes vomiting, apnea and cardiac paralysis in animal experiments. Seed extracts led to advancing paralysis of the central nervous system. Poisonings of humans have not been found in recent reports.

DOSAGE

Mode of Administration: As an infusion, powdered drug, alcoholic extract and homeopathic dilution.

Preparation: The drug is prepared as an infusion.

Daily Dosage: The infusion should be administered under medical supervision.

both ends, and the tube has a winged edge. The flowers form many blossomed spikelets, which in turn form a terminal, oblong ear. The middle spikelets contain male flowers at the tip and female flowers at the base. The upper spikelets are male.

Leaves, Stem and Root: German Sarsaparilla is a 15 to 45 cm high plant with a 2 to 5 mm thick, horizontally creeping rhizome, which produces extremely long runners. The plant has black-brown basal leaves, which break up into long fibers. The stem is sturdy, upright and about 1 mm thick. It is sharply triangular, rough above, and surrounded by brown leaf sheaths at the base. The leaves are linear and usually grooved. The lamina are rigid and gradually tapering forward to the involute tip. The roots form such a thick mass that they prevent water from getting in and thus prevent the washing away of dykes and dams.

Characteristics: The rootstock has an aromatic-turpentine odor.

Habitat: The plant grows in Europe mainly on the Atlantic, Baltic and southern Scandinavian coasts as far as central Germany. It was introduced to the American Atlantic coast.

Production: German Sarsaparilla consists of the dried, underground parts of *Carex arenaria*. The root is dug up in March and April, dried and cut into pieces for sale.

Not to be Confused With: Other *Carex* varieties

Other Names: Red Sedge, Sand Sedge, Red Couchgrass, Sea Sedge

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins

Volatile oil: contents include methyl salicylate and cineol

Flavonoids: including tricine

Tannin: (8 to 10%, catechin tannins)

EFFECTS

There are no studies available on efficacy. The main constituents, saponins, essential oil and flavones, as well as the tannins, are most likely responsible for the effect.

INDICATIONS AND USAGE

Unproven Uses: There are no documented indications to date. In folk medicine, preparations of German Sarsaparilla are used for the prevention of gout, rheumatism, inflammation of the joints, for skin ailments and as a diaphoretic and diuretic; further, for venereal disease, flatulence, colic, liver disorders, diabetes, edema, lung tuberculosis and amenorrhea.

German Sarsaparilla

Carex arenaria

DESCRIPTION

Medicinal Parts: The medicinal part is the dried rhizome.

Flower and Fruit: The inflorescence is somewhat hanging and consists of 6 to 16 ovoid, 1 cm long, terminal, straight, greenish spikes. The lower ones are female; the middle ones are female at the base and male at the tip. The upper ones are only male. These are simple greenish unisexual flowers without a corolla. They have 1 husk with an ovary surrounded by a tubular-like involucre. The style has 2 stigmas, 3 stamens and a fruit oval. It is somewhat acute at

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Since the efficacy for the claimed uses are not documented, a therapeutic application cannot be recommended. The cold maceration and the decoction are used in folk medicine.

Preparation: A decoction is prepared by adding 3 gin drug to 1 cup water. A cold maceration is made by adding 2 teaspoonfuls drug to 1/4 liter water.

Daily Dosage: The average daily dose is 3 gm drug as a decoction. The cold maceration is dosed 1 cup, 2 to 3 times daily.

LITERATURE

Germander

Teucrium chamaedrys

DESCRIPTION

Medicinal Parts: The medicinal part is the herb collected during the flowering season.

Flower and Fruit: The flowers are 10 to 12 mm long and are erect. They are arranged on long pedicles in 1-to-6 blossomed, false racemes inclined to one side. The calyx is tubular-campanulate, often tinged with red-violet and is pubescent. The corolla is usually carmine red, occasionally white. The stamens and styles are exerted. The nutlet is ovoid, 1.5 to 2 cm long, smooth, finely reticulate and has a large, circular, attaching surface.

Leaves, Stem, and Root: The plant is a subshrub with a short-lived main root from which grow long-reaching, branched, thin woody roots and a stem-producing runner. The stems are usually erect and branched. The older branches are decumbent; the younger ones erect, tough, round and lanate. The branches are occasionally covered in glandular hairs, which are often red-violet. The leaves are in close pairs and are always covered in teeth. They are summer-green and have distinctly protruding pinnatifid ribs.

Habitat: The plant is indigenous to the Mediterranean region as far as Anatolia and the Urals.

Production: Germander is the aerial part of *Teucrium chamaedrys*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.07%): chief components beta-caryophyllene (20%), humulene (15%)

Iridoid monoterpenes: including among others, harpagide, acetyl harpagide

Diterpenes: including among others, teugin, teufin, teufidin, dihydroteugin, teucin A, B, E, F, G, marrubiin

Caffeic acid derivatives: including among others, teucroside

Flavonoids: including among others, cirsiol, cirsimaritin, luteolin

EFFECTS

The drug, which contains strong amaroids, is said to have a cholagogic effect, but this has not been scientifically proven. The toxic principle is therefore unknown. Higher doses or poisoning results in hepatitis-like symptoms, which may include liver cell necrosis.

INDICATIONS AND USAGE

Unproven Uses: Germander is used as a digestive aid, as a rinse for gout, as weight-loss aid and for fever.

CONTRAINDICATIONS

The drug is highly toxic and should not be used (see PRECAUTIONS).

PRECAUTIONS AND ADVERSE REACTIONS

Liver cell necrosis has been observed following intake of the drug. Symptoms include jaundice and an elevated level of aminotransferase in the blood. One case of death has been recorded. For that reason, the drug is not to be administered.

DOSAGE

Mode of Administration: Germander is occasionally used in tea mixtures (see PRECAUTIONS).

Daily Dosage: Dosages of more than 600 mg daily can cause toxic effects.

Giant Milkweed

Calotropis gigantea

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the bark and roots.

Flower and Fruit: The flowers are arranged in umbels. The flower structures are arranged in fives. The corolla is fused and campanulate, 3 to 5 cm wide and split up to two-thirds of the length. The lobes are greenish with purple tips. The paracorolla is composed of 5 cap-like points. The 5 stamens and the 2 styles are fused to a stemmed gynostegium and the pollen sticks together to form to a pollinium. The sepals are ovate and the ovary superior. The fruit is a swollen follicle, 9 to 10 cm long and turned back. The seeds have a silky tuft of hair.

Leaves, Stem and Root: *Calotropis gigantea* is a shrub, occasionally tree-like, which grows up to 3 m high. The leaves are sessile with the base clasping the stem, fleshy, 10 to 20 cm long and 4 to 10 cm wide, elongate-ovate or elliptical. The stem is woody.

Habitat: India, China, and Malaysian archipelago

Other Names: Giant Swallow Root, Swallow Wort, Crown Flower

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolids): calotropin, calactin and uscharidin

Steroids: sterols, including beta-sitosterol, taraxasterol

EFFECTS

The drug contains cardioactive cardenolide glycosides and exhibits an emetic-cathartic effect resembling that of *Ipecacuanha*. The calotropin demonstrates anti-tumor qualities against human epidermoid carcinoma cells of the nasopharynx, *in vitro*.

INDICATIONS AND USAGE

Unproven Uses: Giant Milkweed has been used for dysentery, vomiting, toothache, syphilis, convulsions, warts, leprosy and digestion problems.

Indian Medicine: Preparations are used for skin conditions, intestinal worms, coughs, ascites and anasarca.

Homeopathic Uses: *Calotropis gigantea* is used for obesity.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Higher dosages cause severe mucous membrane irritation, characterized by vomiting and diarrhea, as well as bradycardia and convulsions, sometimes leading to death. It is not known whether those compounds found in the plant that belong chemically to the cardioactive steroid glycoside group are indeed cardioactive, because of their unusual structure (the sugar remnant is bound to the aglycone both as a glycoside and as an ether). Mucilaginous drinks are recommended to treat the symptoms of inflammation; morphine and atropine for treating pain.

DOSAGE

Mode of Administration: Whole and cut drug preparations for internal use.

Daily Dosage: As an emetic: 2 to 4 gm; As a diaphoretic and expectorant: 200 to 600 mg.

Homeopathic Dosage: (from D4) 5 to 10 drops, 1 tablet, 5 to 10 globules, 1 to 3 times daily or from D6 1 ml injection solution sc. twice weekly (HAB1).

Ginger

Zingiber officinale

TRADE NAMES

Ginger Root (available from numerous manufacturers,) Ginger Kid, Alcohol Free Ginger Root, Ginger Power, Caffeine-Free Ginger Root, Quanterra Stomach Comfort

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The flower scape grows directly from the root and terminates in a long, curved spike. A white or yellow flower grows from each spike.

Leaves, Stem and Root: Ginger is a creeping perennial on a thick tuberous rhizome, which spreads underground. In the first year, a green, erect, reed-like stem about 60 cm high grows from this rhizome. The plant has narrow, lanceolate to linear-lanceolate leaves 15 to 30 cm long, which die off each year.

Characteristics: The fracture is short and fibrous. The odor and taste are characteristic, aromatic and pungent.

Habitat: The plant is indigenous to southeastern Asia, and is cultivated in the U.S., India, China, the West Indies and tropical regions.

Production: Ginger root consists of the peeled, finger-long, fresh or dried rhizome of *Zingiber officinale*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (2.5-3.0%): chief components vary greatly, depending upon country of origin: (-)-zingiberene and ar-curcumene, beta-bisabolene and ar-curcumene, neral and geranial, D-camphor, beta-phellandrene, geranial, neral and linalool, (E)-alpha-farnesene, important as aroma carrier zingiberol (mixture of cis- and trans-beta-eudesmol)

Aryl alkanes

Gingerols: chief components [6]-gingerol (pungent substances), [8]-gingerol, [10]-gingerol

Shogaols: chief components [6]-shogaol (pungent substance), [8]-shogaol, [10]-shogaol (artifacts formed during storage, arising from the gingerols)

Gingerdiols

Diarylheptanoids: including among others, gingerenone A and B

Starch (50%)

EFFECTS

Compounds isolated from the Ginger rhizome have been studied in numerous in vitro and animal experiments. Other studies show that Ginger root is positively inotropic, antithrombotic; has anti-oxidant, anti-migraine and anti-lipidemic effects, and promotes secretion of saliva, gastric juices and bile.

Anti-Emetic Effects

The components in Ginger that are responsible for the anti-emetic effect are thought to be the gingerols and shogaols. The mechanism of action is not due to a nystagmus response or vestibular stimulation (Holtmann, 1989). In contrast to most anti-emetic medications that act on the CNS, the anti-emetic effect of Ginger is thought to be due to local gastrointestinal actions (Mowrey & Clayton, 1982).

Anti-Inflammatory Effects

The anti-inflammatory effect of Ginger is thought to be due to inhibition of cyclooxygenase and 5-lipoxygenase, results in reduced leukotriene and prostaglandin synthesis (Kiuchi, 1992; Srivastava & Mustafa, 1992).

Miscellaneous Effects

In humans, Ginger increases the tone and peristalsis of the intestine (Bisset, 1994; Iwu, 1993). The root of *Zingiber officinale* has also shown immune system stimulation (Chang, 1995) and platelet aggregation inhibitory activity (Verma, 1993).

CLINICAL TRIALS

Motion Sickness

One double-blind, randomized, non-placebo controlled study compared the effectiveness of Ginger and six other commonly used non-herbal drugs (scopolamine, dimenhydrinate with caffeine, cyclizine, cinnarizine, cinnarizine with domperidone, meclizine with caffeine) in 1489 participants during whale-watching voyages off the coast of Norway. 78.3% of those that took 500 mg of Ginger root 2 hours prior to a boat

trip were symptom-free for the 6-hour duration. The incidence of severe vomiting did not differ in a statistically significant way between Ginger and any of the other test groups (Schmid, 1994).

Postoperative Nausea and Vomiting

A double-blind, placebo-controlled study involving 120 females that underwent gynecologic outpatient surgery was performed. The participants were randomly given either 1 gm of powdered Ginger root or 10 mg of metoclopramide orally and evaluated for incidence of postoperative nausea and vomiting. Ten percent of the patients in the Ginger group had one or more episodes of vomiting. 17.5% of the metoclopramide arm and 22.5% of the placebo group had one or more episodes of vomiting. Fifteen percent of the Ginger group and 32.5% of the metoclopramide group required antiemetic treatment compared to 37.5% of the placebo group. The authors concluded that the Ginger group had a statistically significant lower incidence of nausea and vomiting when compared to placebo (Phillips, 1993).

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Travel sickness
- Dyspeptic complaints

Unproven Uses: In folk medicine. Ginger is used as a carminative, expectorant, and astringent.

Chinese Medicine: In China. Ginger is used to treat colds, nausea, vomiting and shortness of breath.

Indian Medicine: Indian medicine uses include anorexia, dyspeptic symptoms and pharyngitis.

CONTRAINDICATIONS

The German Commission E contraindicates the use of Ginger in morning sickness associated with pregnancy. Most research provides evidence that Ginger can be used and is effective in the treatment of morning sickness. It is recommended that excessive doses are avoided for this purpose (see PRECAUTIONS and ADVERSE REACTIONS).

Because of its cholagogic effect, the drug should not be taken in the presence of gallstone conditions except after consultation with a physician.

Ginger has been found to inhibit thromboxane synthesis, therefore it should not be used by patients who are at risk for hemorrhage (Bracken, 1991)

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

It has been reported that administration of 6 grams of dried powdered Ginger has been shown to increase the exfoliation of gastric surface epithelial cells in human subjects. It is postulated that this action may possibly lead to ulcer formation. Therefore, it is recommended that dosages on an empty stomach be limited to 6 grams (Desai, 1990).

There have been reports that Ginger can cause hypersensitivity reactions resulting in dermatitis. Large overdoses can cause central nervous system depression and cardiac arrhythmias.

Pregnancy: A study in 27 pregnant patients with hyperemesis gravidarum (persistent vomiting occurring prior to the 20th week of pregnancy and requiring hospitalization) found that 1 gram per day (250 milligrams 4 times a day) for 4 days caused no adverse effects. One spontaneous abortion occurred; a causal relationship between the abortion and the use of Ginger was not determined. All infants were normal (Fischer-Rasmussen, 1990).

Drug Interactions: More than one in-vitro study confirms an antithrombotic effect. It is recommended that patients taking anticoagulants or those with bleeding disorders avoid the use of large doses of Ginger.

OVERDOSAGE

According to research, the LD50 of 6-gingerol and 6-shogaol is set between 250 and 680 mg/kg. (Fulder & Tenne, 1991; Suekawa et al, 1984.) Toxicity tests in mice using a Ginger extract via lavage resulted in no mortality or adverse effects in doses up to 2.5 g/kg over a 7 day period. When the dose was increased to between 3 and 3.5 g/kg, a 10% to 30% mortality rate was reported (Macola, 1989.)

Overdosage may cause cardiac arrhythmia and CNS depression (Iwu, 1993).

DOSAGE

Mode of Administration: Comminuted rhizome and dry extracts for teas and other galenic preparations for internal use. The powdered drug is used in some stomach preparations.

How Supplied:

Capsules — 100 mg, 400 mg, 420 mg, 460 mg, 470 mg, 500 mg, 550 mg, 1000 mg

Chewable Tablets — 67.5 mg

Fluid Extract — 1:1

Liquid — 1:4

Oil — 100%

Tea Bags

Preparation: To prepare an infusion, pour boiling water over 0.5 to 1 g drug and strain after 5 minutes (1 teaspoonful = 3 g drug).

Daily Dosage:

ANTI-EMESIS

Capsules/Powder — 0.5 to 2 grams (Bisset, 1994; Schmid et al., 1994)

CHEMOTHERAPY-INDUCED NAUSEA AND VOMITING

All dosage forms — 1.5 grams (Myer et al., 1995).

DYSPEPSIA

Capsules/Powder — 2 to 4 grams/day

HYPEREMESIS GRAVIDARUM

Capsules/Powder — 1 gram/day given for 4 days (Fischer-Rasmussen et al., 1990).

MOTION SICKNESS

Capsules/Powder — 1 gram to be taken 30 minutes before travel; for continuing symptoms, 0.5 to 1 gram every 4 hours (Muller & Clauson, 1997).

POSTOPERATIVE NAUSEA AND VOMITING

Capsules/Powder — 0.5 to 2 gram daily

RHEUMATOID ARTHRITIS. OSTEOARTHRITIS

Powder — 1 to 2 grams/day (Srivastava & Mustafa, 1992).

Storage: Powdered Ginger root should be stored in a cool, dry place protected from light. Powdered Ginger should not be stored in plastic containers.

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried leaves, and the seeds separated from their fleshy outer layer.

Flower and Fruit: The tree flowers for the first time when it is between 20 and 30 years old. The flowers are dioecious. They are in the axils of the lower leaves of the current year's short shoots. The male flowering parts are attached to short catkins. The female flowers have longer pedicles and are at the end of a leafless branch. Fertilization occurs months after pollination by spermatozoids, although usually only one ovule is fully formed. The light green or yellowish seeds, incorrectly called fruit, later become fleshy and plum-like. They have a diameter of 2.5 to 3 cm, and each contains a two-edged edible nut.

Leaves, Stem and Root: Ginkgo biloba is a 30 to 40 m high dioecious tree with a girth of about 4 m. The trees can live for hundreds of years. The bark is light to dark brown with rough grooves and reticulate fissures. The leaves are fan-shaped with bifurcated ribs and glabrous. They are fresh green to golden yellow in autumn. The female trees are pointed and pyramid-shaped; the male trees are broad and sparer.

Characteristics: The seeds smell like butyric, capric or valeric acid when ripe.

Habitat: Ginkgo is indigenous to China, Japan and Korea, and is also found in Europe and the U.S.

Production: The leaves are harvested either mechanically or by hand from plantations or in the wild. The leaves are then dried and pressed into balls. A dry extract from the dried leaf of Ginkgo biloba is manufactured using acetone/water and subsequent purification steps without addition of concentrates or isolated ingredients.

Other Names: Maidenhair-Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids (0.5-1.8%): including monosides, biosides and triosides of quercetin, isorhamnetins, 3-O-methylmyricetins, and kaempferol, to some extent esterified with p-coumaric acid

Biflavonoides (0.4-1.9%): for example, amentoflavone, bilobetin, 5-methoxybilobetin, ginkgetin, isoginkgetin

Proanthocyanidins (8-12%)

Trilactonic diterpenes (0.06-0.23%): ginkgolide A, B, C

Trilactonic sesquiterpene bilabolids (0.04-0.2%)

EFFECTS

Ginkgolide B is a potent inhibitor of platelet-activating factor (PAF), which is important for the induction of

arachidonate-independent platelet aggregation. Ginkgolide B blocks the binding to PAF to its receptor resulting in an antagonistic effect (Chung, 1987). This effect will inhibit PAF-induced bronchoconstriction and airway hyperactivity, along with T-lymphocyte proliferation and cytokine production. PAF induces inflammation and changes in vascular permeability (Braquet, 1989; Delia Loggia, 1993).

Ginkgo biloba exerts ischemic protective and antioxidant effects through the flavonoids. This occurs through a free scavenger action and prevention of lipid peroxidation. Lipid peroxidation is involved in producing tissue and vascular damage, and neuronal loss, which may lead to dementia (Dorman, 1992; Koc, 1995; Otamiri, 1989). The herb also reduces neutrophil infiltration and increases blood flow to prevent the progression of dementia ischemia. The antioxidant and membrane-stabilizing activity increases cerebral hypoxia tolerance (Koltringer, 1989; Otamiri, 1989).

Other effects consist of spasmolytic properties through direct action on alpha-adrenoceptors and smooth muscle relaxing properties via the signal transduction pathway, intracellular cAMP, antagonism of the adrenergic nervous system and hyperpolarization (Hellegouarch, 1985; Struillon, 1995).

CLINICAL TRIALS

Dementia

A placebo-controlled, double-blind, randomized trial with a particular extract of Ginkgo biloba (EGb 761) was conducted to assess the efficacy and safety in Alzheimer's disease and multi-infarct dementia. Alzheimer's Disease Assessment Scale-Cognitive subscale (ADAS-Cog), Geriatric Evaluation by Relative's Rating Instrument (GERRI) and Clinical Global Impression of Change (CGIC) were used to evaluate the response in 309 patients over a 52-week period. EGb 120 mg daily was safe and was shown to stabilize or improve cognitive performance and the social functioning of demented patients for 6 months to 1 year (Le Bars, 1998).

Peripheral Occlusive Arterial Disease

The clinical efficacy of Ginkgo biloba special extract (EGb 761) was demonstrated in 111 patients with peripheral occlusive arterial disease (POAD) in Fontaine stage IIB and intermittent claudication. The mean pain-free walking distances were very similar at the beginning of the treatment period. After 8, 16 and 24 weeks, the EGb treatment group was significantly better than the placebo group with maximum walking distance and relative increases of the pain-free walking distance. The doppler indices remained nearly unchanged during the course of therapy (Peters, 1998).

Equilibrium Disorders

An open, controlled study consisted of 44 patients complaining of vertigo, dizziness or both, caused by vascular vestibular disorders. The patients were randomly treated with extract of Ginkgo biloba (EGb 761) 80 mg twice daily or with betahistine dihydrochloride (BI) 16 mg twice daily for 3 months. A complete neuro-otologic and equilibrium examination was performed at baseline and after 3 months of treatment, including an evaluation of clinical findings. Dizziness and vertigo improved in 64.7% of patients in the BI treatment group and in 65% of those in the EGb 761 treatment group in the first month of therapy. No significant changes were observed in cranial scans for patients with a 'central' cranial pattern or with the equilibrium score. EGb 761 induced a slight decrease of saccadic delay and considerably increased saccadic velocities while BI improved saccadic accuracy but did not modify delay. EGb 761 improved smooth pursuit gain three times more than BI. Both drugs asymmetrically reduced nystagmus maximum velocity and improved the sinusoidal vestibulo-ocular reflex. BI considerably reduced, whereas EGb 761 considerably improved, visuo-vestibular ocular reflex (Cesarani, 1998).

INDICATIONS AND USAGE

Approved by Commission E:

- Symptomatic relief of organic brain dysfunction
- Intermittent claudication
- Vertigo (vascular origin)
- Tinnitus (vascular origin)

The Commission E approvals listed are limited to special standard extracts of Ginkgo.

Unproven Uses: The drug is used for disturbed brain functions that result in dizziness and headache with emotional lability and anxiety. Ginkgo has been demonstrated to improve concentration and memory deficits as a result of peripheral arterial occlusive disease.

Chinese Medicine: Among traditional Chinese uses for Ginkgo biloba are asthma, tinnitus, hypertonia and angina pectoris.

Homeopathic Uses: Homeopathy includes tonsillitis and cephalgia among the indications for use of Ginkgo.

CONTRAINDICATIONS

The drug is contraindicated in patients known to be hypersensitive to Ginkgo biloba preparations.

Patients with known risk factors for intracranial hemorrhage (systemic arterial hypertension, diabetes amyloid senile plaques) should avoid the use of Ginkgo biloba due to a recent case report of subarachnoid hemorrhage associated with the herb (Vale, 1998).

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Mild gastrointestinal complaints could occur as side effects (Cohen, 1998). Also, blood pressure problems, allergic reactions and phlebitis have occasionally been documented after parenteral administration. Allergic skin reactions have been observed on extremely rare occasions. The possible hypersensitivity reactions consist of occurrence of spasms and cramps and, in cases of acute toxicity, atonia and adynamia.

Fertility: Ginkgo has adverse effects on oocytes (Ondrizek, 1999):

Hematologic Effects: Spontaneous bilateral subdural hematoma, subarachnoid hemorrhage and an increase in bleeding time have been associated with chronic Ginkgo biloba ingestion (Rowin, 1996; Vale, 1998).

Drug Interactions: Antithrombotic Agents (anticoagulants, antiplatelets and aspirin) — Spontaneous bleeding has been associated with the herb due to its potent inhibitory effect on the platelet-activating factor (PAF). Case reports involving the herb associated with subarachnoid hemorrhage and intracerebral hemorrhage suggests an additional risk of intracerebral hemorrhage with the use of thrombolytic therapy (Matthews, 1998; Rowin, 1996; Vale, 1998).

DOSAGE

Mode of Administration: Ginkgo is available in liquid or solid pharmaceutical forms, for oral intake and parenterally for homeopathic use.

How Supplied:

Capsules—30 mg, 40 mg, 50 mg, 60 mg, 100 mg, 120 mg, 260 mg, 400 mg, 420 mg, 440 mg, 450 mg, 500 mg

Extract—50:1

Liquid—40mg/5mL

Tablets—30 mg, 40 mg, 60 mg, 80 mg, 120 mg, 260 mg

Daily Dosage: Ginkgo biloba extract should be standardized to contain 24% flavone and 6% terpene lactones: 40 to 80 mg three times a day (van Beek, 1998). Studies have demonstrated efficacy with 120 mg daily in 2 to 3 divided doses for dementia, peripheral arterial occlusive disease and for equilibrium disorders like tinnitus or vertigo (Cesarani, 1998; Le Bar, 1998; Peters, 1998).

Chinese Medicine: In traditional Chinese medicine, the daily dose is 3 to 6 g of leaves as an infusion.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic);

parenterally: 1 to 2 ml acute, 3 times daily; chronic: once a day (HAB1).

Storage: Ginkgo must be protected from light and moisture.

Ginseng

Panax ginseng

TRADE NAMES

Ginseng (available from numerous manufacturers), Ginsana, Gin Zip, Chinese Red Panax Ginseng, Manchurian Ginseng, Premium Blend Korean Ginseng, Ginseng Complex, Korean Ginseng, Siberian Ginseng, Korean Ginseng Extract, Korean White Ginseng, The Ginseng Solution, Herbal Sure Korean Ginseng, American Ginseng Root, Korean Ginseng Root, Standardized Siberian Ginseng Root, Natural Ginseng, Ginseng Up, Herbal Sure Chinese Red Ginseng, Siberian Ginseng Power Herb, Time Release Korean Ginseng Power, American Ginseng, Chinese Red Panax, Concentrated Ginseng Extract, Eleuthero Ginseng Root, Siberian Ginseng Root, Korean White Ginseng Root, Centrum Ginseng, Gin-Action, Ginsai, Ginseng Concentrate, Ginseng Manchurian, Ginseng Natural, Ginseng Power Max 004X G-Sana, Lynae Ginse-Cool, Power Herb Korean Ginseng

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root.

Flower and Fruit: The inflorescence is simple or branched with 1 to 3 umbels of 15 to 30 flowers. The flowers are

"androgynous and have greenish-yellow corollas. The ovary is inferior. The fruit is a pea-sized, globular to reniform, scarlet, smooth and glossy drupe, which contains 2 seeds.

³ *Leaves, Stem and Root:* The plant is a perennial, and stands erect from 30 to 80 cm high. It has a smooth, round stem and bears terminal whorls of 3 to 5 palmate leaves. The leaflets are thin, finely serrate, gradually acuminate, 7 to 20 cm long and 2 to 5 cm wide. The rhizome tapers at the ends and is often palmate at the tip, giving it a human-like form.

Habitat: *Panax ginseng* is indigenous to China. It is cultivated in China, Korea, Japan and Russia.

Production: Ginseng root consists of the dried main and lateral root and root hairs of *Panax ginseng*.

Other Names: Five-fingers, Red berry, American Ginseng, Chinese Ginseng, Korean Ginseng, Oriental Ginseng

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins

Aglycone (20S)-protopanaxadiol: including ginsenoside Ra1, Ra2, Ra3, Rb1, Rb2, Rb3, notoginsenoside R4, Rs1, Rs2, Rs3, Rs4, malonylginsenoside Rb1, Re, Rd

Aglycone (20S)-protopanaxatriol: including ginsenoside Re, Rf, Rg1, notoginsenoside R1

Aglycone oleanolic acid: including ginsenoside Ro, chikusetsusaponin-V Rb1, Rb2, Re, Rd, Re, Rg1

Water-soluble polysaccharides: panaxane A to U

Polyynes: including falcarinol (panaxynol), falcarintriol (panaxytriol), examples esterified with acetic acid or linolenic acid

EFFECTS

The main active component in Ginseng consists of the ginsenosides, a diverse group of steroidal saponins. There are twenty-five ginsenosides that have been separated and detected based on the sugar unit sequences and aglycone moieties (Attele, 1999; Fuzzati, 1999; Wang, 1999). The ginsenosides demonstrate the ability to target a myriad of tissues, producing a variety of pharmaceutical responses quite different from one another. A single ginsenoside may initiate multiple or opposing actions in the same tissue, thus making the overall pharmacology of ginseng complex (Attele, 1999).

Cognitive Function Effects

The loss of nicotinic receptor binding has been associated with age-related cognitive impairments. Nicotinic receptor stimulation of the central nervous system is beneficial for neuroprotection against age associated cognitive disorders. A

non-ginsenoside component of the herb has demonstrated affinity for the nicotinic receptor. This binding of the compound to the receptor results in nicotinic activity (Lewis, 1999). Ginsenoside-Rg2 and -Rg3 block nicotinic acetylcholine and gamma-aminobutyric acid receptors. This results in an inhibitory effect of the acetylcholine-evoked secretion of catecholamines. (Tachikawa, 1999). These different effects of *Panax ginseng* contribute to the variety of pharmacological effects.

Antineoplastic Effects

A protopanaxadiol component of Ginseng was shown to inhibit proliferation of pulmonary adenocarcinoma cells resistant to cisplatin (Lee, 1999). Ginsenoside-Rs4 and -Rs3 elevates protein levels of p53 and p21WAF1, which are associated with the induction of apoptosis in human hepatoma cells (Kim, 1999). Ginsenoside Rh2 induces apoptotic cell death in the glioma cell line through activation of caspase and production of oxygen species (Kim, 1999).

Antioxidant Effects

The antioxidant effects of Ginseng protect against oxidative DNA and protein (globin) damage caused by free radicals (Lee, 1998). Antioxidant activity of the herb also provides a hepatoprotective effect by increasing hepatic glutathione peroxidase activity (Voces, 1999). Antioxidant intervention by Ginseng is exerted by weak radical scavenging activity and stimulation of endothelial nitric oxide synthase in cardiac tissue (Maffei, 1999).

Antiplatelet Effects

The antiplatelet components consist of panaxynol and ginsenosides Ro, Rg1, and Rg2 in the diethyl ether and 1-butanol fractions of the herb. Panaxynol inhibits the aggregation, release reaction, and thromboxane formation in platelets while ginsenosides Ro, Rg1, and Rg2 suppress the release reaction only (Kuo, 1990; Teng, 1989).

Antiviral Effects

Ginseng induces production of interferon, enhances natural killer cell and antibody dependent cytotoxic activities, and stimulates cell mediated immunity (Singh, 1983; Singh, 1984).

Decrease in Alcohol Levels

The effect of ginseng in the reduction of blood ethanol levels may be attributed to different mechanisms. Ginseng increases alcohol dehydrogenase and aldehyde dehydrogenase activity at high concentrations due to an augmented induction of the microsomal ethanol oxidizing system. Ginseng enhances blood alcohol clearance in man (Lee, 1987). The

ginsenosides also reduce plasma ethanol by a delay in gastric emptying time (Koo, 1999).

Hypolipidemic/Cardiac Effects

Ginseng saponins activate lipoprotein lipase, an enzyme that reduces chylomicrons and very low-density lipoproteins, and results in a decrease of triglycerides and cholesterol (Inoue, 1999). The ginsenosides demonstrate negative chronotropic effects and positive and negative inotropic effects on the heart (Wu, 1988). The anti-arrhythmic properties of Rg1 consist of prolonged ventricular refractoriness and repolarization, and increased ventricular fibrillation threshold (Wu, 1995).

Miscellaneous Effects

Stimulation of corticotrophin secretion and increased hepatic ribonucleic acid (RNA) and protein synthesis are effects of the saponin glycosides in Ginseng. *Panax ginseng* is comprised of at least 28 different saponin glycosides, which contain nuclei resembling those of steroids (Punnonen, 1980). The ginsenosides also stimulate insulin release and increase insulin receptors to exert a hypoglycemic effect (Guodong, 1987). Ginseng also decreases blood sugar through glucose metabolism related to adrenergic receptors. Ginseng decreases lactic acid and stimulates other respiratory enzymes in the electron transport chain to promote aerobic oxidation (Yao, 1990). The saponins have shown enhancement of erectile capacity mediated by endothelium-derived relaxing factor and peripheral neurophysiologic enhancement (Choi, 1999; Choi, 1995).

CLINICAL TRIALS

Cognitive Function

A randomized, double-blind, placebo-controlled study was conducted to evaluate the effect of Ginseng on cognitive function over an 8-week period. There were 112 healthy volunteers over 40 years of age. The primary outcome was the change in score on each cognitive test, evaluated at baseline, and again at 8 weeks. Oral standardized ginseng 400 mg daily was significantly better compared to placebo with abstract thinking and a tendency toward faster simple reaction times. There was no difference between the groups with regard to concentration, memory, or subjective experience (Sorenson, 1996).

Hypoglycemic

The effect on blood glucose with Ginseng was demonstrated in a double-blind, placebo-controlled study including 36 newly diagnosed Type 2 diabetic patients. Ginseng 200 mg daily improved glycated hemoglobin, serum aminoterminal-propetptide concentration and physical activity after 8 weeks of therapy. Ginseng 100 mg and 200 mg daily dose elevated

mood, improved psychophysical performance, and reduced fasting blood glucose and weight (Sotaniemi, 1995).

Antiviral

The properties of a standardized extract of ginseng root for inducing a higher immune response in vaccination against influenza were evaluated in 227 volunteers. The placebo-controlled, randomized, double-blind study was conducted over a 12-week period. Oral standardized ginseng extract 100 mg daily was given over the entire 12-week period, with anti-influenza polyvalent vaccination given to all volunteers at week 4. There were significantly fewer cases of influenza or the common cold in the ginseng-treatment group, and significantly higher antibody titers and natural killer cell levels at 8 and 12 weeks in the ginseng treatment group (Scaglione, 1996).

INDICATIONS AND USAGE

Approved by Commission E:

- Lack of stamina

Ginseng is used internally for fatigue and debility, and for a decrease capacity for work and concentration.

Unproven Uses: In Folk medicine, Ginseng is used for loss of appetite, cachexia, anxiety, impotence and sterility, neuralgia and insomnia.

Chinese Medicine: In Chinese medicine, Ginseng is used for hemoptysis, gastric disturbances, and vomiting.

Homeopathic Uses: Ginseng is used for rheumatism and debility.

PRECAUTIONS AND ADVERSE REACTIONS

General: Caution should be taken in patients with cardiovascular disease or diabetes. Hypertension resulting from Ginseng Abuse Syndrome is associated with prolonged high dose Ginseng with concomitant use of caffeine (Siegel, 1979; Siegel, 1980). General adverse effects include insomnia, epistaxis, headache, nervousness, and vomiting.

Mastalgia: Mastalgia with diffuse breast nodularity has been reported with Ginseng use (Palmer, 1978).

Vaginal Bleeding: Oral Ginseng and Ginseng face cream have been associated with post menopausal vaginal bleeding (Greenspan, 1983; Hopkins, 1988).

Pregnancy/Lactation: Maternal use of Ginseng has been associated with neonatal androgenization, thus it is not recommended for use during pregnancy or lactation (Awang, 1991).

Drug Interactions:

Diabetic Agents/Insulin — Caution should be taken when taking an antidiabetic agent or insulin to lower blood glucose

because Ginseng has been shown to have hypoglycemic effects (See EFFECTS and CLINICAL TRIALS).

Warfarin/NSAIDS/Antiplatelet Agents — A case report of a 47-year old male with a mechanical valve in the aortic position taking warfarin had a decrease in the INR 2 weeks after initiating Ginseng therapy. The INR returned to normal 2 weeks after discontinuation of warfarin (Awang, 1991). Due to the antiplatelet effect of Ginseng, avoid concomitant use with antiplatelet agents or NSAIDS.

Phenelzine (MAOI) — Headache, tremors, and mania have been reported with concomitant use of phenelzine and Ginseng (Jones, 1987).

Loop Diuretics — Germanium, present in most Ginseng products, was reported to cause loop diuretic resistance in a 63 year old male with glomerulonephritis. Germanium causes nephrotoxicity in the nephron segment where loop diuretics work (Becker, 1996).

OVERDOSAGE

Massive overdoses can bring about Ginseng Abuse Syndrome, which is characterized by hypertension, insomnia, hypertonia and edema.

DOSAGE

Mode of Administration: Comminuted drug infusions, powder and galenic preparations for internal use. Various standardized preparations containing Ginseng root are available.

How Supplied:

Capsules — 100mg, 150mg, 200mg, 250mg, 404mg, 405mg, 410mg, 424mg, 470mg, 500mg, 505mg, 535mg, 560mg, 1000mg, 1250mg

Liquid — 300mg/ml

Tablet — 350mg, 500mg

Preparation: To make an infusion, pour boiling water over 3 gm comminuted drug and strain after 5 to 10 minutes.

Daily Dosage: The average daily dosage is 1 to 2 gm root. The infusion may be taken 3 to 4 times a day over 3 to 4 weeks.

Cognitive Function — Oral standardized Ginseng 400 mg daily was effective in improving cognitive function (Sorenson, 1996).

Hypoglycemic Effects — Dosage of 100-200 mg of oral standardized Ginseng has been effective in Type 2 diabetic patients (Sotaniemi, 1995).

Antiviral — Studies have proven efficacy in addition vaccination with 100-200 mg daily of oral standardized Ginseng extract (Scaglione, 1996).

Erectile Dysfunction — Korean Red Ginseng given orally as 600 mg three times daily has been effective (Choi, 1995).

Physical and Psychological Performance Capacity (lack of stamina) — Ginsana given 100 mg twice daily has improved oxygen capacity, reduction of maximum stress frequency, increase in lung function parameters and shortened reaction time to visual stimulants after 11 weeks (Forgo, 1985).

Homeopathic Dosage: 5 drops, 1 tablet, 5 to 10 globules or 1 mL injection solution sc twice weekly.

Glechoma hederacea

See *Ground Ivy*

Globe Flower

Trollius europaeus

DESCRIPTION

Medicinal Parts: The medicinal part is the whole fresh plant.

Flower and Fruit: Every branch of the stem bears a solitary, terminal flower. They are up to 5 cm in diameter, globular and have no calyx. The flowers usually have 10 perianth segments. The petals are lemon yellow. The outer petals are occasionally green underneath. They are bent. The stamens are approximately 12 mm long and have a 0.5 to 5 mm long appendage.

Leaves, Stem and Root: The plant is 10 to 70 cm high and glabrous. The stem is hollow, smooth and branched upward. The basal leaves are long-petioled and 3 to 5 lobed. The lobes are cuneate and more or less deeply indented and serrate. The cauline leaves are smaller and more or less sessile.

Habitat: The plant is indigenous to northern and central Europe.

Production: Globe flowers are the flowers of *Trollius europaeus*.

Other Names: Globe Ranunculus, Globe Crowfoot, Globe Trollius

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Ranunculin: protoanemonine-forming substance in the freshly harvested plant that changes enzymatically when the plant is cut into small pieces. The pungent, volatile protoanemonine quickly dimerizes to the non-mucous membrane irritating anemonine. When dried, the plant is not capable of protoanemonine formation.

Flavonoids

Carotinoids: including neoxanthine (trollixanthine), xanthophyll epoxide

Ascorbic acid (vitamin C)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: **Formerly**, the plant was used to treat scurvy. It loses most of its active properties on drying.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Extended skin contact with the freshly harvested, bruised plant can lead to blisters and cauterizations due to the resulting protoanemonine formation, which is severely irritating to skin and mucous membranes.

If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritation of the urinary drainage passages, are possible. Because of the very low level of protoanemonine-forming substances in the plant, the danger of poisoning is quite low.

DOSAGE

Mode of Administration: The drug is obsolete.

Goa Powder

Andira araroba

DESCRIPTION

Medicinal Parts: The medicinal part is the dried and pulverized latex of the trunk and branches.

Flower and Fruit: Andira araroba is a large smooth tree whose yellowish wood has vertically running channels and spaces. The latex collects increasingly in these spaces as the tree ages. The bark forms in long flat pieces about 3 mm thick and is grayish-white and fissured externally. The inner

surface is brownish and striated. The fracture is laminated with yellow fibers.

Characteristics: The taste is mucilaginous and bitter, and the odor is slight but disagreeable.

Habitat: The tree grows in Brazil.

Production: Goa powder is exuded from the nuclear cavity of Andira araroba. The exuded substance is purified by recrystallization in benzol, thus producing raw chrysarobin.

Other Names: Araroba, Bahia Powder, Brazil Powder, Chrysatobine, Crude Chrysarobin, Ringworm Powder

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Anthrone derivatives: in particular chrysophanolanthrone, dehydroemodine anthrone monomethyl ether, emodine anthrone monomethyl ether, dimers of these compounds

EFFECTS

The powder is a strong reducing agent. It causes severe erythema upon contact with the skin. It inhibits glucose-6-phosphate-dehydrogenization in psoriatic skin conditions. The drug easily absorbs through the skin.

INDICATIONS AND USAGE

Unproven Uses: Goa Powder is used for psoriasis in chrysarobin ointments and for various kinds of dermatomycosis. It has been widely replaced by synthetic anthranol, which is also used in the treatment of psoriasis.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely irritating to skin and mucous membranes (redness, swelling, pustules and conjunctivitis, even without eye contact). Internal administration leads to vomiting, diarrhea and kidney inflammation (with as little as 0.01 g). External administration on large skin areas could cause resorptive poisonings.

DOSAGE

Mode of Administration: Goa Powder is administered topically in emulsion form, but has largely been replaced by the synthetic anthranol cignolin.

Goat's Rue

Galega officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves collected at the beginning of the flowering season and dried, as well as the tips of the flowering branches.

Flower and Fruit: The plant's long-peduncled, axillary racemes are made up of numerous 1 cm long, slightly inclined florets. The petals are bluish-white and short stemmed. The filaments are fused. The fruit is a round, indented pod that grows 2 to 3 cm long and 2 to 3 mm thick, and contains many seeds.

Leaves, Stem and Root: The strong, bright green shrub has numerous 40 cm to 1 m high, erect, branched, hollow stems. It has a divided rhizome with brown fibers sprouting numerous erect, corrugated, round, tall stems. The leaves are odd-pinnate; the leaflets are 1.5 to 4 cm long and 4 to 16 mm wide, elliptical to lanceolate and thorny-tipped with a rich green upper surface and a lighter undersurface.

Characteristics: The plant is odorless unless bruised, whereupon it emits a disagreeable smell, which probably gave rise to the common name Goat's Rue.

Habitat: Goat's Rue grows wild throughout Europe and Asia.

Production: Goat's Rue herb consists of the dried, above-ground parts of *Galega officinalis*, harvested during the flowering season.

Other Names: Italian Fitch, French Lilac

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Guanidine derivatives: galegine, 4-hydroxygalegine

Quinazoline alkaloids: (+)-peganine

Lectins

Flavonoids: including galuteolin

EFFECTS

The herb contains galegin, which affects blood sugar. *In vitro*, an inhibiting effect on the glucose transport of human epithelium cells has been demonstrated. The reported blood sugar-lowering effect of Goat's Rue herb on humans has not

been documented, nor have the reported aggregation-inhibiting, lactagogic and diuretic effects.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Goat's Rue herb are used as a diuretic, and also as supportive therapy for diabetes.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages have not been recorded.

Poisonings have only been observed in animals, and then only following the intake of large quantities of the plant. Sheep reportedly experienced salivation, spasms, paralyzes and death through asphyxiation following ingestion of inordinate amounts.

Drug Interactions: A possible interaction exists with hypoglycemic medication. Goat's Rue should not be used by diabetics currently maintained with commercial pharmaceutical hypoglycemics.

DOSAGE

Mode of Administration: Since the efficacy for the claimed uses is not documented, therapeutic application cannot be recommended. Goat's Rue cannot be recommended for diabetes mellitus because of the severity of the disease and the availability of effective therapeutic alternatives.

Preparation: To prepare an infusion, pour boiling water over 2 gm of ground drug and strain after 5 to 10 minutes.

Golden Ragwort

Senecio aureus

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh plant harvested during the flowering season and the dried herb.

Flower and Fruit: The few capitula are in a loose, many-blossomed corymb that is up to 2.5 cm wide. They are surrounded by a double involucre and consist of 8 to 12 yellow lingual, female florets. There are also numerous androgynous, tubular ray florets, which are somewhat darker.

Leaves, Stem and Root: The perennial plant grows up to 60 cm tall. The rhizome is 2 to 5 cm thick, has numerous thread-like roots, and produces an erect or ascending stem. The root bark is hard and blackish. It surrounds a ring of whitish, woody bundles and a large, dark, central pith. The stem is fluffy-haired when young, later glabrous, and bears alternate leaves. The basal leaves grow up to 15 cm long. They are long-petioled, simple, round, and reniform with a cordate base. The cauline leaves are shorter, incised and pinnatifid, becoming bracts.

Characteristics: The herb has a bitter and astringent taste. The smell is slightly acrid.

Habitat: The plant is indigenous to North America.

Other Names: Squaw Weed, Golden Senecio, Golden Groundsel, Ragwort, Coughweed, Cocash Weed, Grundy Swallow, Life Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrrrolizidine alkaloids: chief alkaloids are floridanine, florosanine, otosenine

Sesquiterpenes of the eremophilane-type: including among others, ligularenolide, tetrahydroligularenolide, dehydrofukinone, trans-9-oxofuranoeremophilane

Flavonoids: including among others, kaempferol-3-O-glucosyl acetate, quercetin-3-O-glucosyl acetate

EFFECTS

The active agents are seneciionin (aurein), other alkaloids, and resins. The drug has menstruation stimulant, diuretic, and astringent properties, although the mode of action has not been documented. The ^pyrrrolizidine alkaloids are hepatotoxic and carcinogenic.

INDICATIONS AND USAGE

Unproven Uses: Life Root is used for loss of blood (bleeding) and menopausal symptoms.

PRECAUTIONS AND ADVERSE REACTIONS

Life Root should not be taken internally. Hepatotoxicity and carcinogenicity are possible due to the pyrrrolizidine alkaloids and 1,2-unsaturated necic parent substances.

DOSAGE

Mode of Administration: Internal use of Life Root is not recommended.

Daily Dosage: The traditional average daily dose of the drug as a liquid extract is 4 g taken 3 to 4 times daily. (See Precautions and Adverse Reactions.)

Golden Shower Tree

Cassia fistula

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the bark, fruit and seeds.

Flower and Fruit: The flowers are in loose, hanging, 30 to 50 cm long racemes. There are 5 pale yellow, ovate petals. The diameter of the corolla is approximately 3.8 cm. The calyx is deeply divided and 5-toothed. There are 10 stamens. The fruit is a legume, 30 to 60 cm long, hanging and indehiscent.

Leaves, Stem and Root: Cassia fistula is a tree, that grows up to 9 m high. The leaves are 20 to 40 cm long, 4- to 8-paired pinnate. The leaf spindle is hairy and the leaflet is petiolate, ovate to oval, acuminate, 5 to 12 cm long, 4 to 9 cm wide

and silvery haired underneath. The young bark is smooth and greenish-gray. Older bark is dark brown and rough.

Habitat: India, Africa and South America

Production: Cassia pods are the dried ripe fruit of Cassia fistula.

Not to be Confused With: Very occasionally the tree has been confused with South American Cassia species.

Other Names: Canafistula. Indian Laburnum, Pudding Pipe Tree, Purging Cassia

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (1% in the mesocarp): sennosides, fistulinic acid

Monosaccharides/oligosaccharides (50%): particularly saccharose

Fruit acids: citric acid

Steroids: sterols (in the seeds), including beta-sitosterol

Fatty oil (in the seeds)

EFFECTS

The anthracene derivatives have a laxative effect. Preparations from the fruit have demonstrated antimicrobial and antiviral effects in vitro.

INDICATIONS AND USAGE

Indian Medicine: Golden Shower Tree is used for flatulence, constipation, fever, anorexia, gout, jaundice, itching and skin conditions. Efficacy for constipation is plausible because of the anthranoid content; the other indications have not been proven.

CONTRAINDICATIONS

The drug is contraindicated with ileum, acute-inflammatory diseases of the intestine and appendicitis. It is also contraindicated for children under 12 years of age and for women during pregnancy or while nursing.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The question of the increase in probability of the appearance of carcinomas in the colon following long-term administration of Anthracene drugs has not yet been fully clarified. Recent studies, however, have revealed no connection between the administration of Anthracene drugs and the frequency of carcinomas of the colon.

OVERDOSAGE

In the case of overdose, cramp-like gastrointestinal complaints could occur as a side effect of the laxative effect of the drug. Prolonged administration leads to loss of electro-

lytes, particularly of potassium ions, which in turn leads to aldosteronism, albuminuria, hematuria, inhibition of intestinal motility, muscle weakness, enhancement of the effect of cardioactive steroids and an influence upon the effect of antiarrhythmics. In rare cases, administration of the drug may lead to cardiac arrhythmia, nephropathy, edema and accelerated osteoclasia.

DOSAGE

Mode of Administration: Whole drug preparations are for internal use.

Preparation: To prepare an extract, use pulp and distilled water in a 1:1 ratio, macerate, then exhaustively percolate with distilled water and filter. Evaporate to a soft extract.

Daily Dosage: 4 to 8 gm of fruit pulp

Goldenseal

Hydrastis canadensis

TRADE NAMES

Golden Seal, Goldenseal (Available from numerous manufacturers), Goldenseal Power, Golden Seal Herb, Golden Seal Root, Golden Seal Plus, Goldenseal Root Alcohol Free, Herbal Sure Goldenseal Root

DESCRIPTION

Medicinal Parts: The medicinal parts are the air-dried rhizome with the root fibers.

Flower and Fruit: The flower is small, solitary, terminal and erect. It has 3 small greenish white petals which drop as soon as they come out. The fruit is a group of small, fleshy,

oblong carmine berries with 1 or 2 hard, black and glossy seeds. The fruit is similar to the raspberry but is not edible.

Leaves, Stem and Root: The plant is a low herbaceous perennial about 30 cm high. It has a horizontal bright yellow, knotty and twisted rhizome about 0.6 to 1.8 cm thick out of which the root fibers grow. It is folded longitudinally and encircled by old leaf scars. The fracture is short and shows a dark, yellow cut surface, thick bark, large pith and broad medullary rays. The flowering stem appears in spring and is erect, cylindrical, downward pubescent, 15 to 30 cm tall and has a few short brown scales at the base. It bears 2 clearly ribbed, dark green and pubescent, cauline leaves. The lower one is sessile the upper one petiolate, round and divided into 7 lobes and finely serrate. There is also a root leaf on a long petiole, which is similar to the cauline leaves but larger.

Characteristics: The taste is very bitter, the smell is strong, characteristic and disagreeable.

Habitat: Indigenous to the U.S., cultivated elsewhere.

Production: Goldenseal root is the rhizome of *Hydrastis canadensis*. The root is dug up in the autumn and dried.

Not to be Confused With: Goldenseal is often adulterated with Bloodroot.

Other Names: Orange Root, Yellow Root, Yellow Puccoon, Ground Raspberry, Wild Curcuma, Turmeric Root, Indian Dye, Eye Root, Eye Balm, Indian Paint, Jaundice Root, Warnera, Indian Plant

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids: chief alkaloids hydrastine (1.5 to 4%), berberine (0.5 to 6%), (-)-canadine (0.5%)

Starch

EFFECTS

Many of the studies that have been conducted focus on the berberine and hydrastine components that are found not only in Goldenseal, but also in numerous other herbs commonly used in Chinese and Indian medicine. The effects reported here focus on these components and not necessarily the Goldenseal in its raw form.

Berberine sulfate has been shown to inhibit the growth of *Entamoeba histolytica*, *Giardia lamblia* and *Trichomonas vaginalis*, *in vitro*. The parasites all exhibited morphological changes after exposure to berberine sulfate (Kaneda, 1991). In one experiment by Swab et al (1981), berberine hydrochloride reduced the cholera toxin-induced secretion of water, sodium and chloride in perfused rat ileum. Berberine was also found to inhibit the intestinal secretory response of *Vibrio cholerae* and *Escherichia coli* enterotoxins without causing histological damage to the intestinal mucosa (Sack,

1982). Berberine is also active against other intestinal infections that cause acute diarrhea such as *Shigella dysenteriae*, *Salmonella paratyphi* and various *Klebsiella species*. Berberine sulfate has been shown to block the adherence of *Streptococcus pyrogenes* and *E. coli* to host cells, possibly explaining its mechanism of action against numerous pathogens (Sun, 1988).

Berberine was found to be the active constituent in an extract of *Hydrastis canadensis* root that demonstrated activity against a multiple drug-resistant strain of *Mycobacterium tuberculosis* (Gentry, 1998). Berberine also inhibits *Helicobacter pylori* (Bae, 1998).

Berberine has a long history of use for eye infections. In one study that looked at effectiveness in treating trachoma, berberine was more effective than sulfacetamide in eradicating *Chlamydia trachomatis* from the eye and preventing relapse of symptoms (Babbar, 1982; Mohan, 1982).

Berberine has a choleric (bile-stimulating) effect and has been shown to lower bilirubin levels (Chan, 1977).

Berberine inhibited the effects of tumor promoters on the skin using a mouse model (Nishino, 1986). There is evidence that berberine also has a direct tumor killing effect and has the ability to stimulate production of white blood cells (Zhang, 1990; Liu, 1991).

Berberine has hypotensive, antisecretory and sedative effects. The mechanism for these effects may be explained by the fact that berberine has platelet alpha 2 adrenoceptor agonist activity that is similar to that of clonidine (Hui, 1984).

CONTRAINDICATIONS

Goldenseal is contraindicated in pregnancy.

Goldenseal is contraindicated in people with glucose-6-phosphate-dehydrogenase deficiency (Chan, 1993).

INDICATIONS AND USAGE

Unproven Uses: Goldenseal is used as an antiseptic externally on wounds and *herpes labialis*. It is also used for gastritis and as an astringent. The berberine component is used to treat acute diarrhea caused by numerous gastrointestinal pathogens. Berberine is also used as an adjunct treatment in various cancers and in neutropenia resulting from radiation and chemotherapy. Berberine has been used to treat trachoma, gastric ulcers and gallbladder disease.

Homeopathic Uses: In homeopathic dilutions, *Hydrastis canadensis* is used for the treatment of irregular menstruation, digestive problems and bronchitis.

PRECAUTIONS AND ADVERSE REACTIONS

General: If taken over an extended period, the drug can bring about digestive disorders, mucous membrane irritation, constipation, excitatory states, hallucinations and occasionally deliria.

Pregnancy: Goldenseal should not be taken during pregnancy.

Drug Interactions: Berberine has an antagonistic effect on the anticoagulant activity of heparin (Preininger, 1975).

There have been reports of decreased vitamin B absorption with higher doses of Goldenseal (Tierra, 1980).

Drug/Laboratory Interactions: At one time it was believed that Goldenseal could mask the detection of tetrahydrocannabinol (THC/Marijuana) in illicit drug urinalysis. This effect has since been disproved (Mikkelsen & Ash, 1988).

OVERDOSAGE

The LD50 for berberine in rats was found to be greater than 1,000 mg/kg of body weight making the toxicity of this component in Goldenseal very low (Haldon, 1975). The hydrastine component appears to be the toxic compound in Goldenseal. High doses result in strychnine-like convulsions and gastrointestinal relaxation (Osol & Garrar, 1955). Other effects of overdose that have been reported include difficulty in breathing, bradycardia and central paralysis.

Following stomach and intestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) the treatment for poisonings consists of the instillation of activated charcoal and shock prophylaxis (quiet, warmth). The treatment of spasms with diazepam (I.V.), electrolyte substitution and the countering of any acidosis imbalance that may appear with sodium bicarbonate infusions may be necessary. In the event of shock, plasma volume expanders should be infused. Intubation and oxygen respiration may also be required.

DOSAGE

Daily Dosage:

Extract — Standardized extract (5% hydrastine) 250-500 mg 3 times daily (Werbach & Murray, 1994)

Fluid extract — $\frac{1}{2}$ to 1 teaspoonful (1.25-5 ml) (Grieve, 1971)

Solid extract — 325-520 mg (Grieve, 1971)

Local antiseptic — 1 teaspoonful powder steeped in 1 cup boiling water for 15 minutes. Swish around the mouth or gargle for mouth or throat sores (Tyler, 1997).

Travelers diarrhea — One capsule (500-1000 mg root) 3 times daily (Tyler, 1997)

Storage: Store at room temperature. Avoid moisture, high temperatures and direct light.

Goldthread

Coptis trifolia

DESCRIPTION

Medicinal Parts: The medicinal parts are the rhizome and sometimes the stems and leaves.

Flower and Fruit: The solitary flowers are small and white, and are arranged on leafless scapes.

Leaves, Stem and Root: Goldthread is a perennial plant in bushes of up to 15 cm with yellowish, scaly leaves at the base and long-petioled, obovate, evergreen leaves. The rhizome is thread-like, golden yellow with a matte surface and very small roots.

Characteristics: Goldthread has a very bitter taste and slight odor.

Habitat: *Coptis trifolia* is indigenous to India and *Coptis groenlandica*, which is also used, is indigenous to Greenland and Iceland.

Production: Goldthread rhizome is the rhizome of *Coptis trifolia*.

Other Names: Mouth Root, Cankerroot, Yellowroot, *Coptis*, *Coptide*, *Coptis Groenlandica*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids (6 to 9%): including *coptin*, *berberine*

EFFECTS

The herb is a bitter tonic.

INDICATIONS AND USAGE

Unproven Uses: Goldthread is used in digestive disorders.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Berberine has a mutagenic effect upon yeast cells and in the Ames test (intercalation into the DNA), although that does not necessarily mean a mutagenic effect for the drug when administered to humans.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Internally as a powdered drug or a liquid extract.

Gotu Kola

Centella asiatica

TRADE NAMES

- Jf) Gotu Kola (available from numerous manufacturers and as a combination product), Gotu Kola Herb, Wild Countryside Gotu Kola, Natural Herbal Gotu Kola, Alcohol Free Gotu Kola Herb

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried above-ground parts, the fresh and dried leaves and stem.

Flower and Fruit: The pedicles are 1.2 to 4 cm long. The sepals of the epicalyx are oval to circular, with a membranous border. They are about 2.5 to 3 mm long and 1.5 to 2.5 mm wide. The umbels have 2 or 3 sessile or short-pediced florets. The petals are white, to purple or pink. The calyx is not generally dentate. The fruit is oval to globular in shape, and has a diameter of 2 to 5 mm. The mericarps are clearly flattened at the sides and usually have 7 to 9 ribs and are raised rugose.

- W) *Leaves, Stem and Root:* *Centella asiatica* is a tender umbel plant, which has numerous creeping stems. The stems have roots at the nodes, which are smooth. The circular-reniform leaves are 2 to 6 cm long and 1.5 to 5 wide, with a crenate margin and 5 to 9 ribs. The petioles are 3 to 30 cm long.

Characteristics: Gotu Kola is almost tasteless and odorless.

Habitat: The plant is indigenous to southeast Asia, India, Sri Lanka, parts of China, the western South Sea Islands, Madagascar, South Africa, southeast U.S., Mexico, Venezuela, Columbia, and eastern South America.

Production: Hydrocotyle herb is the aerial part of *Centella asiatica*. The plant is gathered throughout the year and dried in the sun.

Other Names: Indian Pennywort, Marsh Penny, Indian Hydrocotyle, White Rot, Thick-leaved Pennywort, Hydrocotyle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

- t) *Triterpene acids:* including asiatic acid, madecassic acid (6-hydroxy asiatic acid), terminolic acid

Triterpene acid ester from oligosaccharides (pseudosaponins): including asiaticoside, asiaticoside A, asiaticoside B

Volatile oil (0.1%)

EFFECTS

The main constituents of the drug are triterpene acids and their sugar residues (asiaticoside and madegassoside).

Anti-Inflammatory Effects

Anti-inflammatory effects exerted by extracts of *Centella asiatica* were demonstrated by a reduction of acute radiation reaction in rats (Chen, 1999).

Anti-Neoplastic Effects

Cytotoxic and antitumor effects of *Centella asiatica* involve direct action on DNA synthesis. The development of solid and ascites tumors was decreased by the herb (Babu, 1985).

Ulcer-protective Effects

Asiaticoid (suspended in propylene glycol) administered orally to rats, significantly reduced the formation of stress-induced ulcers (Ravokatra, 1993). An extract of the herb also significantly inhibited gastric ulceration induced by cold and restraint stress in animal models. The dose dependent reduction of gastric ulceration was associated with a dose dependent increase of the GABA level in the brain (Chatterjee, 1992).

Vascular/Venous Tone Effects

Ethanol extracts of *Centella asiatica*, *in vitro*, had a remarkable enhancement of fibroblast cell attachment and tissue plasminogen activator (Kim, 1993). Varicose veins are associated with increased uronic acid and lysosomal enzymes involved with mucopolysaccharide (beta-glycuronidase, beta-N-acetylglucosaminidase) metabolism. Total triterpene fraction of *Centella asiatica* (TTFCA) decreases uronic acid, beta-glycuronidase, beta-N-acetylglucosaminidase, and arylsulfatase in the connective tissue and vascular wall (Arpaia, 1990).

Wound Healing Effects

Asiaticoside facilitates wound healing through an increase in peptidic hydroxyproline content, tensile strength, collagen synthesis, angiogenesis and epithelialization, as shown in animal models (Bonte, 1994; Maquart, 1990; Shukla, 1999). Asiatic acid and madecassic have also demonstrated an increase in peptidic hydroxyproline showing an increased remodeling of the collagen matrix (collagen synthesis) in wounds (Bonte, 1994; Maquart, 1999). Asiaticoside also induces enzymatic and non-enzymatic antioxidants, namely superoxide dismutase, catalase, glutathione peroxidase, vitamin E, and ascorbic acid in newly formed tissue (initial stage of wound healing) (Shukla, 1999).

CLINICAL TRIALS

Chronic Venous Insufficiency

A randomized, double-blind, placebo-controlled study evaluated the efficacy of a titrated extract of *Centella asiatica* in treating chronic venous insufficiency. Ninety-four patients with chronic venous insufficiency were included in the

study. The asiaticoid mixture, administered as 60 mg daily and 120 mg daily for 2 months, led to significant improvement in subjective (heaviness in the legs, pain in standing up, edema) and objective (plethysmographic measurements of vein tone) parameters compared to placebo (Pointel, 1987).

Venous Hypertension

The effect of an extract of *Centella asiatica* with capillary filtration and ankle edema was evaluated in patients with venous hypertension. Sixty-two patients were included in the study and administered either placebo or the extract as 60 mg or 30 mg three times daily. Capillary filtration rate and ankle edema both significantly improved in a dose-dependent manner in the extract-treatment groups. The subjective symptoms (swelling, sensation, restless lower extremity, pain and cramps, and tiredness) were significantly improved in the extract-treatment groups, with no change in the placebo-treatment group (Belcaro, 1990).

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for rheumatism and skin diseases. Externally, the drug is used for poorly healing wounds, leprosy sores, and post-operative scarring. In Asia, the drug is used to enhance urination, for physical and mental exhaustion, diarrhea, eye diseases, inflammations, asthma, and high blood pressure.

Indian Medicine: The drug is used for skin diseases, syphilis, rheumatism, and leprosy. Gotu kola is also used for the treatment of mental illness, epilepsy, hysteria, and for dehydration.

Chinese Medicine: The herb is used for dysentery and summer diarrhea, vomiting, jaundice, urinary calculi, epistaxis and scabies.

Homeopathic Uses: Gotu Kola is used for skin diseases associated with itching and swelling and inflammation of the uterus.

PRECAUTIONS AND ADVERSE REACTIONS

Allergic Contact Dermatitis: Although there have been case reports of allergic contact dermatitis due to *Centella asiatica*, the plant's sensitizing capacity is considered low (Bilbao, 1995; Danese, 1994; Gonzalo, 1996; Hausen, 1993).

DOSAGE

Mode of Administration: Gotu Kola is available in liquid or solid pharmaceutical forms, for oral intake. Gotu Kola is also available parenterally for homeopathic use.

How Supplied:

Capsules — 400 mg, 435 mg, 439 mg, 440 mg, 450 mg, 500 mg

Liquid — 1:1; 250 mg/ml

Daily Dosage: 0.6 gm of dried leaves or infusion taken 3 times daily; normal single dose is 0.33 to 0.68 gm.

Varicose Veins — *Centella asiatica* extract administered as 60 mg daily has shown improvement (Arpaia, 1990).

Venous Hypertension — Total triterpenic fraction of *Centella asiatica* (TTFCA) tablets have demonstrated improvement of venous hypertension at doses of 30 mg given three times daily or 60 mg given three times daily (Belcaro, 1990).

Chronic Venous Insufficiency — Titrated extract of *Centella asiatica* (TECA) administered as 120 mg daily and 60 mg daily have demonstrated efficacy in chronic venous insufficiency (Pointel, 1987).

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules or 1 ml injection solution sc twice weekly; ointment 1 to 2 times daily (HAB1).

Storage: Store in a cool, dry place and in well-sealed containers.

Goutweed

Aegopodium podagraria

DESCRIPTION

Flower and Fruit: The flowers range from 50 to 100 cm. They have large white or reddish double umbels that are usually androgynous. The flowers have no involucre and no calyx. The petals are white or pink, about 1.5 mm long, obcordate and cuneate at the base. The fruit is oblong and brownish with pale veins. The fruit is slightly pressed in at the sides, unwinged, unstriped, with a 3 mm-long mericarp.

Leaves, Stem and Root: The stem is erect, angular, grooved, hollow, glabrous and branched. The lower leaves are double trifoliate, and the upper leaves trifoliate. The leaflets are ovate and crenate-serrate.

Characteristics: Propagates via underground runners.

Habitat: Indigenous to Europe (not Spain), West Asia.

Production: Goutweed is the aerial part of *Aegopodium podagraria*.

Other Names: Goutwort, Ground Elder, Gout Herb. Herb Gerard(e), Jack-Jump-About, Goatweed, Ashweed, Achweed, English Masterwort, Pigweed, Eltroot, Bishop's Elder, Weyl Ash, White Ash, Bishopsweed, Bishopwort.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

*Volatile oil**Polyynes:* only in freshly-harvested leaves*Flavonol glycosides:* including hyperoside, isoquercitrin*Caffeic acid derivatives:* including chlorogenic acid*Ascorbic acid*

EFFECTS

No information available.

INDICATIONS AND USAGE*Unproven Uses:* The herb is used internally as an infusion for gout and rheumatic diseases. It is used externally in macerations for poultices and baths for hemorrhoids, gout and rheumatic diseases, as well as for kidney and bladder disorders and intestinal disorders.**PRECAUTIONS AND ADVERSE REACTIONS**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Internally as a tea; externally, the fresh herb is squeezed for poultices.*Daily Dosage:* There is no exact dosage. A daily recommended dose consists of 1 to 2 dessertspoonfuls (30ml) of the juice of the fresh plant.**LITERATURE**

Bohlmann F et al., Chem Ber 93, 981. 1968.

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York. 1992-1994.

Harborne JB, Williams CA, PH 11 (5): 1741-1750. 1972.

Schneider V, Ernahr-Umschau 31(2):54-57. 1984.

Habitat: The plant is indigenous to tropical West Africa.*Not to be Confused With:* The seeds can be mistaken for peppercorns.*Other Names:* Guinea Grains, Melegueta Pepper, Mallaguetta Pepper**ACTIONS AND PHARMACOLOGY**

COMPOUNDS

*Volatile oil**Pungent substances:* including hydroxyphenylalkanones and hydroxyphenylalkanoles*Tannins**Starch**Fatty oil*

EFFECTS

The seed is a stimulant.

INDICATIONS AND USAGE*Unproven Uses:* Grains-of-Paradise was used as a stimulant. Now it is obsolete as a drug.**PRECAUTIONS AND ADVERSE REACTIONS**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Due to the constituent pungent substances, the intake of larger dosages may lead to irritation of the stomach and the urinary tract.

Grains-of-Paradise

*Aframomum melegueta***DESCRIPTION***Medicinal Parts:* The medicinal parts are the ripe seeds.*Flower and Fruit:* The flowers are solitary, mauve and wax-like. The fruit is 10 cm long, pear-shaped and scarlet. The seeds are small, hard, shiny, reddish-brown and oyster-shaped. They have an aromatic and pungent taste and smell.*Leaves, Stem and Root:* Aframomum melegueta is a reed-like plant, 1 to 2.5 m high. The leaves are long and narrow.

Grape

*Vitis vinifera***TRADE NAMES**

Grape Seed Extract (Available from numerous manufacturers), Red Wine Extract, Grape Seed, Activin, Dr. Masquelier's Authentic OPC

DESCRIPTION*Medicinal Parts:* The medicinal parts are the leaves, the fruit and the juice.

Flower and Fruit: The flowers are in compound compact panicles. The petals are about 5 mm long and droop like the sepals. The fruit is oblong to globular. 6 to 22 mm long, dark blue-violet, red, green or yellow, juicy, sweet or sour. The seeds are pear-shaped, with hard skin and two long dimples on the side.

Leaves, Stem and Root: The vine is a 30 cm high climber with deep, heavily-branched roots and a woody trunk. The trunk has striped, loose bark. The brown-red to brown-yellow branches are glabrous or slightly downy and finely grooved. The leaves are orbicular, generally in 3 to 5 lobes or blades. They are deeply notched at the stem. The upper surface of the leaves is glabrous, the under surface is lanate.

Habitat: The plant is indigenous to southern Europe and western Asia and is cultivated today in all temperate regions of the world.

Production: Vine leaves are the foliage leaves of *Vitis vinifera*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids (4 to 5%): including kaempferol-3-O-glucosides, quercetin-3-O-glucosides

Tannins: procyanidolic oligomers (proanthocyanidins), including constituent monomers of catechin epicatechin

Non-flavonoids (Stilbenes): resveratrol and viniferins

Fruit acids: including, tartaric acid, malic acid, succinic acid, citric acid, oxalic acid

Phenylacrylic acid derivatives: p-cumaroyl acid, caffeoyl acid, feruloylsuccinic acid

EFFECTS

Antiatherosclerotic Effects: The oxidation of low-density lipoproteins (LDL) by free radicals is associated with the initiation of atherosclerosis. Proanthocyanidin decreases the number of LDL-positive macrophage-derived foam cells in atherosclerotic lesions. The compound also inhibits the oxidation of cholesteryl linoleate in LDL to exert a reduction in atherosclerosis of the aorta (Nuttall, 1998, Yamakoshi, 1999).

Anticarcinogenic/Antitumor: Chemoprotective properties of proanthocyanidins include activity against free radicals and oxidative stress (Ye, 1999). The anti-tumor-promoting activity due to strong antioxidant effects of the compound has been demonstrated in animal models (Zhao, 1999).

Antioxidant Effects: Proanthocyanidin from the Grape Seed extract exerts a concentration-dependent inhibition of oxygen free radicals. In one study, the antioxidant effect of proanthocyanidin was more potent compared to vitamin C

and vitamin E succinate (Bagchi, 1997). The compound also inhibits peroxidation of phosphatidylcholine liposomes (Plumb, 1998).

Hair Growth: Proanthocyanidins extracted from Grape Seeds promote proliferation of hair follicle cells, and possess remarkable hair-cycle converting activity from the telogen phase to the anagen phase. Epicatechin and catechin are the constitutive monomers inducing the degree of polymerization inducing hair growth (Takahashi, 1998).

Hepatoprotective Effects: Proanthocyanidin has been shown to significantly attenuate acetaminophen induced hepatic DNA damage, apoptotic and necrotic cell death of liver cells. The component also antagonizes acetaminophen induced changes in bcl-XI expression (Ray, 1999).

Ischemia Prevention: Maintenance of microvascular injury by procyanidins occurs through the scavenger effect of reactive oxygen species (Maffei Facino, 1994). Procyanidins also reduce ventricular contraction in a dose-dependent fashion. Procyanidins decrease coronary perfusion pressure and improve cardiac mechanical performance. (Maffei Facino R, 1996).

Vascular Effects: Procyanidins isolated from Grape Seed stabilizes capillary walls and prevents increases in permeability which inhibits edema (Robert, 1990; Zafirov, 1990). Overproduction of hyaluronan content associated with pathologic venous walls, in particular vein-lymphatic edema, is decreased by procyanidolic oligomers (Drubaix, 1997). Procyanidolic oligomers cross-link collagen fibers, resulting in reinforcement of the natural cross-linking of collagen that forms the collagen matrix of vascular connective tissue (Tixier et al, 1984). The vascular activity of procyanidin has positive effects on diabetic retinopathy, night vision and ocular stress (Boissin, 1988; Corbe, 1988; Soyeux, 1987).

CLINICAL TRIALS

Peripheral Venous Insufficiency

The efficacy of Grape Seed extract was evaluated for the treatment of venous insufficiency and symptoms due to hormonal supplementation. Grape Seed extract (150 mg twice daily) was administered to 4,729 patients in an open-label study. Peripheral venous insufficiency was evaluated 45 and 90 days after treatment. The efficacy score was based on symptoms of nocturnal cramps, paresthesias, sensation of warmth, cyanosis and edema. The sensation of heaviness in the legs decreased in 57% of cases by day 45 and 89.4% by day 90. In addition, the improvement of symptoms occurred in 66% of cases by day 45 and 79-83% of cases by day 90 (Henriet, 1993).

Ocular Effects

A lower resistance to glare and alteration of scotopic vision are associated with retinal pathology related to age, fatigue and stress. The effect of procyanidolic oligomers (PCO) on light vision and chorioretinal circulation was determined in 100 subjects. PCO (Endotelon) was administered in tablets of 50 mg four times daily for five weeks. Improvements in visual adaptation to low luminances and visual performances after glare, as measured by a nycometer were significant (Corbe, 1988).

Postoperative Edema

The effect of PCO from Grape Seed extract was shown to have protective effects on the postoperative edema compared to placebo in a double-blind, placebo-controlled study. Thirty-two female patients undergoing a facelift were administered either 300 milligrams Grape Seed extract or placebo daily over the 5 days preceding the operation, and postoperatively from days 2 to 6. Prophylactic decrease in postoperative facial edema was the main efficacy criteria. The Grape Seed extract cohort scored significantly better than placebo against postoperative facial swelling (Baruch, 1984).

INDICATIONS AND USAGE

Unproven Uses: In Folk medicine, Grape preparations are used in venous diseases and blood circulation disorders.

Indian Medicine: Grape is used for headache, dysuria, scabies, skin diseases, gonorrhea, hemorrhoids and vomiting.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. A reversible inhibition of intestinal enzyme activity (alkaline phosphatase, sucrase and dipeptidyl peptidase) was demonstrated in animal models (Tebib, 1994).

DOSAGE*How Supplied:*

Capsule—25 mg, 30 mg, 50 mg, 60 mg, 500 mg

Tablet—50 mg

Daily Dosage: Grape Seed extract has been used for preventive therapy with 50 mg daily and treatment doses of 150-600 mg daily in divided doses (Arne, 1982; Baruch, 1984; Corbe; 1988; Delacroix, 1981; Henriët, 1993; Nuttall, 1998; Soyeux, 1987).

Gratiola officinalis

See *Hedge-Hyssop*

Gray Wallflower

Erysimum diffusum

DESCRIPTION

Medicinal Parts: The medicinal part is the plant's radish.

Flower and Fruit: The flowers are in densely flowered racemes. The 4 sepals are upright and gray-haired, the 4 petals yellow, long-petiolate, pubescent on the lower surface and 8 to 14 mm long. There are 2 short and 4 long stamens; the ovary is superior with 4 fused carpels. The fruit is a 3.5 to 8 cm long, approximately 1 mm wide, 4-sided, appressed pubescent, dehiscent pod that opens on 2 sides. The seeds are elongate with a diameter of approximately 1 to 1.5 mm.

Leaves, Stem and Root: Gray Wallflower is a herbaceous biennial or perennial upright that grows up to 1.2 m high. The leaves are alternate. The lower ones are petiolate, 1 to 8 mm wide, gray-haired, narrow, linear-lanceolate, entire or dentate; the middle and upper ones are sessile. The stem is edged, covered in jointed hairs and branched in larger plants. The root is thin, spindle-shaped and branched.

Habitat: The plant is indigenous to the Commonwealth of Independent States and Hungary.

Production: The gray-leaved wild radish is collected during the flowering season of the two-year-old plants of *Erysimum diffusum* and dried after harvesting at a maximum temperature of 40° C.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolids, 1 to 3%): chief component *erysimoside* (primary glycoside, aglycone *k-strophanthidin*, 0.6%)

Helveticoside (secondary glycoside)

Canescine

Cheirotoxin

Erycanoside

EFFECTS

The drug contains cardioactive glycosides of the cardenolide type with *k-strophanthidin* as the aglycone. It is accordingly positively inotropic and negatively chronotropic in its effect.

INDICATIONS AND USAGE

Unproven Uses: The drug was used in the past for cardiac insufficiency (NYHA I and II), but can no longer be recommended.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

Although poisonings among humans are both unknown and unlikely, due to the difficulties accompanying resorption of the glycosides, the possibility of a poisoning resulting from either high dosages of the drug or its glycosides through peroral administration is not to be completely ruled out.

DOSAGE

How Supplied: capsules; tablets.

Storage: Drug should be stored in a tightly sealed, secure container.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed.), *Hagers Handbuch der Pharmazeutischen Praxis*, 5. Aufl., Bde 4 - 6

(Drogen), Springer Verlag Berlin, Heidelberg, New York. 1992-1994.

Great Burnet

Sanguisorba officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh aerial parts, the dried herb, the rhizomes and roots.

Flower and Fruit: The composite heads are ovate-oblong, approximately 1 to 2 cm long and consist of 5 to 10 usually androgynous flowers. The calyx has 4 dark red-brown tips, 4 stamens with stiffly patent red filaments and yellow anthers. The smooth, spike-like, quadrangular fruit calyx has 1 carpel and 1 style and is narrowly winged. The fruit is a nut enclosed in the perigone tube.

Leaves, Stem and Root: Great Burnet is a semi-rosette shrub with a strong dark brown root that produces thick fibers and a short rhizome. The stems are erect, angular, glabrous, and bifurcated. The rosette leaves are 20 to 40 cm long and consist of 7 to 15 ovate leaflets, which are cordate at the base and blue-green beneath. There are only a few cauline leaves, which taper towards the top.

Characteristics: The brown-red composite head is characteristic for this plant.

Habitat: The plant is widespread in the northern, temperate regions of Europe, temperate Asia, and North America.

Production: Great Burnet is the *Sanguisorba officinalis* plant in flower. The fresh aerial parts are collected in the wild during the flowering season. The rhizomes and roots are harvested in autumn, then washed and dried.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including among others, rutin, flavonoid sulfates

Tannins: including ellagitannins, sanguinarine H-11, casuarinin

Triterpene glycosides: aglycones pomolic acid, tormentolic acid, including among others, ziyuglycosides I and II (sanguisorbin), betulinic acid, ursolic acid

Sterols: including beta-sitosterol

EFFECTS

The drug has been credited with decongestant, astringent and diuretic properties, but no investigation into effects has been carried out.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for female disorders, menorrhagia during menopause, hot flushes, dysentery, enteritis, diarrhea, bladder restraint, hemorrhoids, phlebitis, and varicose veins. Externally, Great Burnet is used in plaster for wounds and ulcers. Folk medicine uses included administration of the plant latex as a remedy for pulmonary tuberculosis.

Chinese Medicine: The Chinese use Great Burnet as an astringent and hemostyptic for nosebleeds, dysentery, reptile bites and bloody coughs.

Homeopathic Uses: Among uses in homeopathy are uterine bleeding, varicose veins and diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally and externally. It is available in ground form and is used as an extract, juice or tea. A plaster is used externally.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34).

Greater Bindweed

Calystegia sepium

DESCRIPTION

Medicinal Parts: The medicinal parts are the whole flowering plant and the root.

Flower and Fruit: The solitary white flowers are about 5 cm long, the pedicle is quadrangular. Under the calyx there are 2 cordate, pointed, red-bordered bracts, which extend to cover the calyx. There are 5 sepals. The corolla is fused and conical. There are 5 stamens and 1 superior ovary. The fruit is a capsule.

Leaves, Stem and Root: The plant is about 10 to 30 cm high and has a creeping rhizome. The stem is angular, glabrous and twining. The leaves are alternate, petiolate, cordate or arrow-shaped. The base of the leaves are acuminate, and they often have dentate lobes. Most twining plants seem to follow the course of the sun and bind round a support from left to right. But the Bindweed will always twine against the sun, confounding all attempts to train it, even dying in the process.

Characteristics: The flowers close in damp weather.

Habitat: The plant is indigenous to Europe and eastern U.S.

Production: The upper part of the herb is harvested during the flowering season and dried at temperatures of no more than 40° C in a well-aired place.

Other Names: Devil's Vine, Hedge Lily, Lady's Nightcap, Rutland Beauty, Hedge Convolvulus, Old Man's Night Cap, Bearbind

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glycoretines: polymeric, resinous glycosides of hydroxy fatty acids (C12-C16) with oligosaccharides; the hydroxyl groups have been esterified with acetic, propionic, isobutyric and valeric acids, among others

Tannins

EFFECTS

The drug has a powerful effect; activity in the smooth muscle area is stimulated, intestinal peristalsis is increased, and there is an increase in bile production.

INDICATIONS AND USAGE

Unproven Uses: Greater Bindweed is used for fevers, urinary tract diseases, as a purgative for constipation and to increase the production of bile.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. It is conceivable that an overdose of the drug would trigger intestinal colic.

DOSAGE

Mode of Administration: The pressed juice, powdered root and an infusion are used internally. The drug is rarely used anymore due to its strong intestinal effects.

Preparation: An infusion is prepared by adding 1 to 2 teaspoons of cut drug per cup of water.

Greek Sage

Salvia triloba

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the leaf.

Flower and Fruit: The flowers are in false whorls of 2 to 6 blossoms. The calyx is campanulate, dentate, 5 to 8 mm long, often purple and pubescent. The corolla is 16 to 25 mm long, typically lilac or pink but occasionally white.

Leaves, Stem and Root: *Salvia triloba* grows as a semi-shrub, up to 1.2 m high. The leaves are petiolate and tomentose. The lamina is simple or pinnatifid with 1 to 2 pairs of lateral leaf sections and a large elongate-ovate end section. The

stem is square, appressed pubescent, grayish-white beneath and green above.

Habitat: The plant is indigenous to Greece, the Commonwealth of Independent States, Albania, Turkey and Cyprus. Various species are particularly widespread in the Mediterranean region.

Production: Greek Sage leaves are the dried leaves of *Salvia triloba*, which are harvested once a year if collected in the wild and three times a year when cultivated.

Other Names: Three-Lobed Sage, Turkish Sage

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1.5 to 3.5%): chief component 1,8-cineole (40 to 67%), camphor (2 to 25%), thujone (5 to 6%), including as well camphene, beta-caryophyllene, myrcene, alpha-pinene, beta-pinene

Flavonoids: including 7-O-glucosides and 7-O-glucuronides of apigenin, chrysoeriol, hispidulin, luteolin, 6-methyl luteolin, as well as salvigenin, jaceosidin

Caffeic acid derivatives: rosmarinic acid (1.0 to 2.5%)

Diterpenes: including carnosol (0.5%)

Triterpenes (8%): ursolic acid, oleanolic acid

EFFECTS

The chief active ingredient (cineole) of the drug's essential oil has an antimicrobial effect. The combined action of the essential oil and the tannins is antiseptic and anti-inflammatory, particularly in the region of the mouth and throat. Decoctions and infusions of the leaves exhibit antihypertensive, spasmolytic and blood sugar-reducing effects in animal experiments, during which the plasma insulin levels remain unchanged. The hypoglycemic effect is traced to the inhibition of intestinal glucose resorption. A sedative effect has also been described.

INDICATIONS AND USAGE

Unproven Uses: *Salvia triloba* is used internally for diabetes in Israel and Cyprus, and elsewhere for cardiac symptoms, lung complaints, colds, coughs, nervousness and digestion problems. Externally it is used to treat skin damage.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Aqueous decoctions and infusions prepared from the whole, cut and powdered drug are used internally. The fresh cut leaves are applied topically.

Preparation: The literature contains no detailed descriptions.

Storage: Store tightly sealed and protected from light.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Green Hellebore

Helleborus viridis

DESCRIPTION

Medicinal Parts: The drug derived from the plant's rhizome and roots is obsolete in medicine today.

Flower and Fruit: There are 2 to 3 flowers with a diameter of 4 to 7 cm and 5 ovate, grass-green, broad flower bracts. The petals are in the form of petaloid honey glands, and there are numerous stamens. The ovary is superior with the carpels only fused at the base. The fruit is a 25 to 28 mm long follicle with beak. The seeds have a narrow longitudinal strip with a ring at the end.

Leaves, Stem and Root: This herbaceous perennial grows upright, up to 40 cm high. There are 2 basal, long-petioled leaves; the lamina is divided like a foot into 7 to 13 sections that are narrow-lanceolate, serrate and dark green. The stem is upright, branching higher up and leafless to that point. The cauline leaves are similar to the basal ones but sessile and smaller. The rhizome is usually branched.

Habitat: The various species of Hellebore grow mainly in mountainous regions of Europe and North America. The plant is most commonly found in the Alps; *Helleborus viridis* is found growing as far north as northwest France.

Production: Green Hellebore root is the dried rhizome with roots of *Helleborus viridis*.

Not to be Confused With: Adulteration and mistaken identity can occur with *Hellebori nigri rhizoma*, *Actaea spicata*, *Adonis vernalis*, *Trollius europaeus* and *Eupatorium cannabinum*.

Other Names: Bear's Foot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (bufadienolids, 0.5 to 1.5%): chief component hellebrin, including deglucohellebrin

Alkaloids of unknown structure: celliamine, sprintillamine, sprintilline

Steroid saponins

EFFECTS

The steroid saponin mixture helleborin is severely toxic and irritating to mucous membranes (ptarmic). It exhibits digi-
 talis-like effects through the cardioactive glycosides it contains (hellebrin). The alkaloids it contains produce an excitation of the motor centers, eventually leading to convulsions and respiratory failure and triggering bradycardia in the heart and a negatively inotropic effect.

INDICATIONS AND USAGE

Unproven Uses: The drug is obsolete today because the risks of use are considered too high, given that efficacy for previously accepted indications has not yet been proven.

Previous uses in folk medicine included nausea, constipation and worm infestation. Root preparations were used also for heart failure and as a diuretic. Helleborus viridis was employed as a laxative according to Hager (around 1930) and was important in homeopathic medicine.

Homeopathic Uses: Helleborus viridis is used for diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

^ The drug is not to be administered in allopathic medicine. No risks are known in connection with the administration of homeopathic dosages of the drug.

OVERDOSAGE

The mucous membrane-irritating effect of the saponins appears to play the largest role in poisonings with the drug, resulting in scratchiness in mouth and throat, salivation, nausea, vomiting, diarrhea, dizziness, shortness of breath, and possible convulsions and asphyxiation. The ingestion of very large dosages leads to disorders of cardiac function (cardiac arrhythmias).

Following gastrointestinal emptying (gastric lavage, sodium sulfate) and the administration of activated charcoal, the treatment for poisonings consists of the treatment of spasms with diazepam (i.v.), electrolyte substitution and the counteracting of any acidosis that may appear through sodium bicarbonate infusions. Intubation and oxygen respiration may also be required.

£f Cases of fatal poisonings are known among animals who fed on the leaves of the plant.

DOSAGE

Mode of Administration: Whole, cut and powdered drug.

Daily Dosage: 1 g drug; maximum single dosage: 0.2 g drug.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every to 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 to ml sc acute, 3 times daily; chronic: once a day (HAB34).

Storage: Store securely.

Green Tea

Camellia sinensis

TRADE NAMES

Green Tea Leaf (available from numerous manufacturers and as a combination product,) Green Tea Extract, Green Tea, Standardized Green Tea Extract, Green Tea Power, Chinese Green Tea Bags, Green Tea Power Caffeine Free

DESCRIPTION

Medicinal Parts: The medicinal parts are the very young downy leaves, from which green or black tea is prepared according to the treatment being given.

Flower and Fruit: The flowers grow short-pedicled and singly or in clusters of a few flowers in the leaf axils. They are white or pale pink and have a diameter of 3 to 5 cm. The flowers have between 5 and 7 sepals and petals at a time. The petals are fused at the base with the numerous stamens. The ovary has 3 chambers. The fruit is a greenish-brown, woody capsule with a diameter of 1 to 1.5 cm and contains 1 to 3 smooth brown seeds.

Leaves, Stem and Root: The plant is an evergreen, heavily-branched shrub. The leaves are glossy dark green, alternate, short-petiolate, coreaceous, lanceolate or elongate-ovate and roughly serrate. The young leaves appear silver because of the covering of downy hairs on the surface.

Habitat: The plant does not originate in the wild. It was originally cultivated in China and is grown as a tea plant today in India, China, Sri Lanka, Japan, Indonesia, Kenya, Turkey, Pakistan, Malawi and Argentina.

Production: Tea leaves are the fermented and/or dried leaves of *Camellia sinensis*. Harvesting takes place under stringent quality control. Green Tea is produced by steaming the fresh-cut leaf. Black Tea is produced by allowing the leaves to oxidize. During oxidation, enzymes present in the tea convert many of the polyphenolic therapeutic substances to less active compounds. Oxidation does not occur with Green Tea because the steaming process inactivates the enzymes responsible for oxidation. The anti-oxidant activity of Green Tea is six times greater than that of Black Tea.

Other Names: Black Tea, Chinese Tea, Green Tea

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Purine alkaloids (methyl xanthines): caffeine (previously referred to as theine or teine; depending upon the development stage of the leaves, 2.9-4.2%, content declining with age), theobromine (0.15-0.2%), theophylline (0.02-0.04%)

Therpepe saponins (theafoia saponins): aglycones including among others, barringtogenol C, RI-barringtogenol

Catechins: in unfermented (green) tea 10-25%, with fermentation partially changing over into oligomeric quinones with tannin character, into theaflavine, theaflavin acid, thearubigene, or into non-water soluble polymeric- flavonoids: including, among others, quercetin, kaempferol, myricetin

Flavonoids: including quercetin, kaempferol, myricetin

Caffeic acid derivatives: including among others, chlorogenic acid, theogallin

Anorganic ions: high fluoride content (130-160 mg/kg), potassium and aluminum ions

Volatile oil: chief components linalool, in fermented tea also 2-methyl-hept-2-en-6-on, alpha-ionon and beta-ionon, more than 300 volatile compounds are involved in tea aroma

EFFECTS

The caffeine in the drug has a centrally stimulating and antidepressive effect (adenosine antagonism.) Adenosine antagonism leads to dilation of the renal vessels with a consecutive increase of the rate of filtration (diuresis). Caffeine is positively inotropic, promotes the secretion of gastric juices, glycolysis and lipolysis. In animal tests, bradykinin and prostaglandin antagonism caused a capillary sealing and anti-inflammatory effect.

An antidiarrheal effect can be attributed to a combination of the tannin effect and the fact that doses of 400 mg polyphenols administered three times daily promotes the growth of *Lactobacillus* and *Bifidobacter* species while inhibiting the growth of *Clostridium perfringens* and *Clostridium difficile* (Yamamoto, 1997).

There is clinical evidence that Green Tea has cancer preventive effects. The types of cancer that Green Tea has been shown to prevent as demonstrated in well controlled clinical studies include cancers of the pancreas, colon, small intestine, stomach, breast and the lung.

Green Tea mouthwashes have been shown to inhibit the growth of cavity-associated bacteria such as *Streptococcus mutans*, *Streptococcus salivarius* and *Escherichia coli* (Rashed 1998; Haider, 1998).

CLINICAL TRIALS

Cancer Treatment/Prevention

A large (n = 2226) case-control study was conducted in China, where recently diagnosed cancer cases (pancreatic, colon and rectum) among residents between the ages of 30 and 74 years were included. Controls (n = 1552) were selected and matched to cases by age and gender and adjustments were made for age, income, education and cigarette smoking. As tea consumption increased, the incidence of all three cancers decreased. Women with the highest tea consumption (> or = 200 g/month) had a 33% reduced risk for colon cancer, 43% reduced risk of rectal cancer and 47% reduction in the risk for pancreatic cancer (p= 0.07, 0.001 and 0.008 respectively). For men who consumed > or = 300 g/month of Green Tea, the risk of colon cancer was reduced by 18%, for rectal cancer there was a 43% reduction of risk and for pancreatic cancer the risk reduction was 47% (p= 0.38, 0.04 and 0.04 respectively) (Ji, 1997).

A two-part case control study of 472 Japanese women with stage I, II or III breast cancer was conducted. The first part of the study assessed the association between consumption of Green Tea prior to clinical cancer and the number of axillary lymph node metastases for premenopausal women or the increased expression of progesterone receptor and estrogen receptor among postmenopausal women with stage I or II cancer. The second part of the study investigated the recurrence rate of those with stage I or II breast cancer in relation to the amount of Green Tea consumption. There was an inverse relationship between the amount of Green Tea consumption and the rate of cancer recurrence. The recurrence rate was 16.7% for those that consumed > or = 5 cups/day and 24.3% among those consuming < or = 4 cups/day (p < 0.05). The authors concluded that increased consumption of Green Tea prior to clinical cancer onset is significantly associated with improved prognosis of stage I and II breast cancer, and that this association may be related to a modifying effect of Green Tea on the clinical characteristics of the disease (Nakachi, 1998).

Dental Caries Prevention

An extract of oolong tea (semifermented tea leaves of *Camellia sinensis*) containing polymerized polyphenols in 0.2% ethanol was administered to 35 volunteers between 18 and 29 years of age to test the inhibitory effect of the extract on dental plaque deposition. The study was repeated 1 week after the first trial using 0.2% ethanol without the tea extract. The oolong tea cohort showed significant inhibition of plaque deposition (Ooshima, 1994).

In another study, it was demonstrated that total inhibition of *Streptococcus mutans* was possible after exposure to a 0.1%

infusion of Chinese Green Tea polyphenols (CTP) for 5 minutes. Plaque Index and Gingival Index decreased significantly ($p < 0.001$) after a 0.2% CTP rinse and brush regimen was used by the study participants. The authors conclude that CTP is an effective agent to prevent dental caries (Chung, 1993).

INDICATIONS AND USAGE

Though no Commission E monograph is available for Green Tea, there is clinical evidence that Green Tea is likely to be useful as a cancer preventive and as a preventive for dental caries.

Unproven Uses: Internal application: Green Tea is used for stomach disorders, migraine, symptoms of fatigue, vomiting and diarrhea when taken as a beverage. It can be used to increase performance (stimulant effect).

Homeopathic Uses: Camellia sinensis is used for cardiac and circulatory conditions, headaches, states of agitation, states of depression and stomach complaints.

Indian Medicine: In India, tea preparations are used for diarrhea, loss of appetite, hyperdipsia, migraine, cardiac pain, fever and fatigue.

Chinese Medicine: In China Green Tea is used to treat migraine, nausea, diarrhoea resulting from malaria and digestion problems. It is also used as a cancer preventive.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Side effects of tea consumption are possible with persons who have sensitive stomachs, chiefly due to the chlorogenic acid and tannin content. Hyperacidity, gastric irritation, reduction of appetite, as well as obstipation or diarrhea, could be the result of intense tea consumption. These side effects can be generally avoided by the addition of milk (reduction of the chlorogenic acid and other tannins).

Care should be taken with patients that have weakened cardiovascular systems, renal diseases, thyroid hyperfunction, elevated susceptibility to spasm and certain psychic disorders, such as panicky states of anxiety. With long-term intake of dosages above 1.5 g caffeine per day, non-specific symptoms occur, such as restlessness, irritability, sleeplessness, palpitation, vertigo, vomiting, diarrhea, loss of appetite and headache.

Pregnancy: Pregnant women should not exceed a dosage of 300 mg per day (5 cups of tea spread out over the course of a day).

Nursing Mothers: Infants whose nursing mothers consume beverages containing caffeine could suffer from sleep disorders.

Children: There have been reports of microcytic anemia in infants that were fed an average of 250 ml Green Tea daily. This effect may possibly be due to impairment of iron metabolism (Merhav, 1985).

Drug Interactions: The resorption of alkaline medications can be delayed because of chemical bonding with the tannins.

OVERDOSAGE

Overdosage (quantities corresponding to more than 300 mg caffeine, or 5 cups of tea as a beverage) can lead to restlessness, tremor and elevated reflex excitability. The first signs of poisoning are vomiting and abdominal spasm. Fatal poisonings are not possible with tea beverages.

DOSAGE

Mode of Administration: Green Tea is administered as an infusion or in capsule form for internal use.

How Supplied: The usual concentration of total polyphenols in dried Green Tea leaf is around 8% to 12%. One cup of Green Tea normally contains 50 to 100 milligrams polyphenols (Murray & Pizzorno, 1998; Yamamoto, 1997).

Capsules — 100 mg, 150 mg, 175 mg, 333 mg, 383 mg, 500 mg

Liquid — 1:1

Tablets — 100 mg

Dried extract (instant tea) — Processed using steam extraction followed by drying

Filter tea bags — Available commercially containing 1.8 to 2.2 gm tea

Preparation: To prepare a tea, boiling water is poured over a heaped teaspoon of leaf tea, a level teaspoon of crushed leaves or a tea bag and left to draw for 3 to 10 minutes as required. The caffeine is almost completely drawn after approximately 3 minutes. The tannin-containing substance (and with it the antidiarrheal action) increases when the tea is left to brew.

Daily Dosage: A daily dose of 300 to 400 mg of polyphenols is typical. The amount of polyphenols in 3 cups of Green Tea is between 240 and 320 mg.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution sc twice weekly (HAB1).

Storage: Store tightly sealed and dried; store separately from other chemicals and aromatic substances.

Grindelia camporum

See *Gumweed*

Ground Ivy

Glechoma hederacea

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb collected during the flowering season and dried, the fresh aerial parts collected during the flowering season, and the whole plant.

Flower and Fruit: The flowers are in 2- to 6-blossomed false whorls in the axils of the foliage leaves. The individual flowers are 1 to 2 cm long with distinct pedicels and bracteoles that are 1 to 1.5 mm long. The calyx is bilabiate and tubular, with 5 tips. The bilabiate corolla is 15 to 22 mm long, usually blue-violet but occasionally red-violet or white. The fruit is a nut of about 2 mm.

Leaves, Stem and Root: This perennial herb grows 15 to 60 cm high and has a creeping main stem, which roots at the lower nodes and keeps its leaves in winter. The quadrangular stem is up to 2 mm thick and often tinged with blue-violet, as are the petioles. The leaves are crossed opposite, long-petioled, reniform to broadly cordate, crenate; dark green above and paler green beneath.

Characteristics: The plant has a mild unpleasant smell; the taste is hot and bitter.

Habitat: Ground Ivy is a common wild plant in Europe.

Production: Ground Ivy is the aboveground part of *Glechoma hederacea*, gathered when in flower (from April to June). It is air-dried in the shade to keep loss of the essential oil to a minimum._s

Other Names: Alehoof. Gill-Go-over-the-Ground, Lizzy-Run-up-the-Hedge, Gill-to-by-the-Hedge, Robin-Run-in-the-Hedge, Catsfoot, Hedgemaids, Tun-Hoof, Haymaids, Turnhoof, Creeping Charlie. Cat's-Paw

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (traces): chief components (-)-pinocarvone, (-)-menthone, (+)-pulegone. also including germacran D, germacran B, cis-ocimene

Sesquiterpenes: glechomafuran, glechomanolide

Hydroxy fatty acid: 9-hydroxy-10-trans, 12-cis-octadecadienic acid

Caffeic acid derivatives: rosmarinic acid

Flavonoids: including cymaroside, cosmosyin, hypersoside isoquercitrin

EFFECTS

^r The drug is said to be an anti-inflammatory, which is believed to be due to the tripterpen content. No detailed information is available.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug is used internally for inflammation of gastrointestinal mucous membranes and diarrhea. Ground Ivy is also used for mild respiratory complaints of the upper bronchia; in the symptomatic treatment of coughs; and as a diuretic in cases of bladder and kidney stones. Externally, the drug is used for the treatment of poorly healing wounds, ulcers and skin diseases. In Italy, it is used for arthritis and rheumatism.

Chinese Medicine: Ground Ivy is used to treat carbuncles, erysipelas, lower abdominal pain, scabies, scrofulous, irregular menstruation, coughs, dysentery and jaundice. Efficacy has not, however, been proven for these indications.

Homeopathic Uses: Uses in homeopathy include diarrhea and hemorrhoids.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Fatal poisonings were observed among horses following intake of large quantities of the fresh plant. Mice who were fed solely on the plant died after 3 to 4 days.

DOSAGE

Mode of Administration: The drug is used internally as well as externally.

Preparations: The liquid extract (1:1) is prepared by using 25% ethanol.

Daily Dosage: The normal single daily dose of the dried drug is 2 to 4 gm internally; externally, crushed leaves are placed on the affected areas.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day; suppositories: 1 suppository 2 to 3 times daily (chronic and acute) (HAB34)

Storage: Ground Ivy should be stored where it is not exposed to light.

Ground Pine

Ajuga chamaepitys

DESCRIPTION

Flower and Fruit: The plant has 2 to 4 flowers at each node. The petals are 4 to 6 mm. The tips of the petals are as long as or shorter than the tube: The corolla is yellow with red or purple markings, rarely entirely purple. The lower lip is entire, and the stamens are exerted. The filaments are hairy. The mericarps are 2 to 5 mm long, obovate and reticulate-wrinkled with a pitted surface.

Leaves, Stem and Root: Ground Pine is an annual or short-lived perennial. The stem is 5 to 30 cm long. It is usually heavily branched, glabrous to densely villous. The leaves are 3-partite with linear segments. They are 0.5 to 4 mm wide. The segments are sometimes 3-pinnatifid. The bracts are similar to the leaves.

Habitat: Sandy, stony areas of southern Britain and parts of Europe.

Other Names: Yellow Bugle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Diterpene bitter principles

Caffeic acid derivatives: including rosemary acid

EFFECTS

Emmenagogue (stimulates menstrual flow), stimulant, diuretic.

INDICATIONS AND USAGE

Unproven Uses: Ground Pine is used for gout, rheumatism and gynecological disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Ground Pine is available in compounded preparations as a liquid extract for internal use.

Groundsel

Senecio vulgaris

DESCRIPTION

Medicinal Parts: The medicinal part is the herb collected during the flowering season.

Flower and Fruit: The yellow composite flowers are in compact cymes. The small capitula have tubular florets but no lingual ones. The bract calyx is globose. The involucre and the very short outer bracts have black tips. The fruit is 1.2 to 2 mm long and densely downy. The pappus, which is 3 times as long as the fruit, is silky and pure white.

Leaves, Stem and Root: Groundsel grows from about 10 to 30 cm high. It is annual, biennial or occasionally perennial. The plant has a thin, fusiform, pale root, which is densely covered in lateral roots. The stem is erect, simple or branched. The leaves are glabrous or cobweb-lanate and pinnatisect. The lower leaves narrow to the petiole; the upper ones are slit at the base and clasping. The tips are detached, oblong, obtuse and unevenly acute dentate.

Habitat: The plant is common in all of Europe, northern and central Asia, northern Africa and has been introduced into various other parts of Africa as well as Australia and the Americas.

Production: Groundsel is the flowering plant of *Senecio vulgaris*. The herb is gathered in uncultivated regions and dried in the shade.

Other Names: Grundy Swallow, Ground Glutton, Simson

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrrolizidine alkaloids (up to 0.16% in the fresh foliage): chief alkaloids are senecionine, seneciphylline

Flavonoids: including among others, isorhamnetin-3-O-glucosides, isorhamnetin-3-O-rutinosides, isorhamnetin-3-monosulphate

Volatile oil (traces)

EFFECTS

The toxic principles of the drug are the pyrrolizidine alkaloids, which are hepatotoxic and carcinogenic. Use of Groundsel for worm infestation can be explained by the high toxicity of the drug.

INDICATIONS AND USAGE

Unproven Uses: Internal use of Groundsel is not recommended because, similar to *S. jacoboeae*, it contains toxic and carcinogenic pyrrolizidine alkaloids. Prior uses have included the treatment of worm infestations, colic and epilepsy. The pressed juice has been used for dysmenorrhea, epilepsy, and as a styptic in dentistry.

PRECAUTIONS AND ADVERSE REACTIONS

Groundsel should not be taken internally because hepatotoxicity and carcinogenicity are possible due to the pyrrolizidine alkaloids with 1,2-unsaturated necic parent substances in its makeup.

DOSAGE

Mode of Administration: Internal use of Groundsel is not advised.

Guaiac

Guaiacum officinale

DESCRIPTION

Medicinal Parts: The primary medicinal part is the resin of the heartwood, which is used for various preparations. The wood also has some medicinal properties.

Flower and Fruit: The pale blue star-shaped flowers are in false umbels with 6 to 10 blooms that have 2 cm long pedicels. There are 5 sepals, 5 petals, 10 stamens and a bilocular ovary. The fruit is a bilocular, cordate capsule that is compressed at the side and contains a long and hard seed, in each chamber.

*j** *Leaves, Stem and Root:* *Guaiacum officinale* is an evergreen tree that grows to 13 m high and has a greenish-brown, usually twisted trunk covered in furrowed bark. The heartwood is greenish brown and heavier than water, with an aromatic taste. The opposite leaves are short-petioled, coriaceous and di- to tri-pinnate. The leaflets are ovate or oblong, obtuse and entire-margined.

Characteristics: The shavings turn green on exposure to the air and blue-green in the presence of nitrogen.

Habitat: The plant grows in Florida, on the Antilles, in Guayana, Venezuela and Columbia. It is closely related to *Guaiacum sanctum*, which grows in the Bahamas and southern Florida.

Production: Guaiac wood consists of the heartwood and sapwood of *Guaiacum officinale* and/or *Guaiacum sanctum*.

Other Names: Guaiacum, Lignum Vitae, Pockwood

ACTIONS AND PHARMACOLOGY

COMPOUNDS

4f *Triterpene saponins:* aglycone oleanolic acid

Resin: containing, among others, the lignans (-)-guaiaretic acid, dihydroguaiaretic acid, guaiacin

Isoguaiacin: alpha-guaiaconic acid, tetrofuroguaiacine A and B

Volatile oil: chief components sesquiterpene alcohols; such as guaiole, which changes into quaiazulene with steam distillation

EFFECTS

Guaiacum officinale is fungistatic because of its saponin content.

INDICATIONS AND USAGE

- Rheumatism

Guaiac is used as supportive therapy for rheumatic complaints.

Unproven Uses: Although folk medicine use has declined, it is used for respiratory complaints, skin disorders and syphilis in the Caribbean.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. High dosages of the drug can lead to diarrhea, gastroenteritis and intestinal colic. Skin rashes have also been observed following intake of the drug.

DOSAGE

Mode of Administration: The comminuted wood is used for decoctions and other galenic preparations for internal use. The essential oil, known as guaiac wood oil, must be evaluated separately.

How Supplied: Forms of commercial pharmaceutical preparations include drops, ointments and compound preparations.

Preparation: To make an infusion, use 1.5 g drug in 1 cup cold water (150 ml). Slowly bring to a boil, remove from heat and let steep, then strain after 15 minutes.

Daily Dosage: The average daily dose is 4 to 5 g of the drug. When using a tincture (*Guajaci Ligni Tinctura*), 20 to 40 drops make a single dose.

Guaiacum officinale

See Guaiac

Guar Gum

Cyamopsis tetragonoloba

DESCRIPTION

Medicinal Parts: The whole plant has medicinal properties.

Flower and Fruit: The flowers are in axillary, 6- to 30-flowered racemes. The structures of the flowers are arranged in fives. The sepals are fused and hairy on the outside; the lower calyx teeth are longer than the upper ones. The corolla is butterfly-shaped (flag, 2 wings, keel formed from 2 fused petals), small and reddish; there are 10 stamens. The fruit developing from a carpel is an upright, 3.8 to 5 cm long, sparsely haired legume with 5 to 6 seeds; these have a very well-developed, slimy endosperm.

Leaves, Stem and Root: *Cyamopsis tetragonoloba* is an annual herb, which grows up to 60 cm high. The leaves are alternate, triple-pinnate; the leaflets are broad-elliptical, acuminate, dentate, pubescent on both surfaces. They measure 3.8 to 7.5 cm long and 1.2 to 5 cm wide. The petiole is 2.5 to 3.8 cm long, while the stipules are 6 to 10 mm long. The root and root tuber have symbiotic bacteria, which bonds nitrogen from the air.

Habitat: The plant is native to the Indian subcontinent. It originated from India, Australia, South Africa and the U.S.

Production: Guar Gum is the powder extracted by milling from the endosperm of *Cyamopsis tetragonoloba*. A dry or wet milling process separates the endosperm from the seed shell!

Other Names: Aconite Bean, Calcutta Lucerne, Guar, Clusterbean

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Water-soluble polysaccharides: galactomannans (85%)

Proteins (2 to 5%)

Saponins (0.1%)

EFFECTS

Clusterbean or Guar Gum causes a lowering of postprandial serum glucose values through (among other things) the influence of the hydrocolloid guar upon glucose resorption (delaying of stomach emptying into the duodenum), a reduction of glucosuria, improvement of the HBA1 value and leveling of the blood sugar profile. A lipid-lowering effect has also been demonstrated.

INDICATIONS AND USAGE

Unproven Uses: Internal application: Guar Gum has been used for diabetes mellitus, for postprandial hyperglycemia and glucosuria, and for hyperlipoproteinemia. It has also been used to regulate digestion.

Indian Medicine: Night blindness, dyspeptic complaints, anorexia, constipation and agalactia have all been treated with Guar Gum.

CONTRAINDICATIONS

Contraindicated in diseases of esophagus, stomach and intestine, which might hinder passage of the chyme.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages of the drug, nor with its use as a pharmaceutical vehicle. Possible side effects, particularly at the beginning of treatment, might include feelings of fullness, nausea, wind and diarrhea. Symptoms of hypoglycemia (outbreaks of sweating, vertigo, ravenous hunger) and resorption difficulties involving vitamins, minerals and medications (such as contraceptives!) have been observed, although rarely. Inadequate intake of fluids could lead to the danger of bolus formation.

DOSAGE

Mode of Administration: Powdered drug, granules and tablets for internal use.

Daily Dosage: Commercial pharmaceutical preparation with one dose of 5 gm per tablet or granules, 3 times daily.

Storage: Keep Guar Gum sealed tightly.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Guarana

Paullinia cupana

TRADE NAME

Guarana (available from numerous manufacturers), Guarana Seed

DESCRIPTION

Medicinal Parts: The medicinal parts are the peeled, dried, roasted and pulverized seeds, formed into a thick paste with water.

[^] *Flower and Fruit:* The usually unisexual flowers are inconspicuous, yellow to whitish and fragrant. They are in 30 long panicles, which only produce female or male flowers at any one time. The fruit is a hazelnut-sized, deep yellow to red-orange 3-sectioned capsule, which bursts open when ripe and releases 1 purple-brown to black seed in a cup-like aril.

Leaves, Stem and Root: The plant is a woody, evergreen perennial vine up to 10 m long, which climbs through the jungle. It is bushier in its cultivated form. The leaves are large, palmate, coriaceous, distinctly ribbed and roughly crenate-serrate.

Characteristics: A paste is formed from the pulverized and roasted seeds, formed into rolls or bars and dried. The taste is astringent, bitter then sweet, and the odor is reminiscent of chocolate.

^{*k} *Habitat:* The plant is indigenous to the Amazon basin and has been introduced into other rain forests. The main area of cultivation is between Maues and Manau in Brazil.

Production: Guarana seeds are the seeds of *Paullinia cupana*. A preparation is also made from the ground seeds. Over a period of approximately 75 days, the pollinated flower develops a "ripe" guarana raceme, which is harvested by hand from October to December. Seeds (up to 80 per raceme) are taken out of the capsule shells, soaked for a time in water and then finally separated from the arillus. Subsequent to being dried in the sun, the seeds are roasted for 2 to 3 hours in special clay ovens. Once they have cooled, the parchment-like shell is removed and the seeds are ground down. Following this, the resulting paste is smoked over aromatic charcoal. The final product is dark brown in color and in stick form.

Other Names: Brazilian Cocoa, Guarana Bread, Paullinia

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Purine alkaloids: chief alkaloid caffeine (3.6-5.8%), in addition, small amounts of theophylline and theobromine

^w *Tannins (12%):* oligomeric proanthocyanidins, condensed tannins

Cyanolipides: including among others, 2,4-dihydroxy-3-methylene-butynitrile

Saponins

Starch (30%)

Proteins (15%)

EFFECTS

Guarana produces a stimulating effect, due to the presence of purines (caffeine, theobromine, theophylline). Caffeine is centrally stimulating, has a positive inotropic and, in high concentrations, has a positive chronotropic cardiac effect. It relaxes the vascular muscles (with the exception of cerebral vessels that constrict) and the bronchial tube.

Caffeine works as a short-term diuretic and increases gastric secretion. Furthermore, it increases the release of catecholamines. Inhibition of blood platelet aggregation has been observed.

INDICATIONS AND USAGE

Unproven Uses: Guarana is used as a tonic for fatigue and to quell hunger and thirst, for headache and dysmenorrhoea, digestion problems, fever and as a diuretic. Its effect in stimulating the circulation, heart and diuresis can be explained by the caffeine content.

Homeopathic Uses: Headache

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Quantities corresponding to up to 400 mg caffeine per day (7 to 11 gm of the herb), spread out over the day, are toxicologically harmless to a healthy adult habituated to caffeine, through regular consumption of coffee or black tea.

One must remember that the quantities of caffeine considered harmless are calculated to include all of the foodstuffs and beverages containing the substance (including coffee, tea, cola, etc.). Caution is advised for patients with sensitive cardiovascular systems, renal diseases, hyperthyroidism, increased tendency to spasms and certain psychic disorders such as panic anxiety.

Drug Interactions: The diuretic action of Guarana may lead to hypokalemia with excessive use. Hypokalemia may increase digoxin toxicity.

Pregnancy: Pregnant women should avoid caffeine, and under no circumstances exceed a dosage of over 300 mg per day.

Nursing Mothers: Infants whose nursing mothers consume caffeine products could suffer from sleeping disorders.

OVERDOSAGE

The first symptoms of poisoning are dysuria, vomiting and abdominal spasms.

DOSAGE

Mode of Administration: The seeds of *Paullinia cupana* are grated and taken directly as powder or diluted in water or

juice as a drink. It is not in use as a drug. It is available in various medicinal preparations.

How Supplied:

Capsules — 200 mg

Liquid — 1:1

Tablets — 800 mg, 1000 mg

Daily Dosage: Average single dose: 1 gm of the powder

Homeopathic Dosage: 5 drops, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB34)

Gum Arabic

Acacia Senegal

DESCRIPTION

Medicinal Parts: The latex from the trunk and branches is the medicinal part of the plant.

Flower and Fruit: The inflorescences, which grow from the leaf axils, are up to 10 cm long. The flowers are white and grow in cylindrical, dense spikes. The calyx is cup-shaped with 5 sepals. The 5 petals are lanceolate. The numerous stamens are long and fused at the base. The pods are about 10 cm long and contain 5 to 6 shiny brown seeds.

Leaves, Stem and Root: *Acacia Senegal* is up to 6 m tall with a 12 to 25 cm thick, slightly leaning trunk, which has knotty branches and a thin crown. The sapwood is white and the heartwood is black. The bark is fibrous, gray on the outside

and rust-colored on the inside. The leaves are double abruptly pinnate. The leaflets are in 10 to 15 pairs, narrow, gray-green, up to 5 mm long, opposite and very short-petioled. There are 2 to 3 stipules, which have formed into thorns, and are covered on the upper surface with yellow, fleshy glands.

Habitat: *Acacia Senegal* is found in the tropical Savannah belt of Africa, in the southern Sahara (Senegal, Gambia), in Arabia, Beludschistan and Sind. Grown in forest-like conditions in the western and southwestern Sahara region (Senegal, Gambia, Ivory Coast, northern Dahomey and northern Nigeria).

Production: *Acacia gummi*, the latex, is the result of a wound infection of the tree, which has occurred naturally or has been induced. The incised bark is removed in strips of approximately 4 cm by 60 cm. The liquid discharge dries to form a hard, glazed substance, which is collected on a weekly basis. The latex is harvested from trees, ranging from 3 to 12 years old.

Not to be Confused With: According to DAB 10 (EUR), USP XXII, only latex from *Acacia Senegal* or other African varieties are officially recognized. In other words, Asian, Australian and American latex are not official.

Other Names: *Acacia*, Cape Gum, Egyptian Thorn, Gum *Acacia*, Gum *Senegal*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Colloidally soluble polysaccharides: especially Arabic acid (acidic arabinogalactan)

Glycoproteins

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: *Acacia gummi* is used in the preparation of emulsions. The drug is used as a mild stimulant and to impede absorption. It is also used for the treatment of catarrh and diarrhea. *Acacia* is often a constituent of cough drops. It is also used in veterinary medicine for mild diarrhea in small animals, foals and calves.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: *Acacia* is used as a pharmaceutical aid and is also administered internally in combination preparations.

Storage: The drug should be stored in tightly closed containers.

Gumweed

Grindelia camporum

DESCRIPTION

Medicinal Parts: The medicinal parts are the flowering branches and the dried leaves.

Flower and Fruit: Gumweed has a number of individual composite heads, each with a diameter of 2 to 3 cm, at the end of leafy stems. The involucre bracts are 3 to 8 mm by 0.5 to 1 mm, with very viscid, cylindrical, deflected apices. If present, the ligules are 7 to 15 mm long and yellow to orange-yellow. The inner florets are yellow. The achenes are 2 to 3 mm, oblong and brown. The 2 to 8 pappus-awns are 3 to 5 mm long and usually finely serrulate.

Leaves, Stem and Root: The plant is an erect biennial or perennial herb or small bush that grows up to 1 m high, often branched above. The alternate leaves are 3 to 7 cm long, triangular to ovate-oblong, clasping, resinous-punctate, serrate-crenate or entire-margined, and light green. They break off easily when dry.

Habitat: The plant grows in the Southwestern U.S. and in Mexico.

Production: Gumweed herb consists of **the** dried tops and leaves of *Grindelia robusta* and/or *Grindelia squarrosa*, which are gathered during flowering season.

Other Names: August Flower, Grindelia, Rosin Weed, Tar Weed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpene acids: grindelic acid, hydroxygrindelic acid, 6-oxogrindelic acid. 7 α ,8 α -epoxygrindelic acid

Volatile oil: including, among others, borneol, bornyl acetate, camphene, camphor, myrcene, alpha- and beta-pinene

Polyynes: including matricarianol, matricarianolacetate

Saponins

Tannins

Flavonoids: including kaempferol-3,7-dimethyl ether, kaempferol-3-dimethyl ether, luteolin, quercetin, quercetin-3,3'-dimethyl ether

EFFECTS

In vitro, the drug has an antimicrobial, fungistatic and spasmolytic effect caused by the resin, which contains diterpenes, and the phenol carboxylic acids. An antibacterial effect has also been demonstrated in vitro. In addition, an inflammation-inhibiting effect has been proven.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough
- Bronchitis

Unproven Uses: Gumweed is also used for infections in the mucous membranes of the upper respiratory tract.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks following the proper administration of designated therapeutic dosages are not recorded. Side effects listed in older scientific literature (Lewin) include gastric irritation and diarrhea. Large dosages, however, are said to have a poisonous effect.

DOSAGE

Mode of Administration: Comminuted herb for teas and other galenic preparations for internal use.

Preparation: The tincture is prepared in a 1:10 or 1:5 concentration with 60% to 80% ethanol (v/v).

Daily Dosage: The recommended dosage is 4 to 6 g of drug or 3 to 6 g Gumweed liquid extract. If using the tincture, the dosage is 1.5 to 3 ml.

Haronga

Haronga madagascariensis

DESCRIPTION

Medicinal Parts: The medicinal parts of the tree are the leaves and bark.

Flower and Fruit: The inflorescences are richly blossomed, terminal and umbel-like, with a diameter of about 20 cm. The flowers are small and white; they have 5 sepals, 5 petals, 4 stamens and a fanned ovary with 2 ovules per section. The fruit is a roundish, reddish drupe. The seeds (approximately

10) are cylindrical and have black glandular hairs and a reticulate surface structure.

Leaves, Stem and Root: *Haronga madagascariensis* is a small evergreen tree that grows up to 8 m high with a heavily branched crown. It has opposite, elliptical-oval leaves, which are rounded to cordate at the base and dotted black. The upper surface is dark green. The lower surface has red-brown hairs.

Habitat: The plant originated in Madagascar and east Africa; it grows in many areas throughout tropical Africa.

Production: *Haronga* is a collective term for extracts from the leaves and bark of the trunk and branches of *Haronga madagascariensis*, as well preparations made from those components. The leaves are collected and then air-dried whole; the bark is peeled and also air-dried.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives: including harunganin, madagascin, madagascinanthrone, haronginanthrone, chrysophanol, physcione, hypericin, pseudohypericin, madagascarine

Volatile oil (traces)

Oligomeric procyanidins

Flavonoids (in the leaves): including quercetin-3-O-arabinoside, quercetin-3-O-xyloside, quercitrin

EFFECTS

Haronga has a digestion regulatory effect through stimulation of the excretory function of the pancreas and gastric juice secretion. In animal experiments, it has demonstrated a choleric, cholecystokinetic and antihepatotoxic effect. An antimicrobial effect has also been observed.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints

Unproven Uses: *Haronga* is used for mild exocrine pancreatic insufficiency. Internal uses of the bark and leaves in folk medicine include constipation, diarrhea, liver and gallbladder conditions, worm infestations, gonorrhea, hemorrhoids, menstrual disturbances and puerperal fever. The bark is used externally for eczema. The effect for the external application seems plausible because of the drug's antibacterial effect.

CONTRAINDICATIONS

The drug is not to be used in patients with acute pancreatitis, severe liver function disorders, gallstone illnesses, obstruction of the biliary ducts, gallbladder empyema or ileus.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Photosensitization in fair-skinned people can be caused by hypericin and pseudohypericin, but is unlikely due to the 4gt, small size of therapeutic dosages.

DOSAGE

Mode of Administration: As comminuted Haronga bark with leaves for decoctions, extracts and other preparations.

How Supplied: Forms of commercial pharmaceutical preparations include drops, tablets and compound preparations.

Preparation: Extracts are standardized to 0.1% chrysophanic acid derivatives; tinctures are standardized to 0.01% chrysophanic acid derivatives.

Daily Dosage: The average daily dose is 7.5 to 15 mg of an aqueous-alcoholic dry extract corresponding to 25 to 50 mg drug.

Hartstongue

Scolopendrium vulgare

DESCRIPTION

Medicinal Parts: The medicinal part is the frond.

Flower and Fruit: Two rows of large sporangia lie almost horizontally on the under surface of the fronds, with a long film stretching toward the margin.

Leaves, Stem and Root: The evergreen plant is a fern with long, wide, simple, short-petioled dark green fronds. They are arranged in clusters and are broad linear-lanceolate, 2-lobed cordate at the base and acuminate higher up, with a sinuate margin. The stem is covered in brown, almost hair-like scales. The root is bushy, short and sturdy.

Habitat: The plant is indigenous to almost all of Europe, North America, northern Africa, and eastern Asia.

Production: Hartstongue is the aerial part of *Scolopendrium vulgare*.

Other Names: Hind's Tongue, Horse Tongue, Buttonhole, God's-Hair

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Tannins

Mucilages

Flavonoids: including among others, kaempferol-7-rhamnoside-3-coffeoyl-7-diglucoside

Thiaminase (probably present only in the fresh plant)

Monosaccharides/oligosaccharides: saccharose, invert sugar

EFFECTS

Hartstongue is a diuretic and has a mild laxative effect.

INDICATIONS AND USAGE

Unproven Uses: Hartstongue is used in folk medicine for digestive disorders, urinary tract diseases, and spleen and liver complaints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Hartstongue is used internally as an infusion.

Heartsease

Viola tricolor

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts, the fresh aerial parts of the flowering plant and the whole plant.

Flower and Fruit: The solitary, long-pedicled flower is yellow or tricolored. It has 5 lanceolate, acute and uneven sepals with an appendage and 5 uneven petals, the largest of which is spurred. The 5 stamens also have an appendage at the tip. There are 3 fused superior ovaries. The fruit is an ellipsoid, obtusely angular capsule, which bursts open at 3 points. The seeds are pear-shaped and yellow.

Leaves, Stem and Root: Heartsease is annual to perennial and grows about 30 cm high. The shoots are usually yellowish green, glabrous or covered in scattered hairs. The stem is erect, angular, unbranched or branched, glabrous or short-haired. It has short internodes below and longer ones above. The leaves are alternate, glabrous, or short-haired. The lower leaves are cordate; the upper ones are oblong-elliptical. The stipules are lyrate-pinnatesect and have a large, crenate terminal tip.

Characteristics: The plant is odorless and the taste slimy-sweetish.

Habitat: The plant is indigenous to temperate Eurasia, from the Mediterranean to India and as far as Ireland. It is cultivated in Holland and France.

Production: Viola herb consists of the dried, above-ground parts of *Viola tricolor*, mainly of the subspecies *vulgaris* and subspecies *arvensis*, harvested at flowering season. The herb is cultivated predominantly in central Europe. The flowering above-ground parts are harvested in the summer months and carefully dried on a well ventilated floor or at 45° C to 50° C. Two to three harvests per year are possible.

Other Names: European Wild Pansy, Johnny-Jump-Up, Wild Pansy

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids (0.2-0.4%): including among others rutin (violaquercitrin, 23%), luteolin-7-O-glucosides, scoparin, saponarine, violanthin, vicinein-2, vitexin

Phenol carboxylic acid: salicylic acid (0.06-0.3%), violuto-side (violutin, glucoarabinoside of the methyl salicylate)

Mucilage (10%)

Tannins (2-5%)

Hydroxycoumarins: umbelliferone

Triterpene saponins (speculated)

EFFECTS

The drug has soothing, salve-like effects due to its mucin content; in animal experiments oral administration brought about an improvement of eczema-like skin conditions after long-term use. The antispasmodic effect attributed to the drug may be explained by the saponin content, as can its use for catarrh of the upper respiratory tract. In vitro the drug is hemolytic and increases chloride elimination in the urine.

INDICATIONS AND USAGE

Approved by Commission E:

- Inflammation of the skin

Unproven Uses: External uses include mild seborrheic skin diseases, cradle cap in children and various skin disorders, including wet and dry exanthema, eczema, *Crusta lactea*, acne, impetigo and *Pruritus vulvae*. The plant is used internally as a mild laxative for constipation and as an auxiliary agent to promote metabolism.

Historic uses of Heartsease include the treatment of respiratory catarrh, throat inflammation, whooping cough and feverish colds.

Homeopathic Uses: The drug is used for eczema and inflammation of the urinary tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole, cut and powdered drug is available for infusions, decoctions and other galenic preparations. It is also available in ointments and shampoos for external use.

Preparation: To make a tea, pour 1 cup of scalding water over 1 dessertspoonful of drug. An infusion for internal use is prepared using 5 to 10 gm drug per 1 liter of water. A

decoction for internal use is prepared by adding 1.5 gm drug to 1 cup water. The drug is also used as a bath additive.

Daily Dosage: A cup of tea should be taken 3 times daily after meals. The dose for the infusion is 1 dessertspoonful 3 times daily. The dose for the powdered drug is 1/2 teaspoonful in hot sugar water 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Storage: Heartsease must be kept stored away from light sources, and if possible, from moisture in well-sealed containers.

Heather

Calluna vulgaris

DESCRIPTION

Medicinal Parts: The medicinal parts are the complete herb with leaves, the flowers, and the growing shoots of the plant that are collected and dried when the plant is in bloom, as well as the fresh aerial parts collected at the same time.

Flowers and Fruit: The inflorescence is turned to one side, dense and hanging. The short-pediced flowers are nodding, pale-violet-pink and occasionally white; they have 4 small, oval, fringed bracts. The calyx has 4 violet-pink, glossy and petaloid sepals, which have the consistency of straw. The 8 stamens form a brown-red club. The superior ovary has 4 sections, and the style is larger than the calyx. The style has a thick, button-like, 4-knobbed stigma. The fruit capsule is globose, 1.5 mm long and 4 sectioned. The fruit is covered in thick white bristles and is many-seeded. The dividing walls break off easily.

Leaves, Stem and Root: *Calluna vulgaris* is a dwarf shrub, 0.2 to 1 m high with decumbent, rooting shoots and ascending branches. The small stems are thin, gray-brown, heavily branched and have numerous upright branches. The leaves are linear-lanceolate, in groups of 4 rows. They are imbricate, 1 to 3.5 mm long, revolute, sessile and have 2 mm long points at the base. The margins are glandular with downward-pointing spurs.

Habitat: With the exception of a few Mediterranean islands, the plant is distributed throughout most of Europe, Russia and Asia Minor, as well as on the Atlantic coast of North America.

Production: The herb is harvested from July to October and dried.

Not to be Confused With: *Erica tetralix*.

Other Names: Ling

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including kempferol, quercetin, myricetin, taxifolin, and the glycosides of each, as well as callunin

Catechin tannins (3-7%): (+)-catechin, (-)-epicatechin

Oligomeric proanthocyanidins

Caffeic acid derivatives: including chlorogenic acid

Phenols: orcin, orcinol

Triterpenes: including ursolic acid (2.5%)

Steroids: beta-sitosterol

Hydroquinone glycosides: including arbutin

EFFECTS

Heather is said to be diuretic, antimicrobial, cholagogic and antirheumatic. It is also used as an agent for wound healing. However, these effects have not yet been documented.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Heather and/or Heather flowers are used as a diuretic for diseases and ailments of the

kidneys and the lower urinary tract, and for enlargement of the prostate. They are also used for gastrointestinal disorders, colic, liver and gallbladder disease, gout, rheumatism, respiratory complaints, insomnia, agitation and wounds.

The efficacy for the claimed uses is not documented.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole, cut and powdered forms are available for internal and external use.

Preparation: A decoction is prepared by adding 1.5 gm of the drug to 1/4 liter of water and then boiling for 3 minutes. For a bath additive, 500 gm of the drug is boiled in a few liters of water, strained and added to the bath. A liquid extract 1:1 is also used.

Daily Dosage: The average daily dose of the decoction is 3 cups daily between meals; the dose for the liquid extract is 1 to 2 teaspoonfuls daily.

Externally, the drug is added to full baths.

Storage: Heather should be stored in well-dried, sealed containers.

Hedge Mustard

Sisymbrium officinale

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh, flowering herb and the fresh aerial parts of the flowering plant.

Flower and Fruit: The inflorescences at the end of the stems and branches have no bracts and are initially umbelliferous-racemous, later stretching into spikes. The pedicles are thin and approximately 1.5 cm long, bearing the small flowers. The 4 sepals are 1.5 to 2.5 mm long, erect, pubescent and narrowly elliptical. The petals are pale yellow and 3 to 4 mm long. The stamens have 0.5 to 0.5 mm long anthers. The fruit is a pubescent pod appressed to the axis of the infructescence. The fruits are 1 to 1.5 cm long and 1 to 1.5 mm thick. The almost-smooth seeds are about 1 mm long, ovate, compressed and unwinged with reddish, yellow-brown seed-skins.

Leaves, Stem and Root: The plant is an annual or biennial, 30 to 60 cm high, and has a thin taproot. The stem is branched, round, leafy and covered in scattered patent hairs. The basal leaves and lower cauline leaves are petiolate-pinnatifid with 3 to 9 segments. The upper leaves are oblong-lanceolate, simple or with 2 to 4 lateral segments, and often hastate and pubescent.

Habitat: The herb is found mainly in temperate Europe, but it also grows as far as northern Africa and eastern Siberia.

Production: Hedge Mustard is the fresh flowering herb of *Sisymbrium officinale*.

Other Names: Singer's Plant, St. Barbara's Hedge Mustard, English Watercress, Erysimum, Thalictrum

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolides, 0.05% in the tips of the foliage): including among others corchorosid A and helveticosid

Glucosinolates: chiefly sinigrin (allylglucosinolates) and glucohapin (3-butenylglucosinolates), releasing through cell destruction the volatile mustard oil allylisoithiocyanate and 3-butenylisoithiocyanate

Vitamins: ascorbic acid (vitamin C, up to 0.2 % in the fresh foliage)

EFFECTS

Hedge mustard contains cardio-active steroids (cardenolids) and is said to be spasmolytic and analgesic. Its use for pharyngitis and laryngitis as well as severe hoarseness may be due to the mustard oils.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug is used for laryngitis and pharyngitis, severe hoarseness including loss of voice, chronic bronchitis and inflammation of the gallbladder.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

It is conceivable that overdosage would have digitalis-like effects. These include queasiness, vomiting, diarrhea, headache and cardiac rhythm disorders. Cases of poisonings have not, however, been recorded.

DOSAGE

Daily Dosage: The average daily internal dose of the drug is 0.5 to 1.0 gm, which would be equal to 3 to 4 cups daily of an infusion. It takes between 6 and 8 g of drug to make 1 g extract.

Externally, the infusion is used as a gargle or mouthwash, several times daily.

Hedge-Hyssop

Gratiola officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb and roots. (In contrast to what its name suggests, Hedge-Hyssop is not a member of the Hyssop family, even though it has a similarly bitter taste.)

Flower and Fruit: The pedicled flowers are arranged singly in the axils of the upper leaf pairs and are a pale red or yellowish-white. The calyx is only fused at the base and has

5 tips. The corolla has a distinct tube and a bilabiate border. The upper lip is margined, and the lower lip is divided into 3. There are 4 stamens, 2 sterile and 2 fertile, and 1 superior ovary. The fruit has 4 lids, which burst open.

Leaves, Stem and Root: The plant is a perennial mat grows 15 to 30 cm high. The stem grows from a creeping scaly rhizome. It is erect and becomes glabrous and quadrangular higher up. The leaves are opposite, lanceolate, weakly serrate, smooth and pale green.

Characteristics: The plant is poisonous and has a bitter taste.

Habitat: The herb is indigenous to western and central Asia, as well as southern Europe.

Production: Hedge-Hyssop is the herb of *Gratiola officinalis*, which is harvested shortly before flowering. The upper portion of the stem is cut down, then dried in thin layers in the shade at temperatures not exceeding 45° C.

Other Names: Gratiola

6 ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Cucurbitacins: gratiogenin, 16-hydroxygratiogenin, cucurbitacins E, I, the glycosides gratiogenin-3beta-D-glucoside, gratioside (gratiolin, gratiogenindiglucoside), elaterinide, desacetylaterinide

*Saponins**Lignans**Flavonoids***EFFECTS**

The glycosides are said to be cardiotoxic. The cucurbitacins, especially elaterinide, cause a reduction of the contraction power of cardiac muscle, a lowering of cardiac frequency and a distinct increase in coronary flow. Elaterinide has a laxative effect. The drug is a strong purgative; it eliminates intestinal parasites and increases micturition.

INDICATIONS AND USAGE

Unproven Uses: The herb was formerly used as a purgative and for treating the liver. In folk medicine, it is used as purgative and emetic for gout, liver complaints and constipation, as well as for chronic skin conditions. The drug is only to be taken under medical supervision of a doctor because of its toxicity.

Homeopathic Uses: Uses in homeopathy include stomach colic and bladder and kidney conditions.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Nonetheless, the drug is extremely poisonous. It is severely

irritating to mucous membranes due to the cucurbitacin and cucurbitacin glycosides content, out of which cucurbitacins are released in watery environments.

OVERDOSAGE

The intake of toxic dosages leads to vomiting, bloody diarrhea, colic, kidney irritation and initially to elevated diuresis, then to anuria. Very high dosages lead to spasm, paralysis and circulatory collapse. Fatalities are seen only rarely. Following gastric lavage, the treatment for poisonings should proceed symptomatically.

DOSAGE

Mode of Administration: Hedge-Hyssop is most effective in alcoholic extracts, but it also is used in infusions and in homeopathic dilutions. Today, it is rarely used in folk medicine.

Daily Dosage: A single dose of tea is noted as containing 0.3 g drug.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Hemlock

Conium maculatum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh flowering foliage, the branches and the dried leaves.

Flower and Fruit: The plant has white flowers in 10 to 20 rayed umbels. The 3 to 5 triangular to lanceolate bracts are acuminate; 3 to 6 small bracts only on the outside of the small umbels. The blossoms have 1.5 mm white petals. The fruit is ovate with undulating veins. Deep indentations on the mericarp on the seam side—with no oil marks in the indentations—are a unique feature.

Leaves, Stem and Root: The plant can be annual or perennial; it grows up to 2 m high. The stem is erect, tubular, hollow, round and finely grooved. It is branched above, glabrous with brownish-red marks below. The leaves are a glossy dark green, 3-pinnate. The root is whitish and fusiform or branched.

Characteristics: When wilting, the highly poisonous herb smells of mice. It tastes disgustingly salty and pungent. The stem has distinctive red marks.

Habitat: The plant is indigenous to Europe and the temperate zones of Asia, North Africa, and North and South America.

Production: Hemlock is the fresh or dried leaves and the flowering branch tips of *Conium maculatum*. They are gathered from June to September in the second year of grown and air-dried in a shaded, open location.

Not to be Confused With: Hemlock may be confused with water hemlock, canine parsley, wild chervil and with tuberous chervil.

Other Names: Cicuta, **Poison Parsley, Poison Root, Poison I Snakeweed, Spotted Crowbane, Spotted Hemlock, Spotted**

Parsley, Water Parsley, Winter Fern, Herb Bennet, Spotted Corobane, Musquash Root, Beaver Poison, Kex, Kecksies

ACTIONS AND PHARMACOLOGY

COMPOUNDS

^ *Piperidin alkaloids*: main alkaloid coniine, including, among others, N-methyl coniine, gamma-coniceine

The piperidin alkaloids are volatile and are likely to be present in toxicologically harmful quantities only in the freshly harvested plant, particularly in its berries, and in the freshly dried plant.

Polyynes: including falcarinol, falcarindiol

Furanocoumarins: including bergaptene, xanthotoxin

EFFECTS

The plant is poisonous. The effects of the drug are caused by coniine in particular. Toxic doses given to mice, rats, guinea pigs and cats provoked the autonomous ganglion, clonic and tonal contractions of individual limbs, cramps and eventually, paralysis. Small doses given to mice led to blood pressure reduction in the short term. Higher doses resulted in a rise in blood pressure. Smaller doses stimulated respiration in cats, while higher doses impeded or slowed down the initial stimulus. In isolated guinea pig ileum, coniine brought on contractions. In isolated perfused rabbit hearts, coniine was negatively inotropic while a stable heart beat was maintained. With anesthetized cats, a suppression of the muscle contraction reflex took place. Feeding or injecting lethal doses of coniine into cows, horses, pigs, sheep and hamsters was initially stimulating, producing twitching of the eyes and ears, which was followed by muscular debility, collapse, limpness and death through paralysis. Coniine absorbed through the skin and mucous membranes is stimulating at first, then causes gradual paralysis of the spinal cord and blockage of the medulla oblongata. Nicotine-like receptors are at first activated, then paralyzed.

INDICATIONS AND USAGE

Unproven Uses: Use is inadvisable due to the uncontrollable amounts of coniine. Formerly, in folk medicine, the drug was used internally for neuralgia, rheumatism of the muscles and joints, stiffness of the neck, tetanic and epileptic cramps, bronchial spasms and pylori spasms. Externally, the drug was used as an ointment for coughs, asthma, sciatica, backache and neuralgia.

Homeopathic Uses: Swollen glands, pareses, calcification of cerebral vessels and depressive moods are considered to be indications for use in homeopathy.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drug is severely poisonous and use is not advised.

Pregnancy: The drug has a teratogenic effect with chronic intake.

OVERDOSAGE

Symptoms of poisoning following intake of toxic quantities (corresponding to 150 mg coniine, approximately 10 g of the freshly dried berries, approximately 30 g of the freshly dried leaves) include burning of the mouth, scratchy throat, salivation, rolling of the eyes, visual disorders and weakness in the legs. Lethal dosages (corresponding to approximately 500 mg coniine) cause glossoplegia, mydriasis, pressure in the head, dizziness, nausea, vomiting, diarrhea, loss of orientation, rising central paralysis, dyspepsia and cyanosis. Death ultimately results through central asphyxiation, in the cases of very high dosages, and also through curare-like paralysis of the breathing musculature.

Following stomach and intestinal emptying (gastric lavage, sodium sulfate) and the administration of activated charcoal, plasma volume expanders and sodium bicarbonate infusions should be given in case of shock or to restore acidosis balance. If necessary, intubation and respiration should be carried out.

DOSAGE

Mode of Administration: Hemlock is obsolete and strongly advised against as an internal drug because of the danger of poisoning. Homeopathic dilutions and ointments containing hemlock are used externally.

How Supplied: Liquid rubs, ointments.

Daily Dosage: Use is discouraged, but the maximum single dose mentioned for internal use is 0.3 g, not to exceed 1.5 g, per day. The standard single dose is 0.1 g.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day; ointment 1 to 2 times daily (HAB34).

Storage: Hemlock should be stored above caustic lime, well dried, in closed containers and kept for no more than one year.

Hemp Agrimony

Eupatorium cannabinum

DESCRIPTION

Medicinal Parts: The medicinal part is the flowering herb.

Flower and Fruit: The flowers are in compact, terminal, umbrella-like umbels. They are small dull pink tubular androgynous flowers whose corolla tube has a 5-tipped edge. The epicalyx is cylindrical and consists of a few bracts. The edge of the calyx consists of yellowish hairs. The style is divided in two parts and shows above the flower. The corolla is covered in resinous spots. The angular fruit bears a crown of hair and is dirty white.

Leaves, Stem and Root: The plant is a small perennial herb 75 to 150 cm high. The rhizome is woody and has stems growing from it, which have short axillary branches. The stems are erect, reddish, pubescent and resinous below. The root leaves are long-petioled. The opposite cauline leaves are short-petioled, trifoliate and serrate and covered in resinous spots.

Habitat: Hemp Agrimony grows in damp regions of Europe.

Production: Hemp Agrimony is the flowering herb of *Eupatorium cannabinum*.

Other Names: Holy Rope, St. John's Herb, Sweet-Smelling Trefoil, Water Maudlin

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Caffeic acid ester: chlorogenic acid

Immunostimulating polysaccharides (heteroxylans)

Pyrrolizidine alkaloids: including echinatine, supinine, eucanecine, amabiline, lycopsamin, intermedin

Sesquiterpene lactones: including eupatoriopicrin, eupatolid

EFFECTS

Eupatorin is said to be cytotoxic and has an immune-stimulating effect. It is also a bitter tonic.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for disorders of the liver and gallbladder and for fevers.

Homeopathic Uses: *Eupatorium cannabinum* is used to treat illnesses of the respiratory organs.

PRECAUTIONS AND ADVERSE REACTIONS

Because of the pyrrolizidine alkaloid content with 1,2-unsaturated necic parent substances, hepatotoxicity and carcinogenicity are likely consequences of internal use. Therefore the drug should not be taken internally. Sensitization after skin contact with the plant has been reported.

DOSAGE

Mode of Administration: The herb is used topically as an alcoholic extract, as a tea, and as an inhalation for the treatment of colds.

Hempnettle

Galeopsis segetum

TRADE NAMES

Hempnettle is available from numerous manufacturers.

DESCRIPTION

Medicinal Parts: The medicinal part is the flowering herb.

Flower and Fruit: The large, pale yellow, bilabiate flowers are in false whorls on the branch ends. The calyx is evenly 5-dentate and covered in patent glandular hairs. The upper lip of the corolla is domed, finely dentate and pubescent. The lateral tips of the 3-lobed lower lip are wide, obtuse and have 1 hollow erect tooth at either side of the base. The stamen halves are horizontal. The fruit is smooth.

*W** *Leaves, Stem and Root:* The herb grows 15 to 100 cm high. The stem is erect, heavily branched and downy, with unthickened nodes. The leaves are ovate and serrate. The lower ones are long petioled, the upper are short petioled.

Habitat: Hempnettle is found in southern and central Europe.

Production: Hempnettle consists of the aboveground parts of *Galeopsis segetum* Necker (synonym *Galeopsis ochroleuca* Lamarck) and is gathered in the wild during the flowering season.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes: including harpagide, 8-O-acetylharpagide, antirrhinoside, 5-O-glucosylantirrhinoside

Silicic acid (to some extent water-soluble)

Tannins

Flavonoids

4|- EFFECTS

The herb acts as expectorant, due to its saponin content, and as an astringent because of the tannins, silicic acid, iridoids and antirrhinoside.

INDICATIONS AND USAGE

Approved by Commission E:

M Cough

- Bronchitis

Unproven Uses: In folk medicine, the herb is used for pulmonary afflictions and as a diuretic.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Ground and cut herb for teas and other galenic preparations for internal use.

Preparation: To prepare an infusion, pour boiling water over 2 g of comminuted drug, strain after 5 minutes.

Daily Dosage: Average daily dose: 6 g drug. One cup of the infusion may be taken several times daily and, if preferred, sweetened with honey.

Henbane

Hyoscyamus niger

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves or the dried leaves with the flowering branches, the dried seeds and the whole fresh flowering plant.

Flower and Fruit: The flowers are in almost sessile terminal, one-sided leafy and revolute spikes. The calyx is jug-shaped, 5-tipped and does not drop. The corolla is funnel-shaped, 5-lobed, dirty yellow with violet veins and dark violet in the tube. The flower has 1 superior ovary and 5 stamens. The fruit is a swollen pixidium with up to 200 seeds. The seeds are gray-brown, pitted, slightly reniform, compressed, 1 to 1.3 mm long and 1 mm wide.

Leaves, Stem and Root: The plant is erect and grows up to 80 cm high. It is an herb with simple leaves. The root is fusiform and turnip-like at the top. The stem is erect and sticky-villous. The leaves are oblong, roughly crenate-dentate and gray-green. The basal leaves are petiolate, and the cauline leaves are stem clasping.

Characteristics: Henbane has a strong, distinctive odor. The plant is poisonous.

Habitat: The plant is indigenous to Europe, western and northern Asia, and northern Africa. It has been introduced to eastern Asia, North America and Australia.

Production: Henbane leaf consists of the dried leaves or the dried leaves and flowering tops of *Hyoscyamus niger*, harvested from cultures or in the wild when in bloom and dried mechanically or in the sun. Henbane seeds are the seeds of *Hyoscyamus niger*.

Other Names: Devil's Eye, Fetid Nightshade, Stinking Nightshade, Hen Bell, Hogbean, Jupiter's Bean and Poison Tobacco

ACTIONS AND PHARMACOLOGY

COMPOUNDS: HENBANE LEAF

Tropane alkaloids (0.05- 0.28%): chief alkaloid (-)-hyoscyamine, under storage conditions changing over to some extent into atropine, and scopolamine

Flavonoids: including, among others, rutin

COMPOUNDS: HENBANE SEED

Tropane alkaloids (0.05-0.3%): chief alkaloid (-)-hyoscyamine, under storage conditions changing to some extent into atropine, and scopolamine

Fatty oil

EFFECTS: HENBANE LEAF AND SEED

Main active agents: Alkaloids, flavonids. Henbane preparations produce a parasympatholytic or anticholinergic effect by competitive inhibition of acetylcholine. This inhibition affects the muscarinic action of acetylcholine but not its nicotine-like effects on ganglia and motor end plates.

Henbane preparations exert peripheral actions on the autonomic nervous system and on smooth muscle, as well as the central nervous system. Because of their parasympatholytic properties, they cause relaxation of organs containing smooth muscle, particularly in the region of the gastrointestinal tract. Furthermore, they relieve muscular tremors of central nervous origin.

The spectrum of actions of *Hyoscyamus niger* additionally includes a sedative effect.

INDICATIONS AND USAGE

HENBANE LEAF

Approved by Commission E:

- Dyspeptic complaints

Unproven Uses: Preparations of henbane oil are used for the treatment of scar tissue.

In folk medicine, Henbane is used internally for various pain syndromes, in particular toothache and facial pain, painful ulcers and tumors, stomach cramps and lower abdominal pain. Externally, henbane oil is used for the treatment of scar tissue.

It has been used for hundreds of years in so-called witches' ointments, as a repellent against mice and rats, as stunning agent for fish and to increase the narcotic effect of beer.

Indian Medicine: Used for toothache, bleeding gums and nose, orchitis, dysmenorrhea, worm infestation, black vomit, asthma, diverse pain syndromes and meningitis.

HENBANE SEED

Approved by Commission E:

- Dyspeptic complaints

Unproven Uses: Internal application: Spasms of the gastrointestinal tract; preparations of Henbane oil are used for the treatment of scar tissue.

In folk medicine, Henbane was formerly used as a fumigant for asthma and toothache.

Chinese Medicine: Used for convulsions, psychoses, joint pains, stomach pains, asthma, chronic dysentery and diarrhea.

CONTRAINDICATIONS

HENBANE LEAF AND SEED

Tachycardiac arrhythmias, prostatic adenoma, angle-closure glaucoma, acute pulmonary edema, mechanical stenoses in the area of the gastrointestinal tract, megacolon.

PRECAUTIONS AND ADVERSE REACTIONS

HENBANE LEAF AND SEED

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Skin reddening, dryness of the mouth, tachycardiac arrhythmias, mydriasis (the 4 early warning symptoms of a poisoning), accommodation disorders, heat build-up through decline in sweat secretion, miction disorders and obstipation can occur as side effects, particularly with overdoses.

Drug Interactions: Enhancement of anticholinergic action by tricyclic antidepressants, amantadine, antihistamines, phenothiazines, procainamide and quinidine.

OVERDOSAGE

HENBANE LEAF AND SEED

Because of the high content of scopolamine in the drug, poisonings lead at first to somnolence, but then also, after the intake of very high dosages, to central excitation (restlessness, hallucinations, deliria, and manic episodes), followed by exhaustion and sleep. Lethal dosages carry with them the danger of asphyxiation (for adults starting at 100

4£ mg atropine, with an alkaloid-rich drug at 30, considerably less for children). Severe poisonings are particularly conceivable in connection with the misuse of the drug as an intoxicant. Treatment for poisonings include gastric lavage, temperature-lowering measures with wet cloths (no antipyretics!), oxygen respiration for respiratory distress, intubation, parenteral physostigmine salts as an antidote, diazepam for spasms and chlorpromazine for severe excitation.

DOSAGE

HENBANE LEAF

Mode of Administration: Standardized Henbane powder and galenic preparations for internal application.

Daily Dosage: The average single dose is 0.5 gm of standardized Henbane powder corresponding to 0.25 to 0.35 mg total alkaloid. Maximum daily dose is 3.0 gm of standardized Henbane powder corresponding to 1.5 to 2.1 mg total alkaloid, calculated as hyoscyamine.

Storage: Keep protected from light in tightly sealed containers.

HENBANE SEED

9^l *Mode of Administration:* The drug is available as an emulsion or powder.

Storage: Should be stored separate from other medicines.

Henna

*Lawsonia inermis***DESCRIPTION**

Medicinal Parts: The medicinal parts are the pulverized leaves, the fruit and the bark.

Flower and Fruit: The flowers are in small impressive groups of 4 panicles and yellowy-white to brick-red. The calyx is top-shaped, later bowl-shaped without appendages. The petals are thick, very wrinkled, yellowish-white to brick-red. The stamens are arranged in pairs. The fruit is an indehiscent or a fibrously torn berry. The seeds are small and angular, and the seed skin is spongy at the tip.

Leaves, Stem and Root: Henna is a deciduous, 2 to 6 m high shrub with partly thorny, short shoots and opposite paired, narrowly acuminate lanceolate leaves.

Habitat: Found in Egypt, India, the Middle East, Kurdistan and Iran.

Production: Henna is the aerial part of *Lawsonia inermis*.

Other Names: Alcanna, Egyptian Privet, Jamaica Mignonette, Mignonette Tree, Reseda, Henne, Mehndi, Mendee, Smooth Lawsonia

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Naphthalene derivatives (1,4-naphthaquinones): in particular lawsone (2-hydroxy-1,4-naphthaquinone), arising during dehydration of the leaves out of the precursor 1,2,4-trihydroxy-naphthalen-4-beta-D-glucoside

*Tannins***EFFECTS**

The drug is an astringent and a diuretic, and has an antibacterial effect.

INDICATIONS AND USAGE

Unproven Uses: The drug is used externally for eczema, scabies, fungal infections and ulcers. It is also used for amebic dysentery and gastrointestinal ulcers. In African folk medicine, it is used as an abortifacient. The drug is also contained in facial and hair lotions and is used to treat dandruff.

Indian Medicine: Henna root preparations are used to treat leprosy, skin diseases, amenorrhea and dysmenorrhea. Henna leaves are used to treat wounds, ulcers, dysuria, coughs, bronchitis, one-sided headache, rheumatism and anemia. The flowers are used for headache, fever and acute psychosis. Henna seeds are used to treat intermittent fever, diarrhea and dysentery.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Stomach complaints are possible due to the tannin content.

DOSAGE

Mode of Administration: Henna is used rarely for internal use in ground form or as an infusion. Henna is applied externally as an ingredient in hair and skin lotions.

Daily Dosage: For internal use, 3 gm of powder leaves to be taken daily, for amebiasis and ulcers.

Herb Paris

Paris quadrifolia

DESCRIPTION

Medicinal Parts: The medicinal part is the whole fresh plant when the fruit begins to ripen.

Flower and Fruit: The flowers are solitary and terminal. The sepals are lanceolate, acuminate, 3-veined and 4 times as wide as the linear-awl-shaped petals. The stamens are thread-like to awl-shaped and bear linear anthers in the middle. The ovary has 5 thread-like stigmas, both of which are purple-brown. The fruit is a blue-black globular berry the size of a small cherry.

Leaves, Stem and Root: The 15 to 30 cm high plant is a perennial herb with a creeping, fleshy rhizome. The stem is erect, round, unbranched and crowned by 4 acuminate leaves. The leaves are whorled, almost obovate, acute, entire-margined and glabrous. The leaves have 3 to 5 ribs. They are dark green and matte above, pale and slightly glossy beneath.

Characteristics: The plant has an unpleasant smell and is poisonous.

Habitat: The plant is indigenous to Europe and Asian Russia.

Production: Herb Paris is the fresh plant of *Paris quadrifolia*, when the fruit is ripe.

Not to be Confused With: Poisoning can occur in children when they confuse the fruit of the Herb Paris plant with that of blueberries.

Other Names: One Berry

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Steroid saponins: chief components are pennogenin triglycoside, pennogenin tetraglycoside, and their bisdemossidic precursors (26-O-glucosides), including 1-dehydrotrillenogennin

EFFECTS

The active agents are the saponins (which irritate mucous membranes), paristyphnin, paridin, citric acid and pectin. The parissaponins are local irritants as well as absorptive when taken orally. The main toxin is paristyphnin, which, when taken orally, leads to miosis and can consequently cause paralysis of the respiratory system.

INDICATIONS AND USAGE

Homeopathic Uses: Herb Paris is used as a homeopathic remedy for headaches, neuralgia, nervous tension, dizziness, palpitations and migraine.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is considered poisonous. Symptoms of poisoning following intake of the berries include nausea, vomiting, diarrhea, miosis and headache. However, no serious poisonings have been recorded in this century.

DOSAGE

Mode of Administration: Herb Paris is available in homeopathic dilutions.

Herb Robert

Geranium robertianum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh or dried aerial parts collected during the flowering season, as well as the whole fresh or dried plant.

Flower and Fruit: The peduncles are usually distinctly longer than the bracts and the 2.2 to 7 mm long, permanently erect pedicles. The flowers are longer than their pedicles. There are 5 separate sepals and 5 petals. The sepals are erect when they first bloom and hang when the fruit matures. The

petals have long stems. There are 10 stamens and 5 ovaries with long styles, which form an upward curve when mature. The fruit is circular and 2 cm long, with 3 mm long protruding, reticulate, glabrous or pubescent fruit lobes which are upward horizontally wrinkled. These permanently enclose the smooth, finely spotted seeds. The fruit lobes burst off from the central column without the awn.

Leaves, Stem and Root: *Geranium robertianum* is a 20 to 40 cm high annual or hardy annual with a weak, branched tap root and a long hypocotyl. The stems are heavily branched, usually red, and glandular-haired. The leaves are 3- to 5-sectioned compound leaves with petiolate, entire-margined to double-pinnate leaflets.

Characteristics: Herb Robert has an unpleasant smell often associated with goats or bugs.

Habitat: The plant is indigenous to the area stretching from Europe to China and Japan; to Africa southward as far as Uganda; to the Atlantic seaboard of North America; and the temperate areas of South America.

Production: Herb Robert is the aerial parts of *Geranium robertianum*, which are gathered between May and October in uncultivated regions, then dried in the open air in the shade.

Not to be Confused With: The herbs of *Geranium palustre* and *Geranium pratense* are frequently used as an adulteration.

Other Names: Dragon's Blood, Storkbill, Wild Crane's-Bill

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including rutin, quercetin-3-O-rhamnogalactoside, kaempferol-3-O-rhamnoglucoside, hyperoside

Tannins: geraniin, isogeraniin, beta-penta-O-galloylglucose

EFFECTS

The drug has the following effects:

Antiviral: The extract of the fresh herb, including rhizome, has been shown to have a mild antiviral effect against the vesicular stomatitis virus. In another study, however, the aqueous solution of the ethanol extract was not shown to have an antiviral effect against the polio virus Type 1, measles, coxsackie-B2, adeno- or Semliki forest virus.

Antimicrobial: The fraction of an extract produced with 80% ethanol was shown to have an inhibitory effect on the growth of *Escherichia coli*, *Pseudomonas aeruginosa* and *Staphylococcus aureus*. In the serial dilution test, growth of *Microsporum canis* and *Trichophyton mentagrophytes* was completely stunted.

Hypotensive effect: Effects have only been described in general reviews.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for functional impairment of the liver and gallbladder, inflammatory conditions of gallbladder and its ducts, inflammation of the kidney and bladder, and calculosis. Folk medicine uses have also included internal use of the drug for diarrhea. In addition, washed fresh leaves are chewed or prepared as an infusion or decoction used as a mouthwash or gargle for inflammatory conditions of the oral mucous membrane. External application is used to treat poorly healing wounds. These uses appear plausible because of the tannins.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: The drug is used internally as well as externally.

Preparation: To prepare an infusion, add 1 dessertspoonful of drug to 1/2 liter of cold water. Bring to a boil and leave to steep.

Daily Dosage: Internally, the average single dose of the drug is 1.5 g; drink 2 to 3 cups of the infusion daily, between meals.

Herniaria glabra

See Rupturewort

Hibiscus

Hibiscus sabdariffa

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the flowers.

Flower and Fruit: The flowers are solitary, axillary and almost sessile. The calyx is red, the corolla is yellow, and the anthers are blood red. The fruit is a 2 cm long, ovoid, many-seeded capsule.

Leaves, Stem and Root: Hibiscus is a 0.15 to 1 m bushy annual that is branched from the base. The stems are reddish, almost glabrous. The basal leaves are undivided and ovate; the cauline leaves are 3-lobed and 7.5 to 10 cm wide. The lobes are 2.5 cm wide and crenate.

Habitat: Hibiscus sabdariffa originally came from the area around the source of the Niger. It grows worldwide in the tropics and is cultivated in Europe.

Production: Hibiscus flowers consist of the calyces of Hibiscus sabdariffa (sabdarriffa ruber variety).

Other Names: Guinea Sorrel, Jamaica Sorrel, Red Sorrel, Roselle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fruit acids (15-30%): in particular hibiscus ((+)-allohydroxy citric acid lacton), additionally lemons, malic acid, tartaric acid

Anthocyanins (intensive red): including delphinidin-3-xyloglucoside, delphinidin-3-glucoside, cyanidin-3-xyloglucoside

Flavonoids: including gossypetin

Mucilages: rhamnogalacturonans, arabinogalactans, arabinans

EFFECTS

Hibiscus tea has a laxative effect due to the high content of poorly absorbable fruit acids.

Aqueous extracts of hibiscus leaves have a relaxant effect on the uterus musculature. The drug also has a hypotensive effect.

INDICATIONS AND USAGE

Unproven Uses: Hibiscus flowers are used for loss of appetite, for colds that affect the respiratory tract and stomach, to dissolve phlegm, as a diuretic and gentle laxative, and for disorders of circulation.

Chinese Medicine: Preparations of the plant are used to treat carbuncles, swelling and inflammation of the skin, scalding, conjunctivitis and herpes zoster.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Hibiscus sabdariffa is available as a tea preparation.

Preparation: To make a tea, pour boiling water over 1.5 gm comminuted drug and strain after 5 to 10 minutes.

Hibiscus sabdariffa

See Hibiscus

High Mallow

Malva sylvestris

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried flowers, the dried leaves and the whole of the flowering fresh plant.

Flower and Fruit: The bright purple flowers with long dark stripes are clustered in leaf axils. They have 3 epicalyx leaves, 5 sepals and 5 petals that are much longer than the calyx and have a deep margin. The numerous stamens are fused to a 10 to 12 mm column. The fruit stems are erect or slanted to one side. The ovaries are made up of a ring of 9 to 11 carpels. The fruit is a 7 to 9 mm wide and 2 mm thick disc, which breaks up into mericarps. These are glabrous or covered in a few scattered hairs, sharply angular and punctate.

Leaves, Stem and Root: *Malva sylvestris* is a biennial or perennial leafy herb 0.3 to 1.2 m high. The stems are branched, prostrate to curved, ascending, slightly woody and roughly pubescent. The leaves are alternate, long-petioled, reniform-orbicular, 5-lobed and crenate-serrate.

Characteristics: High Mallow has a 3-leaved epicalyx (compare with *Althaea officinalis*).

Habitat: The plant probably originated in the southern European-Asia region. Today the tree can be found in subtropical and temperate latitudes of both hemispheres.

Production: Blue Mallow flower and leaves consist of the dried flowers of *Malva sylvestris* and/or *Malva sylvestris* sps. *Mauritiana*, Ascherson and Graebner, as well as its preparations. High Mallow leaves are harvested from June to the beginning of September and dried in thin layers in the shade. High Mallow flowers are harvested without the pedicles from the end of June to October and are dried in layers in the shade.

Not to be Confused With: Other varieties of *Malva*. the leaves of *Althaea officinalis*.

Other Names: Mallow, Blue Mallow, Mauls, Cheeseflower

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MALVA LEAF

Flavonoids: including among others hypolaetin-3-glucoside, gossypetin-3-glucoside; also flavonoid sulfates including among others gossypetin-8-O-beta-D-glucuronide-3-sulfate

Mucilages: 6-8% (galacturonorhamane and arabinogalactans)

COMPOUNDS: MALVA FLOWER

Anthocyanins: including among others malvin

Mucilages: 10% (galacturonorhamane and arabinogalactane)

EFFECTS: MALVA LEAF AND FLOWER

Leaf: Main active principles - polysaccharides, flavonoids, tannins; Flower: Main active principles - polysaccharides, flavonoids.

The drug has a mucous membrane-protective effect: it relieves irritation because of the high level of mucilaginous material.

INDICATIONS AND USAGE

MALVA FLOWER

Approved by Commission E:

- Cough
- Bronchitis
- Inflammation of the mouth and pharynx

Unproven Uses: In folk medicine, the drug is used internally for bronchial catarrh, gastroenteritis, bladder complaints, and it is used externally for wounds. Externally, it is used as a poultice and bath additive for wound treatment.

MALVA LEAF

Approved by Commission E:

- m* Cough
- Bronchitis
- Inflammation of the mouth and pharynx

Unproven Uses: In folk medicine, the drug is used as poultices and bath additives for wounds.

PRECAUTIONS AND ADVERSE REACTIONS

MALVA LEAF AND FLOWER

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

MALVA FLOWER

Mode of Administration: High Mallow flowers are in various tea mixtures as an inactive ingredient.

Preparation: To prepare an infusion, 1.5 to 2 gm of comminuted drug is added to cold water and boiled or scalded and strained after 10 minutes.

Daily Dosage: The average daily dose is 5 gm of the drug.
Tea: Drink 2 to 3 times a day.

Storage: The drug should be protected from light, moisture and insects.

MALVA LEAF

Mode of Administration: Comminuted herb for teas and other preparations are for internal use.

Daily Dosage: The average daily dose is 5 gm of the drug.
Tea: drink 2 to 3 times a day.

Preparation: To prepare an infusion, pour 150 ml of boiling water over 3 to 5 gm of the drug (about 2 teaspoonfuls) and leave to draw for 2 to 3 hours; stir occasionally.

Storage: The drug should be protected from light, moisture and insects.

Hippophae rhamnoides

See Sea Buckthorn

Hogweed

Heracleum sphondylium

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried roots, the herb collected in the flowering season and dried, the fruit, the fresh herb and the whole fresh flowering plant.

Flower and Fruit: The flowers are 15 to 30 rayed, flat umbels with no involucre. The numerous epicalyx leaves are lanceolate and densely pubescent. The petals have a cordate margin with indented lobes. They are irregular, often pubescent on the outside, whitish or greenish, green-yellow or yellowish and sometimes pink. The fruit is compressed, flat, 8 mm long and 5 mm wide, roundish-oval and brownish yellow. The fruit has 10 ribs and oil grooves.

Leaves, Stem and Root: The plant grows from 80 to 150 cm high, is biennial to perennial and has a strong tuberous, whitish-yellow root. The stem is erect, angular, grooved, hollow, stiff-haired and branched above. The leaves are large and odd-pinnate, with 1 to 3 pairs of leaflets. The leaflets are large, ovate and lobed to pinnate. There is a 3-lobed terminal leaflet. The basal leaves are very large and have grooved petioles, which gradually merge into leaf sheaths. The basal and stem foliage are clasping.

Characteristics: There is hot, yellow latex in the stem. The leaf umbel is fragrant.

Habitat: Heracleum sphondylium is found in most of Europe and in western and northern Asia. Subspecies are found mainly in northwestern Europe, eastern and central Europe, and in the Mediterranean region.

Production: Hogweed is the aerial part of Heracleum sphondylium collected between June and August and dried.

Other Names: Masterwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

W> *Furocoumarins (0.5-0.6%):* in particular bergaptene, isopimpinellin, pimpinellin, isobergaptene, sphondin

Volatile oil: including those containing n-octylacetate

EFFECTS

Hogweed is considered a mild expectorant; however, this has not been scientifically proven. A phototoxic effect should be expected after administration.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug is used to relieve muscle cramps, stomach disorders, digestion problems, diarrhea, gastrointestinal catarrh and diarrhea following a cold. The furocoumarin methoxsalin is used in the treatment of psoriasis.

PRECAUTIONS AND ADVERSE REACTIONS

Phototoxic effects must be avoided following intake of the drug due to its furocoumarin content. For that reason, UV-
^ radiation and solarium should be avoided after its administration. The same danger exists following contact with the freshly bruised plant.

DOSAGE

Mode of Administration: An infusion is used internally.

Preparation: To make an infusion, add 3 teaspoonfuls of herb to 2 glasses of cold water and allow to draw for 8 hours.

Daily Dosage: The preparation should be drunk throughout the day.

Holly

Ilex aquifolium

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried foliage leaves, the fresh leaves, the young leafy branches with the ripe berries and the flowers of the branch tips with the leaves.

Flower and Fruit: Because of the shrinking of the one sex, the flowers are usually dioecious. The inflorescence is a 1 to 3 flowered axillary cyme. They are white. The calyx is small and has 4 to 5 tips. The 5-petalled corolla is rotate. The ovary is superior. There are 4 to 5 stamens. The coral red fruit is a 4-sectioned, sessile, berry-like, pea-sized drupe with 4 to 5 seeds.

Leaves, Stem and Root: The plant is a 10 m high evergreen bush or tree with smooth, dark, gray-brown bark. The bark on the younger branches is green and glossy. The branches and foliage are glabrous. The leaves are alternate, coriaceous, stiff, ovate or elliptical and acute. The lower ones are thorny denate, the upper ones entire-margined.

Characteristics: The flowers have a weak pleasant scent. The berries are poisonous to children.

Habitat: The plant is found in central Europe, North America and eastern Asia.

Production: Holly leaves and fruits are the leaves and fruits of *Ilex aquifolium*.

Other Names: Hulver Bush, Holm, Hulm, Holme Chase, Holy Tree, Christ's Thorn, Hulver Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins

Nitrile glycosides: menisdaurin, not cyanogenic

Flavonoids: including, among others, rutin, kaempferol and quercetin glycosides

Caffeic acid derivatives: chlorogenic acid

Sterols: beta-sitosterol, stigmasterol

Triterpenes: alpha-amyrin, alpha-amyrinester, beta-amyrin, ursolic acid

Purine alkaloids: only traces of theobromine

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Holly is used as a diuretic. Also used for coughs, digestive disorders and jaundice.

In folk medicine, Holly is used for fever, chronic bronchitis, constipation, rheumatism and gout.

Homeopathic Uses: Ilex aquifolium is used for conjunctivitis. •=

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

The intake of more than 5 berries can lead to nausea, vomiting and diarrhea. Fatal gastrointestinal inflammation is said to have taken place following the ingestion of very large quantities (20 to 30 berries) (Lewin). Stomach emptying and the administration of activated charcoal should therefore be carried out with the intake of more than 10 berries. Further treatment should proceed according to symptoms. Poisonings have not been reported in recent times.

DOSAGE

Mode of Administration: As a tea and alcoholic extract for internal use.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB34).

Hollyhock

Alcea rosea

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried flowers of plants bearing dark purple flowers.

Flower and Fruit: Six to 10 cm flowers sit in the axils of the cauline leaves singly or in groups of 2 or 4, with the upper ones forming long spikes. Sepals of the epicalyx are broadly triangular and sharp-edged. The epicalyx is significantly shorter than the calyx and both are gray-green haired.

Leaves, Stem and Root: Hollyhock is a biennial plant. In the second year it produces a spire-like, hairy stem up to 3 m tall. The leaves are cordate-orbicular to rhomboid, weakly 3- to 5-lobed and slightly scabrid-setulose. The sepals are epicalyx-subacute and triangular. The flowers are found in the leaf axils with short peduncles. The petals are 30 to 50 mm, contiguous, usually pink but sometimes white or violet. The mericarps are 7 mm long. The dorsal face has a deep, narrow furrow with rugose angles produced into parallel wings. The lateral faces are appressed-setose.

Habitat: The plant was originally indigenous to southwest and central Asia. A few species were probably introduced into southeast central Europe as ornamental plants and then spread in the wild. Hollyhock is now widely cultivated in Europe and temperate regions of Asia. The main suppliers of the drug are Belgium, Hungary, Bulgaria, former Yugoslavia, Rumania, Albania.

Production: Hollyhock flower consists of the flowers of *Alcea rosea* as well as their preparations. The flowers are harvested when not quite in full bloom on plants with over 2 to 3 years of growth, then air-dried at 35°C.

Other Names: Althea Rose, Malva Flowers, Rose Mallow

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages (acetylated galacturonorhamane)

Anthocyanins (termed althaein): delphinidine- and malvidine-mono glycosides

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The herb, roots and seeds have been used internally and externally for treating coughs and lung diseases. The Hollyhock's flower is used as mucilage for prophylaxis and therapy of diseases and discomforts of the respiratory, gastrointestinal and urinary tracts, and to relieve fever and thirst. Other folk uses include external application for skin inflammations and ulcers. Infusions and decoctions

made with the flowers have been used as a gargle for oral and pharyngeal inflammation.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Administered internally as a mucilage for respiratory, gastrointestinal and urinary tract discomforts and diseases, and to relieve fever and thirst. External applications include use for skin inflammations and ulcers. Infusions and decoctions, often with added herbs, are used as a gargle for oral and pharyngeal inflammation.

How Supplied: Whole, cut and powdered drug.

Preparation: To prepare as a tea, use 1 to 2 g of the drug per teacup. For a mouthwash, boil 1.5 g drug with 100 ml water.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.). Hagers Handbuch der Pharmazeutischen Praxis. 5. Aufl., Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994 (unter *Alcea rosea*).

Honeysuckle

Lonicera caprifolium

DESCRIPTION

Medicinal Parts: The medicinal parts are the flowers, the seeds and the leaves.

Flower and Fruit: The flowers are in sixes directly on the upper leaf pair. There are sometimes whorls of 6 in the next 1 or 2 leaf pairs. The corolla has a tight, 25 to 28 mm long tube, and a bilabiate margin. It is yellowish-white, often red-tinged, glabrous inside and glandular outside. The ovary is jug-shaped. The fruit is a berry. They are ellipsoid, 8 mm long and coral red. The seeds are ellipsoid, flattened, longitudinally grooved and 4 mm long.

Leaves, Stem and Root: Honeysuckle is an up to 4 m high, deciduous, clockwise-climbing shrub. The foliage leaves are short-petioled, elliptical or obovate, blunt, entire, glabrous, blue-green beneath and 4 to 10 cm by 3.5 to 6 cm. The leaves are shortly fused in pairs, but the upper ones are fused to an oval or circular leaf through which the stem grows.

They are short-petioled and elliptical. The lower leaves are paired.

Habitat: The plant grows in the northern temperate zones as far as the northern edges of the subtropics and is cultivated extensively.

Production: Honeysuckle flowers and leaves are from *Lonicera caprifolium*.

Other Names: Goat's Leaf, Woodbine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins

Further constituents are largely unknown; iridoide monoterpenes have been demonstrated in the rind including among others loganin (extremely bitter), that possibly also occurs in the drug.

EFFECTS

The main active principles are saponin and luteolin. The drug has a laxative and diaphoretic effect.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for digestive disorders, malignant tumors and as a diaphoretic agent. It is rarely used today.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Because of the saponin content, irritation of the gastrointestinal tract and possibly of the kidneys, urinary passages and urinary bladder are possible in the event of overdosage. Case studies are not known. (The berries of the red honeysuckle are considered poisonous. Intakes above 10 berries are said to trigger nausea, vomiting and tachycardia, elevated body temperature, exanthemas and cyanosis.)

DOSAGE

Mode of Administration: The drug is obsolete.

Hops

Humulus lupulus

DESCRIPTION

Medicinal Parts: The medicinal parts are the glandular hairs separated from the infructescence, the whole dried female flowers, the fresh cones (preferably with few seeds) collected before the seeds ripen and the fresh or dried female inflorescence.

Flower and Fruit: The male flowers are yellowish-greenish, inconspicuous and about 5 mm in diameter. The female flowers are in richly blossomed, heavily branched inflorescence. The ovary, which has 2 long downy stigma, is surrounded at the base by a round compressed nutlet. A yellowish fruit cone grows from the female flower. The inside of the bracts is covered with small, glossy, light yellow glandular scales, which contain hop bitter (Lupulin).

Leaves, Stem and Root: The hop plant is a perennial. The annual shoots reach a height of 6 m (12 m when cultivated). The stems are pencil-thick, green and do not turn woody. They are covered in 6 rows of climbing barbs. The leaves are 3 to 5 lobed, serrate and opposite.

Characteristics: Lupulin has a very strong odor and an extremely bitter taste.

Habitat: Indigenous to Europe, cultivated in Asia, U.S. and elsewhere.

Production: Hop cones consist of the whole dried female inflorescence of *Humulus lupulus*. After the harvest, the hops are dried on racks at temperatures of 30 to 60° C.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Acylphloroglucinols (10%)

Alpha-bitter acids: including, among others, humulone, cohumulone, adhumulone

Beta-bitter acids: including, among others, lupulone, colupulone, adlupulone

Volatile oil (0.3-1.0%): very complex in makeup, chief components myrcene, humulene, beta-caryophyllene, undecane-2-on, furthermore 2-methyl-but-3-en-ol (particularly following storage, as breakdown product of the acylphloroglucinols)

Resins (oxidation products of the bitter acids)

Phenolic acid: including, among others, ferulic acid, caffeic acid and their derivatives, for example, chlorogenic acid

Tannins: oligomeric proanthocyanidines

Flavonoids: including, among others, xanthohumole

EFFECTS

The drug is a sedative and therefore has sleep-inducing effect. This effect, however, strongly depends on the quality of the extract used.

In animal experiments, the 2-methyl-3-buten-2-ol exhaled by the plant caused a long and deep narcotic sleep after a short period of excitation.

The hop bitter acids are antibacterial and antimycotic. They stimulate the secretion of gastric juices. In animal experiments, a strong spasmolytic effect on the smooth muscle of the intestinal tract has been reported.

An estrogenic principle is considered plausible.

INDICATIONS AND USAGE

Approved by Commission E:

- Nervousness and insomnia

Unproven Uses: Used as a bitter and stomachic to stimulate the appetite and increase the secretion of gastric juices.

In folk medicine, Hops has been used internally for nerve pain, priapism, inflammation of the intestinal mucous membrane and tension headaches and used externally for ulcer cruris, ulcers and skin abrasions.

Homeopathic Uses: *Humulus lupulus* is found in preparations for treating nervousness and insomnia.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The fresh plant has a sensitizing effect (hop-picker's disease), which may occur, more rarely, with the dust of the drug as well.

DOSAGE

Mode of Administration: Comminuted drug, powdered drug or dry extract powder for infusions or decoctions or other preparations; liquid and solid preparations for internal use and externally for bath additives.

Hops is often found in combination with other sedatives.

How Supplied:

Liquid extract — drug: 1:1 45% ethanol (V/V) (BHP83).

Tincture — drug 1:5 60% ethanol (V/V) (BHP83)

Preparation: To prepare an infusion, boiling water is poured over the ground hop cones and left to draw for 10 to 15 minutes (1 teaspoonful is equal to 0.4 gm drug).

Daily Dosage: For most indications, a single dose of 0.5 gm is given.

To promote sleep, a single dose of 1 to 2 gm drug is given; liquid extract: single dose: 0.5 to 2 ml; tincture: single dose: 1 to 2 ml.

Tea: 1 cup before bedtime for 2 to 3 days.

m.

^ *Homeopathic Dosage:* 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Storage: Protect from light and moisture in well-sealed containers.

Hordeum distichon

See Barley

Horehound

Marrubium vulgare

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried flowering branches, the fresh aerial parts of the flowering plant and the whole plant.

Flower and Fruit: The small, white 5 to 7 mm long, labiate globular flowers are sessile. There are 6 to 8 richly flowered false whorls that are 1.5 to 2 cm long on each stem. The calyx is tubular, white and tomentose with 10 awl-shaped tips, which are curved back in a hook. The corolla is white and downy. The fruit is an ovate. 1.5 to 2 mm long, obtusely

triangular, smooth, gray-brown with darker marbling or light brown nut.

Leaves, Stem and Root: The plant is a perennial herb with a fusiform root and a multi-headed, often woody, root crown. The stems are erect, branched, obtusely quadrangular, and about 40 to 60 cm high and 7 mm thick at the base. The branches are curved, spreading out, obtusely quadrangular, and loosely downy, like the leaves. The leaves are tomentose-downy, petiolate, orbicular and unevenly crenate. They have distinct veins on the underside and are wrinkled.

Characteristics: The leaves smell tangy when rubbed and contain musk juice, which taste bitter and hot.

Habitat: The plant is indigenous to the Mediterranean region to central Asia. It has become established in central Europe; introduced to America, South Africa and Australia.

Production: Horehound herb consists of the fresh or dried, above-ground parts of *Marrubium vulgare* as well as their preparations. The plant is harvested during the flowering season from June to August. Fast drying is recommended.

Other Names: Houndsbane, Marrubium, White Horehound

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpene bitter principles: chief components marrubiin (0.1-1.0%), premarrubiin (0.1%)

Caffeic acid derivatives: including among others chlorogenic acid, cryptochlorogenic acid

Flavonoids: including among others chrysoeriol, vicenin II, lactoyl flavones, for example luteolin-7-lactate, apigenin-7-lactate

Volatile oil (traces): including among others camphene, p-cymene, fenchene

EFFECTS

The bitter ingredients act as a gastric juice stimulant; marrubinic acid acts as a choleric. In animal experiments, a significant increase of bile secretion was observed after administration of marrubinic acid and its salt. The main active principles, essential oil, diterpene-amaroids, tannins and flavonoids indicate that the drug would probably stimulate gastric juice secretion.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

Unproven Uses: The drug is used for dyspepsia, loss of appetite, bloating and flatulence, and respiratory catarrh. In folk medicine, it is used internally for acute and chronic

bronchitis, whooping cough, asthma, tuberculosis, pulmonary catarrh, respiratory infections, diarrhea, jaundice, debility and painful menstruation, and as a laxative in higher doses; externally for skin damage, ulcers and wounds, and as a gargle for mouth and throat infections.

Homeopathic Uses: Inflammation of the respiratory tract.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Comminuted herb, freshly pressed plant juice and other galenic preparations for internal use.

Preparation: To prepare an infusion, pour boiling water over 1 to 2 gm of the drug; strain after 10 minutes. For a liquid extract, prepare as a (1:1) dilution with ethanol (20%).

Daily Dosage: The average daily dose is 4.5 gm of the drug; 30 to 60 ml pressed juice.

The infusion dosage is 1 to 2 gm of the drug taken up to 3 times daily. The liquid extract dosage is 2 to 4 ml 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Horse Chestnut

Aesculus hippocastanum

TRADE NAMES

Horse Chestnut (available from numerous manufacturers), Horse Chestnut-Power, Venastat, Standardized Horsechestnut Extract

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried Horse Chestnut leaves, the oil extracted from the peeled fruit capsules (seeds) and dried chestnut seeds.

Flower and Fruit: The white flowers are in stiffly upright panicles gradually thickening near the distal end. Most of the flowers are male, but a few are female or androgynous. The calyx is fused and bell-shaped with 5 irregular tips. The petals are 10 to 15 mm long with a yellow spot, which turns red. There are 3 upward petals and 2 downward, which are folded at the edge. The flower is ciliate and cordate (heart shaped) at the base and contains 7 S-shaped, bending stamens with red anthers that are longer than the petals. The ovary is 3-valved, superior and velvety. The fruit capsules are green and globular with soft spines and fine hairs. There are 1 to 3 red-brown seeds (Chestnuts) within the capsules, which are shiny brown with a yellowish gray-brown navel and a tough shell.

Leaves, Stem and Root: The seasonal tree is up to 35 m high; it includes a large regular crown and widely spread roots. The trunk is initially smooth but later has thinly scaled, peeling and fissured bark. The young twigs are yellowish to red-brown and are initially covered with brown hairs. The buds gradually thicken near the distal end and are extremely sticky with dark red bud scales to protect the seed plant bud. The leaves are long, 5 to 7 palmate, with a 20 cm long grooved petiole. The leaflets are initially red-haired, 20 cm

long, cuneate-obovate, acute and dentate. The leaflets are rich green above and beneath are light green.

Habitat: Although the herb is indigenous to the mountains of Greece, Bulgaria, the Caucasus, northern Iran and the Himalayas, it is cultivated elsewhere, especially in northern Europe including the British Isles, Denmark, Scandinavia and Russia (Narva and St. Petersburg).

Production: Horse Chestnut leaf consists of the fresh or dried leaf of *Aesculus hippocastanum*. A dry extract is manufactured from Horse Chestnut seeds standardized to a content of 16-20% triterpene glycosides (calculated as anhydrous aescin).

Not to be Confused With: The leaves of the Horse Chestnut are commonly confused with those of Sweet Chestnut.

Other Names: Spanish Chestnut, Buckeye, Common Horse Chestnut, Conqueror Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS: HORSE CHESTNUT LEAF

Triterpene saponins

Hydroxycoumarins: chief component is aesculin, in addition fraxin and scopolin

Flavonoids: including rutin, quercitrin, and isoquercitrin

Tannins

EFFECTS: HORSE CHESTNUT LEAF

The main active principles of the anti-exudative effect and improvement of venous tone are hydroxycoumarins (aesculin and fraxin), triterpene saponins in the petioles and leaf veins, flavonoids and a rich supply of tannins. Although the drug is said to have an anti-exudative effect and improve venous tone, there is a lack of clinical data to support the efficacy.

COMPOUNDS: HORSE CHESTNUT SEEDS

Triterpene saponins (3-5%): The triterpene saponine mixture known as aescin (also escin) consists of diacylated tetra- and pentahydroxy-beta-amyrin compounds. The compounds bear a glucuronic acid remnant substituted with 2 monosaccharide remnants in position 3 at the OH-group. Aglycones, protoescigenin and barringtonenol C, are bonded like esters onto the OH-group at position 21 with either angelic or tiglic acid, or with either alpha-methyl butyric or isobutyric acid remnants. The OH-group in position 22 (beta-escin) or 28 (cryptoescin) is acetylated, and both positional isomeric compounds remain in equilibrium though migration of the acetyl remnant.

Flavonoids: in particular biosides and triosides of the quercetins

Oligosaccharides: including 1-kestose, 2-kestose, stachyose

Polysaccharides: starch (50%)

Oligomeric proanthocyanidins, condensed tannins: (only in the seed-coat)

Fatty oil (2-3%)

EFFECTS: HORSE CHESTNUT SEEDS

As found in different animal tests and preclinical investigations, the principal ingredient of Horse Chestnut seed extract, triterpene glycoside mixture (aescin), has an anti-exudative, vascular tightening effect, and reduction of vascular permeability which result in an antiedemic effect. The vein-toning properties of the Horse Chestnut extract also demonstrated improvement of venous return flow. A significant reduction of transcapillary filtration was seen in a placebo-controlled human pharmacological trial (Bisler, 1986). Significant improvement in the symptoms of chronic venous insufficiency was demonstrated in diverse, randomized, double-blind and cross-over studies (Calabrese, 1993; Steiner, 1990).

There are indications that Horse Chestnut seed extract reduces the activity of lysosomal enzymes, which increases in chronic pathological conditions of the veins. The enzymes will break down glycoacalyx (mucopolysaccharides) in the region of the capillary walls, allowing proteins to leak into the interstitium. The activity of the enzymes is reduced by the aescin and so the breakdown of glycoacalyx is also inhibited. The transcapillary filtration of low-molecular proteins, electrolytes and water into the interstitium is inhibited through a reduction of vascular permeability by the aescin.

CLINICAL TRIALS

The efficacy and safety of Horse Chestnut seed extract, given as Venostasin retard (50mg aescin) twice daily, was compared to mechanical compression involving bandages and stockings in a randomized, placebo-controlled clinical study. The study consisted of 240 patients with chronic venous insufficiency over a 12-week period. The results determined a similar decrease of lower leg volume of approximately 25% and noted compression treatment is uncomfortable, not convenient and subject to poor compliance (Diehm, 1996).

Venostasin retard was administered to 52 pregnant women with edema due to venous insufficiency in a placebo-controlled, double-blind, cross-over study. A significant reduction of edema and greater resistance to edema provocation was demonstrated in the Venostasin retard group. There were also less severe symptoms of pain, fatigue, swelling and itching with patients receiving Venostasin retard therapy (Steiner, 1990).

A randomized, placebo-controlled, double-blind study was conducted on 40 patients with venous edema in chronic deep

vein incompetence to determine the edema-reducing effect of Horse Chestnut seed extract. The edema reduction effect and reduction of leg volume with edema provocation of the Horse Chestnut seed extract were both statistically significant (Diem, 1992).

INDICATIONS AND USAGE

HORSE CHESTNUT LEAF

Unproven Uses: Eczema, superficial and deep varicose veins, leg pains, phlebitis, hemorrhoids, pains before and during menstruation. In folk medicine, the leaves are used as a cough remedy, as well as for arthritis and rheumatism.

HORSE CHESTNUT SEEDS

Approved by Commission E:

- Venous conditions (chronic venous insufficiency)

Treatment of symptoms found in pathological conditions of the veins of the legs (chronic venous insufficiency), for example pain and a sensation of heaviness in the legs, nocturnal cramps in the calves, pruritis and swelling of the legs.

Unproven uses: Horse Chestnut seeds are used for symptoms of post-traumatic and post-operative soft tissue swelling. Further indications are painful injuries, sprains, bruising, pain syndrome of the spine, edema, rheumatic disease and varicose veins.

Homeopathic Uses: Homeopathic treatments include hemorrhoids, lumbar and low back pain, venous back pressure.

PRECAUTIONS AND ADVERSE REACTIONS

HORSE CHESTNUT LEAF

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. One case of liver damage following intramuscular administration of an extract of the drug (origin details of the drug uncertain) is known.

Drug Interactions: Horse Chestnut leaf has a coumarin component and may interact with warfarin, salicylates and other drugs with anti-coagulant properties.

HORSE CHESTNUT SEEDS

Health risks following the proper administration of designated therapeutic dosages are not recorded. Susceptible patients may nevertheless experience mucous membrane irritations of the gastrointestinal tract (e.g. nausea) following intake of the drug; decrease in kidney function with pre-existing renal insufficiency and acute nephrotoxicity. Hepatotoxicity and urticaria have also been observed. I.V administration of aescin can lead to anaphylactic reactions.

OVERDOSAGE**HORSE CHESTNUT SEEDS**

The intake of larger quantities of Horse Chestnut seeds (in one case of a child with 5 seeds) can bring about vomiting, diarrhea, severe thirst, reddening of the face, enlargement of pupils, vision and consciousness disorders. Following stomach and intestinal emptying (gastric lavage, sodium sulfate) and the administration of activated charcoal, therapy for poisonings consists of diazepam for spasms, atropine for colic, electrolyte replenishment and sodium bicarbonate infusions for any acidosis that may arise. Intubation and oxygen respiration may also be necessary.

DOSAGE**HORSE CHESTNUT LEAF**

Mode of Administration: Extracts of the drug are contained in "vein teas" or "hemorrhoid teas," as well as in pharmaceutical preparations for the treatment of venous symptoms.

Preparation: One ampule corresponds to 4 mg flavones in 0.9% NaCl.

Daily Dosage:

Infusion (as a tea)—Pour boiling water over 1 tsp. of finely cut drug and strain after 5 to 10 minutes (1tsp = 1 gm drug).

Intravenously—1 to 2 ampules daily.

Intramuscularly—1 ampule daily.

HORSE CHESTNUT SEEDS

Mode of Administration: Available in liquid and solid preparations for internal use; semi-solid preparations for external use; and parenterally for homeopathic use.

How Supplied:

Ampules

Capsules — 250 mg, 300 mg, 485 mg

Coated tablets

Drops

Ointment/Gels

Tablets

Tincture

Preparation: Stabilized extract of Horse Chestnut (5:1) is standardized for aescin; tincture of Horse Chestnut 1:1 with 75% ethanol; isolated aescin.

Daily Dosage:

Intravenous—Doses of 5 mg once or twice daily of aescin as the sodium salt has been used for treatment or prevention of post-traumatic edema and postoperative edema. The maximum daily dose is 20 mg (Brandt, 1992/1993).

Oral—Aescin from encapsulated standardized extracts are initially given at doses of 10 mg (Chandler, 1993). The encapsulated standardized extract has been used for the treatment of postoperative or traumatic edema, hemorrhoids or symptoms due to varicose veins in doses providing 40 to 120 mg of aescin per day (Schlesser, 1991). Aescin (escin) 100 mg corresponding to 250-312.5 mg extract may be administered twice daily in delayed-release form.

Tincture—For the treatment of painful hemorrhoids, a dose of 1:10 tincture is 0.6 ml (Reynolds, 1977).

Topical—A 1 to 2% gel is applied topically several times daily for soft tissue injuries, bruises and symptomatic relief of varicose veins (Fachinfo Reparil (R)- Sportgel 1994; Fachinfo Opjio (R) N gel, 1991; Calabrese & Preston 1993).

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 to 2 ml 3 times daily sc; ointment 1 to 2 times daily (HAB1).

Storage: The herb should be stored in a dry and dark place.

Horsemint

Monarda Punctata

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The flowers grow in axillary whorls. They are bilabiate. The corolla is yellow with red spots. The 2 stamens and the sessile bracts are yellow and purple.

Leaves, Stem and Root: The plant is a perennial and grows up to 90 cm high with a branched, round stem. The leaves are opposite, lanceolate and downy.

Characteristics: The taste is pungent and bitter; the odor reminiscent of thyme.

Habitat: The plant is indigenous to the eastern and central U.S.

Other Names: Spotted Monarda, Monarda Lutea, Wild Bergamot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: including among others thymol (20%), thymol methyl ether, thymol hydroquinone; in *Monarda punctata* varieties, *maritima* including also gamma-terpinene, geranylformate, nerylformate

EFFECTS

The drug has carminative, stimulant and emmenagogic effects.

CONTRAINDICATIONS

The drug is not to be used during pregnancy.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for digestive disorders, flatulence and dysmenorrhea.

Indian Medicine: American Indians use the drug for inflammations, rheumatism and backache.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction **with the proper administration** of designated therapeutic dosages. (Oil from the plant, however, is only to be

administered externally. Even then, because it raises blisters in its pure form, it should be diluted with olive oil before application.)

DOSAGE

Mode, of Administration: Ground drug used as an infusion.

LITERATURE

Kem W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Horseradish

Armor acta rusticana

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the fresh or dried horseradish root.

Flower and Fruit: The inflorescence is made up of numerous, richly flowered racemes (cymes). The fragrant flowers are on 5 to 7 mm long, upright pedicels. The sepals are 2.5 to 3 mm long, broadly ovate, with a membranous white margin. The white petals are 5 to 7 mm long and broadly obovate. The inner stamens are 2.5 mm long; the outer ones 1.5 mm long. The stigma is broad, round and gently 2-lobed. The small pods are on 20 mm long, upright spreading stems. They are globose to obovate and 4 to 6 mm long. The seeds are smooth.

Leaves, Stem and Root: The plant is 40 to 120 cm high. It is a sturdy and glabrous perennial. The root is quite thick and woody. In cultivated varieties, it is thick and fleshy with numerous root heads, which are light yellowish-white and have horizontal underground runners. The sometimes solitary stems are upright, branched above, grooved and hollow. The leaves are long-petioled, oblong-ovate, cordate at the base, 30 to 100 cm long and unevenly crenate. The lower cauline leaves have shorter petioles and are lobed or comb-shaped pinnate with linear-oblong, entire-margined or serrate sections. The upper cauline leaves with narrowed bases are sessile, oblong or lanceolate, unevenly crenate to serrate and obtuse. The uppermost leaves are linear or almost entire-margined.

Characteristics: The rootstock has an odor that is strong and irritating, and a sharp, burning taste.

Habitat: The plant is indigenous to the Volga-Don region but has spread to almost all of Europe and other parts of the world.

Production: Horseradish consists of the fresh or dried, peeled or unpeeled roots of *Armoracia rusticana*.

Other Names: Mountain Radish, Red Cole, Great Raifort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glucosinolates sinigrin and gluconasturtin: The freshly harvested root contains the glucosinolates sinigrin (0.3%) and gluconasturtin, which release enzymatically triggered (myrosinase) allyl mustard oil (up to 90%) and a little 2-phenyl mustard when the root is cut up. The dehydrated root contains both of these mustard oils.

EFFECTS

Horseradish works antimicrobially against gram-positive and gram-negative pathogens, and is hyperemic on skin and mucous membranes and carcinostatic (due to the mustard oils). Horseradish demonstrated an antispasmodic effect in animal experiments.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/Bronchitis
- Infections of the urinary tract

Unproven Uses: Internally, Horseradish is used to treat inflammation of the respiratory tract and as supportive therapy for infections of the urinary tract. Externally, the drug is used for inflammation of the respiratory tract and for hyperemic treatment for minor muscle aches. In folk medicine, horseradish is administered for influenza, respiratory ailments, digestion, gout, rheumatism, and liver and gallbladder disorders.

Homeopathic Uses: Uses in homeopathy include eye inflammations, upper respiratory tract inflammations and upper abdominal colic.

CONTRAINDICATIONS

Because of the mucous membrane-irritating effect of the mustard oils, the intake of the drug should not be carried out in the presence of stomach or intestinal ulcers or in patients with a history of kidney disease.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pediatric Use: Preparations of horseradish should not be administered to children under 4 years of age.

DOSAGE

Mode of Administration: Fresh or dried root that has been cut or ground, freshly pressed juice or other galenic preparations for internal or external applications.

Daily Dose: The average dose for internal use is 20 g of fresh root; for external use, ointments and gels with a maximum of 2% mustard oils may be used.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml 3 times daily sc (HAB34). The mother tincture and first decimal dilution to be taken diluted with water.

Storage: Fresh roots should be buried in soil or sand.

Horsetail

Equisetum arvense

TRADE NAMES

Alcohol Free Horsetail, Horsetail, Horsetail Grass, Wild Countryside Springtime Horsetail

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried green, sterile shoots and fresh sterile shoots.

Flower and Fruit: Horsetail appears in two forms during the year. From March to April the red-brown to straw yellow simple stem develops with leaves arranged in a number of levels on the stem in whorls. The leaves are brown, fused to a sheath at the lower level with black-tipped, dry sporangia cones at the tip sprinkling greenish spore powder. In May and June there is a sterile summer form with 10 to 14 cm high stems and numerous branches that are arranged in whorls at the nodes. The stem and branches are deeply grooved, usually square and rough.

Habitat: Horsetail grows throughout Europe. It grows in Asia as far south as Turkey and Iran. The plant is also found in the Himalayas, central and north China and Japan.

Production: Horsetail consists of the fresh or dried, green, sterile stems of *Equisetum arvense* harvested in the summer. The herb is collected in the wild and air-dried.

Not to be Confused With: Other *Equisetum* species.

Other Names: Bottle-Brush, Corn Horsetail, Dutch Rushes, Field Horsetail, Horse Willow, Horsetail Grass, Horsetail Rush, Paddock-Pipes, Pewterwort, Scouring Rush, Shave Grass, Toadpipe

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: (0.6 to 0-9%): apigenin-5-O-glucoside, genkwanin-5-O-glucoside, kaempferol-3,7-di-O-glucoside, kaempferol-3-O-(6'-O-malonyl-glucoside)-7-O-glucoside, kaempferol-3-O-sophoroside, luteolin-5-O-glucoside, quercetin-3-O-glucoside

Caffeic acid ester (up to 1%): including chlorogenic acid, dicoffeoyl-meso-tartaric acid

Silicic acid (5 to 7.7%): to some extent water-soluble

Pyridine alkaloids: nicotine (traces), palustrine (in the gamatophytes and in the rhizome styrolpyrone glucosides, including equisetumpyrone)

EFFECTS

Horsetail has a mild diuretic and spasmolytic action in animal tests. The flavonoids and silicic acid contribute to the astringent effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones
- Wounds and burns

Internal preparations are used for post-traumatic and static edema, flushing-out therapy for bacterial and inflammatory diseases of the lower urinary tract and renal stones. It is used externally as a supportive treatment for poorly healing wounds.

Unproven Uses: In folk medicine, *Equisetum arvense* is used for tuberculosis, as a catarrh in the kidney and bladder regions, as a hemostatic for profuse menstruation, nasal, pulmonary and gastric hemorrhages, for brittle fingernails and loss of hair, for rheumatic diseases, gout, poorly healing wounds and ulcers, swelling and fractures and for frostbite.

CONTRAINDICATIONS

Horsetail is contraindicated in patients who have edema due to impaired heart and kidney function.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

A doctor should be consulted when the drug is utilized as a bath additive in cases of major skin lesions, acute skin lesions of unknown origin, major feverish and infectious diseases, cardiac insufficiency and hypertonia.

DOSAGE

Mode of Administration: Comminuted herb for infusions and other galenic preparations are available for oral administration. Comminuted herb for decoctions and other galenic preparations are used externally.

Preparation: To make a tea, pour 200 ml boiling water over 2 to 3 gm drug and boil for 5 minutes. Strain after 10 to 15 minutes. To make an infusion, use 1.5 gm drug per 1 cup water. A liquid extract is prepared in a 1:1 ratio in 25% alcohol.

Daily Dosage: Daily dose of Horsetail is 6 g drug. The drug should be administered with plenty of fluids.

The internal dosages are as follows:

Infusion — 2 to 4 g

Liquid extract — 1 to 4 ml 3 times daily

Tea — 2-3 g per cup repeatedly during the day between mealtimes

External use:

Compresses: 10 g drug to 1 liter

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc 3 times daily (HAB1).

Storage: Horsetail must be protected from light in well-sealed containers.

Hound's Tongue

Cynoglossum officinale

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial and root of the herb.

Flower and Fruit: The flowers are on short, bent pedicles, which grow to 1 cm after flowering. The corolla is cup-shaped and larger than the calyx. The corolla is initially dark violet, then dull brown. It is occasionally white with thickened, velvety purple or light red, tubular scales. The nutlets are flat, ovoid and light brown. They are 5 to 7 mm wide, thickened at the edge and covered with barbs.

Leaves, Stem and Root: The plant is a biennial. The taproot is 10 to 30 cm long and up to 1.5 cm thick. It is reddish colored with a few fibers. The shoots are gray-green and smell of mice. The stems are usually rigidly erect, angular, hairy and heavily foliated. They are 30 to 80 cm high and up to 1 cm thick. The lower leaves are in rosettes, which form a tough, coriaceous sheath at the base. The upper leaves are sessile and clasping.

Habitat: Especially common in Germany and Switzerland, now also found in the U.S. in areas where Germans and Swiss settled.

Production: Hound's Tongue herb consists of the above-ground parts of *Cynoglossum officinale*. Hound's Tongue

root is the root of *Cynoglossum officinale*. The root is gathered in the second spring and then dried.

Other Names: Dog's Tongue, Dog-Bur, Gypsy Flower, Sheep-Lice, Woolmat

ACTIONS AND PHARMACOLOGY

COMPOUNDS: HOUNDS TONGUE HERB

Pyrrrolizidine alkaloids (0.7 to 1.5%): main alkaloids heliosupine, echinatine, also 7-angeloylheliotridine, acetylheliosupine

EFFECTS:

No information is available.

COMPOUNDS: HOUNDS TONGUE ROOT

Pyrrrolizidine alkaloids: main alkaloids presumably, as in the plant, heliosupine and echinatine

Tannins

EFFECTS: HOUND'S TONGUE ROOT

The root has antidiarrheal and wound-healing effects. It is both toxic and carcinogenic.

According to previous reports, cynoglossin has a paralyzing effect on the peripheral nerve ends of frogs. The substances consolicin and consolidin have a paralyzing effect on the CNS, which is 3 times stronger than the effect of cynoglossin. The toxicity should disappear with storage.

INDICATIONS AND USAGE

HOUND'S TONGUE HERB

Unproven Uses: Preparations of Hound's Tongue have been used as an antidiarrheal and an expectorant. The effectiveness of the herb for the claimed applications is not documented.

CYNOGLOSSUM ROOT

Unproven Uses: In the past, it was used as an analgesic both internally and externally, as a cough sedative and for diarrhea. The root is used externally in the treatment of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

HOUND'S TONGUE HERB AND ROOT

WARNING: The traditional folk medicinal preparations should not be used!

Because of its high pyrrolizidine alkaloid content with 1,2-unsaturated necine parent substances, the drug is both hepatotoxic and hepatocarcinogenic in effect. The drug should under no circumstances be taken internally.

DOSAGE

HOUND'S TONGUE HERB AND ROOT

See Warning above regarding internal use.

Storage: The herb should be protected from light and kept dry above annealed calcium chloride in air-tight, sealed glass or chalk containers, with the possible addition of a few drops of chloroform or carbon tetrachloride as an insecticide. It should be³ renewed annually.

Houseleek

Sempervivum tectorum

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh leaves before flowering and their juice.

Flower and Fruit: The pink or red flowers are in cymes on their own peduncles, which are about 22 cm high. The individual flowers are short-pedicled and splayed in a star shape. The 12 sepals and petals are twice as long as the calyx. The 24 stamens are in 2 circles. There are 24 ovaries. The small fruit is many-seeded and fused at the base.

Leaves, Stem and Root: The green succulent leaves grow directly from the perennial fibrous root and form a dense, obovate, basal rosette 5 to 10 cm in diameter. They are fleshy and juicy, flat, 2.5 to 5 cm long. The purple leaves are sessile-oblong with a ciliate margin and are often in carpets of tufts.

Habitat: The plant is indigenous to central and southern Europe and now grows wild in northern Europe, northern Africa, and western Asia.

Other Names: Jupiter's Eye, Jupiter's Beard, Thor's Beard, Bullock's Eye, Sengreen, Ayron, Ayegreen, Aaron's Rod, Hens and Chickens, Liveforever, Thunder Plant

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fruit acids: L(-)-malic acid, isocitric acid, succinic acid

Tannins

Mucilage

EFFECTS

The active agents are the leaves containing tannin, bitter substances, sugar, and mucous. Results of research carried out to date point to a possible liver-protective and anti-oxidative effect. There are no studies available for the astringent, diuretic and antiseptic effects attributed to the drug.

INDICATIONS AND USAGE

Unproven Uses: Houseleek is used internally to relieve severe diarrhea. Folk medicine uses include dysentery, dysmenorrhea and amenorrhea, impairment of hearing and fever, worm infestation, uterine neuralgia, tonsillitis, headache and toothache. Externally, the drug is used for bums, wounds, ulcers and swelling caused by insect bites, open wounds, sore nipples, corns, inflammation of the throat, hemorrhoids, eczema, stomatitis, oral fungal infections and inflammation of mucous membranes and for the treatment of itchy and burning skin parts. A gargle of diluted juice made from the leaves is used for stomatitis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Houseleek is used internally as a decoction. Freshly pressed leaves and their juice is used externally.

Preparation: To prepare an infusion, allow 15 g of the drug to steep in 1000 ml water for 10 minutes. Poultices are prepared using crushed fresh leaves. A compress is made by soaking a cloth in plant juice that has been diluted with

water. Gargles are prepared using plant juice diluted with water and sweetened with honey. The pure plant juice is used for ear drops.

Daily Dosage: Infusion dosage is 1 cup every 3 hours.

Humulus lupulus

See Hops

Hwema Bark

Corynanthe pachyceras

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the bark.

Flower and Fruit: The inflorescence is an apical, up to 10-cm long panicle. The calyx has 4 short tips. The corolla tube is white and urn-shaped with 4 narrow, approximately 2-mm long lobes. The lobes have globular appendages, with 4 stamens and a 2-chambered ovary. The fruit is a 7 to 10 mm long and 2 to 4 mm wide, loculicidal capsule, which is black when ripe, with numerous double slit winged seeds.

Leaves and Trunk: *Corynanthe pachyceras* is a tree that grows up to 20 m high. The leaves are opposite, with simple lamina that are paper-like. The lamina grow from 15 to 25 cm long and 5 to 7 cm wide. They are elongate-ovate with approximately 12 mm long stipules. The branches are glabrous and the trunk bark is dark green to reddish brown.

Habitat: Tropical Africa

Production: Hwema bark is the dried bark of *Corynanthe pachyceras*. It is dried in the sun or drying cupboard with circulating air at temperatures less than 70° C after harvesting.

Not to be Confused With: Incorrect identification can occur with *Cinchona* cortex and sometimes with *Yohimbe* Cortex.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids of the beta-carboline and oxindole type: chief alkaloids corynanthine (1.2%) and corynantheidine, including as well, corynanthidine (alpha-yohimbine), beta-

yohimbine, corynantheine, dihydrocorynantheine, corynoxine, corynoxine

EFFECTS

The alkaloid-containing drug (yohimbine-corynantheine type) affects the CNS by inhibiting motility in animal experiments. The drug is spasmolytic, blood pressure reducing and also mildly analgesic and locally anesthetic in effect.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, Hwema Bark preparations are used for fever and malaria (infusion), leprosy (decoction), colds, and to lower blood pressure (dry extract).

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The LD50 in mice was determined to be 4.9 mg dry extract/kg body weight, I.V. The symptoms observed included convulsions and dyspnea.

OVERDOSAGE

Overdoses among humans could conceivably lead to signs of poisoning.

DOSAGE

Mode of Administration: Whole and cut drug, liquid and solid preparations for internal use; solid preparations for external use.

Preparation: To prepare a dry extract (10:1), the bark powder is succussed for 30 minutes at 95°C with a 10-fold amount of isotonic NaCl solution. It is filtered after cooling and the solution is concentrated to double the weight of the drug. Freeze-drying follows a 48-hour clarification period. This produces a brown powder. Drugmatic dry extract is 10:1.

Daily Dosage: Dry extract — 200 mg 1 to 4 times daily.

How Supplied: Tablets, capsules, suppositories and drink ampules.

Storage: Hwema Bark should be stored in a dry place.

LITERATURE

Hydrangea

Hydrangea arborescens

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizome and the roots.

Flower and Fruit: The inflorescence is flat cymes of umbels with creamy white flowers. They are androgynous or completely sexless and have inferior ovaries. The fruit is a schizocarp or capsule.

Leaves, Stem and Root: Hydrangea is a marsh plant, a bush up to 3 m high whose leaves are only pubescent on the veins of the undersides. The petiole is 2 to 5 cm long. The leaves are simple or lobed and opposite. There are no stipules. The bark is rough and tends to peel off. The roots are of various lengths and widths. They are pale gray on the outside and solid with a slight splitting structure.

Habitat: Indigenous to the eastern U.S. as far south as Florida.

Production: Hydrangea root is the root of *Hydrangea arborescens*.

Other Names: Seven Barks

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins

Flavonolids: including, among others, rutin

Volatile oil

Isocoumarin derivatives: including, among others, hydrangenol

EFFECTS

The drug has a diuretic effect.

INDICATIONS AND USAGE

Unproven Uses: Hydrangea is used in the treatment of conditions of the urinary tract, particularly bladder and kidney stones.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. According to information in older medical literature, the intake of larger dosages can lead to dizziness, feelings of constriction in the chest and central nervous system disorders. The plant has a weak potential for sensitization (chief allergen hydrangenol).

DOSAGE

Mode of Administration: As a liquid extract, in compounded preparations.

Hydnocarpus species

See Chaulmoogra

Hyssop

Hyssopus officinalis

TRADE NAMES

Hyssop (available from numerous manufacturers and as combination product), Hyssop Herb

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, the flower tips and the essential oil.

Flower and Fruit: The dark-blue bilabiate flowers are medium-sized false whorls in one-sided, terminal, leafy racemes. The calyx is downy, 5-tipped and glabrous inside. There are 4 stamens, which are turned away from each other and extend far above the perianth. The style is very long.

Leaves, Stem and Root: The plant is an evergreen subshrub about 60 cm high. The stem is erect, quadrangular, shrubby and branched. The leaves are sessile, lanceolate, acute, entire-margined, punctate, glabrous, dark green and paler beneath.

Characteristics: The plant has a weak sweetish smell. The taste is bitter.

Habitat: The plant is indigenous to southern Europe and grows wild in the Mediterranean region. It is cultivated elsewhere.

Production: Hyssop herb consists of the fresh or dried aboveground parts of *Hyssopus officinalis*. Hyssop oil consists of the essential oil of *Hyssopus officinalis*, obtained by steam distillation.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

In the foliage:

Volatile oil

Tannins

Bitter principles: including, among others, marubiin

Flavonoids: glycosides of hesperidin and diosmetin

In the volatile oil:

Chief components: 1-pinocamphone, isocamphone, pinocarvone, alpha- and beta-pinene

EFFECTS

1-pinocamphone and isopinocamphone are the toxically active constituents of the drug. The oil has an antimicrobial and anthelmintic effect. Extracts of the leaves are antimicrobial, antiviral (*herpes simplex*) and mildly spasmolytic.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Hyssop herb are used for the gentle stimulation of circulation, for intestinal catarrhs, for diseases of the respiratory tract, colds, chest and lung ailments.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Isolated cases of tonic-clonic spasms have been observed among adults after intake of 10 to 30 drops of the volatile oil over a number of days (2 to 3 drops for children).

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Hyssop herb preparations are available as capsules for internal use.

How Supplied:

Capsules — 445 mg

Iberis amara

See Bitter Candytuft

Iceland Moss

Cetraria islandica

DESCRIPTION

Medicinal Parts: The medicinal part is the dried thalius commonly known as Iceland Moss.

Flower and Fruit: *Cetraria islandica* is a lichen that grows on the ground and has a stiff, curling thalius. The thalius is from 2 to 6 cm high, erect, dichotomously branched, with a 1 to 10 cm wide section. The upper surface is olive-brown-green or brown, the underside is whitish to light brownish. The margins are covered in 0.5 mm long papilla, which contain the reproductive parts.

Characteristics: Iceland Moss tastes bitter, and when wet, has a smell reminiscent of seaweed.

Habitat: Grows in the boreal, alpine and Arctic regions of the Northern Hemisphere and in some regions of the Southern Hemisphere.

Production: Iceland Moss consists of the dried thalius of *Cetraria islandica* as well as its preparations. It is collected in the wild, then air-dried, moistened, cut and re-dried.

Other Names: Iceland Lichen, *Cetraria*. Eryngo-Leaved Liverwort

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Mucilages, glucans (50%): lichenan (lichenan), isolichenan (isolichenan)

Aromatic lichen acids (2-3%): fumarprotocetraric acid, protocetraric acid, cetraric acid

Aliphatic lichen acids (1.0-1.5%): esp. protolichestic acid

EFFECTS

The bitter organic acids have an antibiotic effect. It is also a demulcent and a mild antimicrobial.

The drug has an demulcent effect due to the sesquiterpene action of the polysaccharides. An ethanol precipitation of the aqueous extract containing lichenan and isolichenan demonstrated an antitumoural effect in animal tests.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis
- Dyspeptic complaints
- Inflammation of the mouth and pharynx^r
- Loss of appetite

Unproven Uses: Iceland Moss is also used for irritation of the oral and pharyngeal mucous membranes; loss of appetite and gastroenteritis (the bitter organic acids). In folk medicine, the drug has been used for lung disease, kidney and bladder complaints, gastric conditions, nausea and vomiting (in particular in pregnancy and with migraine), bronchitis, whooping cough and diarrhea. It is also used externally for poorly healing wounds.

Homeopathic Uses: Cetraria islandica is used to treat bronchitis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. In rare cases, external administration of the drug led to sensitization.

DOSAGE

Mode of Administration: Comminuted thallus for infusions and other galenic formulations for internal use; comminuted thallus preferably for cold maceration and other bitter-tasting preparations for internal use.

Preparation: To prepare an infusion, pour boiling water over 1.5 to 2.5 gm of comminuted drug and strain after 10 minutes (1 teaspoonful = 1.3 gm of drug); infusion may be sweetened.

Daily Dosage: The average daily dose is 4 to 6 gm. Single dose: 1.5 g drug in a teacup.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once daily (HAB1).

Storage: Store in the dark and well-sealed containers.

Ignatius Beans

Strychnos ignatii

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe seeds and the dried root bark.

Flower and Fruit: The flowers are in dense, axillary thyrses. Their parts are arranged in fives. They are greenish-white, pubescent and have a 2-valved superior ovary. The fruit is a golden-yellow berry. The berry is up to 13 cm wide and has a hard exocarp. The fruit pulp is yellow and contains up to 40 seeds. The seeds are 2 to 3 cm long by 2 cm wide, oval or rounded-angular, obtuse and very hard.

Leaves, Stem and Root: The plant is a climbing shrub with hooked stems that are up to 20 m long. The trunk is up to 10 cm thick. It is occasionally a small tree. It bears leaves that are up to 25 cm long, broad-ovate, opposite and short-petioled.

Habitat: The plant is common all over southeastern Asia and is cultivated there; especially in Vietnam and the Philippines.

Production: Ignatius beans are the seeds of *Strychnos ignatii*.

Not to be Confused With: The seeds of *S. lanata* and *S. multiflora* were once treated in the same manner as *Ignatii* seeds.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (2.5-5.6%): chief alkaloid strychnine (share 45-60%), in addition, above all, brucine, further including, among others, 12-hydroxystrychnine, alpha-colubrine, icajine, vomicine, novacine. There are also chemical strains for which brucine predominates, and others in which strychnine occurs only in traces.

Fatty oil

EFFECTS

The drug, which contains strychnine and brucine, is psychoanaleptic (see *Nux Vomica*).

INDICATIONS AND USAGE

Unproven Uses: Preparations made of the Ignatius Bean are used to treat faintness. Therapeutic use as a bitter or tonic is not recommended.

Homeopathic Uses: The drug is used for nervous disorders, cramps in hollow organs and muscles, and depressive states.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely **toxic** due to the strychnine content and should not be administered in allopathic medicine.

OVERDOSAGE

Symptoms of poisoning can occur after ingestion of one bean. Strychnine doses of as little as 1.5 mg (30-50 mg of the drug) initially cause restlessness, feelings of anxiety, heightening of sense perception, enhanced reflexes, equilibrium disorders and painful stiffness of the neck and back musculature. Later, twitching, tonic spasms of the masseter and neck musculature, and finally, painful convulsions of the entire body are triggered by visual or tactile stimulation. Dyspnea comes following spasm of the breathing musculature. Death occurs through suffocation or exhaustion. The lethal dosage for an adult is approximately 50 mg strychnine (1-2 gm of the drug). Chronic intake of subconvulsive dosages can also lead to death under similar conditions after a period of weeks. This is due to an accumulation of drug in the body, particularly in those who have liver damage.

Following the administration of a watery suspension of activated charcoal, the therapy for poisoning consists of keeping external stimulation to a minimum through placement in a quiet, warm, darkened room. Convulsions should be treated with dosages of diazepam or barbitol (i.v.). High-calorie glucose infusions should also be given. Intubation and oxygen respiration may also be required. Gastric lavage should be avoided, due to the danger of triggering convulsions. Analeptics or phenothiazines should not be administered. Because of the possibility of unwanted effects occurring in conjunction with the administration of therapeutic dosages, one should forego any administration of the drug.

DOSAGE

Mode of Administration: It is used in the manufacture of strychnine and brucine.

Daily Dosage: If the drug is taken internally, the maximum single dose is 0.1 gm; the maximum daily dosage is 0.3 gm.

Homeopathic Dosage: from D4: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Storage: Mark the container as "poisonous" and keep tightly sealed; protect the drug from cool air and light.

DESCRIPTION

Medicinal Parts: The medicinal parts are the composite heads and the whole of the flowering plant.

Flower and Fruit: The small orange flowers are in dense clustered cymes. The bracts are dry-membranous and usually lemon-yellow. **All** the florets are tubular and funnel-shaped. The **fruit** is pentangular with a tuft of hair.

Leaves, Stem and Root: The plant grows from 10 to 30 cm high. The stem is erect, unbranched and gray-tomentose. The leaves are alternate. The lower leaves are spatulate and the **upper** ones lanceolate, acute and as gray-tomentose as the stem.

Characteristics: Immortelle has a weak aroma.

Habitat: The plant grows in Europe and the U.S.

Production: Immortelle consists of the dried flowers of **Helichrysum arenarium** gathered shortly before fully **unfolding**.

Not to be Confused With: Confusion can arise with the capitula of *Helichrysum stoechas* and *Helichrysum augustifolium*.

Other Names: Common Shrubby Everlasting, Eternal Flower, Goldilocks, Yellow Chaste Weed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: in particular isosalipurposide (intensive yellow chalcone glycoside), naringenin-5-glucosyl-glycoside, helichrysin A and B (C-2-enantiomeric naringenin-5-O-glucosides, B-salipurposide)

Phthalides: including 5-methoxy-7-hydroxy-phthalides and their monoglucoside

Alpha-pyrone derivatives: arenole, homoarenole

Sesquiterpene bitter principles

Volatile oil (traces)

Caffeic acid derivatives

EFFECTS

The drug has antibacterial principles, and is mildly choleric and mildly spasmolytic.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints

Unproven Uses: The drug is used as an adjunct in the treatment of chronic cholecystitis and gallbladder complaints with accompanying cramps. In folk medicine, it is used as a diuretic and for jaundice, gout, rheumatism, kidney complaints and dropsy.

CONTRAINDICATIONS

Because of the bile-stimulating effect of the drug, it is not to be administered when there is biliary obstruction. The presence of gallstone illnesses can lead to colic.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Immortelle is used as a comminuted herb for infusions and other galenic preparations for internal use. Pharmaceutical cholagogues contain extracts of the drug. It is an inactive ingredient in many tea specialties.

How Supplied: Forms of commercial pharmaceutical preparations include teas, drops and compound preparations.

Preparation: To make an infusion, pour boiling water over 2 teaspoonfuls of the drug (3 to 4 g). Allow to stand for 10

minutes and then strain. Drink throughout the day and make a fresh batch daily.

Daily Dosage: The average daily dose is 3 g of drug.

Storage: Store Immortelle protected from light and moisture.

Indian Hemp

Apocynum cannabinum

DESCRIPTION

Medicinal Parts: The medicinal parts are the root and the juice obtained from the fresh plant.

Flower and Fruit: The small whitish-green, occasionally pink to violet flowers are on pods that grow to 2 to 4 mm in length. The calyx is deeply lobed and half as long as the corolla. The petals are oblong-lanceolate. The tufts of hair on the seeds are 2 to 3 cm long.

Leaves, Stem and Root: Indian Hemp is a perennial up to 2 m tall. It has an erect stem, which branches at the top. The whole plant is glabrous or downy. The short-petioled leaves are 5 to 11 cm long, yellowish-green and oblong or oblong-ovoid. The tips of the leaves are initially rounded and then terminate abruptly in a thorny tip.

Characteristics: The plant has an acrid taste and is to a certain degree poisonous.

Habitat: The plant is found mostly in the U.S. and Canada.

Not to be Confused With: Indian Hemp (*Cannabis indica*), though both species contain latex and their tough, fibrous bark can be used as a substitute for hemp, hence the name.

Production: Indian Hemp root is the root of *Apocynum cannabinum*, which is gathered (and sometimes dried), in autumn. The plant is cultivated as a crop in Germany and Russia.

Other Names: Bitterroot, Catchfly, Dogbane, Fly-Trap, Honeybloom, Milk Ipecac, Milkweed, Mountain Hemp, Wallflower. Wild Cotton, Canadian Hemp

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolids): in particular cymarín, k-strophanthoside, apocannoside, cynocannoside

EFFECTS

The high content of cardenolide glycosides causes bradycardia and increased contraction of the heart. Blood pressure is lowered, and rebound vagotonia hypertension can occur. The drug increases diuresis and stimulation of the vasomotor centers. It causes more severe irritation of the intestinal mucous membrane than digitalis and strophanthus preparations. It has a lower therapeutic effect on atrial fibrillation than digitalis.

Cardenolide glycoside cymine has an effect that is similar but generally weaker than glycoside strophanthine, with the exception of the stronger diuretic effect in edema. It is less cumulative.

INDICATIONS AND USAGE

Unproven Uses: The juice of the fresh plant is used in the treatment of condylomatosis and warts. American Indians use the roots for asthma, dropsy, coughs, syphilis and rheumatism. In folk medicine, the root is used to strengthen weak heart muscles following pneumonia, valvular insufficiency and senile heart. It is also used as a diuretic.

Homeopathic Uses: Homeopathic uses include cardiac insufficiency, renal inflammation with edema, and vomiting with diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

The drug should be administered only by someone who is expert in its use. Topical irritation of the mucous membrane of the alimentary canal, accompanied by nausea and vomiting, is more common than in other drugs containing cardenolide glycosides. Vomiting and gastrointestinal irritations can occur, even with the administration of therapeutic

doses of the drug because of the mucous membrane-irritating resin fraction.

OVERDOSAGE

For possible symptoms of overdose and treatment of poisonings see *Digitalis folium*. Despite the strong efficacy of the drug's cardioactive steroid glycosides in parenteral application, serious poisoning in the course of peroral administration is unlikely, due to the low resorption rate.

DOSAGE

Daily Dosage: The average daily dose of the liquid extract is 10 to 30 drops to be taken 3 times daily or 0.3 to 0.6 ml. of a 1:10 tincture.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or every 1 to 3 days (chronic); Parenterally: 1 to 2 ml 3 times daily sc (HAB1).

Storage: Store in secure area as the drug is poisonous.

Indian Nettle

Acalypha indica

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the whole flowering plant.

Flower and Fruit: The inflorescence is spike-like, has 3 to 7 female flowers below, which consist only of a 3-carpeled-

ovary with 3 styles. The male flowers are above these with 4 sepals and 8 stamens. On the tips of the young flower shoots are T-shaped, hairy structures approximately 2 mm wide with 2 side openings. The fruit is a 3-chambered capsule with 3 gray-brown seeds of approximately 1 mm diameter.

Leaves, Stem and Root: Indian nettle is an annual, upright, nettle-like diclinous, monoecious herb, which grows up to 60 cm high. The leaves are alternate, long-petiolate, round to rhomboid, 2 to 6 cm long, 1.5 to 5 cm wide narrowing to the petiole. They are matte above, glossy beneath with strongly protruding ribs, dentate at the front and smooth toward the base. The margin, petiole and ribs are weakly pubescent with 2 awl-like stipules. The stem is usually unbranched and pubescent. The main root is unbranched with thin secondary roots.

Habitat: The plant comes from India, Indochina and Ethiopia.

Other Names: Cat's Nettle

Production: Indian nettle is the whole fresh plant of *Acalypha indica* collected during the flowering season and dried.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyanogenic glycosides: acalyphin (0.3%, 3-cyanopyridone derivative)

Tannins: including tri-O-methyl ellagic acid

Volatile oil

EFFECTS

The drug is hemostyptic and antibacterial in effect (cyanogenic glucoside acalyphine). In vitro, proof of an acceleration of blood coagulation exists, which is due to the high levels of calcium salts. The leaf latex is said to have emetic and expectorant effects upon children. When administered as a suppository for constipation, it is said to immediately relax the contracted anal sphincter.

INDICATIONS AND USAGE

Unproven Uses: Internally used for worm infestation and constipation, for pregnant women, also for upset stomach and bronchitis. Externally used for eczema and skin rashes, ear ache (decoction), tumors (juice), as well as for cuts and other wounds, and also for inflammation of the joints (cut leaves and stems).

Indian Medicine: Preparations are used for ulcers, changes to the skin, bronchitis, constipation, croup and earache.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects other than possible gastric irritation are known in conjunction with the proper adminis-

tration of designated therapeutic dosages. Dermatitis has been observed following skin contact with the latex of the fresh plant. Cyanide poisonings from the drug are unlikely, due to the relatively low levels of cyanogenic glycoside content and the lack of stimuli leading to ingestion.

OVERDOSAGE

In animal experiments (rabbits), administration of large quantities of the drug led to gastrointestinal inflammation and to a change in blood color to chocolate-brown, indicating the presence of additional toxic substances.

DOSAGE

Mode of Administration: Liquid preparations and other galenic preparations for internal use and liquid preparations for external use.

Preparation:

Decoction: 100 gm drug to 1 liter water

Extract: 1000 gm drug to 1000 ml 90% ethanol (V/V)

Infusion: 50 gm drug to 1 liter water

Juice: 800 gm drug to 800 ml water and 200 ml ethanol 90%

Tincture: 125 gm drug to 1000 ml ethanol 90% (V/V)

Daily Dosage:

Decoction — single dose: 15 to 30 ml

Extract — single dose: 0.3 to 2 ml

Infusion — single dose: 15 to 30 ml

Juice — single dose: 0.3 to 2 ml

Tincture — single dose: 2 to 4 ml

Indian Physic

Gillenia trifoliata

DESCRIPTION

Medicinal Parts: The medicinal part is the dried and pulverized root bark.

Flower and Fruit: The flowers are white and tinged with red. They are arranged in a few loose, terminal panicles.

Leaves, Stem and Root: This perennial herb has irregular, cylindrical roots, which are usually transversely grooved and up to 15 cm long. The external surface is blackish, and the transverse section shows a thick, reddish bark, which easily separates from the white woody center. Sprouting from the root are a number of stems 60 to 90 cm high. The leaves and leaflets have various forms.

Characteristics: Indian Physic is odorless, but the plant has a pleasantly bitter taste.

Habitat: The plant is indigenous to the eastern U.S., and is cultivated in Europe and elsewhere.

Production: Indian Physic is the root bark of *Gillenia trifoliata*.

Other Names: Indian Hippo, Bowman's Root, American Ipecacuanha, *Gillenia*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Resins

Gillein (Gillenin)

The constituents of the drug have not been fully investigated.

EFFECTS

The drug is an expectorant, emetic and a "blood purifier."

INDICATIONS AND USAGE

Unproven Uses: The drug is used in the treatment of digestive disorders, particularly in cases in which a safe and reliable emetic is required. Folk medicine applications also include use with dyspepsia, dropsy, rheumatism and chronic constipation.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: The drug is available as a powder, an infusion or a tonic for internal use.

LITERATURE

Kern W, List PH, Horhammer L (Hrsg.), *Hagers Handbuch der Pharmazeutischen Praxis*, 4. Aufl., Bde 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Indian Squill

Urginea indica

DESCRIPTION

Medicinal Parts: The parts used medicinally are the horizontal and vertically cut strips of the dried, middle, fleshy onion layers of the white flowering variety (which are collected after flowering) as well as the fresh, fleshy onion layers of the white and red varieties.

Flower and Fruit: The inflorescence is a 10 to 60 cm long, loose raceme with 4 to 30 flowers in the axils of the bracts, which usually drop before the flower. The peduncle is upright, up to 1 m high, cylindrical, ribbed, glabrous and reddish-brown. The pedicle is up to 3.5 cm long, splayed when in flower and upright when the fruit is ripe. The flowers are radial with 6 corolla-like tepals, which are 5 to 12 mm long, campanulate and reddish-green. There are 6 stamens, 3 fused carpels and a 3-chambered, superior ovary. The fruit is a capsule, 10 to 25 cm long, with 12 to 30 seeds. The seeds are clavate to elliptical with a diameter of 4 to 10 mm, dark brown to black, with orbicular, translucent wings.

Leaves, Stem and Root: Indian squill is a herbaceous perennial bulb plant that reaches up to 35 cm. The flowering varieties might reach up to 1 m high. The leaves are basal, in 2 rows, 13 to 35 cm long, 6 to 30 mm wide, linear to lanceolate or sword-shaped, flat, parallel-veined, glabrous and whorled at the base. The bulb is whitish, globose to ovoid with a diameter of 3 to 7 cm. The outer layer is membranous, the inner one fleshy.

Characteristics: The bulb tastes bitter; slimy.

Habitat: India and Sri Lanka

Production: Indian squill is the dried and cut bulb of *Urginea indica* freed from the outer layers shortly after harvesting. The bulbs are dug up, cleaned and cut into quarters. Then the core is removed and the remaining pieces are dried in the sun or over a fire until the weight is reduced by 80%.

Not to be Confused With: Because of the similarity in name, it can be confused with *Scilla indica*.

Other Names: South Indian Squill

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (bufadienolids, 0.1 to 1.5%): chief components proscillaridin A and scillaren A, including as well scillipheoside, scillarenine-bis-alpha-rhamnoside, scillicyanogenine glucoside, scillicyanosidine glucoside, scilliglaucosidine glucoside

Mucilages (50%, glucomannoxylans)

Steroids: sterols, including beta-sitosterol, campesterol, stigmasterol

EFFECTS

The drug's content levels of cardioactive glycosides explain the administration in the presence of cardiac insufficiency and cardio-conditioned edema formation. The expectorant may be due the drug's effect as a mild irritant of the gastrointestinal tract combined with an increase in secretions of the bronchial system. The drug's administration as an antirheumatic appears plausible, due to the skin-irritating effect of the oxalate raphides it contains.

INDICATIONS AND USAGE

Unproven Uses: For chronic bronchitis, asthma and cardiac insufficiency as a treatment of second choice in the case of hypersensitivity to digitalis.

Indian Medicine: For edema, digestion disturbances, menstruation disorders, worm infestation, chronic bronchitis, asthma, rheumatism and skin conditions.

CONTRAINDICATIONS

Neither the drug nor pure glycosides should be administered in the presence of first- and second-degree AV-Block, hypercalcemia, hypokalemia, hypertrophic cardiomyopathy, carotid sinus syndrome, ventricle tachycardia, thoracic aortic aneurysm, WPW syndrome.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Because of the limited therapeutic range of the cardioactive steroid glycosides, a number of patients receiving no more than therapeutic dosages might experience the following side effects: hypertonia in gastrointestinal area, loss of appetite, vomiting, diarrhea, headache and irregular pulse.

Drug Interactions: The simultaneous administration of arrhythmogenic substances (sympathomimetics, methyl xanthines, phosphodiesterase inhibitors, quinidine) increases the risk of cardiac arrhythmias. Contact with the latex of the fresh bulbs can lead to skin inflammation (Scilla dermatitis).

OVERDOSAGE

Overdose could lead to hypertonia in gastrointestinal area, loss of appetite, vomiting, diarrhea, headache and irregular pulse along with the following:

- heart: cardiac rhythm disorders as serious as life-threatening ventricular tachycardias, atrial tachycardias with atrio-ventricular block.
- CNS: dizziness, vision disorders, depressions, states of confusion, hallucinations, psychoses.

Lethal dosages lead to cardiac arrest or to asphyxiation. Because of the difficulties involved in standardizing the

drug, the administration of pure glycosides is to be preferred (proscillaridin A).

The first-aid measures to be taken with poisonings are gastric lavage and instillation of activated charcoal. All other measures proceed according to the symptoms: careful potassium replacement for potassium loss; phenytoin as an antiarrhythmic for ectopic stimulation formation in the ventricle; lidocaine for ventricular extrasystole; atropine or orciprenaline for pronounced bradycardia. The prophylactic insertion of a cardiac pacemaker is recommended. Hemoperfusion for the elimination of the glycosides or cholestyramine administration for the interruption of the enterohepatic circulation are possible.

DOSAGE

Mode of Administration: Whole herb, cut drug, powdered drug and other galenic preparations for internal and external use.

Preparation: Liquid extract: 100 g drug are percolated with 70% ethanol and then evaporated to 850 ml; the rest is filled to 1000 ml again with 70% ethanol and filtered (BPC79).

Tincture: 100 gm drug is macerated with 1000 ml 60% ethanol (BPC79).

Acetic acid maceration: 100 gm drug is macerated with 1000 ml acetic acid in a closed vessel and then filtered. Finally the filtrate is heated and re-filtered after 7 days (BPC79).

Daily Dosage:

Drug: single dose: 60 to 200 mg; Tincture: 0.3 to 2 ml; Liquid extract: 0.06 to 0.2 ml; Acetic acid essence: 0.6 to 2 ml.

Storage: Store in a dry place and below 25°C.

Ipecac

Cephaelis ipecacuanha

DESCRIPTION

Medicinal Parts: The medicinal parts are the pulverized roots of the 3-to-4-year-old plant, which have been dug up and dried quickly in the sun.

Flower and Fruit: The flowers are in terminal, capitulum-shaped inflorescences surrounded by 4 to 6 bracts. The individual florets have a 5-tipped calyx, ciliated at the tips with a white campanulate-conical, 5-tipped corolla. A bitter, dark purple, fleshy drupe develops from the 2-carpeled ovary.

Leaves, Stem and Root: *Cephaelis ipecacuanha* is a perennial, evergreen, leafy plant about 40 cm high with a 2 to 4 mm thick rhizome from which sprout numerous 20 cm long fibrous roots. Some of these roots develop into tubers. The green stem may be creeping or ascending, simple or branched. It is somewhat quadrangular, occasionally bears adventitious roots. The opposite leaves are entire-margined, and the leaf blade, narrows into the short petiole. There are stipules at the base of the leaf, which are slit like awls and fused together with the petiole-like leaf sheath.

Habitat: Indigenous to the sparser woods of Brazil; cultivated in India and on the Malaysian archipelago.

Production: Ipecac is the root of *Cephaelis ipecacuanha*. The subterranean parts of the 3-to-4-year-old plants are quickly dried in the sun and then cut into pieces of 5 to 10 cm in length.

Other Names: Ipecacuanha, Ipecacuanha Rio, Matto Grosso

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids of the emetine type (2-4%): chief alkaloids emetine and cephaelin

Starch (30 to 40%)

EFFECTS

Emetine hydrochloride and cephaelin hydrochloride, alkaloids contained in the drug, have a locally irritating effect on the gastric mucous membrane and are thus responsible for the reflex increase of bronchial secretions and the expectorant effect. The saponins probably support this effect.

The drug affects the sensory stomach nerves; it is secretory in small doses and emetic in larger doses. It is also spasmolytic and expectorant. It is partially effective in amoebic dysentery due to the action of the alkaloid emetin on the magna-form of the pathogen.

INDICATIONS AND USAGE

Unproven Uses: Ipecac is contained in expectorants and secretory preparations; it is used for amoebic dysentery, as a bronchial treatment and as an emetic in cases of poisoning. It is also used as an expectorant and to soothe and assist in coughing up of thick phlegm and in the treatment of croupous bronchitis in children.

Homeopathic Uses: Ipecac is used to treat bronchitis, asthma, whooping cough, gastrointestinal inflammations, disorders in blood pressure and bleeding of the mucous membranes.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages as an expectorant. Administration over extended periods can lead to myopathias. Frequent contact with the drug can trigger allergic reactions of the skin and the mucous membranes ("druggist's asthma," the allergen is a glycoprotein).

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Higher dosages of the drug (1 to 2 gm) have a nauseate effect (therapeutically used as an emetic). Toxic dosages can lead to mucous membrane erosion in the gastrointestinal tract, tachycardia, drop in blood pressure and cardiac rhythm disorders, as well as disorders in respiratory function and possibly to convulsions, shock and coma.

Following intestinal emptying (sodium sulfate), the treatment for poisonings consists of the administration of generous amounts of liquids (warm tea), instillation of activated charcoal and shock prophylaxis (quiet, warmth), the treatment of spasms with diazepam (i.v.), electrolyte substitution and the countering of any acidosis imbalance that may appear through sodium bicarbonate infusions. In the event of shock, plasma volume expanders should be infused. Monitoring of kidney function is necessary. Intubation and oxygen respiration may also be required.

DOSAGE

Mode of Administration: Ipecac is used orally as a tincture, extract and fluid extract and in medicinal preparations with a standardized alkaloid content.

Preparation: Ipecac extract: After the alkaloids have been determined the powder is stabilized with lactose or dextrin, (DAB 10).

Tincture: 1 part root powder with 8 to 12 parts 70% ethanol (DAB 10).

These preparations are stabilized to a standardized alkaloid content.

Dosage: Infusion 0.5%: 10 ml (adults)

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day; suppositories: 2 to 3 times daily (chronic) (HAB1).

Storage: Store carefully in the dark in tightly sealed containers.

Iporuru

Alchornea floribunda

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the bark.

Flower and Fruit: The female inflorescence is apical and up to 25 cm long; the male inflorescence is axillary and 10 to 25 cm long with pale green flowers. The ovary is 3-carpeled and fused. The fruit is a 3-chambered capsule with glossy brownish seeds.

Leaves, Stem and Root: *Alchornea floribunda* is a tree or shrub up to 4.5 m, occasionally up to 10 m high. The leaves are clustered at the end of the glabrous branches. They are short-petiolate, lanceolate to spatulate, 15 to 35 cm long, 6 to 13 cm wide, glabrous above and slightly downy beneath. The stipules are 3 to 9 mm long and downy.

Habitat: Tropical Africa, Amazon region

Production: Niando root is the fresh or dried root of *Alchornea floribunda* collected in the wild.

Other Names: Macochihua, Niando, Malan

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Imidazole alkaloids (0.6 to 1.2%): alchornein (0.4%), isoalchornein (0.005%)

Tannins

EFFECTS

The drug has stimulating and hallucinogenic effect upon humans, due to the alkaloids it contains (chief active ingredient alchornein). An elevation in the sensitivity of the sympathetic to adrenaline was demonstrated in animal experiments. In comparison to atropine, alchorneine tartrate has a strong anticholinergic, vagolytic and peristalsis-inhibiting effect; in addition, it exhibits the action of a weak local anesthetic.

INDICATIONS AND USAGE

Unproven Uses: The drug can be used for respiratory and urinary tract infections and conditions of the gastrointestinal

tract. The indigenous people of the Amazon have used the bark and roots of Iporuru for many different purposes for hundreds of years. One of the more popular preparations is an alcoholic bark tincture used to treat rheumatism, arthritis, colds and muscle pains. In Africa the drug is used frequently as an aphrodisiac and hallucinogen.

PRECAUTIONS AND ADVERSE REACTIONS

Nothing has been documented regarding side effects in connection with therapeutic administration.

OVERDOSAGE

The drug is considered severely toxic. High dosages in animal experiments led to severe excitation and spasms. Cases of death through exhaustion have been observed among humans following over-stimulation and hallucination.

DOSAGE

Mode of Administration: Whole herb and cut drug preparations for internal use.

Preparation: There are traditional preparations in the form of macerates or palm wine with the appropriate dosage.

Iris species

See Orris

Jaborandi

Pilocarpus microphyllus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves.

Flower and Fruit: The numerous flowers are in terminal or axillary racemes that are up to 30 cm long and 0.5 cm wide. The pedicles are 0.1 to 1.5 mm long and have alternate

bracts. The flowers have a diameter of 4 to 5 cm and are glabrous. The 5 sepals are free, broadly triangular to orbicular and coriaceous. The petals have forward-bending tips and are thinly coriaceous and somewhat translucent. The oval anthers have an oblong gland. The disc is 0.5 mm high and 1.3 to 1.5 mm in diameter. The ovary is 0.5 mm and extends past the disc with a head-like stigma. The mericarp has roundish, flattened, black-brown seeds.

Leaves, Stem and Root: The plant is a tree or shrub 3 to 7 m high with a trunk diameter of 3 to 7.5 cm. The branches are pubescent when young and glabrous when older. The leaves are alternate to opposite, odd-pinnate with 1 to 5 pairs of pinna. The pinna are sessile, elliptical, distinctly asymmetrical at the base and have an indented tip. The leaflets are dull green, up to 5 cm long and 3 cm wide, with entire, slightly recurved margins and an uneven base. The ribs are prominent on the upper surface and have visible oil cells.

Characteristics: The taste is bitter and the odor slightly aromatic.

Habitat: The plant grows in the northeastern part of Brazil.

Production: Jaborandi leaves are the dried leaves of *Pilocarpus microphyllus*.

Other Names: Arruda Brava, Arruda do Mato, Jamguarandi, Juarandi

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Imidazole alkaloids (0.5-1.0%): chief alkaloid is α -pilocarpine, through drying and under storage conditions changing over to some extent into isopilocarpine, companion alkaloids including pilocarpidine, pilosine and others

Volatile oil (0.5%): chief components are limonene and undecanone

EFFECTS

The drug affects the parasympathetic system. It increases the secretion of saliva, sweat, gastric juices and tears, and stimulates the smooth muscle of the gastrointestinal tract, bronchi, bile duct and bladder.

INDICATIONS AND USAGE

Unproven Uses: Jaborandi has been used in the treatment of glaucoma. In folk medicine, it has been used for epilepsy, convulsions, gonorrhoea, ischuria, as an anesthetic for mucous membranes, for fever, influenza, pneumonia, gastrointestinal inflammations, kidney disease, psoriasis, neurosis and poisoning.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug is used today as an industrial

agent for the manufacture of pilocarpine, but is used medicinally only for homeopathic applications.

The incorrect administration of pilocarpine eyedrops can lead to poisoning through leakage into the nose or mouth. Symptoms include bradycardia, bronchial spasms, colics, collapse and possible cardiac arrest, convulsions, drop in blood pressure, dyspnea, nausea, severe salivation, strong secretion of sweat and vomiting.

Pregnancy: Jaborandi should not be used during pregnancy.

OVERDOSAGE

The lethal dose is approximately 60 mg of pilocarpine, corresponding to 5 to 10 gm of the drug. Individuals with cardiac and circulatory illnesses are particularly susceptible. Following stomach and intestinal emptying (gastric lavage, sodium sulphate), the treatment for poisonings consists of the instillation of activated charcoal with atropine and the use of diazepam in the case of spasms. Forced dialysis and the administration of plasma volume expanders can also be useful.

DOSAGE

Mode of Administration: Jaborandi is obsolete by itself as a drug.

Jack-in-the-Pulpit

Arisaema atrorubens

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the rhizome.

Flower and Fruit: The inflorescence (spadix) is yellowish-white, later brown, club-shaped and surrounded by a larger spathe. The spathe is greenish on the outside and white-striped with a weak purple-violet tinge on the inside. The fruit is a scarlet berry.

Leaves, Stem and Root: Jack-in-the-Pulpit is a herbaceous perennial rhizome, which extends up to 30 cm high. The leaves are basal and trifoliolate-digitate. The leaflets are ovoid, acuminate and entire. The rhizome is tuberous with hair-like roots at the top, shaped into a wreath.

Habitat: The plant is found in North America and China.

Production: Arisaema root is the fresh rhizome of Arisaema atrorubens.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Polysaccharides: starch

Pungent substances: structures are unknown (only in the fresh root)

EFFECTS

The pungent substances contained in the fresh drug are severely irritating to skin and mucous membranes, as well as being toxic. This toxicity is eliminated through dehydration and/or extended cooking. The dried or cooked root serves as a source of starch.

INDICATIONS AND USAGE

Unproven Uses: Preparations have been used for chronic bronchitis, asthma, colic, gastrointestinal disturbances, inflammation of the oral mucosa, rheumatism, for bumps, eye inflammations and abscesses (as a poultice) and as a contraceptive by the Hopi Indians.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The fresh rhizome is considered toxic. Internal administration leads to severe mucous membrane irritation and acute gastrointestinal inflammations, and skin inflammation.

Pregnancy: Contraindicated in pregnancy (used as a contraceptive in folk medicine).

DOSAGE

No information is available.

C

Jacob's Ladder

Polemonium caeruleum

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The numerous flowers grow in clusters at the end of the lateral branches. They are open, slightly hanging and have 5 sepals and 5 petals. The corolla is 2 to 2.5 cm, deep blue and has a short pollen tube. The stamens are enclosed in the tube and have yellow anthers.

Leaves, Stem and Root: The plant is a perennial. The plant is bright green and smooth. The upper section is covered in short glandular hairs. The rhizome is short and creeping, and the stem is 45 to 90 cm high, hollow and quadrangular. The leaves with numerous pairs of leaflets are 1.25 to 2.5 cm long. These are pinnate and alternate.

Habitat: The plant is indigenous to central and northern Europe.

Production: Jacob's Ladder is the aerial part of *Polemonium caeruleum*.

Other Names: Charity, English Greek Valerian

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Triterpene saponins

Flavonoids

EFFECTS

All parts of the plant contain saponin, which has astringent, diaphoretic and hemolytic effects.

INDICATIONS AND USAGE

Unproven Uses: Jacob's Ladder is used for febrile and inflammatory conditions.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The ground drug is used as an infusion.

Jalap

Ipomoea purga

DESCRIPTION

Medicinal Parts: The medicinal part is the root tuber.

Flower and Fruit: The flowers are single or in twos (occasionally in threes or fours), radial, with their structures grouped in fives. There are 5 narrow-lanceolate, purple-punctate sepals. The petals are fused to a 7 cm wide, funnel-shaped red corolla, and there are 5 stamens. The superior ovary is 2-chambered. The fruit is a capsule with 4 seeds.

Leaves, Stem and Root: This winding herb grows up to 4 m high. The leaves are alternate, up to 9 cm long and 5 cm wide, cordate, acuminate and entire. The stem is purple-tinged and glabrous. The rhizome is tuberously thickened, milky, approximately 5 cm long, with tuberous, thickened secondary roots.

Habitat: *Ipomoea purga* grows in South and Central America, Mexico and Jamaica.

Production: Jalap resin (also known as jalap or Jalapae resina) is the resin of *Ipomoea purga* derived from alcoholic extraction of the jalap root powder. The tuberous, thickened secondary roots (black rhubarb tubers) of *Ipomoea jalapae* tuber are harvested from May to autumn and dried in the sun on hot ash or over an open fire

Not to be Confused With: Jalap resin may be confused with Brazil jalap, Aloe, Orizaba jalap, colophonium, starch, dextrin and guaiac resin. Confusion can arise between Jalap tuber and *Ipomoea orizabensis*, *Ipomoea operculata*, *Operculina turpethum*, *Convolvulus scammonia* and *Mirabilis jalapa*.

ACTIONS AND PHARMACOLOGY

Ipomoea purga is a centuries-old purgative and vermifuge. It has also been used as an anthelmintic.

COMPOUNDS: JALAP RESIN

Glycoretines: convulvin (55%, non-ether-soluble), jalapin (7%, ether-soluble), convulvin and jalapin are mixtures made up of resinous glycosides of hydroxy-fatty acids (C12 to C16) with oligosaccharides, their hydroxy 1 groups esterified to

the fatty acid esters with, among others, acetic acid, propionic acid, iso-butyric acid, alpha-methylbutyric acid, tiglic acid and iso-valeric acid or n-valeric acid.

EFFECTS: JALAP RESIN

The drug has a drastic laxative effect due to the glycoresins it contains.

COMPOUNDS: JALAP TUBER

Resins (5 to 209c): glycoresins (see Jalap resin)

Polysaccharides: starch

EFFECTS: JALAP TUBER

The drug has a drastic laxative effect due to the glycoresins it contains.

INDICATIONS AND USAGE**JALAP RESIN**

Unproven Uses: Used for constipation, colic and pain in the intestinal region, dysentery, colitis and rheumatism.

Homeopathic Uses: The drug is used for restlessness at night in children and diarrhea in homeopathic medicine.

JALAP TUBER

Unproven Uses: Jalap tuber is considered to be obsolete. In the past, it was used as a laxative and purgative.

PRECAUTIONS AND ADVERSE REACTIONS**JALAP RESIN**

General: The drug's laxative effect frequently produces nausea, cramp-like pains and gastroenteritis.

Pregnancy: Administration is not advisable during pregnancy, particularly because of the possible teratogenic effect.

JALAP TUBER

General: Jalap tuber is to be used only under the supervision of an expert qualified in the appropriate use of this substance. The drug's laxative effect is frequently accompanied by nausea, cramp-like pains and gastroenteritis.

Pregnancy: The administration of jalap tuber is not advisable during pregnancy, particularly because of the possible teratogenic effect.

DOSAGE**JALAP RESIN**

Preparation: There is no information in the literature.

Daily Dosage: 15 g drug; maximum single dosage: 0.1 to 0.3 g drug

Homeopathic Dosage: from D4: 5 drops, 1 tablet, 10 globules, every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 to ml sc acute: 3 times daily; chronic once a day (HAB34).

Storage: Store securely in a tightly sealed container, protected from light.

JALAP TUBER

Mode of Administration: Whole, cut and powdered drug

Preparation: There is no information in the literature.

Daily Dosage: maximum 4.5 g drug; single dosage: maximum 15 g drug

Storage: Store protected from light in a secure, tightly sealed container.

LITERATURE

Jamaica Dogwood

Piscidia piscipula

DESCRIPTION

Medicinal Parts: The medicinal part is the bark.

Flower and Fruit: The plant has blue to white flowers with white stripes out of which 4 pods with 4 longitudinal wings develop.

Leaves, Stem and Root: The plant is a tree or shrub up to 15 m high with compound leaves. The bark is 3 to 6 mm thick and dark gray-brown with thin, longitudinal and transverse ridges. It is roughish and wrinkled, and somewhat fissured. The fracture is tough, fibrous, showing blue-green or brownish-green patches.

Characteristics: The taste is bitter and acrid and the odor characteristic.

Habitat: The tree is indigenous to Central America and the northern parts of South America.

Production: Jamaica Dogwood is the root bark of *Piscidia piscipula*.

Other Names: Dogwood, Fish Poison Tree

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Isoflavonoids: including among others jamaicine, ichthyone, the rotenoids rotenone, milleton, isomilleteone

Tannins**EFFECTS**

Research indicates that Jamaica Dogwood is mildly sedative and spasmolytic.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for states of anxiety and fear and as a daytime sedative.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug and liquid extract are no longer in use. It has been used in some medicinal preparations.

Jambolan

Syzygium cumini

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried bark, the dried seed kernels, the disintegrated kernels, the dried trunk bark and the macerated seeds.

Flower and Fruit: The flowers are in compound, triple panicles. They are sessile, whitish, fragrant, and are usually on older branches behind the leaves. The calyx tube is 4 to 6 mm long and twisted. The petals are hood-like. There are approximately 60 stamens, which are as long as the calyx tube. The drupe is initially pink, becoming black when ripe. The drupe is 1.2 to 3 cm long, globular to ovate, 1-valved, 1-

seeded and edible. The seeds are subcylindrical, about 6 mm long and rather less in diameter. One end of the seed is truncated and has a central depression. Externally, they are hard, tough and blackish-brown; internally they are pinkish-brown.

Characteristics: The taste of the seeds is faintly astringent and aromatic; the odor is slight.

Habitat: The plant is indigenous to the east Indian Malayian region. It has spread as far as China and Australia and is cultivated on the Antilles.

Production: Jambolan seed consists of the dried seed of *Syzygium cumini* (syn. *Syzygium jambolana*). Because the commodity consists mostly of the dried, fallen apart cotyledons, they must be broken apart in order to produce the drug. Jambolan bark consists of the dried bark from the trunk of *Syzygium cumini* (syn. *Syzygium jambolana*).

Other Names: Jambul, Jamum, Java Plum, Rose Apple

ACTIONS AND PHARMACOLOGY**COMPOUNDS: JAMBOLAN SEED**

Fatty oil (3-5%): containing oleic acid, myristic acid, palmitic acid and linoleic acid, sterculiic acid and malvalic acid (cyclopropylidene acids), among others, as well as vernolic acid (epoxy fatty acid)

Tannins (6%): including corilagin, 3,3'-Di-O-methyl ellagic acid, galloyl glucose

EFFECTS: JAMBOLAN SEED

Anti-inflammatory actions were demonstrated in animal experiments. Results of hypoglycemic and CNS experiments were not conclusive.

COMPOUNDS: JAMBOLAN BARK

Tannins: gallic and ellagic acid derivatives including 3,3'-Di-O-methyl ellagic acid

Steroids: sterols, including beta-sitosterol, beta-sitosterol glucoside

Triterpenes: betulinic acid, friedelin, friedelan-3-alpha-ole, epi-friedelanol, eugenin

Flavonoids: including myricetin, kempferol, quercetin, astragalgin

EFFECTS: JAMBOLAN BARK

The bark has astringent effects because of the tannin content.

INDICATIONS AND USAGE**JAMBOLAN SEED**

Unproven Uses: Jambolan seed is used for diabetes and in combination preparations for atonic and spastic constipation, diseases of the pancreas, gastric and pancreatic complaints, nervous disorders and as a diuretic.

JAMBOLAN BARK

Approved by Commission E:

- Diarrhea
- Inflammation of the mouth and pharynx
- Inflammation of the skin

Unproven Uses: Preparations are used internally for bronchitis, asthma, and dysentery, and externally for ulcers.

Indian Medicine: The drug is used for diabetes, leucorrhea, stomachache, fever, dysuria, and inflammation of the skin.

Homeopathic Uses: *Syzygium cumini* is used for diabetes.

PRECAUTIONS AND ADVERSE REACTIONS**JAMBOLAN SEED**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Administration in the presence of diabetes mellitus is not recommended, due to the fact that the blood sugar-reducing effect is Unproven.

JAMBOLAN BARK

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE**JAMBOLAN SEED**

Daily Dosage: A single dose is made up of 30 seeds (1.9 gm) in powdered form.

JAMBOLAN BARK

Mode of Administration: As a comminuted herb for decoctions and other galenic preparations for internal use (gargle, infusion) and local application (compresses).

Preparation: To make a decoction for internal and external use, place 1 to 2 teaspoonfuls of comminuted drug in about 150 ml cold water, bring to a boil, simmer for 5 to 10 minutes and strain.

Daily Dosage: The average daily dosage is 3 to 6 gm drug.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: T to 2 ml sc, acute: 3 times a day; chronic: once a day (HAB1).

Japanese Atractylodes

Atractylodes japonica

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the whole plant and roots.

Flower and Fruit: The composite flowers are surrounded by bracts. The capitula are apical and upright, with a diameter of 1.5 to 2 cm. The calyx is double-rowed and double-pinnate. The lingual florets are in 7 or 8 rows, whitish and 1 to 1.2 cm long. The fruit is an achaene. The pappus is brownish and 8 to 9 mm long.

Leaves, Stem and Root: The plant is an upright, herbaceous perennial with a rhizome that extends up to 1 m high. The basal leaves wilt rapidly; the upper cauline leaves are alternate, small, usually simple and sessile. The lower leaves are long-petiolate, 8 to 10 cm long. The lamina is pergament-like, single pinnate with 3 to 5 elongate-elliptical leaflets. The apical leaflet is larger with short thorns on the margin. The rhizome is elongate, gnarled, 2 to 3 cm thick and up to 8 cm long.

Habitat: Japan.

Production: Japanese *Atractylodes* rhizome is the dried rhizome of *Atractylodes japonica*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1.5%): constituents not investigated

Sesquiterpenes: atractylon, atractylenolids I to III, eudesma-4 (14), 7(11)-dien-8-one

Polyynes: including diacetylactyloidiol, (4E, 6E, 12E)-tetradecatrien-8, 10-diin-1, 3-diolacetate

Water-soluble polysaccharides: attractan A, attractan B

EFFECTS

The furanosesquiterpenes isolated from the essential oil of the drug exhibit antimicrobial, hepatoprotective, mildly analgesic, antiphlogistic, tumor-inhibiting and antioxidative effects.

INDICATIONS AND USAGE

Unproven Uses: Japanese *Atractylodes* has been used for gastric complaints, inflammations, heavy sweating and as a diuretic.

Chinese Medicine: Preparations are used for loss of appetite, physical and mental exhaustion, diarrhea, edema, nausea and vomiting.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb, cut drug, powdered drug and liquid preparations for internal use.

Preparation: The powder is prepared in accordance with Jap XI. There is no information available on the preparation of the infusion.

Daily Dosage: Internally: single dose: 0.5 to 1.0 gm of powder; daily dose: 1.5 to 3.0 gm of powder

Infusion: single dose: 1 to 1.5 gm; daily dose: 3 to 5 gm

Storage: Should be tightly sealed.

LITERATURE

Blaschek W, Hansel R, Keller K, Reichling J, Rimpler G, Schneider G (Eds), Hagers Handbuch der Pharmazeutischen Praxis. Folgebande 1 und 2. Drogen A-Z. Springer. Berlin. Heidelberg 1998.

Japanese Mint

Mentha arvensis var. *piperascens*

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts of the plant and the essential oil, which is extracted by steam distillation followed by partial removal of menthol and rectification.

Flower and Fruit: The flowers are in densely globular, sessile, 8- to 12-blossomed false whorls with small linear-lanceolate bracts. The inflorescence is leafy at the apex. The bracts are like the leaves, smaller above. The tepals are 1.5 by 2.5 mm, broadly campanulate and hairy. The corolla is lilac, white or, rarely, pink. The nutlets are pale brown.

Leaves, Stem and Root: Japanese Mint is a pubescent, fragrant perennial or occasionally annual that grows up to 60 cm. The stems are ascending or erect. The leaves are 15 to 70 mm by 10 to 40 mm, and are elliptic-lanceolate to broadly ovate, usually elliptical with the base narrowing to a petiole, and shallowly dentate.

Habitat: The plant is found in Europe as far north as the 65th latitude, in Asia (particularly in Siberia), the Caucasus, the Himalayas, China, Mongolia, Korea and Japan. It was probably introduced to North America.

Production: Mint oil consists of essential oil recovered from *Mentha arvensis* var. *piperascens*. The oil is obtained by steam distillation of the fresh, flowering herb, followed by partial removal of menthol and rectification.

Menthol is obtained from various species of *Mentha*, chiefly *M. arvensis* var. *piperascens* (from Japan), *M. arvensis* var. *glabrata* (from China) and *M. piperata* (from America). The product extracted from the first two is less valuable than the third, even though it contains a higher proportion of menthol.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Chief components: menthol (25-40%), menthone (15-30%), isomenthone (7-12%), limonene (7-12%), neomenthol (2-4%), menthyl acetate (1-5%), beta-caryophyllene (2-5%).

piperitone (0.5-4%), alpha- and beta-pinene (2-4% each). The composition does not reflect the relationship of the components to one another in the plant. The volatile oil gained through steam distillation loses 30 to 50% of the menthol through winterization and rectification.

EFFECTS

Japanese Mint has carminative, cholagogic, antimicrobial and, possibly, secretolytic effects on the bronchial mucosa. It is also cooling to the skin.

INDICATIONS AND USAGE

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds
- Inflammation of the mouth and pharynx
- Liver and gallbladder complaints
- Pain
- Tendency to infection

Unproven Uses: Internally, the herb is used for sensitivity to weather changes, breathing difficulties, flatulence, functional gastrointestinal and gallbladder disorders, and catarrhs of the upper respiratory tract. Externally, it is used for headaches, myalgia and neuralgic ailments. It is used both externally and internally for functional cardiac complaints.

Chinese Medicine: The herb is used for headaches, dyspeptic complaints, diarrhea and vomiting, toothaches and skin rashes.

Indian Medicine: The herb is used for joint pains, dyspeptic complaints, diarrhea and vomiting, coughs and asthma, headaches and toothaches, as well as general debility.

CONTRAINDICATIONS

Contraindications for the internal administration of the drug include occlusion of the biliary ducts, gallbladder inflammation and severe liver damage. Gallstone sufferers could experience colic due to the cholagogic effect.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The intake can lead to gastric complaints in susceptible patients. Volatile oils containing menthol can worsen the spasms of bronchial asthma. The volatile oil possesses a weak potential for sensitization due to its menthol content.

Pediatric Use: Preparations containing the oil should not be applied to the faces of infants or small children, particularly not in the nasal area (glottal spasm, bronchial spasm, asthma-like attacks, or even possible respiratory failure could occur).

OVERDOSAGE

Cases of poisoning are not recorded. The minimal lethal dosage of menthol is estimated to be 2 gm, although individuals have survived higher dosages (8 to 9 gm).

DOSAGE

Mode of Administration: The essential oil and other galenic preparations are available for internal and external application. Varieties are commercially available as Brazilian, Chinese, Indian and Japanese mint oil.

Daily Dosage: For internal use, the average daily dosage is 3 to 6 drops. When used as inhalation therapy, 3 to 4 drops are placed in hot water. To use externally, rub a few drops on the affected area.

In folk medicine, 2 drops are placed in a glass of water, tea or juice and taken once or twice a day. To make a heart poultice, 10 to 20 drops are placed on a compress, which is applied externally for 10 to 15 minutes. For headaches, 1 to 2 drop-, can be rubbed on the temples.

Storage: Store in air-tight containers protected from light; oils of different batches should not be mixed.

Jasmine

Jasminum officinale

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh and dried flowers.

Flower and Fruit: The flowers are single or in 2 to 12 flowered, axillary cymes. The sepals are fused, with 5 awl-shaped, 6 to 8 mm long tips. The corolla is white. The corolla tube is 15 to 18 mm long with 8 to 9 mm long, ovate tips, which broaden like plates. There are 2 stamens. The fruit is a black berry.

Leaves, Stem and Root: Common jasmine is a procumbent or climbing shrub, that grows up to 5 m high. The leaves are opposite and 5 to 7 pinnatifid. The leaflets are elongate-lanceolate, acute, narrowing at the base, weakly pubescent on both surfaces with a ciliate margin. The branches are initially lightly pubescent, later becoming glabrous, slightly edged, green and cane-like.

Characteristics: The flowers are very fragrant.

Habitat: France, Italy, China, Japan, India, Morocco, Egypt

Production: Common jasmine flowers are the dried, fresh flowers of *Jasminum officinale* var. *grandiflorum*

Other Names: Royal Jasmine, Italian Jasmine, Catalonian Jasmine, Poet's Jasmine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Pyridine alkaloids: jasminine (presumably an artifact)

EFFECTS

No definitive data are available.

INDICATIONS AND USAGE

Chinese Medicine: Jasmine is used for hepatitis and abdominal pain in liver cirrhosis or dysentery.

Indian Medicine: Preparations are used for pain symptoms of the stomach, head, teeth and eyes, for leprosy, itching, skin disease and dysmenorrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: Jasmine is available as a tea blend or oil.

LITERATURE

No data available

Jasminum officinale

Jatamansi

Nardostachys jatamansi

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the rhizome.

Flower and Fruit: The flowers are in 1 to 5 capitula, which are usually surrounded by bracts. Their structures are in fives, the petals fused, the corolla tube 6 mm long and lightly pubescent on the inside. The fruit is crowned by pointed ovate calyx tips, which are covered in splayed white hairs.

Leaves, Stem and Root: This upright herbaceous perennial grows to a height reaching up to 60 cm high. The leaves are

opposite, grow from the rhizome, are 15 to 20 cm long, 2.5 cm wide, spatulate and narrow toward the petiole. The cauline leaves are sessile, opposite, 2.5 to 7.5 cm. long and narrow-ovate. The finger-thick, woody rhizome is covered with reddish brown fibers from the remains of the petioles.

Habitat: *Nardostachys jatamansi* is indigenous to China, India and Nepal.

Production: *Jatamansi* roots are the dried roots and rhizome of *Nardostachys jatamansi*. An essential oil is extracted from the rhizome.

Not to be Confused With: *Selinum vaginatum*

Other Names: Indian Nard, Indian Spikenard, Spikenard, Nard, Narrow-Leaved-Echinacea

ACTION AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.3 to 0.4%): including valeranone (*jatamansone*), nardosinone, calarene, beta-maaliene, maaliol, beta-ionone, 1(10)-aristelonone-(2), nardol, valeranal

EFFECTS

Valid data regarding the pharmacological efficacy of the drug have not yet become available. In animal experiments, a limiting effect upon convulsant thresholds and a reduction of motor coordination ability traceable to the sesquiterpene ketone valeranone contained in the drug have been demonstrated. The authors conclude from this that the substance is anticonvulsive in effect without exhibiting neuroleptic characteristics. In addition, it manifests an antiulcerogenic effect.

INDICATIONS AND USAGE

Unproven Uses: In combination with cold water, the various oils are considered to be effective against nausea, stomach-ache, flatulence, liver problems, jaundice and kidney complaints, insomnia and headache. Externally, the oil is added to a steaming bath to treat inflammation of the uterus. The oils are also used in eye compounds and as poison antidotes.

Indian Medicine: *Jatamansi* is used for nervous headache, excitement, menopausal symptoms, flatulence, epilepsy and for pain in the intestinal region.

CONTRAINDICATIONS

Use of the drug is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards **are known in** conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: *Jatamansi* root is used in the forms of a whole, **cut** or powdered drug for internal and external use.

How Supplied: Forms of commercial pharmaceutical preparations include capsules and compound preparations.

Daily Dosage:

Powder — 0.6 to 1.3 g drug as a single dose

Pure drug — 5 g of the drug 3 times daily with a cup of water

Liquid extract/tincture (1:10) — 1 wineglassful, 3 times daily (corresponds to approximately 2 g drug per single dose)

Infusion (1:40) — 1 wineglassful, 3 times daily (corresponds to approximately 2 g drug per single dose)

Storage: Seal tightly and store in a cool, dry place.

Jateorhiza palmata

See *Colombo*

Java Tea

Orthosiphon spicatus

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and stem tips collected during the flowering season.

Flower and Fruit: The flowers usually are arranged in a whorl of 6 (occasionally 10) blooms. The calyx tube is short with an upright-curved upper lip. The corolla is blue to light violet. The corolla tube is about 2 cm long with a broad upper lip that has 3 indentations. The lower lip is narrow and ovate-lanceolate. The 4 stamens are blue and 2.5 to 3 cm long. The style is as long as the stamen, and the ovary has a

disk. The fruit breaks up into 4 oval-oblong nutlets with bumpy surfaces.

Leaves, Stem and Root: The plant is a 40 to 80 cm high herb. The stem is quadrangular and glabrous to pubescent with crossed, opposite leaves. The leaves are about 75 mm long, usually short-petioled, ovate-lanceolate with an irregularly coarse, roughly serrate to dentate (or occasionally crenate) margin. The upper surface is brownish-green, the lower surface gray-green with strong, protruding ribs and glandular punctate markings. The plant resembles Peppermint.

Characteristics: The herb has a weak, unusual smell reminiscent of a cattle pen. The taste is salty, bitter and astringent.

Habitat: The plant is found in an area extending from tropical Asia to tropical Australia and is cultivated in those areas and elsewhere.

Production: Java Tea consists of the dried leaf and stem tips of *Orthosiphon spicatus*, which is harvested shortly before flowering. The leaves are then dried in a well-ventilated location.

Not to be Confused With: Confusion can arise with other *Orthosiphon* varieties and *Eupatorium* varieties from Java.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.02-0.06%): including among others beta-caryophyllene, alpha-humulene, caryophyllene-epoxide

Flavonoids: in particular more highly methoxylized examples (0.2%) including eupatorin, sinensetin, scutellarin tetramethyl ethers, salvigenin

Caffeic acid derivatives: including among others 2,3-dicofeoyltartrate, rosmarinic acid, 2-caffeoyl tartrate.

Diterpene ester: orthosiphole A to E, (diterpene dibenzoyl diacetyl ester of primarane type)

Triterpene saponins: (up to 4.5%): aglycone hederagenin

EFFECTS

Java Tea has been shown in human and animal tests to be a mild diuretic. The essential oil of the drug, which contains sesquiterpenes, is antimicrobial, antiphlogistic and possibly antitumoral.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Unproven Uses: In folk medicine, it is used for the above conditions and also for gout, rheumatism, hematuria and albuminuria.

M

wk

«^

CONTRAINDICATIONS

Use of the drug for irrigation therapy is contraindicated in the presence of edema resulting from reduced cardiac or renal activity.

^ | PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Comminuted herb for infusions and other galenic preparations for internal use.

How Supplied: Forms of commercial pharmaceutical preparations include:

Capsules

Drops

Tablets

Preparation: To make an infusion (tea), pour 150 ml hot water over the drug and strain after 10 minutes.

- 4| *Daily Dosage:* The daily dosage ranges from 6 to 12 g drug. Adequate fluid intake (at least 2 liters per day) is essential.

Storage: Java Tea should be stored in a tightly sealed container that protects it from light and moisture.

Jequirity

*Abrus precatorius***DESCRIPTION**

Medicinal Parts: The medicinal parts are the leaves, roots and seeds.

Flower and Fruit: The flowers are racemes of pink blossoms. The fruit is a pod with oval seeds, which are rounded at the ends. They are about 3 mm in diameter, hard, red and glossy, with a large black dot at one end. One variety has white seeds.

Leaves, Stem and Root: This deciduous climbing plant with compound leaves grows to about 4 m.

Characteristics: The plant is a protected species in some countries.

Habitat: The plant originated in India and is found today in all tropical regions of the world.

Other Names: Indian Licorice, Wild Licorice, Prayer Beads, Crab's Eyes, Gunga, Goonteh, Rati

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Toxic lectins: abrine and isolectins.

EFFECTS

Jequirity is an irritant and abortifacient.

INDICATIONS AND USAGE

Unproven Uses: Jequirity was used for chronic conjunctivitis and as a contraceptive in folk medicine, but is no longer used for these purposes.

Indian Medicine: Jequirity is used for coughs as well as inflammations and conditions of the upper respiratory tract and lungs.

Chinese Medicine: The drug is used in hepatitis and bronchitis.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is very poisonous because it contains the toxic lectin abrine and isolectins.

OVERDOSAGE

Severe poisonings among adults following the intake of one half to two seeds, as well as cases of death among children following the consumption of two seeds, have been recorded. Besides gastrointestinal emptying, counter-measures include, administration of large amounts of fluid, monitoring of the circulatory system, administration of anti-epileptic drugs and possibly artificial respiration.

Jewel Weed

Impatiens biflora

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The axillary flowers are orange-yellow with large reddish-brown spots. They have an irregular form. The sepal sac abruptly contracts to a spur of about 5 to 9 mm. The spur is bent 180 degrees to lie parallel with the sac. The fruit is an oblong capsule which, when ripe, bursts open at the slightest touch and spreads the seeds over large distances.

Leaves, Stem and Root: The plant is a glabrous, fleshy annual 20 to 180 cm high. The stems are simple or branched and have swollen nodes. The leaves are thin, ovate, with 5 to 12 (up to 14) teeth on each side and are often undulate. They are rich green.

Habitat: *Impatiens* is common in the temperate regions and in South Africa, but it grows mostly in the mountainous, tropical regions of Asia and Africa.

Production: Jewel Weed is the aerial part of *Impatiens biflora*.

Other Names: Wild Balsam, Balsam-Weed, Spotted Touch-Me-Not, Slipperweed, Silverweed, Wild Lady's Slipper, Speckled Jewels, Wild Celandine, Quick-in-the-Hand

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Naphthalene derivatives: 1,4-naphthoquinone, in particular lawsone (2-hydroxy-1, 4-naphthoquinone), yielding from the precursor through drying of the leaves 1,2,4-trihydroxy-naphthalene-4-beta-D-glucoside

EFFECTS

Jewel Weed is a digestive, appetite stimulant and diuretic.

INDICATIONS AND USAGE

Unproven Uses: Jewel Weed is used for mild digestive disorders. In folk medicine the fresh plant is used as an ointment for hemorrhoids and the juice is used for removing warts.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Administered as the ground drug and as an infusion.

LITERATURE

Hegnauer R, *Chemotaxonomie der Pflanzen*, Bde 1 — 11, Birkhauser Verlag Basel. Boston. Berlin 1962-1997.

Jimson Weed

Datura stramonium

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves or the dried leaves with the tips of the flowering branches. Occasionally the fruit, the ripe seeds and the fresh, aerial parts of the plant are used. Parts of the plant are regarded as poisonous.

Flower and Fruit: The flowers are large, white, solitary, terminal or in the branch bifurcations. The calyx has a long 5-edged and short 5-tipped tube. The corolla is funnel-shaped and folded with a short 5-sectioned border. There are 5 free stamens and 1 superior ovary. The fruit is a 5 cm long 4-valved capsule, which is densely thorny and walnut-sized. The numerous seeds are 3.5 mm long, flat, reniform and black.

Leaves, Stem and Root: The plant is an annual and grows to 1.2 m high. It has a simple or bifurcated, round, erect glabrous stem. The leaves are 20 cm long, long-petioled, ovate, dentate, glabrous and dark green.

Characteristics: The foliage has an unpleasant smell; the flowers are fragrant and poisonous.

Habitat: Jimson Weed is found in most temperate and subtropical parts of the world, probably originated in Central America.

Production: Jimson Weed leaf consists of the dried leaf, or the dried leaves and flowering tops of *Datura stramonium*. Jimson Weed seed consists of the ripe seed of *Datura stramonium*.

Other Names: Devil's Apple. Devil's Trumpet, Jamestown Weed, Mad-Apple. Nightshade. Peru-Apple, Stinkweed, Stinkwort, Stramonium, Thorn-Apple, *Datura*

ACTIONS AND PHARMACOLOGY

COMPOUNDS: JIMSON WEED LEAF

Tropane alkaloids (0.1-0.65%): chief alkaloids (-)-hyoscyamine, under drying conditions changing over to some extent into atropine and scopolamine (ratio 4:1), furthermore including, among others, apoatropine, belladonnine, tigloylmeteloidin

Flavonoids

Hydroxycoumarins: including, among others, umbelliferone, scopolin, scopoletin

Withanolide: including, among others, withastramonolide

COMPOUNDS: JIMSON WEED SEED

Tropane alkaloids (0.4-0.6%): chief alkaloids (-)-hyoscyamine, under drying conditions changing over to some extent into atropine, and scopolamine (ratio 4:1).

Indole alkaloids (\$-carboline type): including, among others, fluorodaturin (very fluorescent).

Lectins

Fatty oil (15-45%)

Proteins (12-25%)

EFFECTS: JIMSON WEED LEAF AND SEED

The drug contains alkaloids (hyoscyamine, scopolamine) in extremely varying concentrations. The effect is anticholinergic and parasympatholytic (see *Belladonna*); the scopolamine fraction is more responsible for this effect.

INDICATIONS AND USAGE

JIMSON WEED LEAF AND SEED

Due to the inconsistent alkaloid content of the raw herb, the authors do not recommend use of non-standardized Jimson Weed products.

Unproven Uses: In folk medicine, Jimson Weed preparations have been used for asthma, convulsive cough, pertussis during bronchitis and influenza, for severe catarrh and as an expectorant. It was also used as a basic therapy for diseases of the autonomic nervous system. In the 18th century

stramonium was first used for epileptic fits, and it was also used for hallucinogenic effect in magic and witch potions.

Homeopathic Uses: Used for infection with high temperatures, cramps and inflammations of the eyes.

Chinese Medicine: Used in Chinese medicine for general states of pain. It is smoked for asthma, dyspnea and coughs; externally for rheumatism.

CONTRAINDICATIONS

JIMSON WEED LEAF AND SEED

Glaucoma, suspicion of glaucoma, paralytic ileus, pyloric stenosis, enlarged prostate, tachycardic arrhythmias, acute pulmonary edema.

PRECAUTIONS AND ADVERSE REACTIONS

JIMSON WEED LEAF AND SEED

General: Patients with urine retention or coronary sclerosis should not use Jimson Weed.

Drug Interactions: Jimson Weed will have an additive effect when taken with other anticholinergic medications.

OVERDOSAGE

JIMSON WEED LEAF AND SEED

The intake of very high dosages leads to central excitation (restlessness, compulsive speech, hallucinations, delirium, manic episodes), followed by exhaustion and sleep.

The 4 early warning symptoms of poisoning are skin reddening, dryness of the mouth, tachycardic arrhythmias and mydriasis. Accommodation disorders, heat build-up through decline in sweat secretion, miction disorders and severe constipation can occur as side effects, particularly with overdosages.

Lethal dosages (for adults starting at 100 mg atropine, depending upon atropine content, 15 to 100 g of the leaf drug, 15 to 25 g of the seed drug, considerably less for children) carry with them the danger of asphyxiation. Treatment for poisonings include stomach emptying, temperature-lowering measures with wet cloths (no antipyretics), oxygen respiration for respiratory distress, intubation, parenteral physostigmine salts as antidote, diazepam for spasms and chlorpromazine for severe excitation.

DOSAGE

JIMSON WEED LEAF

Daily Dosage: Stabilized leaf powder: 0.05 to 0.1 gm drug as a single dose up to 3 times a day; daily dose: 0.6 gm drug (OAB90); as a narcotic: 1 gm drug.

Homeopathic Dosage: from D4: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or 1 ml injection solution sc twice weekly; eye drops 1 to 3 times a day (HAB1).

Storage: Keep carefully stored and protected from light.

JIMSON WEED SEED,

Daily Dosage: Seeds: single oral dose: 0.05 gm; daily dose: 0.6 gm drug (EB6); seed tincture: single oral dose: 0.3 gm; daily dose: 3.0 gm (EB6).

Homeopathic Dosage: from D4: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or 1 ml injection solution sc twice weekly; eye drops 1 to 3 times a day (HAB1).

Storage: Keep carefully stored and protected from light.

Jojoba

Simmondsia chinensis

DESCRIPTION

Medicinal Parts: The medicinal part is the liquid Jojoba wax.

Flower and Fruit: The flowers are axillary. The male flowers are small and yellow and have no petals. The female flowers are usually solitary, inconspicuous and pale green. There may also be inflorescences in the form of panicles, umbels and cymes. Pollination is by wind. The fruit capsules contain 1 to 3 seeds although 1-seeded capsules are the most common. The seeds are approximately 2 cm long.

Leaves, Stem and Root: The plant is a heavily branched, evergreen dioecious bush. The male plants are larger, taller and less compact than the female. The desert variety develop taproots up to 3.6 m in length. The horizontal root branches reach from 60 to 90 cm in depth. The leaves are thick, coriaceous, blue-green, entire-margined and oblong. They are in pairs and depending on the dampness of the soil the leaves may remain on the bush for 2 to 3 periods of growth.

Characteristics: The oil from the fruit has a pleasant scent and taste.

Habitat: The plant is indigenous to areas extending from the Sonora dessert of the U.S. to northwest Mexico. It is cultivated in India and Israel.

Production: From the cultivation (of plants) in Mexico and in South America. Liquid Jojoba wax is a clear, light yellow, oily liquid, that is extracted from the seeds of *Simmondsia chinensis*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Liquid wax esters: esters in position 9-10 simple unsaturated C20- and C22-fatty acids, chiefly gadolenic acid (20:1(9), make up 70% of the fatty acids) with the corresponding alcohols, chiefly eicosanol (20:1 (9)-OH) and docosenol (22:1 (9) OH)

EFFECTS

Active agents are the simple unsaturated C20/22 - fatty acids and alcohol.

Jojoba oil has a robust and stable constitution. It is used in skin care products as a carrier (substance) for oxidation sensitive substances (Vitamin A).

INDICATIONS AND USAGE

Skin care - cosmetics

%

ft

A

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper external administration of designated therapeutic dosages. Jojoba wax is not suitable for internal use.

DOSAGE

Mode of Administration: In ointments and creams as a medium (or vehicle) for oxidation sensitive substances.

Jujube (Da-Zao)

Zyzyphus jujube

DESCRIPTION

Medicinal Parts: The medicinal part is the fruit. The Jujube berry is classed with raisins, dates and figs, and can be eaten fresh or dried.

Flower and Fruit: The flowers are small, pale yellow and solitary. The fruit is of variable size, depending on the origin, but is usually up to 3 cm long and 1.5 cm in diameter. The fruit is red, smooth and shiny when fresh, brownish-red and grooved when dried. It is pulpy and contains 1 or 2 acute, oblong seeds.

Characteristics: The taste of the fruit is sweet and mucilaginous.

Habitat: The plant grows in southern Europe, Africa, Middle East and the Far East.

Production: Jujube berries are the fruit of *Zyzyphus jujube*; *Zyzyphus vulgaris* is also used.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Triterpene saponins: zyzyphus saponins I, II and HI, jujuboside-B, in the seeds jujuboside-A and -B, aglycone jujubogenine

Mucilage

Tannins (10%)

Flavonoids: including among others naringenin-6,8-di-C-glucosides, in the seeds spinosin (C-glycoflavone)

Isoquinoline alkaloids: oxonuciferin, normuciferin

Peptide alkaloids: daechucyclopeptide, daechualkaloid-A

Triterpenes: betulonic acid, betulonic acid, maslinic acid, aliphatic acid and oleanolic acid

Hydroxycoumarins

Sugars: including among others saccharose, glucose, fructose, galactose

Fruit acids: including among others malic acid, tartaric acid

EFFECTS

Jujube is emollient, anti-allergenic and sedative. *Zyzyphus vulgaris* also has a hypotensive effect.

INDICATIONS AND USAGE

Unproven Uses: Jujube is used as a nutrient and tonic. It is also used as a prophylactic against liver disease and stress ulcers.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Juniper

Juniperus communis

TRADE NAMES

Juniper (available from numerous manufacturers and as combination product), Juniper Berry, Euro Quality Juniper Berries

DESCRIPTION

Medicinal Parts: The medicinal parts are the essential oil from the berry cones; the ripe, dried berry cones; the ripe fresh berry cones; the fresh or dried pseudo fruit or berry; and the ripe berry.

Flower and Fruit: The plant is usually dioecious, occasionally monoecious and occasionally bears androgynous flowers. The yellowish male flowers are in elliptical catkins consisting of numerous stamens in 3-segmented whorls in the leaf axils of young shoots. The greenish female flowers are almost ovoid and consist of 3 carpels. The carpels become fleshy and in the second year when ripe form pea-sized, globular, and dark-brown to violet, blue-frosted juniper berries. The berries ripen for 2 or 3 years so that blue (ripe) and green (unripe) berries are found on the same tree. The seeds are light brown, oblong-triangular. They are somewhat warty between the edges and have a hard shell.

Leaves, Stem and Root: *Juniperus communis* is a tree or shrub found in varying forms from 2 to 10 m in height. The bark is smooth and yellow-brown at first, later fissured, gray-black and peeling. The buds are covered in scale-like needles, which can be distinguished from the foliage needles by their length. The leaves are needles in whorls of 3 spreading from the branchlets. They are evergreen, stiff, pointed, prickly and sea green. The outer and inner membranes have thickened cell walls.

Characteristics: The berries have a tangy smell. The taste is tangy-sweet, then resinous and bitter.

Habitat: Europe, northern Africa, north Asia and North America.

Production: Juniper Berry is the ripe, fresh or dried spherical ovulate cone (berry) of *Juniper communis* as well as its preparations. The ripe berries are harvested from the end of August to the middle of September and then dried at room temperature and sorted.

Other Names: Juniper Berry, Ginepro, Enebro

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1-2%); make-up is very dependent upon the source of the drug, chief components monoterpene hydrocarbons, for example alpha-pinene, beta-myrcene, gamma-murolen, sabinene, additionally including among others limonene, beta-elemene, beta-caryophyllene, beta-pinene, gamma-cadinene, terpinene-4-ol

Diterpenes

Catechin tannins

Flavonoids

Monosaccharides: inverted sugar (20 to 30%)

Oligomeric proanthocyanidins

EFFECTS

The diuretic effect is attributed to the essential oil content. The drug works to lower blood pressure and as an antidiabetic. In animal experiments a hypotensive, antidiabetic and antiexudative effect was proven. In vitro, an antiviral effect was also demonstrated.

In older studies a spasmogenic, expectorant and bronchospasmolytic effect has been described, for which there are no new data.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints

Unproven Uses: Juniper is used externally for rheumatic symptoms (as a bath additive). In folk medicine it is used internally to regulate menstruation and to relieve menstrual pain, flushing out therapy for inflammatory diseases of the lower urinary tract, gout, arteriosclerosis, for severe irritation resulting from bronchitis and diabetes (ground juniper berries). It is often chewed for halitosis.

Homeopathic Uses: *Juniperus communis* is used for discharge disturbances of the efferent urinary tract and dyspeptic complaints.

CONTRAINDICATIONS

Contraindications for internal administration include pregnancy and inflammatory renal diseases.

PRECAUTIONS AND ADVERSE REACTIONS

4ft General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Long-term internal administration or overdosage can bring about kidney irritation and kidney damage. External administration for large skin wounds, acute skin diseases, feverish diseases, cardiac insufficiency or hypertonia should only take place under the supervision of a doctor.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Whole, crushed or powdered drug for infusions and decoctions, alcohol extracts, and in wine. Essential oil is used for oral application in liquid and solid medicinal forms. Combinations with other plant drugs in bladder and kidney teas and similar preparations may be useful. Juniper berry is also used as bath salts in the treatment of rheumatism.

m

[^] *How Supplied:*

Capsules — 515 mg

Liquid — 1:1

Oil — 100%

Daily Dosage: The daily dose is 2 to 10 gm of the drug, corresponding to 20 to 100 mg of the essential oil. The duration of use should be limited to a maximum of 6 weeks. A 1:20 dilution infusion (0.5 gm in 1 teacup) may be taken 3 times daily. Tincture (1:5): 1 to 2 ml 3 times daily. Liquid extract: 2 to 4 ml 3 times daily.

For diabetes: 10 freshly ground berries to taken daily with water for 15 days; repeat after a month's break from treatment.

Homeopathic Uses: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once daily (HAB1).

#

Storage: Juniper should be protected from light.

Kamala

Mallotus philippinensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the glands and hairs covering the fruit.

Flower and Fruit: The tree has dioecious flowers. The male flowers are in threes in the axils of the bracts, while the female flowers are on longer, heavily branched, lateral boughs. Both flowers are covered by rust-red matted hairs. The fruit is a 3-lobed, pea-sized capsule from which a red, mealy powder is obtained, which consists of minute glands and hairs.

Leaves, Stem and Root: *Mallotus philippinensis* is an 8 to 10 m high tree with a diameter of 90 to 120 cm. The bark of the slender branches is pale, and the younger ones are covered in rust-red matted hairs. The leaves are alternate and have articulate petioles, which are 2.5 to 5 cm long. The leaf blade is rusty tomentose, 8 to 15 cm long, ovate with two inconspicuous basal glands. It is entire-margined, coriaceous and glabrous above with very prominent ribs below.

Habitat: The plant is indigenous to India, Ethiopia, Saudi Arabia, China and Australia.

Production: Kamala fruit skins are from the fruits of *Mallotus philippinensis*, covered in hairs and glands. The fruit is collected in the uncultivated regions and cleaned.

Other Names: Kameela, Kamcela, Spoonwood, Rottlera Tinctoria

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Phloroglucinol derivatives (red to yellow, 47 to 80%): chief constituents include rottlerin (ca. 1%), isorottlerin (ca. 0.1%), 3-hydroxy rottlerin, 3,4-dihydroxyrottlerin, methylene-bis-methyl phloroacetophenone and their resinous polymers, that arise through auto-oxidation

Bergenin

Tannins

EFFECTS

The drug has an anthelmintic and purgative effect.

INDICATIONS AND USAGE

Indian Medicine: Internally, Kamala is used to treat tape worm infestations (ascarides, rectal worms), constipation, kidney and bladder stones, leprosy lesions and as a contraceptive; externally for parasitic skin diseases and wound infections of the ear.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used orally as a powder or liquid extract.

Daily Dosage: For worms: adults: 6 to 12 gm drug in 2 to 3 portions at 30 minute intervals; young children: 1.5 gm drug; school children: 3 gm drug. Preparations can be sweetened with honey prior to administration.

Storage: Keep tightly sealed, dry and protected from light

Kava Kava

Piper methysticum

TRADE NAMES

Kava Kava (available from numerous manufacturers) Alcohol Free Kava Kava, Kava Kava Power, Kava Kava Premium, Kava Kava Root

DESCRIPTION

Medicinal Parts: The medicinal parts are the peeled, dried, cut rhizome, which has normally been freed from the roots, and the fresh rhizome with the roots.

Flower and Fruit: The plant has numerous small flowers in spike-like inflorescences 3 to 9 cm long.

Leaves, Stem and Root: The plant is a 2 to 3 m high, erect dioecious bush. The leaves are very large, measuring 13 to 28 cm by 10 to 22 cm. They have a deeply cordate base and 9 to 13 main ribs that are slightly soft on the undersurface. The stipules are large. The plant has a massive, 2 to 10 kg, branched and very juicy rhizome with many roots. They are blackish-gray on the outside and whitish on the inside. The fracture is mealy and somewhat splintery. The central portion is porous with irregularly twisted thin woody bundles, separated by broad medullary rays, forming meshes beneath the bark.

Characteristics: The taste is pungent and numbing, and the odor is reminiscent of lilac.

Habitat: The plant is indigenous to the South Sea Islands and is mainly cultivated there.

Production: Kava Kava rhizome consists of the dried rhizomes of *Piper methysticum*.

Other Names: Ava, Ava Pepper, Intoxicating Pepper, Kawa, Kawa Pepper, Tonga, Kew

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Kava lactones (kava pyrones, 5-12%): chief components include (+)-kavain, dihydrokavain (marindinine), (+)-methysticin, dihydromethysticin, yangonine, desmethoxy-yangonin

Chalcones: including flavokavin A and B

EFFECTS

The kava pyrones in the drug have centrally muscle-relaxing, anticonvulsive and antispasmodic effects. The herb also contains hypnotic/sedative, analgesic and psychotropic properties contributing to its use for anxiety and insomnia.

The centrally muscle-relaxing, analgesic and anticonvulsive action of the kava pyrones, kavain, dihydrokavain, dihydromethysticin and (+/-) kavain (synthetic kava pyrone) is

attributed to the interaction with ion channels. The interaction consists of fast and specific inhibition of voltage-dependent sodium channels and reduction of currents through voltage-activated sodium and calcium channels (Friese, 1998; Gleitz, 1995; Gleitz, 1996; Schirmmacher, 1999). The paralysis effect of Kava on neuromuscular transmission and muscle contractility is similar to that of local anesthetics (Jameison, 1989; Singh, 1983). The lipid soluble extract (kava resin) decreases spontaneous motility and motor control (Jamieson, 1989).

The analgesic action of kavain, dihydrokavain, methysticin and dihydromethysticin is due to antinociceptive activities. Nalaxone (opiate antagonist) is ineffective in reversing the antinociceptive activities, thus indicating the analgesia produced from the compounds occurs via non-opiate pathways (Jameison, 1990; Jameison, 1989).

The lipid soluble components of kava do not interact with benzodiazepine binding sites, but do seem to potentiate the activity of GABA-A in the brain center for sedative effects (Davies, 1992; Jussofie, 1994). The psychotropic properties of Kava have been demonstrated by the inhibition of norepinephrine uptake by kavain, dihydromethysticin and the racemate (+/-) kavain (Seitz, 1997). One study did find that desmethoxyyangonin, methysticin, yangonin, dihydromethysticin, dihydrokavain and kavain reversibly inhibit MAO-B (Uebelhack, 1998). An increase of dopamine and serotonin by activation of neurons results in central nervous system effects (Fachinfo Antares 120(R), 1996).

A recent study investigated the antithrombotic activity of kava pyrones. Kavain exerts antithrombotic action on human platelets through the inhibition of cyclooxygenase (COX) as a primary target. This suppresses the generation of thromboxane (TXA₂), which normally induces aggregation of platelets and exocytosis of ATP by its binding on TXA₂ receptors (Gleitz, 1997).

CLINICAL TRIALS

A randomized, double-blind, placebo-controlled study was conducted with 101 outpatients suffering from anxiety of non-psychotic origin who met DSM-IV-R criteria. Improvements in anxiety were seen after week 8 with a standardized Kava Kava extract (70% kava-pyrene). The study continued over a 25-week period with significant improvement based upon the Hamilton Anxiety Scale (HAMA), somatic and psychic anxiety, Clinical Global Impression, Self-Report Symptom Inventory and Adjective Mood Scale (Volz, 1997).

The anxiolytic effect of a special kava extract (70 mg of kava pyrones three times daily) was compared to two benzodiazepine preparations (oxazepam 15mg/day, bromazepam). The multi-center, double-blind study involved 172 patients. There was a therapeutically relevant reduction in the severity

of anxiety according to the HAMA scale in all three groups. There wasn't a statistically significant difference between the three types of treatment in terms of reducing anxiety (Woelk, 1993).

A standardized Kava extract give'n 100 mg three times daily was compared to placebo in a randomized, double-blind study. The study included 58 patients with anxiety syndromes not caused by mental disorders. The HAMA overall score of anxiety symptoms revealed significant reduction in the Kava treatment group compared to placebo after 1 week of therapy. After 4 weeks of therapy, an even greater reduction in anxiety symptoms was seen with the Kava treatment group, with no adverse reactions (Lehmann, 1996).

INDICATIONS AND USAGE

- Nervousness and insomnia

Kava Kava is used for nervous tension, stress and agitation.

Unproven Uses: In folk medicine, the herb is used as a sleeping agent and sedative; for asthma, rheumatism, dyspeptic symptoms, chronic cystitis, syphilis, gonorrhea and weight reduction.

Homeopathic Uses: Kava Kava is used for states of excitement and exhaustion. It is also used for gastritis and pain in the urethra.

CONTRAINDICATIONS

The drug is contraindicated in patients with endogenous depression because it increases the danger of suicide. It is also contraindicated during pregnancy and in nursing mothers. The herb is contraindicated in persons with endogenous depression, because there is an increased risk of suicide in this population.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Administration of the herb leads to rare cases of allergic reactions and gastrointestinal complaints. Slight morning tiredness can appear at the beginning of the therapy. Motor reflexes and judgment when driving may be reduced while taking the herb.

Central Nervous System: Dyskinesia and choreoathetosis of the limbs, trunk, neck and facial musculature have been reported secondary to the administration of kava (Schelosky, 1995; Spillane, 1997).

Endocrine: Following long-term use of high doses of Kava extract, weight loss was reported (Mathews, 1988).

Hepatotoxicity: Increase in gamma-glutamyl transferase (GGT) levels have been associated with high doses of Kava extract (Mathews, 1988). Two cases of acute hepatitis with an increase of liver enzymes were reported. Necrotizing

hepatitis was determined after a liver biopsy, and upon discontinuation of Kava, liver tests normalized (Stahl, 1998).

Musculoskeletal: Minor inhibition of movement and impaired motor reflexes have been observed with the use of Kava (Jamieson, 1990).

Ocular: Increase in pupil diameter, reduction of the near point of accommodation and near point of convergence, and disturbance to the oculomotor balance have been reported with Kava (Garner, 1985). Eye irritation has been reported with the heavy consumption of Kava (Ruze, 1990).

Skin: Heavy chronic consumption of Kava is associated with a peculiar, scaly rash suggestive of ichthyosis (Ruze, 1990). A reversible, slight yellowing of the skin has been associated with long-term use of Kava. Sebotropic drug reactions resulting from Kava-Kava extract therapy has been reported (Jappe, 1998).

The drug should not be taken for longer than three months without a doctor's supervision.

Drug Interactions:

Alcohol — Concomitant use of Kava Kava with alcohol results in an increase in each other's hypnotic action. The alcohol also increases the possibility for kava toxicity (Jamieson, 1990).

Alprazolam — Kava used simultaneously with alprazolam has resulted in coma (Almeida, 1996).

CNS depressants, such as barbituates — The herb may potentiate the effectiveness of substances that act on the central nervous system.

Psychoactive agents — The intensity of psychoactive agents may be intensified with kava (Jamieson, 1990).

Dopamine — Kava Kava has been reported to antagonize the effect of dopamine. Patients with Parkinson's Disease taking levodopa should avoid the use of the herb (Baum, 1998; Cupp, 1999; Schelosky, 1995).

Pregnancy: The drug is contraindicated during pregnancy.

Nursing Mothers: The drug is contraindicated in nursing mothers.

OVERDOSAGE

Overdosage can result in disorders of complex movement, accompanied by undisturbed consciousness, later tiredness and tendency to sleep.

DOSAGE

Mode of Administration: Comminuted rhizome and other galenic preparations for oral use.

How Supplied:

Capsules — 100 mg, 125 mg, 128 mg, 150 mg, 250 mg, 390 mg, 400 mg, 425 mg, 455 mg, 500 mg

Liquid — 1:1, 1:2

Preparation: There are a number of different extraction recipes depending on the pharmaceutical companies.

Daily Dosage:

Capsules — The root extract is taken 150 mg to 300 mg twice daily, with a daily dosage of kava pyrones 50 to 240 mg (Herberg, 1996; Lehmann, 1996).

Tincture — The tincture is taken as 30 drops with water three times daily (Chavallier, 1996).

Infusion — Take 1/2 cup twice daily (Chavallier, 1996).

Note: The drug should be administered with food or liquid due to its lipid solubility (Fachinfo Antares 120 (R). 1996). The activity of the herb is enhanced when mixtures of the kava pyrones are taken instead of a single pyrone (Jamieson, 1989).

Homeopathic Dosage: The herb is taken as 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily, or 1 ml injection solution sc twice weekly (HAB1).

Storage: The herb should be stored away from direct light, moisture and heat at room temperature.

Kelp

Laminaria hyperborea

DESCRIPTION

Medicinal Parts: The medicinal part is the stem-like part of the thallus.

Flower and Fruit: The plant fits the general description of brown algae. It is unsegmented to heavily segmented and can

grow into plants many meters in length. The thallus is reminiscent of root, leaf or stem-like organs (in the case of *L. hyperborea* stem-like). The color is greenish-brown to reddish.

Habitat: The plant grows on the North Atlantic coast.

Production: Kelp consists of the dried, stem-like parts of the thallus of *Laminaria hyperborea* (syn. *Laminaria cloustonii*).

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Salts of alginic acid (laminaric acid, 25%)

Iodine (to some extent organically bound, 0.3-0.45%)

Reserve carbohydrates: laminarin (47%), mannitol (5-6%), fucoidin, mannitol glucoside

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Preparations of kelp are used for the regulation of thyroid function.

PRECAUTIONS AND ADVERSE REACTIONS

- t No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The danger of induction or worsening of hyperthyroidism following internal administration of the drug exists with dosages above 150 µg iodide per day. In rare cases, it can lead to severe allergic reactions.

DOSAGE

No information is available.

Khat

Catha edulis

DESCRIPTION

Medicinal Parts: The medicinal parts of the tree are the leaves.

Flower and Fruit: The inflorescence is a cyme growing from the leaf axil. The flowers are radial and inconspicuous, with a fleshy disk and their structures are in fives. The calyx is 5-lobed and there are 5 elongate-oval, white-yellowish petals, 5 stamens, and 3 blunt stigmas. The fruit is 3-sided capsule with chamber containing 1, occasionally 2, seeds. The brownish seeds have a wing-like, whitish aril.

Leaves: Khat is an evergreen shrub or tree that reaches about 2 to 25 m high. The leaves are opposite on flowering branches. They are alternate, coriaceous, 3 to 12 cm long, oval to ovate and crenate or dentate. The upper surface of the leaves is wax-like glossy and olive green. The older leaves are occasionally red-violet.

Habitat: Ethiopia, Kenya, North Yemen, and northern Madagascar

Production: Khat or Arabian tea is the fresh leaves or shoots of *Catha edulis*. The leaves are harvested in the early morning, 5 to 8 years after planting. They are kept in banana * leaves, paper or plastic to prevent it drying out.

Other Names: Abyssinian Tea, Arabian Tea, Somali Tea

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Phenyl alkyl amines (0.3 to 0.9%): khatamine, in fresh leaves as chief effective agent (S)-(-)-cathinone (50% in young leaves, in fully-developed leaves only 2%), becoming dimers during dehydration, as well as (+)-norpseudoephed-

rine (cathine), (-)-norephedrine, merucathinone, pseudomerucathinone, (-)-formyl norephedrine

Sesquiterpene polyester alkaloids: cathaedulines K1 to K15

- *Catechin tannins*

Volatile oil

EFFECTS

The alkaloid-containing drug (chief active ingredient cathinone) is centrally stimulating and indirectly sympathomimetic (amphetamine-like effect). In addition, the leaf preparations have ulcer-protective and insecticidal effects, and the drug's high tannin content makes it constipating.

INDICATIONS AND USAGE

Unproven Uses: Khat has been used for centuries in Islamic culture to improve communicative abilities, performance and to suppress feelings of hunger. The leaves can be chewed or administered as an infusion (Yemen) or paste (Ethiopia/Somalia). Khat leaves are said to have an aphrodisiac effect and are used for depression, headache, gonorrhea, gastric complaints, coughs, asthma and fever.

The medicinal use of Khat preparations is obsolete today.

PRECAUTIONS AND ADVERSE REACTIONS

The fresh shoot tips may lead to central excitation, suppression of appetite, widening of the pupils, increased motor activity, hypertonia and hyperthermia through the sympathomimetic effect of cathinone (the other constituents account for only approximately 10% of the effect) and its ability to bypass the blood-brain barrier. Moderate dosages (100 to 300 g of the fresh leaves) lead to a state of general well being, mental alertness and exaggerated self-regard. Physical ability is temporarily enhanced and the need for sleep is reduced. Depression and anxiety states can follow once the effect wears off. Diabetics could experience hyperglycemia. The tannin content of the drug leads to constipation and digestive disorders. Acute poisonings have not been recorded.

Chronic use can lead to such long-term ill effects as emaciation (through appetite suppression), increased susceptibility to infection, nervousness, insomnia and disturbances of the circadian rhythm. In addition, Khat preparations have been associated with ulcers in the digestive tract and liver and kidney damage. When the drug is used over periods of years, it can lead to personality disorders.

DOSAGE

Mode of Administration: Available as whole herb and powdered drug

Storage: Can be kept for several months deep-frozen

See Field Scabious

Knotweed

Polygonum aviculare

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb, sometimes with the root, collected during the flowering season and dried, as well as the fresh aerial parts collected during the flowering season.

Flower and Fruit: The inflorescences are axillary cymes with 1 or a few flowers. The flowers are very small, short-pedicled, inconspicuous and green or red with white margins. The epicalyx has 5 bracts and is fused at the base. There are 5 stamens, and the superior ovary has 3 styles. The fruit is a nut, which is as long as the epicalyx and is matte brown with wrinkled stripes, ovate to almost elliptical and flattened on 3 sides.

Leaves, Stem and Root: The plant is a sturdy annual. The main stem is initially erect, up to 1 m high and heavily branched. It later becomes closely procumbent and spreads along the ground. The leaves are alternate, entire-margined, short-petioled with varying forms on the main and side shoots. They are broadly elliptical to linear-lanceolate, acute or obtuse. At the base of the leaves there is a scarious divided leaf sheath. The thin, fusiform, brownish roots produce a few hair-thin lateral roots.

Characteristics: The appearance depends on the location. It may also have an ascending stem.

Habitat: The plant is found in most temperate regions of the world.

Production: Knotweed herb consists of the dried herb, occasionally containing roots, of *Polygonum aviculare*, gathered during flowering season.

Other Names: Allseed Nine-Joints, Armstrong, Beggarweed, Bird's Tongue, Birdweed, Centinode, Cow Grass, Crawlgrass, Doorweed, Hogweed, Knotgrass, Ninety-Knot, Pig-rush, Pigweed, Red Robin, Sparrow Tongue, Swine's Grass, Swynel Grass

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids (0.1-1%): chief components are avicularin (quercetin-3-arabinoside), hyperoside, quercitrin, quercetin-3-galactoside, additionally including among others vitexin, isovitexin, rhamnazine bisulphate

Silicic acid (1%): partially water-soluble

Tannins

Hydroxycoumarins: umbelliferone, scopoletin

Lignans: aviculin

EFFECTS

Knotweed has astringent properties. In vitro, the flavonoid fraction is said to inhibit aggregation of human erythrocytes, probably by an effect on cyclo-oxygenase.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

- Inflammation of the mouth and pharynx

The herb is used as a mild catarrh of the respiratory tract for inflammatory changes to the oral and pharyngeal mucosa.

Unproven Uses: In folk medicine iris used as a supportive treatment for pulmonary disorders, as a perspiration inhibitor in cases of tuberculosis, as a diuretic, as a hemostatic in cases of hemorrhage and for skin disorders.

Chinese Medicine: In China, Knotweed is used for gonorrhoea, jaundice, skin defects, dysentery (red), itching and tapeworm in children.

Homeopathic Uses: In homeopathy, *Polygonum aviculare* is used for rheumatism of the fingers.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As a ground herb for teas and other galenic preparations for internal use and local application. The drug is a component of various pectoral and bronchial teas. The extract is found in standardized preparations of antitussives and diuretics.

Preparation: To make a tea, place 1.5 gm finely cut drug in cold water and bring to a simmer. Strain after 5 to 10 minutes (1 teaspoonful = 1.4 gm drug).

Daily Dosage: The daily dosage is 4 to 6 gm of drug.

Tea—As a supportive treatment for coughs and bronchial catarrh, drink 1 cup 3 to 5 times a day.

Infusion for external use—The daily dose is 5 g drug.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB34)

Kombe Seed

Strophanthus hispidus

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the ripe seed.

Flower and Fruit: The inflorescence is a many-blossomed, umbelliferous raceme. The flowers are radial and their structures are in fives. The sepals are 1.3 to 1 cm long and 0.1 to 1 cm wide. They are unevenly divided into five, the outer tips ovate, the inner ones lanceolate and densely pubescent. The corolla is tubular, with the upper part broadened into a cup shape. The margin is covered with 10 scales, 1.1 to 2 cm long with a diameter of 0.8 to 1.7 cm. The margin is white or yellow, with a purple spot in the shaft. There are 5 stamens and a 2-chambered, semi-inferior ovary. The fruit is a follicle, 24 to 48 cm long, 1.3 to 1.8 cm in diameter, dark brown, hard, grooved and white punctate with lenticles. The seeds are spindle-shaped, flat, 1 to 1.8 cm long, 2 to 3 mm wide, densely pubescent with an upright, 4 to 8 cm long tuft of hair.

Leaves, Stem and Root: *Strophanthus hispidus* is either a liana, up to 100 m long, or a shrub, up to 5 m high. The leaves are opposite. The petiole is 1 to 5 mm long, the lamina 15 to 22 cm long and 8 to 12 cm wide. They are simple, elliptical to obovate, acuminate, rounded at the base or cordate. The trunk has a diameter of up to 6 m and has dark gray bark. The branches are dark brown or almost black. The young branches are stiffly villous and punctate with lenticles.

Characteristics: The plant contains latex.

Habitat: West and Central Africa

Production: Brown *Strophanthus* seeds are the ripe seeds of *Strophanthus hispidus* freed from the bushel-like appendage. The seeds are first harvested after 3 years (first flowering). Then the fruit is picked, and the seeds are removed.

Not to be Confused With: Often confused in the past with *Strophanthus kombe*, *S. sarmentosus* and other *Strophanthus* species. Can also be confused with *Alafia*, *Futumia*, *Kickxia* and *Holrrhena* species.

Other Names: Arrow Poison

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolids, 4 to 8%): chief glycoside presumably k-strophanthoside (primary glycoside, strophanthidin glucosyl cymaroside) from which cymarin (strophanthidin cymaroside) is formed through fermentation of the seeds

Saponins (0.2%)

Fatty oil (30%): chief fatty acids oleic acid, linoleic acid, palmitic acid and 9-hydroxy-delta²-octadecenoic acid

EFFECTS

The action mechanism of the drug is dependent upon the cardioactive cardenolide glycosides it contains (see *S. kombe* semen and strophanthine effects).

INDICATIONS AND USAGE

Unproven Uses: Preparations of the herb have been used in the past for cardiac complaints.

Homeopathic Uses: In homeopathy, preparations are used for nervous cardiac complaints and cardiac insufficiency.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

Drug Interactions: The simultaneous administration of quinidine, calcium salts, saluretics, laxatives and glucocorticoids enhance effects and side effects. For symptoms of an acute poisoning and treatment, see *Digitalis folium*.

OVERDOSAGE

Nausea, vomiting, headache, stupor and cardiac arrhythmias could occur as side effects with parenteral administration of glycoside mixtures of the drug, particularly with overdoses.

DOSAGE

Mode of Administration: Communitied drug, herb powder, liquid preparations for internal use.

Homeopathic Dosage: (from D4) 5 drops, 1 tablet, 10 globules every to 30 to 60 minutes, maximum 12 times daily (acute) and 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, IV, IM, 3 times daily (acute) and once a day (chronic) (HPUS88).

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994

Koussou

Hagenia abyssinica

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, the unripe fruit and the dried panicles of female flowers.

Flower and Fruit: The small flowers are large-branched, thickly glandular-haired panicles up to 0.5 m long. They are androgynous, male or female. The male flowers are greenish

and have fertile stamens and hairy bracts. The female flowers are dark-red.

Leaves, Stem and Root: Hagenia abyssinica is tree that grows up to 6 m high with tuft-like, erect, pinnatifid leaves.

Habitat: The plant is indigenous to northeast Africa and is cultivated in Ethiopia.

Production: Koussou flowers are the flowers of Hagenia abyssinica.

Other Names: Cossoo, Kooso. Kosso

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Acylphloroglucinols (kosotoxine): monomelic, dimeric, trimeric compounds, such as protocosin (trimeric); acyl residues are isobutyryl- isovaleryl- and alpha-methylbutyryl residues; representatives include, for example, cosin K6 and cosin K8 (monomeric), cusso toxin (dimerous), protocosin (trimerous)

Tannins

EFFECTS

Koussou is a vermifuge because of its complex mixture of aglyphloroglucinols, which has a taeiafugic effect. An antitumoral effect has also been described

INDICATIONS AND USAGE

Unproven Uses: This obsolete drug, which can no longer be procured, formerly was used to treat tapeworm infestation. Its efficacy depended on the composition of the drug.

PRECAUTIONS AND ADVERSE REACTIONS

Side effects include irritation of the gastrointestinal tract, salivation, nausea and diarrhea. A tendency toward fainting spells, headache and general weakness has been connected with the use of the drug during use as a tapeworm cure. Abortive effects have been described. The drug should no longer be administered in allopathic dosages.

OVERDOSAGE

Conditions of collapse and vision disorders have been observed with overdoses. The treatment for poisoning consists of gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), installation of activated charcoal and shock prophylaxis (quiet, warmth). Diazepam (intravenous) should be used to treat spasms. Atropine and electrolyte substitution should be employed. Possible cases of acidosis should be countered with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be administered. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: The drug is obsolete in most countries.

Labrador Tea

Ledum latifolium

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and the flowering shoots.

Flower and Fruit: The flowers are in flat, terminal umbels. The calyx is small and has 5 tips. The 5-petalled corolla is white. The 10 stamens grow from the edge of a honey ring. The ovary is superior. The fruit is a 5-valvular capsule.

Leaves, Stem and Root: The evergreen, branched shrub grows to about 1.5 m. The young branches are gray or rust-colored. The 1.25 to 2.5 cm long leaves are alternate, short-petioled, entire-margined, and linear, have revolute margins,

and are stiff, coriaceous, dark green above, rust-colored and woolly-downy underneath. *L. palustre* is larger, more regularly formed and has larger leaves.

Characteristics: It has a numbing, tangy aroma and is poisonous. It is a protected species.

Habitat: The plant grows in Greenland, Canada and the U.S. The very similar variety *L. palustre* is more common in northern Europe and northern Asia.

Production: Labrador herb is the aerial part of *Ledum latifolium* and *L. palustre*.

Other Names: St. James's Tea, Marsh Tea, Wild Rosemary

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.9-2.6%): chief components sesquiterpenes, in particular ledol (ledum camphor, porst camphor) and palustrol, Japanese sources also yield ascaridol

Catechin tannins

Flavonoids: including among others hyperoside

Hydroglycosides: arbutin

EFFECTS

Internally mildly expectorant. Externally antiphlogistic (neither proven).

INDICATIONS AND USAGE

Unproven Uses: Labrador Tea has been used for respiratory conditions. Externally, it has been used for skin inflammation.

CONTRAINDICATIONS

The drug is contraindicated in pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: Initially, the drug causes severe gastrointestinal irritation (vomiting, gastroenteritis, diarrhea), due to its ledol content. Following absorption, the drug causes severe CNS excitation. This effect may lead to spasms and paralysis in some cases.

Pregnancy: Contraindicated. Poisonings in earlier times were seen in connection with its misuse for purposes of abortion.

OVERDOSAGE

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), and instillation of activated charcoal, the treatment of poisonings consists of treating spasms with diazepam (I.V.) and colic with atropine; electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. Monitoring of kidney

function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Labrador Tea is obsolete as a drug. It has been used as an extract in some bath additives and is also contained in homeopathic preparations.

Laburnum

Cytisus laburnum

DESCRIPTION

Medicinal Parts: The seeds are the medicinal parts.

Flower and Fruit: The flowers bow down in clusters of 10 to 30. There are 10 to 25 cm long racemes. The calyx is short, campanulate, pubescent and marked brown at the base. The anthers are orange. The pod is 5 to 8 cm by 8 to 9 cm, flat, lumpy and silky-haired with wings. The seeds are flat and dark brown.

Leaves, Stem and Root: *Cytisus laburnum* is a small shrub or tree that can occasionally grow up to 7 m high. It has light gray branches and smooth, dark green, initially erect branchlets. The alternate leaves are almost in rosettes on short shoots with 2 to 7 cm long petioles. The leaflets are elliptical to ovate, rounded or thorn tipped. They are glabrous above and light gray pubescent beneath.

Habitat: The plant is indigenous to mountainous regions of Europe. It is also cultivated worldwide.

Other Names: Golden Chain, Pea Tree, Bean Trifol

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Quinolizidine alkaloids (1-3%): main alkaloids (-)-cytisine (95%), as well as (-)-N-methylcytisine, epibaptifoline

Lectins

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Experiments in the use of cytisine as a pesticide (lice) have shown that in the necessary concentration the danger of poisoning is too high.

PRECAUTIONS AND ADVERSE REACTIONS

There are no indications for this drug. The drug is severely toxic. See Overdosage section.

OVERDOSAGE

Symptoms of poisoning include nausea, dizziness, salivation, pains in the mouth, in the throat and in the stomach area, outbreaks of sweat, headache as well as extended, severe, and sometimes bloody vomiting. If no vomiting occurs, excitatory states can come about from the centrally stimulating effect of the drug, with tonic-clonic spasms that later change over into paralyses. Anuria and uremia have also been observed. Death comes through asphyxiation.

Fifteen to 20 seeds or 3 to 4 unripe berries are considered fatal for an adult. While poisonings occur relatively frequently, cases of death have not been recorded in recent times. If no vomiting has occurred, poisonings are treated with gastric lavage, then through the administration of activated charcoal; spasms are to be treated with chlorpromazine or diazepam. In cases of asphyxiation, intubation and oxygen respiration are to be carried out.

Lactuca virosa

See *Lactucarium*

Lactucarium

Lactuca virosa

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried latex and the leaves.

Flower and Fruit: The composite flowers are in pyramid-shaped panicles. The capitula have a few florets. They are androgynous, pale yellow, lingual florets. The bracts are imbricate. The fruit is 4-lipped and black with a broad edge. It is glabrous at the tip. It has a whitish beak that is as long as the fruit, making the hair tuft look stemmed.

Leaves, Stem and Root: The plant is biennial, up to 1.2 m high, with a fusiform, pale root that produces the erect, branched and hollow stem. It is smooth, light green and sometimes has purple spots. The leaves are oblong to obovate, narrowed at the base, clasping and usually simple. They are thorny-tipped, lie horizontally and are thorny on the underside of the midrib.

Characteristics: The whole plant contains milky latex.

Habitat: The plant is indigenous to western and southern Europe and is cultivated in Germany, Austria, France and Scotland.

Production: Lactucarium leaves are the leaves of the aerial part of *Lactuca virosa*. They are gathered when in flower and then dried.

Not to be Confused With: *L. sativa*, *L. serriola*, *L. quercina* and *Sonchus oleraceus*.

Other Names: Prickly Lettuce, Strong-Scented Lettuce, Green Endive, Lettuce Opium, Acrid Lettuce, Poison Lettuce, Wild Lettuce

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpene lactones: lactucin, lactucopicrin (lactupictin, intybin)

Triterpenes: including among others, taraxasterol, beta-amyrin

EFFECTS

The herb is supposed to have a narcotic effect. It is an analgesic and spasmolytic, and is said to act as a tranquilizer.

INDICATIONS AND USAGE

Unproven Uses: Medicines containing Lactucarium are used to treat whooping cough attacks. The drug is used for bronchial catarrh, asthma and urinary tract diseases. The oil of the seeds is used for arteriosclerosis and was also used as wheat germ oil.

Homeopathic Uses: Lactuca virosa is used for laryngitis, tracheitis with heavy coughing, for swelling of the liver and for urinary complaints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a low potential for sensitization.

OVERDOSAGE

The following signs of poisoning can occur through overdosage or following intake of the fresh leaves, as in salads: outbreaks of sweating, acceleration of breathing, tachycardia, pupil dilation, dizziness, ringing in the ears, vision disorders, pressure in the head, somnolence, on occasion also excitatory states. The toxicity is, however, relatively low. Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), as well as instillation of activated charcoal, the treatment of poisonings should proceed symptomatically.

DOSAGE

Mode of Administration: Due to its poison content, the drug is only administered under medical supervision. It is ground and used as an alcoholic extract and further processed in the pharmaceutical industry.

Lady Fern

Athyrium filix-femina

DESCRIPTION

Medicinal Parts: The medicinal part is the rhizome when gathered in spring or autumn.

Leaves, Stem and Root: *Athyrium filix-femina* is a 10- to 40-cm high fern. The pencil-thick, creeping rhizome is densely covered with dark-brown hairs. Numerous tomentose, long, branched, dark-brown root fibers sprout from the rhizome. The not-so-numerous leaves are in rigid, upright, double rows. They are coriaceous, glabrous, oblong-lanceolate or oblong, deeply pinnatifid and wintergreen. The petioles are semi-round, smooth and whitish. On the underside of the leaf tips there are 2 parallel rows of large groups of filmless sporangia, which are initially yellowish and later turn dark brown.

Habitat: Lady Fern is indigenous to Britain, parts of Europe and the U.S.

Other Names: Common Polypody, Brake Root, Rock Brake, Rock of Polypody, Oak Fern

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (8%)

C-glycosyl flavones: including mangiferin

Phytoecdysones

Amaroids

Saponin: including the steroid saponin osladin

Essential oil

EFFECTS

The drug is a mild expectorant; a choleric-type effect is questionable.

INDICATIONS AND USAGE

Unproven • Uses: The drug is used for respiratory and gastrointestinal tract illnesses.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is obsolete in German-speaking countries. However, Lady Fern is still found in commercial preparations as drops and tablets, as well as in preparations used in the religious system of anthroposophy.

Daily Dosage: In anthroposophic medicine, the usual dose to treat gastrointestinal illnesses is 1 to 2 tablets or 10 to 20 drops taken 3 times daily.

Lady's Bedstraw

Galium verum

DESCRIPTION

Medicinal Parts: The medicinal part is the dried herb.

Flower and Fruit: The small lemon-yellow flowers are in dense terminal panicles. The peduncle is very downy. The corolla is 2 to 3 mm wide, usually golden yellow, and smells strongly of honey. The border of the calyx is pointed, and the ovaries are bivalvular and inferior. The fruit is smooth, indehiscent, 1.5 mm long, glabrous and eventually black.

Leaves, Stem and Root: The true plant is a 30 to 100 cm high herbaceous perennial with a cylindrical, creeping rhizome that sprouts runners. The stem is ascending or erect, bluntly

quadrangular with 4 vertical lines, downy or glabrous and rough. The leaves are in false whorls of 8 to 12. They are linear, dark green above, and gray and short-haired beneath.

Characteristics: The flowers have a strong honey fragrance.

Habitat: The plant grows throughout Europe (with the exception of Lapland and arctic Russia), as well as in Asia Minor, Iran and Syria.

Production: Lady's Bedstraw is the herb of *Galium verum*, collected during the flowering season and dried.

Other Names: Yellow Galium, Cheese Rennet, Curdwort, Maid's Hair, Yellow Cleavers, Petty Mugget, Cheese Renning

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids: asperuloside, monotropein, scandoside, desacetylasperulosidic acid, asperulosidic acid, giniposidic acid, daphylloside

Rennin

Flavonoids : including rutin, isorutin, palustroside, cynaroside, quercetin-3-O-glucoside, quercetin-7-O-glucoside

Anthracene derivatives

Caffeic acid ester: chlorogenic acid

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Internally, the drug is used in folk medicine for swollen ankles and as a diuretic for bladder and kidney irritation. Externally, it is used for poorly healing wounds. **The** efficacy of this drug has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Currently obsolete but formerly the **drug** was used internally as a tea and topically in alcoholic **extracts** as a moist poultice.

Preparation: To prepare a tea or infusion, pour 250 ml of cold water over 2 heaping teaspoonfuls of the drug, bring to simmering point, simmer for 2 minutes and then allow to draw.

Daily Dosage: Internally, 2 to 3 cups of tea daily.

Lady's Mantle

Alchemilla vulgaris

DESCRIPTION

Medicinal Parts: The medicinal part is the herb collected in the flowering season and dried.

Flower and Fruit: The plant has inflorescences of small, insignificant, yellow-green, many-flowered cymes. The perianth is 4-leaved. The flower has 4 stamens, 1 ovary and an inferior style. The fruit is enclosed in the calyx. The flowers are infertile.

Leaves, Stem and Root: *Alchemilla vulgaris* is a hardy, half-rosette shrub, which grows from 30 to 50 cm. It has a branched stem, which is villous to glabrous. The basal leaves are round, 7- to 9-lobed (dew cup); cauline leaves are short-petioled to sessile, 5- to 7-lobed, crenate or serrate and villous. Even the older leaves remain more or less folded.

Characteristics: Lady's Mantle is odorless and has an astringent taste.

Habitat: The plant grows in the Northern Hemisphere from North America, Greenland and Europe to the Mediterranean and Iceland; and Asia from the Caucasus and the Himalayas to Siberia.

Production: Lady's Mantle herb consists of the fresh or dried above-ground parts of *Alchemilla vulgaris* gathered at flowering time, as well as its preparations. It is produced mostly through cultivation.

Other Names: Bear's Foot, Leontopodium, Lion's Foot, Nine Hooks, Stellaria

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Bitter principles

Flavonoids

Tannins

EFFECTS

Lady's Mantle herb has astringent properties, due to the presence of tannins. It has also been shown to inhibit tumor growth. In mice the total retardation of breast neoplasm-induced tumors was achieved using agrimoniin and the average life expectancy of the animals was increased. An extract of the drug hinders the enzymes elastase, trypsin and a-chymotrysin.

INDICATIONS AND USAGE

Approved by Commission E:

- Diarrhea

Unproven Uses: Lady's Mantle is used for mild and non-specific diarrhea and gastrointestinal disorders.

In folk medicine the drug is used internally for menopausal complaints, dysmenorrhea, gastrointestinal disorders, and as a gargle for mouth and throat inflammation. Externally, it is used for ulcers, eczema, skin rashes and as an additive in baths for the treatment of lower-abdominal ailments.

Homeopathic Uses: *Alchemilla vulgaris* is used for leucorrhea and for chronic diarrhea resulting from liver disease.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Lady's Mantle herb is administered as a cut herb for infusions and decoctions, as well as other galenic preparations for internal use.

Preparation: Tea: 2 to 4 gm drug to 150 ml hot water left to draw for 10 minutes. Prepare a fresh batch every day.

Daily Dosage: Lady's Mantle herb is administered in 2 to 4 gm single doses as an infusion; the average daily dose is 5 to 10 gm of herb. The tea is taken 3 times daily between meals.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules, every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); Parenterally: 1 to 2 ml 3 times daily sc; Ointment: Apply 1 to 2 times daily (HAB1).

Larch

Larix laricina (DuRoi) Koch

DESCRIPTION

Medicinal Parts: The medicinal part is the outer bark separated from its outermost layer.

Flower and Fruit: The female flowers are cone-shaped, erect, 2 cm long, short-pedicled, round-ovate and encircled by scales at the base. The covering scales turn dark red when in bloom. The male catkins are sessile, about 1.5 cm long, sulfur yellow, ovoid-globular. The seeds are light brown, glossy with 13 mm long and 5 mm wide wings.

Leaves, Stem and Root: Larch is a deciduous tree that grows up to 54 m high tree (stunted at high altitudes) with a straight trunk, brown-red bark and pyramid-shaped, sparsely foliated crown. The main branches are horizontal and turned up at the tips. The secondary branches are hanging. The foliage is light green with delicate needles, arranged singly in spiral rows on long shoots and in bushels on short ones. They fall in autumn.

Habitat: The plant is indigenous to central Europe, cultivated in North America. It was first introduced to England in 1639.

Production: The balsam of *Larix decidua* is obtained by drilling into the trunks. The balsam contains up to 20% essential oil.

Other Names: European Larch, Common Larch

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (14-15%): chief components: (-)-alpha-pinene (70%), Delta3-carene (10%) (-)-beta-pinene (6.5%), beta-pyrone (3%)

Resins: including among others oleoresin acids (50-65%); including among others larinolic acid, alpha- and beta-larinolic acid

EFFECTS

When used externally the drug has a hyperemic and antiseptic effect due the essential oil content. Its use for catarrhal infections of the upper respiratory tract also seems plausible.

INDICATIONS AND USAGE

Approved by Commission E:

- Fevers and colds
- Cough/bronchitis
- Tendency for infections
- Blood pressure problems
- Inflammation of the mouth and pharynx
- Rheumatism
- Common cold

Unproven Uses: The drug has been used to treat neuralgic discomforts and furuncles.

CONTRAINDICATIONS

Inhalation may cause acute inflammation of the airway passages.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper external administration of designated therapeutic dosages.

OVERDOSAGE

Resorptive poisonings, such as kidney and central nervous system damage, are possible with large-area administration. Kidney damage is conceivable with internal administration.

DOSAGE

Mode of Administration: Available in form of ointments, gels, emulsions and oils.

Preparation: Liquid and semi-solid preparations 10 to 20%.

LITERATURE

Freudenberg K, Weinges K, (1959) Tetrahedron Letters 17:19.

Larix decidua

See *Larch*

Larkspur

Delphinium consolida

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds of the plant.

Flower and Fruit: The flowers are in short racemes and are blue, pink or purple. The petals are fused to a helmet-like form with a honey spur at the back, which reaches into the back of the 5 sepals. There is usually only 1 glabrous ovary, but numerous stamens. The fruit is a follicle with black, flattened seeds, which have sharp edges and a scarred surface.

Leaves, Stem and Root: The plant grows from 15 to 40 cm. Larkspur is an annual and has a thin stem that is sparsely branched from the middle. The leaves are alternate and divided into narrow linear sections. The lower ones are petioled and the upper ones sessile.

Habitat: *E^ope*, western U.S.

Production: *Delphinium* flower consists of the* flowers of *Delphinium consolida*.

Not to be Confused With: the flowers of *Delphinium orientale*.

Other Names: Knight's Spur, Lark Heel, Lark's Claw, Lark's Toe, Staggerweed

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Diterpene alkaloids: chief alkaloid delphinine

The presence of alkaloids has sometimes been described in the literature but they cannot always be found.

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Larkspur is obsolete. It is used only as an inactive ingredient in tea mixtures. Preparations of delphinium

flower are sometimes used as a diuretic and vermifuge, as a sedative and an appetite stimulant. In folk medicine, Larkspur is used occasionally as a diuretic. It was formerly used as an anthelmintic.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

OVERDOSAGE

Although the delphinine has a paralyzing effect upon peripheral and motor nerve endings and the central nervous system, poisonings among humans by *Delphinium consolida* have never been observed.

Toxic dosages in animal experiments have led to death through asphyxiation (LD50 rabbits 1.5-3.0 mg/kg body weight, I.V.). Poisonings of animals with fatal results by *Delphinium* species are particularly frequent in the U.S.

DOSAGE

Mode of Administration: Since the efficacy of *Delphinium* and its preparations is not documented, a therapeutic administration cannot be recommended.

Preparation: Larkspur is found only in teas, often as an inactive ingredient. —

Laurel

Laurus nobilis

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, the fruit and the oil.

Flower and Fruit: The flowers are in axillary bushy umbels or spike-like panicles. They are dioecious, whitish-green with petals fused at the base. The male flower usually has 10 to 12 stamens; the female has 4 staminoids. The ovary is short-stemmed with one chamber with a hanging ovule, a short style and a triangular obtuse stigma. The fruit develops on the stem into deep-black 2 cm long ovate berries.

Leaves, Stem and Root: Laurel is an evergreen shrub or up to 10 m high tree with smooth, olive green to black bark. The dark-green bay leaves are lanceolate and alternate, about 10 cm long and acuminate at both ends. They are short petioled and their margins are often sinuate and coriaceous.

Habitat: Laurel is indigenous to Mediterranean countries.

Production: Bay leaves are the leaves of *Laurus nobilis*. Bay berries are the fruits of *Laurus nobilis*.

Other Names: Sweet Bay, True Laurel, Bay, Roman Laurel, Noble Laurel, Daphne, Bay Laurel, Bay Tree, Grecian Laurel

ACTIONS AND PHARMACOLOGY

COMPOUNDS: LAUREL LEAF

Volatile oil (1-3%): chief components 1,8-cineol

Sesquiterpene lactones: dehydrocostuslactone, costunolide, furthermore eremanthin, laurenbiolide

Isoquinoline alkaloids: including, among others, reticulon

COMPOUNDS: LAUREL FRUIT

Volatile oil (1-4%): including, among others, 1,8-cineol, alpha- and beta-pinene, citral, methylcinnamate

Sesquiterpene lactones: dehydrocostuslactone, costunolide, furthermore eremanthin, laurenbiolide

Fatty oil (25-55%): chief fatty acids lauric, palmitic, oleic acid The green salve-like laurel oil is gained by pressing or cooking the berries. Besides fatty oil, it contains the components of the volatile oil and a large percentage of sesquiterpene lactones.

EFFECTS

Laurel leaves are externally rubefacient and allergenic because of the essential oil they contain. An antimicrobial, molluscidal and insect repellent effect has been demonstrated. *****

INDICATIONS AND USAGE

Unproven Uses: Both forms are used as a skin stimulant (rubefacient) and for rheumatic conditions.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a medium potential for sensitization.

DOSAGE

LAUREL LEAF

Mode of Administration: The essential oil is used in ointments and soaps.

LAUREL FRUIT

Mode of Administration: The mixture of essential and fatty oils, extracted through pressing, was formerly used in the treatment of furuncles; today Laurel is used externally in veterinary medicine, as an udder ointment.

Lavender Cotton

Santolina chamaecyparissias

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the herb.

Flower and Fruit: The yellow flower heads are 1 cm wide, almost semi-globular, long-pedicled, homogamous and without lingual florets. The corolla tube is compressed and somewhat winged, with a one-sided appendage. The fruit is glabrous.[^]

Leaves, Stem affd foot: The evergreen plant fs a bushy, aromatic subshrub with brittle branches. There are 4 compact rows of small leaves that are narrow, linear, 2 to 3 cm wide, fleshy, obtuse, paired-pinate, gray-tomentose, and occasionally green.

Habitat: The plant is common in the Mediterranean region.

Characteristics: The plant has a strong scent similar to that of chamomile.

Production: Lavender Cotton is the aerial part of *Santolina chamaecyparissias*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1%): chief components artemisiaketone (3,5,6-trimethyl-1,5-heptadien-4-one, 65%), as well as myrcene, alpha-pinene

Alkaloids

EFFECTS

The drug has anti-inflammatory, digestive, stimulation of menstruation, and anthelmintic effects.

INDICATIONS AND USAGE

Unproven Uses: Lavender Cotton is used for digestive disorders, PMS, worm infestation, stomach complaints and also to treat jaundice.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is used internally as an infusion, but medicinal use has generally ceased.

Lemon

Citrus limon

DESCRIPTION

Medicinal Parts: The medicinal parts are the juice, peel and oil of the fruit.

Flower and Fruit: Flowers are arranged singly or in short, sparsely flowered racemes, hermaphrodite or functionally male. The petals are suffused with purple on the outer surface. There are 25 to 40 stamens in coherent groups. The fruit is yellow when ripe and grows to 6.5 to 12.5 cm. It is 8-

to 10-locular, oblong or ovoid, with a broad, low, mamilliform projection at the apex. The rind is somewhat rough to almost smooth. The pulp is acidic.

Leaves, Stem and Root: Citrus limon is a small tree, growing only 3 to 6 m tall with twigs that are angular when young and soon become rounded and glabrous with stout axillary spines. The leaves are pale green, broadly elliptical, acute and serrate or crenate. The petiole has a flat wing or is merely margined and is distinctly articulated with the lamina.

Habitat: The tree is indigenous to northern India, cultivated in Mediterranean regions and worldwide in subtropical regions.

Production: Lemons are the fruit, lemon peel is the skin of the fruit and lemon oil the essential oil extracted from the skins of Citrus limon.

Other Names: Limon

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil in the fresh and dehydrated peel: chief components (+)-limonene in addition to citral (as an odor-bearer), n-nonanal, n-decanal, n-dodecanal, linalyl acetate, geranyl acetate, citronellyl acetate, methyl anthranilate; also in pressed oils, lipophilic flavinoids, including sinensetin, nobiletin and furocoumarins

Flavonoids: in particular the bitter neohesperidosides naringin and neohesperidin dihydro chalcones, furthermore hesperidin, rutin and ericitrin

EFFECTS

The flavonoids in lemon affect vascular permeability and are anti-inflammatory, diuretic and a source of vitamin C.

INDICATIONS AND USAGE

Unproven Uses: Lemon is used as a source of vitamin C in cases of general low resistance, scurvy and colds. In folk medicine, lemon juice was recommended as a drink for fever, as a remedy for acute rheumatism and as an antidote to intoxicants, particularly opium. Additional traditional uses that are still recommended include sunburn, and as a quinine substitute for malaria or to reduce body temperature in typhus patients.

Indian Medicine: Uses in Indian medicine include as a remedy for shaking and heartburn.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There is a low potential for sensitization through skin contact with volatile oil.

DOSAGE

Mode of Administration: Lemon is used internally in the form of oil, tincture or fresh fruit.

Lemon Balm

Melissa officinalis

TRADE NAMES

Lemon Balm (available from numerous manufacturers and as combination product), Melissa Lemon Balm Herb, Quanterra Sleep

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted by distillation, the dried leaves, the fresh leaves and the whole plant.

Flower and Fruit: The small white bilabiate flowers are in 6 one-sided false whorls in the axils of the upper leaves. The

calyx is campanulate, bilabiate, and it has a shortly dentate upper lip. The corolla tube is curved upward. The upper lip is slightly domed and divided in two parts, the lower lip is 3-lobed with an extended middle lobe. The flower has 4 stamens. The fruit is an oblong-ovate, 1.5 to 2 mm long and chestnut-brown, nutlet.

Leaves, Stem and Root: The plant is a perennial that grows up to 90 cm high, with an erect, quadrangular, branched and sparsely haired to glabrous stem. The leaves are petiolate and have an ovate to rhomboid, 2 to 6 cm long and 1.5 to 5 cm wide crenate leaf blade, which is shortly pointed at the end, and stunted or wedge-shaped at the base. It is usually only pubescent above or completely glabrous.

Characteristics: Before flowering, the taste and smell is lemon-like, later becoming astringent to balm-like and warming.

Habitat: The plant is indigenous to the east Mediterranean region and west Asia, and is cultivated in central Europe or established in the wild.

Production: Lemon balm is the fresh or dried leaves of *Melissa officinalis* as well as its preparations. The leaves are collected before flowering or before there is too much branching. Leaves and stem are separated and comminuted and dried quickly at temperatures between 30 to 40° C.

Not to be Confused With: *Nepeta cataria*. var. *citriodora* (lemon cat mint).

Other Names: Balm, Sweet Mary, Honey Plant, Cure-AH, Dropsy Plant, Melissa

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatiles: chief components geraniol (citral a), neral (citral "S"), citronellal (together 40-75% of the volatile oil, aroma-carrier), furthermore, linalool, geraniol, geranylacetate, methyl citronellate, trans-P-ocimene, 1-Octen-3-ol, 6-methyl-5-heptene-2-one, beta-caryophyllene, caryophyllene oxide, germacrene D, eugenol

Glycosides: of the alcoholic or phenolic components of the volatile oil, for example eugenol glucoside

Caffeic acid derivatives: rosmarinic acid (up to 4.7%)

Flavonoids: including among others cynaroside, cosmosiin, rhamnocitrin, isoquercitrin

Triterpene acids: including among others ursolic acid. Only the very fresh drug (maximum 6 months old) is usable as a sedative, because of the low volatile oil content and its high volatility; the requirements of the German-language medication texts do not take this into consideration (no minimum content requirement given).

EFFECTS

The drug has mild sedative and carminative, spasmolytic, antibacterial, antiviral, anti-oxidative and anti-hormonal effects.

INDICATIONS AND USAGE

Approved by Commission E:

- Nervousness and insomnia

The drug is used for nervous agitation and sleeping problems.

Unproven Uses: In folk medicine, the drug is utilized as decoctions of the flowering shoots for nervous complaints, lower abdominal disorders, meteorism, nervous gastric complaints, hysteria and melancholia, chronic bronchial catarrh, nervous palpitations, vomiting, migraine, nervous debility, headache and high blood pressure. It is used externally for rheumatism, nerve pains and stiff necks (compress).

Homeopathic Uses: *Melissa officinalis* is used for menstrual irregularities.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Comminuted herb, herb powder, liquid extracts or dry extracts for teas and other galenic preparations; liquid and solid forms for internal and external use; combinations with other sedative and/or carminative herbs may be beneficial.

How Supplied: . . .

Capsules — 395 mg

Preparation: To prepare an infusion pour one cup of hot water over 1.5 to 4.5 gm of the drug and strain after 10 minutes.

Daily Dosage: The average daily dose is 1.5 to 4.5 gm of drug.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB34).

Storage: Store in well-sealed, non-plastic containers, protected from light and moisture for up to 1 year.

Lemon Verbena

Aloysia triphylla L.

DESCRIPTION

Medicinal Parts: The medicinal part is the oil of vervain as a distillate of the fresh twigs and the dried leaves and stems.

Flower and Fruit: The plant has numerous small flowers in panicle-like spikes. The hairy calyx is about 3 mm long with 4 tips. The petals are white or bluish, and fused to a 4 to 5 mm long funnel at the base. There are 2 short and 2 long stamens in the funnel.

Leaves, Stem and Root: Aloysia triphylla is an up to 3 m tall shrub. The branches are striate and scabrous. They bear leaves in whorls of 3 or 4 on the stem. The leaves are entire-margined, short-petioled, lanceolate and about 7 to 10 cm long. They have lateral veins almost at right angles to the midrib, and are dotted on the underside with oil-bearing glands.

Characteristics: The leaves have a lemony fragrance.

Habitat: The plant originated in Argentina, Chile and Peru, and is cultivated in most other warmer countries. Main countries of cultivation are Algeria, Chile, Israel and Morocco.

Production: Lemon Verbena leaves are the leaves and stems, in whole and ground form, of Aloysia triphylla. The shrubs are propagated by runners or cuttings. They are cut from the second year of growth, in the month of July, before flowering. The young lateral branches appear in October. They are dried rapidly in thin layers or bundles. The dried

leaves are then stripped off. The harvest consists of approximately 10,000 kg of the leaf drug per hectare.

Other Names: Herb Louisa, Lemon-Scented Verbena

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: main constituents are geraniol and neral

Flavonoids: including apigenin-, diosmetin- and luteolin-7-O-glucosides. in addition to mono-, di- and trimethoxyflavones, including eupatorin. (See Lippia triphylla aetherolum.)

Iridoids: iridoid glycosides including geniposidic acid

EFFECTS

The leaves are considered to be antispasmodic, sedative and are a febrifuge. There are no up-to-date studies available.

INDICATIONS AND USAGE

Unproven Uses: In France, Lemon Verbena is used in the symptomatic treatment of digestive disorders, agitation and insomnia. The drug has also been used in the treatment of febrile hemorrhoids, varicose veins and impure skin. In Morocco it is also used for chills and constipation. Efficacy has not been proven in any of these areas. The plant is used as an inactive ingredient to improve the flavor in medicinal teas.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: In France, the infusion is available in restaurants under the name "Vervaine odorante." Used in various medicinal preparations and tea mixtures.

Preparation: To prepare an infusion, use 5 to 29 g of the leaf per 1 liter of water.

Daily Dosage: Drink 2 to 5 cups of the infusion during the course of the day. In preparations with a high water content (such as instant teas), the daily dose equivalent should not exceed 10 g. The upper limit for daily dosages of powders and tinctures is 5 g.

Storage: The drug must be stored in sealed containers, protected from light and dampness.

Lemon-Wood

Schisandra sphenanthera

DESCRIPTION

Medicinal Parts: Medicinal properties are attributed to the fruit and seed of the plant.

Flower and Fruit: The flowers are in clusters with a few blossoms in the axils of the bracts. There are 5 to 8 tepals. The perigone of the male flowers has 5 to 8 sections and 11 to 19 stamens. The female flowers have a similar perigone and 30 to 50 ovaries. The fruit is elongate-elliptical, slim and hangs in aggregate clusters. The individual fruit is round, fleshy, brown-red to dark brown and berry-like.

Leaves, Stem and Root: The dioecious Schisandra sphenanthera has leaves that are alternate and arranged like whorls on short shoots. The petiole is 1 to 3 cm long. The lamina is dark green to brown, 5 to 11 cm long and 3 to 7 cm wide. It is ovate to elliptical, acute at both ends and serrate to dentate. The young branches are purple.

Habitat: The plant is indigenous to China.

Production: Southern schisandra fruit is the dried, ripe fruit of Schisandra sphenanthera.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Ascorbic acid (vitamin C)

Lignans (in the seeds 2 to 10%): dibenzo[a,c]cyclooctene derivatives, including schizandrins A and B, schizandrols A and B, schizanthers A to E, additional lignans with other parent substances, including epigalbacin, anwulignan, ganschisandrins

Fatty oil (in the seeds)

EFFECTS

Various lignans have been isolated from the drug that are also present in *Schisandra chinensis*; some of the action mechanisms described there may also apply to *Schisandra sphenanthera*. (See *Schisandra chinensis*.)

INDICATIONS AND USAGE

Chinese Medicine: The plant is used for dyspnea, coughs caused by disturbance of lung function, dry mouth, thirst, spontaneous or night sweats, nocturia, insomnia, amnesia and anxiety states. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole drug and preparations for internal use.

Preparation: To prepare Cuwuweizi powder, the drug is evaporated in the ratio of 1:5 with vinegar in closed containers until the surface turns black. The product is then ground to a powder.

Daily Dosage: The literature has no information.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Lemongrass

Cymbopogon citratus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves and the Lemongrass oil of *Cymbopogon citratus* and the citronella oil from *Cymbopogon nardus*.

CYMOPOGON CITRATUS

Flower and Fruit: The flowers are 30 cm long and have false spikes with reddish brown sheaths 15 to 25 mm long. The racemes are 15 to 17 mm long. The sessile spikelet is 6 mm long and the upper spels are 0.7 mm wide, lanceolate, narrowly winged, flattened at the back, slightly concave and ribless in the lower part. The stemmed spikelet is 4.5 mm long, and the lower spelt is 0.7 mm wide. Inflorescences are rarely formed on this variety.

Leaves, Stem and Root: *Cymbopogon citratus* is a perennial plant with a smooth and glabrous stalk up to 2 m. The leaf blade is linear, acuminate, up to 90 cm long and 5 mm wide and smooth on both sides. The leaf sheaths are round, glabrous and smooth. The ligule is paper-like and less than 1 mm long.

CYMOPOGON NARDUS

Flower and Fruit: The inflorescence is very large and consists of a 1-meter long spike with numerous racemes up to 20 mm long and arranged in zigzag order. The sessile spike is 5 mm long. The lower spelt is oblong-lanceolate, usually flat, narrowly winged with 3 ribs. The awn, if there is one, is 5 mm long. The petiolar spike is 5 mm long, and the lower spelt lanceolate has 7 ribs.

Leaves, Stem and Root: *Cymbopogon nardus* is a perennial plant with a stalk that grows up to 2 to 2.5 m. It is smooth and glabrous. The leaf blade is up to 1 m long and 1.5 cm wide and usually light green. The upper surface is smooth, the lower surface and the margin are rough. The leaf sheaths are glabrous and yellowish-green. The basal leaf sheaths are also glabrous but green to reddish. The ligule is paper-like and about 1 mm long.

Characteristics: *Cymbopogon* species have essential oils in tube-like cells with corked walls.

Habitat: Citronella grass was originally indigenous to the tropics and the subtropics of the Old World. Today it is cultivated in Central and South America and Queensland, Australia.

Production: Lemongrass consists of the above-ground parts of *Cymbopogon citratus*. West Indian Lemongrass oil consists of the essential oil from *Cymbopogon citratus*. Citronella oil consists of the essential oil from *Cymbopogon winterianus*.

Other Names: Citronella, Fevergrass

ACTIONS AND PHARMACOLOGY

COMPOUNDS: LEMONGRASS LEAVES

Volatile oil (0.2-0.4%)

COMPOUNDS: LEMONGRASS LEAVES

Citral (65-86%)

Myrcene (12-20%)

COMPOUNDS: CITRONELLA OIL

Citronellal (32-45%)

Geraniol (12-25%)

Geranyl acetate (3-8%)

Citronellyl acetate (1-4%)

EFFECTS

In rats, i.v. administration of an infusion caused a drop in arterial pressure and a mild diuretic effect. The oral administration of an imprecise amount of extract caused a drop in temperature and tendency to lengthen intestinal passage^{dme}. Because of the small number of experiments carried out, a hypotensive action cannot be considered as conclusively proven. The essential oil has an antibacterial effect in animal tests: in higher doses, it has a sedative/analgesic effect.

INDICATIONS AND USAGE

Unproven Uses: Externally, Lemongrass is used for lumbago, neuralgic and rheumatic pain, sprains, and as a mild astringent. Internally, the herb is used for gastrointestinal symptoms and mild states of agitation.

Indian Medicine: Lemongrass is used for intestinal parasites, stomach complaints, flatulence, leprosy, bronchitis and fever.

PRECAUTIONS AND ADVERSE REACTIONS

The application of salves with the volatile oil upon the skin has led in rare cases to signs of allergy. A toxic alveolitis was observed in 2 cases following inhalation of the volatile oil.

DOSAGE

No information is available.

Storage: Store in air-tight containers protected from light.

Leonurus cardiaca

See Motherwort

Leonurus japonicus

See Chinese Motherwort

Lepidium sativum

See Garden Cress

Leptandra virginica

See Black Root

Lesser Celandine

Ranunculus ficaria

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh herb.

Flower and Fruit: The golden yellow flowers have a diameter of 25 mm. The calyx usually has 3 sepals, the corolla 8 or more petals which are glossy and spread out in a star-shape. Since the petals are green underneath, the flowers are inconspicuous when closed. There are numerous stamens and ovaries. The fruit is 1-seeded and indehiscent.

Leaves, Stem and Root: The plant grows from 5 to 15 cm high. The stems are decumbent and bear bulbils in the leaf axils. The leaves, like the stems, are glabrous and fleshy. The lower ones are long-petioled, alternate and orbicular-cordate. The upper ones are 5-lobed. There are fleshy, cylindrical clavate tubers between the roots.

Characteristics: The herb has a hot, unpleasant taste and is toxic.

Habitat: The plant is found all over Europe, western Asia and northern Africa.

Production: Lesser Celandine is the fresh herb of *Ranunculus ficaria*.

Other Names: Pilewort, Figwort, Smallwort

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

The glycoside ranunculin as protoanemonine-forming agent: The freshly-harvested plant (0.06-0.35% of the fresh weight, of which only 3% of the overall content of the plant is contained in the leaves, 68% in the stalks, 25% in the blossoms) changes enzymatically when it is cut into small pieces, and probably also when it is dried, into the pungent, volatile protoanemonine that quickly dimerizes to non-mu-

cus-membrane-irritating anemonine. When dried, the plant is not capable of protoanemonine-formation.

EFFECTS

Active agents are tannin, the alkaloids chelidonin and cholerytrin, the saponin fikarin and large quantities of vitamin C.

INDICATIONS AND USAGE

Unproven Uses: Lesser Celandine is used for scurvy, treatment of bleeding wounds, gums and swollen joints.

PRECAUTIONS AND ADVERSE REACTIONS

The dangers of irritation of the skin and mucus membranes are relatively low with pilewort. The consumption of small quantities of the fresh leaf sheaths (before blossoming; the stem should be discarded) as a springtime salad is unproblematic.

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug. Extended skin contact with the freshly-harvested, bruised plant can lead to blister formation and cauterizations which are difficult to heal due to the resulting protoanemonine, that is severely irritating to skin and mucus membranes.

If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritations of the urinary drainage passages, are possible. Symptomatic treatment for external contact should consist of irrigation with diluted potassium permanganate solution; in case of internal contact, administration of activated charcoal should follow gastric lavage.

OVERDOSAGE *** jst —

Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments.

DOSAGE

Mode of Administration: Ground and as an extract. The drug extracts can be added to baths to treat hemorrhoids, warts and scratches.

Lesser Galangal

Alpinia officinarum

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the rhizome.

Flower and Fruit: Galangal is a perennial plant. It is similar in appearance to the sword lily.

Leaves, Stem and Root: Lesser Galangal has a dark, reddish-brown, cylindrical rhizome about 1 to 2 cm in diameter and 3 to 6 cm long. The stem is marked at short intervals with raised rings, which are the scars of the leaf bases. Stems are up to 1.5 m with long narrow lanceolate leaves bearing racemes of orchid-shaped flowers, white and veined red. A fracture of the rhizome is hard and tough, showing a pale inside with a darker central column.

Characteristics: Lesser Galangal has a pungent and spicy taste. The odor is aromatic, rather like ginger.

Habitat: The plant is indigenous to China and entered Europe via India and Arabia in the Middle Ages.

Production: Lesser Galangal consists of the dried rhizome of *Alpinia officinarum*.

Not to be Confused With: The rhizome of *Kaempferia galanga* and other *Alpinia* species

Other Names: Galanga, East India Root, Chinese Ginger, China Root, India Root, East India Catarrh Root, Gargaut, Colic Root, Catarrh Root, Galangal

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components-sesquiterpene hydrocarbons, sesquiterpene alcohols

Diarylheptanoids: mixture termed galangol, some of them pungent substances

Gingerole: phenyl alkanones, pungent substances

Starch

Tannin

Flavonoids: including galangin, galangin-3-methylether, kaempferide

EFFECTS

The plant is said to have antispasmodic, antiphlogistic and antibacterial properties.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

Unproven Uses: Folk medicine uses include painful upper abdominal syndrome of the Roemheld complex type, sluggish digestion, and for liver and gallbladder complaints. Additional uses include fevers and colds, cough/bronchitis, tendency for infections, and inflammation of the mouth and pharynx.

Chinese Medicine: The drug is used for pain, particularly stomach pain.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not reported.

DOSAGE

Mode of Administration: Comminuted drug and powder, as well as other galenic preparations for oral administration.

Preparation: Infusion - Pour boiling water over 0.5 to 1 g drug and strain after 10 minutes.

Daily Dosages: 4r g. The infusion dosage is 1 cup 30 minutes before meals.

Levant Cotton

Gossypium herbaceum

DESCRIPTION

Medicinal Parts: The medicinal parts are the root bark, the fresh inner-root bark and the seeds.

Flower and Fruit: The yellow flowers have a dark red spot at the base of the petals. The calyx is 2 to 2.5 cm long. The bracts are broadly deltate-ovate to semicircular, usually at least as wide as long. Their margins have 6 to 8 acute or shortly acuminate teeth, usually less than 3 times as long as wide. The fruit is beak-shaped, terminally rounded, up to 18 mm long, with 3 to 4 chambers. The seeds, which are embedded in the hairs, are square with gray pubescence.

Leaves, Stem and Root: *Gossypium herbaceum* is an evergreen shrub 2 m high and 1 to 1.5 m wide. The few branches are glabrous to sparsely haired and foliated. The leaves are broadly cordate, coriaceous, reticulate, pubescent with undulate margins. They have a short tip and narrow base.

Habitat: The variety is indigenous to Asia and Africa. Today it is mainly cultivated in Egypt, China, India, Anatolia and the southern U.S.

Other Names: Cotton Root, Cotton

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (traces): including with beta-bisabolol

Resinous substance: containing, among others, salicylic acid and 2,3-dihydroxybenzoic acid

Dimeric sesquiterpenes: (+)-gossypol, (+)-gossypol, p-hemigossypol in some strains presumably in very low quantities

The drug has not been investigated in recent times.

EFFECTS

A histamine-releasing effect has been observed in vitro, in the lung tissue of pigs. The drug also appears to have emmenagogic, oxytocic and contraceptive (male) effects, but constituents have not yet been sufficiently investigated. The

oxytocic effect, similar to that of *secale*, has been observed in animal experiments, making its use as a contraction stimulant seem plausible.

INDICATIONS AND USAGE

Unproven Uses: The drug has many indications in folk medicine, such as amenorrhea, dysmenorrhea, irregular menstruation, nausea, fever, headache, diarrhea and dysentery; as an oxytocic, to expel the afterbirth, for urethritis, nerve inflammation, poor lactation, metrorrhagia, hemorrhage, menorrhagia and atonic amenorrhea, painful menstruation and climacteric complaints.

Chinese Medicine: Cotton is used in China as a male contraceptive.

Homeopathic Uses: The drug is used chiefly in gynecology to treat menstrual disturbances, menstrual bleeding, morning sickness and uterine bleeding.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Pregnancy: Cotton is not to be administered during pregnancy, except at delivery.

OVERDOSAGE

In animal studies, numerous poisonings, some of them fatal, have been observed following long-term feeding with large quantities of cotton seed press cakes.

DOSAGE

Mode of Administration: The drug is used as a decoction, liquid extract and tincture, as well as in combination with *secale*, *chaemalirium* and *leonurus*.

Preparation: Tincture and liquid extract of 2 to 4 ml, liquid extract 20 to 40 drops per single dose.

Daily Dosage: The standard single dose to be taken internally is 2 g of the drug, or 10 g of a 20% decoction, i.e. 1 teaspoonful for a single-dose decoction. The dosage of the liquid extract administered during labor is a single dose of 1 to 2 level teaspoonfuls, with another similar dose given 2 to 4 times daily after the birth as a post-natal styptic.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB34).

Storage: Store Cotton in well-filled containers, protected from light and heat.

Licorice

Glycyrrhiza glabra

TRADE NAMES

Licorice Root (available from numerous manufacturers)
Wild Countryside Licorice Root, Standardized Licorice,
Licorice Power, Phyto Power, Licorice

DESCRIPTION

Medicinal Parts: The medicinal parts are the unpeeled, dried roots and the runners, the peeled dried roots, and the rhizome with the roots.

Flower and Fruit: The axillary inflorescences are upright, spike-like and 10 to 15 cm long. The individual flowers are 1 to 1.5 cm long, bluish to pale violet and short-pedicled. The calyx is short, bell-shaped and glandular-haired. The tips of the calyx are longer than the tube, and are pointed lanceolate. The petals are narrow, the carina petals are not fused, and they are pointed but not beaked. The fruit is a pod, 1.5 to 2.5 cm long, and 4 to 6 mm wide. It is erect and splayed, flat with thick sutures, glabrous, somewhat reticulate-pitted, and usually has 3 to 5 brown, reniform seeds.

Leaves, Stem and Root: The plant is a herbaceous perennial. It is 1 to 2 m high and has a long sturdy primary taproot. The taproot is 15 cm long and subdivides into 3 to 5 subsidiary roots, 1.25 m in length. There are several horizontal woody stolons which may reach 8 m. New stems are produced every year. They are sturdy, erect, branched either from the base or from further up, and are generally rough at the top. The foliage leaves are alternate, odd pinnate and 10 to 20 cm long. The leaflets are in 3 to 8 pairs. The stipules are very small and drooping.

Habitat: Individual varieties of *Glycyrrhiza* are found in different regions. *Glycyrrhiza glanulifera* is found in south-eastern Europe and western Asia. *Glycyrrhiza pallida* and *violacea* are found in Iraq. *Glycyrrhiza typica* is indigenous to southern Europe and southwest Asia.

Production: Licorice root consists of the peeled and unpeeled, dried roots and stolons of *Glycyrrhiza glabra*. *Irrir^jtiipg* is the extract of *Glycyrrhiza glabra*.

Other Names: Sweet Root, sweet wort

ACTIONS AND PHARMACOLOGY

COMPOUNDS: LICORICE EXTRACT

Triterpene saponins (3-15%): (according to DAB 1996, 4-6% in the adjusted Licorice extract, according to D AC 1995, 5-7% in the dry Licorice extract): chief components are glycyrrhetic acid (sweet-tasting, aglycone 18 beta^glycyrrhetic acid, salts termed glycyrrizin)

Flavonoids: aglycones, including liquiritigenin, isoliquiritigenin (its chalcone), isolicoflavonol

Isoflavonoids: aglycones formononetin, glabren, glabridin, glabrol, 3-hydroxyglabrol, glycyrrhisoflavone

Cumestan derivatives: glycyrol, isoglycyrol, liqcoumarin

Hydroxycoumarins: including herniarin, umbelliferone, glycycomarin, licopyranocoumarin

Steroids: sterols, including beta-sitosterol, stigmasterol

The drug contains considerably more free flavonoid and isoflavonoid aglycones than the root drug does, due to the hydrolysis that takes place during the extraction procedure.

COMPOUNDS: LICORICE ROOT

Triterpene saponins (3-15%): chief components glycyrrhetic acid (sweet-tasting, aglycone 18beta-glycyrrhetic acid, salts termed glycyrrhizin), 18-alpha-glycyrrhetic acid, glycyrrhetic acid methyl ester, glabric acid, glabrolide, uralenic acid

Flavonoids: aglycones including liquiritigenin, isoliquiritigenin (its chalcone), isolicoflavonol, isoliquiritin, licoricidin

Isoflavonoids: aglycones formononetin, glabren, glabridin, glabrol, 3-hydroxyglabrol, glycyrrhisoflavone

Cumestan derivatives: glycyrol, isoglycyrol, liquocoumarin

Hydroxycoumarins: including herniarin, umbelliferone, glycycomarin, licopyranocoumarin

Steroids: sterols, including beta-sitosterol, stigmasterol

Volatile oil (very little): with anethole, estragole, eugenol, hexanoic acid

EFFECTS: LICORICE EXTRACT AND ROOT

Anti-Inflammatory/Anti-platelet Effects

Glabridin exerts anti-inflammatory effects through inhibition of tyrosinase activity, superoxide anion production, and cyclooxygenase activity (Yokota, 1998). Licoricidin, a potent compound in the root, has an inhibitory effect on isoPAF(platelet-activating factor) acetyltransferase resulting in anti-inflammatory activity (Nagumo, 1999). Isoliquiritigenin, an aldose reductase inhibitor, exerts anti-platelet effects through inhibition of cyclooxygenase, lipoxygenase, and peroxidase activity (Tawata, 1992). The anti-inflammatory effects of glycyrrhizin is attributed to its anti-thrombin action through inhibition of thrombin induced platelet aggregation (Francischetti, 1997).

Antiulcer Effects

Licorice has protective effects against gastric ulcers induced by aspirin (Dehpour, 1994). Licorice has the ability to release endogenous secretin, which is a potential mediator of the antiulcer actions (Shiratori, 1986). Carbenoxolone, a succinate derivative of glycyrrhetic acid, has been shown to accelerate the healing of ulcers (Barbara, 1979; Bianchi, 1985). Deglycyrrhizinated licorice is also effective for healing ulcers and lacks undesirable side effects seen with carbenoxolone (Morgan, 1982).

Antiviral/Antifungal Effects

Glycyrrhizin suppresses the secretion of hepatitis B virus (HBV) surface antigen (HbsAg) in patients with HBV. The compound is thought to bind to hepatocytes at a concentration able to modify the expression of HBV-related antigens on the hepatocytes and suppress sialylation of HbsAg (Sato, 1996). Glycyrrhizin stimulates interferon gamma produced by T-cells for an antiviral effect against influenza virus infection (Utsunomiya, 1997). Antiviral action of glycyrrhizin on the human immunodeficiency virus (HIV) occurs by inhibiting replication through interference with virus-cell binding and also suppression of giant cell formation. (Ito, 1987; Nakashima, 1987). Glycyrrhizin induces CD4 T cells, which suppress type 2 cytokines produced by burn-associated type 2 T cells. This improves resistance to *Candida albicans* associated with thermal injury (Utsunomiya, 1999).

Mineralocorticoid Effects

Licorice inhibits the enzyme 11-beta-hydroxysteroid dehydrogenase in the kidney, which leads to decreased transformation of Cortisol into cortisone. The mineralocorticoid action of Cortisol causes a decrease in serum potassium and an increase in serum sodium concentration resulting in retention of water, causing weight increase and hypertension (Palermo, 1996). Glycyrrhetic acid, the hydrolytic metabolite of glycyrrhizic acid causes the inhibition of peripheral metabolism of Cortisol and produces a pseudo-aldosterone-like effect (Heikens, 1995). Licorice induces high blood pressure also through inhibition of NADPH-dependent short chain dehydrogenase/reductase enzymes in the kidney (Duax, 1998).

MisceUerteoys. Effects

Glabridin has been shown to inhibit UVB induced pigmentation and erythema in skins of guinea pigs (Yokota, 1998). Isoliquiritin inhibits granuloma angiogenesis in a concentration dependent manner (Kobayashi, 1995). Glycyrrhizin has therapeutic effects on liver dysfunction associated with cytomegalovirus infection (Numazaki, 1994). Glycyrrhizin has complementary effects on intracellular calcium mobilization to block neuromuscular transmission (Dezaki, 1995). Licorice exerts a choleric effects through glycyrrhizin and other unknown components (Raggi, 1995).

CLINICAL TRIALS*Gastric Ulcer*

A double-blind study involving thirty-four patients was conducted to compare carbenoxalone and pirenzepine for treatment of a chronic gastric ulcer. Carbenoxalone was administered as 300 mg daily for 1 week followed by 150 mg daily for 5 weeks. Pimzepine was administered as 150 mg daily for 6 weeks. There was no significant difference

between the groups at the end of the treatment period with ulcers healed in 59% of the pirenzepine group and in 52% of the carbenoxalone group. The healing rates in this study do not compare well with reported treatment success rates of H2-receptor antagonists (Bianchi, 1985).

Peptic Ulcer

A randomized, single-blind trial compared the efficacy of deglycyrrhized licorice (Caved-S®) to cimetidine in 100 patients with peptic ulcer disease. The patients were administered either cimetidine 200 mg 3 times daily plus 400 mg at night or Caved-S plus antacid combination, 2 tablets to be chewed 3 times a day between meals. Caved-S® was as effective as cimetidine for healing peptic ulcers over 6 and 12 weeks but was slower in reducing night pain from peptic ulcer. The medications were equally effective and superior to placebo for the prevention of recurrences with peptic ulcers. Endoscopic evaluation showed healing of ulcers in 60% and 66% of the Caved-S and cimetidine groups, respectively at the end of 6 weeks. After 12 weeks, healing had occurred in 88% and 94%, respectively (Morgan et al, 1982).

Hepatitis

A retrospective study evaluated the long-term use of a glycyrrhizin-containing solution for prevention of hepatocellular carcinoma (HCC) in patients with chronic hepatitis C. One-hundred and ninety-two patients with chronic hepatitis C were included in the study. Stronger Neo-Minophagen C (SNMC), an intravenous solution containing 0.2% glycyrrhizin, 0.1% cysteine, and 2% glycine in physiologic solution, 100 milliliters (mL) daily was administered to 83 patients over an 8 week period, then followed by 2 to 7 times per week for 2 to 16-years (median 10.1 years). The other 109 patients were treated with other herbal remedies, such as vitamin K, for 1 to 16 years (median, 9.2 years). The 10-year rate occurrence of HCC were 7% in the SNMC treatment group and 12% respectively in the non-SNMC treatment group. The 15-year rate was 12% in the SNMC treatment group and 25% in the other treatment group (p=0.032). Elevated alanine aminotransferase (ALT), a characteristic of chronic hepatitis and a risk factor for the development of HCC normalized in 35.7% in the SNMC treatment group, which was significantly better than the 6.4% of the other treatment group (Arase et al, 1997).

INDICATIONS AND USAGE**LICORICE ROOT**

Approved by Commission E:

- Cough/bronchitis
- Gastritis

Unproven Uses: The drug is used for catarrh of the upper respiratory tract as well as for gastric/duodenal ulcers. In

folk medicine, the herb is used for appendicitis, constipation, and to increase milk production and micturation. The drug is also used as a treatment for epilepsy and inflammation of the gastrointestinal and urogenital tract. Externally, the herb is used for dermatoses.

Indian Medicine: Internally, the herb is used for gastric ulcers, headaches, bronchitis, eye diseases and sore throat. The drug is used externally for wounds and cuts.

Chinese Medicine: The herb is used for sore throats, carbuncles, spleen disorders, dry cough, and dehydration.

LICORICE EXTRACT

Unproven Uses: The drug is used for gastritis, gastric ulcers, ulcer prophylaxis, and viral liver inflammation.

CONTRAINDICATIONS

LICORICE ROOT AND FRUIT

Contraindications include chronic hepatitis, cholestatic diseases of the liver, cirrhosis of the liver, severe renal insufficiency, diabetes, arrhythmias, hypertension, hypertonia, hypokalemia, and pregnancy. Tobacco use has been associated with licorice toxicity (Synhavsky, 1980).

PRECAUTIONS AND ADVERSE REACTIONS

LICORICE ROOT AND EXTRACT

General: Intake of the herb over a prolonged period of time may result in hypokalemia, hypernatremia, edema, hypertension and cardiac complaints.

Endocrine: Pseudoaldosteronism reported with the use of licorice is attributed to glycyrrhetic acid, the hydrolytic metabolite of glycyrrhizic acid. Hypertension and hypokalemic metabolic alkalosis (e.g. lethargy, paresthesias, muscle cramps, headaches) are possible consequences of the hypermineralocorticoid effect of Licorice extracts. Retention of sodium and water and suppression of the renin-aldosterone system is associated with extracts of the root (Heikens, 1995; Seelen, 1996). Hypokalemic rhabdomyolysis, resulting in acute renal failure and profound deposition of calcium into the damaged skeletal and cardiac muscles was reported with glycyrrhizin use (Saito, 1994).

Drug Interactions: Furosemide/Thiazide Diuretics - Due to the additive effect of hypokalemia, the concomitant use of these medications with licorice is not recommended.

Digitalis Glycosides - Hypokalemia associated with the prolonged use of licorice may potentiate digitalis toxicity.

Anti-arrhythmic Agents (procainamide, quinidine) - Hypokalemia and severe ventricular tachycardia of torsades de pointes type reported with licorice consumption may be potentiated with concomitant use of anti-arrhythmic agents (Eriksson, 1999).

Corticosteroids - Concomitant use of licorice with corticosteroids potentiates effects due to the prolonged half-life of Cortisol.

OVERDOSAGE

LICORICE ROOT AND EXTRACT

The intake of higher dosages (above 20 gm per day for the extract and above 50 gm per day for the root) over an extended period of time will lead to hypokalemia, hypernatremia, edemas, hypertension and cardiac complaints. In rare cases, myoglobinemia has resulted due to the mineralocorticoid (aldosterone-like) effect of the saponins (Heikens, 1995; Saito, 1994; Seelen, 1996). Preparations from the drug should not be administered for longer than 6 weeks. The complaints disappear after discontinuing the drug. (SEE PRECAUTIONS AND ADVERSE REACTIONS)

DOSAGE

LICORICE ROOT

Mode of Administration: Comminuted drug, drug powder, dry extracts for infusions, decoctions, liquid or solid forms for internal use. Various teas contain extracts of the drug, for example, bronchial teas, gastric teas, and laxative teas.

The drug should not be administered for more than 6 weeks (see side effects).

How Supplied:

Capsules — 100mg, 200mg, 400mg, 444mg, 445mg, 450mg, 500mg

Preparation: To prepare an infusion, use 1 to 1.5 gm of finely comminuted drug and add cold water. Bring to a boil, or pour the boiling water over the drug and allow to draw for 10 to 15 minutes and then strain (1 teaspoonful = 3 gm drug).

Daily Dosage: The average daily dose is 5 to 15 gm of the root, equivalent to 200 to 600 mg of glycyrrhizin. The drug is not to be taken longer than 6 weeks (SEE OVERDOSAGE). Succus liquiritiae: 0.5 to 1 gm for catarrhs of the upper respiratory tract and 1.5 to 3.0 gm for gastric/duodenal ulcers.

Tea - Drink one cup of tea after meals.

LICORICE EXTRACT

Mode of Administration: The drug is widely available in medicinal preparations, as tea or in drop form; the juice of licorice is found in liquorice edible goods and preparations.

Preparation: For preparation of tea, pour a cup of boiling water over 1 teaspoon of juice, leave to draw for 5 minutes.

Daily Dosage: Drink one cup of tea after each meal. The dosage for the drop form is 25 drops to be taken 4 times daily.

Lilium martagon

See *Martagon*

Lily-of-the-Valley

Convallaria majalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried flower tips and the dried inflorescence, the Lily-of-the-Valley herb, the dried root rhizome with the roots, the flowering aerial parts and the whole, fresh, flowering plant.

Flower and Fruit: The flowers are in racemes nodding to one side, usually with a triangular peduncle. The tips are hemispheric, campanulate. 6-petaled with ovoid revolute tips. The perigone is white or pink. The stamens are attached to the base of the perigone. The fruit is a bright red, globular berry with 2 blue seeds. The plant is autosterile.

Leaves, Stem and Root: The 15 to 20 cm high plant has 2 to 3 leaves at the tip of the runner-like, branched rhizome. The leaves are elliptoid and acute. They taper to a long, sharp petiole at the base, which is clasped by a membranous sheath.

Characteristics: Fragrant but poisonous (all parts).

Habitat: The plant is native to Europe and has been introduced into the U.S. and northern Asia.

Production: Lily-of-the-Valley herb consists of the dried, above-ground parts of *Convallaria majalis* (or closely related species) harvested during the flowering season. The harvested parts of the plant must be dried quickly at a maximum temperature of 60°C.

Not to be Confused With: Lily-of-the-Valley is easily confused with *Polygonatum odoratum*.

Other Names: May Lily, May Bells, *Convallaria*, Our Lady's Tears, *Convall-Lily*, Lily Constancy, Jacob's Ladder, Ladder-to-Heaven, Muguet

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolides): varying according to geographical source, chief glycoside convallatoxin (western and northwestern Europe), convalloside (northern and eastern Europe), or convallatoxin + convallatoxinol (central Europe)

EFFECTS

Only older studies are available, which indicate the convallaria glycosides are qualitatively similar to digitoxin and

strophanthin. The studies show Lily-of-the-Valley to have the following effects:

Cardiac: The power and speed of cardiac muscle contraction is increased and there is a reduced relaxation time. The beat frequency is slowed, stimulation transfer is delayed and the ability of the chamber muscles to be stimulated is increased (positively inotropic, negatively chronotropic, negatively dromotropic and positively bathmotropic effect.)

Renal: In animal tests, the effect was natriuretic and diuretic.

Venous: In animal tests, Lily-of-the-Valley demonstrated a dose-dependent, veno-constrictive effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Arrhythmia
- Cardiac insufficiency NYHA I and II
- Nervous heart complaints

Unproven Uses: The drug is used for mild cardiac insufficiency (stage I-II NYHA), heart insufficiency due to old age and chronic cor pulmonale. In folk medicine, Lily-of-the-Valley was also used for weak contractions in labor, epilepsy, dropsy, strokes and ensuing paralysis, conjunctivitis and leprosy. Use for these applications is no longer common because of the drug's toxic effect.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks following the proper administration of designated therapeutic dosages are not recorded. Nausea, vomiting, headache, stupor, disorders of color perception and cardiac arrhythmias can occur as side effects, particularly with an overdose.

Drug Interactions: The simultaneous administration of quinidine, digoxin, calcium salts, saluretics, laxatives and glucocorticoids enhances effects and side effects.

OVERDOSAGE

For symptoms of an acute poisoning and therapy, see *Digitalis folium*. The dangers of poisoning are relatively low with oral application, due to the poor absorbability of the glycosides.

DOSAGE

Mode of Administration: Comminuted herb, as well as galenic preparations for internal use; no longer considered safe because of the levels of toxins.

How Supplied: All information is based on stabilized Lily-of-the-Valley powder as specified in the German pharmacopoeia. No other forms can be recommended. However, commercial pharmaceutical preparations are available as capsules, drops, solutions and tablets.

Preparation: Tincture 1:10; liquid extract: 1:1; dry extract: 4:1.

Daily Dosage: The average daily dose of the drug: 0.6 g of tincture; 0.6 g of liquid extract; 0.15 g of dried extract. The average single dose: 2 g of tincture; 0.2 g of liquid extract; 0.05 g of dry extract. In intravenous application, the full effective dose of convallotoxin is 0.4 to 0.6 mg, the prepared dose 0.2 to 0.3 mg.

Storage: The preparations should be stored in well-sealed containers and protected from light.

Lime

Citrus aurantifolia

DESCRIPTION

Medicinal Parts: The medicinal component is the bergamot oil extracted from the plant.

Flower and Fruit: The fragrant flowers are small and pure white. The fruit is about half the size of a lemon, with a smoother, thinner peel, a greenish-yellow color and sweet taste.

Leaves. Stem and Root: The evergreen tree is small, bent, thorny and normally only grows to a height of 2.5 m. The leaves are ovate-lanceolate and acuminate.

Habitat: Lime is indigenous to Southern Asia and is cultivated in the West Indies, semi-tropic areas of the U.S. and Central America.

Production: Limes and lemons are the fruit of *Citrus aurantifolia*.

Other Names: Limette, Italian Limetta, Adam's Apple

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (in the fruit rind): containing, among others, citral, (+)-limonene, pinenes, alkanes, alkanols, alkanals, beta-bisabolene; also, in pressed oils, furocoumarins

Citric acid

Flavonoids: including hesperidine

EFFECTS

Lime acts as an antiscorbutic and refrigerant as well as a vitamin C supplement.

INDICATIONS AND USAGE

Lime is used as a source of vitamin C to treat scurvy and in cases of general low resistance.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There is a low potential for sensitization through skin contact with the juice of the fruit or with the volatile oil.

DOSAGE

Mode of Administration: Lime is used internally as a liquid extract of the fresh fruit.

Linaria vulgaris

See Yellow Toadflax

Linden

Tilia species

DESCRIPTION

Medicifffif Parts: The medicinal parts are the fresh and dried flowers. ".*" ".*" ""

Flower and Fruit: The yellowish-white flowers are arranged in clusters of 5 to 11. The calyx is 5-sepaled, oblong or ovate-lanceolate, acute and deep. The 5 petals are spatulate-lanceolate with crenate tips. There are numerous stamens and 1 superior ovary, which is almost globular and has silky-haired villi. The fruit is a 1-seeded, pear-shaped, indistinctly angular, thin-shelled nut. There is a tongue-shaped, parchment-like, greenish- or yellowish-white bract at the base of the flowers.

Leaves, Stem and Root: Linden is an impressive tree up to 25 m high with a large, closed crown. The bark is fissured, gray-brown or black-gray. The bark of the branches is smooth. The branchlets are olive-green, brown or brown-red with white warts. The leaves are long-petioled, uneven at the base and broadly cordate. They have a dark upper surface and are bluish-green beneath with rust-colored tufts of down in the vein axils.

Characteristics: The flowers have a strong, sweet fragrance and the fruit tastes slightly sweet, slimy and dry.

Habitat: The tree is common in northern temperate regions.

Production: Linden charcoal consists of the charcoal obtained from the wood of *Tilia cordata* and/or *Tilia platyphyllos*. Linden leaf consists of the dried leaf of *Tilia cordata* and/or *Tilia platyphyllos*. Silver Linden flower consists of the dried flowers of *Tilia tomentosa* (synonym *Tilia argentea*). Linden wood consists of the dried sapwood of *Tilia cordata* and/or *Tilia platyphyllos*. Linden flower consists of the dried flower of *Tilia cordata* and/or *Tilia platyphyllos*.

Not to be Confused With: Linden flower should not be confused with *Tilia tometosa* and *Tilia x euchlora*

Other Names: Lime, Linn Flowers

ACTIONS AND PHARMACOLOGY

COMPOUNDS: LINDEN CHARCOAL

Extremely adsorbent charcoals

EFFECTS: LINDEN CHARCOAL

No information is available.

COMPOUNDS: LINDEN LEAF

Flavonoids: including tiliroside, kempferol-3,7-dirhamnoside, kempferol-3-O-glucoside-7-O-rhamnoside, linarine (acacetin-7-rutinoside), quercetin-3,7-di-O-rhamnoside, quercetin-3-O-glucoside-7-O-rhamnoside

Tannins

Mucilages

EFFECTS: LINDEN LEAF

The apparent diaphoretic effect has not been proven.

COMPOUNDS: SILVER LINDEN FLOWER

Flavonoids: including astragalinalin, isoquercitrin, kempferitrin, quercitrin, tiliroside, quercetin-3-O-glucoside-7-O-rhamnoside, kempferol-3-O-rhamnoside, kempferol-3-O-glucoside-7-O-rhamnoside, quercetin-rhamnoxyloside

Hydroxycoumarins: including, among others, calycanthoside, aesculin

Caffeic acid derivatives: chlorogenic acid

Mucilages

EFFECTS: SILVER LINDEN FLOWER

A possible sedative-anxiolytic effect and an anti-stress effect are under investigation. The flavone-like substances in the drug are thought to be responsible for these effects.

COMPOUNDS: LINDEN WOOD

Mucilages

Sterols: beta-sitosterol, stigmasterol, stigmastenol and their fatty acid esters

Triterpenes: squalene

EFFECTS: LINDEN WOOD

The diuretic, hypotensive, and choleric effects ascribed to the drug are insufficiently documented. In animal experiments, an increase of bile secretion and a lowering of arterial pressure have been described. Aqueous extracts of the drug are antimicrobial.

COMPOUNDS: LINDEN FLOWER

Flavonoids (1%): including chief constituents astragalín, isoquercitrín, kempferol-3-O-rhamnoside, quercitrín, tiliroside (astragalín-6"-p-cumaroyléster), including as well rutin, hyperoside, afzelín, kempferitrín

Mucilages (10%): arabinogalactans with uronic acid share

Volatile oil (0.01-0.02%): including linalool, germacrene, geraniol, 1,8-cineole, 2-phenyl ethanol, phenyl ethyl benzoate, alkanes

Caffeic acid derivatives: chlorogenic acid

Tannins

EFFECTS: LINDEN FLOWER

The antitussive, astringent, diaphoretic, diuretic, sedative, and analgesic effects attributed to the drug have not yet been widely supported by experimental data. The toxic principle is unknown.

An alcoholic extract of the flowers is antimicrobial in vitro with the tannins, glycosides, and the essential oil the active components. Tilia flavonoids, which have not been described in detail, are anti-edemic in animal experiments. In addition, various experimental results point to a sedative effect. The diaphoretic effect is controversial. After steam inhalation with a lime flower additive, an improvement of the symptoms of uncomplicated colds was observed in comparison to a control group (only steam).

INDICATIONS AND USAGE

LINDEN CHARCOAL

Unproven Uses: Preparations of Linden charcoal are used internally for intestinal disorders and externally for ulcus cruris (leg ulcers).

LINDEN LEAF

Unproven Uses: Preparations of Linden leaf are used as a diaphoretic.

SILVER LINDEN FLOWER-

Unproven Uses: Preparations of Silver Linden flower are used for catarrhs of the respiratory tract and as an antispasmodic, expectorant, diaphoretic and diuretic.

LINDEN WOOD

Unproven Uses: Preparations of Linden wood are used for diseases and ailments of the liver and gallbladder systems and for cellulitis.

LINDEN FLOWER

Approved by Commission E:

- Cough
- Bronchitis

Unproven Uses: The flowers are used for catarrh of the respiratory tract and as a diaphoretic for feverish colds and infectious diseases, where a sweating cure is needed. It is occasionally used as a diuretic, a stomachic, an antispasmodic and a sedative.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

LINDEN FLOWER

Mode of Administration: The drug is available as a comminuted herb for teas, infusions, and other galenic preparations for internal use. The drug is a component of some standardized urologic, antitussive, and sedative preparations; it is also found in cold remedy tea mixtures.

Preparation: To make a tea, pour boiling water over 2 gm drug, or add the drug to cold water and boil briefly; steep 5' to 10 minutes and strain (1 teaspoonful = 1.8 gm drug).

Daily Dosage: The recommended daily dosage is 2 to 4 gm of drug.

Lobelia

Lobelia inflata

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh and dried herb and the seeds.

Flower and Fruit: The flowers are on long pedicles in the leaf axils. They are pale violet-blue and lightly tinged with pale yellow. The fruit consists of an ovoid or flattened bilocular capsule containing numerous small, brown and reticulate seeds. —

Leaves, Stem and Root: The plant is an erect annual or biennial herb 30 to 60 cm high. The stem is pubescent, angular, branching near the top. It contains an acrid latex. The leaves are pale green or yellowish, the lower ones are petiolate, the upper ones are sessile. They are alternate, ovate-lanceolate, 3 to 8 cm long, with a dentate margin and a finely pubescent lamina.

Characteristics: After chewing the leaves^the taste is similar to tobacco. The taste 'is' acrid, the odor faintly irritant.

Habitat: The plant is indigenous to the regions in the north of U.S., Canada and Kamchatka. It is cultivated elsewhere.

Production: Lobelia is the aerial part of *Lobelia inflata*.

Other Names: Indian Tobacco, Pukeweed, Asthma Weed, Gagroot, Vomitwort, Bladderpod, Eyebright, Emetic Herb, Emetic Weed, Wild Tobacco and Vomitroot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Piperidine alkaloids (6%): chief alkaloids L-lobeline (alpha-lobeline); companion alkaloids including among others lobelanine, lobelanidine, norlobelanine, and isobobanine

EFFECTS

The main active principle is lobelin. The drug has a stimulating effect on the respiratory center but it is broken down too quickly in the body to be used as a respiratory analeptic.

INDICATIONS AND USAGE

Homeopathic Uses: Lobelia inflata is used only in homeopathy as an asthma treatment and also as an aid in curing addiction to smoking.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Overdosage leads to dryness of the mouth, nausea, vomiting, diarrhea, abdominal pain, burning in the urinary passages, feelings of anxiety, dizziness, headache, shivering, respiratory difficulties, paraesthesias, outbreak of sweating, bradycardia, cardiac arrhythmias, somnolence and muscle twitching; death can occur through respiratory failure, accompanied by convulsions. 0.6 to 1 gm of the leaves are said to be toxic, 4 gm fatal.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), instillation of activated charcoal, and shock prophylaxis (quiet, warmth), the therapy for poisonings consists of treating spasms with diazepam (i.v.), children with chloral hydrate (rectal); monitoring of ECG. Cardiac massage and artificial respiration may also be required.

DOSAGE

Mode of Administration: The drug is no longer used. It is a constituent in some homeopathic preparations.

See Lobelia

Logwood

Haematoxylon campechianum

DESCRIPTION

Medicinal Parts: The medicinal part of the tree is the unfermented heartwood.

Flower and Fruit: The small yellow flowers grow in axillary racemes. There are 5 petals. The fruit is a flat pod, usually with 1 seed.

Leaves, Stem and Root: Haematoxylon campechianum is a 10 to 12 m high tree. The twisted branches are thorny, while the bark is rough and dark. The leaves have 4 pairs of small, smooth and cordate stipules whose tips point to the small trunk.

Habitat: The plant originated in the tropical regions of the U.S. and is cultivated in the Caribbean and other regions.

Production: Logwood is the wood from Haematoxylon campechianum. The cultivated trees are felled in their 11th year and the red heartwood is extracted.

Other Names: Blood wood, H. lignum, Peach wood

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Homoisoflavanes (neoflavane derivatives): to some extent in glycosidic bonds, changing over into the intensively red-colored, quinoide hematein through oxidation

Tannins**EFFECTS**

Logwood has astringent properties, due to the isoflavone hematoxylin. An antiphlogistic effect has been proven in animal experiments and an antimicrobial effect in vitro. Hemateine and hematoxylin are said to inhibit the production of melanin in skin when used topically.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses have included diarrhea and hemorrhage.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. However, internal administration of hematoxylin carried out in animal experiments led to elevated body temperature, vomiting, anuria, coma and death. Reports of these studies provided no information regarding dosage (Lewin).

DOSAGE

Mode of Administration: The drug is administered as an infusion and a liquid extract.

Daily Dosage: A single dose of a decoction equal to 1 g of drug is mentioned, but the number of times it could be taken daily was not specified.

Lolium temulentum

See Taumelloolch

Lonicera caprifolium

See Honeysuckle

Loosestrife

Lysimachia vulgaris

DESCRIPTION

Medicinal Parts: The medicinal part is the dried herb.

Flower and Fruit: The flowers grow in long-peduncled racemes in the axils of the upper stem and in terminal, paniced inflorescence. The pedicle is about 1 cm long, downy and glandular-haired. The calyx is split almost to the base. The filaments are glandular-haired, usually fused to the middle with each other and in a tube containing the ovary.

A The seeds are triangular, covered thickly in long warts, whitish and 1.5 mm long.

Leaves, Stem and Root: The plant is a perennial and has underground runners, which produce new buds. The stem is erect, up to 1.5 m tall, branched, obtusely angular, leafy and thickly downy. The leaves are slightly downy with glandular hairs. The leaves are in whorls or opposite, rarely spiralled, up to 14 cm long and 3.5 cm wide, short petioled, tightly reticulate and red-glandular punctate.

Habitat: The plant is found in the temperate regions of Europe and Asia.

Production: Loosestrife is the aerial part of *Lysimachia vulgaris*.

Other Names: Yellow Willowherb

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Flavonoids: glycosides of the myricetin, kaempferol and quercetin, including among others rutin

Steroids: beta-sitosterol, stigmasterol

The constituents of the drug have not been extensively investigated.

EFFECTS

Loosestrife has an astringent effect. The main active principle is rutin.

INDICATIONS AND USAGE

Unproven Uses: Loosestrife is used for scurvy, diarrhea and dysentery, as well as hemorrhages (nose bleeds and heavy menstrual blood flow) and wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is used externally in the powdered form.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Lophophora williamsii

See Peyote

Lotus

Nelumbo nucifera

DESCRIPTION

Medicinal Parts: The medicinal parts are the roots, the seeds and the aerial parts of the flowering plant.

Flower and Fruit: The solitary flowers are 16 to 23 cm across, pink and scented. They grow above the leaves. The seeds are 1.7 by 1.3 cm and ovoid.

Leaves, Stem and Root: The rhizome is 10 to 20 cm long, stout and branching. It bears numerous scale-like leaves as well as foliage leaves. The foliage leaves are peltate and have no sinuses. The petioles are 1 to 2 cm long, the lamina are 30 to 100 cm in diameter and are almost circular, glossy and unwettable.

Habitat: The plant is indigenous to India.

Production: Lotus is the whole plant of *Nelumbo nucifera*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids: including,

benzyl isoquinoline type: arnepavine, n-methyl coclaurine

aporphine type: roemerine (remerine), nuciferine, n-nomuciferine, normuciferine, anonaine, liriodenine, asimilobin, lirinidin

proaporphine type: prunuciferine

Flavonoids: including hyperoside, isoquercitrin, nelumboside, quercetin glucuronide, camphor glucuronide

Tannins

EFFECTS

Active agents are the alkaloids nelumbin and roemerine in the leaves. The drug is an astringent.

INDICATIONS AND USAGE

Unproven Uses: The powdered beans are used in the treatment of digestive disorders, particularly diarrhea. The flowers are used, as aji astringent for bleeding.

Indian Medicine: Lotus is used for cholera, diarrhea, worm infestation, vomiting, states of exhaustion and intermittent fever.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Preparations of the plant are available in powder and liquid extract for internal use.

LITERATURE

Hegnauer R: *Chemotaxonomie der Pflanzen*, Bde 1-11, Birkhauser Verlag Basel, Boston, Berlin 1962-1997.

Lovage

Levisticum officinale

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizome and roots, the cut, dried herb and the dried fruit.

Flower and Fruit: The flowers are in 8 to 20 rayed compound umbels. There is an involucre and epicalyx. There is no calyx. The orbicular petals are pale yellow and involute. The fruit is yellow-brown, 5 to 7 mm long, compressed, and has sharply keeled to winged ribs.

Leaves, Stem and Root: The plant is a sturdy perennial. It has a thick, spindle-shaped, branched root, which is brownish-yellow on the outside and whitish on the inside. The stem is erect, round, hollow, finely grooved, glabrous and up to 4 cm thick at the base. The leaves are rich green, glossy, coriaceous; the lower ones double pinnate, the upper ones simple-pinnate. The leaflets are broad and obovate.

Characteristics: The rubbed leaves give off an aromatic scent. The fruit is very fragrant.

Habitat: Lovage is indigenous to the Mediterranean region. It grows wild in the Balkans and northern Greece and is cultivated elsewhere.

Production: Lovage root consists of the dried rhizomes and roots of *Levisticum officinale*, as well as their preparations. Roots of 2-year-old plants are collected in autumn. It is important that the roots are not damaged during the drying process since this would result in a loss of the essential oil.

Not to be Confused With: *Angelicae radix*, *Pastinacae radix* or *Pimpinellae radix*.

Other Names: Lavose, Sea Parsley

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.35-1.7%): chief components alkylphthalides (aroma-bearers), including among others 3-butylphthalide, ligusticumlactone (E- and Z-butylidenphthalides), E- and Z-ligustilide furthermore, including among others, alpha- and beta-pinene, beta-phellandrene, citronellal

Hydroxycoumarins: umbelliferone

Coumarin

Furocoumarins: bergaptene, apterin

Polyyenes: including among others, faltarindiol (probably only in the fresh rhizome)

EFFECTS

Lovage has diuretic, sedative, antimicrobial and cholinergic properties.

The Hgustilide-containing essential oil has an antispasmodic effect on smooth muscle.

The folk use for gastric complaints is probably based on the specific odor caused by phthalide as well as on the bitter taste, which increases saliva and gastric secretions.

*

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Lovage is used for flushing-out therapy for inflammation of the lower urinary tract and flushing-out therapy for prevention of kidney gravel.

Unproven Uses: The folk medicine uses include dyspeptic complaints, such as indigestion, heartburn, feelings of fullness, flatulence, menstrual complaints. Lovage is also used as a secretolytic for respiratory catarrh.

CONTRAINDICATIONS

Because of the irritating effect of the volatile oil, the drug should not be administered in the presence of inflammation of the kidneys or of the urinary drainage passages, nor with reduced kidney function. No irrigation therapy is to be carried out in the presence of edema resulting from reduced cardiac and kidney function.

*P

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a low potential for sensitization. An elevation of UV-sensitivity among light-skinned people is possible (phototoxic effect of the furocoumarins).

Pregnancy: Not tffbeT used during pregnancy.*

DOSAGE

Mode of Administration: Comminuted herb and other galenic preparations for internal use.

Daily Dosage: 4 to 8 gm drug. Ample intake of liquid is essential. Tea: 2 to 4 gm drug to 1 cup, several times a day between meals.

Infusion: 1.5 gm per cup.

£ *Storage:* Protect from light and insects in well-sealed containers. The whole drug should be stored not longer than 18 months; the powdered drug, not longer than 24 hours.

Luffa

Luffa aegyptica

DESCRIPTION

Medicinal Parts: The medicinal part is the dried network of vascular bundles of the ripe cucumber-like plant. When dried, the dense vascular network mat-makes up the fruit becomes the Loofah; which is used to scrub and soften the skin.

Flower and Fruit: The plant bears solitary, yellow, female flowers, which are 5 to 10 cm wide and have an oblong, clavate calyx tube. The fruit is cylindrical or oblong-clavate. It is not ribbed, prickly or sharp-edged. It is somewhat tomentose, up to 40 cm long and 5 to 15 cm thick. The seeds are blackish, smooth and winged.

Leaves, Stem and Root: The plant is an annual climbing plant that grows from 3 to 6 m high. The stems are thin and pentangular. The leaves are cordate-indentated, 15 to 30 cm long and wide and 3- to 7-lobed.

Habitat: The plant probably originated in India and was brought to Egypt in the Middle Ages. Today, it is cultivated in the tropical regions of the world.

Production: Luffa sponge consists of the dried fiber structure of the ripe cucumber-like fruits of *Luffa aegyptica*. The ripe fruit is freed of soft material by banging and washing.

ACTIONS AND PHARMACOLOGY**COMPOUNDS: LUFFA FRESH FRUIT**

Triterpene saponins: including among others lucyoside A-M (aglycones including oleanolic acid, hederagenin 21-hydroxy-hederagenin, gypsogenin, arjunolic acid)

CucurBitacins (the young fruits are eaten as salad)

Sterols: including delta5-sterols, delta7-sterols

Triterpenes (triterpene acids): including bryonolic acid (3%)

The luffa fungus (*Luffa*, *Luffa aegyptica*) is likely to be mostly free of soluble constituents and to consist chiefly of cellulose, hemicellulose and pectins.

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Preparations of *Luffa* sponge are used as a preventive for infections or colds, as a remedy for colds and nasal catarrhs, and for sinusitis and suppuration of the sinus.

Chinese Medicine: *Luffa* is used for coughs, chronic bronchitis, diseases of the spleen and paralyzing diseases.

Indian Medicine: *Luffa* is used for splenopathy, leprosy, syphilis, bronchitis, fever and hematuria.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

No information is available.

Lungmoss

Lobaria pulmonaria

DESCRIPTION

Medicinal Parts: The medicinal part is the lichen.

Flower and Fruit: *Lobaria pulmonaria* is a lichen, with deeply pinnatisect lobes with indented tips, measuring from

1.5 cm up to hand size. It is found on the trunks of old woodland trees and is brownish-green or red-brown with a reticulate, punctate structure. It is tomentose and whitish-brown beneath and is covered with glabrous white spots on the margin and on the reticulate ridges.

Habitat: Lungmoss is found throughout Europe.

Production: Lungmoss is the whole lichen tissue of *Lobaria pulmonaria*. The lichen is gathered throughout the entire year. The minute roots in the subterranean part, along with any possible earth, are cleaned off (do not gather dry lichen, as they are mostly found on dead plants, and therefore are no longer effective).

Not to be Confused With: Common Lungwort, which is a plant.

Other Names: Oak Lungs, Lungwort

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Lichen acids: including among others stictictic, norstictic, thelophoric acid, gyrophoric acid

*Mucilages***EFFECTS**

"~"

The drug has diaphoretic, expectorant, anti-inflammatory, and antimicrobial effects. The active agents exhibiting the antimicrobial effects are unknown.

INDICATIONS AND USAGE

Unproven Uses: As a result of the relaxing effect of Lungmoss on the respiratory tract, the drug is used for all chronic respiratory tract illnesses: bronchitis, coughs and asthma, as well as for irritable coughs and smoker's cough.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Lungmoss is available as dried lichen as a liquid extract for internal use. Lichen preparations can be bought as sweets, syrups or pastilles.

Storage: The drug should be stored in glass or porcelain containers, protected from light.

LITERATURE

Catalano S et al., (1976) *Phytochemistry* 15:22.

* Lungwort

Pulmonaria officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried herb and the fresh, aerial parts of the flowering plant.

Flower and Fruit: The blue, later blue-violet flowers are in terminal curled cyme-like inflorescences on flowering branches. The calyx is fused and has 5 tips. The corolla is fused to a tube and the 5 tips are rotate. There are 5 stamens and a 4-valved ovary with 1 style. There are both long and short-styled flowers. There are 5 tufts of hair at the entrance to the corolla tube. The fruit consists of 4 nuts 3.5 to 4 mm in length, glabrous when ripe, glossy brown to black, mildly keeled with a distinct displaced ring.

Leaves, Stem and Root: The plant grows from 15 to 30 cm high. The rhizome is quite thin and branched. First it produces flowering shoots and then the leaf rosettes. The shoots are fresh green and covered in glandular hairs. The stems are erect or ascending, slightly angular and pubescent. The rosette-like basal leaves that form after flowering are long petioled, cordate-ovate, acute, more long than wide with whitish spots. The cauline leaves are alternate, taper to a winged stem and are sharply pointed; only the lower ones have some pinnatifid ribs.

Charact^{er}istics[^] The taste is slightly bitter and slimy.

Habitat: The plant is common in many parts of Europe.

Production: Lungwort consists of the dried plant section of *Pulmonaria officinalis* and its effective pharmaceutical preparations. Lungwort is collected in uncultivated regions and air-dried.

Not to be Confused With: Lungwort is occasionally adulterated with other *Pulmonaria* species, particularly *Pulmonaria mollis*.

m Other Names: Dage of Jerusalem, Common Lungwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Allantoin

Caffeic acid derivatives: chlorogenic acid, rosmarinic acid

Flavonoids (0.3 to 0.5%): especially O-glycosides of the kaempferol and quercetin

Mucilages: polygalacturonane, arabinogalactans, rhamnogalacturonane

Silicic acid: more than 2.5% water-soluble silicic acid

Tannins

EFFECTS

The drug has an expectorant, soothing effect due to the mucilaginous polysaccharide and tannin content.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine Lungwort is used internally for illnesses and conditions of the respiratory tract, gastrointestinal tract, kidney and efferent urinary tract; and externally in the treatment of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Lungwort is available as whole, cut and powdered drug for internal and external use. It is also available in commercial forms as syrup, juice, drops and in compounded preparations.

Preparation: To prepare a tea, 1.5 gm finely cut drug is put in cold water which is brought quickly to a boil or it is scalded with boiling water and strained after 5 to 10 minutes (1 teaspoon corresponds to approximately 0.7 gm drug).

Liquid extract: 1:1 with 25% ethanol. (V/V)

Daily Dosage: As bronchial tea it is drunk in sips throughout the day. It may be sweetened with honey.

Storage: Should be protected from light

Lupinus luteus

See *Yellow Lupin*

Lycium barbarum

See *Lycium Berries (Go-Qi-Zi)*

Lycium Bark (Di-Gu-Pi)

Lycium chinense

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fruit and root bark.

Flower and Fruit: The plant has 1 to 3 axillary, radial flowers. The calyx and petals are fused; the calyx is bilabial with a double-toothed upper lip and triple-toothed lower lip. The corolla is funnel-shaped, light purple or violet with a 5-lobed margin. There are 4 stamens, which are hairy at the base. The ovary is 2-chambered with 1 style. The fruit is a yellow-orange, elongate, sweet-tasting berry.

Leaves, Stem and Root: *Lycium chinense* is a shrub that grows up to 3 m high. The leaves are alternate, ovate-lanceolate, narrowing suddenly to the petiole, and bright green. The branches are cane-like, initially upright, then hanging down bow-like and thornless.

Habitat: The plant is native to eastern Asia, particularly to China and Japan.

Production: Lycium bark is the dried root bark of *Lycium chinense* or *Lycium barbarum*. Harvest begins in early spring or in late autumn when the roots are dug up and then peeled. The root bark is then cleaned and dried in the sun. Lycium leaves are the dried leaves of *Lycium chinense*.

Other Names: Chinese Matrimony Vine, Chinese Wolfberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS: LYCIUM ROOT BARK

Polyamines: kukoamine A (spermidin-dihydrocaffeoyl-bisamide)

Dipeptides: Lyciumamide (N-benzoyl-L-phenylalanyl-L-phenylalaninol-acetate)

Cyclopeptides: lyciumin A, lyciumin B

Steroids: sterols, including beta-sitosterol, 5alpha-stigmastan-3,6-dione

Diterpenes: sugiol

EFFECTS: LYCIUM ROOT BARK

The methanolic root extract and the kukoamine A isolated from the plant are reported to have had significant antihypertensive effects in animal experiments. The isolated octapeptides lyciumines A and B are believed to inhibit the activity of renin and the angiotensin-converting enzyme. Experimental data confirming these results are not available.

COMPOUNDS: LYCIUM LEAVES

Steroids: withasteroids (0.1%), including withanolide A, withanolide B

Sterols: including beta-sitosterol and beta-sitosterol glucoside

EFFECTS: LYCIUM LEAVES

No experimental data regarding the pharmacological efficacy of the drug are available. In vitro experimental models have indicated that the steroid withanolide isolated from it may have immunosuppressive effect.

INDICATIONS AND USAGE

LYCIUM ROOT BARK

Unproven Uses: The root of the plant is used in fever and blood pressure-reducing medications. The berries are considered to provide a liver and kidney tonic.

Chinese Medicine: Used internally for fever, hyperhidrosis, thirst, coughs, nose bleeds, pulpitis, diabetes, hypertension, malaria and for black vomit. External uses include eczema and rheumatism. Efficacy for these indications has not yet been proven.

LYCIUM LEAVES

Unproven Uses: Preparations from the leaf are used in folk medicine for whooping cough and paroxysmal cough (Iberian peninsula), as a mouthwash for toothache (Indonesia).

Chinese Medicine: Lycium leaf is used for inflammatory processes, such as rheumatism, and as a tea taken for pain.

Indian Medicine: Used for rheumatism.

PRECAUTIONS AND ADVERSE REACTIONS

LYCIUM ROOT BARK AND LEAVES

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

CONTRAINDICATIONS

LYCIUM ROOT BARK

Contraindications include pregnancy, symptoms of the common cold and diarrhea.

LYCIUM LEAVES

Not to be used during pregnancy.

DOSAGE

LYCIUM ROOT BARK

Mode of Administration: Whole, cut and powdered drug preparations are administered internally and externally.

Storage: Store in a dry place.

LYCIUM LEAVES

Mode of Administration: Lycium leaf is administered as a tea or as an infusion for use as a gargle.

Daily Dosage: Drug/tea: 9 to 15 g or 6 to 12 g, depending on the literature source. For Whooping Cough, 1 cup of tea sipped throughout the day.

Lycium Berries (Go-Qi-Zi)

Lycium barbarum

DESCRIPTION -

Medicinal Parts: *the medicinal part is the fruit.*

Flower and Fruit: There are 1 to 3 axillary, radial flowers. The calyx and petals are fused; the calyx is bilabial with the upper lip double-toothed and the lower lip triple-toothed. The corolla is funnel-shaped, light purple or violet with a 5-lobed margin. There are 4 stamens, which are hairy at the base. The ovary is 2-chambered with 1 style. The fruit is a scarlet, elongate, sweet-tasting berry.

Leaves, Stem and Root: Lycium barbarum is a shrub, growing up to 3 m high. The gray-green leaves are alternate, lanceolate and gradually narrow to the petiole. The branches are cane-like, initially upright, then hanging down bow-like and often thorny.

Habitat: The shrub is indigenous to China and Mongolia.

Production: Barbary wolfberry fruits are the dried ripe fruit of Lycium barbarum. The fruit is harvested in summer or autumn. The whole fruit, with stem attached, is dried in the

sun until the skin is hard and the fruit pulp is soft inside. After drying, the fruit stem is removed.

Other Names: Bastard Jasmine, Box Thorn, Common Matrimony Vine, Prickly Box, Tea Plant, Barbary, Tea Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Water-soluble polysaccharides

Glycoproteins

Carotenoids: particularly physalien (zeaxanthin dipalmitate)

EFFECTS.

A possible immunostimulating and hypoglycemic effect has been described. The plant contains a mydriatic acting protein.

INDICATIONS AND USAGE

Unproven Uses: The drug is administered as a non-specific strengthening agent, due to the minerals and vitamins (particularly vitamin C) that it contains. Lycium barbarum is also used as a purgative and diuretic.

Chinese Medicine: The plant is used to treat weakness of the lumbar region and knee; liver and kidney disorders, diabetes, tinnitus, impaired hearing, poor sight, anemia, coughs, dizziness and excessive tear production.

Indian Medicine: Lycium barbarum is used for ascitis, anemia, menstruation disorders, toothache, scabies and bleeding hemorrhoids.

CONTRAINDICATIONS

Not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Application: Whole, cut and powdered drug.

Daily Dosage: Drug/tea: 6 to 12 g or 6 to 15 g, depending on the literature source.

Storage: Store in cool, dry place and in tightly sealed container.

Ma-Huang

Ephedra sinica

DESCRIPTION

Medicinal Parts: The medicinal parts are the young canes collected in autumn and the dried rhizome with roots.

Flower and Fruit: The flowers are small and occasionally reduced to acuminate scales. They are fused in pairs at the base. They are unisexual, usually dioecious and sometimes monoecious. The male inflorescences consist of 2 to 24 blooms. The involucre is 2-lobed and fused to a tube. The fruit is a red, berry-like false fruit formed from the upper bract. '

Leaves, Stem and Root: The plant is a 30 cm tall lightly branched subshrub with lengthened, cylindrical branches that are 1 to 2 mm in diameter. It is similar in appearance to Horsetail, and is sometimes twining and often has underground runners. The stem and branches are round with numerous vertical grooves of gray-green or bright green coloring. Very small leaves are occasionally reduced to pointed scales and are almost always fused at the base to form a sheath. They are reddish brown.

Habitat: *Ephedra sinica* grows mainly in Mongolia and the bordering area of China, *Ephedra Gerardiana* is from India.

Production: Ma-Huang consists of the dried, young branchlets, harvested in the fall, of *Ephedra sinica*, *Ephedra shennungiana*, or other equivalent *Ephedra* species. It is mostly cultivated. The plant is harvested as late as possible after the last rain, but before the winter frost and is air-dried in the sun.

Not to be Confused' With: Many similar species

Other Names: Desert Herb, Ephedrine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alkaloids of the 2-aminophenylpropane type: main alkaloids L-(-)-ephedrine (1R,2S-(-)- ephedrine) and D-pseudoephedrine (1S,2S-(+)- ephedrine); lesser alkaloids L-norephedrine, D-norpseudoephedrine.

EFFECTS

The level of the active principles can fluctuate drastically. Ephedrine acts by indirectly stimulating the sympathomimetic and central nervous system. The herb is bacteriostatic, positively inotropic and positively chronotropic. In animal tests ephedrine acts as an antitussive.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

Unproven Uses: Ma-Huang is used for diseases of the respiratory tract with mild bronchospasms in adults and children over the age of six. Various indications include asthma, cardiovascular stimulation and as a CNS stimulant.

Chines&"Me"dicine: The drug has been used for over 4000 years for severe febrile illnesses, bronchial asthma, joint symptoms, inability to perspire, coughing with dyspnea, edema and pains in the bones.

CONTRAINDICATIONS

Contraindications include states of anxiety and restlessness, high blood pressure, angle-closure glaucoma, cerebral perfusions, prostate adenoma with residual urine volume, pheochromocytoma and thyrotoxicosis.

PRECAUTIONS AND ADVERSE REACTIONS

General: Common side effects include headache, irritability, motor restlessness, nausea, sleeplessness, tachycardia, urinary disorders and vomiting. Higher dosages may result in blood pressure and cardiac rhythm disorders.

Dependence can develop with extended intake. Because of the danger of the development of tachyphylaxis and of dependence, the drug should only be administered for short periods.

Pregnancy: Ma-Huang should not to be used during pregnancy

Drug Interactions: Ephedra has an addictive effect on the CNS when used in conjunction with caffeine, decongestants and other central stimulants.

Cardiac heart glycosides or halothane: disturbance of heart rhythm.

GuanethidineⁿfeanGement of the sympathomimetic effect
MAO-inhibitors: potentiate the sympathomimetic action of ephedrine.

Secale alkaloid derivatives or oxytocin: development of high blood pressure.

OVERDOSAGE

Life-threatening poisonings are seen with very high dosages of the drug (over 100 gm, lethal dosage with oral administration corresponding to approximately 1 to 2 gm L-ephedrine). Symptoms of poisoning include severe outbreaks of sweating, enlarged pupils, spasms and elevated body temperature. Death following overdose is due to heart failure and asphyxiation. Following stomach emptying (gastric lavage with burgundy-colored potassium permanganate solution), therapy consists of the administration of activated charcoal and prophylaxis against shock. Spasms should be treated with diazepam, electrolyte substitution should be employed, and sodium bicarbonate infusions should be used to prevent

acidosis. Intubation and oxygen respiration are also on occasion necessary.

DOSAGE

Mode of Administration: Ma-Huang is administered as a comminuted herb, as well as other galenic preparations for internal use.

Daily Dosage: For adults, the average single dose is 15 to 30 mg total alkaloid, calculated as ephedrine, for a total dose of 120 mg per day. When used in children, single doses of herb preparations corresponding to 0.5 mg total alkaloid per kg of body weight are employed. The recommended daily dosage for children is 2 mg.

Tea — Made with 1 to 4 gm, 3 times daily.

Ephedra tincture (1:1) — medium single dose 5 gm.

Ephedra extract — 1 to 3 ml 3 times daily.

Ephedra tincture (1:4) — 6 to 8 ml 3 times daily.

Storage: Ma-Huang must be protected from light.

Macrocystis pyrifera

See *Brown Kelp*

Madder

Rubia tinctorum

TRADE NAMES

Madder Whole Root (available from numerous manufacturers and as combination product)

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root.

Flower and Fruit: The small yellowish-green flowers are in loose, leafy, long-peduncled terminal or axillary cymes. The margin of the calyx is indistinct, 4 to 5 sectioned and has a tip which is curved inward. There are 5 stamens and an inferior ovary. The fruit is a black, pea-sized glabrous, smooth drupe containing 2 seeds.

Leaves, Stem and Root: The perennial plant grows from 60 to 100 cm high. The pencil-thick rhizome creeps widely underground. The stem is quadrangular with backward turning prickles at the edges. The stems are at times so thin that they are more decumbent than erect. The leaves are in whorls, in fours below, in sixes above. They are oblong to lanceolate with 1 rib and are protrudingly reticulate beneath.

Habitat: The plant is indigenous to Southern Europe, Western Asia and North Africa and is cultivated elsewhere.

Production: Madder root consists of the dried root of *Rubia tinctorum* as well as its preparations.

Other Names: Dyer's Madder, Robbia

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (rubiadins, 2 to 4%): chief components alizarin, lucidin, pseudopurpurin (purpurin carboxylic acid), purpurin, rubiadin and die glucosides and/or the primerosides of these compounds.

EFFECTS

Madder root inhibits calcium oxalate crystallization in the kidney. Lucidin is the toxic principle and is mutagenic.

INDICATIONS AND USAGE

Unproven Uses: Madder root is used to dissolve kidney stones

PRECAUTIONS AND ADVERSE REACTIONS

Because of the possible carcinogenic effect of the rubiadins, the drug should not be administered.

DOSAGE

Magnolia

Magnolia glauca

DESCRIPTION

Medicinal Parts: The bark is the medicinal part.

Leaves, Stem and Root: The inner bark occurs in long, fibrous strips. The outer surface is rough, almost granular and pitted. The inner surface is striated but almost smooth. The fracture is short with the inner part tough and fibrous.

Habitat: The plant is indigenous to North America.

Production: Magnolia bark is the bark from the trunk and branches of *Magnolia glauca*.

Other Names: White Laurel, Beaver Tree, Swamp Sassafras, White Bay, Sweet Bay, Holly Bay, Indian Bark, Red Bay, Swamp Laurel

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Neolignans: magnolol

Volatile oil

The constituents of the drug have not been widely investigated.

EFFECTS

Magnolia has diaphoretic, anti-inflammatory and stimulant effects. It is also a tonic.

INDICATIONS AND USAGE

Unproven Uses: The preparations are used for digestive disorders; used rarely, except in Oriental medicine.

PRECAUTIONS AND ADVERSE REACTIONS

^ No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Magnolia has been used internally as a powder or liquid extract.

Magnolia glauca

See Magnolia

Mahonia aquifolium

See Mountain Grape

Maidenhair

Adiantum capillus-veneris

TRADE NAMES

Oregon Grape (*Berberis aquifolium* variety available from numerous manufacturers) Oregon Grape Root

DESCRIPTION

Medicinal Parts: The dried fronds (Maidenhair) are used as a drug as well the dried herb with rhizome and roots (Maidenhair with roots).

Flower and Fruit: There are lumps of sporangia without a veil on the underside of the lateral lobes. The sporangia are square to reniform and later, dark brown.

Leaves, Stem and Root: Maidenhair is a hardy, up to 35 cm high plant with an aromatic lily fragrance. It has a creeping rhizbme. The leaves are double-rowed, tender, glabrous and up to 50 cm long. They have a glossy black petiole and are covered with hairs at the base. The leaf-blade is ovate to oblong-ovate. The leaflets are light-green periolate. The pinnules have hair-like petioles. The veins of the sterile pinna terminate in teeth at the edge of the leaf.

Habitat: Southern Europe, Atlantic coast as far as Ireland, from the south to the southern Alpine valleys (Tessin, southern Tyrol).

Production: Maidenhair fern, which is gathered in June and dried, is the frond of *Adiantum capillus-veneris*.

Not to be Confused With: It has sometimes been observed that the drug has been made impure by an addition of bracken leaf fronds (*Pteridium aquilinum*).

Other Names: Venus Hair, Rock Fem, Hair of Venus, Five-Finger Fern, Maiden Fern

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids

Proanthocyan idins

Hydroxycinnamic acid ester

EFFECTS

The drug is an expectorant, beneficial in bringing up phlegm, and a demulcent.

INDICATIONS AND USAGE

Unproven Uses: In the middle ages, the drug was used for various illnesses of the respiratory tract, in the form of so-called pectoral teas and as a syrup for severe coughs. Because of its similarity to Maidenhair, the drug was used to treat a lack of hair growth and to promote dark hair color.

It is still taken as an infusion in Spain, Belgium and the Canary Islands to treat bronchitis, coughs and whooping cough, and also for painful and excessive menstruation.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Not to be used during pregnancy

DOSAGE

Mode of Administration: The drug is taken internally as a tea prepared from the ground or powdered drug.

Daily Dosage: The standard single dose is 1.5 gm of the drug to 1 cup of liquid per dose (average single dose)

Storage: Protect from light.

Malabar Nut

Justicia adhatoda

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried foliage leaves, collected in the flowering season, the dried bark of the trunk, branches and roots, and the fresh leaves.

Flower and Fruit: The flowers are in dense, 2.5 to 7.5 cm long peduncled, axillary spikes. The bracts are elliptical, and the bracteoles are oblong-lanceolate. The calyx is 1.5 cm long, glabrous or black pubescent, with 5 sections containing regular lanceolate segments. The corolla is white with red to purple bands. The corolla tube is 1.3 cm long and is cylindrical and pubescent inside of the lower half. The upper lip is convexly domed. The anthers are arrow-shaped and sometimes spurred at the base. The ovary is bivalvular with a 2-lobed stigma. The fruit is a 4-seeded, short-haired, longitudinally grooved capsule. The seeds are orbicular, glabrous, slightly bumpy-warty and 5 to 7 mm across.

Leaves, Stem and Root: The plant is an evergreen, unpleasant-smelling shrub 2.5 m high with numerous, usually opposite, branches. The bark is yellow. The leaves are 8 to 25 cm long, 2.5 to 8 cm wide, short-stalked, opposite,

lanceolate to elliptical, tapering to an acute apex with entire margins. The leaf blade and petiole are finely pubescent.

Characteristics: The taste is bitter and the odor tea-like.

Habitat: Originally indigenous to northern India, the plant is now found in all the areas of Ayurveda medicine in India, Sri Lanka and the Maylan archipelago.

Production: Vasaca leaves are the leaves of *Justicia adhatoda*.

Other Names: Arusa, Adulsa

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Quinazoline alkaloids: including vasicine and vasicinone

Volatile oil

EFFECTS

Mildly spasmolytic, bronchodilatory and expectorant

INDICATIONS AND USAGE

Unproven Uses: For acute and chronic bronchial infections, catarrh of the upper respiratory tract and tuberculosis as an expectorant and to alleviate coughs.

Indian Medicine: *Justicia adhatoda* is used as an expectorant and secretory agent.

Homeopathic Uses: *Justicia adhatoda* preparations are used for hay fever and acute inflammation of the upper respiratory tract.

CONTRAINDICATIONS

The drug is contraindicated in pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Because of the vasicine content, the administration of large dosages can lead to excitatory states.

Pregnancy: Administration during pregnancy is to be avoided.

DOSAGE

Mode of Administration: Today, the extract of the leaves is only found in some combination preparations.

Daily Dosage: 1 to 2 gm as drug or liquid extract (1:1) with 40% ethanol (V/V)

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute), and 1 to 3 times daily (chronic); Parenterally: 1 to 2 ml sc acute. 3 times daily; Chronic: once a day (HAB1).

Male Fern

Dryopteris filix-mas

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried fronds, the dried rhizome collected in autumn with the leaf bases, the fresh rhizome and the fresh aerial parts.

Flower and Fruit: On the underside of the leaflets there are 2 rows of sori, covered by kidney-shaped, red-brown film. The spores are dark brown.

Leaves, Stem and Root: The root is a crooked half-underground fleshy rhizome, covered in the remains of dark brown petioles, which produces long branched root fibers. The remains of the petioles are linear-lanceolate and tomentose with red-brown scales. The foliage grows in a crown, with fronds arranged in spirals, 60 cm to 1.5 m high. There are 2-pinnate, oblong-lanceolate, alternate, sessile leaflets, subdivided with round segments. The young fronds are rolled in spirals and thickly covered in hairs. They gradually open out as the fronds grow.

Habitat: plant is found in the temperate zones of Europe, northern Asia and in North and South America.

Production: Male Fern leaf consists of the fresh or dried leaf of *Dryopteris filix-mas*. Male Fern herb consists of the fresh or dried above-ground parts of *Dryopteris filix-mas*. Male Fern rhizome consists of the fresh or dried rhizomes separated from the attached roots. The root-stock is collected in autumn and gently dried.

Not to be Confused With: The rhizomes of most European *Dryopteris* species.

Other Names: Aspidium, Bear's Paw Root, Fern, Knotty Brake, Male Shield Fern, Marginal Fern, Sweet Brake

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MALE FERN RHIZOME

Acylphloroglucinoles (2%, mixtures termed raw filicin or filicin): in particular, flavaspidic acids, filicinic acids, paraspidin, desaspidin

Tannins

COMPOUNDS: MALE FERN LEAVES

Acylphloroglucinoles (0.2%, mixtures termed raw filicin or filicin): in particular, flavaspidic acids, filicinic acids, paraspidin, desaspidin

Flavonoids

EFFECTS

Male Fern herb has an anthelmintic effect and is strongly cytotoxic against band worms and liver flukes, although roundworm and oxyuris are resistant. It is also cell toxic, virostatic and antiviral. The pharmacological effect is largely due to the flavaspidic acid with filicinic acids being the main active principle.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Male Fern herb are used externally for rheumatism, sciatica, muscle pain, neuralgia, earache and toothache, for festering and poorly healing wounds, burns, hemorrhoids, for teething in infants, and sleep disorders, as well as internally for tapeworms and flukes.

Homeopathic Uses: *Dryopteris filix-mas* is used for weak sight and damage to the optic nerve.

CONTRAINDICATIONS

The drug should not be administered in the presence of anemia, cardiac, liver or kidney diseases or diabetes.

PRECAUTIONS AND ADVERSE REACTIONS

General: The following can occur even with therapeutic dosages: queasiness, nausea, severe headache, vomiting, diarrhea.

Pregnancy: The drug should not be used during pregnancy.

Pediatric Use: The drug should not be administered to children under 4 years.

Use in the Elderly: The drug should not be administered to elderly persons.

OVERDOSAGE

Overdosages in susceptible patients can lead to liver, cardiac and kidney damage as well as central nervous system disorders, psychoses and permanent injuries such as paralysis and visual disorders may be seen as a result of overdose.

Cases of death, particularly among children, have been observed following administration of Filmaron oil (10% solution of volatile extracts of the rhizomic drug in cooking oil).

DOSAGE

Mode of Administration: **Warning:** Dosages may be toxic! Due to the risks, internal application is not recommended; if possible other remedies should be used. Because the efficacy

of the claimed applications is not documented, therapeutic usage is not recommended.

Preparation: Filix-mas extract: The percolate is completely freed from ether by steaming (maximum 50° C). It is made into a dried extract in a vacuum. The content is stabilized with high-fat cooking oil (DAB6)

Daily Dosage: The single and daily dose of Filix-mas extract is 6 to 8 gm for adults and 4 to 6 gm for children. In case of an unsuccessful cure, the treatment may only be repeated after an interim of a few weeks. The single and daily maximum dose of Filix-mas liquid extract is 3 gm. The maximum daily dosage of Aspidinolfilicium oii solution is 20 gm.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1);

Storage: The drug is stored over adsorbant calcium for a maximum duration of 1 year, with a relative humidity below 0.05 in sealed containers away from light sources.

Manaca

Brunfelsia hopeana

DESCRIPTION

Medicinal Parts: The medicinal parts of Manaca are the roots and stem.

Flower and Fruit: The blue or white flowers are large, conical and very fragrant. The calyx is divided into 5 sections, with rounded lobes and 2 lips covering the bud. There are 4 fertile anthers, which fuse together above where they divide into 2 stigma-like lobes. The fruit is a fleshy or leathery capsule with numerous large seeds embedded in it.

Leaves, Stem and Root: Manaca is a shrub with obovate, deciduous leaves. The tough, woody roots are about 1.5 cm in diameter. They are yellow in the center and have a papery, pale brown epidermis. The stems have a small yellow medulla.

Habitat: Manaca grows in South America, the West Indies and Brazil.

Production: Manaca root is the root of *Brunfelsia hopeana*.

Other Names: Pohl, Vegetable Mercury

ACTIONS AND PHARMACOLOGY

COMPOUNDS

The active ingredients of the drug have not yet been adequately investigated. The spasmogenic bnfelsamidine (pyrrole-3-carboxamidine, identical with Nierembergia toxin) has been demonstrated in the related species *Brunfelsia grandiflora*.

EFFECTS

Diuretic and antirheumatic effect have been attributed to Manaca.

INDICATIONS AND USAGE

Unproven Uses: Manaca is used in the treatment of rheumatic conditions. In the past, folk medicine uses have included syphilis and scrofulosis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. In animal experiments, anxiety states, restlessness, increase in cardiac and pulmonary frequency, elevated salivation, vomiting, muscle tremors and tonic-clonic spasms were observed following intake of plant parts of *Brunfelsia* species, as well as death.

DOSAGE

Mode of Administration: Liquid extract preparations for internal use.

Mandragora officinarum

See Mandrake

Mandrake-

Mandragora officinarum

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried underground part, the fresh herb and the root.

Flower and Fruit: The numerous flowers are on light green pedicels. They are glabrous on the outside. The corolla is light green to yellow. The calyx is lanceolate with a pointed tip, half as long as the 3 cm corolla. The hairs on the outside of the corolla have heads, which consist of 15 cells and sit on a tiny stem of 2 to 3 cm. The fruit is yellow, globular and extends with a diameter of 2 to 3 cm well beyond the calyx.

Leaves, Stem and Root: The plant has a thick, tuberous root and is almost stemless. The root is light brown on the outside, simple or branched, and up to 60 cm deep. The leaves are all the same size, pubescent, short petiolate, ovate-lanceolate. They have a disgusting smell.

Habitat: The plant is indigenous to the Mediterranean region and bordering frost-free regions.

Production: Mandrake root is the dried, underground part of *Mandragora vernalis* or *M. officinarum*. The plant is gathered in uncultivated regions.

Not to be Confused With: The roots of *Atropa belladonna*, whose alkaloid pattern is similar.

Other Names: Mandragora, Satan's Apple

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MANDRAGORA ROOT

Tropane alkaloids (0.4%): chief alkaloids (-)-hyoscyamine, under storage conditions changing over to some extent into atropine, and scopolamine

COMPOUNDS: MANDRAKE HERB

The leaves have hardly been investigated, but in view of the demonstrated toxicity, the same alkaloid mixture is to be assumed.

EFFECTS: MANDRAKE ROOT AND HERB

The action of the drug is mainly due to the anticholinergic effect of the main alkaloids (atropine, hyoscamine and scopolamine).

INDICATIONS AND USAGE

Unproven Uses: Mandragora is one of the oldest of the medicinal plants. In folk medicine, a tincture of *Mandragora radix* was used for stomach ulcers, colic, asthma, hay fever and whooping cough. Today, Mandrake is only used in homeopathy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Skin reddening, dryness of the mouth, tachycardiac arrhythmias, mydriasis (the 4 early warning symptoms of a poisoning), accommodation disorders, heat build-up through decline in sweat secretion, micturition disorders and constipation can occur as side effects, particularly with overdoses.

OVERDOSAGE

Because of the high content of scopolamine in the drug, poisonings lead at first to somnolence, but then also, after the intake of very high dosages, to central excitation (restlessness, hallucinations, delirium and manic episodes), followed by exhaustion and sleep. Lethal dosages (for adults starting at 100 mg atropine, considerably less for children) carry with them the danger of respiratory failure. Severe poisonings are particularly conceivable in connection with the misuse of the drug as an intoxicant.

The treatment for poisonings include stomach emptying; temperature-lowering measures with wet cloths (no antipyretics!); oxygen respiration for respiratory distress; intuba-

tion; parenteral physostigmine salts as antidote; diazepam for spasms while monitoring respiratory function; catheter for cystoparalysis.

DOSAGE

Mode of Administration: The drug is now obsolete and is only rarely used in medicinal preparations. In homeopathy, dilutions from the fresh herb are used.

LITERATURE

Manna

Fraxinus ornus

DESCRIPTION

Medicinal Parts: The medicinal part is the juice extracted from the bark starting from the 8m to the 10th year. This tree yields from its bark a sugary sap known in pharmacy as Manna.

Flower and Fruit: The inflorescence is in upright, later hanging, feathery panicles. The sepals are very short. The petals are fused at the base in pairs. They are linear to narrowly linguiform and white. The 2 stamens have very long filaments. The fruit is a nutlet. It is hanging, linguiform,

3 to 4 mm long and 7 to 10 mm wide. It is rounded at the base or narrowed wedge-shaped, glossy dark brown, flat and longitudinally striped. The seeds are ovate, 15 to 20 mm by 4 to 5 mm, broad, flat, longitudinally striped and brown.

Leaves, Stem and Root: *Fraxinus ornus* is a tree growing up to 8 m tall with gray, crust-embossed bark. The new-year's branchlets are olive-green or brownish gray-green, somewhat glossy, with numerous, light-brown lenticels. The long shoots are downy to the tip; the short shoots are awned at the base. The terminal and lateral buds are orbicular and 4-scaled. The leaflets are elliptical-ovate-lanceolate or ovate, tapering to a tip and crenate-serrate. The upper surface is rich green and the underside lighter green with pink veins. The nerves are pink-tomentose.

Habitat: The tree is indigenous to southern Europe, extending to the southern borders of the Alps and as far as European Turkey. The tree is cultivated in Italy.

Production: Manna consists of the dried sap generated from the slit bark of trunk and branches of *Fraxinus ornus*, as well as its preparations in effective dosage. The eight to ten year-old trees are incised. The manna flows out of the bark and is collected.

Other Names: Flowering Ash, Manna Ash, Flake Manna

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alditols: Mannitol (70-90%)

Oligosaccharides: Stachyose, Mannotriose, Glucose, Fructose

EFFECTS

Manna acts as a laxative.

INDICATIONS AND USAGE

Approved by Commission E:

- Constipation

Unproven Uses: Manna is also used for ailments where an easier elimination and a soft stool is desirable, such as anal fissures, hemorrhoids, and post-rectal/anal surgery.

CONTRAINDICATIONS

The drug is not to be used in the presence of ileus.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Susceptible persons could experience flatulence and nausea.

DOSAGE

Mode of Administration: Comminuted herb and other galenic preparations for internal use.

Daily Dosage: For adults, 20 to 30 gm of drug; For children, 2 to 16 gm of drug. Manna, like other laxatives, should not be used for an extended period of time.

LITERATURE

*Iansel R, Keller K, Rimpler H, Schneider G (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994 (unter Fraxinus ornus).

Maranta arundinacea

See Arrowroot

Marigold

Calendula officinalis

TRADE NAMES

Califlora Calndula Gel, Calendula Gel, Calendula Ointment

DESCRIPTION

4Q *Flower and Fruit:* On the tip of each stem there is a 5 to 7 cm composite flower head consisting of an epicalyx of numerous narrow-lanceolate sepals, which are densely covered on both sides with glandular hairs. The inner section of the flower head is made up of orange-yellow tubular florets. The disc florets are pseudohermaphrodites; the female sterile. The zygomorphic ray florets at the edge are female, their stamens are completely absent, and their inferior ovaries are much more developed than those of the tubular florets. -*SeBftJEonns* only in the female ray flowers. The heterocarp acherte\$*are~sickle-shaped, curved and ringed.

Leaves, Stem and Root: The plant is usually an annual, seldom biennial. It grows to between 30 and 50 cm high and has a 20 cm long tap root and numerous thin, secondary roots. The stem is erect, angular, downy and branched from the base up or higher. The alternate leaves are almost spatulate at the base, oblong to lanceolate above and are all tomentose.

Characteristics: The plant has a strong, unpleasant smell.

Habitat: Central and southern Europe, western Asia and the U.S.

Production: Marigold flowers are the ray florets of the completely unfolded, collected and dried capitula of *Calendula officinalis*. Harvest begins in July. Drying takes place in the shade at a maximum of 45° C. *Calendula* herb consists of the fresh or dried above-ground parts of *Calendula officinalis* harvested during flowering season.

Not to be Confused With: Other Asteraceae; arnica and saffron are often adulterated with Marigold.

Other Names: Calendula, Holligold, Goldbloom, Golds, Mary Bud, Ruddes, Mary Gowles, Holigold, Marybud

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MARIGOLD FLOWERS

Triterpene saponins (2 to 10%): glycosides A to F (mono- or bisdesmosidic oleanolic acid glycosides)

Triterpene alcohols: tirterpene monooles (0.8%), triterpene dioles (4%) and triterpene trioles, including lupeol, taraxasterol, psi-taraxasterol, faradiol, arnidiol, their mono- and diesters (chiefly acetic acid, lauric, myristic and palmitic acid as acid components)

Flavonoids (0.3 to 0.8%): including isorhamnetin and quercetin glycosides

Hydroxycoumarins: including scopoletin, umbelliferone, esculetin

Carotinoids: chief components lutein, zeaxanthine

Volatile oil (0.2%): chief components alpha-cadinol, T-cadinol, fatty acids

Water-soluble polysaccharides (15%): rhamnoarabinogalactans, arabinogalactans

Polyynes

EFFECTS: MARIGOLD FLOWERS

The results of numerous studies on the mode of action are available. The flowers are antimicrobial due to the terpene alkaloids, lactone and flavones contained in the essential oil. Flavonoids isolated from flowers of *Calendula officinalis* demonstrated positive antimicrobial activity against *Staphylococcus aureus* (at a concentration of 1 milligram/milliliter (Dumenil et al., 1980). Other studies have demonstrated the flavones to be effective against *Klebsiella pneumoniae*, *Sarcina lutea* and *Candida monosa*.

Organic extracts of the dried flowers of *Calendula officinalis* exhibited potent anti-HIV activity in an in-vitro MTT/tetrazolium-based assay. It was also found that the organic extract caused a significant dose- and time-dependent reduction of HIV-1 reverse transcription activity (Kalvatchev et al, 1997).

Antiviral tests performed using the oleanolic acid glycosides from the aerial parts of the plant demonstrated an inhibitory effect against *Vesicular stomatitis virus* (VSV). Only one compound (3.MH) significantly affected replication in *Rhinovirus* (HRV) cultures (De Tommasi et al., 1991).

Topical application of Calendula has been shown to enhance the granulation and epithelialization of damaged skin (Klouček-Popova et al., 1982).

CLINICAL STUDIES

Wound Treatment/Tissue Repair

In one study, surgically induced skin wounds in rats were treated with a 5% Calendula ointment in combination with allantoin. Histological studies of the damaged tissue at 8 hours, 24 hours and 48 hours after inflicting the wounds were performed. The drug combination was found to markedly stimulate physiological regeneration and epithelialization. This effect was attributed to more extensive metabolism of glycoproteins, nucleoproteins and collagen protein during the regenerative period in the tissues (Klouček-Popova et al., 1982).

In another in-vitro study, an extract of Calendula was shown to induce formation of new blood vessels, which is important in the process of granulation (Patrick et al., 1996).

Anti-Inflammatory Action

The anti-inflammatory activity of the 3 main triterpene diol esters of Marigold were tested against Croton oil-induced edema of the ears in mice. Faradiol-3-myristic acid ester and faradiol-3-palmitic acid ester were found to have the same dose-dependent anti-inflammatory activity. The non-esterified faradiol was more active than the esters and had an equivalent effect on inflammation as an equimolar dose of indomethacin (Zitterl-Eglseder, et al., 1997).

In another study, the faradiol monoester was proven to be the most relevant anti-inflammatory principle due to its quantitative prevalence in the flowers. The unesterified faradiol was found to be the most active of all tested compounds, equal to indomethacin (Delia Loggia et al., 1994).

COMPOUNDS: MARIGOLD HERB

Triterpene saponins

Flavonoids

Carotenoids

Volatile oil

EFFECTS: MARIGOLD HERB

The astringent and granulation-promoting effect may be attributable to the essential oil, saponin and the amaroid loliolid. Efficacy has not been documented with valid data.

INDICATIONS AND USAGE

MARIGOLD FLOWERS

Approved by Commission E:

- Inflammation of the mouth and pharynx
- Wounds and burns

Externally, Marigold is used for inflammation of the oral and pharyngeal mucosa, poorly healing wounds, leg ulcers, to clean wounds, and for acute and chronic skin inflammation.

Unproven Uses: Marigold has been used extensively as a folk medicine. Externally it is used for varicosis, vascular disease wounds, inflammatory skin disease, anal eczema, proctitis, conjunctivitis. It is a constituent in treatments for sore, dry skin, bee stings and frostbite.

Marigold is used internally for inflammatory conditions of internal organs, gastrointestinal ulcers, constipation, worm infestation and dysmenorrhea. It is also used as a diuretic and diaphoretic. In the past (19th century), Marigold was used as a cancer therapy but is no longer in use today for this purpose.

Homeopathic Uses: Calendula officinalis is used for frostbite, burns to the skin and poorly healing wounds. The efficacy of the homeopathic uses has not been proven.

MARIGOLD HERB

Unproven Uses: Preparations are used for circulation, ulcers, spasms, swelling of the glands, jaundice, and for wounds and eczema. The herb is used in Russia for strep throat, on the Canaries for coughs and cramps and in China for irregular menstruation.

PRECAUTIONS AND ADVERSE REACTIONS

MARIGOLD FLOWERS AND HERB

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There is a low potential for sensitization after frequent skin contact with the drug. A low rate of contact dermatitis (less than 1%) occurred in patients patch-tested with a tincture of 10% Calendula. Only 2 of 1032 patients had a positive skin reaction to Calendula (Bruynzeel et al, 1992).

DOSAGE

MARIGOLD FLOWERS

Mode of Administration: Comminuted drug for decoctions, and other preparations to be applied topically. It is available as tinctures, liquid extracts and infusions.

How Supplied: Powder, gel ointment, ophthalmic solution, tincture (10%), tea (infusion), shampoo and hand cream.

Cream

Gel — 7%, 10%

Ointment — 4%

Ophthalmic solution

Tea

Tincture

Shampoo

Preparation:

Tea — 150 ml of hot water are poured over 1 to 2 teaspoons drug and strained after approximately 10 minutes.

Diaphoretic — 2 to 4 ml tincture to 250 to 500 ml water or 0.5 to 1 ml liquid extract 1:1 ethanol 40%.

Ointment (10 to 20%) — 2 to 5 g drug in 100 g ointment with a fatty base.

Marigold oil — olive oil extraction 1:10 peanut oil; this 1:1 in 40% ethanol or 1:5 in 90% ethanol.

Daily Dosage:

Sore Throat and Inflammation, powder — 1 to 2 grams of Calendula powder to 150 milliliters of water (Bisset, 1994).

Sore Throat and Inflammation, tea — 1 to 2 grams in one cup of water, steep 10 to 15 minutes.

Peptic Ulcer, tea — 1 to 4 grams in one cup of water, steep 10 to 15 minutes. Take three times daily (Mills, 1991).

Wound Treatment, ointment 2% to 5% — Apply topically to the affected area (Bisset, 1994).

Wound Treatment, compress — Steep one tablespoon herb in 500 milliliters water for 10 to 15 minutes and apply as a moist compress (Weiss, 1985).

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution sc twice weekly (HAB1).

Sfora^gProtejt from light and moisture. May be stored a maximum of *3 years:

MARIGOLD HERB

Mode of Administration: Since efficacy has not been proven the therapeutic value is uncertain.

Preparation: Contained in Kneipp's Calendula Ointment.

Marijuana

Cannabis sativa

DESCRIPTION

Medicinal Parts: The medicinal parts are the twig tips of the female flowers, with either flowers or fruit attached, the flower-bearing twigs that have been dried; the ripe hemp fruit and various homeopathic preparations of the fresh dried plant-parts.

Flower and Fruit: Hemp is dioecious. The female flowers are reduced to the perigone with one bract. The complete inflorescences form a leafy, false spike. The male flowers form panicles rich in pollen. Pollination is by wind. The fruit is a gray-green, glossy achene, 3.5 to 5 mm long and 2.5 to 4 mm wide. The seeds have little endosperm, are white, oily-fleshy and hooked.

Leaves, Stem and Root: Cannabis is an annual or biennial plant, which is usually branched and grows up to 5 m. The plant has rough-haired and compressed bristles. The leaves are long-petioled and 3 to 7 pinnate. The leaflets are lanceolate and serrate.

Habitat: The plant probably originated in the Middle East. Today it is grown worldwide in temperate and tropical regions.

Production: Indian hemp is the dried flowering or fruiting branch tips of *Cannabis sativa* var. *indica*. Production depends on the origin. One method is by stripping the leaves. Another method is stripping the resin exuded from the flowers and multiple fruit, which is shaped into balls or sheet forms. The final method involves cutting 5 cm to 10 cm long branch tips, which have just borne fruit, removing the leaves, pressing the shooting tips and gathering them into bundles.

Not to be Confused With: Prior to being used as a narcotic, marijuana was often combined with *Nicotiana tabacum*, *Lavandula officinalis*, *Nepeta catarina* or *Origanum vulgare*.

It is possible to confuse Marijuana with varieties of *Urtica*, *Moraceae*, *Ulmaceae* and *Boraginaceae*.

Other Names: Cannabis, Pot, Bhang, Grass, Indian Hemp, Weed, Ganja, Kif

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cannabinoids: chief active agent 9-tetrahydrocannabinol (9-THC = 1-THC), in addition to 60 additional cannabinoids

Volatile oil: of a very complex composition, with, among other things beta-caryophyllenes, humules, caryophyllene oxide, alpha-pinenes, beta-pinenes, limonene, myrcene, beta-ocimene

Flavonoids: including canniflavone-1, canniflavone-2

EFFECTS

Psychotropic action: In most subjects the effect is registered following an oral dose of 20 mg d-9-tetrahydrocannabinol or after inhaling a cigarette with 2% d-9-tetrahydrocannabinol. The symptoms are mood swings, reduction in drive, inability to think clearly, confusion, lack of concentration, impairment of short term memory and perception of time. Sensory impressions become heightened or experienced differently.

Complex tasks become more difficult, the capacity to understand or empathize is impaired. Negative reactions such as anxiety, panic and psychosis can occur.

It is only possible to describe this effect in animal tests, on the basis of free behavioral and controlled behavioral tests. A stimulating effect has also been observed with lower doses. Not all cannabinoids cause the same effect. CBC, CBD and CBG have no psychomimetic effect. Various interactions occur in combination with d-9-tetrahydrocannabinol.

Antiemetic action: has been reported in clinical studies involving cancer patients receiving chemotherapy.

Anticonvulsive action: d-9-tetrahydrocannabinol reduces the clinical and electrographic convulsion intensity in cats.

Analgesic characteristics: d-9-tetrahydrocannabinol displays analgesic characteristics, while at the same time partially increasing sensitivity to pain.

Body temperature: In animal tests, d-9-tetrahydrocannabinol and other cannabinoids reduced body temperature. The maximum reduction was relatively small. A stronger hypothermic effect was observed in higher doses, which affected behavior.

Respiratory tract: The inhalation of marijuana smoke caused bronchial dilation in healthy subjects. Methacholine-induced asthma attacks can be terminated by inhaling marijuana, in this case only psychomimetic cannabinoids are active.

fl

M

TM

Eyes: The ability of cannabis products to reduce intraocular pressure was discovered accidentally during trials on the effect of inhaling high doses. During the tests, intraocular pressure dropped by 45%. Eye drops applied locally had the same effect as standard medication but the effect lasted longer.

Immune system: In vitro and in animal testing, depending on the tissue, the immune system was significantly suppressed after cannabinoid administration.

Antimicrobial action: CBC, CBDA, CBG and d-9-tetrahydrocannabinol displayed antibacterial effects. CBC and d-9-tetrahydrocannabinol are bacteriostatic and bactericidal against *streptococci* and *staphylococci*.

Tumor inhibiting effect: The in-vitro inhibiting effect of d-9-tetrahydrocannabinol, d-8-tetrahydrocannabinol and CBN on the growth of transplanted lung tumors has been documented.

Heart, circulation: Cannaboids increase heart frequency, peripheral vasodilatation causes an increase in systolic blood pressure in the prone position and a decrease in the supine position.

Other effects: d-9-tetrahydrocannabinol is said to be an appetite stimulant. Long term usage leads to a clear increase in tolerance for most of the pharmacological effects.

Mode of action: Most cannaboids act on the CNS. The multiplicity of effects does not point to just one receptor. Possible interaction with cell-wall lipids or effects on prostoglandin biosynthesis is under discussion at present.

When administered orally, the first psychotropic reactions take 15 to 60 minutes later. The effect is at its optimum between 2 to 3 hours later and lasts for a total of 8 hours. When inhaled the effect sets in within a few minutes, reaches its climax or maximum after 30 minutes and lasts for 3 hours.

INDICATIONS AND USAGE

Unproven Uses: Cannabis was first mentioned in the pharmacopoeia of the Chinese Emperor about 3,000 years ago. Cannabis resin was used for beriberi, constipation, female conditions, gout, malaria, rheumatism and absent-mindedness. In medieval herbals, it was mostly used externally. There are recipes for balms for healing contractions and for cooling poultices for the head and joints and for podagra.

In 1845, the herb tips were mentioned for internal administration for gonorrhoea, angina pectoris and choking fits. It was not until the nineteenth century that Indian hemp was described as having a euphoric effect; it was used for insomnia, neuralgia, painful rheumatism, painful gastrointes-

tinal disorders, cholera, tetanus, epilepsy, strychnine poisoning, acute bronchitis, whooping cough, asthma, impending abortion and weak contractions. The extract was used as a sedative and mild soporific.

Current literature on phytotherapeutic drugs cite as indications for Indian hemp: painful disorders of the alimentary canal such as ulcers or cancer; respiratory disorders such as asthma, emphysema or chronic bronchitis; neuralgia, migraine; urinary tract disorders; mental disorders such as anxiety, neurasthenia or hysteria.

Dronabinol (delta-9-tetrahydrocannabinol, Marinol®) is marketed as an appetite stimulant in the treatment of AIDS-related anorexia and as an antiemetic for chemotherapy-induced emeses.

Indian and Chinese Medicine: In early Indian and Chinese medicine, it was used for nervous depressive states, insomnia, vomiting, tetanus and coughs.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The intake of toxic dosages, as is common with the smoking of cannabis, leads almost at once to euphoric states (pronounced gaiety, laughing fits) with exaggerated apprehension of sensual impressions. Alterations in the perception of time and space, as well as acoustical, visual and sensory hallucinations, lasting for 2 to 3 hours are common in higher dosages.

Driving ability can be disturbed for as long as 8 hours. Although only rarely reported, acute poisoning symptoms include nausea, vomiting, tear flow, hacking cough, disturbance of cardiac function and numbness of the limbs. Despite its widespread use as a recreational drug, instances of death are very rare. The results of chronic abuse are laryngitis, bronchitis, apathy, psychic decline and disturbances of genital functions.

DOSAGE

Mode of Administration: Marijuana is widely used as an illegal recreational drug. It is usually either smoked or eaten to produce mind-altering effects. The extracted or synthetically produced delta-9-tetrahydrocannabinol component is used legally in capsule form for oral administration.

How Supplied:

Capsules — (Marinol®) 2.5 mg, 5 mg, 10 mg

Dried Herb

Daily Dosage: The former average oral single dose of the drug was 0.1 gm.

Appetite stimulation — (Marinol®) 2.5 mg to 10 mg twice daily

Antiemetic (Marinol®) 5 mg/m² to 15 mg/m² four to six times daily

Narcotic — hash and tobacco are mixed. 1 cigarette contains 0.5 gm to 1 gm of the drug with at least 5 mg to 10 mg d-9-tetrahydrocannabinol for the psychotropic effect. More exact dosages are almost impossible to stipulate due to the varieties of action of the different cannabinoids and because of varying breathing techniques.

Storage: Store with care, protected from light. Studies have shown that 9-tetrahydrocannabinol has a strong affinity with synthetics and rubber and is easily absorbed by them.

Marrubium vulgare

See *Horehound*

Marsdenia condurango

See *Condurango*

Margli Blazing Star

*Liatris spicata** ~

DESCRIPTION

Medicinal Parts: The medicinal parts are the roots.

Flower and Fruit: The inflorescence is compound spikes of carmine red flowers, 4 to 8 mm in diameter.

Leaves, Stem and Root: The plant is a perennial and has an erect, leafy stem up 2 m. The leaves are opposite, up to 30 cm long and 1 cm wide. The rhizome is 1 cm or more in diameter. It is gnarled with several cup-shaped scars. The rhizome is brownish and slightly wrinkled on the outside. Inside it is whitish with dark gray spots.

Characteristics: The root is very solid. The taste is bitter, and the odor is faintly aromatic, resembling cedar.

Habitat: U.S., cultivated in parts of Europe.

Production: Marsh Blazing Star is the rhizome of *Liatris spicata*.

Other Names: Button Snakeroot, Gay-Feather, Backache Root, Colic Root, Devil's Bite

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Coumarin

Flavonoids: including rutin, quercetin-3-O-glucoside

EFFECTS

Main active principle: Coumarin. There is no reliable information available.

INDICATIONS AND USAGE

Unproven Uses: Marsh Blazing Star has been used for disorders of the kidney, dysmenorrhea, as a diuretic and for gonorrhoea treatment.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Ground drug as an infusion.

LITERATURE

Kern W, List PH, Hdrhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Marsh Marigold

Caltha palustris

DESCRIPTION

Medicinal Parts: The medicinal part is the dried aerial part of the flowering plant

Flower and Fruit: The flowers are about 4 cm in diameter. The involucre is simple and has 5 or more yolk-yellow, 12 to 18 mm long ovate bracts, that are glossy greenish on the outside. There are numerous stamens and 5 to 8 ovaries. The fruit is a star-shaped follicle with a short beak. The seeds are dark brown to black, measuring about 2.5 cm long by 1.3 cm wide.

Leaves, Stem and Root: *Caltha palustris* is a 15 to 30 cm high perennial marsh plant with a sturdy, many-headed rhizome. The glabrous, hollow stem is ascending or decumbent. The leaves are dark green and have an oily-glossy, cordate to reniform, crenate or serrate-margined leaf blade. The petioles

are grooved. The cauline leaves have shorter petioles and are smaller, clasping, and often have a membranous leaf sheath.

Characteristics: The plant is highly poisonous.

Habitat: *Caltha palustris* is found in all temperate regions of the Northern Hemisphere.

Other Names: Cowslip, Kingcups, Water Blobs, Horse Blobs, Bull's Eyes, Leopard's Foot, Meadow Routs, Verrucaria, Solsequia, Sponsa Solis, Palsy Root, Water Dragon

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Protoanemonine-forming agents: In the freshly harvested plant, it is presumably the glycoside ranunculin that changes enzymatically when the plant is cut into small pieces, and probably also when it is dried. It then changes into the pungent, volatile protoanemonine that is severely irritating to skin and mucous membranes but quickly dimerizes to anemonine; when dried, the plant is not capable of protoanemonine formation

Triterpene saponins: including hederagenin glycosides

Triterpene lactones: caltholid, palustroid

Isoquinoline alkaloids (aporphine type, very small quantities): including corytuberine, magnoflorine, protopine

EFFECTS

The drug lowers cholesterol levels and raises blood sugar levels in rats subsequent to oral administration (according to unavailable Russian research). There are also reports of anti-inflammatory effects on formaldehyde-induced inflammation.

The drug contains alkaloids of the benzyloisoquinoline type (magnoflorine, triterpene saponins, triterpene lactones). In animal tests magnoflorine temporarily lowers blood pressure and induces hypothermia in mice. An effect on the nicotine receptor in the parasympathetic nervous system is under discussion.

Insufficient information is available for an authoritative assessment of these effects.

INDICATIONS AND USAGE

Unproven Uses: Marsh Marigold was formerly used for jaundice, liver and bilious complaints. Some Native American tribes and those practicing Russian folk medicine used the plant for dressing and cleansing skin lesions and sores. When administered internally, it is meant to have a laxative and diuretic effect. Since this has not been sufficiently proven, and the side effects of Marsh Marigold are so dangerous, its internal use is not recommended.

Homeopathic Uses: The drug is used externally for skin rashes.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug.

Extended skin contact with the freshly harvested, bruised plant can lead to treatment-resistant blisters and cauterizations due to the release of protoanemonine, which is severely irritating to skin and mucous membranes.

If taken internally, large quantities could lead to severe irritation of the gastrointestinal tract, combined with colic and diarrhea, as well as with irritation of the urinary drainage passages.

OVERDOSAGE

Symptomatic treatment for external contact should consist of irrigation with diluted potassium permanganate solution followed by mucilage. Ingestion of the drug should be treated with gastric lavage followed by activated charcoal. The toxicity of this plant is less than that of many other Ranunculaceae (*Anemones nemorosa*) due to the relatively low levels of protoanemonine-forming agents.

DOSAGE

Mode of Administration:-Because of the herb's toxicity, its use is not recommended other than topically and as an extract.

Marshmallow

Althaea officinalis

TRADE NAMES

Marshmallow is available from a number of manufacturers, often as Marshmallow Root.

DESCRIPTION

Medicinal Parts: The medicinal parts are the mallow flowers, leaves, syrup and roots.

Flower and Fruit: The reddish-white flowers are usually in axillary or terminal clusters. The 6 to 9 sepals of the epicalyx are fused at the base, pointed and 8 to 10 mm long. There are 5 sepals, 5 heart-shaped petals and numerous stamens fused together with the anthers to a column. The ovaries are in a ring. There are numerous styles. The mericarps are smooth and downy. The 5 to 8 mm fruit is disc-like and breaks up into the mericarps, which are downy on the outside and often have fine, branched and radiating ribs. The seeds are dark-brown, glabrous, kidney-shaped and somewhat compressed.

Leaves, Stem and Root: The 60 to 120 cm high, hardy, velvety plant has a thick erect root up to 50 cm long by a few cm with secondary roots. The erect, succulent stem is usually woody at the base but unbranched. The leaves are short-petioled with an ovate, acute leaf-blade. The secondary leaves are narrow and drooping. The lower leaves are 5-lobed, and the upper cauline leaves are often triangular, wider than they are long, and irregularly and roughly dentate.

Habitat: The plant was originally indigenous to Asia and then spread westward to southeast Europe and eastward to China. In temperate latitudes, Marshmallow is established as a garden plant.

Production: Marshmallow root consists of the dried root, unpeeled or peeled, of *Althaea officinalis*. The root cultures are harvested from October to November, and after cleaning, are carefully dried at a maximum temperature of 35° C. Marshmallow leaves consist of the dried leaves of *Althaea officinalis*. After harvest, the leaves are dried at a temperature of 40° C.

Not to be Confused With: May be confused with other *Althaea* species.

Other Names: Moorish Mallow, Cheeses, White Mallow, Althea, Mortification Root, Sweet Weed, Wymote, Mallards, Schloss Tea

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages: mixture of colloiddally soluble polysaccharides, particularly galacturonic rhamnans, arabinogalactans, arabinans and glucans

Pectins

Starch

EFFECTS

The drug alleviates local irritation, inhibits mucociliary activity, stimulates phagocytosis, and functions as an anti-inflammatory and anticomplementary agent, immune stimulant and hypoglycemic. Efficacy has been demonstrated when used as a gargle for inflammation of the mucous membrane of the mouth and throat.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

Unproven Uses: Uses of the drug include irritation of the oral and pharyngeal mucosa and associated dry cough; mild inflammation of the gastric mucosa; as cataplasm for light inflammations and skin burns; and for insect bites. In folk medicine, marshmallow is employed for catarrh of the mouth, throat, gastrointestinal tract and urinary tract, as well as for inflammation, ulcers, abscesses, burns, constipation and diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Drug Interactions: The absorption of other drugs taken simultaneously may be delayed.

DOSAGE

Mode of Administration: Cut leaves for aqueous extracts as well as other galenic preparations for internal use. Cut or ground root for aqueous extracts as well as other galenic preparations for internal use. Marshmallow syrup is to be used only for treatment of dry coughs.

Note: Diabetics need to consider sugar concentration of marshmallow syrup.

How Supplied:

Capsules — 460 mg

Cough mixture

Drops

Liquid — Generally in syrup form, which is also called "snail juice": (1:1)

Powder

Tablets (coated and uncoated)

Preparation: To prepare a tea, use 10 to 15 g with 150 ml of cold water and allow to stand for 90 minutes, then warm to drink.

Daily Dosage: The average daily dose is 6 gm of the root and 5 gm of the leaf. The tea dosage is several cups of the slightly warmed tea taken during the course of the day. A single dose of the syrup is 10 gm.

Storage: The drug should be protected from light sources and insects.

Martagon

Lilium martagon

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, stem and flowers, which are collected when the plant is completely mature.

Flower and Fruit: The inflorescence is terminal and racemous with 3 to 10 inclined flowers. The flower buds are globose or oblong-ovate. The tepal petals are 3 to 3.5 cm long, involute and orange with dark spots. They contain a ciliate mauve honey gland. The anthers are red. The fruit is a 2-winged capsule with an erect fruit stem. The seeds are flat, light brown and 6 to 8 mm long. Since the seeds do not ripen in northern regions, propagation takes place by means of bulbils, which occur at the leaf axils. Flowers are produced during the third year of growth.

Leaves, Stem and Root: The plant is a perennial, 30 to 60 cm high or higher. The bulb is golden yellow, ovate and about 5 cm long. The stem is erect, round, glabrous or with short rough hairs on the upper section. The stem is green or spotted red and leafy in the middle. The leaves are 7 to 11 ribbed, oblong-spatulate, shortly ciliated and up to 15 cm long.

Habitat: The plant comes from China and Japan, but is also cultivated in central and southern Europe.

Production: Martagon is the tuber of *Lilium martagon*.

Other Names: Purple Turk's Cap Lily, Turk's Cap

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Soluble polysaccharides

Starch

Gamma-methylene glutamic acid

Tuliposide

The constituents of the drug have not been fully investigated.

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as a diuretic and in the treatment of dysmenorrhea. It is used externally for ulcers.

Homeopathic Uses: All the above uses are also employed in homeopathic medicine.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Martagon is available as cut drug for internal use in infusions and external use in poultices. Homeopathic dilutions are also available.

LITERATURE

Satou T, Mimaki Y, Kuroda M, Sashida Y, Hatakeyama Y, A pyrroline glucoside ester and steroidal saponins from *Lilium martagon*. *Phytochemistry*, 41:1225-30, 1996 Mar.

Masterwort

Peucedanum ostruthium

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root.

Flower and Fruit: The white flowers form many-blossomed compound umbels. There is no involucre. The epicalyx has only a few leaves. The calyx is indistinct. The petals have indented, pointed tips.

Leaves, Stem and Root: The plant grows from 50 to 100 cm high. The rhizome is gray-brown and produces runners. The stem is round, slightly grooved and glabrous. The basal leaves are doubly trifoliate. The leaflets are ovate to oblong, about 4 cm wide, roughly serrate and pale green beneath. The lateral leaflets are dipinnate. The terminal leaflet is tripinnate. The cauline leaves are small with a bulbous, membranous sheath.

Characteristics: Masterwort has an aromatic-bitter taste.

Habitat: The plant grows in central Europe.

Production: Masterwort rootstock is the rhizome of *Peucedanum ostruthium*. The thickened rhizomes are harvested. These are dug up in autumn or spring, then cleaned, freed from any root or green residue, cut and dried at a temperature of 35° C.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil: chief components alpha-pinene, (+)-phellandrene, (+)-limonene, esters of isobutyric and isovaleric acid

Furocoumarins: in particular imperatorin, oxypeucedanin, osthrol gamma-chromones: peucenine

*Phthalides**Polyynes***EFFECTS**

Masterwort is said to be stomachic and to have a mild sedative effect. Its main action is as a diuretic.

INDICATIONS AND USAGE

Unproven Uses: Masterwort is used for bloating, flatulence, Roemheld syndrome, digestive disorders, weak stomach and intestinal catarrh.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Light-skinned individuals may experience an increase in UV-sensitivity, due to the phototoxic effect of the furocoumarins.

DOSAGE

Mode of Administration: Masterwort is obsolete as a drug in German-speaking countries. It is occasionally used as a constituent in medicinal preparations in combination with other bitters. It is administered as a powder or as an infusion.

Preparation: To prepare an infusion, use a cold extraction of 1 teaspoonful of the drug over a period of 8 hours.

Daily Dosage:

Infusion — Can be drunk throughout the day.

Powder — 0.5 gm to 2 gm can be taken 2 to 3 times daily.

Storage: Store in a dry place, in closed containers.

Mastic Tree

Pistacia lentiscus

DESCRIPTION

Medicinal Parts: The medicinal part is the resin.

Flower and Fruit: The inflorescence is compact and spike-like. The flowers are yellowish or purplish. The drupe is approximately 4 mm, globose, apiculate and is red, but later turns black.

Leaves, Stem and Root: The plant is a small evergreen tree or shrub 1 to 8 m high. The trees are said to be exclusively male. The leaves are bipinnate. The 8 to 12 leaflets measure 1 to 5 cm by 0.5 to 1.5 cm. They are lanceolate to ovate-lanceolate, mucronate and coriaceous. The rachis is broadly winged. The petioles are glabrous.

Habitat: The tree thrives in the Mediterranean region, Portugal, Turkey, on the Canaries and in tropical Africa.

Production: Mastic resin is the resin from the trunk of *Pistacia lentiscus*.

Other Names: Lentisk

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Resins (90%): chief components are the triterpenes mastic acid, isomastic acid, oleanolic acid and tirucalol

Volatile oil (1-3%): including alpha-pinene, myrcene, linalool, beta-pinene, beta-caryophyllene (constituents vary a great deal)

EFFECTS

In animal experiments Mastic is ulcer protective. The amaroids and essential oil are astringent and aromatic.

INDICATIONS AND USAGE

Unproven Uses: Mastic Tree resin was formerly used in dentistry, as a material for fillings. The masticated resin releases substances that freshen the breath and tighten the gums.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pediatric Use: There is an occasional risk of diarrhea in small children.

DOSAGE

Mode of Administration: The resin is used for the production of chewing gum and is used in the food and drink industries.

Mate

Ilex paraguariensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried or roasted leaves.

Flower and Fruit: The white flowers are axillary and are in clusters of 40 to 50. They have a 4 to 5 sepaled calyx and 4 to 5 petalled corolla, are unisexual and dioecious. The fruit is a globoid reddish drupe with 5 to 8 seeds.

Leaves, Stem and Root: The plant is an evergreen shrub or tree up to 20 m tall with pale bark and an oblong-oval crown. The leaves are alternate, obovate, acuminate with a crenate or serrate margin. They are dark green above and pale green beneath and are tough, coriaceous and 6 to 20 cm long and 3 to 9 cm wide.

Characteristics: The taste is astringent and bitter. The odor is characteristic and aromatic.

Habitat: The plant is only found in South America between the 20th and 30th parallel.

Production: Mate consists of the dried leaf and leaf stem of *Ilex paraguariensis*. It is harvested every 2 years from May to September, then dried and cut.

Other Names: Yerba Mate, Jesuit's Tea, Paraguay Tea

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Purine alkaloids: chief alkaloids caffeine (0.4-2.4%) and theobromine (0.3-0.5%)

Caffeic acid derivatives: including among others chlorogenic acid, neochlorogenic acid, cryptochlorogenic acid

Flavonoids: including among others rutin, isoquercitrin, kaempferol glycosides

Triterpene saponins (mate saponins)

Nitrite glycosides: menisdaurin, not cyanogenic

Volatile oil

EFFECTS

The main active principles are caffeine in varying amounts, tannins and small amounts of essential oil. Depending on the caffeine content the drug can display analeptic, diuretic, positively inotropic and positively chronotropic, glycogenolytic and lipolytic effects.

The centrally stimulating effect of the drug is due to the chlorogenic acids.

INDICATIONS AND USAGE

Approved by Commission E:

- Lack of stamina

Mate is used for mental and physical fatigue.

Unproven Uses: In folk medicine Mate is used internally for ulcers, rheumatism, anemia, neurasthenia, depression, as a diuretic for oliguria and as a prophylaxis against fever and infections. Externally Mate is used as a poultice for ulcers and inflammation.

Homeopathic Uses: *Ilex paraguariensis* is used to treat poor digestion.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Mate is available as comminuted herb infusions, herb powder and as galenic preparations for internal use. Mate-drug is available as filter teas in mono tea form and in various tea combinations such as bladder and kidney teas.

Preparation: To prepare an infusion, pour water that has just been brought to boil over 1 teaspoonful drug (2 gm) and leave to draw for 5 to 10 minutes, then strain. The briefly infused drink is more stimulating, less astringent and tastes better (caffeine dissolves more quickly than the tannins).

Roasted leaves: The dried leaves are heated for 20 minutes to 100° C and then rinsed with water. The leaves are stored for 3 to 4 days to allow the taste and aroma to develop (DAC86).

Daily Dosage: 3 gm of drug.

Tea: as required (1 teaspoon corresponds to 2 gm drug).

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB34).

Matico

Piper elongatum

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the leaf.

Flower and Fruit: The inflorescence is a long spike of up to 20 cm, opposite the leaf. The flowers have no tepals and are very small with 4 stamens and an obovoid ovary with a very short 3-stigmaed style'. The fruit is a very narrow, black, 1-seeded drupe.

Leaves, Stem and Root: *Piper elongatum* is a shrub that typically grows to over 2 m high. The leaves are alternate, entire, up to 20 cm long and 4 cm wide, short petiolate and coriaceous. The lamina is elongate-lanceolate, long acuminate and punctate with oil glands. The leaf base is unevenly cordate; the petiole is winged and clasps the stem. The stem is round, conspicuously jointed and pubescent toward the top.

Characteristics: The leaves have an aromatic smell when rubbed and a bitter, mildly astringent taste.

Habitat: The plant is indigenous to Argentina, Columbia and Tanzania.

Production: *Piper elongatum* is cultivated as a medicinal plant in the countries of origin. Matico leaves are the dried leaves of *Piper elongatum*. The fresh leaves are also used medicinally.

Not to be Confused With: Confusion can occur with Piper aduncum.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.3 to 6.0%): chief component dill apiol, as well as asaltone, parsley apiol

Tannins

Sesquiterpene: maticin

EFFECTS

Use as a hemostyptic could possibly be a result of the tannin content.

INDICATIONS AND USAGE

Unproven Uses: The hemostyptic effect of the leaves is used externally for bleeding wounds and in the treatment of ulcers. Internally, it is used for urogenital complaints (primarily bacterial infections), atonic diarrhea and dysentery. In Peru, Matico is considered to be an aphrodisiac. It has also been used for minor wounds such as leech bites and after tooth extraction.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The leaves are administered as whole, cut and powdered forms for internal and external use.

Preparation: There is no information in the literature.

Daily Dosage:

Powder — 0.5 to 2 g drug, 3 to 4 times daily

Infusion — single dose: 1 g drug per cup; or 10% infusion: taken 3 or 4 times daily.

Matricaria Recutita

See German Chamomile

Mayapple

Podophyllum peltatum

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizome and the resin extracted from it.

Flower and Fruit: The solitary white flowers are located in the stem bifurcation between 2 leaves. When the flower drops, the developing fruit swells to the size and shape of a 2.5 to 5 cm long rosehip. It is yellow and fleshy.

Leaves, Stem and Root: The plant is a perennial reaching a height of 40 cm. It has a bifurcated, 45 cm high stem and deeply indented, umbrella-like, hand-sized leaves. The rhizome is reddish-brown and is 0.5 cm in diameter. Depending on the time of harvesting, the surface of the rhizome may be smooth or wrinkled. Nodes occur at intervals of 3 to 5 cm, and the fracture is whitish.

Characteristics: The odor is unpleasant and acrid.

Habitat: The plant is indigenous to northeast North America.

Production: Mayapple rhizome consists of the dried rhizome and connected roots of Podophyllum peltatum. Mayapple resin consists of the resin of the dried and aged rhizome of Podophyllum peltatum.

Not to be Confused With: Mayapple should not be confused with English Mandrake or Bryonia dioica.

Other Names: Duck's Foot, Ground Lemon, Hog Apple, Indian Apple, Mandrake, Raccoon Berry, Wild Lemon

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE ROOT

Podophyllin: mixture of ethanol-soluble extractive material from the root

Lignans: chief components podophyllotoxin (20%), including as well, alpha-peltatin (5%), beta-peltatin (10%), 4'-dimethyl podophyllotoxin, dioxypodophyllotoxin

EFFECTS

The drug is antimitotic.

INDICATIONS AND USAGE

Approved by Commission E:

M Warts

Preparations of Mayapple are used externally for removal of pointed condyloma. The treated skin surface must not be larger than 25 sq. cm. Be sure to protect skin adjacent to the treated area.

CONTRAINDICATIONS

The drug is contraindicated in pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drug is severely irritating to skin and mucous membranes. External administration of the drug over large skin areas can also bring about resorptive poisonings. The drug should not be taken internally in allopathic medicine. With external use, the skin area to be treated should not exceed 25 sq. cm. The drug serves as an industrial drug for

the extraction of podophyllotoxin and its semi-synthetic derivatives that are used in tumor therapy.

Use in Pregnancy: The drug is contraindicated in pregnancy.

OVERDOSAGE

In dosages over 0.2 gm, it causes severe abdominal pain, bloody-watery diarrhea, vomiting of liquid bile, dizziness, headache, coordination disorders, spasms, nephritis, later collapse and death in coma through respiratory failure.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) and instillation of activated charcoal, the therapy for poisonings consists of treating spasms with diazepam (i.v.), electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be used. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: The dried rhizome is used for production of resin exclusively for external application.

Daily Dosage: The daily dosage is 1.5 to 3.0 gm root, 1.5 to 3.0 gm liquid extract or 2.5 to 7.5 gm tincture.

Maytenus ilicifolia

See Congorosa

Meadowsweet

Filipendula ulmaria

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried flowers, the dried aerial parts of the flowering plant, and the fresh underground and aerial parts of the flowering plant.

Flower and Fruit: The radial flowers are in terminal compound, loose cymes arranged with erect, very irregular branches. The 5 to 6 free sepals are triangular, pointed, 1 mm long, downy on the outside and fused to the flat receptacle at the base. The 5 to 6 petals are obovate, narrowed to a short stem, yellowish white and 2 to 5 mm long. The ovaries are glabrous or downy and have a flattened-stigma-bearing style under 1 mm. The one-seeded indehiscent fruit twine in a spiral.

Leaves, Stem and Root: The plant is perennial and grows to about 50 to 200 cm high. The stem is erect, simple or branched above, woody below, angular, usually glabrous or occasionally tomentose. The leaves are alternate, long-petioled to almost sessile, irregularly odd-pinnate with paired opposite pinna. These are ovate, rounded at the base or short-wedge-shaped, double serrate to dentate. The pinna is dark green and usually glabrous above and gray to white tomentose beneath and only pubescent on the ribs.

Characteristics: The leaves smell very different from the flowers, having a pleasant, almond-like fragrance.

Habitat: The plant is found in northern and southern Europe, North America and northern Asia.

Production: Meadowsweet flower consists of the dried flower of *Filipendula ulmaria* (syn. *Spiraea ulmaria*), as well as its preparations. Meadowsweet herb consists of the dried

above-ground parts of *Filipendula ulmaria*, harvested during flowering season, as well as its preparations. The plant is combed off during the flowering season and air-dried in a dark place.

Not to be Confused With: May be confused with elder flowers and *Filipendula hexapetala*.

Other Names: Bridewort, Dolloff, Meadsweet, Meadow Queen, Meadow-Wort, Queen of the Meadow, Lady of the Meadow, *Spirea ulmaria*

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MEADOWSWEET FLOWER

Flavonoids: chief components - spiraeoside (quercetin-4'-O-glucosides, 3-4%), further including among others kaempferol-4'-O-glucosides, hyperoside, rutin

Volatile oil (0.2%): chief components salicylaldehyde and methyl salicylate (yielded through dehydration from monotropitin - salicylaldehyde primveroside - and spiraeine - salicylic acid ester primveroside), further, a little vanillin and heliotropine

Tannins: ellagic tannins

EFFECTS: MEADOWSWEET FLOWER

Meadowsweet has antiphlogistic and astringent effects. The drug, which contains salicylate, has an antimicrobial, antipyretic and diuretic effect. In animal tests the flavonoid fraction had a positive effect on the healing of stomach ulcers and a tone-increasing effect on smooth muscle was observed.

COMPOUNDS: MEADOWSWEET HERB

Etheric oil (traces): including salicylic acid ester

Flavonoids: including rutin, hyperoside, quercetin-3-O-glucuronide, quercetin-3-O-arabinoside

Tannins: ellagic tannins

EFFECTS: MEADOWSWEET HERB

The drug, which contains salicylate, has an antimicrobial, antipyretic and diuretic effect. In animal tests the flavonoid fraction had a positive effect on the healing of stomach ulcers and a tone-increasing effect on smooth muscle was observed.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough
- Bronchitis
- Fever and cold

Meadowsweet is used as supportive therapy for colds, for febrile colds, and as a diuretic.

Unproven Uses: In folk medicine Meadowsweet is used as a diuretic, for rheumatism of the joints and muscles, for gout, I

for bladder and kidney disease and for headaches. Meadowsweet herb is used for stomach complaints with hyperacidity, prophylaxis and therapy of stomach ulcers and for diarrhea in children.

Homeopathic Uses: *Filipendula ulmaria* is used for rheumatism and inflammation of mucous membrane.

CONTRAINDICATIONS

Preparations are contraindicated when sensitivity to salicylate exists.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Overdosage can lead to queasiness and stomach complaints.

DOSAGE

Mode of Administration: Commuted drug and other galenic preparations for infusions. Meadowsweet flower is contained in various tea mixtures which are used for the flu, rheumatism, kidney and bladder inflammations.

Preparation: To prepare an infusion, pour boiling water over 3 to 6 gm cut drug, steam for 10 minutes and then strain. Fluid extract (herb): 1:1 in 25% ethanol (BHP83). Tincture (herb): 1:5 in 45% ethanol (BHP83)

Daily Dosage: 2.5 to 3.5 gm of Meadowsweet flower or 4 to 5 gm Meadowsweet herb. Infusion dosage is 1 cup several times a day (1 tsp. = 1.4 gm drug). Liquid extract (herb) daily dose: 1.5 to 6 ml; Tincture (herb) daily dose: 2 to 4 ml

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute), or 1 to 3 times daily (chronic); from D6: parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1)

Storage: Should be protected from light and moisture.

Mercury Herb

Mercurialis annua

DESCRIPTION

Medicinal Parts: The drug is the flowering plant.

Flower and Fruit: The plant has yellow-green flowers. The male flowers are in tightly packed, interrupted ears, on thin, hair-like pedicles. They have 12 stamens. The female flowers are short-petioled in twos or threes in the leaf axils. The style is short or non-existent. There are 2 stigmas. The fruit is a 2-headed capsule.

Leaves, Stem and Root: The plant is an annual that grows 20 to 50 cm high. The stem is erect, cross-branched, obtuse, quadrangular, glabrous and segmented. The leaves are opposite, petiolate, ovate to lanceolate, light green and have a ciliate margin.

Characteristics: The plant has an unpleasant smell when rubbed. The whole plant has no latex.

Habitat: The plant grows in Europe and is naturalized in the eastern U.S.

Production: Mercury Herb is the flowering herb of *Mercurialis annua*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyanogenic glycosides (small amounts)

Pyridone derivatives (that color the urine red): including among others hermidin

Saponins (1%)

Amines: including among others, methyl amine (mercurialine), ethyl amine, propyl amine, isobutyl amine, isoamyl amine

Flavonoids: including among others, rutin, narcissine, isorhamnetin.

Nothing is known regarding the type of the toxins. The cyanogenic glycosides are probably not responsible for the toxicity.

EFFECTS

The drug is slightly poisonous, and it can lead to diarrhea and an overactive bladder. The root and stock act as strong laxatives.

INDICATIONS ANOU^AGE"

Unproven Uses: The drug is used for suppurating inflammation, as a laxative and diuretic, and as an adjuvant in the treatment of gastrointestinal and urinary tract diseases.

Homeopathic Uses: Mercury Herb is used for rheumatism and colds.

PRECAUTIONS AND ADVERSE REACTIONS

The fresh plant, in particular the root and the rhizome, are considered poisonous. Symptoms of poisoning include diarrhea, nerve paralysis, and liver and kidney damage. Poisonings, including fatal ones, are only known among animals. There are no reports available on the drug's toxicity in humans. The intake of small doses would likely lead to nothing more than diarrhea.

DOSAGE

Mode of Administration: The drug is administered ground, as an extract, in juice and in homeopathic dilutions.

Mexican Scammony Root

Ipomoea orizabensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried roots and the steamed ethanol extract from the roots.

Flower and Fruit: The plant has reddish-purple, campanulate flowers.

Leaves, Stem and Root: Mexican Scammony Root is a twining plant with large cordate leaves. The root tuber is about 18 to 25 cm long, 9 to 10 cm wide and cylindrical-fusiform. It is grayish-brown to brownish-black and wrinkled externally. Inside the section shows irregular concentric rings and scattered resin glands, resembling jalap.

Characteristics: The taste is acrid and resinous. The odor is slight.

Habitat: Mexico

Production: Mexican Scammony Root is the root extracted from *Ipomoea orizabensis*. Both the root and the yielded resin are effective as drugs.

Other Names: Ipomoea, Jalap, Mexican Jalap

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glycoresines (12-15%, resinous): polymeric ester glycosides made up of hydroxy- and dihydroxy fatty acids bonded in ester-like fashion (including 11-hydroxy palmitic acid = jalapinolic acid), on the hydroxyl groups of which oligosaccharide remnants are bonded as glycosides. These bear in turn short-chained acyl remnants (acetyl, isobutyryl, isovaleryl, and tigoyl remnants).

EFFECTS

The drug has a strong laxative effect on the small and large intestines caused by resin (Resina Scammoniae) combined with ester glycoside mixtures (glycoretine).

INDICATIONS AND USAGE

Unproven Uses: Preparations have been used as a very drastic purgative for constipation.

CONTRAINDICATIONS

The drug is contraindicated in pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Intestinal colic occurs frequently as a side effect.

Pregnancy: Mexican Scammony Root is contraindicated in pregnancy.

OVERDOSAGE

Overdosages cause vomiting.

DOSAGE

Mode of Administration: The herb is obsolete as a drug in many countries. Used on rare occasions in combination preparations. The same applies to other *Ipomoea* varieties e.g., *I. turpethum*, *I. operculata*.

Daily Dosage: The average single dose is 1 gm of drug.

Mezereon

*Daphne mezereum***DESCRIPTION**

Medicinal Parts: The medicinal part is the bark, which is collected before the flowering season.

Flower and Fruit: The flowers are dark pink. They appear before the leaves in irregular, sessile clusters usually in threes. There is a 4-tipped calyx with an external silky-haired tube. There are 8 stamens in 2 rows and 1 free ovary. The fruit consists of a bright red, pea-sized, juicy, ovoid, 1-seeded berry.

Leaves, Stem and Root: The plant is a 50 to 150 cm high perennial. It is a deciduous, sparsely branched shrub with reed-like, grayish or yellow-brown branches that are very tough. The leaves are short-petioled, lanceolate, narrowing toward the petiole and entire-margined.

Characteristics: Mezereon has a strong, pleasant fragrance. The plant is poisonous and can be fatal if ingested. It is a protected species.

Habitat: The plant is indigenous to Europe as far as Siberia. It is cultivated in the U.S., Canada and elsewhere.

Production: Mezereon root, root bark and bark are from *Daphne mezereum*. The bark of the trunk and the root are gathered before flowering, dried and rolled up but with the phloem facing outward. Care should be taken not to destroy the plant during the harvest.

Other Names: Spurge Olive, Spurge Laurel, Daphne, Spurge Flax, Wild Pepper, Dwarf Bay, Camolea

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Diterpenes: diterpene esters, daphnane derivatives, including mezerein, daphnetoxin

Hydroxycoumarins: including umbelliferone, daphnetin, daphnoretin (dimerous), triumbellin (trimerous) and hydroxycoumarin glycosides, for example daphnin, daphnorin

*Flavonoids***EFFECTS**

The drug acts as a powerful skin stimulant, hallucinogenic and a rubefacient. A possible immunostimulating effect has been observed in vitro. Antitumoral, anticoagulant and abortifacient effects have been observed in animal tests.

INDICATIONS AND USAGE

Unproven Uses: Use of Mezeron is no longer recommended due to its toxicity.

In the past, Mezeron root was used to relieve headache, toothache, gout, whooping cough, syphilis, constipation and worm infestation. It was used externally for joint pains and to increase circulation in the case of rheumatic complaints, skin conditions and conjunctivitis. The drug is known in old drug manuals as 'Spanish fly plaster' or Drouotic plaster and recommended for various pain symptoms.

Homeopathic Uses: In homeopathic medicine, Daphne mezereon is used for skin conditions such as cradle cap, shingles, weeping eczema and encrusted, weeping blisters, as well as for neuralgia and pains in the bones.

PRECAUTIONS AND ADVERSE REACTIONS

External contact with the severely irritating toxic diterpenes of Daphne mezereon causes erysipeloid reddening of the skin, swelling, blister formation and shedding of the epidermis. Extended exposure leads to the formation of necroses. Contact with the eyes causes severe conjunctivitis. If taken internally, reddening and swelling of the oral mucous membranes, feeling of thirst, salivation, stomach pains, vomiting and severe diarrhea occur.

Resorption of the drug may cause headache, dizziness, stupor, tachycardia, spasms and possibly death through circulatory collapse. Cool wrappings and anesthetic salves are recommended for treatment of the skin injuries.

OVERDOSAGE

Poisoning resulting from ingestion of the drug should be treated with gastric lavage and calcium gluconate, IV. Administration of corticosteroids may also be indicated.

DOSAGE

Mode of Administration: The drug is seldom used today. Used in homeopathic dilutions, topically and internally.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Storage: The effect fades if it is stored for too long. Therefore, do not store for a period of more than 2 years.

Milk Thistle

Silybum marianum'

TRADE NAMES

Milk Thistle (available from numerous manufacturers), Silymarin, Milk Thistle Extract, Milk Thistle Super Complex, Milk Thistle Phytosome, Alcohol Free Milk Thistle Seed, Milk Thistle Extract, Milk Thistle Plus, Silymarin Milk Thistle, Milk Thistle Power, Time Release Milk Thistle Power, Thisilyn Standardized Milk Thistle Extract

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the ripe seeds.

Flower and Fruit: The inflorescences are large, solitary and purple. They consist of somewhat nodding, composite flower heads. The perigone is globular. The inner tepals taper to a slender point, and the outer tepals are tough at the base, then spread and terminate at a horny tip. There are only tubular florets. The fruit is brown, spotted and glossy, with a white tuft of hair.

Leaves, Stem and Root: The plant grows from 70 to 150 cm high with an erect stem. The leaves are arranged in different levels with the lower leaves indented-pinnatisect, and the upper ones lanceolate and clasping. There are white spots along the ribs of the leaf and yellow thorns at the margin.

Habitat: The plant is indigenous to Europe.

Other Names: Marian Thistle, Mediterranean Milk Thistle, Mary Thistle

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MILK THISTLE HERB

Flavonoids: in particular, apigenin-, luteolin- and kaempferol-7-0-glycosides, apigenin-4,7'-di-0-glucoside, kaempferol-7-0-glucoside-3-sulfate

Steroids: sterols, including beta-sitosterol, beta-sitosterol glucoside

Polyynes

Organic Acids: fumaric acid (3.3%)

(Silymarin is absent; it is localized only in the seed case)

EFFECTS: MILK THISTLE HERB

The cholagogue effect of the drug has not been documented.

COMPOUNDS: MILK THISTLE SEED

Silymarin (flavonolignan mixture, 1.5-3%): chief components silybin A, silybin B (mixture known as silibinin), isosilybin A, isosilybin B, silychristin, silydianin

Flavonoids: apigenin, chrysoeriol, eriodictyol, naringenin, quercetin, taxifolin

Fatty oil (20-30%)

EFFECTS: MILK THISTLE SEED

Hepatoprotective Effects

The hepatoprotective activity of the seed is from silymarin, in particular, silychristin and silydianin. The compounds seem to inhibit the entrance of toxins and block toxin-binding sites through alteration of the liver cell's outer membrane. (Hikino, 1994; Leng-Peschlow, 1996). The hepatoprotective effect of silibinin also involves different functions of the Kupffer cells. Silibinin decreases production of superoxide-anion radicals and nitric-oxide-, (free-radical scavenger or antioxidant) by the Kupffer cells. Silibinin also inhibits leukotriene formation by the Kupffer cells (Dehmlow, 1996). Silymarin increases glutathione production by the liver, intestines and stomach. Glutathione is used for detoxification cells in the liver (Valenzuela, 1989). Silibinin decreases hepatic and mitochondrial glutathione oxidation induced by iron overload and is a mild chelator of iron (Pietrangelo, 1995).

Protective Effects

The seed exerts an anti-inflammatory effect through inhibition of leukotriene production by silymarin (Leng-Peschlow, 1996). A renoprotective effect of the herb on kidney cells damaged by acetaminophen, cisplatin and vincristin was demonstrated in a recent study. Silibinin and silychristin demonstrated remarkable stimulatory effects on proliferation rate, biosynthesis of protein and DNA, and activity of the enzyme lactate dehydrogenase in kidney cells (Sonnenbi-

chler, 1999). Silibinin reduces intracellular and secreted forms of prostate-specific antigen (PSA) levels and inhibits cell growth via a G1 arrest in cell cycle progression in hormone-refractory prostate carcinomas. Silibinin-induced G1 arrest decreases the kinase activity of cyclin-dependent kinases (CDKs) and associated cyclins for an anticarcinogenic effect (Zi, 1999; Zi, 1998)

Liver Regenerative Effects

Silymarin stimulates RNA polymerase I in the cell nucleus of the hepatocytes, resulting in an increase of ribosomal protein synthesis and the regenerative ability of the liver. This mechanism is of particular importance in the antidote effect against death-cap mushroom poisoning since the poison which it contains, alpha-Amanitin, inhibits this enzyme in the cell nucleus. The drug also has a cholagogic effect.

CLINICAL TRIALS

Hepatoprotection

A double-blind, randomized, placebo-controlled trial was conducted to determine the hepatoprotective effect of silymarin in 170 cirrhosis patients. The patients were given either 140 mg silymarin three times daily or a placebo. After treatment for two years, biochemical markers did not change significantly. After a four-year analysis, treatment was seen most effective in patients with alcoholic cirrhosis and Child's A group classification of portal hypertension. The drug was ineffective in patients with Child's B and C group hypertension (Ferenci, 1989).

The effect of silymarin in 200 alcoholic patients with cirrhosis of the liver was demonstrated in a controlled, double-blind, randomized and multicenter trial. The study was comparing 450 mg of silymarin (150 mg/ three times per day) with placebo. Patient survival was similar in the silymarin and placebo treatment group after 2 years of therapy. No relevant side effects were observed in either group, and the results indicated that silymarin has no effect on survival and the clinical course in alcoholics with liver cirrhosis (Pares, 1998).

Silymarin 420 mg per day was compared to placebo in a double-blind, controlled study to determine the effect on chemical, functional and morphological alterations of the liver. The study involved 106 patients with relatively slight and subacute liver disease induced by alcohol abuse. The patients were selected on the basis of elevated serum transaminase levels. After 4 weeks, there was a highly significant decrease of S-SGPT and S-SGOT in the silymarin treatment group. There was also a decrease in the serum total and conjugated bilirubin with the silymarin treatment group, although the decrease was not significant. Histological

changes normalized significantly more in the silymarin treatment group (Salmi, 1982).

INDICATIONS AND USAGE

MILK THISTLE HERB

Unproven Uses: Preparations of Milk Thistle herb are used as a stimulant, for functional disorders of liver and gallbladder including jaundice, gallbladder colic and diseases of the spleen. The herb was formerly used as a malaria treatment, emmenagogue and for uterine complaints.

MILK THISTLE SEED

Approved by Commission E:

- Dyspeptic complaints
- Liver and gallbladder complaints

The drug is used for toxic liver damage, adjunctive treatment in chronic inflammatory liver disease and hepatic cirrhosis.

Unproven Uses: The drug is also used as an antidote to death-cap mushroom poisoning.

PRECAUTIONS AND ADVERSE REACTIONS

MILK THISTLE HERB AND SEED

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Episodes of severe sweating, abdominal cramping, nausea, vomiting, diarrhea and weakness were recently reported in Australia, but the reaction was found to be due to a substance in the Milk Thistle product other than silybin (Adverse Drug Reaction Advisory Committee, 1999).

Drug Interactions: The concomitant use of silymarin and butyrophenones or phenothiazines results in a reduction of lipid peroxidation (Palasciano, 1994). Silymarin has an antagonistic effect with yohimbine and phentolamine when given simultaneously (Di Carlo, 1993).

DOSAGE

MILK THISTLE HERB

Preparation: An infusion is prepared by pouring boiling water over 1/2 teaspoonful of the drug and then straining after 5 to 10 minutes.

Daily Dosage: The average dose of the infusion is 2 to 3 cups daily.

MILK THISTLE SEED

Mode of Administration: Comminuted drug for infusions and extracts; tinctures for liquids and solid forms.

How Supplied:

Capsules—70 mg, 100 mg, 140 mg, 150 mg, 175 mg, 180 mg, 500 mg, 540 mg, 1000 mg, 1050 mg

Liquid—1:1, 1:2

Tablet—50 mg, 500 mg

Preparation: To prepare an infusion, add 3 gm of the drug to cold water and bring to a boil. Drain after 10 to 20 minutes.

Daily Dosage: For liver dysfunction or ailments, the daily dosage has been effective and well tolerated at 140 to 420 mg divided in 2 to 3 doses (Ferenci, 1989; Frerick, 1990; Pares, 1998; Schuppan, 1998). The average dose of silymarin was approximately 33 milligrams/kilogram/day for cyclopeptide mushroom poisoning. Silymarin administered up to 48 hours after mushroom ingestion appears to be effective in preventing severe liver damage in *Amanita phalloides* poisoning (Hruby, 1983).

Although products are usually standardized to 70% to 80% (not milligrams) of silymarin, the silymarin concentrations may vary without government regulation (Flora et al, 1998).

Storage: Store away from direct light, heat and moisture; keep at room temperature.

Monarda Punctata

See *Horsemint*

Moneywort

Lysimachia nummularia

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried whole flowering plant.

Fruit and Flower: The flowers are solitary or in pairs. The leaf axils have 5 free, almost cordate sepals. The corolla is rotate, divided into 5 and fused at the base. It is rich yellow and spotted with dark red glands on the inside. There are 5 glandular-haired stamens fused at the base and 1 ovary. The fruit is a 4- to 5-mm long globular capsule. The seeds are triangular, blackish-brown, warty and 1.5 mm long.

Leaves, Stem and Root: The plant is a perennial. The stem is a runner-like creeper, lightly branched, quadrangular, glabrous to slightly pubescent with roots at the nodes. It grows I from 10 to 45 cm. The leaves are entire-margined, crossed-

opposite, short-petioled, red-glandular punctate and orbicular elliptical.

Habitat: The plant is indigenous to all of Europe and the Caucasus and has been introduced into America and Japan.

Production: Moneywort is the complete plant of *Lysimachia nummularia*. The whole flowering plant, including the root, is collected, cleaned and dried in the shade.

Other Names: Creeping Jenny, Creeping Joan, Herb Twopence, Meadow Runagates, Running Jenny, *Serpentaria*, String of Sovereigns, Twopenny Grass, Wandering Jenny, Wandering Tailor

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including among others glycosides of myricetins, kempferols and quercetins, including rutin, hyperosides

Tannins

Triterpene saponins

The constituents of the drug have not been fully investigated.

EFFECTS

Moneywort is mildly astringent and expectorant. Extracts of the aerial plant parts are said to be antibacterial in vitro; however, scientific results are not available.

INDICATIONS AND USAGE

Unproven Uses: Moneywort is used externally as a vulnerary and for acute and chronic eczema. It is used internally for diarrhea and excessive salivation, and as an expectorant for coughs.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards- or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: To make a tea, pour 250 ml boiling water over 2 heaping teaspoonfuls drug and leave to draw for 5 minutes. For a wound poultice, dilute the tea preparation with the same amount of chamomile tea.

Daily Dosage: For the treatment of coughs, drink 1 cup of tea, 2 to 3 times daily with honey if desired.

Monkshood

Aconitum napellus

DESCRIPTION

Medicinal Parts: Deadly poison.

Flower and Fruit: The flowers are 50 to 160 cm long and form violet, bluish or reddish upright racemes. The calyx has 5 petal-like sepals. The upper sepal is convex and helmet-shaped. There are 2 petals with nectar-releasing spurs under the upper sepal. There are numerous glabrous or ciliate stamens. There are 3 glabrous ovaries with 10 to 14 ovules. The fruit is a 16 to 20 mm long by 5 mm thick follicle. The seeds are glossy black and triangular with narrow wings on the edges.

Leaves, Stem and Root: *Aconitum napellus* is a 0.5 to 1.5 m high shrub with a tuberous, thickened, fleshy root and an erect, rigid, undivided stem. The raceme axis and petioles are glabrous or hairy. The leaves are dark green, glossy above and lighter beneath. They are palmate and 5 to 7-pinnately The sections of the leaf are rhomboid in outline and deeply indented with oblong tips.

Characteristics: The "plant is extremely poisonous.

Habitat: *Aconitum napellus* is common to the Alps and the Carpathians and is to be found in all the mountainous regions of Europe. The plant is found as far as Sweden in the north, as far as England and Portugal in the west, as far as the Pyrenees in the south and as far as the Carpathians in the east.

Production: Monkshood tuber consists of the fresh or dried tubers and roots of *Aconitum napellus*-harvested in autumn after flowering. Monkshood herb consists of the dried herb of *Aconitum napellus* collected at the beginning of the flowering season. The collected roots are quickly dried at 40° C.

Not to be Confused With: Other blue-flowering *Aconitum* species.

Other names: Aconite, Wolfsbane, Blue Rocket, Friar's Cap, Mousebane

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Nor-diterpene alkaloids: including aconitine, mesaconitine, hypaconitine, N-desethyl aconitine, oxoaconitine

EFFECTS

The efficacy of the drug is based on the di-ester alkaloids aconitin, mesaconitin and hypaconitin. Aconitin raises membrane permeability for sodium ions and retards repolarization. Aconitin is initially stimulating, and then causes paralysis in the motor and sensitive nerve ends, and in the

CNS. The other di-ester alkaloids function in a similar fashion. Hypaconitin works more intensely. Aconitin applied in small doses triggers bradycardia and hypotension; in higher doses it has at first, a positive inotropic effect, followed by tachycardia, cardiac arrhythmia and cardiac arrest. Ester alkaloids were shown to be analgesic in animal experiments. Applied topically in humans, the drug is initially stimulating, in the form of itchiness or burning, and then anesthetizing. The drug has an anti-febrile effect. Therapeutic doses influence the heart minimally; the heart rate may increase slightly. Given orally, the drug is active after a few minutes.

INDICATIONS AND USAGE

Unproven Uses: The drug is used to reduce pain from neuralgia, particularly with trigeminal and intercostal neuralgia. It is also used for myalgia, muscular and articular rheumatism, serous skin inflammation and migraine. Preparations of blue monkshood are used for pain, facial paralyses, ailments of the joints, arthritis, gout, rheumatic complaints, inflammation, pleurisy, pericarditis sicca, fever, and skin and mucosal diseases, as well as for disinfecting and wound treatment. In experimental pharmacology, Aconitin is used due to its ability to trigger cardiac arrhythmia.

Chinese Medicine: Monkshood is used for analgesia, as an anti-inflammatory and a cardiac tonic.

Homeopathic Uses: Aconitum napellus is used for acute inflammatory illnesses, cardiac palpitations with anxiety states and painful peripheral nerve disease.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is highly toxic. Signs of poisoning can appear even with the administration of therapeutic dosages. The first sign of poisoning is a tingling of the mouth, fingers and toes, which then spreads over the entire body surface and changes into a furry sensation. Body temperature decreases quickly and queasiness, vomiting, diarrhea and urination follow.

OVERDOSAGE

With fatal doses, breathing becomes irregular and the heartbeat slows down and becomes arrhythmic. Intense pains are characteristic. Death usually follows within 6 hours due to heart failure or asphyxiation. For adults, the estimated fatal dosage lies between 1 to 2 g. Countermeasures include gastrointestinal emptying, keeping the patient warm, cardiovascular and pulmonary support, magnesium and calcium infusions, administration of atropine to fight bradycardia, lidocaine for relieving the arrhythmias, possibly artificial respiration, pain relief (no opiates).

DOSAGE

Mode of Administration:

The use of the drug is risky and not recommended.

Preparation: Aconiti tinctura: 1:1

Daily Dosage:

Aconiti tinctura: Average dose 0.1 gm; maximum dose 0.2 gm; maximum daily dose 0.6 gm. Only standardized preparations should be used.

Externally: Aconiti tinctura is applied with a brush.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) and 1 to 3 times per day (chronic); Parenterally: 1 to 2 ml 3 times daily sc; Ointment 1 to 2 times daily (HAB1).

Storage: The herb must be kept in a dry place protected from light and insects.

DESCRIPTION

41 *Medicinal Parts:* The medicinal parts are the seeds and root.

Flower and Fruit: The flowering branches bear 1 to 5 radial flowers with structures in fives. The 5 sepals are 1.3 to 2.5 cm long, narrow-lanceolate, acuminate and rough-haired at the base. The 5 petals are 3.8 to 5 cm long, funnel-shaped, spotted blue-pink or are fused at the base of the orange corolla. The plant has 5 stamens and a superior 3-chambered ovary. The fruit is a capsule with a diameter of approximately 8 mm containing 4 to 6 smooth seeds.

Leaves, Stem and Root: This winding herb grows 1 to 3 m high. The leaves are alternate, ovate-cordate and entire, with a diameter of 5 to 12.5 cm. The stem is slightly pubescent.

Habitat: The plant is indigenous to China, India, and Central and South America.

Production: Morning Glory seeds are the dried, ripe seeds of *Ipomoea hederacea*. The plants are harvested in autumn before the seeds open, then dried in the sun. The seeds are then removed and cleaned.

Not to be Confused With: Morning Glory seeds are similar to and sometimes confused with the seeds of other *Ipomoea* species.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids of the ergoline type (0.5%): chief alkaloids lysergol (50%) and chanoclavine (35%). Smaller amounts of penniclavine and elymoclavine

Fatty oil (12 to 14%): chief fatty acids oleic acid, palmitic acid, stearic acid

Resins (15%): glycoresins (macromolecular, resinous glycosides of hydroxy-fatty acids [C12 to C16]) with oligosaccharides, the so-called pharbitinic acids; the latter's hydroxyl groups are esterified with (among others) alpha-methylbutyric acid, tiglic acid and valeric acid to the fatty acid remnant

EFFECTS

The drug has a drastic laxative effect due to the glycoresins it contains, which presumably explains its usefulness against ascarid and tapeworm infestations.

INDICATIONS AND USAGE

Unproven Uses: Morning Glory has been used for worm infestation and constipation.

Indian Medicine: Morning Glory is used for constipation, flatulence, parasite infestation, scabies and dyspepsia. According to the Tschirch manual, the roots of *Ipomoea* species have long been in use in India, and the drug also was used extensively by the Persians and Arabs.

Chinese Medicine: Uses of Morning Glory include edema, constipation, parasite infestation and feelings of fullness.

PRECAUTIONS AND ADVERSE REACTIONS

The drug's laxative effect is frequently accompanied by cramp-like pains.

CONTRAINDICATIONS

Because of the possible teratogenic effect, the drug should not be used during pregnancy.

DOSAGE

~*~

Mode of Administration: Whole, cut and powdered drug.

Preparation: Resin is made by heating the powdered drug until it melts, then cooling it to form a pale translucent mass.

Daily dosage:

Drug — 0.5 to 3 g drug

Resin — daily dose: 0.3 g; maximum single dose: 0.1 g

Chinese Dosage:

Powder — 1.5 to 5 g drug, can be raised to 12 to 15 g

Tea — 24 to 30 g drug

Storage: Store in dry place.

Moms nigra

See *Black Mulberry*

Motherwort

Leonurus cardiaca

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh aerial parts collected during the flowering season.

Flower and Fruit: Small, bright red, bilabiate flowers are in dense false whorls in the upper leaf axils. The calyx is funnel-shaped with 5 rigid, awned tips, which are bent outward. The corolla is densely villous on the outside and longer than the calyx. The stamens stretch out longer than the flower. The fruit is a brown, triangular, 2.5 to 3 mm long nutlet with a tuft of hair at the tip.

Leaves, Stem and Root: The plant is perennial and has a short woody rhizome. It grows to about 120 cm. The stem is erect, quadrangular, grooved, hollow, often red-violet and usually hairy. The leaves are long-petioled, pubescent or glabrous. The lower leaves are palmate and cordate at the base. The upper leaves are 3-lobed. The upper surface is dark green, the lower surface light green.

Characteristics: Motherwort has an unpleasant smell.

Habitat: The plant is indigenous to central Europe and Scandinavia through temperate Russia to central Asia. It was introduced to North America and has become established in the wild there.

Production: The herb consists of the above-ground parts of *Leonurus cardiaca*, gathered during flowering season, as well as their preparations. They are collected in the wild and dried at 35° C.

Other Names: Lion's Tail, Lion's Ear, Throw-Wort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpene bitter principles: leocardin

Iridoide monoterpenes: ajugoside (leonuride), ajugol, galiridoside, reptoside

Flavonoids: including, among others, rutin, quercitrin, isoquercitrin, hyperoside, genkwanin

Leonurin: (syringic acid esters of 4-guanidino-butane-1-ols)

Betaine: stachydrine (N-dimethyl-L-proline)

Caffeic acid derivatives: caffeic acid-4-O-rutinoside

Tannins

Volatile oil (traces)

EFFECTS

Mildly negatively chronotropic, hypotonic, sedative.

INDICATIONS AND USAGE

Approved by Commission E:

- Nervous heart complaints

Unproven Uses: Hyperthyroidism and flatulence. In folk medicine it is used for bronchial asthma, climacteric symptoms and amenorrhea.

Homeopathic Uses: Homeopathic treatments include use for cardiac complaints, flatulence and hyperthyroidism.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Not to be used during pregnancy.

DOSEAGE

Mode of Administration: Comminuted herb for infusions and other galenic preparations for internal use.

Daily Dosage: 4.5 gm herb; infusion: 2 to 4 gm drug 3 times daily; liquid extract (1:1): 2 to 4 ml 3 times daily; tincture: daily dose: 2 to 6 ml.

Homeopathic Dosage: Acute states: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes. Chronic states: 5 drops, 1 tablet, 10 pellets or a knife tip 1 to 3 times daily. Parenterally: Acute: 1 to 2 ml sc, 3 times daily; chronic: 1 to 2 ml once a day (HAB1).

Mountain Ash Berry

Sorbus aucuparia

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe, dried fruit or the dried and then boiled fruit.

Flower and Fruit: The inflorescence is broadly umbelliferous-paniculate, erect, floriferous, loosely tomentose, occasionally completely or almost completely glabrous. The calyx has 5 segments. There are 5 white petals and numerous stamens. The ovary is inferior and has 2 to 4 free styles, which are pubescent in the lower portion. The false fruit is almost gtebular with a diameter of 9 to 10 mm and is scarlet. There are usually 3 seeds which are narrow-oblong, acute and reddish.

Leaves, Stem and Root: The plant is usually a medium-sized tree up to 16 m high with a round, rather loose crown. The bark is smooth and pale gray, later becoming vertically fissured and blackish. The leaves are odd-pinnate with 5 to 11 almost sessile leaflets. These are oblong-lanceolate, irregularly thorny-tipped and serrate, pubescent or almost glabrous.

Characteristics: The flowers have an unpleasant smell and the berries are sharp-tasting and sour. *Sorbus moravica* tastes sweet in contrast

Habitat: The plant is indigenous to almost all of Europe, to Western Siberia and Asia Minor, and is found in North America.

Production: Mountain Ash Berry consists of the fresh or dried fruit, or fruit cooked and dried thereafter, of *Sorbus*

aucuparia as well as its preparations. The ripe, shiny red fruit is harvested from August to October

Other Names: Quick-Beam, Rowan Tree, Witchen, European Mountain Ash, Sorb Apple

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyanogenic glycosides (0.06%; in the seeds 0.2 to 0.59c: traces in the fruit pulp): in the seeds amygdalin, in the fruit pulp prunasin

Fruit acids: malic acid (3 to 5%), tartaric acid

Monosaccharides/oligosaccharides: saccharose, glucose, fructose, sorbose

Parasorboside (bitter substance): parasorbic acid is formed from it through cell destruction (lactone of the (5S)-Hydroxyhex-2-en-1-yl, pungent in odor, mucus-membrane-irritating, 0.1 to 0.3% of the fresh weight). Parasorbic acid is destroyed through dehydration or volatilized during cooking. It is present only in traces (less than 0.01%) in the cultivated variety, that contains few bitter substances.

Sugar alcohols: sorbitol

Tannins

Vitamins: ascorbic acid (vitamin C, 0.03 to 0.13%, higher content in the non-bitter fruits)

EFFECTS

The parasorbic acid is weakly laxative and irritating to the mucous membrane. Ascorbic acid is a vitamin C supplement.

INDICATIONS AND USAGE

Unproven uses: Mountain Ash is used in folk medicine for kidney diseases, diabetes, rheumatism, disorders of the uric acid metabolism, for dissolution of uric acid deposits, menstruation disturbances, the alkalization of the blood, to improve the metabolism and for vitamin C deficiency.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug or with the consumption of fruit sauces, juices, jellies, jams, etc. produced through cooking.

OVERDOSAGE

Because of the formation of the mucus-membrane-irritating parasorboside that results from cutting up the fruit, the intake of very large quantities of the fresh fruit leads to gastroenteritis, vomiting, queasiness, gastric pain, diarrhea, kidney damage (albuminuria, glycosuria) and to polymorphic exanthemas.

DOSEAGE

Mode of Administration: Mountain Ash is available as whole and crude drug forms.

Daily Dosage: A puree is used for diarrhea. Freshly pressed juice (or juice with sugar) is taken by the dessertspoonful for conditions of the lungs and pleura with fever.

Mountain Avens

Dryas, j@etQpetala

DESCRIPTION

Medicinal Parts: Mountain Avens or Silverweed Herb is the whole dried plant of *Dryas octopetala*.

Flower and Fruit: The flower stalk is upright, 2 to 8 cm long. The diameter of the flowers is 2 to 4 cm; there are 6 to 9 sepals, which are glabrous on the inside and brown, felt-like and glandular on the outside. There are 6 to 9 white petals and numerous stamens. The carpels are numerous, free and densely haired, with apical styles twisted like screws. The fruit is like a nut.

Leaves, Stem and Root: This evergreen dwarf shrub grows up to 0.5 m high. The leaves are 0.5 to 4 cm long, up to 2.5 cm wide, coriaceous, crenate, short-petiolate; the lamina is spatulate, obovate or elongate-elliptical, with a cordate base, wrinkled and glabrous above, tomentose beneath; the stipules are dry-membranous and sharply acuminate. The small stem is heavily branched, the leaves on the horizontal

branches are double-rowed, the upright stem has leaves all around. The plant has a primary taproot.

Habitat: The shrub grows in the Arctic, subarctic and high mountainous regions.

Production: The plant is collected in the wild, cut and powdered.

Other Names: Silverweed Herb

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Tannins (2.5 to 5.5% in the root; 7.5 to 14% in the leaves)

Catechin tannins (7 to 14%)

Flavonoids (0.7 to 1.6%): glycosides of quercetin, kaempferol, isorhamnetin, limocitrin, gossypetin, corniculatusin and sexangularetin

Triterpenes: including tormentoside

EFFECTS

Due to its tannin and flavonoid glycoside content, the drug is astringent in effect.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include stomach pains and diarrhea.

The effect appears to be plausible because of the flavonoid glycoside content, but is Unproven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The ingestion of larger dosages can lead to digestive complaints and constipation, due to the high tannin content. Available data are insufficient to classify the drug's safety.

LITERATURE

Mountain Flax

Linum catharticum

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb, the fresh flowering plant and the whole plant.

Flower and Fruit: The flowers are on loose, paniced, branched, sparsely leafed twining stems on long peduncles in the leaf axils. They hang before flowering. The sepals are

elliptically acuminate, 2 to 2.5 mm long with ciliate glands. The 5 white petals are up to 5 mm long, and yellow at the base. There are 5 stamens fused at the base and 1 ovary with 5 headed stigma on long thin styles. The fruit is erect, globular, 2 to 3 cm long and incomplete 10-valved with long, pubescent, dividing membranes. The seeds are elliptical, 1 to 1.5 mm long, flat, smooth and light brown.

Leaves, Stem and Root: The plant is an inconspicuous annual (occasionally perennial) that grows up to 30 cm. It has a long erect or ascending stem, which is undivided or dividing into the flowering branches. The leaves are opposite or alternate, entire-margined, sessile and have a partly ciliate margin.

Habitat: Found in central Europe as far as the British Isles and southward as far as the Mediterranean countries, the Caucasus, Iran and northern Africa.

Production: Mountain Flax is the flowering plant (aerial part) of *Linum catharticum*, collected in the uncultivated regions.

Other Names: Purging Flax, Dwarf Flax, Fairy Flax, Mill Mountain

ACTIONS AND PHARMACOLOGY

COMPOUNDS

& *Lignans:* achromatin (bitter), presumably present in the fresh plant as a glycoside

Tannins

Volatile oil

The constituents of the drug have not been extensively investigated.

EFFECTS

MountakFFlax has a laxative effect in therapeutic doses of up to 0.5 gm.* Higfi'ddSes cause vomiting-and gastroenteritis.

Although the amaroid linin is not laxative, it is probably present in the form of a glycoside, which has a stronger laxative effect.

INDICATIONS AND USAGE

Unproven Uses: Its use as a laxative is obsolete. In folk medicine Mountain Flax is used for constipation, oliguria, edema, worm infestation, catarrhal and rheumatic conditions.

~ *Homeopathic Uses:* Used homeopathically for coughs, hemorrhoids, diarrhea, catarrh and rheumatic disorders, dropsy and worm infestation. Also used as a purgative and emetic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug can lead to vomiting, inflammations of the gastrointestinal tract and diarrhea. The emetic and laxative effects are used therapeutically.

DOSAGE

Mode of Administration: Ground and as an extract.

Preparation: To prepare an infusion, add 2.5 gm to 1 cup of hot water.

Dosage: 2.0 gm powder as a single dose.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Mountain Grape

Mahonia aquifolium

TRADE NAMES

Oregon Grape (*Berberis aquifolium* variety available from numerous manufacturers) Oregon Grape Root

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizome and the roots, the dried branch and twig bark, as well as the root bark.

Flower and Fruit: The heavily scented flowers are either in dense 5 to 10 cm panicles or in groups of 3 to 6 in erect 5 to 8 cm racemes in the leaf axils. The flowers are yellow and have 9 sepals, 6 petals and 6 stamens, which are about 8 cm long. The pedicels are 5 to 10 mm long. The fruit is a globose, purple-black, frosted berry with red juice. The 2 to 5 seeds are glossy brown.

Leaves, Stem and Root: The plant is a fast-growing, evergreen, stoloniferous shrub about 50 to 150 cm high with stout stems, sparingly branched. The leaves are odd-pinnate, 10 to 20 cm long with 3 to 6 pairs of leaflets. The leaflets are 4 to 8 cm by 2 to 4 cm, ovate, distally spinose dentate, coriaceous, dark and shining green.

Habitat: Indigenous to the Pacific U.S.; ornamental or cultivated in Europe.

Production: Mountain Grape bark consists of the branch and twig bark as well as the twig tips of *Mahonia aquifolium*.

Other Names: Holly-Leaved *Berberis*, Oregon Grape

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids (in the root bark, 7 to 16%, in the stem bark, 2.4-4.5%):

benzyl isoquinoline type: including among others berberine

bisbenzyl isoquinoline type: including among others berbamine, oxyacanthine

aporphine type: including among others isocorydine

EFFECTS

The use of the drug as a tonic for loss of appetite is plausible in view of the alkaloid and amaroid content. The berberine has a mild mutagenic effect. It is an antipsoriatic when used externally.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for scaly skin, psoriasis, eczema, bronchitis, gastritis, cholecystitis and digestion problems.

Homeopathic Uses: Mountain Grape is used for dry skin rashes (e.g., for psoriasis between the acute phases) and for liver and gallbladder conditions.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: The drug should not be used during pregnancy.

DOSAGE

Mode of Administration: The drug is available in commercial ointments for external use.

Storage: Protect from light.

Mountain Laurel

Kalmia latifolia

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried leaves.

Flower and Fruit: The inflorescence is a compound umbel-like raceme with numerous flowers. The flowers are red, whitish or purple-brown to chocolate brown; solitary on long glandular-hairy pedicels in the axils of the bracts and 2 lateral, brown bracteoles. The bud has 10 folds and spreads out in a bowl shape. There are 10 stamens, red anthers without appendages that burst open at irregular holes. The fruit is an erect, orbicular, 5-to-7-valvular capsule. The numerous seeds are flat, oblong, 1 mm long and fly easily.

Leaves, Stem and Root: The plant is a heavily branched shrub or tree about 4 m high with reddish-brown or gray branches. The evergreen, laurel-like, ovate-lanceolate acuminate, glabrous leaves are alternate, 4 to 12 cm long and have a 1 to 3 cm long petiole. They are red-brown on the lower surface, have numerous glandular hairs and a distinct midrib. The upper surface is dark green.

Habitat: Eastern U.S.

Production: Mountain Laurel leaves are the leaves (fresh or dried) of *Kalmia latifolia*.

Other Names: Broad-Leafed Laurel, Calico Bush, Spoonwood, Sheep Laurel, Rose Laurel, Laurel, Lambkill, Mountain Ivy

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Diterpenes (andromedan- derivatives): including among others grayanotoxin I (andromedotoxin, asebotoxin, acetyl-andromedol, rhodotoxin), grayanotoxin II, HI, XVIII, lyonol
Ht A, leucothol A, kalmiatoxine

Acylphloroglucinols: including among others 2\6'-dihydroxy-4'-methoxy-acetophenone, phloretin

Flavonoids: including among others asebotin, hyperoside

EFFECTS

Use of Mountain Laurel is no longer recommended because of the formation of grayanotoxins, which are highly toxic. Efficacy for the recorded indications has not been proven.

According to earlier sources (which are questionable), the drug is antiphlogistic and mildly diuretic.

INDICATIONS AND USAGE

Unproven Uses: Today, the drug is only used in homeopathic dilutions. In the past it was used as a decoction in the treatment of tinea capitis and to treat psoriasis, herpes and secondary syphilis.

Homeopathic Uses: Uses include rheumatism, shingles, nerve pain, rheumatic and cardiac pain.

PRECAUTIONS AND ADVERSE REACTIONS

The andromedan derivatives of the drug prevent the closure of the excitable cells of the sodium channels and thereby prevent conduction. Painful mucous membranes in the mouth and in the stomach, increased salivation, cold sweat, nausea, vomiting, diarrhea and paresthesias are experienced following intake of the drug. Dizziness, headache, fever attacks as well as intoxicated states with temporary loss of vision, follow. Muscle weakness, coordination disorders and spasms can also occur. Bradycardia, cardiac arrhythmias, drops in blood pressure, eventual cardiac arrest and respiratory failure can lead to death.

OVERDOSAGE

Following gastrointestinal emptying, (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) and instillation of activated charcoal, the treatment of poisoning consists of electrolyte replacement, countering of acidosis with sodium bicarbonate, plasma volume expanders if required, diazepam (I.V.) in case of spasms and oxygen in case of respiratory failure.

DOSAGE

Mode of Administration: Available in homeopathic preparations.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic);

parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Mouse Ear

Pilosella officinarum

DESCRIPTION

Medicinal Parts: The medicinal parts are the flowering aerial parts.

Flower and Fruit: The yellow, composite flowers are solitary at the end of long pedicles. There are bright yellow, lingual florets. The lateral ones are usually striped reddish underneath. The bracts are linear and acute, have a membranous margin and are covered in star-hairs. They have black glandular hairs at the base. The fruit is cylindrical and has a simple, brittle tuft of hair.

Leaves, Stem and Root: The plant is a perennial herb, which grows up to 30 cm. Erect, leafless stems grow from the rosette of basal leaves. The plant produces long, leafy runners. The leaves are oblong or obovate to lanceolate. They bear long bristles, which are thickened at the base and are star-haired to tomentose beneath.

Habitat: The plant grows in large areas of Europe and temperate Asia. It is also found in North America.

Production: Mouse Ear is the aerial part of *Pilosella officinarum*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Flavonoids: including among others luteolin-7-glucoside, isoetin

Hydroxycoumarins: umbelliferone, skimmine

Tannins

EFFECTS

The plant has been shown to have diuretic, spasmolytic and diaphoretic effects.

INDICATIONS AND USAGE

Unproven Uses: Mouse Ear is used internally in the treatment of asthma, bronchitis, coughs and whooping cough and externally in the treatment of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally and externally as a liquid extract.

stemmed, erect or slightly drooping. They are in dense heavily branched panicles with numerous lanceolate bracts. The bracts are downy white with a green midrib. The inner bracts are lanceolate and acuminate. The outside ones are oblong and obtuse with broad membranous margin. The flowers are yellowish or red-brown and almost glabrous. The inner flowers are androgynous and those on the outside are female. The receptacle is glabrous. The fruit has an indistinct margin.

Leaves, Stem and Root: The plant is a long-stemmed, 70 to 150 cm high shrub with a branched, many-headed and creeping rhizome without runners or rosette. The shoots are slightly, pubescent, often red-tinged and have a weak unpleasant smell. The erect or ascending, edged, coriaceous stems die off each year. They are in branched panicles and downy. The leaves are 5 to 10 cm long, coriaceous, and the margins are often rolled back. The upper surface is usually dark green and glabrous, occasionally pubescent, and the lower surface is tomentose. The basal leaves are short-petioled and lobed with an end section and 1 to 2 pairs of small side leaflets. The rest of the leaves are sessile or almost sessile with a slit base. The lower leaves are double-pinnate, the middle and upper ones are pinnatifid and lanceolate, acuminate, entire-margined or slightly serrated.

Characteristics: Mugwort has a pleasant tangy taste. The root is sweet and pungent, the herb is aromatic and bitter.

Habitat: The plant is indigenous to Asia and North America, and is also distributed all over Europe except in the south.

Production: Mugwort herb consists of the above-ground parts of *Artemisia vulgaris*. The branch tips are gathered during the flowering season and carefully dried. Other fresh above- and underground parts of the plant are harvested at the beginning of winter, primarily from the wild. Mugwort root consists of the below-ground parts of *Artemisia vulgaris*.

Not to be Confused With: Some confusion can arise with *Asinthii herba*.

Other Names: Felon Herb, St. John's Plant, Wormwood

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (complex composition): chief constituents, according to plant variety, 1,8- cineol, camphor, linalool or thujone

Sesquiterpene lactones: including vulgarin, pilostachyin, pilostachyin C

Lipophilic flavonoids

Polyynes

Mucuna pruriens

See Cowhage

Mugwort

Artemisia vulgaris

DESCRIPTION

Medicinal Parts: The medicinal parts are the root and the above-ground parts of the plant, particularly the dried branch tips.

Flower and Fruit: The flower heads are ovoid, 3 to 4 mm long by 2 mm wide. The numerous flowers are short-

Hydroxycoumarins: for example, umbelliferone, aesculetin

EFFECTS

The aqueous extract and essential oil show antimicrobial activity in laboratory tests.

CONTRAINDICATIONS

Mugwort is not to be used during pregnancy.

INDICATIONS AND USAGE

Unproven Uses: Mugwort is used in complaints and problems involving the gastrointestinal tract such as stomach ulcers and indigestion. The plant is also used for worm infestations, epilepsy, persistent vomiting, to promote circulation, as a sedative, and for delayed or irregular menstruation. The root is used for asthenic states as a tonic, and in combination with other remedies also for psychoneuroses, neurasthenia, depression, hypochondria, autonomic neuroses, general irritability and restlessness, insomnia and anxiety states. The efficacy of Mugwort for the listed indications has not been substantiated.

Chinese Medicine: Mugwort is used in China for female complaints as well as for ulcers and burns.

Homeopathic Uses: Homeopathic uses of the root include convulsions and worm infestations.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Sensitization through skin contact has been observed, although very rarely.

Pregnancy: Mugwort is not to be used during pregnancy.

DOSAGE^a,

Mode of Administration: Since the efficacy for the claimed applications is not verified, therapeutic administration is not recommended.

Preparation: "Moxibustion" (China, Japan) leaves are ground with water in a mortar and, after removal of the larger remnants, small cones are formed and dried to be later burnt onto the skin of the patient. Tea is prepared by allowing 1 tsp. to draw in 150 to 200 ml boiling water for 10 minutes. A liquid extract is prepared in a 1:1 proportion from a mixture of the drug in 25% ethanol.

Daily Dosage: An infusion (drug 0.5 to 2 g) is given 3 times daily. Usual dosage of tea is one cup 2 or 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); Parenterally: 1 to 2 ml 3 times daily sc (HAB1).

Muirea-Puama

Ptychopetalum olacoides

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried roots and the dried trunk with bark.

Flower and Fruit: The inflorescences are racemous; there are 1 or 2 per axil. They have 5 to 8 flowers and are about 2 cm long. The calyx is narrow and has 5 tips. The corolla is white, oblong and about 1.3 to 2 mm long. The outside is smooth, and the inside is white pubescent. There are usually 10 stamens with long anthers. The ovary is clavate. The fruit is a long elliptical drupe that is initially green and changes to pink and finally to lilac-black when ripening. The pericarp is thin, and the endocarp is crusty.

Leaves, Stem and Root: The plant is a 5 to 15 m high tree with a trunk 25 cm in diameter, which is vertically grooved. The leaves are oblong-lanceolate, very tapered and narrow toward the base. They are sometimes acute, coriaceous, smooth and gray or frosted to blue-green beneath. The dried

leaves are matte with a dark green to black upper surface and a dark gray undersurface. The ribs are pinnatifid, curved, becoming distinct at the margin and protruding on the undersurface. The petioles are deeply grooved and do not thicken.

Habitat: The plant is indigenous to Guyana and the Amazon region of Brazil.

Production: Muira-Puama consists of the wood from the trunk and/or roots of *Ptychopetalum olacoides* and/or *Ptychopetalum unicatum*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene acid esters (0.4-0.5%): chief components are behenic acid esters of lupeol (60%), including, among others, fatty acid esters of beta-sitosterol

Sterols: beta-sitosterol, campesterol, lupeol

Volatile oil: chief components are alpha-pinene (25%), alpha-humulene (10%), beta-pinene (8%), beta-caryophyllene (8%) camphene (7%), camphor (6%),

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Muira-Puama is used internally for diarrhea, loss of appetite and for the prevention of sexual disorders. The herb is also used externally for the prevention of sexual disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages^

DOSAGE .*** **

Mode of Administration: Muira-Puama is administered whole, ground, as a powder and as an extract.

Preparation: To prepare a liquid extract, mix the powdered herb in a ratio of 10:2:1 with spirit of wine and glycerine. Then percolate the mixture with spirit of wine, yielding 10 parts liquid extract.

Daily Dosage: When used internally, a single dose is 0.5 gm drug. The daily dosage for the liquid extract and the decoction is 0.5 to 2 ml 3 times daily. For external use, die herb can be added to baths.

Mullein

Verbascum densiflorum

TRADE NAMES

Mullein Leaf, Alcohol-Free Mullein Leaves, Mullein Leaves

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb at die beginning of the flowering season, the flowers and the root.

Flower and Fruit: The large, yellow flowers with a diameter of 30 to 35 mm are in apical spike-like racemes. The calyx is divided deeply into five. The corolla is rotate, has a short tube and a 5-lobed, uneven margin. There are 5 stamens of uneven length. The 3 upper ones are lanate and have long anthers. There is 1 superior ovary. The fruit is a 2-lobed capsule.

Leaves, Stem and Root: The plant is biennial. It has petiolate basal leaves and is up to 2 m high. The stem is erect, undivided or lightly branched above. It is tomentose like the leaves and calyx. The leaves are alternate, turned downward and finely crenate. The lower ones are lanceolate or oblong lanceolate; the upper ones, ovate.

Characteristics: The flowers have a honey-like fragrance and an almond-like taste. The leaves are slimy and bitter.

Habitat: The plant is widespread in Europe, temperate Asia and North America.

Production: Mullein flower consists of die dried petals of *Verbascum densiflorum* and/or of *Verbascum phlomoides*.

Not to be Confused With: Other *Verbascum* species.

Other Names: Torch Weed, Aaron's Rod, Blanket-Leaf, Candlewick Plant, Flannelflower, Feltwort, Hedge-Taper, Jacob's Staff, Shepherd's Club, Velvet Plant, Shepherd's Staff, Torches, Our Lady's Flannel, Blanket Herb, Woollen, Rag Paper, Wild Ice Leaf, Clown's Lungwort, Golden Rod, Adam's Flannel, Beggar's Blanket, Clot-Bur, Cuddy's lungs, Duffle, Fluffweed, Hare's Beard, Hag's Taper

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilage (3%): including among others, arabino galactans, xyloglucans

Triterpene saponins: chief components verbascosaponine (0.007%)

Iridoide monoterpenes: including among others, aucubin, 6beta-xylosylaucubin, catalpol, isocatalpol, methyl catalpol

Caffeic acid derivatives: verbascoside (acteoside)

Flavonoids (0.5-4.0%): including among others, rutin, diosmin, quercetin-7-O-glucoside, hesperidine, apigenin-7-O-glucoside, kempferol-7-O-glucoside

w *Invert sugar (11%)*

EFFECTS

Mullein alleviates irritation and has an expectorant effect due to its mucin and saponin content.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

Unproven Uses: Mullein is used internally for catarrh of the respiratory tract, bladder and kidney conditions, enteritis, rheumatism, coughs, flu, intestinal pain caused by colic, asthma, cystitis, hemorrhoids, dermatoses, and painful diarrhea. The plant is used externally for earache, ear furuncles, eczema of the auditory canal, middle ear infection, inflammatory skin diseases with itch, burns, eczema, weeping eczema, nappy dermatitis, insect bites, and itching in the anal and genital regions.

tt PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole, cut, and powdered drug is available in the form of teas and other galenic preparations for internal and external use.

How Supplied:

Liquid — 250" n^mT, 285 mg/ml - -

Liquid Extract — 1:1

Preparation: To prepare tea, pour boiling water over 1.5 to 2 gm finely cut drug and strain after 10 to 15 minutes (1 teaspoonful is equivalent to 0.5 gm drug).

To make an oil preparation, pour 100 gm of olive oil over a handful of fresh flowers. Leave the mixture outdoors in the sun, stirring several times a day, then filter after 3 to 4 weeks.

To prepare a tincture, add 20 gm cut drug to 80 gm of 70% ethanol and leave to draw for 10 days.

Daily Dose: The daily dose is 3 to 4 gm of drug. The tincture dose is 20 to 30 drops taken several times a day.

Storage: Mullein must be protected from light and particularly from moisture to prevent the drug from changing color to brown or dark brown due to the iridoid content.

Muskmallow

Abelmoschus moschatus

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds of the plant and the oil extracted from them.

Flower and Fruit: The flowers are solitary and axillary. They have 5 to 7 pubescent, linear, 1.5 cm long epicalyx leaves. The sepals are about 3 cm long. The corolla has a diameter of 7.5 cm. The petals are sulfur yellow with a crimson spot at the base. The petals are ovate and lightly pubescent. The fruit is a 5 to 8 cm long capsule, which is shaped like a pentagonal pyramid and filled with numerous large seeds. The seeds are kidney-shaped, compressed and about 3 mm in diameter. They are grayish-brown, with numerous striations that are concentric around the hilum.

Leaves, Stem and Root: The plant is an annual erect herb about 1 to 2 m high with star-shaped, pubescent stem, stalks and leaves. The leaves are 15 to 25 cm long, cordate to round with 3 to 7 lobes, which taper to a point. The petioles are as long or longer than the leaves. The stipules are oblong and pubescent.

Characteristics: The seeds have a strong, musky smell, and the taste is oily. The seed pods have an aromatic flavor and are used in some parts of the Middle East to mix with and flavor coffee.

Habitat: The plant is indigenous to Africa, India, Java and South America and is cultivated in all tropical regions.

Production: Muskmallow seeds are the dried seeds of *Hibiscus abelmoschus*. The seeds are dried in the open air.

Not to be Confused With: *Foenugraeci semen*.

Other Names: Muskseed, Ambrette Seed, Abelmosk, Ambretta, Egyptian Alcee, Target-Leaved Hibiscus, Okra

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil and chief fatty acids: palmitic acid, linoleic acid, stearic acid

Volatile oil: ambrette oil, chief components famesylacetate, macrocyclic lactones as carriers of the musk smell such as hexadec-7-en-16-olide (ambrettolide), tetradec-5-en-14-olide

Sterols: including beta-sitosterin, beta-sitosterin-beta-D-glucoside

EFFECTS

Muskmallow is said to be an aromatic, a stimulant and carminative.

INDICATIONS AND USES

Unproven Uses: The various preparations are used internally and externally for snake bite, cramps, stomach and intestinal disorders with cramps, loss of appetite and headache.

Homeopathic Uses: Muskmallow is used for feelings of tightness in the rib cage area.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Muskmallow is used as a tea or tincture, and is administered both internally and externally.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules, 1 to 3 times a day (HAB34).

Myroxylon balsamum

See Tolu Balsam

Myrrh

Commiphora molmol

TRADE NAMES

Myrrh is sold as Myrrh Commiphora, Myrrh Gum, Guggal Resin, Wild Countryside Myrrh Gum (available from numerous manufacturers).

DESCRIPTION

Medicinal Parts: The resin, which has exuded from the bark and dried in the air, is the medicinal part. Myrrh is the pale yellow granular secretion that is discharged into cavities in the bark when it is wounded. The exudate hardens to a red-brown mass about the size of a walnut.

Flower and Fruit: The yellowish-red inflorescences are paniced. The fruit is brown, about 7 mm long, ovate and acuminate.

Leaves, Stem and Root: Commiphora molmol is a thorny shrub or small tree up 3 m high. It has a thick trunk and numerous irregular knotted branches and smaller clustered branchlets. A few trifoliate leaves grow at the end of short branches, with very small lateral leaflets dentate only at the tip. The terminal leaflet is 1 cm long, obovate and glabrous. The oleo-gum resin exudes from fissures or incisions in the bark and is collected as irregular masses or tears, varying in color from yellowish to reddish-brown, often with white patches.

Characteristics: The surface may be oily or covered with fine dust. The taste is bitter and acrid. The odor is aromatic.

Habitat: The plant is indigenous to eastern Mediterranean countries, Somalia, Ethiopia, Eritrea, Yemen and South Arabia.

Production: Myrrh is collected in the wild from June to August and consists of oleo-gum resin exuded from the stems of Commiphora molmol after incisions have been made in the bark. It is then air-dried. Myrrh can also originate from other Commiphora species if the chemical composition is comparable to the official drug.

Not to be Confused With: Some confusion can arise with "False myrrh" or Commiphora mukul.

Other Names: Guggal Gum, Guggal Resin, Didin, Didtfin

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (2-10%): chief components are sesquiterpenes including, among others, delta-elemene, beta-eudesmol, alpha-copaene and furosesquiterpenes, especially 5-acetoxy-2-methoxy-4,5-dienone (aroma-bearer), furanoeudesma-1,3-dien, isofufanogermacren (curzeren), curzenenone, 2-methoxy-furanoguaia-9-ene

Triterpenes (30-50%): including 3-epi-alpha-amyrin, alpha-amyrone

Mucilages (30-60%): chiefly methyl-glucurono-galactans)

EFFECTS

Myrrh has a local astringent, disinfectant and granulation-promoting effect because of its essential oil (consisting mainly of sesquiterpenes) and amaroids.

INDICATIONS AND USAGE

Approved by Commission E:

- Inflammation of the mouth and pharynx

Unproven Uses: Myrrh is used for the topical treatment of mild inflammations of the oral and pharyngeal mucosa. In folk medicine, Myrrh is occasionally used internally as a carminative for non-specific intestinal infections and also as an expectorant for coughs. Folk medicine uses have also

included stimulating the appetite and the flow of digestive juices.

Chinese Medicine: Uses include carbuncles, furuncles, wounds (as a styptic), amenorrhea and abdominal tumors.

Indian Medicine: Among uses in Indian medicine are menstrual disorders, stomach complaints, wounds, ulcers and inflammations of the skin and mouth.

CONTRAINDICATIONS

Use of myrrh is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Powdered resin, myrrh tincture and other galenic preparations for topical use.

How Supplied:

Capsules — 657 mg

Dental powders — 10% powdered resin

Liquid — 1:1 (Myrrh gum)

Oil — 100% (Myrrh commiphora)

Preparation: Prepare 1:5 tincture using 90% ethanol (V/V) in accordance with DAB 10.

Daily Dosage: Myrrh tincture: Paint an undiluted tincture (1:5) on 2 to 3 times daily for external applications. As a rinse, use 5 to 10 drops in a glass of water; as a gargle, 30 to 60 drops in a glass of water. In dental powders: 10% of powdered resin.

Storage: The herb and its preparations should be stored in sealed containers that protect them from light and moisture. A desiccant should be present because the carbohydrate component of the drug readily absorbs water. For this reason, powdered forms should not be stored.

Myrrhis odorata

See Sweet Cicely

*Myrtus communis**

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves (dried and as a source of oil), twigs and the fresh, flowering branches.

Flower and Fruit: The flowers are medium-sized and stiff. They are short, glandular-haired pedicles, which are covered in bracteoles. They grow solitary in the leaf axils. The petals are white with fine glands and a somewhat tomentose margin covered with fine hairs. The anthers are yellow. The berries are pea-sized, orbicular or ovoid-ellipsoid, blue-black or white. They are crowned by the calyx.

Leaves, Stem and Root: Myrtle is an evergreen, bushy shrub or a small tree growing up to 5 m high with opposite branches and quadrangular cane-shaped, initially delicately glandular, downy branches. The dark green leaves are glossy, glabrous, coriaceous, opposite-paired or whorled, I

ovate to lanceolate, entire-margined, acuminate and 1-3 cm long.

Characteristics: The berries have a sweet-spicy taste.

Habitat: Myrtle grows from the Mediterranean region to the northwestern Himalayas.

Production: Myrtle leaves are the dried leaves of *Myrtus communis*. Myrtle oil is the essential oil of *Myrtus communis*, which is extracted from the leaves and branches through steam distillation. (The percentage extracted ranges from 0.1 to 0.5%.) May and June are the best months for harvesting, since the plant has the highest concentration of essential oil during this period.

Not to be Confused With: Confusion can arise with the leaves of *Bux semper-virens* and *Vaccinium vitisidaea*, which resemble Myrtle.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MYRTLE OIL

Chief components: 1,8-cineol (15-45%), alpha-pinene (15-38%), myrtenol (1-5%), myrtenylacetate (4-20%), limonene (4-10%), alpha-terpineol (2-12%), geraniol (0.5-1.5%), geranylacetate (1-5%), myrtol (a myrtle oil fraction that boils between 160-180°C, ~chief components 1,8-cineole and alpha-pinene)

EFFECTS: MYRTLE OIL

The oil's mono- and sesquiterpenes display antibacterial, fungicidal and disinfectant activity.

COMPOUNDS: MYRTLE LEAVES

Volatile oil (0.1-0.5%): (see Myrtle Oil compounds listing above for composition)

Tannins (gallotannins, condensed tannins)

Acylphloroglucinols: myrtocommulon A and B

EFFECTS: MYRTLE LEAVES

The leaves, which contain essential oil and tannins, display antimicrobial activity. An antiademic and hypoglycemic effect was demonstrated in animal experiments. An effect on the central nervous system (an increase in the duration of sleep) was also proven. The efficacy in cold infections may be attributable to the deodorizing and bronchosecretolytic effect of the essential oil.

INDICATIONS AND USAGE

MYRTLE OIL

Unproven Uses: Myrtle oil is used internally in folk medicine for acute and chronic infections of the respiratory tract such as bronchitis, whooping cough, tuberculosis of the lung, as well as for bladder conditions, diarrhea, hemorrhoids, prostatitis and worm infestation. It is sometimes used as a substitute for Buchu.

MYRTLE LEAVES

Unproven Uses: Folk medicine internal uses include diarrhea, hemorrhoids, prostatitis, bronchitis, sinusitis, tuberculosis and colds. Among external uses are ear infections, tired limbs, fatigue and leukorrhea. External applications include ear infections, tired limbs, and leukorrhea.

CONTRAINDICATIONS

No internal administration of the drug should take place in the presence of inflammatory illnesses of the gastrointestinal area or of the biliary ducts, or in the case of severe liver diseases.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. In rare cases, the internal administration of Myrtle oil as a drug leads to nausea, vomiting and diarrhea.

Pediatric Use: Preparations containing the oil should not be applied to the faces of infants or small children because of the possibility of triggering glottal spasm, bronchial spasm, asthma-like attacks or even respiratory failure.

OVERDOSAGE

Overdoses of Myrtle oil (more than 10 g) can lead to life-threatening poisoning, due to the high cineole content. Symptoms include, among others, a decrease in or loss of blood pressure, circulatory disorders, collapse and respiratory failure. Do not induce vomiting if poisoning occurs, because of the danger of aspiration. Following administration of activated charcoal, the therapy for poisonings consists of treating spasms with diazepam (i.v.); treating colic with atropine providing electrolyte substitution. Treat possible cases of addosTs with sodium bicarbonate infusions. Intubation and oxygen respiration may also be necessary.

DOSAGE**MYRTLE OIL**

Mode of Administration: Myrtle is available in various medicinal/pharmaceutical preparations for internal use.

Preparation: Prepare an infusion by mixing 15 to 30 g of the drug with 1 L water and leave to draw for 15 minutes.

Daily Dosage: Single dose: 0.2 g of drug to be taken internally.

Storage: Protect from light and keep tightly sealed.

MYRTLE LEAVES

Preparation: Prepare an infusion by mixing 15 to 30 g of the drug with 1 L water and leave to draw for 15 minutes. A wash is prepared by adding 30 g of leaves to 1 L of water and letting it stand.

Daily Dosage: The average daily dosage of powder from the leaves is 5 g taken before meals. 3 cups of an infusion may be taken each day. Washes may be used several times daily.

Storage: Store the leaves in a tightly sealed container that blocks exposure to light.

Nasturtium

Tropaeolum majus

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh herb, the whole fresh flowering plant and the seeds.

Flower and Fruit: The handsome campanulate flowers are orange with flame-red to fiery red stripes. The calyx is bilabiate, colored and has a spurred upper lip. There are 5 uneven petals. The 2 upper petals are unstemmed, the 3 lower ones are stemmed and fringed at the base. There are 8 stamens and a superior ovary with a 3-stigmaed style. The fruit is a 3-valved pericarp. It is orbicular-reniform, fleshy, wrinkled when ripe and dirty yellow.

Leaves, Stem and Root: The plant is an annual, sometimes perennial and often creeping or climbing plant, 0.3 to 5 m long. The main root is thin and forms an underground runner. The stem is round, branched, fleshy and glabrous, like the whole plant. The leaves are alternate, long-petioled, hastate and almost circular. The leaves are 3 to 5 cm and deeply lobed at the petiole.

Characteristics: The flowers are fragrant and the leafy parts smell and taste like cress.

Habitat: The plant is indigenous to warmer regions of South America and is becoming naturalized in the Mediterranean region, otherwise found as a garden or ornamental plant.

Production: Garden Nasturtium consists of the aerial parts, the seeds or leaves of *Tropaeolum majus*.

Other Names: Indian Cress

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glucosinolates (0.1%): in the fresh, unbruised plant: chief components are glucotropaeolin, yielding benzyl isothiocyanate after cell destruction

Ascorbieffid-(vitamin C, 300 mg/100 gm fresh weight)

Cucurbitacins (in the fruits): including cucurbitacins B and E

Fatty oil (in the seeds, 7.5%): chief fatty acids erucic acid (50%), 11-cis-eicosenic acid (25%), oleic acid (12%)

Oxalates

Flavonoids: including among others, isoquercetin and quercetin glycosides

Carotinoids (as blossom pigments): lutein, zeaxanthine

EFFECTS

Benzyl mustard oil extracted from Nasturtium is bacteriostatic, virostatic, and antimycotic in vitro. Mustard oils are eliminated mainly via the breath or are collected and eliminated in the urine; used externally, Nasturtium is a rubefacient.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Cough
- Bronchitis

Unproven Uses: Nastertium is used internally for infections of the urinary tract and catarrh of the upper respiratory tract. It is also used internally for mild muscular pain, skin diseases, scurvy, tuberculosis, conditions of the respiratory and urinary tracts, and menstrual disorders. The herb is used externally for hair loss and for infected and poorly healing wounds.

CONTRAINDICATIONS

Do not administer to patients with gastrointestinal ulcers or kidney diseases.

Do not administer to infants or small children.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Administration of higher dosages of the fresh plant or of its volatile oil can lead to mucous membrane irritation of the gastrointestinal tract. External administration involving long-term intensive contact with the fresh plant can lead to skin irritations. The plant possesses a low potential for sensitization.

Pediatric Use: Not to be administered to infants or small children.

DOSAGE

Mode of Administration: The cut drug is available in the form of coated and filmed tablets * and compound preparations.

Preparation: To make an infusion, add 30 gm of leaves to 1 liter of water.

Daily Dosage: The dose for the extract is 14.4 mg of benzylisothiocyanate taken 3 times daily. The dose for the infusion is 2 to 3 cups per day; for the pressed juice, 30 gm per day.

Nasturtium officinale

See Watercress

Neem

Antelaea azadirachta

TRADE NAMES

Neem (available from numerous manufacturers)

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the bark, the leaves, the branches, the seeds and the latex.

Flower and Fruit: The plant has small white flowers.

Leaves, Stem and Root: *Antelaea azadirachta* is a deciduous tree up to 16 m high with leaves that are compound, alternate, oblong, ovate-lanceolate and pointed. The bark is grayish-brown, externally fissured, and has a buff inner surface and fibrous fracture.

Characteristics: The plant has no odor, the taste is bitter.

Habitat: Indigenous to the woods of India and Sri Lanka. Found today in other tropical regions such as Indonesia, Australia and western Africa.

Production: Neem tree bark, leaves and seeds are the trunk and branch bark, leaves and seeds of *Azadirachta indica* or of the closely related variety (in the literature often given as a synonym) of *Melia azedarach*.

Other Names: Azedarach, Holy Tree, Nim

ACTIONS AND PHARMACOLOGY

COMPOUNDS: NEEM SEED OIL

Triterpenes and tetranortriterpenes (limonoids and protolimonoids of the gedunin-group): for example nimbin A and B, nimbin, gedunin

COMPOUNDS: NEEM BARK AND LEAVES

Tannin

Volatile oil

EFFECTS

Azadirachta indica has anti-inflammatory and antipyretic properties. *Melia azedarach* has an anthelmintic effect.

INDICATIONS AND USAGE

Unproven Uses: *Azadirachta indica* is used in inflammatory and febrile diseases (including malaria, although unconfirmed). *Melia azedarach* is used for worm infestation.

Indian Medicine: *Antelaea azadirachta* is used for inflammatory and febrile diseases (including malaria and leprosy, although unconfirmed), dyspeptic complaints and worm infestation.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or "side effects" are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is available as a tincture. A slightly narcotic decoction can be prepared (said to lower a fever). An ointment for killing lice is administered topically.

How Supplied:

Capsules — 475 mg

Nelumbo nucifera

See Lotus

Nepalese Cardamom

Amomum aromaticum

DESCRIPTION

Medicinal Parts: The medicinal parts of the giant are the bark and fruit.

Flower and Fruit: The flowers are arranged in globose, 4 cm long spikes with single flowers in the axils of the scale-like, stem-clasping bracts. The inner flower bracts are elongate, ribbed and thorn-tipped. The flowers are pale yellow with a tubular, 3-toothed calyx. The corolla petals are tubular. The flower tube is approximately, 2.5 cm long. The petals are 2.5 cm long, lanceolate, blunt and somewhat cap-shaped. The lip is twice as long as the petals. The lip is round with a cuneiform base and single stamen. The fruit is 3-chambered and narrow ovoid in shape. It is approximately 3 cm long and has numerous 3 mm long seeds in each chamber.

Leaves, Stem and Root: *Amomum aromaticum* is a herbaceous perennial, which grows up to 1 m high. The leaves are lanceolate, up to 25 cm long and 6 cm wide. They are pubescent beneath, with a 2 mm long ligule. The rhizome is up to 5 m long with shoots growing in clusters from it.

Habitat: India

Production: The ripe fruit is harvested in autumn and dried in the sun at low temperatures. Nepalese cardamoms are the dried, ripe fruit of *Amomum aromaticum*.

Not to be Confused With: *Amomum aromaticum* may be confused with *Amomum subulatum*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1%): chief constituent 1.8-cineole, including as well, alpha- and beta-pinene, limonene, myrcene, terpinene, p-cymol, terpineol, nerolidol, 1H-indene-2,3-dihydro-5-carboxyl aldehyde

EFFECTS

The efficacy of the drug in the context of folk medicine is believed to be traceable to the cineole contained in the essential oil, although scientific data regarding this are not available.

INDICATIONS AND USAGE

Chinese Medicine: Nepalese cardamom is used for malaria, diarrhea, vomiting and digestive disturbances.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Overdoses of the essential oil can lead to life-threatening poisoning, due to the high levels of cineole. Symptoms include reduced blood pressure, circulatory disorders, circulatory collapse and asphyxiation. Vomiting is not to be induced in the case of poisoning, due to the danger of aspiration.

Following instillation of activated charcoal, the therapy for poisoning consists of the treatment of spasms with diazepam, of colic with atropine, electrolyte substitution and the countering of any acidosis that may appear with sodium bicarbonate infusions. Intubation and oxygen respiration may also be required.

DOSAGE

Mode of Administration: Whole herb, cut drug and liquid preparations for internal use.

Daily Dosage: As decoction 3-6 gm.

Storage: Should be protected from light and moisture.

LITERATURE

Nerve Root

Cypripedium calceolus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizome with the roots, the fresh underground parts harvested in autumn and the fresh roots. The roots of several varieties are used as a sedative and antispasmodic.

Flower and Fruit: The plant develops terminal inflorescences with 1 to 2 flowers that have leaf-like bracts. The flowers are 4 to 9 cm long by 0.5 to 1 cm wide. They are linear-lanceolate and twisted. The petals are green, green-brown or yellow. The petals, including the protruding lip or shoe, are splayed. The shoe is 3 to 4 cm long in the shape of an inflated sack. It is lemon yellow to gold with purple spots and veins. The pollen is powdery. The pollen seeds are in 4 groups. The ovary is single-valved and pubescent.

Leaves, Stem and Root: Nerve Root is a perennial, 15 to 70 cm high. The plant has a horizontal rootstock with scales and thick root fibers. The stem is round with short hairs, and is (x>vered'aTme"base with scaly brown leaves. There are 3 to 4 leaves above these, which are broad, elliptical/sheath-like, folded and acute. The upper surface is bright green, the underside is paler.

Characteristics: The plant has a faintly gentian-like smell and has an irritating effect on the skin.

Habitat: Indigenous to the U.S. and Canada, cultivated in Europe.

Production: Lady's Slipper rhizome is the rhizome of *Cypripedium calceolus*.

Not to be Confused With: Other *Cypripedium* varieties

Other Names: Lady's Slipper, American Valerian, Bleeding Heart, Moccasin Flower, Monkey Flower, Noah's Ark, Slipper Root, Venus Shoe, Yellows

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Phenanthrene quinones: including cypripedine (2,8-dimethoxy-7-hydroxy-1,4-phenanthrene quinone)

Tannins

EFFECTS

The constituents of the drug have not been investigated. Some species of *Cypripedium* contain allergens and skin-irritating phenanthrene quinones. Nerve Root is astringent and hemostyptic. No additional information is available.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug is used for insomnia, emotional tension, states of agitation, nervousness and hysteria. It is also used internally in the treatment of menorrhagia and diarrhea, as well as externally in the treatment of pruritus vulvae.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The plant possesses a medium potential for sensitization through skin contact.

DOSAGE

Mode of Administration: The drug is administered in its dry form or as liquid extract. The supply of higher (concentrated) doses should be avoided.

Preparation: Liquid extract: 1:1 in 45% alcohol.

Daily Dosage: To be taken internally, 2 teaspoonfuls (2 to 4 gm) of the dried drug as an infusion.

New Jersey Tea

Ceanothus americanus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the dried root bark and the fresh leaves.

Flower and Fruit: The inflorescences grow in the axils of the upper leaves and have long peduncles. They are 5 to 15 cm long, paniced, and have numerous cyme-like partial inflo-

rescences. The flowers are white, the petals are 2 to 3 mm long and twice as long as the sepals. The fruit is a globose capsule with a diameter of about 7 mm.

Leaves, Stem and Root: Ceanothus americanus is a low deciduous shrub 40 to 100 cm high with greenish-purple branches. The petioled leaves are alternate, 3 to 10 cm long by 1.5 to 5 cm wide, ovate or oblong-ovate, rounded at the base, lightly pointed at the tip, and with pinnatifid nerves. The upper surface is glabrous or has finely compressed silky hairs. The lower surface is densely gray and pubescent. The leaf blade is finely and irregularly serrated. The root is tough, woody, dark brown, and striated or finely wrinkled longitudinally. The bark is thin, brittle and dark brown.

Characteristics: The taste is astringent; odorless.

Habitat: Indigenous to eastern and central North America. It is also used for breeding garden hybrids.

Production: Red Root is the root of Ceanothus americanus. The shrub is cultivated.

Other Names: Red Root, Wild Snowball, Jersey Tea, Mountain-Sweet, Walpole Tea, Redroot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyclic peptide alkaloids (0.16% in the root cortex): including ceanothines A to E, americine, adouetines X and Y cyclic peptines

Triterpenes: including ceanothusic acid, ceanothenic acid, and betulic acid

EFFECTS

The taiwijas J have an astringent effect. In blood taken from young rats, an aqueous-ethanol extract of the drug reduced blood-clotting time by 25%. However, the results are difficult to assess. The hemostyptic effect is attributed to the acid fraction of the drug. The drug is still useful as an astringent, expectorant and antispasmodic. There is no valid data on the expectorant and antispasmodic effect.

INDICATIONS AND USAGE

Unproven Uses: Formerly, New Jersey Tea was used as an astringent, in the clotting of the blood, for fever, gonorrhea, syphilis, and for colds and chills, especially of the respiratory organs.

Homeopathic Uses: In homeopathy, Ceanothus americanus is used to treat enlarged spleen.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Orally as a liquid extract.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc 3 times daily (HAB1).

LITERATURE

Niauli

Melaleucaea viridiflora

DESCRIPTION

Medicinal Parts: The medicinal parts are the young or shrubby plants and the oil, which is distilled from the fresh leaves and twigs.

Flower and Fruit: The plant grows up to 15 m.

Characteristics: The presence of traces of copper in the Niauli oil make it slightly greenish. The aromatic odor is reminiscent of camphor.

Habitat: The plant grows in tropical parts of southeast Asia and Australia. -?-

Production: Niauli oil consists of the essential oil from the leaves of Melaleucaea viridiflora, obtained by water distillation.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Chief components: 1,8-cineole (up to 40%), viridiflorol (up to 25%), nerolidol (up to 95%), linalool (up to 30%), (+)-alpha-terpineol and (-)-alpha-terpineol as well as their valeric acid esters, alpha-pinene, limonene

EFFECTS

The drug is antibacterial and stimulates circulation.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

Unproven Uses: Niauli is used for catarrhs of the upper respiratory tract, rheumatism, neuralgia, cystitis.

CONTRAINDICATIONS

Contraindications to internal use include inflammatory illnesses of the gastrointestinal area or of the biliary ducts, and severe liver diseases.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The internal administration of Niauli oil as a drug leads, in rare cases, to nausea, vomiting and diarrhea.

Drug Interactions: Niauli oil contains 35-60% cineole. Cineole causes the induction of the enzymes involved in the detoxification of the liver. The effect of other drugs can therefore be reduced and/or shortened.

Pediatric Use: Preparations containing the oil should not be applied to the faces of infants or small children, since glottal spasm, bronchial spasm and asthma-like attacks are possible, as is respiratory failure.

OVERDOSAGE

Overdosages of Niauli oil (more than 10 gm), can lead to life-threatening poisonings due to the high cineole content. Symptoms include, among others, fall in blood pressure, circulatory disorders, collapse and respiratory failure. In case of poisoning, vomiting should not be induced because of the danger of aspiration. Following administration of activated charcoal, the therapy for poisonings consists of treating spasms with diazepam (i.v.), treating colics with atropine, electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: The oil and other galenic preparations are for internal and external application.

Preparation: Oily nose drops are prepared in a 2 to 5% concentration in vegetable oil. For external use, preparations contain 10 to 30% active ingredient in oil.

Daily Dosage: For internal use, the single dose is 0.2 gm, with the daily dosage ranging from 0.2 to 2.0 gm.

Nicotiana tabacum

See Tobacco

Night-Blooming Cereus

Selenicereus grandiflorus

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried flowers, the fresh young stems and flowers, and the fresh young shoots and sprouts.

Flower and Fruit: The flowers are 18 to 25 cm long and have a diameter of 15 to 27 cm. They have numerous, long-acute, lanceolate tepals that are arranged in a spiral. The outer tepals are brown; the middle ones are light yellow and the inner ones are spatulate to acute, lanceolate and snow white. The numerous stamens are white and have yellow anthers. The styles with the 4-rayed stigmas become yellow toward the top. The ovary is globular and bumpy, with triangular scales and many brownish-gray hairs and thorns, which are approximately 10 mm long, dark brown and bristly.

Leaves, Stem and Root: The plant has a succulent trunk as well as a 1 to 4 cm thick snake-like, creeping or climbing, branched stem, which can grow to 10 m long or longer. The stem is 4- to 8-sided, green to bluish, has no bumps and is covered in adventitious roots. It has white tomentose axis buds on the protruding vertical ribs with 6 to 11 needle-like thorns that are 4 to 6 mm long.

Characteristics: The plant has sweet-smelling flowers, which only bloom for about 6 hours before dying.

Habitat: The plant is indigenous to Central America and is cultivated in Mexico and also in Europe.

Production: The young shoots and flowers are harvested in June or July and then preserved in alcohol. Some cultivated production is done in greenhouse settings, particularly in Europe.

Not to be Confused With: Confusion can arise with the flowers of *Opuntia maxima*, *Selenicereus hamatus*, and *Selenicereus pteranthus*. The drug is adulterated commercially with the flowers of *Opuntia vulgaris* and *Opuntia ficus-indica*.

Other Names: Sweet-Scented Cactus

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Flavonoids (1.5%): including among others, narcissin, rutin, I cacticine, kaempferitine, grandiflorin, hyperoside

Amines: (found only in the shoots) chief components are hordenine (cactine), tyramine, N-methyltyramine, N,N-dimethyl tyramine

Betacyans: (in the blossoms, yellow pigments)

EFFECTS

The drug has an effect similar to digitalis, which includes cardiac stimulation as well as coronary and peripheral vessel dilation. The drug is also said to stimulate the motor neurons of the spinal cord. In addition, the drug may act topically as an antiphlogistic, but this is Unproven.

INDICATIONS AND USAGE

Unproven Uses: Preparations of *Selenicereus grandiflorus* are used for nervous cardiac disorders, angina pectoris, stenocardia, and urinary ailments. In Mexico and Central America, folk medicine internal uses include hemoptysis, menorrhagia, dysmenorrhea, hemorrhage, cardiac complaints, cystitis, shortness of breath and dropsy. Externally, it also is used in these countries as a skin stimulant for rheumatism.

Homeopathic Uses: Night-Blooming Cereus is used to treat heart disease in homeopathy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Intake of the fresh juice is said to cause itching and pustules on the skin, burning of the mouth, queasiness, vomiting and diarrhea.

DOSAGE

Mode of Administration: Fluid extracts and tinctures are used internally and externally.

Preparations: iHujd extract (Extractum Cerei lkjuidium 1:1); Tinctura Cerei (1:4) BPC 34; Tincture in sweetened water (1:10).

Daily Dosage: For the folk medicine dosages, a liquid extract is used in doses up to 0.6 ml, one to 10 times daily. The Tincture Cerei dosage is 0.12 to 2 ml taken 2 to 3 times daily. Dosage for the tincture in sweetened water is 10 drops, 3 to 5 times daily.

Noni

Morinda citrifolia

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaf, fruit and root.

Flower and Fruit: The inflorescence is globose. The flowers are radial, their structures in fives with fused yellowish-white tepals. The ovary is inferior with 1 stigma. The fruit is a many-seeded, glassy-white berry the size of a chicken egg.

Leaves, Branches: *Morinda citrifolia* is a tree that is occasionally shrub-like. It grows up to 10 m high. The leaves are opposite, 10 to 30 cm long. The petiole is approximately 12 mm long. The lamina is coriaceous, glossy, elliptical to elliptical-ovate, acuniinate, somewhat crenate and cuneiform at the base with stipules. The branches are square, divided jointed and contain nodes.

Characteristics: The fruit is inedible.

Habitat: Malaysia

Production: Noni fruit and leaves are the fresh ripe fruit and dried leaves of *Morinda citrifolia*.

Other Names: Mengkudu

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Iridoids: asperulosid, deacetylasperuloside

EFFECTS

No definitive data available.

INDICATIONS AND USAGE

Unproven Uses: Noni is used for diabetes, as a blood purifier (for women), for fever and stomachache (Malaysia).

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: The dried leaves are used as hot compresses on the chest and stomach (for fever and stomachache).

LITERATURE

Hirazumi A, Furusawa E, Chou SC, Hokama Y, Immunomodulation contributes to the anticancer activity of morinda citrifolia (noni) fruit juice. *Planta Med*, 39:7-9, 1996.

Northern Prickly Ash

Zanthoxylum americanum

TRADE NAMES

Prickly Ash Autumn-Harvested

DESCRIPTION

Medicinal Parts: The medicinal parts are the root bark and the berries.

Flower and Fruit: The greenish-yellow flowers are in terminal umbels. The fruit is black or deep blue and enclosed in a gray shell.

Leaves, Stem and Root: The plant is an aromatic shrub or small tree up to 3 m tall. The branches are alternate and the leaves pinnatifid. The bark and the petioles are covered in sharp spines about 5 mm long. The bark is brownish-gray on the outside and faintly furrowed with whitish patches and flattened spines that are about 5 mm long.

Characteristics: The leaves and berries have an aromatic lemon-like fragrance, and the bark has a pungent, acrid taste.

Habitat: The plant grows in North America.

Other "rfSrnes:" Prickly Ash, Toothache Tree, Yellow Wood, Suterberry "'''' ~ " *"

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Pyranocoumarins: xanthoxyletin (xanthoxyloin), xanthyletin, alloxanthyletin

Isoquinoline alkaloids: chelerythrine, berberine, N-methylisocorydine, laurifoline, magnoflorine, nitidine

Volatile oil

Resins

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Northern Prickly Ash is used for low blood pressure, rheumatic disorders, fever and inflammation.

Indian Medicine: The drug is used for toothache, headache, eye and ear conditions, dyspeptic symptoms, colic, flatu-

lence, worm infestation, diarrhea, fever, coughs, asthma, paralyses and leprosy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Overdosage is said to lead to salivation, increased cardiac function and elevated blood pressure. Severe poisonings resulting from intake of the drug have not been recorded.

DOSAGE

Mode of Administration: Liquid extract, in preparations and in combinations.

How Supplied: Liquid extract—1:4

Nutmeg

Myristica fragrans

DESCRIPTION

Medicinal Parts: The medicinal parts are die nutmeg seeds, which through various processes yield several therapeutic components. They include the essential oil of the seed; the compressed, dried aril; the mixture of fat, oil and color pigment from the pressed seeds; the dried seed kernels freed from the aril and shell of the nut; calcified seed kernels; and the dried seed kernels.

Flower and Fruit: *Myristica fragrans* is either male or female, although mere are male trees with female flowers and fruit. The flowers are unisexual. The male flowers are in sparsely flowered inflorescence; the female ones are solitary and inconspicuous. The flowers have a simple 3-lobed involucre; the filaments are fused to a tube. The fruit ripens 7 to 10

months after flowering. The fruit is fleshy, almost round, acuminate at the stem end, 3 to 6 cm long and 2.5 to 5 cm thick. The fruit is light yellow and about the size of a peach. The fruit flesh bursts open when ripe and exposes the bright red seed's aril that surrounds the dark brown seed. Within the aril, the seed kernel is covered in a hard brown testis that shows the marks of the aril.

Leaves, Stem and Root: Nutmeg is an evergreen tree up to 15 m in height. The smooth bark is green on the young branches, then turns grayish-brown. The alternate leaves are dark green, entire-margined, sharp edged, short-petioled, ovate-elliptical and up to 8 cm long.

Habitat: The plant is indigenous to the Molucca Islands and New Guinea and has spread to Indonesia, the West Indies and other tropical areas, where it also is cultivated.

Production: Nutmeg is the seed of *Myristica fragrans*. After harvesting, the nut is shelled and dried (maximum 45° C), and the seed is opened after 4 to 8 weeks. The lacy, fleshy covering of the nut, which is scarlet when fresh and dark orange when dried, yields Nutmeg and Mace. After being separated, both parts are dried slowly. The nut is ground and then distilled. Nutmeg butter is made by pressing and steaming the nuts to extract the fatty and essential oils from the seeds.

Not to be Confused With: Several other nuts are often given the name nutmeg. Confusion may occur with calabash nutmeg (*Monodora myristica*), Papua nutmeg (*Myristica succedanea*) and *Myristica malabarica*, *Laurelia sempervirens*, *Atherosperma moschatum*, *Ravensara aromatica*, *Cryptocarya moschata*, *Torreya californica*. Nutmeg oil is sometimes confused with the oil from the green leaves of *Myristica fragrans*.

Other NameSx^M&ce^ ~ - «•

ACTIONS AND PHARMACOLOGY

COMPOUNDS: NUTMEG

Volatile oil (7-16%)

Fatty oil (30-40%): fatty acids including among others lauric, myristic, pentadecanoic, palmitic, heptadecanoic, stearic, oleic acid

Triterpene saponins

Sterols: including among others beta-sitosterol, campesterol

COMPOUNDS: NUTMEG OIL

Monoterpene hydrocarbons (80%): including sabinene (39%), alpha-pinene (13%), beta-pinene (9%)

monoterpene alcohols (5%): including 1,8-cineole (3.5%)

phenyl propane derivatives (10 to 18%): including myristicin (2 to 5%), elemicin (1 to 2.5%)

Fatty oil (30 to 40%) in the nutmeg oil rendered through pressing

EFFECTS

In animal experiments, the eugenol in the essential oil inhibits, dose-dependently, medicinally induced diarrhea and slows down the transport of active carbon in the gastrointestinal tract. An effect on prostaglandin synthesis and an antimicrobial effect have also been demonstrated. The use of the drug for dysentery and rheumatic complaints seems plausible.

INDICATIONS AND USAGE

Unproven Uses: Internal folk medicine uses of nutmeg include diarrhea and dysentery, inflammation of the stomach membranes, cramps, flatulence and vomiting. Externally, the oil is used for rheumatism, sciatica, neuralgia and disorders of the upper respiratory tract.

Chinese Medicine: Indications include diarrhea, vomiting and digestive problems.

Indian Medicine: Indications in Indian medicine include headaches, poor vision, insomnia, fever and malaria, cholera, impotence and general debility.

Homeopathic Uses: Among uses in homeopathy are nervous physical symptoms, digestive problems with flatulence and disturbed perception.

CONTRAINDICATIONS

The drug is not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. However, the drug can trigger allergic contact dermatitis.

OVERDOSAGE: NUTMEG SEED AND OIL

Ingestion of 1 to 3 "nuts" (or even fewer) can produce amphetamine derivatives through bioconversion of the phenylpropane derivatives in the human body. This eventually leads to intense thirst, nausea, reddening and swelling of the face, and alterations of consciousness from mild changes, such as anxiety or lethargy, to intensive hallucinations. The stupor can last from 2 to 3 days. The therapy for poisonings consists of gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), and installation of activated charcoal. That is followed by treating spasms intravenously with diazepam; treating colic with atropine; electrolyte substitution; and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Nutmeg oils, extracts, powders, syrups and butters are used internally. The oil also is used externally as a liniment 10%

Preparation: There is no information in the literature.

Daily Dosage:

Infusion/decoction: 1%, 50 to 200 ml daily.

Liquid extract: 1 to 2 times daily.

Oil: 1 to 3 drops internally 2 to 3 times a day.

Powder: 0.3 to 1 g; not to exceed 3 times daily.

Syrup: 10 to 40 ml daily.

Tincture: 2 to 10 ml daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 sc acute, 3 times daily; chronic: once a day (HAB1).

Storage: Nutmeg should be stored in tightly sealed containers and kept cool and dry. The oil should be protected from light in containers that are tightly sealed, completely filled and kept at a temperature not to exceed 25° C.

Nux Vomica

Strychnos nux vomica

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe, dried seeds and the dried bark.

Flower and Fruit: The inflorescences are terminal and cyme-like. The flowers have a 5-tipped calyx and a white to greenish-white plate-shaped corolla with a long tube. There are 5 sessile stamens in the mouth of the corolla tube. The ovary is superior, 2-valved and has a long style and a 2-lobed stigma. The fruit, when ripe, is an orange-red, globular berry with a diameter of 4 to 6 cm. The pulp is white, bitter and surrounded by a tough, brittle exocarp about 1.5 mm thick. There are usually 1 to 9 seeds in the pulp, of which 2 to 4 are erect. The seeds are disc-like, orbicular, 12 to 25 mm wide, radially striped, appressed pubescent and exceptionally bitter.

Leaves, Stem and Root: The plant is a tree up to 25 m high with a trunk circumference of up to 3 m. The branches are obtuse-quadrangular, close together and repeatedly bifurcated. They are glabrous and they have 1 to 2 leaf pairs, which are thickened at the nodes. The trunk bark is blackish-ash-gray and the branch bark is gray. The twigs are green and glossy. The leaves are petiolate and crossed-opposite. The leaf blade is glabrous, broadly ovate, entire-margined and has a curved main rib. The broad stipules dry later.

Habitat: The plant grows all over southeast Asia from Pakistan to Vietnam.

Production: Nux Vomica consists of the seeds of *Strychnos nux-vomica*. The berries are picked when ripe. The hard exocarp is removed and the seeds are taken out and washed to remove any pulp residue. They are subsequently dried in the sun.

Not to be Confused With: The seeds of *Strychnos nux-blanda*, *Strychnos potatorum* and *Strychnos wallichiana*. Nux vomica powder may be confused with the powder of date nuts or olive stones and with by-products of stone-nut processing.

Other Names: Poison Nut, Quaker Button's

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (2.0-5.0%): chief alkaloids strychnine and brucine (approximately in a 1:1 ratio), including among others, 12-hydroxystrychnine, 15-hydroxystrychnine, alpha-colubrine, beta-colubrine, icajine

Fatty oil

Polysaccharides as insoluble reserve substances

Iridoide monoterpenes: including among others, loganine

EFFECTS

Nux Vomica increases reflex excitability. Endogenic and exogenic stimuli reach the targeted organ without hindrance and, as a result, possess a strengthened effect that can be attributed to the alkaloid strychnine. The toxic principle strychnine deadens the inhibitory synapse of the CNS and results in overextended musculature reactions.

The strychnine and brucine components act as competitive antagonists of the neurotransmitter glycine. The drug is psychoaateptic due to an increase in reflex action, i.e., endogenic and exogenic stimuli reach the targeted organ without hindrance and as a result have a strengthened effect. In addition, strychnine is cholinolytic in animal experiments.

In lower doses, the drug causes a reflexive increase of glandular secretion in the gastrointestinal tract through the amaroids.

INDICATIONS AND USAGE

Unproven Uses: Nux Vomica and its preparations are used in combinations for diseases and conditions of the gastrointestinal tract, organic and functional disorders of the heart and circulatory system, diseases of the eye, nervous conditions, depression, migraine, and climacteric complaints. In addition, the herb is used as a tonic, an appetite stimulant, for respiratory complaints, for secondary anemia and for unspecific geriatric complaints.

Chinese Medicine: The drug is used for general pain, febrile illnesses, sore throat and abdominal tumors.

Indian Medicine: The drug is used for loss of appetite, anemia, lumbago, asthma, bronchitis, constipation, diabetes, intermittent and malarial fever, skin diseases, paralyses, and muscle weakness; a special procedure is supposed to detoxify the seeds.

Homeopathic Uses: The drug is used for inflammations of the respiratory and gastrointestinal tracts, disorders of the urinary tract, febrile illnesses, hepatocystic disorders, hemorrhoids, dizziness, headache, neuralgia, rheumatic pain, cramps, paralyses, insomnia and nervous irritability.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely toxic due to the strychnine content and is not recommended for use.

OVERDOSAGE

Symptoms of poisoning can occur after ingestion of one bean. Strychnine doses of as little as 1.5 mg (30-50 mg of the drug) initially cause restlessness, feelings of anxiety, heightening of sense perception, enhanced reflexes, equilibrium disorders, and painful stiffness of the neck and back musculature. Later, twitching, tonic spasms of the masseter and neck musculature, and finally painful convulsions of the entire body that are triggered by visual or tactile stimulation occur. Dyspnea comes following spasm of the breathing musculature. Death occurs through suffocation or exhaustion. The lethal dosage for an adult is approximately 50 mg strychnine (1-2 gm of the drug). Chronic intake of subconvulsive dosages can also lead to death under similar conditions after a period of weeks. This is due to an accumulation of drug in the body, particularly in those who have liver damage.

Following the administration of a watery suspension of activated charcoal, the therapy for poisoning consists of keeping external stimulation to a minimum through placement in a quiet, warm, darkened room. Convulsions should be treated with dosages of diazepam or barbital (i.v.). High-calorie glucose infusions should also be given. Intubation and oxygen respiration may also be required. Gastric lavage should be avoided, due to the danger of triggering convulsions. Analeptics or phehothiazines should not be administered. Because of the possibility of unwanted effects occurring in conjunction with the administration of therapeutic dosages, one should forgo any administration of the drug.

DOSAGE

Mode of Administration: Nux Vomica is used almost exclusively in homeopathy. Radioactively tagged strychnine is used in medicine to detect glycinergic receptors. In industry, the drug is used as an active agent for pest control.

Daily Dosage: The average single dose is 0.02-0.05 gm.

The daily dosages for various preparations are as follows: liquid (0.05 to 2 ml), extract (0.005 gm, with a maximum dose of 0.1 gm), tincture (0.5 to 2 ml (BP80), or *Strychninum nitricum* (maximum single dose of 0.005 gm).

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Storage: Mark the container as "poisonous" and keep tightly sealed; protect the drug from cool air and light.

Nymphaea odorata

See American White Pond Lily

Oak

Quercus robur

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried bark of the young branches and the lateral shoots, the dried bark of the trunk and branches, the dried leaves of various oak species and the seed kernels without the seed coats.

Flower and Fruit: The flowers are reddish brown and monoecious. The male flowers consist of a 5-part perigone with 6 to 10 stamens that appear in small groups in limp, hanging catkins. The female flowers, solitary or in groups of up to 5, appear in a involucre which clasps the base of the fruit and which later becomes bowl-shaped. The fruit is solitary or in groups of up to 5 on 1 shared, glabrous or occasionally sparsely pubescent stem. They are oblong-ovoid, acuminate and enclosed in the cupule.

Leaves, Stem and Root: The tree is about 50 m high with a broad, irregular, heavily branched crown and a trunk which divides into gnarled, strong, bent branches. The bark is deeply fissured, thick and grey-brown. The leaves are short-petioled, almost sessile, oblong-obovate, almost lobed, usually cordate or pedate at the base.

Habitat: The tree is widespread in Europe, Asia Minor and the Caucasus region.

Production: Oak bark consists of the dried bark of young branches and saplings of *Quercus robur* and/or *Quercus petraea*, harvested in the spring, as well as their preparations. Oak bark is harvested from March to April. The trees fall every 10 years. The bark is dried rapidly.

Other Names: Common Oak, Pedunculate Oak, English Oak, Tanner's Bark

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Catechin tannins: oligomeric proanthocyanidins

Ellagitannins: (including castalagin, pedunculagin, vesvalagin, 2,3-(S)-hexahydroxy diphenoyl glucose), flavano-ellagitannins (acutissimins A and B, eugenigrandin, guajavacin B, stenophyllanin C)

Gallo tannins

Monomeric and dimeric catechins and leucoanthocyanidins

Tannins (12 to 16%)

EFFECTS

The drug, which contains tannins, is astringent, antiphlogistic, antiviral and anthelmintic.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis
- Diarrhea
- Inflammation of the mouth and pharynx
- Inflammation of the skin

Unproven Uses: Oak is used internally for non-specific diarrhea. In smaller doses it is used as a stomach tonic. The drug is used externally for inflammatory skin diseases, inflammation of the mouth and throat as well as the genital and anal area, suppurating eczema, hyperhidrosis, intertrigo and as an adjuvant treatment of chilblains.

Oak is also used in folk medicine internally for hemorrhagic stool, non-menstrual uterine bleeding, hemoptysis and chronic inflammation of the gastrointestinal tract. External uses include hemorrhoid bleeding, varicose veins, uterine bleeding, vaginal discharge (washes/douches), rashes, chronic, itching, scaly and suppurating eczema and eye inflammations.

CONTRAINDICATIONS

Whole-body baths are contraindicated with large-area weeping eczemas and skin injuries, with feverish and infectious illnesses, with cardiac insufficiency in stages III and IV (NYHA) and with hypertonia in stage IV (WHO).

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Internal administration could lead to digestive complaints because of the secretion-inhibiting effect of the tannins.

Drug-Interactions: The absorption of alkaloids and other alkaline Tmigs* may be reduced or inhibited.

DOSAGE

Mode of Administration: Oak is available as whole, crude and powdered drug form, as a bath additive and in compounded preparations. It is also available in solid pharmaceutical form for oral intake.

Preparation:

Tea — 1 gm finely cut or coarse powdered drug is put in cold water, rapidly boiled and strained after some time (1 teaspoon corresponds to 3 gm drug).

Bath additive — 5 gm drug is boiled with 1 Liter water and added to the full or hip bath.

Daily Dosage:

Internally — 3 gm of drug; Tea: 1 cup 3 times a day.

Externally — Rinses/gargles: boil 2 dessertspoons finely cut drug with 3 cups water.

Bath additive — duration: 20 minutes at 32 to 37° C.

Storage: Should be tightly sealed and protected from light

Oak Gall

Quercus infectoria

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the leaf.

Flower and Fruit: The male flowers are tangled into hanging, axillary catkins, with a 6- to 8-tepaled perigone and 6 to 10 stamens. The female sessile flowers are single or in small groups in the leaf axils of dropping stipules. The perigone is 6-tipped with an inferior 3-chambered ovary surrounded by an initially inconspicuous and then later cup-shaped cupula. The fruit is up to 4 cm long, cylindrical, shiny brown and is 3 times longer than the cupula, which is covered with narrow scales.

Leaves, Stem and Root: The plant grows as a shrub or small tree, dichinous and monoecious. The leaves are alternate, approximately 5 cm long, short-petiolate, elongate, sinuate, roughly thorny-tipped serrate.

Characteristics: Apical galls are formed by the laying of eggs by the gall wasp (*Andricus gallae-tinctoriae*) in the young leaf buds.

Habitat: The various *Quercus* species originated in Iran, Iraq and Turkey, but are now widespread and particularly common in Asia Minor, Europe and North Africa.

Production: Oak Gall is the gall of *Quercus infectoria* produced by gall wasps (*Andricus gallae-tinctoriae*) laying their eggs in the leaf buds. The development of the larva probably stimulates the bud as an infection would and produces the gall as a reaction.

Other Names: Gallinaccia Oak

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (60 to 70%): gallotannins, particularly hexa- and heptagalloyl-glucoses

Phenol carboxylic acids: gallic acid (3%), ellagic acid (2%)

EFFECTS

The astringent quality of the drug can be explained by the tannins it contains. The dry extract exhibits analgetic, hypoglycemic and sedative-hypnotic efficacy.

INDICATIONS AND USAGE

Unproven Uses: External uses include treatment of inflammation of the skin and frostbite and as an adjuvant in the treatment of infectious skin conditions. Oak gall is used exterrily "for chilblains and gingivitis, for which efficacy appears plausible but has not yet been sufficiently documented.

Indian Medicine: Uses include intestinal hemorrhaging, coughing blood, diarrhea, dysentery, ulcerative stomatitis, coughs, bronchitis, dyspepsia, fever, gonorrhea, leucorrhea, menorrhagia, impetigo, eczema, hemorrhoids, pharyngodynia, diabetes, hyperhidrosis and tonsillitis.

Chinese Medicine: Dysentery, hyperhidrosis, oral ulceration, leucorrhea, hemorrhoids, wounds and rectal prolapse are considered to be indications. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper external administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Preparations of the whole, cut and powdered drug have internal and external applications.

Preparation:

Tincture — Powdered gall apples are mixed roughly 1:5 with spirit of wine.

Storage: The drug should be stored in a tightly sealed container.

Oats

Avena sativa

TRADE NAMES

Wild Oats, Oat Bran, Oatstraw

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried above-ground plant, the ripe, dried fruits, and the dried, threshed leaf and stem.

Flower and Fruit: The spikelet has 2 to 3 flowers. The outer glume has no awn, is 18 to 30 mm long and has 7 to 11 ribs. The top glumes grow from 12 to 24 mm long, have 2 divisions and a dentate tip. They have 7 ribs and can either be awned or unawned. The awn is 15 to 40 mm long, upright and rough. The double ribbed husks are 10 to 20 mm long and are thickly ciliate on the short ridge. The 3 stamens are 2.5 to 4 mm long. The ovary has a pinnatifid stigma. The fruit is 7 to 12 mm long, narrowly elliptoid and pubescent.

Leaves, Stem and Root: Oat is a light-green annual grass with a bushy root. The stalks are 60 to 100 cm high, smooth and glabrous. The linear-lanceolate tapering, flat leaves are in double rows, and the leaf sheath is clasping. The ligula is short and ovate with triangular pointed teeth. The leaf blade is linear-lanceolate and is 45 cm long by 5 to 15 mm wide.

Habitat: Oats originated in England, France, Poland, Germany and Russia, and are now cultivated worldwide.

Production: Wild oat herb consists of the fresh above-ground parts of *Avena sativa*, which are harvested shortly before the height of the flowering season and then quickly

dried. Oats consist of the ripe, dried fruits of *Avena sativa*. Oat bran is taken from the outer layer of the husked fruit. To make rolled oats, the husked fruit is treated with steam, then crushed. Oat straw consists of the dried, threshed leaves and stems of *Avena sativa*, also harvested shortly before the height of the flowering season.

Other Names: Grain, Groats, Oatmeal, Straw

ACTIONS AND PHARMACOLOGY

COMPOUNDS: OAT HERB

Soluble oligo- and polysaccharides: including saccharose, kestose, neokestose, bifurcose, beta- glucans, galactoarabinoxylans

Silicic acid (partially water-soluble)

Steroid saponins: avenacoside A and B

Unusual amino acids: avenic acid A and B

Flavonoids: including vitexin-, isovitexin-, apigenin-, isoorientin-, tricinglycosides

EFFECTS: OAT HERB

In one poorly constructed experimental investigation, the drug was said to lower the uric acid level and to display an antihepatotoxin effect in animal experiments. The mode of action was not explained.

COMPOUNDS: OAT FRUIT

Starch

Soluble polysaccharides: in particular beta-glucans and arabinoxylans

Proteic substances: including gliadin, avenin, avenalin

Peptides: alpjia-avenothionine, beta-avenothionine

Steroid saponins: avenacoside A and B * " *

Sterols: including beta-sitosterol, delta-5-avenasterol

Fatty oil

Vitamins of the B-group

Amines: including gramine

EFFECTS: OAT FRUIT

Dehusked oats are, according to various studies, able to lower serum cholesterol and to hinder prostaglandin biosynthesis. The latest research attributes the cholesterol-lowering effect to the water-soluble polysaccharides, in particular beta-glucans.

COMPOUNDS: OAT STRAW

Soluble oligo- and polysaccharides: including saccharose, kestose, neokestose, bifurcose, beta-glucans, galactoarabinoxylans

Silicic acid (partially water-soluble)

Steroid saponins: avenacoside A and B

Unusual amino acids: avenic acid A and B

Flavonoids: including vitexin-, isovitexin-, apigenin-, isoorientin-, tricinglycosides

EFFECTS: OAT STRAW

There is no information available concerning the efficacy of oat straw.

INDICATIONS AND USAGE

OAT HERB

Unproven Uses: Wild oat herb preparations are used for many purposes, including acute and chronic anxiety, atonia of the bladder and connective tissue, connective tissue deficiencies, excitation, gout, kidney ailments in Kneipp therapy, neurasthenic and pseudoneurasthenic syndromes, old age symptoms, opium and tobacco withdrawal treatment, rheumatism, skin diseases, sleeplessness, stress, weakness of the bladder, and as a tonic and roborant. The efficacy for the claimed applications is not documented.

Homeopathic Uses: Oats are used in homeopathy for exhaustion and insomnia.

OAT FRUIT

Unproven Uses: Oat preparations are used for diseases and complaints of the gastrointestinal tract, gallbladder and kidneys, for cardiovascular disorders, constipation, diabetes, diarrhea, physical fatigue, rheumatism, and as a gruel for chest and throat complaints. The claimed efficacy has not been fully substantiated. ""

OAT STRAW

Approved by Commission E:

- Inflammation of the skin
- Warts

Unproven Uses: The drug is employed externally for seborrheic skin disorders, especially those accompanied by itch. Oat straw is used for abdominal fatigue, bladder and rheumatic disorders, eye ailments, frostbite, gout, impetigo and metabolic diseases. It is used in foot baths for chronically cold or tired feet. It is also used as a tea for flu and coughs.

PRECAUTIONS AND ADVERSE REACTIONS

OAT HERB, FRUIT AND STRAW

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

AVENA HERB

Mode of Administration: The herb is used in combination therapy, as a tea for internal use, and in homeopathic mother tinctures and dilutions.

How Supplied:

Liquid — 1000 mg/ml

Preparation: To make a tea, 3 gm drug is boiled in 250 ml water, which is strained after cooling.

Daily Dosage: The tea is taken repeatedly throughout the day and shortly before going to bed.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution twice weekly sc (HAB1).

Storage: The herb should be protected from light and moisture.

OAT FRUIT

Mode of Administration: The fruit is used in homeopathy and in combination preparations.

OAT STRAW

Mode of Administration: As a comminuted herb for decoctions and other galenic preparations as teas and bath additives.

Preparation: To make oat straw bath, 100 g chopped drug is boiled with 3 liters water for 20 minutes and the decoction is added to the bath.

Daily Dosage: 100 g of herb is used for one full bath.

Oilseed Rape

Brassica napus

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the roots and seeds.

Flower and Fruit: The flowers are in racemes with 4 upright, splayed sepals. The 4 petals are yellow, 11 to 14 mm long, almost twice as long as the calyx, with an orbicular-elliptical surface. There are 2 short and 4 long stamens. The ovary is superior, with 4-floreted carpels. The fruit is 4.5 to 11 cm long and is a dehiscent pod opening on 2 sides with a septum and 20 to 40 seeds. The seeds are globose and approximately 1.5 to 3 mm in diameter.

Leaves, Stem and Root: Oilseed Rape is an annual or biennial herb that grows up to 1.4 m high. The leaves are alternate with a bluish bloom; the lower ones are petiolate and pinnatisect, with relatively large terminal lobes and are slightly pubescent. The middle and upper leaves are sessile, partly clasping, simple, glabrous, dentate or entire. The stem of larger plants is branched. The root is thin and spindle-shaped.

Habitat: Europe, North Africa, U.S.

Production: The seeds are cold-pressed and then refined. Rapeseed oil is the cold-pressed and refined oil from the ripe seeds of *Brassica napus*.

Not to be Confused With: Rapeseed oil may be adulterated with resins and mineral oil. *Sinapis arvensis* is a permitted substitute.

Other Names: Colza, Cole, Rape, Rape Seed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil: chief fatty acids: oleic acid (60%), linoleic acid (20%), linolenic acid (10%), as well as palmitic acid, stearic acid, eicosanoic acid, behenic acid. Varieties with high erucic acid content (40 to 50%) are no longer cultivated (reduction of the erucic acid content in the Common Market countries to below 5%)

Sterols: beta-sitosterol, campesterol, brassicasterol, esterified to some extent

EFFECTS

Rapeseed oil, when ingested in high dosages over an extended period of time, is cardiotoxic. The drug is chiefly used as a substitute for olive oil and in the manufacture of salves and liniments.

INDICATIONS AND USAGE

No medicinal indications

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages of the oil, which is low on erucic acid.

DOSAGE

Storage: Store in the dark, in well-filled containers.

LITERATURE

Butcher RD, Goodman BA, Deighton N, SnDth WH, Evaluation of the allergic/irritant potential of air pollutants: detection of proteins modified by volatile organic compounds from oilseed rape (*Brassica napus* ssp. *oleifera*) using electrospray ionization-mass spectrometry. *Clin Exp Allergy*, 25 (1995).

Olea europaea

See Olive

Oleander

Nerium oleander

DESCRIPTION

£ *Medicinal Parts:* The leaves are the medicinal part of the plant.

Flower and Fruit: The corolla is 4 to 7 mm in diameter, usually pink to red but sometimes white. The petals are thickly covered in glands. The tube is 2 cm long as are the obtuse and patent lobes. The anther appendages are long, pubescent and twisted. The follicles are 8 to 16 cm by 0.5 to 1 cm, erect and reddish-brown.

Leaves, Stem and Root: The evergreen plant can be tree or shrub-like. The trunks are up to 4 m high. The leaves are 6 to 12 by 1.2 to 2 cm, linear-lanceolate, sharp-edged, coriaceous, dark green.

Habitat: *Nerium oleander* grows mainly in the Mediterranean region but also in parts of Asia. It is cultivated in Europe.

Production: Oleander leaf is the leaf of *Nerium oleander*, collected shortly before flowering and then dried in the shade.

Other Names: Rose Laurel

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardiac steroids (cardenolide): chief components are 16-acetyl neogistonin, adynerin, 5 α -adynerin, gentiobiosyl-adynerin, delta 16-dehydroadynerin, digitoxigenin oleandroside, gentiobiosyl-odoroside A, gentiobiosyl-oleandrin, glucosyl-oleandrin, oleandrogenin glucoside, kaneroside, neriaside, nerigoside, neriumoside

Pregnanes and pregnane glycosides: including 12 β -hydroxy-16 α -methoxy-pregna-4,6-dien-3,20-dione

EFFECTS

Oleander is positively inotropic and negatively chronotropic. The cardenolide glycosides of the drug are qualitatively digitoxin-like in their action, but generally weaker, probably due to the lower rate of absorption.

INDICATIONS AND USAGE

£ *Unproven Uses:* Folk medicine uses of Oleander leaf include diseases and functional disorders of the heart, as well as skin diseases. Previous internal application for myocardial insufficiency, decompensated hypertonia and cardiac insufficiency is no longer common.

Indian Medicine: Among uses in Indian medicine are scabies, eye diseases (using only the juice of the leaves) and hemorrhoids.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Side effects can include, particularly in the case of overdoses, nausea, vomiting, diarrhea, headache, stupor and cardiac arrhythmias.

Drug Interactions: The simultaneous administration of the drug with quinidine, calcium salts, saluretics, laxatives or glucocorticoids increases both efficacy and side effects. For symptoms of an acute poisoning and therapy see Digitalis. The scientific literature (Lewin) contains numerous descriptions of fatalities.

OVERDOSAGE

See PRECAUTIONS and ADVERSE REACTIONS.

DOSAGE

How Supplied: Forms of commercial pharmaceutical preparations include solutions, coated tablets and compound preparations.

Dosage: No information is available.

Storage: Oleander should be stored where it is protected from dampness and light.

Olive

Olea europaea

TRADE NAMES

Olive oil and Olive leaves are available from numerous manufacturers. The leaves are sometimes marketed as Olive Leaf-Powder.

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the oil extracted from the ripe drupes, and the fresh branches containing leaves and clusters of flowers.

Flower and Fruit: The flowers are in small axillary clustered inflorescence. The calyx has 4 tips. The white corolla has a short tube and 4 lobes. The superior ovary is bilocular, with each side having 2 hanging anatropal ovules. The drupe has 1 to 2 seeds, is fleshy, plum-like or round. The smooth drupe is initially green, then red and finally blue-black when ripe. The very hard stone contains oblong compact seeds with many endosperm.

Leaves, Stem and Root: Olive grows as a medium high shrub or a tree up to 10 m high. The plant has pale bark and cane-like, quadrangular to round, initially downy, thorny or thornless branches. The leaves are opposite, entire, stiff, coriaceous, narrow-elliptical to lanceolate or cordate with thorny tips. The upper surface is dark green, glabrous or covered with scattered scutiform hairs; the underside shimmers silver with scutiform hairs.

Habitat: The plant grows in almost all of the southern European countries and throughout the entire Mediterranean region as far as Iran and beyond the Caucasus. Olive trees are cultivated in many regions of the world.

Production: Olive leaves consist of the fresh or dried leaves of *Olea europaea*. The leaves are harvested from cultivated trees and dried in the shade. Olive oil is the fatty oil extracted from the drupes of *Olea europaea*, using the cold-press method.

Not to be Confused With: Confusion can arise between Olive leaves and the leaves of *Nerium oleander*. The oils of *Camellia sasanqua* and other *Camellia* species can be mistaken for Olive oil.

Other Names: Olivier

ACTIONS AND PHARMACOLOGY

COMPOUNDS: OLIVE LEAVES

Iridoide monoterpenes: including among others, oleoropine (6-9%), additionally 6-O-oleoropinesaccharose, ligstroside, oleoroside, oleoside-7,11-dimethylether

Triterpenes: including oleanolic acid, maslinic acid

Flavonoids: luteolin-7-O-glucoside, apigenine-7-O-glucoside

Chalcones: olivin, olivin-4'-O-diglucoside

EFFECTS: OLIVE LEAVES

Animal tests demonstrated hypotensive, antiarrhythmic and spasmolytic effects on the smooth muscle of the intestine, caused by the terpenes and phenols of the drug.

COMPOUNDS: OLIVE OIL

Chief fatty acids: oleic acid (56-83%), palmitic acid (8-20%), linoleic acid (4-20%)

Steroids (0.125 to 0.25%): beta-sitosterol, delta7-stigmasterol, delta5-avenasterol, campesterol, stigmasterol

Tocopherols (0.02%)

EFFECTS: OLIVE OIL

Through the presence of polyunsaturated fatty acids, the drug has an antisclerotic effect by positively influencing the serum lipids. A reduction of plasma glucose was also observed. Contraction of the gallbladder was observed with the increase of cholecystokinin in the plasma.

(Use for gallstones is not advised because, efficacy has not been proven and use may cause colic.)

INDICATIONS AND USAGE

OLIVE LEAVES

Unproven Uses: Folk medicine uses include hypertension, arteriosclerosis, rheumatism and gout, diabetes mellitus and fever.

OLIVE OIL

Unproven Uses: Internal uses of the oil in folk medicine include cholangitis, inflammation of the gallbladder, flatulence, constipation, icterus, Roemhel syndrome, gastrointestinal ulcers and kidney stones. Externally, it has been used for psoriasis, eczema, sunburn, mild burns and rheumatism. Its use as a lubricant for constipation and dry skin conditions appears plausible because of the oily characteristics.

CONTRAINDICATIONS

The internal administration of the drug can trigger colic among gallstone sufferers, so its use is contraindicated.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

OLIVE LEAVES

Mode of Administration: The drug is available for oral use in mono and combination tea mixture preparations.

How Supplied:

Capsules — 580 mg

Drops

Preparation: An infusion is prepared by pouring 150 ml of hot water over 7 to 8 g of the dried leaves. Prepare a tea by pouring hot water over 2 teaspoonfuls of the drug and allowing it to steep for 30 minutes.

Daily Dosage: Tea: 3 to 4 cups throughout the day.

OLIVE OIL

Daily Dosage:

Constipation — 100 to 500 ml Olive oil at body temperature applied rectally.

Gastrointestinal ulcers — 15 to 30 ml 3 taken times daily at mealtimes.

Onion

Allium cepa

DESCRIPTION

Medicinal Parts: The medicinal part is the bulb.

Flower and Fruit: The peduncles are up to 3 cm long. Trie flowers are greenish-white, in orbicular umbels, with 6 free flower bracts that are shorter than the 6 stamens. The pedicles are eight times as long as the flowers. The fruit is a thin-skinned capsule. The seeds are black and angular. The flowers are in globular umbels, before blooming in membranous sheaths.

Leaves, Stem and Root: The plant is perennial or biennial. There are many varieties and can be compressed-globose, ovate or oblong. Most varieties have secondary bulbs. Leaves are shorter than the peduncle, tubular or swollen, and blue-green. There is a hollow scape, which is gray-blue, expanded and bloated below the middle.

Habitat: Central Asia is considered to be the region of origin. Onion was introduced to the Mediterranean and is cultivated worldwide.

Production: Onion consists of the fresh or dried, thick and fleshy leaf sheaths and stipules of *Allium cepa*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alliins (alkylcysteine sulphoxides): in particular allylalliin (allyl-L (+)-cysteine sulphoxide) and its gamma-glutamyl conjugates, that in the course of cutting up either the freshly harvested bulbs or those that have been already dried and then re-moistened, are transformed into the so-called alliaceous oils.

Fructosans (polysaccharides, 10-40%)

Saccharose and other sugars

Flavonoids: including quercetin-4'-O-beta-D-glucoside (spiraeoside)

Steroid Saponins

EFFECTS

The thiosulphinates exhibit an antimicrobial effect, and is effective against *Bacillus subtilis*, *Salmonella typhi*, *Pseudomonas aeruginosa* and *Escherichia coli*.

558/ONION

Lipid and blood pressure lowering effect: Certain constituents function similarly to those in garlic, although this is not yet clinically proven.

Inhibits thrombocyte aggregation: Dimethyl and diphenyl-tiiosulphinate both retard thrombocyte biosynthesis using thrombase stimulation.

Antiasthmatic and anti-allergic effect: Guinea pigs sensitized using ovalbumin were protected from asthma attack through the oral administration of onion juice. Administration of an ethanol onion extract significantly reduced allergy-induced bronchial constriction in asthma patients.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Arteriosclerosis
- Dyspeptic complaints
- Fevers and colds
- Cough/bronchitis
- Hypertension
- Tendency to infection
- Inflammation of the mouth and pharynx
- Common cold

Unproven Uses: In folk medicine, the drug is administered internally for cough, whooping cough, bronchitis, asthma and angina. Onion has been used to stimulate gallbladder functions, for digestive disorders with bloating and colic pain, for dehydration, as an aid at the introduction of menstruation. Onion is also used for ascariasis, high blood pressure, arteriosclerosis and in the treatment of diabetes. Externally the drug is used for insect bites, wounds, light burns, fujjmcles, warts, and in the after-care of bruises.

Indian Medicine: t5nion preparations are*Used for dyspeptic conditions, respiratory conditions, wounds, pain and for malarial fever.

Chinese Medicine: Preparations are used for worm infestation, fungal and bacterial infections.

Homeopathic Uses: Allium cepa is used for acute inflammatory illnesses, pain syndrome, flatulent colic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The intake of large quantities can lead to stomach complaints. Frequent contact with the drug leads on rare occasion to allergic reactions (hand eczema).

DOSAGE

Mode of Administration: Cut onions, pressed juice from fresh onions and other oral galenic preparations.

Preparation: Onion oil maceration: same as garlic maceration drug extract 1:1.

Old recipe: Siripus Cepae: freshly grated onions 15 g; water 60 ml; ethanol 90% (\7V) 15 ml; saccharose 150 g; the ethanolic extract is boiled with the saccharose.

Popular: pressed juice and onion syrup: made of 500 g onions, 500 g water, 100 g honey and 350 g sugar.

Onion tincture: 100 g minced onions in 300 g ethanol 70% macerated for 10 days.

Daily Dosage: Raw drug is used therapeutically.

Externally the juice is spread or laid on as a poultice or in slices.

Internally: onion tincture 4 to 5 teaspoonfuls daily; onion syrup 4 to 5 tablespoons daily.

Average daily dose: 50 g of fresh onions or 20 g of dried drug.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); Parenterally: 1 to 2 ml 3 times daily sc; Ointment 1 to 2 times daily (HAB1)

Opium Antidote

Combretum micranthum

DESCRIPTION

Medicinal Parts: The dry leaves and stems are the medicinal parts of the plant.

Leaves, Stem and Root: The leaves are 10 to 13 cm long and about 6 cm wide, with 8 to 10 lateral spreading veins, transparent in the axils. The surface of the young leaves has small scales.

Characteristics: The taste is astringent and strong.

Habitat: The plant is indigenous to China, Malaysia and Indonesia.

Production: Combretum leaves are the dried leaves of Combretum micranthum.

Other Names: Combretum, Jungle Weed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrrolidine alkaloid betaines: stachydrines, 4-hydroxystachydrines, combretin-A (betaines drawn from the proline)

Catechin tannins

Flavonoids: including vitexin, saponaretin, orietin

EFFECTS

The drug has mild choleric and astringent effects.

INDICATIONS AND USAGE

Unproven Uses: The drug has been used for cholecystopathy, dyspepsia and liver disease. It is obsolete as a drug and now found only in combination preparations.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Oregano

Origanum vulgare

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the fresh or dried leaves through a process of steam distillation, the herb picked during the flowering season and freed from the thicker stems and dried, as well as the fresh flowering herb.

Flower and Fruit: The bright purple labiate flowers are in cyme-like panicles with elliptical, pointed and usually dark purple bracts, which are longer than the calyx. The calyx is tubular and has 5 even tips. The upper lip of the corolla is flat. The lower lip has 3 lobes; the middle lobe is the widest. There are 4 stamens, the longer ones extending beyond the lower lip.

Leaves, Stem and Root: *Origanum vulgare* is a woody perennial plant, which grows up to 90 cm high. The upper part is branched. The plant has rhizome-like runners and is downy, bristly or velvet-like. The leaves are 10 to 40 cm

long and 4 to 25 mm wide, ovate, entire-margined or slightly crenate, glabrous or pubescent, translucent-punctate and petiolate.

Characteristics: The plant has an aromatic scent, similar to *Origanum majorana*.

Habitat: The plant is common throughout Asia, Europe and northern Africa.

Production: Oregano consists of the above-ground parts of *Origanum vulgare*. It is harvested 5 cm above the ground during the flowering season and dried carefully on the field or under a roofed loft.

Other Names: Mountain Mint, Origano, Wild Marjoram, Winter Marjoram, Wintersweet

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.15-1.0%): chief components carvacrol (share 40-70%), gamma-terpinene (8-10%), p-cymene (5-10%), additionally alpha-pinene, myrcene, thymol. There are also strains with thymol, linalool + terpinene-4-ol, linalool, caryophyllene +germacren D, or germacren D as chief components

Flavonoids: including naringin

Caffeic acid derivatives: in particular, rosmarinic acid (5%)

EFFECTS

The essential oil, which contains carvacrol, is antimicrobial *in vitro*.

INDICATIONS AND USAGE

Unproven Uses: Oregano herb is used for respiratory disorders such as coughs, inflammation of the bronchial mucous membranes and as an expectorant. In folk medicine, it is used for coughs, dyspepsia, painful menstruation, rheumatoid arthritis, scrofulosis, urinary tract disorders and as a diaphoretic.

Chinese Medicine: In China, Oregano is used for colds, fever, vomiting, dysentery, jaundice and malnutrition for children.

Homeopathy Uses: Oregano is used to increase sexual excitability.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Oregano infusions and powders are used as teas, gargles and bath additives.

Preparation: For internal use, pour 250 ml boiling water over 1 heaped teaspoonful and strain after 10 minutes; the tea can be sweetened with honey. The unsweetened infusion is used as gargle and mouthwash. To use as a bath additive, pour 1 l of water over 100 g drug, strain after 10 minutes and add to a full bath.

Daily Dosage: Tea: 1 cup several times a day. Powder: 0.5 to 1 dessertspoon 2 to 3 times daily with food.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution sc twice weekly (HAB34).

Storage: Store Oregano where it is protected from moisture and light.

Oriental Arborvitae[^]

Thuja orientalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves and leafy branches.

Flower and Fruit: The inflorescence forms cones with horned cone scales. The male cones are apical and globose with 3 to 6 stamens. The female cones are small, ovoid to globose with 3 pairs of scales, the upper one sterile, the middle one with 1 ovule and the lower one with three. The seeds are ovoid to elliptical and have no wings.

Leaves, Stem and Root: Oriental arborvitae is a diclinous, monoecious, evergreen tree, which grows up to 10 m high. The leaves are decussately arranged, scale-like, imbricate, appressed to the branches, thick and acute. The edge leaves are pressed together and keeled. The surface leaves are ovate-rhomboid, grooved on the back, needle-like when young and acutely splayed. The branches are vertical,

flattened and vertically branched. The smaller branches are the same color on both sides.

Habitat: China, Korea, Afghanistan, Iran

Production: Oriental Arborvitae tops are the dried leaves and leafy branches of *Thuja orientalis*. They are harvested from cultivated stock in late summer or early autumn, followed by drying in the shade.

Not to be Confused With: May be confused with other *Thujae* species.

Other Names: Chinese Arborvitae

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.4%): containing alpha-pinene, alpha-thujone (6%)

Flavonoids: including tricetin-3-glucoside

Wax (0.5%, estolides): chief acid juniperic acid

EFFECTS

The terpene-containing drug is severely toxic. The hemostyptic and hair growth-promoting effects with which it is credited have not yet been documented in experimental data.

INDICATIONS AND USAGE

Chinese Medicine: Oriental Arborvitae is used for coughing blood, nose bleeds, dysentery, hematuria and hair loss.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb preparations, cut and powdered drug for internal and external use.*

Preparation: to prepare *Biotae Cacumen*. The rubbed branches are roasted in an iron pan until the surface blackens.

Daily Dosage: 3 to 18 gm of drug

Storage: Should be stored in a dry place and protected from light.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl, Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Orris

Iris species

DESCRIPTION

Medicinal Parts: The medicinal part is the rhizome with the roots.

Flower and Fruit: The flowers are long-pedicled and perfumed. The tepals are white or slightly blue. The outer ones are darker with a yellow beard. The anthers are as big as the filaments. The upper lip of the stigma branch is inclined forward. The fruit is a large capsule with a number of sections in which the brown seeds are lined up like rolls of coins.

Leaves, Stem and Root: The plants are perennial, 30 to 100 cm high. The rhizome is thick and short. The strong flower-bearing stem is branched from the middle. The leaves are broad, sword-shaped, usually curved and gray-green.

Habitat: Indigenous to southern Europe.

Production: Orris root is the root of *Iris germanica*, *Iris versicolor* and other varieties.

Other Names: Iris, Florentine Orris, White Flag Root, Blue Flag, Flag Lily, Liver Lily, Poison Flag, Snake Lily, Water Flag, Wild Iris, Yellow Flag, Yellow Iris, Dragon Flower, Myrtle Flower, Fliggers, Flaggon, Sheggs, Segg, Daggers, Jacob's Sword, Gladys

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief constituent's irone, in particular alpha-, beta- and gamma-irone (odor resembling violets)

Triterpenes: Iridale (mono-, bi- and spirocyclic compounds, precursors of the irones), including among others irigermanal

Isoflavonoids: including, among others, irilon, irisolone, irigenine, tectorigenin and their glycosides including iridine

Flavonoids

Xanthones: C-glucosylxanthones, for example iris xanthone, magniferin

Starch

EFFECTS

Orris root is mildly expectorant. Some of the flavonoids (in particular the isoflavon irigenin) have an inhibitory effect on c-AMP phosphodiesterase. Root extracts are said to have an

ulcer-protective, spasmolytic and serotonin-antagonistic effect.

INDICATIONS AND USAGE

Unproven Uses: Orris has been used for disorders of the respiratory system.

Homeopathic Uses: This species has been used to treat disorders of the respiratory tract or thyroid gland, for digestion complaints and headaches.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The juice of the fresh plant has a severely irritating effect upon skin and mucous membranes. If taken internally, it can lead to vomiting, abdominal pain and bloody diarrhea. Severe inflammation occurs following mucous membrane contact.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Iris is available in homeopathic dilutions, as a constituent of various combination preparations and in various tea mixtures.

Oswego Tea

Monarda didyma

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the herb.

Flower and Fruit: The terminal flowers are in 1 to 3 richly blossomed false whorls supported by bracts. The bracts bear leaflets that are pale green with a reddish tinge. The calyx tips are awl-shaped. The corolla is scarlet and 3.5 to 6 cm in length. The plant is propagated using root cuttings.

Leaves, Stem and Root: The plant is a bristly haired to glabrous 50 to 90 cm high herbaceous perennial with runners. The stems are erect, acutely quadrangular, grooved and hard. The leaves are in pairs, ovate-lanceolate, clearly petiolate, crenate and often rough on both sides.

Characteristics: *Monarda didyma* has a scent similar to that of the bergamot orange.

Habitat: The plant is indigenous to swampy regions from Georgia and Michigan in the U.S. and to wet areas extending northward to Ontario, Canada.

Other Names: Scarlet *Monarda*, Bee Balm, Blue Balm, High Balm, Low Balm, Mountain Balm, Mountain Mint, Bergamot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.1-0.3%): including among others carvacrol, thymol, p-cymene, linalool, linalyl acetate, limonene, ocimene, alpha-pinene, camphene, Delta3-carene

Flavonoids: including linarin, didymin (isosakurenatin-7-O-beta-D), isosakuranin, genkwanin

Anthocyanins: monardein (triacyliertes pelargonidine-3, 5-di-O-glucoside, 2 malonyl- and 1 p-cumaroyl- residue)

EFFECTS

The drug has antispasmodic, digestive, carminative and diuretic effects; it is also used to regulate menstruation.

CONTRAINDICATIONS

Oswego Tea is not to be used during pregnancy.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for flatulence and other digestive disorders and also menstrual complaints including premenstrual syndrome (PMS). In Europe, the herb is sometimes used as an aromatic, carminative and antipruritic. Former use of the drug as an alternative to quinine is no longer common.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Ground drug (powder) prepared as an infusion or tea.

Ox-Eye Daisy

Chrysanthemum leucanthemum

DESCRIPTION

Flower and Fruit: Long pedicled flowers with a semi-globular calyx. Sepals are imbricate, green and wide, the corolla golden-yellow and orbicular. The young flowers are white and 1 to 2 cm long. The fruit is 2.5 to 3 mm long and top-shaped.

Leaves, Stem and Root: Ox-Eye Daisy is a perennial growing 10 to 100 cm high. It is somewhat hairy or glabrous with cylindrical knotted root. The stem is erect, glabrous, simple or divided into numerous oblong 1-headed branches. The

leaves are tough, compound and glabrous or slightly pubescent. The cauline leaves are petiolate, linear to ovate-oblong, roughly dentate to almost pinnatisect.

Habitat: The plant is found in Britain, Europe, Russia, Asia and numerous other parts of the world.

Production: Ox-Eye Daisy is the above-ground part of *Chrysanthemum leucanthemum*.

Other Names: White Weed, Golden Daisy, Herb Margaret, Maudlinwort, White Daisy, Great Ox-Eye, Goldenseal, Marguerite, Moon Daisy, Horse Gowan, Maudlin Daisy, Dun Daisy, Butter Daisy, Horse Daisy, Moon Flower, Moon Penny, Poverty Weed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyclitols: including meso-inositol, L(-)-quercitol, meso-inositol L(-)-quercitol

Polyynes: among them the strongly sensitizing trideca-3,5,7,9,11-pentain-1-ol and its acetate

Flavonoids: including nivaside (a C-glycosyl flavone, containing a cyclitol instead of a sugar), apigenein-7-O-glucuronide

EFFECTS

Ox-Eye Daisy herb and flowers are used similarly to Chamomile as a tonic, although they have a much weaker effect. They are also considered to have an antispasmodic and diuretic effect.

INDICATIONS AND USAGE

Unproven Uses: Internal folk medicine uses include asthma, whooping cough and nervous agitation. Among external applications are skin ulcers, wounds and nose bleeds. (Also see Chamomile.)

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There is, however, a strong potential for sensitization resulting from skin contact with the drug.

DOSAGE

Mode of Administration: See Chamomile.

Daily Dosage: Decoction: 1 cup 3 times daily.

Paeonia officinalis

See European Peony

Pagoda Tree

Sophora japonica

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe seeds.

Flower and Fruit: The white flowers are in large, broad, sweeping terminal panicles made up of racemes. The flowers are papilionaceous with a patent standard. The lower edge of the lateral wing petals are bent over so that one surrounds the others. The fruit is a round pod tied in around the seeds like a string of pearls.

Leaves, Stem and Trunk: The tree is reminiscent of the robinia, with a densely branched crown. It grows 12 to 15 m high. It has smooth, green branches. The leaves are odd-pinnate with 11 to 15 leaflets. The leaflets are ovate, acute, dark green above and glaucous beneath. The main leaf petiole is very thick at the base.

Habitat: The plant is indigenous to China and Japan, and is found in Europe as an ornamental and roadside tree.

Production: Pagoda Tree seeds are the ripe seeds of *Sophora japonica*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS•

Quinolizidine alkaloids (0-0.04%): including among others cytisine, N-methyl cytisine, matrine, sophocarpine

Flavonoids: including rutin, sophorine

Toxic lectins

Polysaccharides: galactomannans

Fatty oil

Proteins

EFFECTS

The active agent, rutin, increases the permeability of the capillaries.

INDICATIONS AND USAGE

Homeopathic Uses: Pagoda Tree is used in homeopathy for dysentery.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards, side effects, or cases of poisoning are known in conjunction with the proper administration of designated therapeutic dosages. Nevertheless, according to older reports, regular consumption of the seed meal can cause facial edema and even death. Cystine poisonings are possible through the intake of very high dosages.

DOSAGE

Mode of Administration: As a mother tincture in homeopathic dilutions. *Sophora* is used by the pharmaceutical industry in the production of rutin (a substance that influences the resolution and porosity of the dilation of the capillaries). The drug is contained in medicinal preparations, which are used to stabilize blood circulation and as a cure for nervous disorders and inflammation.

Papaya

Carica papaya

TRADE NAMES

- 41 Papaya (available from numerous manufacturers), Papaya Digestive Enzyme, Papaya Enzyme Double Strength, Papaya with Papain

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and fruits.

Flower and Fruit: The plant has varying yellow to yellowish-white flowers of both sexes. The male flowers form many-branched, hanging panicles with small flowers. The female flowers are almost sessile in the leaf axils on the trunk. In addition there are androgynous, fertile flowers. The yellow to yellow-green berry fruit is up to 30 cm long, 15 cm thick and weighs 2 to 5 kg. The fruit is clavate and lightly grooved. It contains numerous peppercorn-sized seeds surrounded by orange-yellow and melon-flavored flesh.

Leaves, Stem and Root: *Carica papaya* is a 4 to 8 m high bushy tree with an unbranched fleshy-woody trunk that is hollow in the middle. The leaves are long-petioled, very large and segmented into 5 to 7 palmate lobes, which terminate in sharp tips.

Habitat: Indigenous to tropical America. Cultivated in all tropical regions today.

Production: Papaya leaves consist of the fresh or dried leaves of *Carica papaya* harvested before the fruit appears. Raw papain is the latex from *Carica papaya*, which has been dried using various methods; where necessary the latex is decontaminated mechanically or by filtration.

Other Names: Melon Tree, Papaw, Mamaeire

ACTIONS AND PHARMACOLOGY

COMPOUNDS: RAW PAPAINE

Proteolytic enzymes (proteinases): papain, chymopapain A and B, proteinase A and B, papaya peptidase A

Other enzymes: lysozyme, chitintransferase, glycosidases, callase, pectinesterases, lipases, phosphatases, cycloligases

EFFECTS: RAW PAPAINE

The proteolytic activity of the raw papain enzymes can be used within the parameters of enzyme substitution for digestive complaints, particularly pancreatic conditions. Papain has an antimicrobial, anthelmintic and anti-ulcerative effect.

The results of the analgesic and anti-inflammatory effects are contradictory. Experiments have shown that papain has an

edema-reducing effect. The fibrinogen effect has not been sufficiently proven.

COMPOUNDS: PAPAINE LEAVES

Polyketide alkaloids: carpaine, pseudocarpaine

Glucosinolates

Cyanogenic glycosides (traces): including prunasin

Saponins

Proteolytic ferments (ficin)

EFFECTS: PAPAINE LEAVES

No information is available.

INDICATIONS AND USAGE

RAW PAPAINE

Unproven Uses: Papaya is used for gastrointestinal digestion complaints, inflammations and ulcers in the gastro-duodenal area, and pancreas excretion insufficiency.

PAPAINE LEAVES

Unproven Uses: Papaya leaf preparations are used singly or in combinations for prophylaxis and therapy of diseases and disorders of the gastrointestinal tract and for infections with intestinal parasites.

Indian Medicine: Worm infestation, damage to the urinary tract and stones, hemorrhoids, coughs and bronchitis have been treated with Papaya leaves.

CONTRAINDICATIONS

RAW PAPAINE AND PAPAINE LEAVES

Papaya is contraindicated in pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

RAW PAPAINE

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Because of the fibrinolytic effect, a tendency to bleed is possible when there is a predisposition to clotting delay and during treatment with anticoagulants. Allergic reactions, including asthma attacks, are also possible.

Drug Interactions: There has been some documented interactions with warfarin. Papaya extract has been shown to increase the international normalized ratio (INR) levels when used in conjunction with warfarin.

Pregnancy: Because of the experimentally proven embryotoxic and teratogenic effects, as well as its known abortifacient effect in humans, unripe papain fruit should not be used during pregnancy.

PAPAYA LEAVES

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

RAW PAPAIN

Daily Dosage: The dosage depends on the composition of the enzyme substitute preparation.

How Supplied:

Chewable Tablets

Tablets

PAPAYA LEAVES

Daily Dosage: No information is available.

Pareira

Chondrodendron tomentosum

DESCRIPTION

Medicinal Parts: The medicinal parts are the curare, which is the extract from the fresh or dried trunk, along with the bark and the dried roots.

Flower and Fruit: The flowers grow in axillary clusters 10 to 15 cm long on stems that are often unbranched. There are 9 outer pubescent sepals about 1 mm long. The inner 6 sepals are about 3.5 mm long and glabrous. The petals are 0.4 mm long. The fruit is a drupe about 12 mm long and 9 mm wide on a stem 4 mm long.

Leaves, Stem and Root: The plant is a climber that grows up to 30 m in height. The stems are velvety. The petioles are short-haired at the base, have long erect hairs near the leaf blade and are about 8 to 12 cm long. The leaves are somewhat coriaceous, entire-margined, sparse above and tomentose beneath. They are mildly cordate, triangular-ovate or roundish and obtuse, 10 to 15 cm in length and width. The root is about 2 to 5 cm in diameter, tortuous, black, longitudinally furrowed with transverse ridges and some constrictions. Internally the root is grayish-brown, and the transverse section shows three or four concentric rings traversed by wide medullary rays. The stem pieces are similar but the external surface is grayish and marked with numerous round, warty lenticels.

Characteristics: The taste is at first bitter, then slightly sweet. The plant is odorless.

Habitat: The plant is found in western Bolivia, Peru, Ecuador, central Columbia and Panama.

Production: Pareira root is the root of *Chondrodendron tomentosum*. Tubocurare is extracted from the fresh or dried trunk with bark of the same plant.

Other Names: Pereira Brava, Velvet Leaf, Ice Vine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Bibenzyl isoquinoline alkaloids: including, among others, D-tubocurarine, chondrocurarine, (-)-curine, (+)-chondrofoline, chondrocurine, isochondrodendrine

EFFECTS

Tubocurare contains tubocurarine and acts as an emmenagogic and diuretic.

INDICATIONS AND USAGE

Unproven Uses: Only the tubocurarine extracted from the bark and twigs is in use. It is a peripheral muscle relaxant, which inhibits the stimulation of transference in the neuromuscular, hence causing a paralysis of the skeletal muscles. *L Tubocurare is used in modern anesthetics as tubocurarine. In Brazil, an infusion of the root is taken internally and the crushed leaves applied externally as treatments for poisonous snake bites.

Homeopathic Uses: Uses in homeopathy include inflammations of the urinary tract and enlarged prostate.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the oral administration of designated therapeutic dosages of the drug. The alkaloids with curare-like effect, such as tubocurarine, are not resorbed with oral administration of the drug.

OVERDOSAGE

Nausea and heavy urine flow have been observed in individuals poisoned with tubocurare.

4jt DOSAGE

Mode of Administration: Use of drug is no longer common.

Storage: The plant is considered poisonous and should be stored in clearly marked containers that are impervious to insects.

Parietaria officinalis

See *Pellitory-of-the-Wall*

Paris quadrifolia

See *Herb Paris*

Parsley

Petroselinum crispum

TRADE NAME

Parsley Leaf, Parsley Herb (available from numerous manufacturers)

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the parsley fruit, the dried, separated schizocarp. the fresh or dried aerial parts, the dried underground parts and the whole fresh plant at the beginning of the flowering season.

Flower and Fruit: The inflorescences are long pedicled. terminal, occasionally apical, 10 to 20 rayed yellowish umbels. The involucre has 1 to 2 bracts, and the epicalyx has 6 to 8 leaves. The petals are splayed with a curved tip. The style thickening is very developed. The fruit is orbicular-ovate, 2.5 mm long and greenish-gray.

Leaves, Stem and Root: The plant is a biennial. It is glabrous. has a characteristic odor and grows from 60 to 100 cm high. The usually numerous stems grow from 1 root and are erect round, finely grooved, glabrous and branched. The root is thin or thick fusiform to tuberous, vertical and almost fiberless. The leaves are ovate and tripinnate. The upper ones are shorter stemmed and less compound. The leaflets are tripinnate.

Characteristics: Parsley has a spicy smell.

Habitat: The plant originated in the Mediterranean region and is cultivated worldwide today. *

Production: Parsley consists of the fresh or dried plant section of *Petroselinum*. Parsley root is the dried root of *Petroselinum crispum*. The fresh herb is harvested from cultivations. Parsley seed consists of the dried ripe fruits of *Petroselinum crispum*.

Not to be Confused With: The leaves of *Aethusa cynapium*.

Other Names: Hamburg Parsley, Persely, Petersylinge. Rock Parsley

ACTIONS AND PHARMACOLOGY

COMPOUNDS: PARSLEY HERB

Volatile oil (0.02-0.3%): chief components, according to breed, up to 90%

Apiole

Myristicin

l-allyl-2,3,4,5-tetramethoxybenzole: additionally including among others mentha-1,3,8-triene (up to 50%, aroma-bear-

er). alpha- and beta-pinene, alpha- and beta-phellandrene, hybrid strains also exist

Furocoumarins: including among others, bergapten, oxy-peucedanin, isopimpinellin, psoralen, xanthotoxin, imperatorin

Flavonoids (1.9-5.6%): chief components apiin

Vitamins: in particular ascorbic acid (up to 165 mg per 100 gm)

COMPOUNDS: PARSLEY ROOT

Volatile oil (0.05-0.12%): chief components of *Petroselinum crispum* ssp. *crispum* apiole, myristicin, terpinolene, tuberosum apiole, beta-pinene, additionally including among others, alpha- and beta-pinene, (+)limonene, beta-bisabolene

Phthalides: including among others, ligustilide, senkyunolide

Furocoumarins: including among others, bergaptene, oxy-peucedanin, isopimpinellin, psoralen, xanmotoxin and imperatorin

Flavonoids (0.2-1.3%): chief components apiin

Polyynes: including among others, falcarinol, falcaringiol

EFFECTS: PARSLEY HERB AND ROOT

Although its mode of action has not been clearly explained, its use for urinary tract complaints seems plausible.

COMPOUNDS: PARSLEY FRUIT

Volatile oil (2-6%): chief components, according to breed

Apiole (58-80J& ^...._

Myristicin (49-77%)

1 -allyl-2,3,4,5-tetramethoxybenzole (50-60%)

Alpha- and beta-pinene, beta-phellandrene: among others

Furocoumarins: including among others bergapten, oxy-peucedanin, isopimpinellin, psoralen, xanthotoxin and imperatorin

Fatty oil: chief fatty acid petroselic acid (60-80%)

EFFECTS: PARSLEY FRUIT

In animal experiments, a diuretic effect is said to have been demonstrated with low doses as well as a moderate increase in uterine tone. Higher doses increase contractility of the smooth muscle of the intestine, bladder and especially the uterus and therefore may be abortifacient; this explains its use for menstruation complaints.

INDICATIONS AND USAGE

PARSLEY HERB AND ROOT

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Unproven Uses: The herb is used for flushing the efferent urinary tract and for the prevention and treatment of kidney gravel. In folk medicine, it is used for gastrointestinal disorders, jaundice, kidney and bladder inflammation, as a diuretic and as an emmenagogue.

Homeopathic Uses: Inflammation of the urinary tract and irritable bladder.

PARSLEY FRUIT

Unproven Uses: In folk medicine, the fruit has been used for menstrual disturbances, disorders of the gastrointestinal tract, the kidneys and lower urinary tract, and as a digestive.

CONTRAINDICATIONS

PARSLEY HERB, ROOT AND FRUIT

The herb is contraindicated in patients allergic to parsley or apiole, those with kidney inflammations and in pregnant women. Irrigation therapy should not be carried out in the presence of edema resulting from reduced cardiac and kidney function.

PRECAUTIONS AND ADVERSE REACTIONS

PARSLEY HERB AND ROOT

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug leads rarely to contact allergies; photodermatitis is also conceivable following intensive skin contact between freshly harvested plant parts and light-skinned individuals.

Pregnancy: Therapeutic doses are contraindicated in pregnancy.

PARSLEY FRUIT

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug leads rarely to contact allergies; photodermatoses occur somewhat more frequently following skin contact.

Pregnancy: Parsley fruit preparations are contraindicated in pregnancy; an abortive effect has been observed.

OVERDOSAGE

PARSLEY HERB, ROOT AND FRUIT

The administration of higher dosages of the volatile oil or of preparations with high concentrations of the volatile oil can lead to poisonings. Symptoms include elevated contractility of the smooth musculature, in particular of the urinary bladder, of the intestines and of the uterus. Other symptoms

HERBAL MONOGRAPHS

may include anuria, bloody stools, emaciation, fatty liver* hemolysis, methemoglobinuria and mucous membrane bleeding.

DOSAGE

PARSLEY HERB AND ROOT

Mode of Administration: Comminuted drug for infusions as well as other galenic preparations with a comparably small proportion of essential oil to be taken orally. Dry extracts are used in pharmaceutical products, such as tablets.

How Supplied:

Capsules — 450 mg, 455 mg

Liquid — 1:1

Preparation: Infusion: Pour boiling water over 2 gm finely cut drug and strain after 10 to 15 minutes.

Daily Dosage: A total of 6 gm in the appropriate preparations.

Infusion: 2 to 3 cups over the course of the day.

Adequate intake of liquid is essential for flushing out treatment.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1). The daily dosage is 6 gm drug. Adequate intake of liquid is essential for flushing out treatment.

Storage: Protect from light and moisture and tightly sealed.

PARSLEY FRUIT

Mode of Administration: Preparations of the fruit are for internal use.

Preparation: To rrfake'an infusion, pour boiling* water over 1gm freshly pressed drug and strain after 10 minutes.

Daily Dosage: The average single dose is 1 gm.

Tea — Two to 3 cups of the infusion can be taken daily.

Storage: Protect from light and moisture.

Parsley Piert

Aphanes arvensis

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the above-ground section.

Flower and Fruit: The flowers are in axillary clusters of 10 to 20. They are encircled by stipules. The sepals are erect, acuminate-ovate and pubescent on the outside and on the

margins. They are glabrous on the inside and draw together when the fruit ripens. The fruit is 1 mm long, ovate, keeled, flat and jug-shaped. The calyx is vertically wrinkled and pubescent.

Leaves, Stem and Root: The plant is an annual or hardy annual 2 to 30 cm long and dull green in color. The root is thin, branched and fusiform. The stem is generally branched and decumbent, with short internodes. The leaves are 3 to 5 lobed fan- or diamond-shaped. The upper ones are short-petioled. The lower leaves are sessile and usually rough-haired, occasionally only ciliate. The stipules are semi-ovate, indentate-serrate, leafy and pubescent.

Habitat: Parsley Piert grows in Britain, Europe, northern Africa, and the U.S.

Production: Parsley Piert herb is the above-ground part of *Aphanes arvensis*.

Not to be Confused With: The plants name is a reference to the serrated shape of the leaves; it is not related to the parsley herb.

Other Names: Parsley Breakstone, Field Lady's Mantle, Parsley Piercestone

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannin

EFFECTS

The herb is claimed to be effective as a diuretic and a psychostimulant.

INDICATIONS AND USAGE

Unproven Uses: Parsley Piert is used in folk remedies in the treatment of urinary tract disorders, especially kidney and bladder stones, and as a diuretic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The fresh or dried drug and the liquid extract are used.

LITERATURE

Kem W, List PH, Horhammer L (Hrsg.), *Hagers Handbuch der Pharmazeutischen Praxis*, 4. Aufl., Bde 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Parsnip

Pastinaca sativa

DESCRIPTION

^ *Medicinal Parts:* The medicinal parts are the dried fruit, the dried herb, the dried root and the fresh, 2-year-old root of cultivated plants.

Flower and Fruit: The golden yellow flowers are in 8- to 12-rayed umbels, which are quite flat and contain androgynous blooms. There is usually no involucre or epicalyx, or they consist of 1 or 2 dropping bracts. The petals are even-sized, golden yellow, 0.5 mm long when rolled up and 1 mm wide. The fruit is broad-elliptical, compressed, similar to a lentil, 5 to 7 mm long and 4 to 5.5 mm wide. It is yellow-brownish when ripe. The fruit is marked with oil marks and hollows.

Leaves, Stem and Root: The plant is a biennial, which grows from 30 to 100 cm. The root is fusiform or tuberous like a carrot or turnip. It is whitish and usually bears only 1 stem. The stem is erect, angular, grooved, short-haired to glabrous and branched above. The leaves are simple pinnate, glossy above, paler and soft-haired beneath. The cauline leaves are on a long sheath, which is rolled at the edge. The basal *ML* leaves are petiolate; the leaflets are ovate-oblong and deeply lobed at the base. The terminal leaflet is 3 lobed and roughly crenate to serrate.

Characteristics: The turnip-like root tastes like carrot.

Habitat: Parsnip grows wild in most parts of Europe and Asia Minor as far as western Siberia. It is naturalized in the U.S. It is cultivated in Europe, America, Australia, India, China and southern Africa.

Production: Parsnip root or herb are the dried parts of *Pastinaca sativa*.

Not to be Confused With: Other types of root such as Corium, Parsley Roots and the root of Bear's Breech (also known as Hogweed).

ACTIONS AND PHARMACOLOGY

COMPOUNDS: PARSNIP HERB

Furocoumarins: in particular angelicin, bergaptene, xanthotoxin, imperatorin, psoralen

Volatile oil: chief components cis- and trans-beta-ocimene, trans-beta-farnesene, terpineols, palmitolactone

Flavonoids: including rutin

COMPOUNDS: PARSNIP ROOT

Furocoumarins: in particular angelicin, bergaptene, xanthotoxin, imperatorin, psoralen

Volatile oil (1.9-3.1%): chief components including aliphatic ester, in particular octylbutyrate (29-85%), in certain strains

also octylacetate, additionally other esters and some myristicin (depending on strain, 5-65%)

Fatty oil: chief fatty acid petroselic acid (46%)

EFFECTS

No information is available.

INDICATIONS AND USAGE

PARSNIP HERB

Unproven Uses: The herb is used in kidney and gastrointestinal complaints and for digestion problems.

Homeopathic Uses: The herb is used for delirium.

PARSNIP ROOT

Unproven Uses: The root is used for kidney stones, sprains and fever.

Homeopathic Uses: The root is used for delirium.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. An increase in UV-sensitivity is possible among light-skinned persons (due to phototoxic effect of the furocoumarins).

DOSAGE

PARSNIP HERB

Mode of Administration: Available ground, as a decoction of the dried herb.

Preparation: 1 handful of Parsnip herb cooked in 1 liter of water for 10 minutes.

Daily Dosage: For the first 8 days, drink-one wine-glassful 3 times daily; during the second week drink one water glassful. The daily intake can be increased up to 2 liters. The cure takes 4 to 6 weeks.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute, 3 times daily; chronic: once daily (HAB34).

PARSNIP ROOT

Daily Dosage: Take 1 teaspoon of freshly grated root, containing 50% plant material, 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute, 3 times daily; chronic: once daily (HAB34).

Parthenocissus quinquefolia

See American Ivy

Pasque Flower

Pulsatilla pratensis

DESCRIPTION

Medicinal Parts: The medicinal part is the whole fresh plant collected during the flowering season.

Flower and Fruit: The flowers are solitary and almost always nodding. They have 6 campanulate, close, bright-violet tepals. These are usually thickly silky-haired on the outside with revolute tips, and are 1.5 to 3 cm long. The stamens are yellow and numerous; the longer ones are at least two-thirds the length of the tepals. The carpels with the style are as long as the tepals. The ripe fruit is oblong and densely pubescent. The protruding style is up to 6 cm long.

Leaves, Stem and Root: The plant is a perennial, 7 to 50 cm high with a strong, dark, usually divided, rhizome. The basal leaves usually appear after the flowers and are not hardy. They are 3 to 4 pinnate with narrow linear acuminate end sections that, along with the petioles, are thickly white villous. The stems are erect and densely pubescent with 3 whorled high leaves, divided into linear, pubescent tips.

Characteristics: The plant is poisonous.

Habitat: The plant originated in southwestern Europe and now also grows in central and eastern Europe.

Production: Pasque Flower herb consists of the dried, above-ground parts of *Pulsatilla vulgaris* and/or *Pulsatilla pratensis*.

Other Names: Easter Flower, Meadow Anemone, Pasque Flower, Pulsatilla, Wind Flower

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Protoanemonine-forming agents: In the freshly harvested plant, presumably the glycoside ranunculin changes enzymatically when the plant is cut into small pieces, and probably also when it is dried, into the pungent, volatile protoanemonine that quickly dimerizes to anemonin. When dried, the plant is not capable of protoanemonine-formation.

Triterpene saponins

EFFECTS

In animal experiments, the protoanemonin and anemonin had an antipyretic and motility-inhibiting effect. In the inhibition test, an antibiotic effect was shown. Protoanemonin is a strong local irritant to the mucous membranes and skin.

INDICATIONS AND USAGE

Unproven Uses: Pasque Flower is used for diseases and functional disorders of genital organs; inflammatory and infectious diseases of skin and mucosa; diseases and functional disorders of the gastrointestinal tract and the urinary tract; neuralgia; migraine; and general restlessness. It has also been used to treat iritis, scleritis, gray cataract and glaucoma.

Homeopathic Uses: Homeopathic uses include inflammation of the respiratory tract, digestive organs, female genital organs, bladder, eyes, middle ear, menstruation complaints, problems during pregnancy and nursing, rheumatism, problems with voiding urine, headaches, insomnia, measles, mumps and depressive states.

CONTRAINDICATIONS

The drug is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug. Extended skin contact with the freshly harvested, bruised plant (which releases protoanemonine that is severely irritating to skin and mucous membranes) can lead to blister formation and cauterizations that are difficult to heal. If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritation of the urinary drainage passages, are possible.

Pregnancy: Administration of the drug during pregnancy is absolutely contraindicated.

OVERDOSAGE

Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments.

- ^ Symptomatic treatment for external contact should consist of mucilaginous, after irrigation with diluted potassium permanganate solution; in case of internal contact, activated charcoal should follow gastric lavage.

DOSAGE

Mode of Administration: Whole, cut and powdered forms of the drug are used, as are homeopathic forms for internal use.

Daily Dosage: A single dose of a decoction/liquid extract/infusion is 0.12 to 0.3 g taken 3 times daily. The usual single dose of the drug is 0.2 g; Powder 0.1 to 0.4 g; Tincture: single dose: 0.3 to 1 ml.

Conditions of the inner eye: 1 to 3 pills 3 times daily (from powder and extract at 50 g /75 pills).

Homeopathic Dosage: From D2: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day; from D3: 1 suppository 2 to 3 times a day; from D4: 1 ml injection solution sc twice weekly and 3 to 4 nose drops 3 to 5 times a day (HAB1).

Passiflora incarnata

See Passion Flower

Passion Flower

Passiflora incarnata

TRADE NAME

Passion Flower (available from numerous manufacturers), Alcohol Free Passion Flower Liquid

DESCRIPTION

Medicinal Parts: The medicinal parts are the whole or cut dried herb and the fresh aerial parts. The yellow pulp from the berry is edible. Several other related species also have edible fruits or healing properties.

Flower and Fruit: The axillary pedicle grows up to 8 cm and bears 1 flower. The flowers are androgynous and rayed with a diameter of 5 to 9 cm and have an involucre. The 5 sepals are green on the outside, white on the inside and tough. The 5 petals are white to pale red. There is a secondary corolla inside the petals made up of 4 thread wreaths arranged in rays around the axis of the flower, which are white on the inside and purple on the outside. The ovary has 3 carpels and 3 style branches, which end in a thickened stigma. The 5 stamens are joined at the base and fused to the androgynophor.

Leaves, Stem and Root: The Passion Flower is a perennial vine on a strong, woody stem reaching up to about 10 m in length. The vine is initially angular, later gray and rounded with longitudinally striated bark. The leaves are alternate, petiolate, serrate and very finely pubescent. The under surface is hairier than the upper surface. There are bumpy extra-floral nectaries on the leaf blades. Stipules and tendrils grow from the leaf axils.

Habitat: The plant is indigenous to an area from the southeast U.S. to Argentina and Brazil. It is cultivated in Europe as a garden plant.

Production: Passion Flower herb consists of the fresh or dried aerial parts of *Passiflora incarnata*. The flowering shoots are cut 10 to 15 cm above the ground, usually after the formation of the first apple-sized fruit. The harvest is dried in a hay drier or in the air. For a maximum flavonoid content in the flowering shoot, twice yearly harvest is recommended; opinions are not, however, unanimous.

Not to be Confused With: *Passiflora caerulea*, *Passiflora foetida* or *Passiflora edulis*

Other Names: Granadilla, Maypop, Passion Vine

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Flavonoids (up to 2.5%): in particular C-glycosyl-flavones, including among others isovitexin-2"-o-glucoside, schaftoside, isoschaftoside, isoorientin, isoorientin-2"-o-glucoside, vicianin-2, lucenin-2

Cyanogenic glycosides: gyncocardine (less than 0.1%)

Volatile oil (trace)

The frequently postulated presence of harmaline alkaloids could not be confirmed.

EFFECTS

Passion Flower contains glycosides and in animal tests is hypotensive and stimulates respiration. Sedative or spasmolytic effects could not be definitively proven. The use of the herb for nervous agitation, difficulty falling asleep or nervous gastrointestinal symptoms needs further investigation. A motility-inhibiting effect has been observed in animal tests.

INDICATIONS AND USAGE

Approved by Commission E:

- Nervousness and insomnia

Unproven Uses: Passion Flower is used internally for depressive states such as hysteria, general nervous agitation, insomnia and nervous gastrointestinal complaints. The herb is used externally for hemorrhoids and as a bath additive for nervous agitation.

Homeopathic Uses: Passifloraincamata is used for insomnia, convulsions and agitation.

PRECAUTIONS.MMOADVERSE REACTIONS .. ~

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As a comminuted herb for tea and other galenic preparations for internal use or as sedative bath additives.

How Supplied:

Capsules — 400 mg

Liquid (alcohol free) — 1:1

Preparation: To make an infusion, pour 150 ml of hot water over 1 teaspoon drug and strain after 10 minutes. To make a rinse for the external treatment of hemorrhoids, put 20 gm drug into 200 ml simmering water, strain and use when cooled.

Daily Dosage:

Tea — Pour 150 ml of hot water over 1 teaspoon of the herb and strain after 10 minutes. Drink 2 to 3 times throughout the day and one-half hour before bedtime.

Tincture — 0.5 to 2 ml, 3 times daily.

External use — 20 gm of the herb in 200 ml simmering water. Strain and use when cool as a wash or rinse.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml SC, acute: 3 times daily; chronic: once a day; ointment: 1 to 2 times daily; 1 suppository 2 to 3 times daily (acute and chronic) (HAB1).

Pastinaca sativa

See Parsnip

Patchouli

Pogostemon cablin

DESCRIPTION

Medicinal Part&Hit medicinal parts are the young leaves and shoots and the oil extracted from them.

Flower and Fruit: The flowers, which are whitish and often have reddish marks, grow in terminal and axillary spikes.

Leaves, Stem and Root: The plant is a pubescent, perennial herb, which grows from 60 to 90 cm high. The stem is erect and quadrangular, and the leaves are ovate, opposite and soft.

£ *Characteristics:* The ovate leaves have a strong characteristic odor when rubbed. The extracted oil is used in perfumery. The desired characteristics improve with age.

Habitat: The plant is cultivated in tropical and subtropical regions worldwide.

Production: Patchouli oil is extracted from the leaves of *Pogostemon cablin*.

Other Names: Putch-Pat, Patchouly

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1.5-4%): chief components are sesquiterpenes, including among others patchouli alcohol (35%), alpha-guaiene (20%), alpha-bulnesen (20%), beta-patchoulen (2%) as well as nordehydropatchoulol (aroma-bearer); Sesquiterpene pyridine alkaloids were isolated from the volatile oil, including among others patchouli pyridine, epigui pyridine

EFFECTS

No information is available.

INDICATIONS AND USAGE

There is no known medicinal use. The herb is used in perfumes and cosmetics.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: It is used only in the perfume and cosmetic industry.

Paullinia cupana

See Guarana

Pausinystalia yohimbe

See Yohimbe Bark

Peanut

Arachis hypogaea

DESCRIPTION

Medicinal Parts: The oil has medicinal applications.

Flower and Fruit: The flowers are 5 to 7 cm long, monosymmetrical and have a large golden-yellow standard. The flowers have lemon-yellow wings and a pure white carina. They are arranged singularly or in pairs in the leaf

axils. They blossom at sunrise and wilt in the same morning, during which time they stretch from 5 to 20 cm and act negatively phototropically downward. After pollination, a meristem develops at the base of the ovary, from which the fruit axis grows. The fruit only starts to grow when the stem is 5 to 10 cm underground, where it grows horizontally. The fruit is a 4 cm long by 1.5 cm thick closed pod with a fibrous, reticulate-wrinkled wall and 1 to 4 large seeds with no endosperm and a thin, red shell.

Leaves, Stem and Root: The peanut plant is an annual herbaceous 30 to 70 cm high legume, with glabrous, double pinnate leaves and a decumbent to upright stem.

Habitat: Peanuts were originally indigenous to tropical and sub-tropical South America. Today, *Arachis hypogaea* is cultivated in all tropical and sub-tropical regions worldwide except in the rain forests.

Production: Peanut oil is the fatty oil extracted from the husked seeds of *Arachis hypogaea* by means of a "cold press" method or by hexane extraction and refining.

Other Names: *Arachis*, Groundnuts, Monkey Nuts

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil: chief fatty acids include oleic acid, linolic acid and palmitin acid. Also present in small quantities are longer-chained fatty acids such as eicosanoic acid and tetracosanoic acid.

EFFECTS

The effect obtained when used as an enema for constipation and in dermatology for dry skin, eczema and dandruff is achieved primarily* from the drug's oiliness, although it has been shown to contain lectines.

INDICATIONS AND USAGE

Unproven Uses: Peanut oil is added to ointments and medicinal oils, and applied rectally in rectal constipation. It is also used in dermatology for crusting and scaling of the scalp (with hair), baby care and dry skin. Other applications include use as a bath additive for subacute and chronic eczema and for atrophic eczema and ichthyosis.

The pharmaceutical and medical industries use peanut oil as a vehicle for medication in external, enteral or parenteral preparations; the cosmetics industry uses it in skin, sun and massage oil. Domestically, it is used as a salad or cooking oil that is said to lower blood cholesterol levels.

Indian Medicine: Peanut oil is used for constipation, neuralgia and dislocated joints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As an enema, oil, bath additive and medicinal base component.

Daily Dosage: As a rectal enema, use 130 ml of oil at body temperature. For use in a bath, the recommended concentration is 4 ml per 10 liters of water. Adults should bathe for 15 to 20 minutes 2 to 3 times weekly. Children and babies should bathe for a few minutes 2 to 3 times weekly.

Storage: Protect from light in well-sealed and, if possible, fully filled containers. Oils from different deliveries should not be stored together. Oils with a tocopherol content less than 50 mg/100 mg do not store well.

Pear

Pyrus communis

DESCRIPTION

Medicinal Parts: The medicinal part is the fruit.

Flower and Fruit: The fleshy fruit is typically smaller near the stem and larger at the apical end, with a relatively tough skin. The core has a number of carpels, which are large and

edible. The seeds are pointed at one end and rounded at the other. When ripe, they are dark brown to black, glabrous and about 0.5 cm long.

Leaves, Stem and Root: The pear is a tree, up to 20 m tall, with a long-clavate crown. The bark is dark brown to black and broken into square plates. The glabrous or slightly pubescent branches are glossy brown or thorny. The leaves are 2 to 8 cm long, ovate-round, acuminate, tough and serrate. The ribs are protruding.

Habitat: The Pear Tree grows mainly in the temperate regions of the Northern Hemisphere.

Production: Pears are the fruit of *Pyrus communis*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fruit acids: malic acid (0.06-0.1%), additionally citric acid, quinic acid

Cyanogenic glycosides: amygdalin (only in the seeds)

Aromatic substances: including (E,Z)-2,4-deca-dien-(E)-2-octen and -(Z)-4-decenacylethylester. acetic acid hexylester

Caffeic acid derivatives: in particular 5-caffeoyl quinic acid

Pectin

EFFECTS

In folk remedies, Pear is said to be astringent and cooling.

INDICATIONS AND USAGE

Unproven Uses: Pear is used in the treatment of mild digestive disorders, while its syrup is used as a diuretic and laxative.

PRECAUTIONS AND ADVERSE REACTIONS "

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Fresh fruit (as food)

LITERATURE

Belitz HD, Grosch W, *Lehrbuch der Lebensmittelchemie*, 4. Aufl., Springer Verlag Berlin, Heidelberg. New York 1992.

Pellitory

Anacyclus Pyrethrum

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root.

Flower and Fruit: Each stem bears a 1 cm wide flower. The bracts are fused. The ray florets are white and tinged purple beneath. The disc florets are pointed. The fruit has transparent wings.

Leaves, Stem and Root: Pellitory is a perennial grass plant whose thickened, hollow stems grow a short distance along the ground before turning upward. The plant grows to about 45 cm high and has double-pinnate, tough leaves. The root is almost cylindrical, easily twisted, tapered and crowned with a tuft of gray hair. The outside is brown and fissured with shiny black markings.

Habitat: The plant grows in North Africa and is cultivated in the Mediterranean.

Production: Pellitory root is the root of *Anacyclus Pyrethrum*.

Other Names: Pellitory of Spain, Pyrethre, Pyrethrum, Roman Pellitory, Spanish Camomile

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alkamides: including deca-2, 4-dien acid-isobutylamide, anacycline, dehydroanacycline

Lignans: including sesamine

Inulin (fructosan)

Tannins

EFFECTS

Application to the skin stimulates the nerve ends, resulting in redness and irritation (hot, burning sensation). Pellitorin (rather than anacycline) is the local irritant. The drug, which contains alkamides, (pellitorin) and tannins, had an inhibitory effect in vitro on cyclo-oxygenase and 5-lipoxygenase (affecting prostaglandin metabolism), and also an antimicrobial, insecticidal and molluscicidal effect. In tests on animals and humans, a local anesthetic effect was observed indicating ptery mandibular block with infiltration of the long buccal nerves after extraction of mandibular molars.

INDICATIONS AND USAGE

Unproven Uses: Pellitory is used externally for rheumatic conditions, the treatment of toothache. Pellitory is used internally as a tonic to aid digestion and as an insecticide.

Indian Medicine: Used as a gargle for toothache and as a powder mixed with honey for epilepsy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Signs of irritation are possible in connection with overdoses due to the mucous-membrane-stimulating character of the alkamides.

DOSAGE

Mode of Administration: There is mention of use as a gargle and as a powder, but no precise information is available.

LITERATURE

Kem W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Pellitory-of-the-Wall

Parietaria officinalis

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The small, green, sessile flowers grow in axillary racemes and bloom throughout the summer. The bracteoles are free and shorter than the calyx. The filaments of the stamens are strangely jointed and so elastic that when they are touched before the flower has opened, they uncoil from their rolled-up position and distribute the pollen. The achenes are black.

Leaves, Stem and Root: The plant is a perennial, heavily branched, bushy and leafy. It grows to 70 cm high. It has a reddish hard stem and narrow petiole, ovate-lanceolate or elliptical, long-acuminate leaves 2.5 to 5 cm long. The leaf stalk is shorter than the leaf blade. The stem and the undersurface of the leaf ribs are pubescent with short, soft hairs. The upper surface of the leaves is almost glabrous and the ribs sunken.

Habitat: The herb is indigenous to Europe.

Production: Pellitory-of-the-Wall is the aerial part of *Parietaria officinalis*.

Other Names: Lichwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including among others kaempferol-, quercetin- and isorhamnetin-3-glucosides, -3-sophoroside, -3-rutinosides, -3-neohesperidosides

Caffeic acid derivatives: including caffeoyl malic acid

Bitter principles

EFFECTS

The drug is a mild diuretic.

INDICATIONS AND USAGE

The herb is used to treat diseases of the urinary tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is obsolete as a drug, but is occasionally used in commercial medicinal preparations.

Pennyroyal

Mentha pulegium

DESCRIPTION

Medicinal Parts: The medicinal parts are the essential oil extracted from the fresh plant, the dried aerial parts and the whole plant.

Flower and Fruit: The flowers are in axillary, loose and globular false whorls. The calyx is cylindrical-funnel-shaped, grooved and is-awned in the tube. The lower lip is awl-shaped, the upper ones shorter and wider. The upper lip has 3 tips and is curved slightly upward. The lower lip is divided in two and is straight. The corolla is violet, glabrous or downy. It has a tube, which suddenly widens in a sack-like manner and has a slightly developed ring of hair as well as lobes. These extend well beyond the calyx. The nutlets are glossy brown.

Leaves, Stem and Root: Pennyroyal is a glabrous to downy perennial, which grows from 10 to 40 cm high. The stem is ascendent or decumbent, branched and slightly downy. The leaves are elliptical to narrow ovate-elliptical, short-petioled, entire-margined, translucently glandular punctate with 1 to 3 pairs of shallow teeth and curved pinnate ribs.

Characteristics: Strongly aromatic.

Habitat: The plant thrives in western, southern and central Europe, in Asia as far as Turkmenistan, Iran, in the Arab countries and Ethiopia. It is naturalized in America.

Production: Pennyroyal is the flowering herb of *Menma pulegium*. The plants are harvested during the flowering season and dried.

Other Names: Pulegium, Run-by-the-Ground, Lurk-in-the-Ditch, Pudding Grass, Piliolerial, Mosquito Plant, Squaw Balm, Squawmint Tickweed

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (1-2%): chief constituents D-pulegone (60-90%), menthone (10-20%), isomenthone (2-10%), additionally including among others piperitone, neoisomenthylacetate

Tannins: presumably rosmarinic acid

Flavonoids: including among others diosmin, hesperidin

EFFECTS

Pennyroyal oil (main component pulegone) has an antimicrobial and insecticidal effect. There is no scientific proof of the described effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for digestive disorders, liver and gallbladder disorders, amenorrhea, gout, colds and increased micturation; externally, it is used for skin diseases.

PRECAUTIONS AND ADVERSE REACTIONS

General: European Pennyroyal oil is hepatotoxic in effect.

Acute poisonings are not to be feared in conjunction with the proper administration of designated therapeutic dosages of the foliage drug. Still, because of its hepatotoxicity, it is recommended that the drug not be used.

Pregnancy: In high doses, Pennyroyal has* been reported to cause abortion. Use in pregnancy is not recommended.

OVERDOSAGE

Severely acute poisonings have been observed following administration of 5 gm of the volatile oil. Vomiting, blood-pressure elevation, anesthetic-like paralysis and death through respiratory failure have been reported following larger dosages. Cases of death have been described following misuse of the volatile oil to induce abortion.

DOSAGE

See: PRECAUTIONS AND ADVERSE REACTIONS.

Mode of Administration: Internally as a ground drug, an extract and a tea. The oil is applied topically.

Daily Dosage: The average daily internal dose of the dried drug is 1 to 4 gm, taken 3 times daily. Pennyroyal is prepared as an infusion. Drink one cupful at a time during the course of the day. Extract: 1 to 4 ml, 3 times daily.

Peppermint

Mentha piperita

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the aerial parts of the flowering plant, the dried leaves and flowering branch tips, the fresh flowering plant and the whole plant.

Flower and Fruit: The flowers are false spikes with numerous inconspicuous bracts. The calyx is tubular with a ring of hair. The corolla is violet, glabrous inside and has an almost even margin divided into four parts.

Leaves, Stem and Root: The plant is a perennial 50 to 90 cm high. The usually branched stems are normally glabrous, but sometimes they are gray-tomentose and are often tinged violet. The leaves are short-petioled, oblong-ovate and serrate. The plant has over- and underground runners.

Habitat: Common in Europe and the U.S., usually cultivated.

Production: Peppermint oil consists of the essential oil of *Mentha piperita* obtained by aqueous steam distillation from freshly harvested, flowering sprigs and preparations of same. Peppermint leaves consist of the fresh or dried leaf of Peppermint as well as its preparations.

Peppermint leaf is harvested several times a year. The maximum leaf harvest and highest oil content is shortly before the flowering season. The harvest is dried mechanically on drying belts at a temperature of 42° C. Peppermint is harvested mechanically shortly after flowering and dried in the field.

Not to be Confused With: Peppermint should not be confused with rectified mint oil. Sometimes adulterated by increasing the ester content with racemic menthol acetate.

Other Names: Brandy Mint, Lamb Mint

ACTIONS AND PHARMACOLOGY

COMPOUNDS: PEPPERMINT LEAVES

Volatile oil: chief components: menthol (35-45%), menthone (15-20%), menthyl acetate (3-5%), neomenthol (2.5-3.5%), isomenthone (2-3%), menthofurane (2-7%), additionally including among others limonene, pulegone, alpha- and beta-pinene, trans-sabinene hydrate

Caffeic acid: including among others, rosmarinic acid

Flavonoids: apigenine-, diosmetin- and luteolin glycosides, free lipophile methoxylized flavone including among others, xanthomicrol, gardenine D

EFFECTS: PEPPERMINT LEAVES

The drug has a spasmolytic effect on the smooth muscle of the digestive tract. It also has antiviral, antimicrobial, diuretic, cholagogic, carminative and mild sedative effect.

COMPOUNDS: PEPPERMINT OIL

Chief components: menthol (35-45%), menthone (15-20%), menthyl acetate (3-5%), neomenthol (2.5-3.5%), isomenthone (2-3%), menthofurane (2-7%), additionally including among others limonene, pulegone, alpha- and beta-pinene, trans-sabinene hydrate

Lubritantannins: including, among others rosmarinic acid

Flavonoids: apigenine-, diosmetin- and luteolin glycosides, free lipophile methoxylized flavone including, among others xanthomicrol, gardenine D

EFFECTS: PEPPERMINT OIL

The drug has a spasmolytic effect on smooth muscle of the gastrointestinal tract. It is a carminative, cholagogue, antibacterial, insecticidal and secretolytic agent; it also has a cooling effect on the skin.

INDICATIONS AND USAGE

PEPPERMINT LEAVES

Approved by Commission E:

- Liver and gallbladder complaints
- 9 Dyspeptic complaints

The drug is used for convulsive complaints of the gastrointestinal tract as well as gallbladder and bile ducts.

Unproven Uses: In folk use, peppermint is utilized for nausea, vomiting, morning sickness, respiratory infections, dysmenorrhea and colds.

Homeopathic Uses: The drug is used for colds.

PEPPERMINT OIL

Approved by Commission E:

- Common cold
- Cough/bronchitis

**km* Fevers and colds

- Inflammation of the mouth and pharynx
- Liver and gallbladder complaints
- Dyspeptic complaints
- Tendency to infection

The drug is used internally for cramps of the upper gastrointestinal tract and bile ducts, irritable colon, catarrhs of the respiratory tract, and inflammation of the oral and pharyngeal mucosa.

Unproven Uses: Externally, Peppermint oil is used for myalgia and neuralgia.

CONTRAINDICATIONS

PEPPERMINT LEAVES

Contraindicated in cases of gallstones.

PEPPERMINT OIL

Contraindications for the internal administration of the drug include occlusion of the biliary ducts, gallbladder inflammation and severe liver damage. Gallstone carriers could experience colic due to the cholagogic effect.

PRECAUTIONS AND ADVERSE REACTIONS

PEPPERMINT LEAVES

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Gallstone carriers could experience colic due to the cholagogic effect.

PEPPERMINT OIL

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The intake can lead to gastric complaints in susceptible persons. The volatile oil possesses a weak potential for sensitization due to its menthol content. One is advised against administration of the drug in the presence of a tendency to gastroesophageal reflux.

Pediatric Use: Preparations containing the oil should not be applied to the faces of infants or small children, particularly not in the nasal area (glottal spasm or bronchial spasm up to ^asthma-like attacks or even possible respiratory failure).

OVERDOSAGE

Cases of poisoning are not recorded. The minimal lethal dosage of menthol is estimated to be 2 gm, although individuals have survived higher dosages (8 to 9 gm).

DOSAGE

PEPPERMINT LEAVES

Mode of Administration: Comminuted herb for infusions, extracts of peppermint leaves for internal use.

Preparation: To prepare an infusion, pour 150 ml of hot water over 1 dessertspoonful of the drug, strain after 10 minutes (one study has shown that the maximum level of menthol and methon is present after this time).

Tincture: leave 200 parts leaves in spirit of wine for 10 days (shaken at intervals), which is filtered after this time (EB6).

Daily Dosage: The average daily dose of the drug is 3 to 6 gm. The average daily dose of the tincture (1:10) is 5 to 15 gm. Tea: 1 cup to be consumed 3 to 4 times a day between meals. Infusion: 2 to 4 gm drug, drink slowly in sips while warm.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB34).

Storage: Peppermint should be stored cool and dry and protected from light in non-plastic containers.

PEPPERMINT OIL

Mode of Administration: The essential oil and the galenic preparations are for internal and external use.

Daily Dosage: The average daily internal dose is 6 to 12 drops; inhalation, 3 to 4 drops in hot water; for irritable colon, daily dose: 0.6 ml; single dose: 0.2 ml in enteric coated form.

Externally, a few drops rubbed into the affected skin areas several times a day (2 to 4 times). For young children: Rub 5 to 15 drops on the chest and back. The drug is available as semi-solid and oily preparations (5 to 20%); aqueous-ethanol preparations (5 to 10%); nasal ointments with 1 to 5% essential oil.

Storage: Peppermint should be stored cool and dry and protected from light in non-plastic containers.

Perilla

Perilla frutescens

DESCRIPTION

Medicinal Parts: The medicinal parts of the plants are the leaf-bearing branches and leaves.

Flower and Fruit: The flowers are in 2-blossomed false whorls in the axils of the triangular bracts in 5 to 15 cm long, spike-like, downy-haired inflorescences. The calyx is campanulate, bilabiate, 3 to 10 mm long, with a triple-toothed upper lip and a lower lip divided in two. The corolla is 4 to 5 mm long, almost radial, with a short tube and a broadened, almost circular section having a whitish, 5-lobed margin. There are 4 stamens of almost equal length and a superior, 2-carpeled, 4-chambered ovary. The fruit is globose, gray-brown, with purple reticulate stripes and a diameter of approximately 1.5 mm. The pericarp is thin and brittle; the seeds yellowish-white.

Leaves, Stem and Root: The herb, stands up to 1 m high. The leaves are long-petiolate. The lamina is wide-ovate, acuminate, rounded at the base, crenate, curly, dull green with brown-red spots to blackish-purple. The leaves are glossy and downy-haired along the veins. The stem is square, branched and downy.

Habitat: The species is found in India, Burma, Japan and China.

Production: Perilla leaves are the dried leaves and leaf-bearing branches of *Perilla frutescens*. Harvesting is from July to August, after which the leaves and branches are dried in the sun or shade.

Other Names: Beefsteak Plant

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: constituents vary greatly according to chemotype, with perillaldehyde, L-limonene + perillaldehyde, perilla ketone, myristicin, dill apiole or elsholtzia ketone predominating

Caffeic acid derivatives: rosmarinic acid (0.4 to 1.7%)

Monoterpene glucosides: including perillosides A to D, citrusine C

Flavonoids: apigenin glucoside and luteolin glucoside, esterified to some extent with caffeic acid

EFFECTS

Perilla aldehyde (chemotype PA) is sedative and antibacterial in effect; perilla ketone (chemotype PK) acts as a propulsive in the gastrointestinal tract. In addition, a cytotoxic and antitumor effect was able to be demonstrated. Perilla leaves may trigger allergic skin reactions (Kanzaki & Kimura, 1992.) In at least one study, serum cholesterol and triglyceride levels in rats that were fed Perilla oil were lowered (Sakono et al, 1993.)

INDICATIONS AND USAGE

Unproven Uses: The herb is used pharmaceutical[^] as an antiseptic and for diseases of the mouth. The oil may also have positive antilipidemic effects.

Chinese Medicine: Perilla is used in traditional Chinese medicine for colds with fever, coughs, shortness of breath, chills, swelling of the nasal mucous membrane, headache and to treat poisoning from ingestion of fish or crab. Efficacy for these indications has not yet been proven.

CONTRAINDICATIONS

Use during pregnancy is contraindicated because perillaldehyde was demonstrated to have a mutagenic effect in some in vitro studies.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The plant possesses potential for sensitization. In tests with sheep using .15 to 20 mg/kg body weight administration per infusion, Perilla ketone triggered pulmonary edema. Perillaldehyde had mutagenic effect in some in vitro studies.

DOSAGE

Mode of Administration: Whole, cut, powdered drug preparations and oil for internal use.

Daily Dosage: Extract (aqueous): 3 to 10 g

Periwinkle

Vine a minor

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the fresh aerial parts of the flowering plant and the whole fresh flowering plant.

Flower and Fruit: The flowers are solitary, long-pedicled, 40 to 50 mm in diameter and grow in the axils of the upper leaves. The calyx is funnel-shaped with long, narrow-linear, pointed-ciliated tips. The corolla is light blue or violet with a funnel-shaped tube and 5 irregularly terminated tips. The fruit is a follicle. It is oblong, acuminate, 15 to 2 mm long and has 2 to 3 seeds.

Leaves, Stem and Root: The plant is a perennial subshrub, 10 to 60 cm high. The non-flowering shoots are prostrate root at the nodes. The flowering shoots are ascending, up to 20 cm high and woody at the base. The leaves are evergreen, ovate, tapering at the front and distinctly pinnate-ribbed. They are 5 cm by 2 cm, petiolate with finely ciliated margins, which become glabrous later.

Habitat: The plant is indigenous to northern Spain, through western France, eastward via central and southern Europe as far as the Caucasus; it has been naturalized in many regions.

Production: Periwinkle herb consists of the above-ground parts of *Vinca minor*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (0.15-1.4%): chief alkaloid vincamine (ebumamine-type, 25-65%), including as well vincine, apovincamine, vincadifformin

Flavonoids: including kempferol-3-0-rhamnoside-7-0-glucoside, kempferol-3-0-rhamnoglucoside-3-0-galactoside,

kempferol-3-0-rhamnoglucoside-3-0-glucoside, quercetin-3-0-rhamnoglucoside-7-0-glucoside

EFFECTS

The alkaloid vincamine is hypotensive, negatively chronotropic, spasmolytic, hypoglycemic and sympatholytic. Scientifically validated studies on the hypotensive effect on humans have not yet been carried out. Its use as an amaroïd seems plausible.

INDICATIONS AND USAGE

Unproven Uses: Periwinkle is used internally for circulatory disorders, cerebral circulatory impairment and support for the metabolism of the brain. It is also used internally for loss of memory, hypertension, cystitis, gastritis and enteritis, diarrhea, raised blood sugar levels and to help weaning. Periwinkle is used externally for sore throats, nose bleeds, bruising, abscesses, eczema and to stop bleeding.

Homeopathic Uses: Periwinkle is used for weeping eczema and bleeding mucous membranes.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Gastrointestinal complaints and skin flushing have been observed as side effects.

OVERDOSAGE

Overdosage will bring about a severe drop in blood pressure. Cases of poisonings have not yet been recorded.

Treatment includes gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-coloured potassium permanganate solution, sodium sulphate), instillation of activated charcoal and shock prophylaxis (appropriate body position, quiet, warmth). The therapy for poisonings consists of treating bradycardia with atropine or Alupent, cardiac arrhythmias with lidocaine or phenytoin and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused.

DOSAGE

Mode of Administration: Whole, cut and powdered drug is available in the form of capsules, ampules, coated and filmed tablets, and compound preparations.

Preparation: To make a tea, pour 200 ml boiling water over 1 teaspoonful of drug, steep for 10 minutes, then strain. To make a decoction, boil 60 gm of drug in 1 liter of water for 2 minutes, steep for 10 minutes, then strain.

To make an infusion, boil 15 gm of drug in 1/4 liter of water. To make wine, macerate 100 gm of drug in 1 liter of wine for 10 days, decant, then press. To make a liquid for gargling, boil 2 dessertspoonfuls of drug for a few minutes in 1/2 liter water.

Daily Dosage: The usual drug dosage is as follows: Tea—2 to 3 cups daily; Decoction—2 to 4 cups between meals; Infusion—drink after meals for diarrhea; Wine—1 dessert-spoonful after meals; a gargle or wash can be used externally as needed.

ti *Homeopathic Dosage:* 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc. acute: 3 times daily; chronic: once a day (HAB1).

Petasites

Petasites hybridus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried or fresh leaves, the underground parts collected in autumn and dried, the aerial parts collected toward the end of the flowering season and the whole fresh plant.

Flower and Fruit: The reddish flowers appear before the leaves, immediately after the snow has melted. They grow on flowering shafts from the base of the plant. The shaft is erect, thick and has purplish scales. The ones bearing the male flowers are 15 to 20 cm high and those bearing the female flowers are 40 cm high. The capitula of the mainly male flowers are initially in ovate, compact racemes. The flowers are tubular campanulate. The female flowers have a thread-like, tight tube and a bilabiate margin. The involucre is in 1 to 2 rows and is reddish. A prismatic fruit with a yellowish-whitish pappus develops from the flower.

Leaves, Stern and Root: The short and gnarled rhizome lies vertically or somewhat slanted in the ground. It is about 4 cm thick, brownish and thickened at the nodes. The root creeps and branches under the surface. The leaves are large, basal, long-petioled and roundish with a deeply cordate base. It is gray underneath and irregularly dentate.

Characteristics: Petasite has the largest leaves of all indigenous flora and has an unpleasant smell.

Habitat: The species is found in northern Asia, Europe and some areas of North America.

Production: Petasite consists of the whole plant of *Petasites hybridus*. Petasite leaf consists of the leaves of *Petasites hybridus*. The leaves are harvested before the end of the flowering season and quickly dried. Only leaves that are the size of the palm of the hand are picked, as these are said to have a higher level of active principles than the larger leaves. Petasite root consists of the dried underground parts of *Petasites hybridus*. A distinction is made between androdynamic and gynodynamic varieties. The roots of the former are dug up in autumn and of the latter in spring. After being dug up they are washed and dried. If drugs containing petasin are to be extracted, then cultivation must be carried out under laboratory conditions.

Not to be Confused With: Other Petasite varieties and the leaves of *Adenostyles alliariae* or *Tussilago farfara*.

Other Names: Blatterdock, Bog Rhubarb, Bogshorns, Butterbur, Butter-Dock, Butterfly Dock, Capdockin, Flapperdock, Langwort, P. Vulgaris, Umbrella Leaves

ACTIONS AND PHARMACOLOGY

COMPOUNDS: PETASITES LEAF

Sesquiterpene alcohol esters: chief components including among others according to chemotype - petasitine, neopetasitine and isopetasitine, or furanopetasin and 9-hydroxyfuranoteremophilone

Pyrrolizidine alkaloids: senecionine, integerrimine, senkirkine, presumably only in traces

Volatile oil: including, among others, dodecanal (aroma-bearer)

Flavonoids: including among others, isoquercitrin, astragaline

Mucilages

Tannins

EFFECTS: PETASITES LEAF

A spasmolytic effect has been demonstrated in animals.

COMPOUNDS: PETASITES ROOT

Sesquiterpene alcohol esters: including among others, chief components according to chemotype - petasitine, neopetasitine and isopetasitine or furanopetasin and 9-hydroxyfuranoteremophilone

Volatile oil (0.1-0.4%): including among others, 1-nonen, eremophilone, furanoteremophilone

Pyrrolizidine alkaloids: senecionine, integerrimine

EFFECTS: PETASITES ROOT

In animals, the* pyrrolizidine alkaloids inhibit leukotriene synthesis and are spasmolytic and spasmolytic as well as cytoprotective. In humans, it provides analgesia for nervous headaches. Its application for psychasthenic symptoms seems plausible.

In higher doses and with chronic use, a hepatotoxic, mutagenic, teratogenic and carcinogenic effect may be expected.

INDICATIONS AND USAGE

PETASITES LEAF

Unproven Uses: Petasite leaves are used to stimulate the appetite and to treat nervous cramp-like states and states associated with pain, colic and headaches. In folk medicine, the leaves are used internally for respiratory disorders, liver, gallbladder or pancreas disorders, as a prophylaxis for agitation and to induce sleep. Externally, the leaves are used to heal wounds and as a poultice for malignant ulcers.

PETASITES ROOT

Approved by Commission E:

- Kidney and bladder stones

Unproven Uses: The underground stem is used as an adjunct in the treatment of acute spastic pain in the efferent urinary tract, particularly if stones are present. It is also used for respiratory disorders, particularly for coughs, whoopin cough and bronchial asthma. Other uses include gastrointestinal disorders, migraine and tension headaches.

Homeopathic Uses: Smooth muscle cramps.

CONTRAINDICATIONS

All forms of the drug should not be used during pregnancy or by nursing mothers.

PRECAUTIONS AND ADVERSE REACTIONS

PETASITES LEAF

General: One should entirely forgo any administration of the drug, due to the presence of pyrrolizidine alkaloids with hepatotoxic and carcinogenic effects in the parts of the plant above ground, as even mere traces of the alkaloids present a danger. The industrial manufacture of extracts virtually free of pyrrolizidine alkaloids is possible. The drug should not be used without knowledge of the pyrrolizidine alkaloids content.

Note: Alkaloid-free varieties are cultivated.

Pregnancy: The administration of the drug during pregnancy is to be completely ruled out.

Nursing Mothers: The drug should not be consumed by nursing mothers.

PETASITES ROOT

One should unconditionally forgo any administration of the drug, due to the presence of pyrrolizidine alkaloids with hepatotoxic and carcinogenic effect. The industrial manufacture of extracts virtually free of pyrrolizidine alkaloids is possible.

DOSAGE

PETASITES LEAF

Preparation: To make an infusion, pour boiling water over 1.2 to 2 gm comminuted drug and strain after 10 minutes.

Daily Dosage: Drink 2 to 3 cups of the infusion per day.

Note: The herb should not be used unless the pyrrolizidine content is known. The maximum daily dose of pyrrolizidine alkaloids is 0.1 micrograms.

PETASITES ROOT

Mode of Administration: Extracts obtained with ethanol or lipophilic solvents and other galenic preparations for internal use.

Daily Dosage: Dosing of herbal preparations is highly dependent on a variety of factors, such as growing and harvesting conditions, plant parts, extraction methods used and the dosage form chosen by the manufacturer. Standardization to single constituent makers has proven unreliable. ^{^P} Since no official standards have been established to date to regulate production of herbal medicines in the United States, dosage ranges must be employed as guidelines.

Preparations equivalent to 4.5 to 7 gm drug may be used. When used internally, the daily dosage must not exceed 0.1 micrograms of pyrrolizidine alkaloids with 1.2 unsaturated necine structure including their N-oxides. When used externally, the maximum daily dosage should not exceed 10 micrograms of pyrrolizidine alkaloids with 1.2 unsaturated necine structure including their N-oxides. Teas should not be used.

Homeopathic Uses: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Peyote

Lophophora williamsii

DESCRIPTION

Medicinal Parts: The medicinal parts are the "pincushion-like, aerial, transversely cut and dried, tough-corky shoot, and the fresh plant.

Flower and Fruit: The flowers grow from the center of the cactus head. They are 1 to 2.5 cm long and 1 to 2.2 cm across. The outer petals are green with a darker middle stripe and have green-pink or white margins. The filaments are white with yellow anthers. The ovary is glabrous. The fruit is a 15 to 20 mm long berry, which is 2 to 3.5 mm across, sturdy, clavate, initially fleshy, glabrous and red. It turns brown-white and dries out when ripe. The seeds are black, rough, 1 to 1.5 mm long and 1 mm wide.

Leaves, Stem and Root: The plant is a succulent, spineless, globular or top-shaped, bluish-green cactus with up to 13 distinct vertical ribs. It grows to 20 cm. From one rhizome side shoots are produced to create a cactus formation of 1.5 m across. The roots are tuberous and 8 to 11 cm long. The

aerial part has a diameter of 4 to 12 cm, and the pressed-in top is filled with gray, woolly bushels of hair. The head is divided into irregular flat warts by horizontal grooves. Roundish areoles of paintbrush-like yellowish or whitish tufts of hair grow from the tip of the warts.

Habitat: The plant grows in northern Mexico and bordering southern Texas.

Production: Mescal Button stem consists of the pincushion-like cactus *Lophophora williamsii*, cut into slices and dried. The root and hair tuft of the Peyote plant are cut off. Particularly mescaline and chlorophyll-rich center is dried as a slice. This slice is referred to as the Mescal Button.

Other Names: Pellote, Mescal Buttons, Devil's Root, Dumping Cactus, Sacred Mushroom

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alkaloids phenylethylamine type: chief among them mescaline (up to 7%), hordenine; tetrahydroisoquinoline type: including among others pelletin, anhalonidine, anhalamine

EFFECTS

Peyote has an emetic and a hallucinogenic effect. The psychotropic effects of Peyote consumption are mainly due to the mescaline content. Controlled pharmacological studies on the Peyote cactus are unknown. Mescal beans cause visual, auditory, taste and kinesthetic hallucinations.

INDICATIONS AND USAGE

Unproven Uses: Peyote is rarely used as a medicinal preparation. In folk medicine, Peyote is one of the oldest hallucinogens.

PRECAUTIONS AND ADVERSE REACTIONS

Due to its mescaline content, the drug causes chiefly visual, but also aural, kinesthetic and synesthetic hallucinations when taken in dosages of between 4 and 12 dried slices of the sprout (so-called Mescal Buttons: diameter 3 to 4.5 cm, thickness 0.5 cm).

DOSAGE

Mode of Administration: Peyote is obsolete as a drug; it is often ingested illegally for its hallucinogenic effect.

Picrorhiza

Picrorhiza kurroa

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the rhizome, which is cut and dried.

Flower and Fruit: The inflorescence is a terminal, dense spike, 5 to 10 cm long, on an upright peduncle over a rosette of dentate leaves (may be absent). The sepals are fused, approximately 6 mm long. The calyx is 5-lobed and pubescent, the corolla 5-lobed, radial, pale blue or reddish-blue. There are *A* stamens, and the ovary is 2-chambered with numerous ovules. The flowers are dimorphic, having either 6 to 8 mm long corollas and 8 mm long filaments or a single 6 mm long corolla and 2 cm long filaments. The fruit is an approximately 1.3 cm long, ovoid, 4-sided capsule. The seeds are ellipsoid with a translucent, thick, blisterly aril.

Leaves, Stem and Roots: The leaves on this herbaceous creeping perennial are alternate, 5 to 15 cm long and 2 to 6 cm wide. The lamina is coriaceous, spatulate to narrow-elliptical with a rounded tip. The margin is dentate and the petiole winged. The rhizome is woody, up to 25 cm long, and covered in the remains of dried leaf bases.

Habitat: The plant is native to the mountains of India, Nepal, Tibet and Pakistan.

Production: Kharbagehindi (Arabic name) roots are the cut and dried rhizome of *Picrorhiza kurroa*, which are collected in the wild.

Not to be Confused With: Mistaken identity can occur with *Lagotis cashmiriana*.

Other Names: Kharbagehindi

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids: catalpol derivatives, including picroside I (0.6 to 7.4%, extremely bitter), kutkoside (10-O-vanilloyl catalpol with picroside I present in a stable state as a mixed crystal: kutkin), picroside II (3 to 5%), minecoside (0.5%), veronicoside and picroside III

Acetophenone derivatives: androsine (0.1 to 0.7%), apocynin (0.1%), picein

Cucurbitacins: chief component 25-acetoxy-2beta-D-glucosyloxy-3,16,20-trihydroxy-9-methyl-19-norlanosta-5,23-dien-22-one (1.0 to 1.5%. extremely bitter)

Glycoproteins

EFFECTS

The acetophenone derivatives androsine and apocynine are bronchospasmolytic and antiasthmatic in effect. In addition, antiphlogistic, immunostimulating, antibacterial and antiviral, hepatoprotective, choleric, spasmolytic and insecticidal action mechanisms were able to be demonstrated. The positive influence of *Picrorhiza kurroa* in the treatment of vitiligo is traceable to the immunomodulating and hepatoprotective characteristics of the drug.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses have included menstrual complaints, enteritis, gall bladder complaints, for stomach conditions as an emetic, fever, constipation, chronic dysentery, scabies, leucoderma, joint pain, chronic asthma, infections, inflammations, coughs, hepatitis and snakebite.

Chinese Medicine: *Picrorhiza* is used for fever induced by strain, hyperemia, dysentery, jaundice, carbuncles, hemorrhoids, epilepsy and malnutrition in children.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Preparations for internal use.

Preparation: To prepare a tincture, 100 g finely cut and crushed *Kharbagehindi* root with 37.5 g dried and crushed orange peels, 12.5 g crushed cardamom to 1000 ml 45% ethanol.

Daily Dosage: Powder: 0.6 to 1.2 g drug; as an antiperiodic 3 to 4 g. Tincture: 2 to 4 ml.

Pimenta racemosa

See Pimento

Pimento

Pimenta racemosa

DESCRIPTION

Medicinal Parts: The medicinal parts are the berries and the oil extracted from them.

Flower and Fruit: The inflorescences are racemes of white or lilac flowers, which develop very quickly into the infructescence. The fruit is a brown, globular berry, which is about 0.75 cm in diameter. The fruit has a rough surface and the remains of the calyx are present as a toothed ring at the apex. It contains 2 reniform seeds.

Leaves, Stem and Root: The tree is an evergreen up to 12 m in height. The leaves are oblong and coriaceous.

Characteristics: The odor is aromatic and reminiscent of cloves.

Habitat: The plant is indigenous to the West Indies and is cultivated in South America, Central America and Jamaica.

Production: Pimento leaves are the foliage leaves of *Pimenta racemosa*. *Pimentae fructus* is obsolete as a drug.

Other Names: Allspice, Clove Pepper, Jamaica Pepper, *Pimenta*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (hay oil, 0.7-1.2%): chief components- eugenol (50-60%), chavicol (20%), additionally including among others eugenol methyl ether, methyl chavicol, myrcene, limonene, (-)-phellandrene, 3-octanon, 1-octen-3-ole, citral

EFFECTS

Pimento is antiseptic and analgesic, and is a skin irritant.

INDICATIONS AND USAGE

Unproven Uses: Pimento is used externally in rubefacient lotions or liniments.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Allergic reactions to eugenol occur rarely.

DOSAGE

Mode of Administration: Pimento preparations are administered externally as lotions or liniments.

Pimpinella

Pimpinella major

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizome, the dried roots and the fresh roots collected in May.

Flower and Fruit: The white flowers are in compound 5- to 15-rayed umbels. There is no involucre or epicalyx. The flowers are small. The petals are uneven with curved lobes. The style is longer than the ovary during the flowering season. The fruit is dark brown to black, oblong-ovate, compressed at the sides, 2 to 3.5 mm long, heavily grooved and has no beak.

Leaves, Stem and Root: The 50 to 100 cm high plant is a perennial. During the flowering season, it develops lateral rosettes of leaves for the following year. These are usually glabrous, occasionally finely downy to short-bristly. The root is fusiform or carrot-shaped. The root is 10 to 20 cm long and 1 to 1.5 cm thick, gray-yellow and somewhat ringed. The stem is erect, angular, grooved, hollow, glabrous, somewhat leafy and branched from the ground up. The leaves are simple pinnate and glossy. The leaflets of the lower leaves are petiolate. They are ovate or oblong-indentated or serrate acuminate.

Characteristics: The fresh root smells rancid, suet or carrot-like. The taste is tangy at first then burning-hot.

Habitat: The plant grows all over Europe with the exception of Scandinavia and the southern Balkans. It has been introduced to North America.

Production: Pimpinella herb consists of the above-ground parts of *Pimpinella saxifrage* and/or *Pimpinella major*. Pimpinella root consists of the dried rhizomes and roots of *Pimpinella saxifrage* and/or *Pimpinella major*. The root is dug up in spring and autumn. The uncut root is dried at temperatures of 40° C to prevent loss of essential oils. The drying process is completed when the roots can be broken.

Not to be Confused With: Pimpinellae radix should not be confused with other Apiaca roots. It is often adulterated with the roots of *Heracleum sphondylium*, *Heracleum mantegazzianum* and *Pastinaca sativa*.

Other Names: Pimpernell, Saxifrage, Burnet Saxifrage

ACTIONS AND PHARMACOLOGY

COMPOUNDS: PIMPINELLA HERB

Flavonoids

The foliage of the plant has not been fully investigated.

EFFECTS: PIMPINELLA HERB

No information is available.

COMPOUNDS: PIMPINELLA ROOT

Volatile oil (0.05 to 0.7%): chief components- trans-epoxy-pseudo-isoeugenol (20-57%), additionally pregeijeren (10%), geijerene (3%), beta-bisabolene, germacrenes A to D, 1,4-dimethyl azulene

Furocoumarins (1.2-2.3%): including among others bergapten, isopimpinellin, pimpinellin, isobergapten, sphondine

Hydroxycoumarins: umbelliferone, scopoletin

Caffeic acid esters: including among others, chlorogenic acid

Polyynes: including trideca-2,8,10-trien-4,6-diene; trideca-2,8-dien-4,6-diin-10-ole

EFFECTS: PIMPINELLA ROOT

The drug contains essential oil. The efficacy of the drug as a flushing-out therapy in bacterial infections of the urinary tract seems plausible. The expectorant effect has not been proven.

INDICATIONS AND USAGE**PIMPINELLA HERB**

Preparations of Pimpinella herb are used internally for lung ailments and to stimulate gastrointestinal activity. The herb is used externally for varicose veins.

PIMPINELLA ROOT

Approved by Commission E:

- Cough/bronchitis

Preparations of the root are also used for colds, chills and catarrh of the upper respiratory tract.

Unproven Uses: In folk medicine, it is used internally for disorders of the urinary organs, inflammation of the bladder and kidney, bladder and kidney stones, and edema. It is also used as flushing-out therapy in bacterial inflammation of the efferent urinary tract. Externally, it is used for inflammation of the oral and pharyngeal mucous membrane and as a bath additive for poorly healing wounds. •

Homeopathic Uses: Homeopathic uses include febrile states and spinal pain. Efficacy of the flushing-out therapy seems plausible, efficacy for the other indications has not been sufficiently proven.

PRECAUTIONS AND ADVERSE REACTIONS**PIMPINELLA HERB**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

PIMPINELLA ROOT

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Photosensitivity may occur in light-skinned individuals.

DOSAGE**PIMPINELLA ROOT**

Mode of Administration: Pimpinella root is administered as a tincture (Tinctura Pimpinellae) and as a comminuted herb for teas and other galenic preparations for internal use.

Daily Dosage: 6 to 12 g drug for infusions or 6 to 15 ml pimperl tincture (1:5).

Folk medicine — Add freshly cut drug to cold water and bring to the boil, use as a gargle and as a bath additive.

Infusion — 3 to 10 g; 1 cup 3 to 4 times daily (sweetened with honey).

Gargle tincture — 30 drops in a glass of water.

For coughs — 5 to 10 drops on a sugar lump.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc; acute: 3 times daily; chronic: once a day (HAB1).

Pimpinella major

See *Pimpinella*

Pineapple-

Ananas comosus

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the fruit.

Flower and Fruit: The white, blue or purple flowers are arranged in approximately 30 cm long spikes. The flowers are in the axils of reddish, thorny bracts. The 3 sepals are free or fused at the base, and the 3 petals form a tube. There are 6 stamens and a 3-chambered ovary. The fruit is fused with the thickening receptacle to an oval to cylindrical, cone-like pseudocarp. The pseudocarp is 10 to 25 cm thick, 15 to 25 cm high, 0.5 to 5 kg in weight, yellow to orange-red with large warts and a hexagonal area bearing a leaf cluster at the tip.

Leaves, Stem and Root: *Ananas comosus* is a leafy rosette perennial plant, which grows up to 1.2 m high. The leaves are narrow-linear, thorny-tipped, up to 0.9 m long and 6 cm

wide. They are usually thorny dentate and arranged in rosette. The stem is short.

Characteristics: The fruit is usually parthenocarpic. The cultivated fruits are seedless. The fruit pulp is white to yellow with a sourish-sweet, aromatic smell and taste.

Habitat: Hawaii, Japan, Taiwan

Production: Bromelain is a mixture of proteolytic enzymes from the main stump of *Ananas comosus*. Bromelain is produced from the main pineapple stumps harvested after 4 years. The main stumps are pressed and put through an extraction process with water. The juice is then precipitated with acetone to produce raw bromelain. The resulting waste product is a soft wax, which is used in the cosmetic industry.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Proteases: mixture of at least 5 chemically very similar cysteine proteinases, including EC 3.4.22.4 and EC 3.4.22.5, that can be deactivated with oxidizing substances or activated with thiols such as cysteine, as well as small amounts of a phosphatase, a peroxidase or protease inhibitors.

EFFECTS

Pineapple is antiphlogistic, fibrinolytic and proteolytic. The proteolytic enzymes promote the healing of wounds. In addition, an inhibition of thrombocyte aggregation and an antineoplastic effect have been observed, as well as an elevation of the serum level of antibiotics when administered concurrently.

INDICATIONS AND USAGE

Approved by Commission E:

- Wounds and burns

Unproven Uses: Internal application: For post traumatic and postoperative swelling to stimulate healing and as an enzyme substitution for digestive symptoms after pancreatic disease. The drug can also be used for edema, digestive complaints, for inflammation and febrile conditions (Hawaiian Islands, Philippines and South America), for asthmatic conditions in children (Zaire) and as a vermifuge (Brazil). Pineapple bran is used in weight reduction.

Indian Medicine: The fruit is used for dyspeptic symptoms, constipation, amenorrhea and dysmenorrhea, as well as for black vomiting and fever.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Gastric complaints and diarrhea may occur as side effects of internal administration. Allergic reactions following repeated administration have been observed.

DOSAGE

Mode of Administration: Available as tablets, granules and galenic preparations for internal use; compounded preparations for external use.

Daily Dosage: Internal application: 80 to 240 mg of raw bromelain in galenic preparations, corresponding to 200 to 600 FIP units.

Storage: Seal tightly and air dry.

Pink Root

Spigelia marilandica

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizomes and roots.

Fruit and Flower: The inflorescences are terminal, sometimes branched spikes inclined to one side. The flowers are erect. The high leaves are tiny or awl-shaped in fives, and they are narrow. The 5-petaled corolla is red or yellow. The fruit is a 2-valved capsule. The seeds are angular and packed tightly in the fruit.

Leaves, Stem and Root: The plant is a perennial that grows up to 45 cm high and has fibrous, twisted roots. The stem is

quadrangular and glabrous. The foliage leaves are opposite, membranous, ovate to ovate-lanceolate, acuminate, rounded at the base, entire-margined and sessile. The stipules are small.

Habitat: The plant is indigenous to the U.S.

Production: Pink Root and herb are the rhizome and aerial parts of *Spigelia marilandica*.

Other Names: American Wormgrass, Indian Pink, Maryland Pink, Pinkroot, Starbloom, Wormgrass

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

The drug has not been investigated in recent times. Older sources include, among others, references to the presence of acidic resins, volatile oil, tannins, waxes and a volatile base (presumably identical with isoquinoline).

EFFECTS

Pink Root has anthelmintic actions.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for worm infestation, as a febrifuge and for malaria.

Homeopathic Uses:- *Spigelia marilandica* is used as a calmative during states of excitement.

PRECAUTIONS AND ADVERSE REACTIONS

According to older sources, the drug allegedly contains a toxin that paralyzes the spinal marrow and leads to death through asphyxiation.

DOSAGE

Mode of Administration: As a powdered root or herb or as a liquid extract.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen): Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Pinus Bark

Tsuga canadensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the latex, which exudes from the plant and the essential oil.

Flower and Fruit: The pedicle of the male flower is shorter than the scale sheath. The cones are small (1.5 to 2.5 cm long) and light brown. The wood contains no resin.

Leaves, Stem and Root: The young shoots are villous, becoming pubescent. The leaves have a leaf cushion and are flat, short (1 to 1.5 cm long) and obtuse. The upper surface is dark green and the under surface has 2 blue-white long stripes.

Habitat: The plant is indigenous to North America.

Other Names: Hemlock Bark, Canada Pitch, Hemlock Gum

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (8-15%)

Flavonoids: hemlock tannin

Stilbene derivatives (8-10%): picea tannols

EFFECTS

The active agents are the tannin, hemlock tannin, and picea tannols. The drug has astringent, anti-inflammatory, diaphoretic, and diuretic properties.

INDICATIONS AND USAGE

Unproven Uses: Pinus Bark is used for digestive disorders, diarrhea, and diseases of the mouth and throat. It was formerly used to treat scurvy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Administration in allopathic medicine is not common.

DOSAGE

Mode of Administration: The drug is available as a liquid extract, in medicinal preparations and combinations.

Pipsissewa

Chimaphila umbellata

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves (occasionally mixed with twigs and flowers), the fresh aerial parts of the flowering plant and the complete dried plant.

Flower and Fruit: The plant has terminal inflorescences 10 cm long with umbels of 2 to 7 flowers. The flowers, which are initially bright pink and then white, are nodding and mildly campanulate. The 5 sepals are obovate, glabrous and about a third as long as the 5 petals. The petals are broadly ovate, domed, pink and 5 to 6 mm long. The 10 stamens are thickened at the base, the edges are winged and ciliate. The anthers are short, thick and red. The style is very short and the stigma broad and shorter than the anthers. The fruit is a 5-grooved capsule with erect stems.

Leaves, Stem and Root: The plant is a perennial semi-shrub growing up to 25 cm high with an upright, angular stem and a creeping white rhizome. The evergreen, alternate leaves are short-petioled, coriaceous, ovate-spatulate to linear and wedge-shaped. The leaf margin is sharply serrate.

Habitat: The plant grows extensively in Europe, Asia, Siberia, and North and South America. It is a protected species in Germany.

Production: Pipsissewa is the aerial part of *Chimaphila umbellata*, which is collected in the wild.

Not to be Confused With: Confusion sometimes arises with *Chimaphila maculata*.

Other Names: Prince's Pine, Ground Holly, Umbellate Wintergreen, Butter Winter, King's Cureall, Love in Winter, Rheumatism Weed, King's Cure

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Hydroquinone glycosides: chief component isohomoarbutin, additionally homoarbutin

Naphthacene derivatives (naphthoquinone): chimaphilin (2,7-dimethyl-1,4-naphthoquinone)

Flavonoids: including among others hyperoside, avicularin

Tannins: (4-5%)

EFFECTS

The drug contains quinine, which is said to be a urinary antiseptic. (See *Uva Ursi*) Alcoholic and aqueous extracts of the plant are said to have antimicrobial properties in vitro.

INDICATIONS AND USAGE

Unproven Uses: Internal applications include acute and chronic cystitis and edema.

Indian Medicine: Pipsissewa is used internally by American Indians for complaints of the kidneys and bladder, and to regulate menstruation, both before and after giving birth. It is also used for rheumatism and cancerous conditions. It is used externally for skin diseases and smallpox.

Homeopathic Uses: Among uses in homeopathy are chronic inflammation of the efferent urinary tracts, prostate gland and mammary glands.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a weak sensitizing effect, due to its chimaphilin content. The drug is not suitable for long-term use because of its hydroquinone glycoside content. (See *Uva-Ursi* leaf.)

DOSAGE

Mode of Administration: Constituent of homeopathic preparations in dilutions or as a mother tincture.

Preparation: A liquid extract is prepared 1:1 with ethanol.

Daily Dosage: The usual single dose is 2 g drug, 1 to 3 g drug in a tea, or 1 to 4 ml of extract.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules 1 to 3 times daily, or 1 ml injection solution sc twice weekly (HAB1).

Piscidia piscipula

See Jamaica Dogwood

Pistacia lentiscus

See Mastic Tree

Pitcher Plant

Sarracenia purpurea

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and roots.

Flower and Fruit: The androgynous flowers usually have numerous stamens and a large 3- to 5-valved superior ovary. The style spreads into a wide, stemmed umbrella, which spreads over the stamens. The 5 stigma sit as small cone-like structures on the underside of the roof of the tips. The numerous marginal ovules are on individual axillary shafts. The fruit is a valved capsule. The small, membranous, thin-skinned seeds contain an abundance of endosperm.

Leaves, Stem and Root: *Sarracenia purpurea* is a strange, perennial plant with leaves that are in a basal rosette and change into a tube or beaker-like formation. The beaker bears a long wing-like strip on the side turned towards the stem. These beakers are often very colorful and fill up with rainwater and insects. During hot weather they are closed because of a concentration of fibers. The enclosed rainwater and insects form a mass, which probably acts as a fertilizer and has a strong odor.

Habitat: The plant is indigenous to the U.S.

Production: Pitcher Plant root and leaves are the root and leaves of *Sarracenia purpurea*.

Other Names: Eve's Cups, Fly-Catcher, Fly-Trap, Huntsman's Cup, Purple Side-Saddle Flower, Side-Saddle Plant, Water-Cup, Smallpox Plant

ACTIONS AND PHARMACOLOGY

• COMPOUNDS

Piperidine alkaloids: coniine, gamma-conicein (particularly in the trapping fluid of the pitcher leaves)

EFFECTS

The drug has stomachic, diuretic, and laxative effects due to its active agents, which include sarracenia acid, tannin, resin, and the alkaloid sarracenin, which is similar to veratrin.

INDICATIONS AND USAGE

Unproven Uses: Pitcher Plant was formerly used for digestive disorders, particularly constipation, also for urinary tract diseases, and as a cure for smallpox. Indigenous North American Indians believe the drug not only saved lives of smallpox victims, but they also administered it to prevent scar formation.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Both the root and leaf preparations are considered completely obsolete.

Plantago lanceolata

See English Plantain

Plantago ovata

See Psyllium

Plantain

Musa paradisiaca

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the fruit.

Flower and Fruit: The inflorescence, growing through the false trunk and curving downward, bears groups of male flowers in the axils of the bracts at the tip, groups of androgynous flowers beneath and finally female flowers. The flowers are zygomorphic with 5 fused and 1 free tepal. There are 5 stamens and a superior ovary. The fruit is a berry. The 10 to 16 single fruits that develop from the flowers of a bract are called a hand.

Leaves, Stem and Root: The herbaceous perennial grows up to 6 m high. The leaves are very large, entire and simple. They are often pinnatifid and grow from an underground rhizome. The leaf sheaths form a hollow false trunk. There are adventitious roots.

Characteristics: A seedless berry fruit develops from the female flowers without pollination.

Habitat: The plant grows in tropical areas.

Production: Plantain banana pulp is the unripened pulp of *Musa paradisiaca*. Plantains are harvested when still green and ripened in special rooms for 3 to 10 days.

Other Names: Banana, Banana Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Polysaccharides: starch (20% of fresh weight)

Protein (1% of fresh weight)

Ascorbic acid (vitamin C): 10 to 20 mg/100 g fresh weight

Amines: serotonin (28 g/g fresh weight), tyramine (7 g/g fresh weight), dopamine (8 g/g fresh weight), noradrenaline (2 g/g fresh weight)

Fruit acids: including malic and citric acid

Aromatic substances: 180 components, including isopentenyl acetate (chief aroma-bearer)

EFFECTS

The starchy fruit has antiatherogenic and cholesterol-reducing effects, and is a source of potassium. In East Africa and elsewhere, Plantain is used to prepare a narcotic drink.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for dyspepsia, gastrointestinal complaints, diabetes, scurvy, diarrhea, hypertension and gout. The roots of the tree have been used as an anthelmintic

and considered useful in alleviating bronchocele. The juice was used as a snakebite antidote.

Indian Medicine: Uses include worm disease, scabies, severe thirst, bronchitis, itching, kidney disease, pharyngalgia and dysuria. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. It is conceivable that the amine content could trigger attacks of migraine headache. The frequency of myocardial fibrosis in tropical countries is said to be caused by chronic ingestion of the plant. (Plantain should never be eaten raw; it must be cooked or fried.)

DOSAGE

Mode of Administration: Preparations of the whole, cut and powdered drug are administered orally.

Preparation: Plantain starch is extracted through the elutriation of the ground fruit pulp. Plantain powder is produced by dividing the fruit into slices and air- or chamber-drying them to a water content of only 15%, and then grinding. Plantain powder (or the unripened mashed fruit) is added to milk and drunk or made into bread called Chapatis.

Pleurisy Root

Asclepias tuberosa

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root.

Flower and Fruit: The plant bears panicles of deep yellow and orange petalous flowers on the apex of the stem.

Leaves, Stem and Root: The plant is perennial, erect, 50 to 100 cm high with a fleshy tuberous root stock bearing a few stout, hairy stems. The leaves are alternate, oblong, glabrous, narrowly lanceolate and dark green. The under surface of the leaves is somewhat lighter than the upper surface. The rootstock is mildly ring-shaped with a branched crown. The roots are grooved lengthwise, grayish brown on the outside and whitish on the inside. The tissue is made up of concentric rings, which divide easily. The root is tough, short and starchy. *Asclepias tuberosa* is devoid of the latex typical of the genus (see *Asclepias incarnata*).

Characteristics: Pleurisy Root has a nutty and bitter taste. The odor is faint.

Habitat: Indigenous to America and Canada.

Production: Pleurisy Root is the root of *Asclepias tuberosa*.

Other Names: Butterfly Weed, Canada Root, Flux Root, Orange Swallow-Wort, Swallow-Wort, Tuber Root, White Root, Wind Root, Orange Milkweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroids (cardenolids) : including frugoside, glucofrugoside, coriglaucigenin (aglycone)

EFFECTS

Pleurisy Root is said to act as an expectorant, tonic, diaphoretic and antispasmodic.

INDICATIONS AND USAGE

Unproven Uses: Pleurisy Root is used for coughs, pleurisy, disorders of the uterus, as an analgesic and to ease breathing.

The plant plays a particularly important role in the medicine of American Indians as a remedy for pleurisy. It is also used as a diaphoretic in treating pneumonia, inflammation of the mucous membranes, local or general atrophy, diarrhea, dysentery, rheumatism and stomach ache. Pleurisy Root is also used as a diaphoretic and expectorant.

CONTRAINDICATIONS

Pleurisy Root is not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

The drug has an emetic effect in higher dosages, and digitalis-like poisonings are possible due to the cardioactive steroid content. For possible symptoms and treatments for poisonings, see *Digitalis purpurea*.

DOSAGE

Mode of Administration: The drug is used internally as a liquid extract and is also available in combination preparations.

Plumbago

Plumbago zeylanica

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaf and root.

Flower and Fruit: The flowers are radial, their structures are arranged in fives with white petals and a superior ovary. The fruit is a 1-seeded nut.

Leaves, Stem and Root: *Plumbago* is a semi-shrub. The leaves are simple and entire.

Habitat: The plant is indigenous to Malaysia and China.

Production: *Plumbago* herb is the dried aerial part of *Plumbago zeylandica*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Naphthalene derivatives: chief component plumbagin (0.04%), including as well 3-chlorplumbagin, isoshinanolone, 3,3'-biplumbagin, elliptinone (6,6'-biplumbagin), droserone, 3,6'-biplumbagin (chitranone), zeylanone, isozeylanone, maritinone, 2-methyl naphthazarine

EFFECTS

No definitive data available.

INDICATIONS AND USAGE

Chinese Medicine: The herb has been used for rheumatism, intestinal parasites, joint pain, anemia, scabies and furuncles.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Daily Dosage: 9 to 15 gm of drug

LITERATURE

No data available.

Plumbago zeylanica

See Plumbago

Podophyllum peltatum

See Mayapple

Pogostemon cablin

See Patchouli

Poison Ivy

Rhus toxicodendron

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves collected after flowering and dried, the fresh young shoots, the young flowering branches and the fresh leaves.

Flower and Fruit: The pedicled flowers are in axillary, pubescent panicles. They are dioecious, sometimes androgynous. The stemmed petals are whitish-green with red hearts. The fruit is an almost globular, glabrous, yellow or yellowish-white, 10-grooved drupe. The fruit varies in size and contains a viscous latex in resin channels, which turns black in the air.

Leaves, Stem and Root: The plant is a dioecious shrub up to 1 m high with ascending, procumbent or climbing rooting branches and underground runners. The branches are initially green and softly pubescent, later brown and glabrous. There are numerous lenticels on the two-year old shoots. The leaves are trifoliolate with 8 to 14 cm long petioles. The leaflets are oblong, acute or obtuse, entire-margined or roughly serrate in the middle. They have a dark-green upper surface and slightly pubescent lower surface, which is a lighter green.

Habitat: The plant is indigenous to North America; it is also found in east Asia and is cultivated in Germany in botanical and apothecary gardens.

Production: Poison Ivy leaves are the leaves of *Rhus toxicodendron*. Subsequent to the flowering period, the leaves of *R. toxicodendron* are gathered and then well-dried. Gloves should be worn to protect hands while gathering the leaves, as they can cause unpleasant inflammation of the skin.

Not to be Confused With: Although it is sometimes called "Ampelopsis hoggii," *Rhus toxicodendron* actually has nothing in common with the *Ampelopsis* group of vines.

Other Names: Poison Oak, Poison Vine, Epright Sumach

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alkyl phenols: urushiol, chiefly cis,cis-3-(n-heptadeca-8',H'-dienyl)catechol, cis,cis, cis-3-(n-heptadeca-8',11\14'-trienyl)catechol, cis-3-(n-heptadec-8'-enyl)catechol

Tannins

Flavonoids

EFFECTS

"Rhus poison," even in very small amounts, causes severe irritation to the skin. Following contact it can result in

reddening, swelling and herpes simplex-like blisters. It also has a strong toxic effect if taken internally. The mother tincture (main constituents: gallic acid and urushiol) inhibits in vitro prostaglandin biosynthesis.

INDICATIONS AND USAGE

Homeopathic uses: The drug is used to treat rheumatism in the joints and muscles; overexertion (stress and strain); febrile infections with giddiness; inflammation of the respiratory tract, gastrointestinal tract and the eyes; menstrual disturbances; anxiety and depressive states; and itching skin diseases.

PRECAUTIONS AND ADVERSE REACTIONS

Contact with larger quantities of the allergen can bring about resorption and generalized erythema; in severe cases also fever and unconsciousness. Severe conjunctivitis and corneal inflammations, with possible loss of sight, may result after contact with the eyes. External application of the drug should be avoided. Skin affected by accidental contact should be intensively rinsed with a soapy solution and then cleaned with ether or ethanol. The points of inflammation should be covered with bicarbonate of soda paste (mixed with water). Internal treatment is carried out with systematically effective corticosteroids. Cooling bandages give relief in mild cases.

OVERDOSAGE

Overdoses of homeopathic preparations lead to severe mucous membrane irritation, accompanied by queasiness, vomiting, intestinal colic and diarrhea, as well as signs of resorption, e.g., vertigo, stupor, kidney damage (nephritis, hematuria).

Following gastrointestinal emptying (gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), installation of activated charcoal and shock prophylaxis (quiet, warmth), the therapy for these sorts of poisonings consists of treating spasms with diazepam (i.v.), electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary. Furthermore, the leaves possess a very severe potential for sensitization, due to their urushiol content. Following sensitization (which can also occur through contact with decorative art from the Far East, such as wooden chairs that have been treated with toxicodendron lacquers), renewed contact leads within a few hours to itching eczemas and eventual blister formation.

DOSAGE

Mode of Administration: Homeopathic dilutions of the mother tincture.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic);

parenterally: 1 to 2 ml sc; acute: 3 times daily; chronic: once a day (HAB34); children are given different doses.

Storage: In tightly sealed containers, not to be kept for more than a year.

Poisonous Buttercup

Ranunculus sceleratus

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh herb.

- & *Flower and Fruit:* The plant produces numerous flowers. They are small, pale yellow and 4 to 10 mm in size. The petals are as long as the calyx. The sepals are revolute, ovate and downy. There are many stamens and numerous ovaries. The fruit consists of an oblong, ear-like capitula. The calyx and corolla drop easily.

Leaves, Stem and Root: The plant grows from 20 to 60 cm high with an annual root. The plant is pale, glossy,

yellowish-green, fleshy and glabrous. The upper part of the stem is occasionally pubescent. The stem is erect, tubular, glabrous and branched. The leaves are palmate: The lower ones are long-petioled with 2- to 3-lobed segments, and the upper ones are sessile and usually trifoliate.

Characteristics: A bruised leaf coming into contact with the skin creates a blister that heals very slowly.

Habitat: The plant is indigenous to central and northern Europe.

Production: Poisonous Buttercup is the fresh herb of *R. sceleratus*, which is gathered in October.

Other Names: Celery-Leaved Crowfoot, Cursed Crowfoot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glycoside ranunculin: as protoanemonine-forming agent in the, freshly harvested plant (1.4% of the fresh weight) that changes enzymatically when the plant is cut into small pieces, and probably also while it is drying, into the pungent, volatile protoanemonine that quickly dimerizes to non-mucous-membrane-irritating anemonine. When dried, the plant may not be capable of protoanemonine formation.

Saponins

EFFECTS

The active agents are ranunculin, protoanemonin and anemonin and flavoid in the leaves. The plant is highly toxic. The juice contains protoanemonin, which causes pain and burning sensations, increases saliva secretion and causes severe inflammation of the tongue.

INDICATIONS AND USAGE

Unproven Uses: Poisonous Buttercup is used as a skin stimulant for skin diseases (such as scabies) and leukoderma.

Homeopathic Uses: Poisonous Buttercup is used for skin complaints, swollen muscles and joints, and influenza.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug. Extended skin contact with the freshly harvested, bruised plant can lead to blister formation and cauterizations that are difficult to heal due to the resulting protoanemonine, which is severely irritating to skin and mucous membranes. If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritation of the urinary drainage passages, may occur. Symptomatic treatment for external contact consists of mucilaginous after irrigation with diluted potassium permanganate solution. In case of internal contact, administration of activated charcoal should follow gastric lavage.

OVERDOSAGE

Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments.

DOSAGE

Mode of Administration: The herb is available as a mother tincture and extract in homeopathic dilutions.

Poke

Phytolacca americana

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried root and the berries.

Flower and Fruit: The racemes are about 10 cm long and more or less erect. The flowers are androgynous. There is a calyx without a corolla. The involucre segments are 2.5 cm, broadly ovate, greenish-white and turn reddish at the fruit. There are 10 stamens and 10 carpels, which are fused. The fruits are 10 mm depressed-globose, purplish-black berries, which cover the stem like a raceme. They are similar to blueberries.

Leaves, Stem and Root: The plant is a glabrous, perennial herb, somewhat woody at the base. The root is long and fleshy. The stems are 1 to 3 m high, hollow, bifurcated and often marked with grooves. The leaves are alternate, entire-margined, unpleasantly scented, 12 to 25 cm by 5 to 10 cm, ovate-lanceolate and petiolate.

Habitat: The plant is indigenous to the U.S. and has also become common in Mediterranean countries.

Production: Poke Root and berries are the root and fruit of *Phytolacca americana*.

Other Names: American Nightshade, American Spinach, Bear's Grape, Branching Phytolacca, Cancer-Root, Coakum-Chongras, Cokan, Crowberry, Inkberry, Jalap, Phytolacca Berry, Phytolacca Root, Pigeon Berry, Poca, Poke Root, Poke Berry, Pokeweed, Red Weed, Red-Ink Plant, Soko, Skoke, Virginian Poke

ACTIONS AND PHARMACOLOGY**COMPOUNDS: POKE FRUIT**

Triterpene saponins (mixture termed phytolaccatoxin): phytolaccoside A-G, phytolaccasaponin B, aglycones 28,30-dicarboxy-oleans, including jaligonic acid, esculentic acid, phytolaccagenic acid, pokeberrygenin

Triterpenes: including alpha-amyrin, beta-amyrin, taraxasterol, psi-taraxasterol, tirucallol

Lectins (pokeweed-mitogens)

Ribosome: inactivating proteins (1-RIP), in the seeds

Betacyans (red pigments): including among others phytolaccanin (betanin), particularly in the fruits

Lignans: caffeic acid aldehyde-oligomers; including among others americanin A, B and D

Histamine: gamma-aminobutyric acid (in the rhizomes)

Saccharose: cyclitols

EFFECTS: POKE FRUIT

An antihepatotoxic and antiviral effect has been demonstrated for the fruit. The saponins have an emetic effect.

COMPOUNDS: POKE ROOT

Triterpene saponins (mixture termed phytolaccatoxin): phytolaccosides A, B, D, D2, E (chief component, aglycone phytolaccagenin), F, G, phytolaccasaponin B, aglycone 28,30-dicarboxy-oleans, including jaligonic acid, jaligonic acid-30-methyl ester, esculentic acid, phytolaccagenic acid

Amines: histamine (0.13 to 0.16%), in the roots

Starch**EFFECTS: POKE ROOT**

An anti-edemic and immune-stimulating effect has been demonstrated for the root. The saponins have an emetic effect.

INDICATIONS AND USAGE**POKE FRUIT**

Unproven Uses: Rheumatism and skin ulcers

POKE ROOT

Unproven Uses: Poke has been used to treat dysmenorrhoea, dyspepsia, catarrh, rheumatism, tonsillitis, pharyngitis, syp-

ilis, mumps, conjunctivitis, scabies, ring worm infestation, ulcers, constipation and as an emetic.

Homeopathic Uses: Uses in homeopathic medicine include inflammation of the mucous membranes (particularly of the respiratory tract), feverish infections, inflammation of conditions of the mammary glands and rheumatic conditions.

PRECAUTIONS AND ADVERSE REACTIONS

General: All parts of the plants are poisonous, due to the presence of mucous membrane-irritating saponins and of the toxic, perorally effective lectins. The toxicity is reduced through cooking, since this destroys the lectins.

Pediatric Use: Emergency poison treatment procedures should be instituted in small children who consume even one berry.

OVERDOSAGE

Symptoms of poisoning include diarrhea (sometimes bloody), dizziness, hypotension, severe thirst, somnolence, tachycardia, vomiting, and in severe cases, spasm and death through respiratory failure. Up to 10 berries are considered harmless for an adult, but could be dangerous for a small child. Adults who consume more than 10 berries and small children who consume any berries should be treated for poisoning. This includes stomach and intestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulphate) and instillation of activated charcoal. Electrolyte substitution and the use of sodium bicarbonate to treat possible acidosis may be necessary.

DOSAGE

Mode of Administration: Administered as a powder, liquid extract and tincture.

Daily Dosage: Usual dosage is 60 to 100 mg

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml SC, IV., IM, acute: 3 times daily; chronic: once a day (HAB1).

Storage: The drug should be stored in paper or sacks made from cloth.

Polemonium caeruleum

See Jacob's Ladder

Polemonium reptans

See Abscess Root

Poley

Teucrium polium

DESCRIPTION

Medicinal Parts: The medicinal part is the whole herb.

Flower and Fruit: The flowers are axillary forming a capitula. They are fused and sessile, and their structures are in "fives. The calyx is turned slightly upward with 5 acuminate tips and is white-gray pubescent. The corolla is reddish-white or yellowish. The upper lip is deeply divided into two and fused to half of the lower lip so that it appears 5-tipped. There are 4 stamens, which are much longer than the corolla, and a 2-carpeled ovary, divided, but not to the base. The fruit is a nutlet.

Leaves, Stem and Root: Poley is a dwarf shrub that grows up to 45 cm high. The leaves are decussate, obovate to elongate, crenate, involute and pubescent. The stem is densely covered with white, greenish or golden hairs.

Habitat: Mediterranean region

Production: Poley herb is the dried aerial part of *Teucrium polium* collected during the flowering season.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: including picropolin, picropolinol, picropolinon, teucrin A, teucrin PI, teucrin H3, montanines B and C, teupolins I to V, gnaphalidin. the diterpene spectrum varies a great deal according to both the subspecies being investigated and its source

Volatile oil (0.1 to 1%): the following have been demonstrated to be chief components, varying according to chemical race, alpha-pinene and beta-pinene, alpha-cadinol, alpha-humulene, beta-caryophyllene, caryophyllene oxide, cedrol, gamma-cadinene, delta-cadinene, limonene, linalool, menthofurane, myrcene, ocimene, T-cadinol, terpine-4-ol

Iridoids: iridoid glycosides, including 8-O-acetyl harpagide, harpagide, teucardoside

Flavonoids: including apigenin-7-O-glucoside, luteolin-7-O-glucoside, acacetin, apigenin, cirsiol, cirsimaritin, eupatorin, luteolin, salvigenin

EFFECTS

The antidiabetic and anti-ulcer efficacy with which the drug has been credited has not yet been documented in definitive clinical studies. A reduction of the ulcer index was described in connection with animal experiments; furthermore, a definite reduction of the blood sugar levels was exhibited following the I.V. administration of a 4% decoction of the dried herb. The drug is additionally antibacterial, antipyretic and possibly anti-edematous and antiexudative in effect.

INDICATIONS AND USAGE

Unproven Uses: Poley is used for diabetes (Israel), gastric complaints (North Africa), fever (Italy) and as a vulnerary (Spain).

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Cut drug and liquid extract for internal use.

Daily Dosage: Single dose for infusion: 1.5 gm drug per cup

Storage: Should be tightly sealed and protected from light.

Pomegranate

Punica granatum

DESCRIPTION

^ *Medicinal Parts:* The medicinal parts are the root, the bark, the fruits, the peel of the fruit and the flowers.

Flower and Fruit: The flowers are infundibulate or rotate, usually solitary or in pairs of threes at the tips of the branches. The calyx and receptacle are bright coral-red and have a tough margin. There are 5 to 8 bright-red campanulate nodding petals and numerous stamens. The filaments are orange-red and the anthers yellow-gold. The ovary consists of 2 or 3 layers lying on top of one another. The fruit is an apple-sized, round, 1.6 to 12 cm wide false berry whose skin turns from bright red to leather-brown. The seeds are roughly square and purple, later acquiring a soft red outer skin.

^ *Leaves, Stem and Root:* The plant is an erect, roughly branched shrub up to 1.5 m high or a small, tree 3 to 5 m tall with a curved trunk and glabrous 4- to 6-edged, sometimes spiny-tipped branches. The branches are narrowly winged when young. The trunk later becomes fissured and twisted. The leaves are generally opposite or in clusters on the short shoots. They are deciduous, simple, pinnate-veined, short-petioled, glabrous, hard, oval-lanceolate with a tough middle rib.

Habitat: The plant probably originated in Asia. Today it is widespread in the Mediterranean region as far as South Tyrol, the Near East, South Africa, South Asia, China, Australia, U.S., and South America.

Production: Pomegranate bark is the dried bark of the trunk roots and branches of *Punica granatum*. The roots, trunk and older branches are collected at the beginning of autumn. Their bark is peeled off and air-dried.

Other Names: Delima, Grenadier

ACTIONS AND PHARMACOLOGY

COMPOUNDS: POMEGRANATE FRUIT PEEL

Tannins (25 to 28%; gallo tannins): including punicalin (granatine D), punicalagin (granatine C), granatine A, granatine B

COMPOUNDS: POMEGRANATE STEMS AND ROOT

W *Tannins (20 to 25% gallo tannins):* including punicalagin, punicalcorcein C, casuarin

Piperidine alkaloids (0.4% in the rind of the stem, up to 0.8% in the rind of the root): chief alkaloids isopelletierine, N-methylisopelletierine, pseudopelletierine

EFFECTS

The drug, which contains tannins and alkaloids, is anthelmintic and amoeboid.

Pelletierin triggers, like strychnine, a raised stimulant reflex, which can escalate to tetanus and is effective against diverse tapeworms, ring worms and nematodes.

The tannins in the drug makes it useful as an astringent for sore throats, diarrhea and dysentery.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine Pomegranate is used for infestation with tapeworm and other worms, for diarrhea and dysentery, as an abortifacient and astringent; externally used for hemorrhoids and as a gargle in cases of sore throat.

Homeopathic Uses: *Punica granatum* is used for gastrointestinal disturbances.

Chinese Medicine: In China, Pomegranate is used to treat chronic diarrhea and dysentery, blood in the stool, worm infestation and anal prolapses.

Indian Medicine: In India, uses include diarrhea, dysentery, vomiting and eye pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The high levels of tannin content in the drug could lead to gastric irritation.

OVERDOSAGE

Due to the alkaloid content, overdoses with the rind of the stem or the root (above 80 gm) lead to vomiting, including the vomiting of blood, later to dizziness, chills, vision disorders, collapse and possible death through respiratory failure. Total blindness (amaurosis) could occur within a few hours or a few days.

Following gastrointestinal emptying, (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), installation of medicinal charcoal and shock prophylaxis (quiet, warmth), the therapy for poisonings consists of treating spasms with diazepam (i.v.), electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Pomegranate is available as whole, crude and powder forms for internal and external use. It is also available in parenteral form for homeopathic use.

Preparation:

Decoction — 1 part drug and 5 parts water.

Macerations — 60 parts drug and 400 parts water macerated for 12 hours to half the initial volume.

Liquid extract — percolation of 1000 parts coarse powder and 59% ethanol (V/V). The percolate is evaporated to the initial amount of the drug (EB6).

Decoction — 250 parts bark powder and 1500 parts water boiled for 30 minutes (Belg IV).

Daily Dosage:

Tapeworm treatment 1 (decoction) — 4 doses of 60 ml with 2 hour intervals between doses accompanied before treatment and after treatment by a laxative.

Tapeworm treatment 2 (maceration) — administration of 3 doses of 65 ml with a duodenal probe at 30 minute intervals; a laxative is administered after an hour.

As pomegranate bark juice extract — single dose: for tapeworm 20 gm.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1).

Storage: Pomegranate should be sealed in containers and protected from moisture.

Pontian Rhododendron

Rhododendron ponticum

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is its leafy branches.

Flower and Fruit: The inflorescence is an umbelliferous raceme with 8 to 15 single flowers on 3 pubescent pedicels that are up to 3.5 cm long. The flower structures are in fives and fused. The calyx is inconspicuous, up to 3 mm long, and 5-toothed. The corolla is campanulate, 5-lobed, 4 to 5 cm in diameter, violet to pink-violet with green-yellow spots on the upper lobes. There are 10 stamens and a multi-chambered ovary on sessile disc. The fruit is an elongate-cylindrical capsule. The seeds are small and can fly.

Leaves, Stem and Root: *Rhododendron ponticum* is an evergreen shrub typically growing up to 5 m high, occasionally up to a tree height of 8 m. The leaves are 8 to 15 cm long, 3 to 5 cm wide with a 1 to 2 cm long petiole. The lamina is elliptical-elongate, acute at both ends, entire, coriaceous, dark green, smooth and glabrous above, pale green and glabrous beneath. The plant is heavily branched. The branches are glabrous.

Habitat: The plant is indigenous to the Balkan states, the Commonwealth of Independent States, Spain, Portugal and England.

Production: Pontian rhododendron herb is the dried leafy branches of *Rhododendron ponticum*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes of the andromedan type: grayanbtoxin I (andromedotoxin, acetylandromedol, asebotoxin, rhodotoxin, 0.001 to 0.02%), grayanotoxin II (andromedol), grayanotoxin HI (andromedenol)

Flavonoids: myricetin, gossypetin, azaleatin, malvin

Steroids: sterols, including beta-sitosterol, alpha-amyrin, ursolic acid

EFFECTS

The drug has the effect of reducing blood pressure in animal experiments, due to the diterpenes it contains of the andromedan type (grayanotoxins). Historically, effects also have been described as stimulating, narcotic, diaphoretic and diuretic.

INDICATIONS AND USAGE

Therapeutic use is no longer recommended because of the drug's possibly dangerous side-effects due to its toxic content.

Unproven Uses: Folk medicine uses have focused on primary hypertension and arthritis. Various species of *Rhododendron* have been used for rheumatic and gouty conditions and for stones.

PRECAUTIONS AND ADVERSE REACTIONS

All medicinal administration of the drug is discouraged. The observed effect (lowered blood pressure resulting from bradycardia) is the first sign of a toxic reaction.

The plant is toxic because of its andromedan derivative content. The grayanotoxins it contains prevent the closure of the sodium channels and thus inhibit conduction.

OVERDOSAGE

Symptoms of poisoning in case of overdosage could include salivation, cold sweats, paresthesia, vomiting, diarrhea, severe stupor, coordination disorders, spasm, bradycardia, cardiac arrhythmias, hypotension, and eventually death through cardiac failure or apnea. While poisonings among humans have not been documented, poisonings (including fatal ones such as "goat death") occur frequently among animals. The presumed explanation is that the leathery leaves are not tempting to humans to eat, and because of the low levels of andromedan derivatives present in medicinal preparations.

Toxic and/or lethal dosage levels cannot be determined with any precision because the plant's andromedan derivative content can vary so wildly. The LD50 for mice amounts to 5.1 mg grayanotoxin I/kg body weight, p.o.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), installation of medicinal charcoal and shock prophylaxis (quiet, warmth), the therapy for poisonings consists of treating spasms with diazepam (IV), bradycardia with atropine and electrolyte substitution, and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. It is crucial that no opiates are administered. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Whole drug. Folk medicine modes also include administration as a tea or cigarette.

How Supplied: Forms of commercial pharmaceutical preparations include coated tablets and compound preparations.

Daily Dosage: There are no more exact details available.

Poplar

Populus species

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark, leaves, and leaf buds.

Flower and Fruit: The plant is dioecious. The carmine red flowers are in large, cylindrical hanging, thick catkins with carmine anthers. The male flowers have carmine red anthers: the female flowers have carmine stigmas. The flowers appear before the leaves. The seeds, which ripen in May/June, are very small and have a white lanate tuft of hair.

Leaves, Stem and Root: The tree may grow up to 30 m. The bark is initially yellow brown and later black-gray and fissured. The leaf buds are viscid. The leaves are almost circular with a dark green upper surface and a light grey-green under surface. They are dentate or lobed with obtuse teeth, initially silky-haired, later glabrous. The petioles are long, thin and laterally compressed.

Habitat: There are both European and North American species within the genus that have spread to other temperate zones.

Other Names: White Poplar, Canadian Poplar, Black Poplar, Trembling Poplar, European Aspen, Quaking Aspen

Production: Poplar bark consists of the fresh or dried bark of salicin-rich Poplar species as well as their preparations. Poplar leaves consist of the leaves of salicin-rich Poplar species as well as their preparations. Poplar buds consist of the dried, unopened leaf buds of *Populus* species, as well as their preparations.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: POPLAR BARK AND LEAVES

Glycosides and esters yielding salicylic acid:

In *Populus alba* (leaf 6%, bark 2%) chief components: salicortin, tremulacin, salicin

In *Populus nigra* (leaf 2%, bark 1.5%) chief components: salicortin, salicin

In *Populus tremula* (leaf 3%, bark 2%) chief components: salicin, tremulacin, salicortin including as well as salireposide, populin, tremuloidin

EFFECTS

Poplar bark and leaves have antiphlogistic, analgesic, antibacterial and spasmolytic effects.

The salicylate acid derivatives and flavonoids are responsible for the antiphlogistic, analgesic, spasmolytic and antibacterial characteristics of the drug. The beneficial effect in micturition complaints due to prostate hypertrophy may be due to the content of zinc lignans in the drug.

COMPOUNDS: POPLAR LEAF BUDS

Flavonoids: (particularly in the glutinous coating of the buds, also yielding propolis) including chrysin, tectochrysin, galengine, izalpinine, galangin-3-methyl ether, kaempferol-3-methyl ether, pinocembrin, pinocembrin-7-methyl ether, apigenin

Glycosides and esters yielding salicylic acid: including salicin, populin

Volatile oil: chief components alpha- and beta-caryophyllene

EFFECTS: POPLAR LEAF BUDS

Poplar buds have antiphlogistic, antibacterial and wound healing effects.

INDICATIONS**POPLAR BARK AND LEAVES**

Unproven Uses: Poplar bark and leaves are used for pain and rheumatism therapy; and in micturition complaints due to prostate hypertrophy.

POPLAR LEAF BUDS

Approved by Commission E:

- Hemorrhoids
- Wounds and bums

Unproven Uses: Poplar buds are used for superficial skin injuries, external hemorrhoids, frostbite and sunburn.

CONTRAINDICATIONS**POPLAR BARK AND LEAVES**

Contraindicated in cases of hypersensitivity to salicylates.

POPLAR LEAF BUDS

Contraindicated in cases of hypersensitivity to salicylates, propolis and balsam of Peru, which may be a component in commercially available ointments.

PRECAUTIONS**POPLAR BARK AND LEAVES**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

POPLAR LEAF BUDS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. External administration of the drug occasionally leads to allergic skin reactions.

DOSAGE**POPLAR BARK AND LEAVES**

Mode of Administration: Poplar leaves are available in crude form as well as galenic preparations for internal use. Poplar bark is only available in compounded preparations.

Daily Dosage: 10 gm of drug

POPLAR LEAF BUDS

Mode of Administration: Poplar buds are available in semi-solid preparations for application to the skin.

How Supplied: Semi-solid preparations equivalent to 20% to 30% of drug.

Daily Dosage: Externally, 5 gm drug.

Poppyseed

Papaver somniferum

DESCRIPTION

Medicinal Parts: The medicinal part is the latex extracted from the seed capsule.

Flower and Fruit: A solitary flower grows on a long, glabrous or pubescent pedicle. The flowers are erect with a diameter of 10 cm. There are 2 green, glabrous, falling sepals and 4 violet-white or red petals with a darker mark at the base. The fruit is round or ellipsoid and often has a very large capsule! The numerous seeds are reniform, pitted, black, and blue-frosted or whitish.

Leaves, Stem and Root: The opium Poppy is an annual that grows 30 to 150 cm high. It is a 1-stemmed blue-gray frosted plant. The stem is erect, straight or branched and produces, as does the whole plant, white milky latex. The leaves are entire, glabrous, serrated or crenate at the margin and clasping.

Characteristics: The cultivation of the plant and the extraction and sale of opium is banned in many countries.

Habitat: The plant originated in western Asia. It is cultivated worldwide commercially.

Production: Opium is the thickened latex collected from the outside of immature Poppy capsules that have had incisions made in the fruit capsules. The unripe seed capsules suitable for the production of opium are trimmed. Subsequent to drying, the processed latex is scraped off and formed into pieces of varying size. The obtained material is referred to as raw opium (Rohopium) and is also the basic substance used for the production of heroin.

Other Names: Garden-Poppy, Mawseed, Opium Poppy

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids (20-30%): chief alkaloids morphine (3-23%), narcotine (2-10%), codeine (0.2-3.5%), papaverine (0.5-3%), thebaine (0.2-1%).] The alkaloids are present as salts of meconic acid, lactic acid or fumaric acid.

Benzyl isoquinoline type: papaverine (0.5 to 3%)

Phthalide isochinoline type: narcotine (noscapine, 2 to 10[^])

Rubber (5-10%)

Resins

Mucilages

EFFECTS

The main alkaloid is morphine, which is a strong analgesic that, even in small doses, causes euphoria, sedation then narcotic sleep. It depresses breathing and slows down evacuation of the stomach, causing constipation and urine retention. Codeine has an antitussive effect and papaverine is spasmolytic and vasodilatory.

INDICATIONS AND USAGE

Unproven Uses: Opium is used most frequently as a sedative and/or analgesic. Uses in folk medicine include as a sedative in cases of typhus, intestinal tuberculosis and intestinal ulcers; for spasms of smooth muscle, bile ducts and urinary tract; for peritonitis; for gallstones, kidney stones and bladder colic; as well as for coughs and certain types of depression.

Chinese Medicine: Uses in Chinese medicine include chronic coughs, diarrhea, dysentery, anal prolapse and abdominal symptoms.

Indian Medicine: Irritable cough, ear and eye inflammation, proctologic symptoms, diarrhea and dysentery are considered indications for use in Indian medicine.

CONTRAINDICATIONS

Contraindications include pregnancy (alkaloids pass through the placenta barrier), nursing (alkaloids entering the mother's

milk), illnesses connected with reduced respiratory function, pancreatitis, colon ulcers, elevated internal cranial pressure, acute hepatitis propheria and biliary colic. Caution is to be observed when administering in the presence of Addison's disease and hypothyroidism because of opium's centrally depressive effect.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. However, the following can occur as side effects: clonic twitching, constipation, dizziness, general weakness, headache, hyperthermia, itchy skin, rashes and trembling of the hands. Sensitization has been reported, with papaverin the presumed allergen.

OVERDOSAGE

Overdosage leads initially to reduction of mental capacity, reactive euphoria, analgesia, miosis, bradycardia, slowed respiration. That can progress to respiratory failure, cyanosis. tonic-clonic spasms, pylorospasm and sphincterism, intestinal atonia, nausea, vomiting, pulmonary and brain edemas. Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) and instillation of activated charcoal, the therapy for poisoning consists of electrolyte substitution, treating possible cases of acidosis with sodium bicarbonate infusions and administration of plasma volume expanders in the event of shock. Intubation and oxygen respiration may also be necessary. Naloxone (i.v.) is suitable as an antidote.

DOSAGE

Mode of Administration: Opium is obsolete as a drug. Morphine is administered as a pure substance and in combination with other active substances, although it has been extensively replaced by synthetic analgesia. Codeine is used by itself and in combination with other agents. Numerous cases of death due to opium use are known.

Potentilla

Potentilla anserina

DESCRIPTION

Medicinal Parts: The medicinal parts are leaves and flowers, whole or macerated, collected during or shortly before the flowering season and dried.

Flower and Fruit: The flowers are solitary on long pedicles of lateral shoots growing from the stem nodes. They are 1.5 to 3 cm wide. There are 5 epicalyx bracts, 5 sepals and 5 petals. The last are twice as long as the sepals and are golden yellow, ovate and without a distinct margin. The 20 stamens have ovate anthers. The styles occur laterally, are thread-like

and only thickened at the stigmas. The ripe fruit is glabrous, ovate to almost globular and grooved on the back.

Leaves, Stem and Root: The plant is a two-axis herbaceous perennial with a short, thick, branched rhizome and rosettes of basal leaves. The stems are 80 cm long, creeping, rooting at the nodes, softly pubescent eventually becoming glabrous. The leaves are unevenly paired, pinnate and glossy with silky white hairs beneath, tomentose and fresh green above.

Characteristics: The plant has an almond-like fragrance and dry taste.

Habitat: The plant is found in temperate and colder regions of the entire Northern Hemisphere.

Production: Potentilla herb consists of the fresh or dried leaf and flowers of *Potentilla anserina* harvested shortly before or during flowering, as well as its preparations.

Other Names: Cinquefoil, Crampweed, Goosegrass, Goose Tansy, Moor Grass, Silver Cinquefoil, Goosewort, Prince's Feathers, Trailing Tansy, Wild Agrimony

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (5 to 10%): chiefly ellagitannins

Flavonoids: including quercitrin

Hydroxycoumarins: umbelliferone, scopoletin

EFFECTS

The drug is astringent because of the tannin concentration.

On isolated rat uterus a paralyzing effect was proven which is due to the presence of ammonium salts. The empirical evidence of a spasmolytic effect in dysmenorrhea could not be definitively proven.

INDICATIONS

Approved by Commission E:

- Diarrhea
- Inflammation of the mouth and pharynx
- Premenstrual syndrome (PMS)

Internal application for topical treatment of inflammation of the oral and pharyngeal mucosa, adjuvant treatment of non-specific, acute diarrhea, and dysmenorrhea symptoms.

Unproven Uses: In folk medicine, *Potentilla* is used externally as a wash for poorly healing wounds.

PRECAUTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There have been complaints of stomach irritation associated with *Potentilla*.

DOSAGE

Mode of Administration: *Potentilla* is available in commercial forms for oral intake. It is also available in crude and powder forms.

Preparation: To prepare a tea, pour boiling water over 2 gm finely cut drug, strain after 10 minutes (1 teaspoon corresponds to approximately 0.7 gm drug).

Daily Dosage: 4 to 6 gm of drug; Tea: 1 cup freshly prepared several times a day between meals.

Storage: Protect from light and moisture.

Potentilla anserina

See Potentilla

Potentilla erecta

See Cinquefoil

Potentilla reptans

Sge European Five-Finger Grass

Premorse

Scabiosa succisa

DESCRIPTION

Medicinal Parts: The medicinal part is the dried herb.

Flower and Fruit: The flowers are purple-blue, globular and long pedicled composite blooms, with a 2 to 3 rowed involucre. The florets are all the same size. The epicalyx has thorn-tipped teeth and the calyx has 5 bristles. The corolla is fused and has 4 tips. There are 4 stamens and 1 inferior ovary. The fruit is a nutlet.

Leaves, Stem and Root: The plant grows from 15 to 80 cm high. It has a short, finger-thick rhizome, which looks bitten off. In the first year of growth, the root resembles a carrot. Later it becomes woody and dies off except for the upper part, which accounts for its appearance. The remaining upper part then develops lateral roots. The stem is erect, sparsely branched, pubescent and has few leaves. The basal leaves are petiolate, oblong and obtuse. The cauline leaves are narrow and acute.

Habitat: Scabiosae succisae is indigenous to all of Europe.

Production: Premorse is the aerial part of *Scabiosa succisa*.

Other Names: Devil's Bit, Ofbit, Premorse scaboius

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpene: including among others, dipsacane, cephalaroside (structures unknown)

Saponins

Tannins

Flavonoids: including among others, saponarine (C-glycosyl-flavone)

Triterpenes: including among others, ursolic acid

EFFECTS

Premorse is a febrifuge and a diaphoretic.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for febrile colds and coughs.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is ground as a drug for infusion.

Psyllium

Plantago ovata

TRADE NAMES

Psyllium Husk, Psyllium Husk Bulk-Forming Laxative, Psyllium Husks, Konsyl Easy Mix, Konsyl for Kids, Konsyl Powder Sugar Free Unflavored, Metamucil

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe and dried seeds, the epidermis, the adjacent, broken-down layers of the Indian variety and the fresh plant.

Flower and Fruit: The flowers are on cylindrical, glabrous or finely pubescent scapes, which are only slightly longer than the leaves. They form 0.5 to 3.5 cm long spikes. The bracts are about 3 mm, suborbicular to ovate and sometimes shortly pubescent. The sepals are about 2.5 mm, similarly shaped, almost free, keeled at the apex with wide scarious margins. The anterior ones are usually pubescent. The corolla-tube is 1.5 to 2 mm long and glabrous. The lobes are 2.5 mm, ovate-orbicular, subobtusate to very shortly acuminate. The stamens are exerted up to 1 mm and the capsule is about 3 mm. The seeds are 2.2 to 2.5 mm and cymbiform.

Leaves, Stem and Root: The plant is an annual almost stemless, softly pubescent plant. The plant may have one or several rosettes. The leaves are 2.5 to 12 cm by 0.1 to 0.8 cm, linear to linear-lanceolate. The leaves are entire-margined or slightly denticulate and sparsely to densely villous-lanate.

Habitat: The plant grows in India, Afghanistan, Iran, Israel, northern Africa, Spain and the Canary Islands. The plant is cultivated in India and neighboring countries, Arizona and southern Brazil.

Production: Psyllium consists of the ripe seeds or epidermis of *Plantago ovata* (synonym: *Plantago isphagula*).

Other Names: Blood Plantago, Indian Plantago, Ispaghula, Sand Plantain, Spogel, Blond Psyllium, Black Psyllium

ACTIONS AND PHARMACOLOGY**COMPOUNDS: PSYLLIUM SEED**

Mucilages (20-30%): chiefly arabinoxylans and glacturonosidorhamnoses

Fatty oil

Iridoids: aucubin

Proteic Substances

COMPOUNDS: PSYLLIUM SEED EPIDERMIS

Mucilages (parent substances arabinoxylans)

EFFECTS

The drug is rich in mucins with swelling properties that exert laxative and anti-diarrheal effects. Psyllium also lowers serum cholesterol levels, reduces postprandial blood glucose, decreases gallstone formation, and decreases the feeling of fullness.

Antidiarrheal: When used for diarrhea, psyllium absorbs water to increase the bowel content viscosity and delay gastric emptying (Washington, 1998).

Decreases Hypercholesterolemia: Psyllium increases cholesterol and bile acid fecal excretion but does not affect cholesterol synthesis (Miettinen, 1989). Psyllium may lower serum cholesterol levels by replacing dietary fats, thereby reducing the amount available for absorption, and not directly affecting cholesterol (Swain, 1990). A decrease in low-density lipoprotein (LDL) cholesterol levels and total cholesterol with the herb have been seen in many studies (Davidson, 1998; MacMahon, 1998; Rodriguez-Moran, 1998; Romero, 1998). Although one study indicated an increase in high-density lipoprotein (HDL) cholesterol and a decrease in serum triglycerides (TG) with Psyllium, other studies have reported no change in these parameters (Anderson, 1988; Bell, 1989; Davidson, 1998; Rodriguez-Moran, 1998).

Glucose Control: Postprandial glucose and fasting plasma glucose significantly improved in type 2 diabetic patients taking psyllium (Anderson, 1999; Rodriguez-Moran, 1998).

Inhibition of Gallstones: Psyllium hydrocolloid exerts bile acid sequestrant properties determined by a rise in the cholic/chenodeoxycholic acid ratio. This activity protects against cholesterol gallstone formation (Berman, 1975). Psyllium also protects against cholesterol-gallstone formation by reducing biliary cholesterol saturation index. The protective effect is associated with a selective decrease in biliary cholesterol and chenodeoxycholic acid (Schwesinger, 1999).

Irritable Bowel Syndrome/Ulcerative Colitis: Stool frequency and consistency, abdominal pain and abdominal distention have shown improvement in irritable bowel syndrome patients taking psyllium (Hotz, 1994; Prior, 1987). A decrease in transit time of bowel content may also be seen with the herb (Prior, 1987).

Laxative Effects: Psyllium decreases the passage time of the bowel content by increasing the volume of the stool, thus exerting a laxative effect. The herb acts as stool softener by increasing stool water content. Psyllium was superior to docusate sodium in subjects with chronic idiopathic constipation (McRorie, 1998).

Weight Reduction: Psyllium may be a useful supplement in weight control diets as it decreases fat intake, and increases the subjective feeling of fullness (Turnbull, 1995). The herb exerts these actions by increasing the time for intestinal absorption by inhibition of pancreatic enzymes such as amylase (Hansen, 1982; Hansen, 1987; Rigaud, 1998).

CLINICAL TRIALS*Hypercholesterolemia/Hyperglycemia*

A randomized, double-blind, placebo-controlled study was conducted to determine the lipid and glucose lowering effects of Psyllium in type 2 diabetic patients. One hundred

twenty-five subjects were included in the study and received either placebo or Psyllium (5 gm three times daily) over a 6-week period. Prior to the treatment period, all patients participated in a 6-week period of diet counseling. Fasting plasma glucose, total cholesterol, LDL cholesterol and triglyceride levels were significantly reduced in the Psyllium treatment group compared to placebo. HDL significantly increased in the Psyllium treatment group compared to the placebo group, suggesting Psyllium as a useful adjunct to diet in Type 2 diabetes (Rodriguez-Moran, 1998).

Hypercholesterolemia/Hyperglycemia

The safety and effectiveness of Psyllium husk fiber as an adjunct to diet was evaluated in patients with type 2 diabetes and mild- to-moderate hypercholesterolemia. After a 2-week dietary stabilization phase, 34 patients were randomly assigned to receive 5.1 gm psyllium or placebo twice daily for an 8 week period. The Psyllium group had significant improvements in glucose and lipid values compared with the placebo group. Serum total and LDL-cholesterol concentrations were 8.9% ($P < 0.05$) and 13.0% ($P = 0.07$) lower, respectively, in the Psyllium treatment group compared to the placebo group. All day and postprandial glucose concentrations were 11.0% ($P < 0.05$) and 19.2% ($P < 0.01$) lower in the Psyllium treatment group than in the placebo group (Anderson, 1999).

Ulcerative Colitis

The objective of an open label, parallel-group, randomized clinical trial was to assess the efficacy and safety of *Plantago ovata* seeds compared to mesalamine in maintaining remission in ulcerative colitis patients. One hundred and five ulcerative colitis patients who were in remission received oral treatment with *Plantago ovata* seeds (10 gm twice daily), mesalamine (500 mg three times daily), or *Plantago ovata* seeds plus mesalamine at the same doses. After 12 months, treatment failure rate was 40% in the *Plantago ovata* seed group, 35% in the mesalamine group, and 30% in the *Plantago ovata* plus mesalamine group. The probability of continued remission was similar between all treatment groups (Mantel-Cox test, $p = 0.67$; intent-to-treat analysis), thus implicating the herb might be as effective as mesalamine to maintain remission in ulcerative colitis (Fernandez-Banares F, 1999).

INDICATIONS AND USAGE

Approved by Commission E:

- Constipation
- Diarrhea
- Raised levels of cholesterol
- Hemorrhoids

Psyllium is used for disorders where easy bowel movements with a loose stool is desirable (e.g., in patients with anal fissures and hemorrhoids; following anal/rectal surgery; and during pregnancy).

Unproven Uses: In Folk medicine, the herb is used internally for inflammation of the mucous membrane of the urogenital tract and gastrointestinal tract, and dysentery. Externally, Psyllium is used for gout, rheumatism, furuncles and as an analgesic.

Indian Medicine: Psyllium is used for gastritis, chronic diarrhea, constipation, dysentery, dry cough, gout, gonorrhea, nephropathy, dysuria, duodenal ulcers and hemorrhoids.

CONTRAINDICATIONS

The drug is contraindicated in patients who have pathological narrowing in the gastrointestinal tract, obstruction or threatening obstruction of the bowel (ileus), or difficulties in regulating diabetes mellitus.

PRECAUTIONS AND ADVERSE REACTIONS

General: Incorrect administration procedures (with too little fluid) can cause the product to swell and lead to obstruction of the esophagus or of the intestine, particularly with older people. Patients with exocrine pancreatic insufficiency should avoid use of Psyllium due to inhibitory actions on pancreatic lipase (Hansen, 1987).

Allergic Reactions/Anaphylaxis: Allergic reactions ranging from sneezing to chest congestion and wheezing were reported in three nurses after Psyllium use (Ford, 1992). One patient reported anaphylaxis after Psyllium ingestion, and had experienced recurrent rhinitis and asthma related to Psyllium exposure for the past 15 years (Vaswani, 1996). IgE mediated anaphylaxis was reported after the ingestion of Psyllium seed laxative (Seggav, 1984). Occupational allergic rhinitis reaction was confirmed by elevation of antipsyllium IgE after exposure to a Psyllium-based powdered laxative (Schwartz, 1989).

Flatulence Symptoms: Psyllium did not cause greater gaseous symptoms compared to placebo reported in one study (Zumarraga, 1997). One study decreased flatulence symptoms by adding psyllium to half the usual dose of bile acid sequestrant resins to maintain efficacy and tolerability of resins (Spence, 1995).

Drug Interactions: The absorption of other drugs taken simultaneously may be delayed. There is a possibility that insulin dosage adjustment (downward) will be necessary when diabetics use psyllium products.

DOSAGE

Mode of Administration: The whole or coarsely-chopped drug as well as other galenic preparations are used internally-

Sufficient fluid must be taken with the drug (150 ml water per 5 gm drug). One study did show a greater effect of Psyllium on cholesterol after mixing with food (Wolever, 1994). The dose should be taken one-half hour to one hour after taking other medication.

How Supplied:

Capsule — 525 mg, 567 mg, 610 mg, 625 mg

Powder — 2.0 gm Psyllium per dose, 3.4 gm Psyllium per dose, 6.0 gm Psyllium per dose (available in a variety of package sizes)

Daily Dosage: The daily dosage ranges from 2 to 40 gm of the drug. The powder products should be administered as 1 teaspoonful (3.4 gm to 6.0 gm drug) in 8 oz. of fruit juice or cool water. Either stir briskly or shake for 3-5 seconds, depending on the specific product. Psyllium may be taken up to 3 times daily (Prod. Info. Konsyl®. 1999; Prod. Info. Metamucil®, 1999).

Children: For children 6 to 12 years of age administer 1 teaspoonful (2.0 gm of the drug) in an empty glass and add 8 oz. of cool water. Stir briskly for 3-5 seconds. The dose may be taken up to 3 times daily (Prod Info Konsyl for Kids®, 1999)

Psyllium Seed

Plantago afra

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe seeds.

Flower and Fruit: The inflorescence is a 12-mm long spike with glandular hairs and ovate-lanceolate bracts with a midrib and translucent lateral lamina. The corolla is disc-shaped with 4 translucent petals. The edge of the calyx has 4 acute lobes. The sepals are 3 to 4.5 cm and lanceolate. The ovary is superior, and the fruit is a 2-sectioned, membranous pyxidium. The seeds are dark brown, glossy and narrowly oblong in outline.

Leaves, Stem and Root: The plant is an annual that is erect with stems up to 60 cm high. The stems have ascending, pubescent branches with patent or ascending hairs and are more or less minutely glandular above. The leaves are 3 to 8 by 0.1 to 0.3 cm, linear or linear-lanceolate and are not fleshy. The bracts are 3.5 to 8 mm and all have a similar shape. They are ovate-lanceolate to lanceolate, sharp-edged or acuminate with a broad dry membranous margin without lateral ribs.

Habitat: The plant is indigenous to the Mediterranean region and western Asia. Psyllium Seeds are cultivated in Spain, central Europe, Israel, Russia, India, Pakistan, Japan, Cuba and southern Brazil.

Production: Psyllium Seed (blonde) consists of the dried, ripe seed of *Plantago psyllium* (syn. *Plantago afra*) and of *Plantago indica* (syn. *Plantago arenaria*), with a swell index of at least 10, and its formulations.

Not to be Confused With: The seeds of other *Plantago* seeds.

Other Names: Plantain, Fleeseed, Flea Wort, Psyllion, Psyllios

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages (only in the epidermis of the seed coat, 10-12%): chiefly arabinoxylans

Iridoids: aucubin (0.14%)

Pyridine alkaloids: boschniakines, including plantagonine, indicaine, indicanine

Proteic substances

Fatty oil

EFFECTS

The mucins are laxative and antidiarrheal; they regulate intestinal peristalsis through the swelling effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Diarrhea
- Constipation

Unproven Uses: Psyllium Seed is used internally for constipation, diarrhea, cystitis and all conditions in which a soft stool is desirable, such as anal fissures, hemorrhoids, anal-rectal surgery and pregnancy. It is also used externally for furunculosis.

CONTRAINDICATIONS

Psyllium Seed is contraindicated in pathologic constriction of the gastrointestinal tract, inflammatory illnesses of the gastrointestinal tract, the threat or presence of ileus and in severely variable diabetes mellitus.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Allergic reactions could, however, arise in isolated cases (rhinitis, conjunctivitis, asthma and urticaria). Incorrect administration procedures (with too little fluid) can lead to obstruction (blockage) of the esophagus or the intestine, particularly with older people.

Drug Interactions: Absorption of other drugs taken simultaneously could be delayed.

DOSAGE

Mode of Administration: Internally as whole, cut or powdered drug, and externally as a poultice.

Preparation: The ratio for the liquid extract is 1:1 (25% ethanol).

Daily Dosage: The recommended daily dose is 12 to 40 g drug. The dose for the liquid extract is 2 to 5 ml.

Storage: The cut drug should be protected from light and moisture and used within 24 hours.

Puff Ball

Lycoperdon species

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial parts and the mature spores of the fungus.

Flower and Fruit: The giant form of this fungus attains a diameter of 20 to 50 cm and a weight of 9 kg. The outer covering is at first whitish, smooth and downy. It later turns gray-yellow or ochre, develops grooves and patches, and starts to break off from above. The now-visible inner section bursts at the vertex and disintegrates. The content is composed of a whitish mass, which turns yellow and mushy and finally breaks down into greenish-brown spore dust. A cup-shaped receptacle with torn edges remains.

Habitat: *Lycoperdon* species are indigenous to Europe.

Production: Puff Ball is the aerial part and the mature spores of *Lycoperdon* species.

Other Names: Bovista, Hart's Truffle, Deer Balls

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Calvacin (mucoprotein)

Steroids: mycosterols

Urea

EFFECTS

The main active agents are various amino acids, glucosamine, sterol, enzymes and approximately 3% urea.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for dysmenorrhea, nose bleeds and skin disorders.

Homeopathic Uses: *Lycoperdon* is used for anemia, skin complaints and chronic catarrh.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The young mushroom is edible.

DOSAGE

Mode of Administration: Puff Ball is available ground or in alcoholic extracts.

Pumpkin

Cucurbita pepo

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh and dried seeds.

Flower and Fruit: The flower is yellow, monoecious, very large and solitary in the leaf axils. The male flower has a longer pedicle. The calyx is fused to the corolla except for the 5 awl-shaped tips. The corolla is 5-tipped and funnel-shaped. The interior is pubescent. There are 3 stamens fused to the anther. The ovary is inferior and 3-locular. The fruit is very large with many seeds. The flesh is fibrous, yellow-orange to white, and has a viscous placenta. The seeds are 7 to 15 mm long, narrow, broad or narrow-ovate with a shallow groove and flat ridge around the margin.

Leaves, Stem and Root: Annual plant 3 to 8 m long. The stem is sharply-angular with longitudinal grooves and hairy spines. The leaves are alternate, very large and bristly, petiolate with 5 to 7 lobes from a cordate base.

Characteristics: The seeds taste somewhat like almonds.

Habitat: Pumpkin is indigenous to America and widely cultivated, especially in temperate climates.

Production: Pumpkin seed consists of the ripe, dried seed of *Cucurbita pepo* and cultivated varieties of *Cucurbita pepo*.

Other Names: Field Pumpkin

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroids: Delta5-, Delta7- and Delta8-phytosterols (24- alkyl sterols), including clerosterol, isofucosterol, sitosterol, stigmasterol, cholesterol, isoavenasterol, spinasterol

Fatty oil: chief fatty acids are oleic acid and linoleic acid

Proteic substances (25 to 42%)

Unusual amino acids: including cucurbitin (vermifuge)

I *Gamma-tocopherol*

EFFECTS

As well as amaroids (cucurbitacin), the drug contains delta-7-sterols, which are similar in conformation to the dihydrosterone. Cucurbitacin has anthelmintic properties.

There are no pharmacological studies that substantiate the empirically documented clinical efficacy; the empirical evidence indicates efficacy for prostate hyperplasia. Pumpkin is also antiphlogistic and antioxidative.

INDICATIONS AND USAGE

Approved by Commission E:

- Irritable bladder
- Prostate complaints

Unproven Uses: Pumpkin is used for irritable bladder, micturition problems accompanying prostate adenoma stages I to II. This medication relieves only the difficulties associated with an enlarged prostate without reducing the enlargement. Medical supervision is essential.

In folk medicine, it is also used for kidney inflammation, intestinal parasites, particularly tape worm, and vulvury.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Whole and coarsely ground seed and other galenic preparations are for internal use.

Daily Dosage: The average daily dose is 10 gm of ground seeds; 1 to 2 heaping dessert spoons with liquid in the mornings and evenings.

Storage: It should be protected from light and moisture.

Punica granatum

See Pomegranate

Purple Gromwell (Ying Zicao)

Lithospermum erythrorhizon

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root, which is dried.

Flower and Fruit: The radial flowers are in axillary or apical racemes. The calyx has up to 5 tips, and the sepals are fused. The petals are white and also fused. The corolla tube is approximately 4 mm long. The diameter of the corolla is approximately 4 mm. There are 5 stamens and one superior, 2-carpeled, 4-chambered ovary. The fruit is a glossy nutlet, approximately 3 mm long, ovoid and gray-white.

Leaves, Stem and Root: This herbaceous perennial grows up to 80 cm high. The leaves are alternate, sessile, simple, lanceolate to elongate-lanceolate with acute tips and parallel veins. It has a few upright, roughly pubescent stems and a thick root.

Characteristics: The root becomes purple when dried.

Habitat: This herb is indigenous to Korea, China and Japan.

Production: Purple Gromwell root or Ying Zicao (Chinese) is the dried root of *Lithospermum erythrorhizon*. The 3-year-old roots are collected in spring or autumn, cleaned, cut in slices and then dried.

Other Names: Ying~ficao

ACTION AND PHARMACOLOGY

COMPOUNDS

Naphthalene derivatives (0.5 to 3%): isohexenyl-naphthazarines, particularly esters of the (R)-(+)-shikonins with short-chained fatty acids, including acetic acid, isobutyric acid, isovaleric acid

Water-soluble polysaccharides: lithospermans A to C

Pyrrolizidine alkaloids: chief alkaloid intermedine, as well as myoscorpine, hydroxymyoscorpine

Hydroquinone derivatives (0.3%): furylhydroquinones and furylquinones, including shikonofurane A to E

Caffeic acid derivatives: rosmarinic acid, lithospermic acid, caffeic acid esters of higher alcohols, for example docosanylcaffeate

EFFECTS

The naphthoquinone derivatives contained in the drug are antimicrobial, antiphlogistic, analgetic, antipyretic tumor-inhibiting and immunomodulating in their activity. In addition, a hypoglycemic effect from the glycane fraction has been described.

INDICATIONS AND USAGE

Unproven Uses: Uses in folk medicine include fever, constipation, smallpox, strangury, bacterial skin conditions and insect bites (Korea).

Chinese Medicine: Uses include constipation, swellings, tumors and eczema of the skin. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is no longer considered safe for internal use. Hepatotoxicity and carcinogenicity are to be assumed for the drug, due to the pyrrolizidine alkaloid content with 1,2-unsaturated necic parent substances.

DOSAGE

Mode of Administration: Whole drug.

Preparation: There is no exact information in the literature.

Daily Dosage: Drug/tea: 3 to 10 g. The traditional daily dose for smallpox is 5 to 8 g drug to taken internally. (The drug is no longer considered safe for internal use.)

Purple Loosestrife

Lythrum salicaria

DESCRIPTION

Medicinal Parts: The medicinal parts are the flowering plant without the roots and flowering branch tips.

Flower and Fruit: The purple flowers are in axillary whorls and form terminal spikes. There are 6 small sepals, 6 long thin tips, 6 free petals, 12 stamens and 1 half-superior ovary. There are flowers with long, short or medium-long styles and similar stamens.

Leaves, Stem and Root: The plant is an annual and grows from 60 to 120 cm high. It has a creeping rhizome with 4 to 6 unbranched, erect, 6-sided, reddish-brown, pubescent stems. The leaves are simple lanceolate, 7.5 to 15 cm long, sometimes opposite and sometimes clasping whorls.

Habitat: The plant is indigenous to Europe including Russia, central Asia, Australia and North America.

Production: Purple Loosestrife is the plant in flower, excluding the root, of *Lythrum salicaria*. Before the seeds form, the plants are cut and gathered during the blossoming period, which occurs from June to August. The material is bound into small bundles. It is hung in an open-air, shaded area to dry.

Other Names: Loosestrife, Lythrum, Purple Willow-Herb, Long Purples, Milk Willow-Herb, Rainbow Weed, Soldiers,

Spiked Loosestrife, Spiked. Willow Sage, Salicaire, Flowering Sally, Blooming Sally

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (ellagitannins = lythartannin, condensed tannins)

Flavonoids: including among others vitexin, orientin

Phthalides: diisobutyl-, butyl-, isobutyl-, dibutylphthalides

Steroids: beta-sitosterol « -

EFFECTS **

The active agents are tannin, pectin, resins, cholin and salicarin.

The drug has an anti-inflammatory, astringent, and antibiotic effect. The astringent properties of the Purple Loosestrife is attributed not just to the tannin content, but also to the glycoside salcarin, which has a special antimicrobial effect on various bacteria in the intestinal tract.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for diarrhea, chronic intestinal catarrh and menstrual complaints; externally, in the treatment of varicose veins, bleeding of the gums, hemorrhoids and eczema.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally as well as externally.

Preparation: For internal use, an infusion is made from 3 gm of the drug added to 100 ml of water. To prepare a tincture, add 20 gm of the drug to 100 ml of 20% alcohol (leave to set for 5 days).

Daily Dosage: Two to 3 cups of an infusion are to be taken per day. Two to 3 teaspoons of the tincture should be taken per day.

Storage: Keep wrapped in paper or in cloth sacks.

LITERATURE

Kem W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Pyrethrum

Chrysanthemum cinerariifolium

DESCRIPTION

Medicinal Parts: The part of the plant used for medicinal purposes (primary as an insecticide) is the flower.

Flower and Fruit: Solitary flower heads are at the end of long slender peduncles, consisting of white lingual florets and yellow tubular florets. The fruit is an achene.

Leaves, Stem and Root: Pyrethrum is a perennial, 20 to 60 cm high plant with an erect stem covered in alternating, pinnate, roughly serrated leaves. The underside of the leaves is downy.

Characteristics: The entire plant gives off a heavy perfume.

Habitat: Pyrethrum is indigenous to Kenya and the Mediterranean region and is widely cultivated in other parts of the world.

Production: Pyrethrum flowers are the just-opening compound flower heads of 2-to-8-year-old *Chrysanthemum cinerariifolium* and/or *Chrysanthemum coccineum*. The heads are left to wilt and then dried in special drying plants.

Other Names: Dalmatian Pellitory, Dalmation Insect Flowers

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrethrine (ester of monoterpene acid with alkylcyclopentolone, 1%): chief components pyrethrines I and II, cinerines I and II, jasmoline I and II

Flavonoids: including apigenin-, luteolin- and quercetin-7-O-glucosides and —glucuronides

Sesquiterpenes: sesquiterpene lactones, including pyrethrosine, cyclopyrethrosine

Lignans: sesamine

Polynes: thiophenes, including 5-(4-hydroxy-1-butenyl)-2,2'-bithienyl

EFFECTS

Pyrethrum exhibits a neurotoxic effect on the sodium canal of insects with no development of habitual immunity. Pyrethrine and cinerine are contact insecticides that paralyze the nerve center of lower animals.

INDICATIONS AND USAGE

Unproven Uses: Pyrethrum is used as an insecticide for scabies, head lice, crab lice and their nits.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic

dosages. The pyrethrines possess only limited toxicity in humans, with dosages up to 2 g of the drug are considered non-toxic.

OVERDOSAGE

Dosages exceeding 2 g of the drug have been observed to produce poisoning symptoms including headache, ringing in the ears, nausea, paresthesias, respiratory disturbances and other neurotoxic complaints.

Following gastric lavage with burgundy-colored potassium permanganate solution and installation of activated charcoal, the therapy for poisonings consists of treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Externally as a liquid extract. (Area must be rinsed after use.) Some homeopathic remedies contain Pyrethrum mother tincture and dilutions.

How Supplied: Solutions, sprays and shampoos.

Pyrus communis

See *Pear*

Quassia

Picrasma excelsa

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the dried trunk wood.

Flower and Fruit: The flowers are in leaf-axillary, richly blossomed cymose panicles. The flower structures are in fours or fives. There are 5, 0.6 to 0.9 mm long, pubescent sepals, 5 yellow-green (in male flowers approximately 2 mm long, in androgynous flowers 3 mm long) petals, 10 stamens and 5 carpels surrounded by a disc. The fruit is a 1-seeded, orbicular to oval, blue-black drupe.

Leaves, Stem and Root: An evergreen, this tree is usually dioecious and grows to a height of up to 25 m. The leaves are alternate, 15 to 35 cm long, odd pinnate, with 9 to 13 leaflets. The leaflets are 5 to 13 cm long, 20 to 45 cm wide, blunt-acuminate and glossy. The trunk has gray grooved bark.

Habitat: The tree is indigenous to the Caribbean and northern Venezuela.

Production: Bitterwood is the dried trunk wood of *Picrasma excelsa*, collected in the wild.

Not to be Confused With: Mistaken identity can occur with *Rhus metopium*.

Other Names: Ash. Bitter Ash, Bitterwood

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Triterpenes: decanor-triterpenes (picrasan derivatives, quassinoids, simaroubolides, 0.15 to 0.3%), chief components quassin (nigaki lactone D) and neoquassin (both extremely bitter), and also including isoquassin (picrasmine) and 18-hydroxyquassin

Indole alkaloids: beta-carboline types, including N-methoxy-2-vinyl-beta-carboline and canthinone types, including canthine-6-one, 4-methoxy-5-hydroxycanthine-6-one

EFFECTS

The bitter substances contained in the drug (quassinoids and canthinones) exhibit antimicrobial, antiviral, anthelmintic and insecticidal effects. Quassia extract is positively inotropic and negatively chronotropic in animal experiment models. An antitumor activity was able to be demonstrated for various quassinoids. The drug's use to stimulate appetite and promote digestion is traceable to the bitter substances it contains.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include dyspepsia (Mexico and Brazil), loss of appetite, and stimulation of gastric juice and saliva production. These effects are attributed to the amaroid content. Quassia is also used for fever (Costa Rica and Surinam), malaria, dysentery, gonorrhea (Brazil), lice and worm infestations, as an antiseptic wound treatment, for diarrhea (Costa Rica and Brazil), for snake bites (Guyana), for liver disease, edema and menstrual complaints.

Homeopathic Uses: Uses in homeopathy include poor digestion and liver disease.

CONTRAINDICATIONS

Not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Internal administration has occasionally led to dizziness and headache, as well as uterine pain.

OVERDOSAGE

Gastric mucous membrane irritation has been observed with cases of overdosage, followed by vomiting. It is said that prolonged use can lead to weakened vision and total blindness.

DOSAGE

Mode of Administration: Preparations are available for internal and external use.

Daily Dosage:

Drug — single dose, 0.3 to 0.6 g, 3 times daily; Tincture: daily dose; 2 to 4 ml; Lice: apply tincture twice weekly to the scalp.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules, every 30 to 60 minutes (acute), and 1 to 3 times daily (chronic); Parenterally: 1 to 2 ml sc, IV, IF; Acute: 3 times daily; Chronic: 1 to 3 times daily (HA).

Storage: Store protected from light and moisture.

Quebracho

Aspidosperma quebracho-bianco

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the bark.

Flower and Fruit: The inflorescences, which grow from the upper leaf axils, are opposite or in threes. They are shaped like a thyrus and are warty to almost glabrous with numerous flowers. The flowers are 1 to 3 cm long. The bracts, which fall off, are very small and have a 2 to 3 mm stem. The sepals are ovate, obtuse, 1- to 2 mm long and uneven. The corolla is white, yellow or yellowish-green, smooth or uneven on the outside. The tube is 3 to 5 mm long and has long, narrow, lanceolate petals. The stamens are in the middle of the corolla tube. The anthers are 1 mm long. The follicles are cylindrical to ovoid, 4 to 10 cm long and 1 to 7 cm wide. They are very woody, slightly warty, with or without a midrib, uneven and stemless.

Leaves, Stem and Root: The tree grows to a height of 20 m and has slim branches. The young branches are warty; the older branches are smooth with thin orange-brown bark. The leaves are opposite or trifoliate, oblong-elliptoid, ovate-lanceolate to lanceolate, acuminate and gradually narrow at the base. They are 3 to 5 cm long by 0.5 to 1.5 cm wide, coriaceous, often yellow-green and smooth. The leaves have 20 to 30 pairs of steeply ascending secondary ribs, which are very close to each other and sunk into a thick mesophyll. The exterior of the bark is grayish and deeply fissured. The inner surface is yellowish-brown, often with a reddish tint, and is grooved. The transverse fracture shows a coarsely granular outer layer and a fibrous or splintery, darker inner layer.

Characteristics: The bark has a bitter taste and is odorless.

Habitat: The plant grows in Chile, Argentina, southeast Bolivia and southeast Brazil.

Production: Quebracho bark is the bark of *Aspidosperma quebracho-bianco*.

Not to be Confused With: Confusion can arise with *Aspidosperma horco quebracho*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (0.5-1.5%): chief alkaloids aspidospermine (30%), yohimbine (quebrachine, 10%), further including, among others, (-)-quebrachamine, akuammidine

Tannins

EFFECTS

Quebracho bark works as an expectorant and stimulates the respiratory center. A respiratory-stimulating effect has been proven for the main alkaloid aspidospermin in animal tests,

but there are no studies available on the effect of the whole drug.

INDICATIONS AND USAGE

Unproven Uses: Internal folk medicine uses of Quebracho include bronchial asthma, breathing difficulties, bronchitis, fever, cramps and loss of appetite.

Homeopathic Uses: Uses in homeopathy are primarily chronic respiratory tract conditions with accompanying breathing difficulties.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Side effects can include, among others, salivation, headache, outbreaks of sweating, vertigo, stupor and sleepiness.

OVERDOSAGE

Intakes of larger-than-recommended therapeutic dosages lead to queasiness and vomiting.

DOSAGE

Mode of Administration: The drug is available in extract and powder form, and is often used in combination bronchial preparations. However, it is rarely used as a drug in asthma remedies.

How Supplied: Commercial pharmaceutical preparations include powder, tablets, coated tablets, drops and elixir.

Preparation: Quebracho tincture is a 1:5 (ethanol 70%) combination.

Daily Dosage: A single dose of the drug is 1 to 2 g. (Recommended daily amount not specified.)

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules, 1 to 3 times daily or 1 ml injection solution sc twice weekly (HAB1).

Storage: Keep the drug in tightly sealed containers.

Quillaja

Quillaja saponaria

DESCRIPTION

Medicinal Parts: The medicinal part is the inner bark.

Flower and Fruit: The terminal inflorescence consists of white androgynous flowers with a calyx and corolla but no epicalyx. They are arranged in groups of 3 to 5 on the peduncle. The flower head is 5-lobed, splayed flat and formed into a disc on the upper surface. The many-seeded carpels spread into a star shape in the ripe fruit. The seeds are winged with little or no endosperm.

m

TM

Leaves, Stem and Root: The tree is up to 18 m tall. The leaves are smooth, glossy, short petioled, and oval. The bark is thick, dark and very hard. It is odorless, very bitter and astringent.

Habitat: The plant is indigenous to Chile, Peru and is cultivated in India and California.

Production: Quillaja Bark is the bark of *Quillaja saponaria*.

Other Names: Quillai, Quillaja Bark, Soap Tree, Panama Bark, and Cullay

ACTIONS AND PHARMACOLOGY

COMPOUNDS ~

Tannins (10 to 15%)

Triterpene saponins (8.5 to 17%): chief saponins quillajasaponins 17 (QS 17, QS III), 18 (QS 18), 21 (QS 21), chief saponin quillaic acid

EFFECTS

Because of its saponin content the drug is lipid-lowering, anti-exudative and immune-stimulating in animal experiments. The expectorant and purgative effect is also attributed to the saponin content.

INDICATIONS AND USAGE

Unproven Uses: Quillaja is used internally for coughs, chronic bronchitis, and conditions of the respiratory tract. It is used externally for dandruff.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Mucus membrane irritation could occur in the event of overdosage. Overdosage complaints include gastroenteritis, combined with vertigo, stomach pain and diarrhea. The drug possesses a low potential for sensitization.

DOSAGE

Mode of Administration: Quillaja is available as liquid extract and tincture for internal and external use.

Quillaja saponaria

See Quillaja

Quince

Cydonia oblongata

DESCRIPTION

Medicinal Parts: The medicinal parts are the fruit and seeds.

Flower and Fruit: The flowers are pink, relatively large, solitary and perfumed. The fruit is yellow, downy and apple or pear-shaped.

Leaves, Stem and Root: Quince is a 3 to 6 m high tree or shrub with tomentose branches covered in alternate, ovate leaves. The undersurface of the leaves is grass-green and tomentose.

Habitat: Quince is indigenous to southwest and central Asia, but it has also spread to Europe and in particularly the Mediterranean.

Production: Quince seeds are the seeds of *Cydonia oblongata*. The ripe quinces are picked, stored for a period, then cut and finally dried at temperatures not exceeding 50°C. The seeds are gathered up and used in whole or ground form.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyanogenic glycosides: amygdalin (corresponding to 0.4 - 1.5%, 27 to 75 mg HCN/100 g)

Mucilages

Fatty oil

EFFECTS

The main active principles are mucilage, some tannins and vitamin C. There is no information available on the mode of action.

INDICATIONS AND USAGE

Unproven Uses: Quince is used as a demulcent in digestive disorders and diarrhea. As a lotion, it is used to soothe the eyes. The seeds are also used to treat coughs and gastrointestinal catarrh. Additionally, the herb is used as compresses or poultices for injuries, inflammation of the joints, injuries of the nipples and gashed or deeply cut fingers.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Because quince mucilage is prepared from the whole seeds, and/or the whole seeds are taken internally, the cyanogenic glycosides are credited with a slight toxicological relevance.

DOSAGE

Mode of Administration: The drug is used as a powder, a lotion, a decoction and an extract.

Preparation: Extract/decoction: 1 tsp. of whole seeds per cup of water. A viscous poultice is prepared from the ground seeds.

Quinine

Cinchona pubescens

DESCRIPTION

Medicinal Parts: The medicinal part is the dried bark of 6- to 8-year-old trees.

Flower and Fruit: The 35 cm long inflorescence is paniced, opposite, often leafy and densely blossomed. The flowers are almost sessile, and the tube is thickly covered in silky hairs. The calyx has appressed hairs, and the tips are short and widely acuminate. The corolla is red or pink and 10 to 12 mm long. The fruit is an oblong, glabrous and longitudinally grooved capsule.

Leaves, Stem and Root: The plant is an evergreen tree, sometimes a bush, which grows from 5 to 15 m high, with a dense crown. The branches are at right angles to the trunk. The young branches are usually pubescent. The stipules are large, ovate, obtuse or acuminate, silky-haired or glabrous. The leaves have an up to 8 cm long petiole. The leaf blade is 15 to 40 cm long and 7 to 25 cm wide, oblong-elliptoid to roundish with curved side ribs. The bark occurs in quills or flat pieces up to 30 cm long and 3 to 6 mm thick. The external surface is brownish-gray, usually fissured with an exfoliating cork. Lichens and mosses may be seen as grayish-white or greenish patches. The inner surface is yellowish to reddish-brown. The fracture is fibrous.

Characteristics: The bark has an astringent, bitter taste and the odor is slight.

Habitat: The herb is indigenous to mountainous regions of the tropical U.S. and is cultivated elsewhere.

Production: Cinchona bark consists of the dried bark of *Cinchona pubescens* or other varieties. Trees are felled at between 6 and 12 years. They are dried slowly in the sun initially and then artificially dried at maximum temperatures of 70° C.

Not to be Confused With: Yellow factory bark

Other Names: Peruvian Bark, Jesuit's Bark, Cinchona

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Quinoline alkaloids (5-15%): main alkaloids are quinine (0.8-4%), quinidine (0.02-0.4%), cinchonine (1.5-3%), cinchonidine (1.5-5%)

Triterpenes: bitter acid monoglycosides, in particular, phenolic acid-3-O-chinovoside, chinovic acid-3-O-glucoside

Catechin tannins (3-5%)

EFFECTS

Quinine promotes stimulation of the secretion of saliva and gastric juices.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints

Unproven Uses: Quinine is used internally to correct loss of appetite, dyspepsia and flatulence with a sense of fullness. The bark is used for malaria, flu, enlarged spleen, muscle cramps, muscle pain, cancer and gastric disorders. Externally, it is used for scrapes and skin ulcers.

Chinese Medicine: Quinine is used for malaria, fever and alcohol intoxication.

Indian Medicine: The drug is used to treat intermittent fever, malaria, intercostal neuralgia, sciatica and neuritis (especially of the arm).

Homeopathic Uses: Quinine is used to treat general poisoning, attacks of fever, inflammation of the respiratory tract, acute diarrhea, anemia, general debility, skin rashes and neuralgia.

CONTRAINDICATIONS

Quinine should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: Sensitization to Quinine and Quinidine have been observed (eczema, itching). Even at therapeutic dosages, an enhanced pseudo-hemophilic effect can occur through the triggering of thrombocytopenia.

Drug Interactions: Because of the possibility of thrombocytopenia, care must be taken when Quinine preparations are administered along with other drugs that are known to precipitate thrombocytopenia.

OVERDOSAGE

In cases of overdose (more than 3 gm Quinine) or of long-term administration of the drug or its alkaloids, nausea, summer cholera, headache, fall of body temperature, intravascular hemolysis, cardiac arrhythmias, buzzing in the ears, hearing and visual disorders (all the way to complete deafness and blindness) may occur. Death comes with dosages of 10 to 15 gm of Quinine through heart failure and asphyxiation. Following gastric lavage, the symptomatic therapy for acute poisonings includes atropine for bradycardia and phenytoin in the presence of tachycardic heart rhythm disorders. Forced diuresis and hemodialysis are not suitable as therapeutic measures.

DOSAGE

Mode of Administration: Whole, cut and powdered drug are used in various galenic preparations, including tonics, drops, tablets, compresses, ampules, coated tablets, suppositories and compound preparations.

Preparation: A tea is prepared by pouring 150 ml of boiling water over 1/2 teaspoonful of the drug and allowing it to draw for 10 minutes. A decoction is prepared by adding 0.5 g to 1 teacup of water. A tincture in the proportion of 1:5 in 75% ethanol is also used.

Daily Dosage: Total daily dose is 1 to 3 gm of drug. The liquid extract daily dose is 0.6 to 3 gm of cinchona liquid extract, which contains 4 to 5% total alkaloids. A daily dose of 0.15 to 0.6 g cinchona extract with 15 to 20% total alkaloids may also be used.

The standard single dose of the extract is 0.2 gm. The liquid extract single dose is 0.5 to 1 gm.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules, every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Storage: Keep protected from light and moisture.

Radish

Raphanus sativus

DESCRIPTION

Medicinal Parts". The medicinal part is the fresh root. The plant is an important drug in homeopathic medicine.

Flower and Fruit: The raceme is loose and has about 30 flowers. The pedicles are 1 to 2 cm long and are covered in scattered bristles. The sepals are 6.5 to 10 mm long, oblong, acute, glabrous or with scattered bristles and red or green. The petals are 17 to 22 mm long, obovate, slightly margined, violet or white with dark veins. The fruit is on upright, patent stems. They are upright, cylindrical and conically acuminate. The upper segment is up to 9 cm long and even or slightly constricted between the seeds, and straw-like on the outside. The seeds are ovate. 4 mm long and 3 mm wide, light brown with a black hilum.

Leaves, Stem and Root: The root is annual or biennial and thin. The stem is up to 1 m high, bent, cane-like, branched, glabrous or covered with bristles and often violet, particularly in the axils of the lateral branches. The lower leaves are lyrate-pinnatisect with large sweeping crenate end segments and smaller, oblong-ovate, obtuse, dentate lateral lobes. They are light green, often red-veined and covered with scattered, appressed bristles.

Characteristics: The large, thick, tuberous, fleshy root, is hot to the taste.

Habitat: The plant is probably indigenous to China and Japan and today is cultivated in most temperate regions of the world.

Production: Radish consists of the fresh roots of *Raphanus sativus* and/or of *Raphanus sativus*, as well as their preparations. It is a cultivated plant.

Other Names: Common Radish, Garden Radish

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glucosinolates in the fresh, unbruised rhizome: chief component 4-methylthio-3-butenyl-giucosinolate, glucobrassin, sinigrin, glucoraphanine

EFFECTS

The drug is said to be choleric, antimicrobial and to increase motility in the upper gastrointestinal tract, an effect caused by the mustard oils.

A choleric effect and an antiviral effect were proven in animal experiments. M

Radish has a secretolytic effect in patients suffering from chronic bronchitis.

INDICATIONS AND USAGE

Approved by Commission.E:

- Cough/Bronchitis - :-
- Dyspeptic complaints

Radish is used internally for respiratory catarrh and dyspeptic disorders, especially those related to dyskinesia of the bile ducts.

Unproven Uses: In folk medicine Radish is used for whooping cough and gallstones.

Chinese Medicine: In China, Radish is used to treat coughs, diarrhea and abdominal pain.

Indian Medicine: Uses in India include dyspeptic complaints, nausea, flatulence, gallbladder disturbances, headache, neuralgias, and urological conditions. %

Homeopathic Uses: *Raphanus sativus* is used for poor digestion and oily skin.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Administration of higher dosages of the fresh root could lead to mucus membrane irritation of the gastrointestinal tract. Due to the cholagogic effect of the drug, biliary colic could be triggered in patients with gallstones.

DOSAGE

Preparation:

Radish-honey juice — 1 radish is grated and the resulting juice is mixed with honey, then allowed to stand for 10 hours.

Radish plant juice — The Radish is washed, cut and grated and up to 17% of the liquid is pressed out. 1-liter of juice is extracted from 1.3 kg of fresh drug.

Daily Dosage:

Pressed juice — 50 to 100 ml; ¹/_h tablespoon several times daily over a 3-day period.

Radish-honey juice — spoonfuls taken over the course of the day for whooping cough.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1)

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.). Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl. Bde 4-6 (Drogen): Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Ragwort

Senecio jacoboea

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts of the flowering plant and the entire fresh plant gathered during the flowering season.

Flower and Fruit: The golden yellow composite flowers grow in dense, terminal, erect, branched cymes. The linguiform ray florets are female. The disc florets are tubular and androgynous. The capitula has a diameter of 15 to 20 mm. The involucre is cylindrical. The bracts are in 1 row and are oblong-lanceolate, acuminate and black at the tip, with a short 1- to 4-leafed epicalyx. The lateral fruit is glabrous and has drooping tufts of hair. The other fruit is covered in thick tufts of loosely attached hair.

Leaves, Stem and Root: The plant is biennial to perennial and grows 30 to 90 cm high. The stem is erect, branched above and cobweb-pubescent. The basal leaves are lyrate-pinnatifid. The cauline leaves are pinnatifid with indented pinna. The lateral tips are almost at right angles and have small, 4-sectioned, slit ears that clasp the stem.

Habitat: The plant is indigenous to all of Europe, Asia Minor and northern Africa, and is naturalized in North America.

Production: Ragwort is the flowering plant of *Senecio jacoboea*. The plant is gathered in the wild, usually during the flowering season. The cut drug is dried away from direct sunlight.

Other Names: Ragweed, St. James Wort, Stinking Nanny, Staggerwort, Dog Standard, Cankerwort, Stammerwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrrolizidine alkaloids (0.1-0.9%): the alkaloid spectrum depends upon the chemotype. Jacobine chemotype: chief alkaloid jacobine; erucifoline chemotype: chief alkaloids erucifoline and O-acetylerucifoline

Volatile oil (traces)

EFFECTS

The toxic principles of the drug are the pyrrolizidine alkaloids, which should be assumed to be hepatotoxic and carcinogenic. Countless experiments have shown the plant to be acutely and chronically poisonous in animals.

INDICATIONS AND USAGE

Because of its potential carcinogenic effect. Ragwort should not be used. Traditional folk medicine uses have included painful menstruation, urinary tract inflammation, chronic cough, rheumatism, anemia and anemic headaches.

PRECAUTIONS AND ADVERSE REACTIONS

Ragwort should not be taken internally since hepatotoxicity and carcinogenicity are possible due to the pyrrolizidine alkaloids with 1,2-unsaturated necic parent substances in its makeup.

DOSAGE

Mode of Administration: The drug is used externally as a component of lotions, but should not be taken internally.

Preparation: The lotion is made using 1 part of the drug and 5 parts of 10% ethanol.

Daily Dosage: The lotion is applied topically for the treatment of rheumatic arthritis.

Raspberry

Rubus idaeus

TRADE NAMES

Alcohol Free Red Raspberry Leaf, Certified Organic Red Raspberry, Red Raspberry Leaves, Red Raspberry Leaves Glycerine, Wild Countryside Red Raspberry Leafs

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and fruit.

Flower and Fruit: The white flowers are in cymes. The calyx has 5 sepals and the corolla is 5-petaled. There are

numerous stamens and ovaries. Similar to the blackberry, the small fruit forms a red aggregate fruit, the raspberry.

Leaves, Stem and Root: Raspberry is a 2 m high deciduous bush with erect, woody stems, which are densely covered in tough thorns. The aerial part is usually biennial while the creeping root is perennial. The leaves are pale green. There are 3 leaves that sit atop 7 leaflets.

Habitat: The plant is indigenous to Europe and Asia and is cultivated in temperate climates.

Production: Raspberry leaf consists %of the leaf of *Rubus idaeus*.

Not to be Confused With: Blackberry leaves.

Other Names: Red Raspberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins: gallo tannins, ellagic tannins

Flavonoids

EFFECTS

The main active agents are tannin, flavonoids, and vitamin C. The tannins give the fruit an astringent effect.

INDICATIONS AND USAGE

Unproven Uses: Raspberry leaf is used for disorders of the gastrointestinal tract, the respiratory tract, the cardiovascular system, and the mouth and throat. In folk medicine, Raspberry preparations were used to facilitate childbirth.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As a component of purgative and "blood purifying" teas, and in fruit tea mixtures.

Preparation: To prepare an infusion, scald 1.5 gm finely cut drug, steep for 5 minutes and then strain. (1 teaspoonful = 0.8 gm drug).

tinal tract with subsequent increase of peristalsis. The drug is severely toxic in higher dosages.

INDICATIONS AND USAGE

Unproven Uses: The drug can be used for respiratory tract and rheumatic conditions, gastrointestinal tract, metabolic disorders, liver disease, and acute and chronic infectious conditions.

Homeopathic Uses: Bryonia cretica is used for acute and chronic rheumatism, peritonitis, and inflammation of the respiratory organs and the pleura.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated homeopathic therapeutic dosages. Side effects connected with the ingestion of the base tincture and DI include signs of irritation in the gastrointestinal tract. All parts of the plant are strongly toxic, due to the cucurbitacins content, which is irritating to mucous membranes.

OVERDOSAGE

Symptoms of poisoning include vomiting, bloody diarrhea, colic, kidney irritation, anuria, spasms, -palsies and aborted pregnancy. Death occurs through asphyxiation. Forty berries are considered lethal for an adult, 15 for a child. 3.5 gm of the drug is considered poisonous; one death has been documented following the ingestion of an infusion made from 30 gm of the root.

Following gastrointestinal emptying (in case vomiting has not occurred, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) and installation of activated charcoal, the therapy for poisoning consists of treating spasms with diazepam (i.v.), electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. In the event of shock, plasma volume expanders should be infused. Monitoring of kidney function is imperative. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Liquid and solid preparations for internal use; semi-solid preparations for external use.

Preparation:

Wine — 40 gm drug to 1 L white wine, leave to draw for 1 day.

Tincture — 10 gm to 90 gm ethyl alcohol (60%), leave to draw for 8 days.

Honey decoction — 20 gm drug to 250 gm honey and 350 gm wine vinegar, simmer for 30 minutes at a low temperature, strain when cool and store in a well-sealed bottle.

Ointment — Mix 30 gm cut drug with the same amount of Vaseline or wax.

Daily Dosage:

Powder — 0.3 to 0.5 gm as a laxative and emetic.

Decoction — 0.5 gm to 1 gm per cup.

Wine — 1 to 2 dessertspoons daily.

Tincture — 1 to 10 drops per day; maximum 20 drops.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules, 1 to 3 times daily or 1 ml injection solution sc. twice weekly; ointment 1 to 2 times daily; mother tincture DI diluted to be taken with liquid (HAB1)

Storage: Should be sealed tightly.

LITERATURE

Red Clover

Trifolium pratense

TRADE NAMES

Red Clover liquid, Red Clover Blossom, Red Clover Herb, Promensil, EuroQuality Red Clover Blossoms, NuVeg Red Clover Concentrate

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried and the fresh flower heads.

Flower and Fruit: One to 4 globular, ovate flower heads form on the tip of the stem. The calyx is tubular-campamilate. The petals are light carmine to fleshy red, occasionally yellowish-white or pure white. The fruit is a pod, which is ovate, 1-seeded and thin-skinned. The seed is oblong-ovate, yellow to brownish or violet.

Leaves, Stem and Root: The plant is a perennial herb, 15 to 40 cm high with a bushy rhizome and a basal leaf rosette. An erect, angular stem grows from the rhizome. The rhizome is covered in alternate, trifoliate, elliptical or ovate leaves, which have a characteristic arrow-shaped white spot on the upper surface. The leaflets are short-petioled, almost entire-margined, appressed, softly pubescent on both surfaces or only on the upper surface.

Habitat: The plant is indigenous to Europe, central Asia, northern Africa and is naturalized in many other parts of the world.

Production: Red Clover flowers are the flowers of *Trifolium pratense*. The dried flower buds are used to produce the drug.

Other Names: Purple Clover, Trefoil, Wild Clover

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: including among others, benzyl alcohol, 2-phenyl ethanol, their formates and acetates, methyl salicylate, methyl anthranilate (likely only in the fresh blossoms)

Isoflavonoids: including among others, biochanin A

Coumarin derivatives

Cyanogenic glycosides: presumably lotaustralin, linamarin

EFFECTS

Red Clover has antispasmodic and expectorant effects and also promotes the skin's healing process.

INDICATIONS AND USAGE

Unproven Uses: Internally, Red Clover is used for coughs and respiratory conditions, particularly whooping cough. Externally, it is used in the treatment of chronic skin conditions such as psoriasis and eczema.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally and externally as a liquid extract and in medicinal preparations.

Preparation: Liquid extract 1:1 can be prepared in 25% ethanol.

Daily Dosage: The daily dosage is 4 gm of drug, taken as an infusion, up to 3 times a day. Alternately, 1.5 to 3 ml of the liquid extract can be taken 3 times daily.

Red Currant

Ribes rubrum

DESCRIPTION

Medicinal Parts: The medicinal parts are the fruit and leaves.

Flower and Fruit: The flowers are in hanging, many-blossomed racemes. The green flowers are inconspicuous and their structures are in fives. The sepals and petals are fused with the hollowed receptacle. The calyx tips are wide obovate and longer than the petals. The corolla tube is flat with a pentagonal ring swelling. There are 2 carpels fused with the corolla tube to an inferior, single-chambered ovary. The ovary has a concave tip and a disc ring. The fruit is multi-seeded red berry. The cultivated forms are pink or white.

Leaves, Stem and Root: *Ribes rubrum* grows as a shrub, reaching up to 2 m high. The leaves are alternate, over 10 cm wide with a petiole half as long as the lamina, which is 3- to 5-lobed. The lobes are blunt to acute, double crenate and cordate at the base with an acute indentation.

Habitat: The plant is indigenous to Western Europe.

Production: Red Currants are the fresh ripe berries of *Ribes rubrum*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fruit acids: chief fruit acid is citric acid; other acids include malic acid, isocitric acid and tartartic acid

Monosaccharides/polysaccharides (7%): D-glucose, D-fructose

Pectins (15%)

Fatty oil (in the seeds 20%) with gamma-linolenic acid (6%)

Ascorbic acid (vitamin C, 0.005 to 0.015%)

Caffeic acid derivatives: including caffeoyl glucose, p-cumaric acid-O-glucoside

EFFECTS

Red Currant is a source of vitamin C and exhibits in vitro radical scavenger qualities. The fruit and juice are considered cooling and antiscorbutic and have often been used as a febrifuge. The jelly prepared from the berries has an

antiseptic effect and was often used to treat burns to prevent the formation of blisters. The leaves are said to have emmenagogic properties.

INDICATIONS AND USAGE

Unproven Uses: Red currant has been used in folk medicine to treat febrile conditions.

PRECAUTIONS AND CONTRAINDICATIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

No data are available in the literature.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen). Springer Verlag Berlin, Heidelberg, New York. 1992-1994.

Red Maple

Acer rubrum

DESCRIPTION

Medicinal Parts: The medicinal part is the bark.

Flower and Fruit: The flowers are red and aromatic, forming round bunches. The ovary is formed from 2 simple carpels pressed together at the sides, which are also present in the male flowers in rudimentary form. Each section contains 2 ovules. The fruit is a schizocarp with 2 one-sided or many-sided, often heavily veined wings. There is usually only one seed in each section.

Leaves, Stem and Root: The Red Maple tree grows to a height of up to 36 m. The leaves are crossed-opposite, petiolate and partially 3-lobed.

Habitat: Canada and the U.S., introduced into England and Europe around 1650.

Production: Red Acom bark is the trunk bark of *Acer rubrum*.

Other Names: Swamp Maple, Bird's Eye Maple, Sugar Maple

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins

Triterpenoid saponins

Allantoins

EFFECTS

Red maple has an astringent effect.

INDICATIONS AND USAGE

Unproven Uses: Red Maple is used for eye conditions (folk medicine of the North American Indians).

This product should not be used otherwise.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Comminuted drug.

LITERATURE

No literature references are available.

Red Sandalwood

Pterocarpus santalinus

DESCRIPTION

Medicinal Parts: The medicinal part is the wood.

Flower and Fruit: The tree bears spikes of yellow flowers.

Leaves, Stem and Root: The plant is a 6 to 8 m high tree with red bark.

Habitat: The plant grows in South India, Sri Lanka and the Philippines.

Production: Red Sandalwood consists of the heartwood of the trunk of *Pterocarpus santalinus* separated from the sapwood, in some regions also obtained from other *Pterocarpus* species. It is collected in uncultivated regions.

Other Names: Real Sandalwood, Rubywood, Red Saunders, Sappan, and Sanderswood Red

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Benzoxanthone derivatives (red pigments): chief components santalins A and B (red), additionally santalin AC and santalin Y (yellow)

Isoflavonoids: santal, pterocarpine, and homopterocarpine

Stilbene derivatives: pterostilbene

Volatile oil (traces): chief components cedrol (cedar camphor, up to 50%), including as well pterocarpol, isopterocarpol, eudesmol

EFFECTS

In animal experiments, extracts of the wood are hypoglycemic. Insecticidal and antidiabetic effects are attributed to the pterostilbene constituent. In addition CNS-suppressive, spas-

molytic and anti-exudative effects have been described, although detailed information is unavailable.

INDICATIONS AND USAGE

Indian Medicine: Red Sandalwood is used for headaches, toothaches, vomiting, black vomit, diarrhea, fever and conditions of the eye. It is also used to treat stomach ulcers, gallbladder complaints, diabetes, and snakebite poisoning.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Red Sandalwood is available as whole, crude and powdered drug forms for internal and external use.

Preparation: To prepare a tincture, 200 parts coarsely powdered drug are mixed with 1000 parts ethanol (EB6).

Daily Dosage: As a tincture, 5 gm.

Storage: Red Sandalwood should be tightly sealed, powdered and protected from light.

Red-Rooted Sage (Dan-Shen)

Salvia miltiorrhiza

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried rhizome and root.

Flower and Fruit: The inflorescences are false whorls with 6 to 8 flowers arranged very close together in glandularly haired racemes with a few lanceolate bracts. The calyx is

campanulate, dark purple and glandularly pubescent. The upper lip is simple, the lower lip is longer than the upper lip and thorny-double-dentate with an inner dense ring of white hairs. The petals are violet and glandularly pubescent on the outside. The corolla tube is approximately 1.9 cm long; the upper lip slightly enlarged and turned out. There are 2 long and 2 short stamens and a superior, 2-merous, 4-chambered ovary. The fruit breaks up into 4, 1-seeded mericarps.

Leaves, Stem and Root: *Salvia miltiorrhiza* is a herbaceous perennial growing upright to a height of up to 80 cm. The lower leaves are cordate to ovate. The upper leaves are trifoliolate, crenate-dentate, pubescent above and along the ribs of the lower surface. The rhizome is thick and short.

Habitat: The plant is found in China and Japan.

Production: Red sage (red ginseng) root is the dried rhizome and root of *Salvia miltiorrhiza*. The plant is dug up in spring or autumn, cleaned, cut and dried.

Not to be Confused With: Mistaken identity can occur with *Salvia przewalskii* or *Salvia trijuga*.

- *Other Names:* Red Ginseng, Red-Rooted Salvia, Dan-Shen

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: the so-called tanshinones, including cryptotanshinone, isocryptotanshinone, isotanshinones I and II, tanshinones I and II, miltiron, ferruginol, salvicol

Caffeic acid derivatives: including rosmarinic acid, lithospermic acid ethyl ester, salvianolic acids A to E

EFFECTS

Patients with coronary heart disease experienced an improvement in various hemodynamic parameters. At the same time, a significant increase in coronary blood flow due to a reduction of vascular resistance was demonstrated. The drug is antithrombotic, antihypertonic, antimicrobial, antipyretic/anti-inflammatory and hepatoprotective in its effect; it is also said to possess sedative characteristics.

INDICATIONS AND USAGE

Chinese Medicine: Preparations of the root are used for metrorrhagia, pain following menstruation, amenorrhea, post partum bleeding and pain, angina pectoris, furuncles, carbuncles, painful swellings, swelling of the liver and spleen, and joint pain. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and cut drug and their preparations are for internal use.

Preparation: Jiudanshen - Slices of the root, to which wine has been added in accordance with the Jiuzhi method, are roasted until dry.

Daily Dosage: The daily dosage of the drug is 9 to 15 g. The daily dosage of tea is an amount prepared from 3 to 15 g of the drug.

Storage: The drug should be stored in a dry place.

Red-Spur Valerian

Centranthus ruber

DESCRIPTION

Medicinal Parts: The medicinal part is the root of the plant.

Flower and Fruit: The numerous flowers are in dense cymes, red, pink or seldom white. The corolla is tubular and spurred at the base. Each flower contains 1 stamen. The fruit is small and dry. The margin of the surrounding calyx forms a pinnatifid rosette or a papus.

Leaves, Stem and Root: The plant grows from about 30 to 80 cm high. The rhizome is perennial and very branched. The stems are tough, bushy at the base, hollow and smooth. The leaves are 5 to 10 cm long in opposite pairs, somewhat fleshy and entire-margined.

Habitat: The plant is probably indigenous to the Mediterranean region, although it is found in Europe.

Other Names: Pretty Betsy, Bouncing Bess, Delicate Bess, Drunken Sailor, Bovisand Soldier

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids (iridoid epoxy compounds, 1-3%): valepotriates, including valtrate, acevaltrate, didrovaltrate

EFFECTS

The drug has sedative and equilibratory effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is not in current use. It was previously used as a sedative.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

No information is available.

Reed Herb

Phragmites communis

DESCRIPTION

Medicinal Parts: The medicinal parts are the stem and the rhizome.

Flower and Fruit: The grassy flowers appear in long panicles of up to 30 cm with a thick crown of hair.

Leaves, Stem and Root: The plant is a sturdy grass with a long, creeping rhizome. It grows up to 3 m and has gray-green leaves.

Habitat: Reed Herb is common worldwide.

Production: Reed Herb and rhizome are the stem (base) and rhizome of *Phragmites communis*.

Other -Names: Common Reed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including tricine, luteolin, chrysoeriol, rutin, isoquercitrin

Vitamin A (5 mg/100 gm in the fresh foliage)

Ascorbic acid (vitamin C, 100 mg/100 gm in the fresh foliage)

B vitamins

Sugar: in particular saccharose, inverted sugar (relatively high content in the rhizome)

Triterpenes: including beta-amyrin, taraxerol, taraxerone

EFFECTS

The plant has diuretic and diaphoretic effects.

INDICATIONS AND USAGE

Unproven Uses: Reed Herb is used as a diuretic and diaphoretic to treat digestive disorders. The juice is used to soothe insect bites.

Chinese Medicine: Reed Herb is used for diabetes, leukemia and breast cancer.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Preparations are used internally and externally. The fresh and dried forms are used as infusions.

Rehmannia (Di-Huang)

Rehmannia glutinosa

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root tuber.

Flower and Fruit: The inflorescences are racemes with approximately 10 flowers. The flower structures are in fives; the calyx is approximately 1.5 cm long, 5-lobed and campanulate. The corolla is a tube that broadens higher up, is 3 to 4 cm long and red-violet. There are 4 stamens and a superior, 2-chambered ovary. The fruit is a loculicidal capsule.

Leaves, Stem and Root: This herbaceous perennial grows up to 40 cm high. The leaves are alternate, 3 to 10 cm long and

1.5 to 4 cm wide. The lamina is obovate to lanceolate and undulating with a crenate margin; the leaves and stem are velvet-pubescent. The roots are partly thickened to tubers.

Habitat: *Rehmannia glutinosa* is indigenous to China, Japan and Korea.

Production: *Rehmannia glutinosa* is harvested in autumn; the root tuber is either cleaned and used as it is (called Shoudihuang or Xiandihuang) or is moistened with steam, cut into slices and dried over a fire until the water is reduced by 80% (Shengdihuang).

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids: chief component catalpol (0.3 to 0.5%), including ajugol, aucubin, melittoside, rehmaniosides A to D

Monoterpene: rehmapicroside

Ionone glucosides: rehmanionones A and B

Monosaccharides/oligosaccharides: stachyose (10%, based upon the fresh weight), saccharose, raffinose, D-fructose, D-glucose, D-galactose

Steroids: sterols, including beta-sitosterol, campesterol, stigmasterol

EFFECTS

The phenolic glycosides of the drug are antibacterial, immunosuppressive and antihepatotoxic in effect. Verbascoside inhibits the thromboxane synthetase system; its efficacy with rheumatic diseases, among others, is thus plausible.

INDICATIONS AND USAGE

Chinese Medicine: The drug is used in traditional Chinese medicine as a diuretic and for its nourishing and strengthening effect on the liver, kidney and heart. The fresh and dried forms are used differently.

Shoudihuang (fresh root tuber) is used in the liver and kidney meridians for paralysis of the larynx, irregular menstruation, allergic lowered immunity, insomnia, vertigo, tinnitus, impaired hearing, hyperhidrosis, diabetes and increased frequency of urination.

Shengdihuang (dried root tuber) is used mainly in the heart, kidney and liver meridians for febrile conditions, dry mouth, nose bleeds, internal bleeding, rheumatism, constipation, hepatitis, diabetes and metrorrhagia.

Efficacy for the indications rheumatism, eczema and viral hepatitis (IV) has been proven in clinical trials with decoctions of the fresh root. Efficacy for the other indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and powdered drug. Preparations are for internal use.

Preparation: Shoudihuang can be prepared in two ways:

Jiushoudihuang (jiudun method): The drug is simmered in yellow rice wine over a low flame until all of the wine has been absorbed (30 to 50 kg for 100-kg drug). It is then dried in the sun until the outer skin (initially slimy) is dry, and is then cut into 2 to 3 mm thick slices, which are dried.

Zhengshoudihuang (zheng method): Using this method, the drug is steamed until it is smooth and black (80% loss of moisture). It is then cut into 2 to 4 mm thick slices and dried.

Daily Dosage: Decoction — 9 to 15 g drug

Storage: The fresh root is stored in sandy earth, protected from frost. The dried drug is stored dry in areas having good air circulation.

Rhatany

Krameria triandra

DESCRIPTION

Medicinal Parts: The medicinal part is the air-dried root, separated from the rhizome.

Flower and Fruit: The 7 to 12 mm long flowers are sparse terminal racemes. The calyx is petaloid. The sepals are splayed, lanceolate, dark red, silky-haired on the outside. The petals are irregular, with 2 glands, wedge-shaped, 3 to 5 mm wide, crimson and spatulate. The flower has 3 stamens. The ovary is ovate, covered in bristly hairs with a thick glabrous style. The fruit is solitary angular and bristled. It is ovate and has numerous red-black bristly thorns.

Leaves, Stem and Root: The plant is a 0.3 to 1 m high subshrub whose long, 3 cm thick root is covered in a brown-red, smooth, peeling bark. The younger branches are dark green, silky to bristly haired, the older ones are black and often gnarled. The leaves are entire-margined, ovate, silver-gray pubescent, 6 to 15 mm long and 2 to 6 mm wide.

Habitat: Rhatany is mostly found in Peru, but there are a few areas in countries bordering Peru and in the central Andes where it is also found.

Production: Rhatany root consists of the dried root of *Krameria triandra* Ruiz et Pavon as well as its preparations collected in the wild, washed and air-dried in the shade.

Not to be Confused With: roots of other *Krameria* species

Other Names: Rhatania. Krameria Root, Mapato

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (JO-15%): oligomeric proanthocyanidins

Tanner's reds (phlohaphenes): polymeric, insoluble oxidation products of the tannins

Neolignans: including among others rhatany phenols I—III (0.3%)

EFFECTS

In vitro the drug is antimicrobial, fungitoxic and astringent. Because of the tannin and lignan content, local treatment of oral and pharyngeal mucous membrane inflammation seems reasonable.

INDICATIONS AND USAGE

Approved by Commission E:

- Inflammation of the mouth and pharynx

Unproven Uses: In folk medicine used internally as an antidiarrheal agent for enteritis, inflammation of female genital organs and urinary tract. It is used externally to strengthen gums and clean teeth.

Homeopathic Uses: *Krameria triandra* is used for bleeding mucous membranes and painful conditions of the rectum.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Internal administration can lead to digestive complaints because of the secretion-inhibiting efficacy. Allergic mucus membrane reactions have been observed in rare cases.

DOSAGE

Mode of Administration: Comminuted herb for decoctions and other galenic preparations for topical application, especially in oral and pharyngeal areas.

The drug is a component of various standardized preparations of pharyngeal remedies.

Preparation: 1.5 to 2 gm coarsely powdered drug in boiling water, strain after 10 to 15 minutes (1 teaspoonful = approx. 3 g drug).

Daily Dosage: About 1 gm comminuted drug in 1 cup of water as decoction or 5 to 10 drops of Rhatany tincture in 1 glass of water, 2 to 3 times daily.

Undiluted Rhatany tincture painted on the affected surface 2 to 3 times daily. Tea: freshly prepared as a rinse or gargle 2 to 3 times a day.

Storage: Rhatany should be protected from light.

Rice

Oryza sativa "•

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the seeds.

Flower and Fruit: The panicle is up to 30 cm long. The husk is 7 to 9 mm long with 5 clearly protruding veins. They have 8 cm long, light or dark red awns, or no awns at all. The seed is tightly covered by the layers of the husk and is compressed from the side.

Leaves, Stem and Root: Rice is an annual. The stem is hollow, leafy and erect. The leaves are clasping and sheath-like at the base and grow up to 1 m in length. The leaf surface is up to 60 cm long and 1.5 cm wide. The leaves have bristly ciliate spikelets at the base.

Habitat: Rice is probably native to China and India. Today it is cultivated widely in wet areas in the tropics and subtropics.

Production: Rice is the seed of *Oryza sativa*.

Other Names: Nivara

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Starch (70%)

Proteins: including prolamines, glutelins, globulins, albumins

Fatty oil (1,0-1.8% in the entire fruit, 7—12 % in the germ): chief fatty acid linoleic acid (45%)

Polysaccharides, soluble: galactoarabinoxylan

Monosaccharides, oligosaccharides: glucose, fructose, saccharose

Flavonoids: including tricine, tricine-7-O-glucoside, tricinine

Steroids: sterols, including beta-sitosterol, gamma-sitosterol, campesterol

Diterpenes: momilactone A, momilactone B

Trigonelline

Trypsin inhibitors

Lectins

Vitamins of the B-group

EFFECTS

Rice has been shown to be effective for pain relief and sedation of the digestive tract.

INDICATIONS AND USAGE

Unproven Uses: Rice is used during recovery from disorders of the gastrointestinal tract, illnesses of the gastrointestinal tract and diarrhea.

Chinese Medicine: Among uses in Chinese medicine are diabetes, spontaneous perspiration, diarrhea and debility.

Indian Medicine: Rice is used for pneumonia, diarrhea and diseases of the colon.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: Rice seeds are boiled in water before ingestion.

Ricinus communis

See Castor Oil

Rosa canina

See Dog Rose

Rosa gallica & Rosa centifolia

See Rose

Rose -

Rosa gallica & Rosa centifolia

DESCRIPTION

Medicinal Parts: The medicinal parts are the petals and the oil extracted from them. Rose is also used in homeopathic medicine.

Flower and Fruit: The flowers are usually solitary, more rarely in twos and threes, on 2 to 3 cm long, thickly-glandular pedicels. The calyx is round to peaf-shaped and is usually thickly covered with stem glands and gland bristles. The velvety petals are pink to purple, 2 to 3 cm long and wide. The style and stigma form the ovary that is surrounded by carpels enclosed in the calyx, forming woolly capitula. The ripe, red-brown false fruit is 1 to 1.5 cm long.

Leaves, Stem and Root: The plant, a descendant of *Rosa gallica* is a low shrub with extensive runners and above ground reed-like shoots, which are erect and branched. They usually grow to between 0.5 to 1 m and are covered with long, revolute or erect thorns and stem glands of different length. The leaves, which are usually penfoliate, less frequently trifoliate, have long glanular, dark green above, lighter and bluer below, leaflets. They grow together at the leaf stem that terminate in free tips.

Habitat: Rose is probably indigenous to Iran and is cultivated worldwide.

Production: Rose flowers consist of the dried petals of *Rosa gallica* and *Rosa centifolia* that are gathered prior to fully unfolding. The petals are harvested by hand and dried in the shade.

Other Names: Cabbage Rose, Hundred-Leafed Rose, French Rose, Damask Rose

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins: oligomeric proanthocyanidins

Volatile oil (in the fresh blossoms): chief components (-)-citronellol, geraniol, nerol, phenyl ethanol, Including as well (-)-linalool, and citral

EFFECTS

The astringent effect attributed to the drug is due to the tannin content.

INDICATIONS AND USAGE

Approved by Commission E:

- Inflammation of the mouth and pharynx

Unproven Uses: Rose flowers are used in folk medicine internally for diarrhea, tuberculosis of the lungs, pulmonary catarrh and asthma, hemorrhage and leucorrhea. Externally, it is used for inflammations of the oral and pharyngeal mucosa, suppurating wounds and lid inflammation.

Indian Medicine: In India, Rose is used for coughs, bronchitis, asthma, fever and general debility. It is also used for wounds and hyperhydrosis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Rose flowers are available as whole, crude and powdered drug forms for internal and external use.

Preparation:

Tea — 1 to 2 gm drug added to 1 cup (200 ml) water.

Rose vinegar — 60 gm petals added to 750 ml red wine vinegar.

Daily Dosage:

Tea infusion — up to 3 cups per day. It is also used for rinses and washes.

Powder — 5 to 10 gm with honey or liquid.

The leaves can be applied directly to the eyes.

Storage: Should be tightly sealed and stored in dry arid cool place.

LITERATURE

Rosemary

Rosmarinus officinalis

TRADE NAMES

Rosemary Leaf (available from numerous manufacturers and as combination product)

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the leaves and the leafy stems, the flowering, dried twig tips, the dried leaves, the fresh leaves, the fresh aerial parts collected during flowering and the flowering branches.

Flower and Fruit: Labiate flowers grow on tomentose inflorescences in the leaf axils of the upper part of the branches. The calyx is 3 to 4 mm. green or reddish, initially tomentose, later 5 to 7 mm and glabrous. The venation is conspicuous. The corolla is 10 to 12 mm long, bluish, occasionally pink or white. The nutlet is brown.

Leaves, Stem and Root: The plant is an evergreen, branched subshrub, 50 to 150 cm high with erect, climbing or occasionally decumbent brown branches. The leaves are linear, coriaceous, entire-margined, light green and somewhat rugose above. They are tomentose, 15 to 40 mm by 1.2 to 3.5 mm.

Characteristics: The plant has a very pungent aroma.

Habitat: The plant is indigenous to the Mediterranean region and Portugal and is cultivated there as well as on the Crimea, in the Transcaucasus, Central Asia, India, Southeast Asia, South Africa, Australia and the U.S.

Production: Rosemary leaves consist of the fresh or dried leaves of *Rosmarinus officinalis* collected after flowering as well as their preparations. The leaves are harvested after flowering on sunny, warm days and dried.

Not to be Confused With: May be confused with *Ledum palustre*, *Andromeda polifolia*, *Teucrium montanum*, *Taxus baccata*, *Santolina rosmarinifolia*, and *S. chamaecyparissus*.

Other Names: Polar Plant, Compass-Weed, Compass Plant

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Caffeic acid derivatives: chief component rosmarinic acid

Diterpenes (bitter): including carnosolic acid (picosalvin), isorosmanol, rosmadial, rosmaridiphenol, rosmariquinone

Flavonoids: including cirsimarin, diosmin, hesperidin, homoplantiginin, phegopolin

Triterpenes: chief components oleanolic acid, ursolic acid and their 3-acetyl esters

Volatile oil (1.0 to 2.5%): chief components 1,8-cineole (20 to 50%), alpha-pinene (15 to 25%), camphor (10 to 25%), including as well camphene, borneol, bornyl acetate, beta-caryophyllene, p-cymene, limonene, linalool, myrcene, alpha-terpineol, verbenone

EFFECTS

The drug is mildly antimicrobial and antiviral (probably because of the diterpenes).

Animal tests have demonstrated spasmolytic effects on the gallbladder ducts and on the upper intestine. The tests have confirmed choleric, liver-protective, anti-convulsive, anti-mutagenic and tumor-inhibiting effects. The metabolism of the drug is accelerated by the presence of 1,8 cineol. In humans Rosemary oil improves circulation when applied externally because of a certain skin irritating effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Blood pressure problems
- Dyspeptic complaints
- Loss of appetite
- Rheumatism

Rosemary is used internally for dyspeptic disorders and externally for hypotonic circulatory disorders and rheumatic conditions.

Unproven Uses: Rosemary is used in folk medicine for digestive symptoms, headaches and migraine, dysmenorrhea, amenorrhea and oligomenorrhea, states of exhaustion, dizziness and poor memory. It is used externally as a poultice for poorly healing wounds, for eczema, as an analgesic for injuries of the mouth and throat, topically for myalgias, intercostal neuralgia and sciatica.

Homeopathic Uses: *Rosmarinus officinalis* is used for gastrointestinal disorders.

CONTRAINDICATIONS

Rosemary preparations should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Contact allergies have been observed on occasion.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Very large quantities of rosemary leaves misused for the purpose of abortion, can lead to deep coma, spasm, vomiting, gastroenteritis, uterine bleeding, kidney irritation, and to death in humans.

DOSEAGE

Mode of Administration: Rosemary is available as whole, crude and powdered drug forms for internal and external use. It is also available in compounded preparations.

How Supplied:

Liquid — 1:1

Preparation:

Tea — pour boiling water over 2 gm finely cut drug and strain after 15 minutes (1 teaspoon corresponds to approximately 2 gm drug).

Rosemary wine — Add 20 gm drug in 1 Liter wine, let stand for 5 days, shake occasionally.

Tincture — 1:5 with 70% ethanol (V/V)

Liquid extract — 1:1 45% ethanol (V/V)

Daily Dosage: The daily dose is 4 to 6 gm drug.

Tea — 1 cup several times a day

Tincture (1:5) — single dose: 20 to 40 drops

Liquid extract — single dose: 2 to 4 ml

Externally — semi-solid and liquid forms wjth 6 to 10% essential oil

Bath additive — 50 gm drug to 1 Liter hot water added to full or hip bath

Washes — use 1% infusion

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1)

Storage: Rosemary should be protected from light and moisture.

Rosinweed

Silphium laciniatum

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Leaves, Stem and Root: **The plant** is a stately 1 to 4 m high **herbaceous perennial, with an almost** leafless, round shaft. **The leaves are 30 to 60 cm long.** They are long-petioled, **simple or double pinnate** leaves. The leaves are alternate, **with their edges turned upward and downward and their surfaces facing north and south.**

Characteristics: **The taste of the root is bitter** and then acrid. **The roots are odorless.**

Habitat: **The plant grows in the** midwestern U.S., especially **Ohio.**

Other Names: **Compass Weed, Polar Plant, Pilot Weed**

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Resins (smelling terpene-like, mastic-like)

Volatile oil

Inulin (in the root)

EFFECTS

The active agents are resin, with 19% terpene and 37% of a resin acid, and inulin in the root. The drug has antispasmodic, diuretic and diaphoretic effects.

INDICATIONS AND USAGE

Homeopathic Uses: In homeopathy, the drug is used for the treatment of digestive disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Rosinweed is available as a tincture or liquid extract.

LITERATURE

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8: Springer Verlag Berlin, Heidelberg, New York, 1969.

Rosmarinus officinalis

See Rosemary

Round-Leafed Wintergreen

Pyrola rotundifolia

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves.

Flower and Fruit: The white, sometimes reddish flowers are in many-blossomed, nodding racemes turning to all sides. The calyx is divided in 5 almost to the base and has lanceolate, revolute, splayed tips. The corolla has 5 petals and is flatly campanulate. The 10 stamens are curved upward. The ovary is superior with 5 sections and a downward curving style. The fruit is a 5-sectioned capsule.

Leaves, Stem and Root: The plant grows from 15 to 30 cm high. The stem is erect, obtusely angular and glabrous; it has 2 sheath-like bracts. The leaves in die basal rosette are

petiolate, orbicular and glabrous. They are grass-green, glossy, somewhat cordate at the base, shallowly crenate, coriaceous and evergreen.

Characteristics: The flowers have a slight, pleasant fragrance, and the leaves are astringent.

Habitat: The plant originated in the South Sea islands but is now naturalized in other climates.

Production: Wintergreen leaves are the leaves of *Pyrola rotundifolia*.

Other Names: Wintergreen

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Hydroquinone derivatives (4-8%): chief components isohomoarbutin, additionally homoarbutin (arbutin)

Naphthacene derivatives (naphthoquinone): chimaphilin (2,7-dimethyl-1,4-naphthoquinone)

Tannins (up to 18%)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Wintergreen is used for bladder inflammation and urinary tract diseases, diseases of the prostate and kidney disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a weak sensitizing effect due to its chimaphilin content. The drug is not suitable for long-term use because of its hydroquinone glycoside content.

DOSAGE

Mode of Administration: The drug is administered ground and as an extract.

Rubus idaeus

See *Raspberry*

Rue

Ruta graveolens^.

DESCRIPTION

Medicinal Parts: The medicinal parts are oil extracted from the herb, the herbal parts of the plant harvested after flowering, the fresh aerial parts of the plant collected at the beginning of the flowering season and the whole plant.

Flower and Fruit: The yellow flowers are in cymes, which are on twining branches with entire or 3-lobed bracts. The calyx has 4 or 5 segments. The 4 to 5 petals are spoon-like concave-ovate and end suddenly in the stem. The 8 to 10 stamens are in 2 circles. The single short, broadly ovate ovary has 4 to 5 grooves and is covered with hemispherical glands. The fruit is a globular, 4 to 5 valvular, many-seeded capsule. The seeds are angular and have a bumpy brown skin.

Leaves, Stem and Root: The plant is a sturdy shrub 30 to 80 cm high with a woody root and a crooked, branched rhizome. The shoots are glabrous, pale green and more or less covered in oil glands. The stems are erect, rigid, round, lightly branched and woody from below. The leaves are 4 to 11 cm long and 3 to 7 cm wide, odd-pinnate, with 1 to 3 pinnatesect pinna. The terminal segments are spatulate to lanceolate. The front leaves are very finely crenate or serrate, somewhat fleshy, pale yellowish or bluish green.

Characteristics: The odor is tangy and the taste is hot, somewhat bitter and can cause skin irritation.

Habitat: The plant grows in the Balkans as far as Siebengebirge, upper Italy and central Italy and is cultivated elsewhere. Rue is completely naturalized in the southern Alps, southern France and Spain.

Production: Rue leaves consist of the dried leaves of *Ruta graveolens*. Rue herb consists of the dried above-ground parts of *Ruta graveolens*. Both are dried in the shade at a maximum of 35° C.

Not to be Confused With: Confusion can arise with other *Ruta* species.

Other Names: Herb-of-Grace, Herbygrass

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alkaloids (0.4-0.4%): furoquinoline alkaloids including among others, skimmianin, gamma-fagarine, dictamnin, kokusaginine, ptelein

Acridine alkaloids: including arborinine- 2-arylquinoline

Quinazoline alkaloids: including among others, arborine

Quinoline alkaloids: including graveoline, graveolineine

Volatile oil (0.2-0.4%): chief components are nonan-2-one (50%), nonan-2-ylacetate, undecan-2-one, undec-2-ylacetate further including, among others, linalyl acetate, 1,8-cineole, menthol

Flavonoids: chief component is rutin (2-5%)

Hydroxycoumarins: umbelliferone, herniarin, gravelliferon, rutacultin

Furocoumarins: bergapten, psoralen, xanthotoxin, chalepentin, isopimpinellin, isoimperatorin, rutarin, rutaretine

Pyranocoumarins: including among others, xanthyletine

Lignans: savinin, helioxanthine

EFFECTS

The alkaloids in the drug are anti-exudative. Chalepentin inhibits fertility, and the coumarin derivatives and alkaloids are spasmolytic. In addition, the drug is antimicrobial, abortifacient and photosensitizing.

INDICATIONS AND USAGE

Unproven Uses: Preparations of rue herb and/or leaves are used for menstrual disorders, as an effective uterine remedy and as an abortive agent. In folk medicine, Rue is used for menstrual complaints, as a contraceptive and as an abortive agent. The herb is also used for inflammation of the skin, oral and pharyngeal cavities, earache, toothache, for feverish infectious diseases, for cramps, as an obstetric remedy, hepatitis, dyspepsia, diarrhea and intestinal worm infestations.

Homeopathic Uses: Among uses in homeopathy are contusions, sprains, bruising, varicose veins and rheumatism (especially of the spine).

CONTRAINDICATIONS

Rue is not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The drug can lead to photosensitization, due to its furocoumarine and furoquinoline content; photodermatoses have

been observed following skin contact with the fresh leaves. Sensitization is possible following skin contact.

Pregnancy: Vomiting, epigastric pain, liver damage, kidney damage, depression, sleep disorders, feelings of vertigo, delirium, fainting, tremor, and spasm, occasionally with fatal outcome, have occurred after misuse of extracts of the plant as an abortive agent.

OVERDOSAGE

Vomiting, epigastric pain, liver damage, kidney damage, depression, sleep disorders, feelings of vertigo, delirium, fainting, tremor, and spasm, occasionally with fatal outcome, have occurred in cases of overdose.

DOSAGE

Mode of Administration: Preparations of the leaves and root are used internally as a tea and also externally.

Preparation: Tea or a cold decoction is prepared by adding 1 heaping teaspoonful to 1/4 liter of water. (1 teaspoonful is roughly equivalent to 2.8 g drug).

Daily Dosage: 0.5 g of the drug is considered a medium single dose; 1.0 g the maximum daily dose. The tea may be taken several times a day.

Delayed menstruation—2 cups per day of the infusion

For topical use, leaves are used to fill hollow teeth for toothache and juice from the leaves is used as an ear drop for earaches.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or 1 ml injection solution sc twice a week (HAB1)

Rupturewort

Herniaria glabra

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh flowering plant.

Flower and Fruit: The flowers are in flat clusters of 7 to 10 in the leaf axils or opposite the leaves along the stem. They are yellow-white and very small. The fruit is a membranous capsule covered by the calyx and contains 1 seed.

Leaves, Stem and Root: The plant is an annual small shrub of about 15 cm. The stem tends to be decumbent. It is round and branched. The leaves are sessile, entire-margined, elliptical and opposite. The leaves are alternate.

Characteristics: The plant is yellow-green and glabrous; it creates suds when rubbed under water.

Habitat: The plant is found in the temperate and southern regions of Europe and in Asian Russia.

Production: Rupturewort is the complete aerial part of *Herniaria glabra* or *Herniaria hirsuta*. -

Other Names: Flax Weed, Herniary

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins: herniaria saponins I-VII (aglycones medicagen, gypsogen, 16-hydroxy-medicagen)

Flavonoids: including hyperoside

Hydroxycoumarins: umbelliferone, herniarin

EFFECTS

The main active principles (saponins, flavonoids, coumarins and small amounts of tannins) are reported to have mild spasmolytic and diuretic effects, which have not been scientifically proven.

INDICATIONS AND USAGE

Unproven Uses: *Herniaria glabra* is used for disorders of the efferent urinary tract, inflammatory disorders of the kidneys and bladder, respiratory disorders, nerve inflammation, gout and rheumatism, and as a blood purifier.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: The drug is administered as an infusion and in tea mixtures, as an extract in drops and in urological pharmaceutical preparations.

Preparation: Put 1.5 gm comminuted drug (1 teaspoonful is equal to 1.4 gm) in cold water and bring briefly to a boil. Strain after 5 minutes.

Daily Dosage: Drink 1 cup 2 to 3 times daily as a diuretic.

Ruscus aculeatus

See Butcher's Broom

Rust-Red Rhododendron

Rhododendron ferrugineum

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried foliage leaves, the dried leafy branches and the fresh leafy branches.

Flower and Fruit: The pink flowers are in umbel-like racemes. The calyx has 5 short ovate tips. The corolla is fused and funnel-shaped with an edge divided into 5 segments. It is covered on the outside with white or golden-yellow resin spots. There are 10 stamens and 1 superior ovary. The fruit is a 5-valved capsule. The seeds are fusiform, about 1 mm long and light brown.

Leaves, Stem and Root: The plant is an evergreen shrub up to 1 m high and is richly branched from the base upward. The branches are sturdy and elastic with gray-brown bark. The leaves are oblong-lanceolate, tough and glabrous. The margin is entire, involuted. The leaves are dark green above, densely scaled underneath and sometimes rust-colored.

Characteristics: The leaves are not ciliate at the edge.

Habitat: The plant grows in the Alpine chain from the Pyrenees to the southern Croatian mountains, but not in the Carpathians.

Production: Rust-Red Rhododendron consists of the dried leaves of *Rhododendron ferrugineum*.

Not to be Confused With: The leaves of *R. hirsutum*. The plant product may be altered through the addition of cranberry leaves.

Other Names: Rosebay, Snow Rose

ACTIONS AND PHARMACOLOGY

COMPOUNDS: RHODODENDRON AUREUM

Diterpenes of the andromedan type (presence questionable)

Hydroquinone glycosides: arbutin (ericolin)

Flavonoids: including polystachoside, avicularin, myricetin, gossypetin, azaleatin

Phenol glycosides (bitter substances): rhododendrine (betuloside, 4-(3'-glucosyloxybutyl)-phenol)

COMPOUNDS: RHODODENDRON FERRUGINEUM

Diterpenes of the andromedan type (presence questionable, but probable)

Flavonoids: including myricetin, gossypetin, azaleatin

Phenol glycosides (bitter substances): rhododendrine (betuloside, 4-(3'-glucosyloxybutyl)-phenol)

COMPOUNDS: RHODODENDRON PONTICUM

Diterpenes of the andromedan type: grayanotoxin I (andromedotoxin, acetyl andromedol, asebotoxin, rhodotoxin), grayanotoxin II (andromedol), grayanotoxin III (andromedenol).

Flavonoids: including myricetin, gossypetin, azaleatin

Phenol glycosides (bitter substances): rhododendrine (betuloside, 4-(3'-glucosyloxybutyl)-phenol)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Because the drug's composition is not fully known, its use cannot be recommended.

Unproven Uses: Rust-Red Rhododendron is used to treat rheumatic symptoms, calculosis, geriatric complaints, gout, high blood pressure, meteorosensitiveness, migraine, muscular pain and neuralgia.

Homeopathic Uses: The drug is used for neuralgia, rheumatism, and inflammation of the testicles.

PRECAUTIONS AND ADVERSE REACTIONS

The Rhododendron species mentioned are considered poisonous. The grayanotoxins prevent the closure of the sodium channels and thus paralyze conduction.

OVERDOSAGE

Signs of poisoning could include cardiac arrhythmias, coordination disorders, diarrhea, hypotension, cold sweats, paresthesia, salivation, severe stupor, spasm bradycardia, vomiting and eventually death through cardiac failure or apnea. Unambiguous proof of toxicity is available only for the foliage, blossoms and sap of *Rhododendron ponticum*.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulphate), administration of activated charcoal and shock prophylaxis (quiet, warmth), therapy for poisonings consists of treating spasms with diazepam (i.v.), bradycardia with atropine, electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Opiates should not be given. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Daily Dosage: The daily dosage is 5 to 6 gm of drug as an infusion.

See Brewer's Yeast

Safflower

Carthamus tinctorius

DESCRIPTION

Medicinal Parts: The medicinal parts are the flowers, seeds and the oil extracted from its embryos.

Flower and Fruit: Axillary flowers grow in the leaf axils. They are initially red-yellow, later bright orange. The heads are up to 4 by 3 cm and are encircled by upper leaves. The bracts are light green and have thorny tips with a thorny appendage. The fruit is 6 to 8 cm long, obovate or pear-shaped and bluntly wedge-shaped at the base with protruding long ribs. The pappus consists of scales.

Leaves, Stem and Root: *Carthamus tinctorius* is an annual plant, that grows up to 90 cm high. It has a thin fusiform root. The stem is erect, simple or branched at the top into stiff, glabrous, whitish-yellow and glossy branches. The leaves are long, fairly soft, and glabrous with a thorny-serrate margin and tip.

Habitat: The plant is said to be indigenous to Iran, northwest India and possibly parts of Africa. It is also found in the Far East and North America, and can be cultivated.

Production: Safflower blooms are the dried flowers of *Carthamus tinctorius*. The flowers are gathered as they begin to wilt, the calyx and inferior ovary are removed, the remainder is put in the shade where it is mildly warm, and

left to dry. Direct sunlight destroys the coloring pigment. Safflower or thistle oil is the oil extracted from the embryos of the fruits of *Carthamus tinctorius*.

Other Names: Dyer's Saffron, American Saffron, Fake Saffron, Bastard Saffron, Zaffer

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SAFFLOWER FLOWERS

Chalcones and their p-quinones: carthamin (yellow), carthamone (red-orange)

Flavonoids

EFFECTS: SAFFLOWER FLOWERS

No information is available.

COMPOUNDS: SAFFLOWER OIL

Fatty oil: chief fatty acids linoleic acid (55-88%), linolenic acid

Carotinoids

EFFECTS: SAFFLOWER OIL

Safflower oil lowers the serum cholesterol levels.

INDICATIONS AND USAGE

SAFFLOWER FLOWERS

Unproven Uses: In folk medicine, it is mainly used as a stimulant, purgative, antihydrotic, emmenagogue, abortifacient, expectorant, pneumonic and for tumors. It is also added to teas for soothing which soothe coughs and bronchial conditions.

Chinese Medicine: In China, Safflower flowers treat amenorrhoea and stomach tumors, as well as for external and internal wounds.

Indian Medicine: The flowers are used for scabies, arthritis, and chest pains.

SAFFLOWER OIL

Unproven Uses: Safflower oil is used for the prophylaxis of arteriosclerosis.

PRECAUTIONS AND ADVERSE REACTIONS

SAFFLOWER FLOWERS AND OIL

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

SAFFLOWER FLOWERS

Pregnancy: Not to be used during pregnancy.

DOSAGE

SAFFLOWER FLOWERS

Daily Dosage: The average daily dose is 3 gm of decoction; single dose is 1 gm.

Saffron

Crocus sativus

-:.-

DESCRIPTION

Medicinal Parts: The medicinal parts are the stigma and style.

Flower and Fruit: The lily-like flowers have two 2 bracts at the base. There is a pale violet-veined calyx, yellow anthers and a white filament. The thread-like style is 10 mm long. The stigma is bright orange. The plant is non-fruit-bearing.

Leaves, Stem and Root: The grass-like plant is a perennial that grows 8 to 30 cm high. There is a large squat tuber, surrounded by reticulate and fibrous sheaths. The leaves are erect or splayed, narrow, and have a ciliate margin and keel.

Habitat: The plant is indigenous to India, the Balkans and the eastern Mediterranean region. It is cultivated in India, Spain, France, Italy and the Middle East.

Production: Saffron is produced by drying the brown-red stigma over fire.

Not to be Confused With: The powdered drug is more or less always adulterated; *Calsendula officinalis*, *Carthamus tinctorius* are usually used.

Other Names: Spanish Saffron

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Apocarotenoid glycosides: in particular crocin (crocin-beta-digentiobioside), colored intensive yellow orange ^

Picrocrocin (glycosidic bitter principle, up to 4%): the apocarotenoids and picrocrocin are presumably breakdown products of a carotenoid-digentiobioside-diglucoside (picrocrocin)

Volatile oil (0.4 to 1.3%): components 4,5-dehydro-beta-cyclocitral (safranal), 4-hydroxy-beta-cyclocitral (breakdown products of the picrocrocin)

Carotenoids: lycopene, alpha-, beta-, gamma-carotene

Fatty oil

*Starch***EFFECTS**

Small doses of Saffron stimulate the secretion of the gastric juices. Large doses stimulate the smooth muscle of the uterus.

INDICATIONS AND USAGE

Unproven Uses: Saffron is no longer of interest medicinally. It is sometimes used in folk medicine to stimulate digestion.

Chinese Medicine: Chinese uses include menorrhagia, amenorrhea, high-risk deliveries and postpartum lochiostasis.

Indian Medicine: In India, Saffron is used for bronchitis, sore throat, headache, vomiting and fever.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Pregnancy: The herb is not to be used during pregnancy.

OVERDOSAGE

Lethal poisonings can occur with overdoses or through the abuse of larger doses as an abortient (abortive dosage approximately 10 gm, lethal dosage approximately 12 to 20 gm).

Symptoms of poisoning include vomiting, uterine bleeding, intestinal colic, bloody diarrhea, hematuria, severe severe purpuras, hemorrhaging of skin of the nose, lips and eyelids, attacks of dizziness, stupor, yellowing of the skin and the mucous membranes (through inclusion of the apocarotino-dermas) and central paralysis.

The treatment consists of stomach and intestinal emptying (gastric lavage, sodium sulfate) and the administration of activated charcoal; convulsions to be treated with diazepam, colics with atropine, and any eventual acidosis with sodium bicarbonate infusions. Intubation and oxygen respiration may also be necessary.

DOSAGE

Storage: It is stored in air-tight, non-synthetic containers and protected from light.

Sage

Salvia officinalis

TRADE NAMES

Sage (available from a number of manufacturers), Alcohol-Free Sage.

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh leaves and the fresh flowering aerial parts, the dried leaves, and the oils extracted from the flowers and stems.

Flower and Fruit: The medium-sized, pale violet, white or pink labiate flowers are in 6- to 12- blossomed false whorls, which are arranged above each other in 4 to 8 rows. The surrounding leaves fall early. The calyx is 10 to 14 mm long, funnel-shaped-campanulate, downy, glandular punctate and bilabiate. The upper lip has 3 thorny-awned teeth; the lower lip has 2. The corolla tube has a ring of hair inside. The upper lip is almost straight and the lower lip has 3 segments. There are 2 stamens with almost semicircular bent filaments.

Leaves, Stem and Root: Sage grows as a bush up to 60 cm high. The stem is erect and woody at the base with leafy, quadrangular, white-gray tomentose branches. The leaves are simple, oblong or oblong-lanceolate and narrowed at the base. They are petiolate, densely and finely crenate, ribbed-wrinkled, and white-gray tomentose initially, tough, and evergreen.

Characteristics: The leaves are aromatic, tangy, and bitterly astringent.

Habitat: The plant is indigenous to the Mediterranean region and has naturalized in all of Europe. It is cultivated in North America.

Production: Sage leaf consists of the fresh or dried leaf of *Salvia officinalis*. In the wild, sage is collected from the former Yugoslavia, the Adriatic coast and those areas that are farther from the coast but are still under Mediterranean influence. The harvest lasts from mid-July until December, depending on the area. October is recommended as the most favorable time to harvest Dalmatian sage.

When Sage is cultivated, it is recommended that the harvest take place beginning in the second vegetation year at the beginning of the flowering period and in the afternoon.

Sage can be dried in direct sunlight, but up to 25% of the oil can be lost. Drying in shade reduces oil loss to 2 to 10%. Optimum drying conditions for preventing oil loss use a drying chamber with vertical incoming air currents at 50° C with 0.9% absolute humidity.

Not to be Confused With: Confusion can arise with the leaves of *Salvia triloba* and also with *Salvia* or *Phlomis* species.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1.5-3.5%): chief constituents alpha-thujone and beta-thujone(20-60%), 1,8-cineole (6-16%), camphor (14-37%), borneol, isobutyl acetate, camphene, linalool, alpha- and beta-pinene, viridiflorol, alpha- and beta-caryophyllene (humulene)

Caffeic acid derivatives (3-6%): rosmarinic acid, chlorogenic acid

Diterpenes: chief components carnosolic acid (picrosalvin, 0.2-0.4%), rosmanol, safficinolide

Flavonoids: including, among others, apigenin- and luteolin-7-glucosides, numerous methoxylated aglycones, including among others, genkwanin, genkwanin-6-methylether

Triterpenes: chief components ursolic acid (5%)

EFFECTS

Sage has antibacterial, fungistatic, virostatic, astringent, secretolytic, and perspiration-inhibiting effects. In animal experiments, the herb was found to be antihypertensive and choleric. It acts on the CNS and is a spasmolytic agent. Proof of an antidiabetic effect found in one study has not yet been confirmed. The essential oil has bactericidal, fungistatic, and virostatic.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Inflammation of the mouth and pharynx
- Excessive perspiration

Sage is used externally for inflammation of the mucous membranes of the nose and throat and internally for dyspeptic symptoms and as a diaphoretic.

Unproven Uses: In folk medicine, the drug is used internally for gastric disorders such as loss of appetite, bloating, flatulence, diarrhea, enteritis, and excessive perspiration. Externally, Sage is used as a rinse and gargle for light injuries and skin inflammation, bleeding gums, stomatitis, laryngitis, pharyngitis, and for firming the gums.

Homeopathic Uses: The most common application in homeopathy is for excessive perspiration.

CONTRAINDICATIONS

Sage preparations are contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Sage preparations should not be taken during pregnancy.

OVERDOSAGE

A sense of heat, tachycardia, feelings of vertigo and epileptiform convulsions can occur following extended intake of ethanolic extracts of the drug or volatile oil, or through overdosage (corresponding to more than 15 g of the sage leaves).

DOSAGE

Mode of Administration: Cut herb for infusions, alcoholic extracts, and distillates for gargles, rinses, and other topical applications such as compresses or poultices. The pressed juice of fresh plants is also used. In folk medicine, Sage is used internally as an antihidrotic infusion and "medicinal cigarettes" are used for asthma.

How Supplied: Sage is available as an alcohol-free 1:1 liquid.

Preparation:

Tincture — prepared 1:10 with 70% ethanol.

Liquid extract — 1:1 with 45% ethanol.

The formulas for several "generic" folk medicine decoctions and infusions follows.

Decoction No. 1 — One spoonful of powdered drug scalded with 1 cup of water, quickly strained, and sweetened.

Decoction No. 2 — 15 g of the fresh leaves with 200 ml of water heated for 3 minutes.

Infusion No.1 — Scald 20 g dried leaves with 1 liter water, steep for 15 minutes, strain, press, and sweeten if required.

Infusion No. 2 — Pour 1 liter boiling water over 50 g drug, strain after 15 minutes and sweeten with honey.

Antihidrotic infusion — Scald 20 g of the dried leaves with 1 liter water, steep 15 minutes, strain, compress and sweeten if required.

Cardiac insufficiency — A tonic infusion is prepared by pouring 1 liter boiling water over 50 g of the drug, strain after 15 minutes, sweeten with sugar or honey.

Diabetes — Prepare a fortified wine made by boiling 100 g of the leaves with one liter wine for 2 minutes.

Inflammation of the bronchial mucous membranes — An expectorant honey is made by mixing 50 g of the powdered drug with 80 g of honey.

Nervous exhaustion — A fortified wine is manufactured using an 8-day maceration of 100 g of the leaves with one liter of wine.

Tumors — The drug is worked into an ointment base or pounded into a paste together with salt and vinegar to make an adhesive paste.

Wounds — The drug is prepared as a cleanser or rinse to heal wounds using a wine made by heating 100 g of the leaves with 0.5 liter white wine for 1 minute.

Daily Dosage: The average daily internal dose is 4 to 6 g of the drug; 0.1 to 0.3 g of the essential oil; 2.5 to 7.5 g of the tincture; 1.5 to 3 g of the liquid extract.

Antihidrotic — 0.25 g of the powdered drug (spoonful or capsules) taken before meals for excessive perspiration and nervous complaints.

Cardiac insufficiency — 1 glass of the tonic infusion can be taken 4 times daily. The decoction dosage (using No. 1 or No. 2) is 1 glass at hourly intervals.

Diabetes — 1 glass of the wine preparation after meals.

Halitosis — The leaves may be chewed occasionally.

Inflammation of the bronchial mucous membranes — 1 spoonful of the expectorant in the morning and at bedtime.

Nervous complaints — 0.25 g of the powdered drug (spoonful or capsules) before meals.

Externally, the following dosages/applications are often used:

Antihidrotic infusion — 200 ml of infusion 1 to three times daily.

Gargles and rinses — 2.5 g of the drug or 2 to 3 drops of essential oil in 100 ml of water as infusion or 5 g of the alcoholic extract in 1 glass of water.

Inflamed mucous membranes — Undiluted alcohol extract is applied repeatedly.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (**HAB1**), Special doses must be prepared for children.

Storage: Sage leaves are to be protected from light and humidity in sealed containers. Storage duration of coarsely cut drug is 18 months; powder, maximum 24 hours. The tincture is stored in tightly sealed containers away from light. **The liquid extract may be kept for up to 2 years.**

Salep

Orchis species

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the tubers of *Orchis morio* and other varieties.

Flower and Fruit: The flowers form erect spikes. The surrounding leaves are sometimes large and longer than the flowers; they are often colored. The pollen mass is enclosed in 1 to 2 sectioned anthers. The ovary is almost always twisted. The seed skins can be with or without a reticulate thickening.

Leaves, Stem and Root: The species are perennial, medium-sized, glabrous plants with a round, ovate or variously palmate tuber. The leaves are green, sheath-like and tapering.

Habitat: The plant comes from central and southern Europe.

Production: Salep tubers are the subterranean parts of *Orchis morio* and other varieties of *Orchis*. They are gathered during flowering season, dried and processed into Salep powder.

Other Names: Cuckoo Flower, Levant Salep, Orchid, Sahlep, Saloop, Satyrion

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilage (Salep mannan, up to 50%): glucans, glucomannans (partially acetylated)

Starch (25%)

Proteins (5-15%)

EFFECTS

The mucilage is rich in mucine and polysaccharides, which act as a demulcent and have protective and sequestering effects on mucous membranes. In animal tests, a lowering of the plasma cholesterol effect was proven. In addition, the drug is said to be analgesic, cholagogic and hypoglycemic. but no further details are available.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for unspecified diarrhea, particularly in children, and for heartburn, flatulence and indigestion.

Indian Medicine: Uses in Indian medicine include diabetes, hemiplegia, chronic diarrhea, neurasthenia and general debility.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As a powdered formulation in medicinal preparations.

Daily Dosage: Dosage for commercial pharmaceutical preparations for heartburn, flatulence and indigestion is often 1 teaspoon of powder stirred into a glass of warm water and drunk before or after meals.

Samphire

Crithmum maritimum

DESCRIPTION

Medicinal Parts: The aerial parts of the plant are the medicinal parts.

Flower and Fruit: The 10 to 20 radiating umbels are medium-sized, sturdy and domed. The barely 1 mm long petals are yellow or greenish-white. The style is very short and barely visible. The fruit is ovate-oblong. The fruit wall is thick and filled with a spongy, air-retaining tissue.

Leaves, Stem and Root: The plant is a perennial, glabrous shrub with woody base. The root is long, cylindrical, thick, hard, knotty, ringed, gray, branching upward and polycephalous. The stem is erect, 20 to 50 cm high, round, tender, grooved, hollowed, woody and with fewer branches higher up. The leaves are sea green, fleshy and glossy.

Habitat: The plant grows on the Atlantic, Mediterranean and Baltic coasts.

Production: Samphire herb is the above-ground part of *Crithmum maritimum*.

Other Names: Sea Fennel, Sampier, Crest Marine, Pierce-Stone, Peter's Cress.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil

Polyynes: including faltarindiol

Furanocoumarins

Ascorbic acid (high content)

EFFECTS

Samphire is a diuretic and also a source of vitamin C.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for scurvy and states of general resistance.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Samphire is used internally and is available as an extract and a food additive.

LITERATURE

Francke W, (1982) *Econ Bot* 36 (2): 163.

Hegnauer R, *Chemotaxonomie der Pflanzen*, Bde 1-11, Birkhauser Verlag Basel, Boston, Berlin 1962-1997.

Sandalwood

Santalum album

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the trunk wood, the heartwood freed from the sapwood and the bark, and the dried wood.

Flower and Fruit: The flowers are in numerous, small, short pedicled, odorless and erect panicle inflorescences. There is no calyx. The perianth is 4 to 5 mm long, campanulate and changes from yellow to deep red. There are 4 stamens at the mouth of the tube, which have simple hairs at their base. The semi-inferior ovary with 3 ovules is free in the bud and later enclosed in the disc. The fruit is a round, black, pea-sized drupe with a crown made up of the perianth remains.

Leaves, Stem and Root: The plant is a small evergreen tree up to 10 m high that flowers the whole year round. It has smooth bark and pendulous branches. The leaves are opposite, 4 to 6 cm long and 2 cm wide, lanceolate, entire-margined, and matte underneath. The petiole is approximately 1 cm long.

Characteristics: The wood has a characteristic odor.

Habitat: The tree grows wild in India and also is cultivated there and on Timor and the Sunda Islands.

Production: Sandalwood consists of the heartwood, the trunk and branches of *Santalum album* or *Pterocarpus santalinus*, which has been freed from the bark and sapwood.

Not to be Confused With: Confusion can arise with other sandalwoods, i.e. the heartwood of *Pterocarpus santalinus*. The white sapwood, which contains almost no essential oil, is occasionally marketed as *Lignum santali albi*. The brownish-yellow to brown-red root wood is, in contrast, rich in essential oil, but is disallowed as a drug in EB6.

Other Names: Sanderswood, White Saunders, Yellow Saunders

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (3-5%): chief components santalols (50% cis-alpha-santalol, 20% cis-beta-santalol, 4% epi-beta-santalol), further including among others, alpha-bergamotol, alpha-bergamotal

Tannins

Resins

EFFECTS

The essential oil of Sandalwood has disinfecting effect on the urinary tract. However, if used in high doses and for long periods, it can be toxic to the kidneys.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract

Sandalwood is used for inflammatory conditions of the efferent urinary tract. It is generally used in combination with other diuretic or urinary disinfecting drugs.

Chinese Medicine: The Chinese use Sandalwood primarily for epigastric pain, chest pain and vomiting.

Homeopathic Uses: Uses of the drug in homeopathy include urethral inflammation. It is advisable to use Sandalwood in combination with other diuretic or urinary disinfecting drugs.

Indian Medicine: Internal uses include heat stroke, sunstroke and resulting fever. It is used as an infusion mixed with honey (in Kerala); with water cooked in rice (in Nepal): in the treatment of gonorrhea and as an anti-aphrodisiac in ayurvedic medicine.

CONTRAINDICATIONS

Sandalwood is contraindicated in diseases of the kidney.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Intake can occasionally lead to skin itching, queasiness, gastrointestinal complaints and hematuria. The drug possesses minimal potential for sensitization.

DOSAGE

Mode of Administration: Sandalwood is used internally in preparations derived from comminuted drug.

Preparation: Sandalwood oil should only be taken in an enteric-coated form.

Daily Dosage: The average daily dose is 10 g of the drug; 1 to 1.5 g of the essential oil.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34).

Sandarac

Tetraclinis articulata

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the naturally flowing resin and the bark.

Flowers and Fruit: The inflorescences are apical on the lateral branches and conical. The male flowers are 4 to 5 mm wide. There are 4 stamens with very short filaments and scale-like anthers. The female flowers are very small, with 4 scales in 2 pairs arranged like whorls. The upper surface of the flower is fleshy, with a swelling at the base almost completely covering the ovules, which are on woody, dark-brown, approximately 12 mm long cone scales. The seeds are narrow ovoid with large, membranous wings on both sides.

Leaves, Stem and Root: *Tetraclinis articulata* grows as a monoclinous, monoecious evergreen shrub or tree, reaching a height of up to 12 m. The leaves are opposite, scaly, long and down-turned. They grow close together in groups of 2 pairs on young branches in whorls. The branches are jointed and somewhat pressed together.

Habitat: North Africa, particularly Morocco and Algeria

Production: Sandarac gum is the resin that flows naturally from the branches and bark of *Tetraclinis articulata*.

Other Names: Arartree, Alerce, Sandarac Gum Tree, Gharghar

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes (95%): diterpene acids: including pimaric acid, callitrolic acid, sandaracinic acid, sandaracinolic acid, sandaracolic acid, callitrisinic acid

Bitter substances

Volatile oil (1.3%): including alpha- and beta-pinene, limonene, thymoquinone

EFFECTS

The resin is said to be antibacterial and bacteriostatic in effect. Experimental data supporting these effects is not available.

INDICATIONS AND USAGE

Unproven Uses: The plant's use as a fumigant for rheumatic and gouty complaints and edematous swellings has been known since the 19th century. Other folk medicine uses include fever and diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and cut drug is either inhaled or used in the form of compresses.

Sarsaparilla

Smilax species

TRADE NAMES

Sarsaparilla (available from numerous manufacturers) Sarsaparilla Root

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried roots, the entire underground part and the tuberous swellings produced by the runners.

Flower and Fruit: The flowers are white to pale green, yellow or brown. They are dioecious, usually in axillary cymes or racemes, and contain 6 petals in 2 circles. The ovate to lanceolate tepals are curved outward. The male flowers have 6 stamens with thick filaments and anthers, which are fused at the base of the petals. The female flowers have 6, sometimes only 3, staminoids. The ovate ovary has 3 carpels, each with 1 to 2 atropic ovules and with an almost sessile, bent-back, 3-lobed stigma. The fruit is a globular, red, blue or black berry with 1 to 6 seeds.

Leaves, Stem and Root: The species are evergreen shrubs or semishrubs with climbing branches and stipular tendrils. They have a short, gnarled, perennial, creeping or ascending rhizome with numerous long roots stretching over many meters. The branched, thorny, nodular stem has the thickness of an arm and is yellowish-green. The leaves are in 2 rows. They are alternate, simple and often hardy, with 3, occasionally 5, reticulately joined main ribs. The leaf sheaths are ovate and cordate, sagittate and petiolate, or often stipule-like. They turn into climbing tendrils above and break off at this point when they die.

Habitat: The species is indigenous to tropical and subtropical regions of America, eastern Asia and India. In Europe, only the variety *S. aspera* is found in the Mediterranean region.

Production: Sarsaparilla consists of the dried root of *Smilax* species, such as *Smilax aristolochiaefolia*, *Smilax regelii* and *Smilax febrifuga*. The plant is collected in the wild from January to May. The roots are cut up and air-dried.

Not to be Confused With: Adulterations and mistaken identity often occurs among the *Smilax* species.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins (0.5-3%): chief components are sarsaparillose, along with parillin, as a breakdown product; also including among others desglucoparillin, desglucorhamnoparillin, aglycones sarsapogenin

EFFECTS

The steroid saponins in the drug are responsible for its irritating effect on the skin and the strong diuretic and diaphoretic effect in high doses, as well as its effect as an emulsifier and foam stabilizer.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Sarsaparilla root are used for skin diseases, psoriasis, rheumatic complaints, kidney diseases, and as a diuretic and diaphoretic.

Homeopathic Uses: In homeopathy *Smilax* is used for itching skin rashes, rheumatism and inflammation of the urinary organs.

- PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Stomach complaints and queasiness may occur in rare cases, as could kidney irritation.

DOSAGE

Daily Dosage:

Powder — 0.3 to 1.5 g drug

Tea — 3 cups daily with meals

Cold water extract — 500 ml mornings and evenings

Decoction — 1 to 5 g 3 times daily

Tincture — 5 to 15 g per day

Liquid extract — 8 to 15 ml

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB34)

Sassafras

Sassafras albidum

DESCRIPTION

Medicinal Parts: The medicinal parts are the essential oil of the root wood, the peeled and dried root bark, and the root wood.

Flower and Fruit: The flowers appear before the leaves. They are dioecious, small and yellowish, and form loose cymes. The perigone has 6 tepals. The male flower has 6 filaments and the female has 1 ovate ovary and 6 bent stamens. The fruit is a pea-sized, oval drupe that, when ripe, is dark blue and appears in the beaker-shaped receptacle.

Leaves, Stem and Root: *Sassafras albidum* is a deciduous tree up to 30 m tall with numerous branches. The bark of the trunk and of the thicker branches is rough, deeply grooved and grayish. The bark of the outer branches is green. The alternate leaves are petiolate and 7 to 12 cm long. Some are simple ovate, others deeply 2- or 3-lobed. The root bark is a bright, rusty-brown and its irregular pieces are soft, brittle and corky. They grow in distinct layers and show numerous oil glands. The root itself is brownish-white with clear concentric rings traversed by narrow medullary rays.

Characteristics: The taste is sweet and slightly astringent and the odor is pleasantly aromatic. *Sassafras'* carcinogenic effect, however, has made its use inadvisable.

Habitat: The plant is common to eastern North America, Mexico, and Taiwan.

Production: *Sassafras* wood is the root wood of *Sassafras albidum*. The woody roots (up to 20 cm thick) are dug up in

autumn, then shredded, cut or sawn into cubes. The wood must not be moistened when being cut because moisture will cause a deterioration of smell and taste in the later drying process.

Not to be Confused With: *Sassafras* root wood is sometimes confused with the wood of the tree's trunk, which has distinctive annual ring growth and marrow, or with the bark, which has calculus and primary fibers. Another difference is that the trunk wood and bark have little smell or taste.

Other Names: Ague Tree, Cinnamon Wood, Saxifrax, *Sassafras*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (6-9%): chief components safrole (up to 90%), 5-methoxyeugenol (up to 30%), asarone (up to 18%), camphor (up to 5%)

Isoquinoline alkaloids: representatives of the aporphine and reticuline type (less than 0.1%)

EFFECTS

The drug is said to have a mild diuretic effect, which is undocumented. The toxic characteristics are determined by the essential oil, which contains safrole (*sassafras aetheroleum* that is renal toxic and carcinogenic).

INDICATIONS AND USAGE

Unproven Uses: *Sassafras* is considered obsolete, but previously was used for disorders of the urinary tract. The drug, which was formerly an ingredient of "blood-cleaning tea," has also been used for skin disorders, inflammation of the mucous membranes, rheumatism and syphilis.

PRECAUTIONS AND ADVERSE REACTIONS

Because of the carcinogenic effect of the safrole, neither the drug nor its volatile oil should be administered.

DOSAGE

Mode of Administration: The drug is a constituent of tea mixtures.

Preparation: To prepare an infusion, add 50 g of the drug to 1 liter of water. To prepare a tea, add 1 teaspoonful (3 g) of the drug to boiling water and strain after 10 minutes. A tincture is prepared using 200 parts coarse powder mixed with 100 parts diluted wine spirit.

Daily Dosage: A single dose of tincture consists of 5 g.

Storage: Keep *Sassafras* in a tightly sealed tin container.

Savin Tops

Juniperus sabina

DESCRIPTION

Medicinal Parts: The medicinal parts are the essential oil of the leaves and branch tips; the dried leafy branch tips; the fresh, youngest non-woody branch tips with leaves; and the branches and leaves.

Flower and Fruit: The male and female flowers are at the end of the twigs, which are covered in leaf-scales. The male flowers are up to 2 mm wide and oblong to ovate. The female flowering branch bears the flowers erect when in bloom, later curved inward. The flowers have 4 carpels, which develop into pea-sized berry-cones with 4 ovate seeds. The seeds are ovate and striped with numerous edges.

Leaves, Stem and Root: It is generally a 4.5 m high, dioecious, evergreen shrub with either an erect trunk, an irregular crown or numerous low-lying branches with erect tips. The bark of the young branches are light brown, of more mature branches red-brown and peeling. The young plants up to 10 years have only needle-like 4 mm long, blue-green leaves whose tips stand out. -Mature plants have -triangular, scale-like, imbricate leaves.

Habitat: Found in southern and central Europe, the Caucasus and the southern mountains of Asian Russia, as well as in the northern U.S.

Production: Savin Tops is the young shoots and twig tips of *Juniperus sabina*.

Other Names: Savin, Savine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (3-5%): chief components sabinyl acetate, sabinene, further including among others beta-myrcene, terpin-4-ol, gamma-terpinene, alpha-pinene, limonene

Lignans: including among others deoxypodorhizone, deoxypodophyllotoxin, junaphtoinsaure, deoxypicropodophyllo-toxin, and dehydropodophyllotoxin

Hydroxycoumarins: including among others cumarsabine, 8-methoxycumarsabine, siderin, 4-methoxy-5-methylcoumarin- propiophenone

Propiophenone derivatives: including among others 2-hydroxy-3,4-dimethoxy-6-methyl-propiophenone

EFFECTS

The drug is hyperemic both internally and externally, and is a strong irritant to the skin and mucous membrane.

Lignans are also said to have antineoplastic and antiviral properties: The main substance is 3 to 5% essential oil with

thujon acting as the principal ingredient, along with containing podophyllotoxin and other lignans.

A diuretic effect has been described for the essential oil and the drug is also said to be emmenagogic and hemostyptic.

The use of the drug on viral warts seems justified because of the podophyllotoxin content.

INDICATIONS AND USAGE

Unproven Uses: For external use only, in the treatment of fig warts.

Homeopathic Uses: Juniperus sabina is used for metrorrhagia, gout, inflammation of the urogenital tract, rheumatism and warts.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely toxic. External administration, in particular of the volatile oil, can lead to severe skin irritation, blister formation, necroses and resorbent poisonings.

OVERDOSAGE

One is cautioned against internal administration of the drug and of the volatile oil. Fatal poisonings have occurred repeatedly following administration of the drug in either powder form or infusion as an abortient. Symptoms include, among others, queasiness, cardiac rhythm disorders, spasm, kidney damage and hematuria. Death finds the patient in a state of central paralysis and deep unconsciousness. The internal administration of 6 drops of the volatile oil is life-threatening for humans.

Following gastrointestinal emptying, (inducement of vomiting, gastric lavage, sodium sulfate) and instillation of activated charcoal, the therapy for poisonings consists of treating spasms with diazepam (I.V.), colic with atropine, electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. Monitoring of kidney function, blood coagulation and liver values is essential. Intubation and oxygen respiration may also be necessary. The level of danger depends upon the age of the drug of the volatile oil, as the toxicity probably develops chiefly through the formation of terpene peroxides during storage. The fresh tips of the branches contain presumably very little toxicity.

DOSAGE

Mode of Administration: For external use, as a powdered drug. Internal application is obsolete because of the danger of intoxication.

Daily Dosage: maximum 1 gm externally.

Savin Tops powder - Powder twice daily, put bandages into the folds of skin.

Skin ointment - Average content: 50% drug.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Saw Palmetto

Serenoa repens

TRADE NAMES

Saw Palmetto (available from numerous manufacturers), Saw Palmetto Berries, Saw Palmetto Standardized, Centrum Saw Palmetto, Proactive Saw Palmetto, Standardized Saw Palmetto ExtractCap, Saw Palmetto Extract, Saw Palmetto Power, Premium Blend. Saw Palmetto, Herbal Sure Saw Palmetto, Quanterra Prostate, Super Saw Palmetto Plus

DESCRIPTION

Medicinal Parts: The medicinal parts are the partially dried ripe fruit, the ripe fresh fruit and the ripe dried fruit.

Flower and Fruit: The inconspicuous cream flowers are in short, densely pubescent, paniculately branched inflorescences. The fruit is deep purple to almost black. It is an ovate, 3 cm long, 1-seeded berry. It has a hard but fragile pericarp that covers a pale brown, spongy pulp. The endocarp is thin and papery. The fruit is slightly wrinkled,

1.25 to 2.5 cm long and 1.25 cm in diameter. The hard seed is pale brown, oval or globular, and has a hilum near the base. The whole panicle can weigh up to 4 kg.

A *Leaves, Stem and Root:* The plant is a bushy palm with a maximum height of 6 m. The large, yellow-green leaves have up to 20 segments and form a crown.

Characteristics: The taste of the seeds is soapy and unpleasant.

Habitat: The plant is indigenous to the coastal regions of the southern states of the U.S., from South Carolina to Florida and southern California.

Other Names: Sabal, Shrub Palmetto

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroids: Sterols, including beta-sitosterol, beta-sitosterol-3-O-glucosides, beta-sitosterol-3-O-digluconide, beta-sitosterol-3-O-fatty acid esters and their glucosides, for example beta-sitosterol-3-O-myristate, beta-sitosterol-3-O-(6-O-myristyl-beta-glucosides)

^ *Flavonoids:* including isoquercitrin, kaempferol-3-O-gluconides, rhoifolin

Water-soluble polysaccharides (galactoarabane with uronic acid)

Fatty oil: free fatty acids

The lipophilic components (fatty oil with phytosterines) can be found in ethanolic and hexane-extracts. The anti-exudative components (polysaccharides) are found in aqueous extracts. Ethanolic extracts contain both component groups.

EFFECTS

Anti-Androgenic Effects

W* The lipophilic extract of the herb inhibits binding of dihydrotestosterone (DHT) to the cytosolic androgenic receptor and alpha 1-adrenoceptor in the prostate, thus preventing accumulation of the steroid, which may lead to prostate hyperplasia (Carilla, 1984; Goepel, 1999). Anti-androgenic effects of the lipophilic extract also consist of 5-alpha-reductase and 3-ketosteroid reductase inhibition. These enzymes are responsible for the conversion of testosterone to DHT and for conversion of DHT to an androgen compound, respectively (Sultan, 1984).

Anti-Estrogenic Effects

The herb lowers cytosol and nuclear receptor values for estrogen which result in an anti-estrogen effect since progesterone receptor content is linked to estrogenic activity. Anti-estrogenic agents inhibit stromal prostate mass growth in patients with benign prostate hypertrophy (DiSil-

verio, 1992). There is also some evidence with inhibition of several steps involved in prolactin receptor signal transduction in ovary cells (Vacher, 1995).

Anti-Inflammatory Effects

The hexane extracts of the herb have demonstrated anti-inflammatory activity (Champault, 1984). Inhibition of the synthesis of arachidonic acid inflammatory metabolites, through a double blocking of cyclooxygenase and 5-lipoxygenase pathways results in anti-inflammatory properties. (Breu, 1992). The drug also contains anti-spasmodic properties by inhibiting calcium influx and activation of the sodium/calcium ion exchanger. Induction of protein synthesis plays a role in the antispasmodic effect with cyclic AMP as a possible mediator. Extracts of the drug may also antagonize the contracting effect of acetylcholine on urinary bladders. (Gutierrez, 1996).

CLINICAL TRIALS

Benign Prostatic Hyperplasia

The effect of Saw Palmetto on voiding symptoms and urodynamic parameters was determined in men with lower urinary tract symptoms (LUTS) presumed secondary to benign prostatic hyperplasia (BPH). The study was conducted over a 6-month period with Saw Palmetto 160 mg given twice daily. Parameters evaluated included peak urinary flow rate, postvoid residual urine volume, pressure-flow study and serum prostate-specific antigen. The herb was well-tolerated and significantly improved urinary tract symptoms. There was no significant improvement in objective measures of bladder outlet obstruction (Gerber, 1998).

A 6-month, double-blind, randomized equivalence study was conducted to compare the effects of a Saw Palmetto extract (320 mg Permixon) with those of a 5-alpha-reductase inhibitor (5 mg finasteride). The study included 1098 men with moderate benign prostate hypertrophy (BPH) using the International Prostate Symptom Score (IPSS) as the primary end-point. The finasteride and Permixon treatment groups relieved the symptoms of BPH including a decrease in IPSS, improved quality of life and increased peak urinary flow rate. There was no statistical difference in improvement between the two treatment groups. Finasteride markedly decreased serum PSA levels and prostate volume while Permixon had little effect on androgen-dependent parameters. This conclusion suggests that other pathways might also be involved in the symptomatology of BPH (Carraro, 1996).

Serenoa repens given 160 mg twice daily was compared to alfuzosin 2.5 mg three times daily to determine the effect on 63 benign prostatic hyperplasia. The double-blind, comparative, parallel-groups study determined efficacy by assessment of clinical symptoms (Boyarsky's scale, visual

analogue scale, clinical global impression), urinary flow rates (uroflowmetry) and residual urinary volume (transabdominal ultrasound). The *Serenoa repens* treatment group had similar improvement to that of the alfuzosin treatment group, but significant effects were in favor of the alfuzosin treatment group with overall clinical impression and visual analogue scale (Grasso, 1995).

INDICATIONS AND USAGE

Approved by Commission E:

- Prostate complaints
- Irritable bladder

Saw Palmetto is used for urination problems in benign prostate hyperplasia stages I and II. This medication relieves only the difficulties associated with an enlarged prostate without reducing the enlargement.

Unproven Uses: In folk medicine, Saw Palmetto is used for inflammation of the urinary tract, bladder, testicles and mammary glands. It has been used for nocturnal enuresis, persistent cough, eczema and improvement of libido.

Homeopathic Uses: The herb is used for micturition problems and inflammation of the urinary tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Stomach complaints following intake have been observed in rare cases. Patients with hormone-dependent cancers should observe caution and speak to a physician regarding the use of Saw Palmetto because of its anti-estrogenic, estrogenic and anti-androgenic effects. The use of Saw Palmetto with pregnancy and breast feeding is not recommended due to its potential hormonal effects.

Drug Interactions: Saw Palmetto is believed to exert estrogen, androgen and alpha-adrenergic blocking effects. Because of this, the use of hormones, hormone-like drugs or adrenergic drugs concomitantly may need to be adjusted.

DOSAGE

Mode of Administration: Comminuted herb and other galenic preparations for oral use.

How Supplied:

Capsule—80 mg, 125 mg, 160 mg, 227 mg, 250 mg, 320 mg, 450 mg, 500 mg, 565 mg, 570 mg, 585 mg, 600 mg, 1000 mg

Liquid—1:1

Daily Dosage: The average daily dose is 1 to 2 gm of the drug or 320 mg of the lipophilic extract (hexane or ethanol 90% v/v). Dosages used in studies demonstrated efficacy at

160 mg given twice daily or 320 mg given once daily (Carraro, 1996; Gerber, 1998; Grasso, 1995).

See *Premorse*

Scarlet Pimpernel

Anagallis arvensis

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the dried flowering herb, usually with the roots removed.

Flower and Fruit: The plant has 6 to 10 brick-red flowers in the leaf axils, which are up to 2.5 times as long as the bracts. The symmetrically radiating flower has a double perianth. It has 5 sepals that are 4 to 5 mm long, entire-margined, narrow-lanceolate and acute. The wheel-shaped corolla is usually vermilion, but occasionally blue-flesh colored, lilac or white. The tip of the corolla is obovate to oval, about 7 mm long by 6 mm wide, overlapping at the base, entire-margined or slightly crenate with 50 to 70 glandular hairs. Its 5 stamens have a distinct awn and are fused to a funnel at the tube. The anthers are short, ellipsoid and cordate at the base. The superior ovary is globose and one-valved with an oblong style and head-like stigma. The fruit is a globose pyxidum, 4 to 5 mm in diameter, that contains 20 to 22 rough wart-like, brown seeds 1.3 mm long by 1 mm wide.

Leaves, Stem and Root: *Anagallis arvensis* is an annual herb with prostrate, creeping, square stems up to 30 cm long. Its thinner, branched, ascending stems grow to a length of 6 to 30 cm. The square shoots, like the leaves, are thickly covered with short hairs when young; they later become glabrous. The leaves are opposite, occasionally in whorls of 3, ovate to lanceolate, up to 20 mm long by 10 mm wide, sessile, entire-margined, acute and spotted black on the underside.

Characteristics: The flowers, which are poisonous, close at night and open at about 9:00 each morning. They also close at the first sign of rain.

Habitat: The plant is widely distributed throughout Europe, Asia, the U.S. and non-tropical South America.

Production: Scarlet Pimpernel herb is the dried herb in flower of *Anagallis arvensis*, generally without the root but occasionally including the whole plant. It is collected in the wild and also cultivated.

Not to be Confused With: The blue flowering form of Scarlet Pimpernel is often confused with *Anagallis foemina*, and occasionally with *Stellaria media*.

Other Names: Adder's Eyes, Poor Man's Weatherglass, Red Chickweed, Red Pimpernel, Shepherd's Barometer

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins: including anagalline, chief sapogenine 13, 28-epoxy-16-oxooleanan

Cucurbitacins: including cucurbitacins E, B, D, I and L

Flavonoids

Caffeic acid derivatives

EFFECTS

In vitro and animal tests showed the drug (main constituents saponins and amaroids of the cucurbitacin group) to have fungitoxic, antiviral, taecidal, spermicidal, estrogenic, oxytocic and hemolytic effects. The aqueous extract of the dried leaves is fungitoxic. Triterpenglycoside, anagalloside and aglycon anagalligenones, when isolated from the drug, displayed inhibitory results against numerous micro-organisms. Aqueous extracts showed uterine contracting activity in rats, guinea pigs, rabbits, and on strips of human uterine material. The triterpene saponins isolated from the drug demonstrated action against human sperm. The methanol extract of the drug demonstrated estrogen activity in the Allen-Doisy test. The saponins isolated from the powder[^] drug with ethanol demonstrated hemolytic activity in human blood. The methanol extract of the dried powdered drug is antiviral against *Herpes simplex Type I*, *Adenovirus Type II* and *Polio Type II*, among others. The saponins are the active constituents. The acetyl-saponin isolated from the drug acts as a teniacide.

INDICATIONS AND USAGE

Unproven Uses: The drug is used to treat depression, disorders of the mucous membranes, hemorrhoids, herpes, painful kidney and liver disorders (in particular, to increase urination), poorly healing wounds and pruritus. The herb is used as a supporting treatment in various carcinomas. It is used both internally and externally (as a poultice) to treat pains in the joints.

Chinese Medicine: The herb is used for snake bites, dog bites, fish poisoning, joint ailments and edema.

Indian Medicine: Employed as a treatment for menstruation disorders.

Homeopathic Uses: Used in the treatment of skin rashes, warts and urinary tract infections.

Efficacy has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Large doses or long-term administration could lead to gastroenteritis and nephritis, due to the cucurbitacins content of the drug.

OVERDOSAGE

Higher dosages (no amounts specified) are said to have a strong diuretic, diarrheic and mildly narcotic effect.

DOSAGE

- A *Mode of Administration:* Scarlet Pimpernel topically as a poultice and internally as an infusion.

Preparation: For the treatment of liver and kidney disorders as well as dropsy, add one teaspoonful of the drug to a glass of hot water and let it steep for 10 minutes. Drink throughout the day.

Daily Dosage: The usual dosage is 1.8 g of the powder 4 times a day.

Homeopathic Dosage: The oral dosage is 5 to 10 drops, 1 tablet or 10 globules daily. The parenteral dosage is 1 ml twice a week sc. Topically, ointment can be applied 1 to 2 times daily.

Schisandra (Wu-Wei-Zi)

Schisandra chinensis

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the fruit.

Flower and Fruit: The flowers are in clusters with a few blossoms in the axils of the bracts. There are 6 to 8 tepals. The perigone of the male flowers has 6 to 8 tepals that are 6 to 11 mm long and 5 mm wide, and 5 to 15 stamens. The female flowers have a similar perigone and 17 to 40 elongated, elliptical ovaries. The round, fleshy, berry-like fruit grows as a slim, hanging aggregate or as bloomed individual fruits. The fruit is deep red to black-brown and appears partly white-powdered. The fruit has a diameter of 5 to 8 mm and contains 1 to 2 reniform seeds.

Leaves, Stem and Root: This liana plant can be monoecious or dioecious. The leaves are alternate. They are arranged like whorls on short shoots. The petiole is 1 to 4 cm long. The lamina is 5 to 11 cm long, 3 to 9 cm wide, elongate to ovate-elliptical, serrate to dentate with up to 3 teeth per cm. The upper surface is green or brown. The lower surface is partly pubescent. The young branches are brown to purple.

Characteristics: The crushed seeds taste hot and are aromatic.

Habitat: The plant is indigenous to northeastern China and Korea.

Production: Northern schisandra fruit is the dried, ripe fruit of *Schisandra chinensis*. The fruit is harvested in autumn, then steamed before being dried in the sun.

Other Names: Chinese Mock-Barberry, Lemonwood

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: containing among others, alpha- and beta-chamigrene, chamigrenal, sesquicarene, (+)-ylangene

Ascorbic acid (vitamin C)

Lignans (in the seeds 5 to 20%): dibenzo[a,c]cyclooctene derivatives, including schizandrine A to C, schizandrol A and B, schizanthrine A and B, gomisins D to J, KI to K3, LI and L2, M1 and M2. N and O, P to T, the gomisins present to some extent as esters, among them those of angelic acid, benzoic acid and acetic acid; additional lignans with other parent substances, including pregomisin

Fatty oil (in the seeds): chief fatty acids oleic acid and linoleic acid

EFFECTS

The lignans isolated from the drug (schizandrin, schizandrol) are liver-protective in effect, acting as radical scavengers and promoting liver regeneration. Anti-inflammatory and tumor-inhibiting characteristics have also been demonstrated. Schizandrol A is said to be neuroleptic, anticonvulsive and sedative in effect. Schisandra fruits and seeds are believed to bring about a non-specific increase in physical performance ability and to be antihelminthic in effect.

INDICATIONS AND USAGE

Chinese Medicine: The plant is used mainly for conditions of the digestive tract such as intestinal inflammation, and also for insomnia, enuresis, pollakisuria, nightly ejaculation, coughs, chronic diarrhea, dyspnea, insomnia, spontaneous outbreaks of sweating, hepatitis, neurasthenia and anxiety states. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and powdered drug and their preparations for internal use.

Preparation: To prepare Cuwuweizi powder, the drug is evaporated in the ratio of 1:5 with vinegar in closed containers until the surface turns black. This substance is then ground to a powder.

Daily Dosage: Powder/tincture/extract: 1.5 to 6 g daily

Storage: Store in dry area with good air circulation to avoid fungal formation.

Scolopendrium vulgare

See *Hartstongue*

Scopolia

Scopolia carniolica

DESCRIPTION

Medicinal Parts: The medicinal part is the dried rhizome.

Flower and Fruit: The nodding flowers are solitary and axillary on long bending pedicels. The calyx is campanulate with obtuse tips. The corolla is tubular-campanulate, glossy brown outside, and matte olive-green inside. The anthers are large and yellowish. The fruit is a 2-valved pixedium. The seeds are 3 to 4 mm long, brownish-yellow and bumpy.

Leaves, Stem and Root: The erect perennial plant grows from 30 to 60 cm high. The rhizome is horizontal, slightly bent and almost cylindrical. The rhizome grows up to 12 cm long and 5 cm thick, and is covered in tough, loose-skinned fibers. The color varies between yellowish-brown to dark brownish-gray. The stems bear scale-like stipules at the base that are bifurcated, fleshy and also glabrous or with scattered hairs. The 12 cm by 4 to 9 cm foliage leaves are petiolate, obovate, entire-margined or lightly sinuate and dull green.

Characteristics: Scopolia is considered to be a narcotic. The taste is initially somewhat sweet, then bitter and biting. The plant is odorless.

Habitat: The plant is indigenous to southern Germany, Austria, Hungary, and southwest Russia.

Production: Scopolia root consists of the dried rhizome of *Scopolia carniolica*.

Other Names: Scopolia, Japanese Belladonna, Belladonna Scopolia, Russian Belladonna

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tropane alkaloids (0.2-0.5%): chief alkaloid (-)-hyoscyamine, which changes (to some extent) under drying conditions into atropine; also including scopolamine

Hydroxycoumarins: including among others, scopoletins, scopoline

Caffeic acid derivatives: chlorogenic acids

EFFECTS

The drug acts as a parasympatholytic/anticholinergic via competitive antagonism of the neuromuscular transmitter acetylcholine. Because of its parasympatholytic properties, Scopolia root relaxes the smooth muscle organs and eliminates spastic conditions, especially of the gastrointestinal tract and the bile ducts.

Conditions of muscular tremors and muscular rigidity caused by central nervous impulses, are alleviated. The action on the heart is positively chronotropic and positively dromotropic.

INDICATIONS AND USAGE

Approved by Commission E:

- Liver and gallbladder complaints

The drug is used for spasms and colic-like pain of the gastrointestinal tract, bile ducts, and urinary tract for adults and for children over 6 years of age.

CONTRAINDICATIONS

The drug is contraindicated in angle-closure glaucoma, prostatic adenoma with residual urine, tachycardia, mechanical stenosis in the area of the gastrointestinal tract, and megacolon.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. However, accommodation disorders, heat build-up due to a decline in sweat secretion, micturition disorders, and obstipation can occur as side effects, particularly with overdoses. Scopolia should be used only under the supervision of an expert qualified in its appropriate use.

Drug Interactions: Scopolia increases the effectiveness of simultaneously administered tricyclic antidepressants, amantadine, and quinidine.

OVERDOSAGE

The four early warning symptoms of atropine poisoning are skin reddening, dryness of the mouth, and tachycardiac arrhythmias and mydriasis. In addition, other side effects, particularly with overdoses, can include accommodation disorders, heat build-up through decline in sweat secretion, micturition disorders, and obstipation.

The intake of very high dosages leads to central excitation (restlessness, compulsive speech, hallucinations, delirium, manic episodes, followed by exhaustion and sleep). Potentially lethal dosages for adults start at 100 mg of atropine, depending upon alkaloid content, and may result from use of between 20 to 50 g of the drug: considerably less can prove lethal for children.

The treatment for poisonings includes gastric lavage; temperature-lowering measures with wet cloths (no antipyretics!); oxygen respiration for respiratory distress; intubation; parenteral physostigmine salts as antidote; diazepam for spasms and chlorpromazine for severe excitation.

DOSAGE

Mode of Administration: Comminuted root, powder and other galenic preparations for oral application.

Daily Dosage: The average daily dose is equivalent to 0.25 mg of total alkaloids, calculated as hyoscyamine. The maximum daily dose should not exceed the equivalent of 3.0 mg of total alkaloids, calculated as hyoscyamine. The maximum recommended single dose is equivalent to 1.0 mg of total alkaloids, calculated as hyoscyamine.

Scotch Broom

Cytisus scoparius

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried and stripped broom flowers, the dried aerial parts (broom herb) and freshly picked flowers.

Flower and Fruit: The bilabiate flowers are bright yellow, 20 to 25 mm long, large, solitary or in pairs. The flowers are on 2 or 3 obovate bracts on short stems, or singly in the leaf axils. They seem to form long racemes. The corolla is bright yellow, sometimes white. The standard is revolute, the wings obtuse. The ovary is short-stemmed and villous with a glabrous, strongly hooked style. The pod is oblong, compressed, glabrous on the surfaces, villous on the seams and is a matte black. There are numerous brown-black seeds.

Leaves, Stem and Root: Scotch Broom is a shrub that grows from 0.5 to 2 m high. The tap root is very sturdy and woody. The bark of the root is brown. The branches are thick, usually crooked, and the bark is also brown." Young shoots are glabrous, later pubescent. The branchlets are cane-like, erect and pentagonal. The leaves are small, short-petioled, with 3 obovate to lanceolate, 1 to 2 cm long and 1.5 to 9 mm wide, pointed leaflets. The leaflets, particularly on the undersurface, are silky pubescent. After flowering, sessile and entire leaves form on the upper shoot.

Habitat: The herb is found in Europe, northern Africa, Canary Islands, North America, Chile, South Africa and Japan.

Production: Scotch Broom herb consists of the aerial parts of *Cytisus scoparius*. Broom flowers consist of the flowers of *Cytisus scoparius*.

Not to be Confused With: The herb should not be confused with other *Cytisus* or *Genista* varieties. The flowers should not be confused with Spanish Broom.

Other Names: Broom, Broomtops, Besom, Scoparium, Irish Tops, Basam, Bizzom, Browme, Brum, Bream

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SCOTCH BROOM HERB

Quinolizidine alkaloids (0.5 to 1.6%): main alkaloid (-)-sparteine, including among others 11, 12-dehydrosparteine, 17-oxosparteine, lupanine, alpha-isosparteine

Biogenic amines: including tyramine, epinine, dopamine

Flavonoids: including spirasoside, isoquercitrin, scoparin

Isoflavonoids: including genistein, sarothamnocide

EFFECTS: SCOTCH BROOM HERB

No specific studies are available. Tyramine acts indirectly on the sympathetic nervous system as a vasoconstrictor and hypertensive.

COMPOUNDS: SCOTCH BROOM FLOWERS

Quinolizidine alkaloids (0.004%) (very small quantities): main alkaloid (-)-sparteine

Biogenic amines: including tyramine (0.13 to 2%)

Flavonoids: including scoparin (C-glycosylflavone)

EFFECTS: SCOTCH BROOM FLOWERS

The drug can contain over 2% tyramine. It contains small amounts of alkaloids. The main alkaloid is sparteine. Tyramine acts as an indirect sympathicomimetic, vasoconstrictor and hypotensive. Sparteine acts negatively inotropic and negatively chronotropic; because of the very minimal amounts of sparteine no intense effect can be expected.

INDICATIONS AND USAGE

SCOTCH BROOM HERB

Approved by Commission E:

- Circulatory disorders
- Hypertension

Unproven Uses: The herb is used for functional heart and circulatory disorders, as an adjunct in the stabilization of circulation and to raise blood pressure. Folk medicine uses include pathological edema, cardiac arrhythmia, nervous cardiac complaints, low blood pressure, heavy menstruation, hemorrhaging after birth, as a contraction stimulant, for bleeding gums, hemophilia, gout, rheumatism, sciatica, gall and kidney stones, enlarged spleen, jaundice, bronchial conditions and snake bites.

SCOTCH BROOM FLOWERS

Unproven Uses: The use of the pure drug cannot be recommended except as an inactive ingredient in teas. In folk medicine, the flowers are used for edema, rheumatism, gout, kidney stones, jaundice, liver disorders, enlarged spleen and as a blood purifier.

CONTRAINDICATIONS

SCOTCH BROOM HERB AND FLOWERS

The drug is contraindicated in high blood pressure, A-V block, pregnancy and with MAO inhibitor drugs.

PRECAUTIONS AND ADVERSE REACTIONS

SCOTCH BROOM HERB

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Scotch Broom preparations should not be used in cases of high blood pressure or with atrioventricular block.

Drug Interactions: Use of Scotch Broom herb with monoamine oxidase inhibitors (amine content) may cause a hypertensive crisis.

Pregnancy: The herb should not be used during pregnancy (abortive effect).

SCOTCH BROOM FLOWERS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug should not be used in cases of high blood pressure or

when the patient is being treated with monoamine oxidase inhibitors (amine content).

OVERDOSAGE

SCOTCH BROOM HERB

Doses corresponding to more than 300 mg sparteine (approximately 30 gm of the drug), lead to dizziness, headache, palpitations, prickling in the extremities, feeling of weakness in the legs, outbreaks of sweat, sleepiness, pupil dilation and ocular palsy. If no vomiting has occurred, poisonings are treated with gastric lavage and administration of activated charcoal. Spasms are to be treated with chlorpromazine or diazepam. In cases of asphyxiation, intubation and oxygen respiration are to be carried out. No deaths through poisonings with this drug have been proven beyond a doubt (though they certainly have been with sparteine).

DOSAGE

SCOTCH BROOM HERB

Mode of Administration: The herb is available in aqueous essential oil extracts for internal administration.

Preparation: Tea: Pour 150 ml boiling water over 1 to 2 gm drug and strain after 10 minutes

Decoction — from 1 to 2 gm drug.

Liquid extract — 1:1 25% ethanol (V/V) (BHP83).

Tincture — 1:5 45% ethanol (V/V) (BHP83).

Daily Dosage: The daily dose of the infusion is 1 cup fresh infusion 3 times daily. The liquid extract dosage is 1 to 2 ml daily. The tincture internal use dosage is 0.5 to 2 ml. Aqueous-ethanol extracts corresponding to 1:1.5 drug are also used.

Storage: Carefully protect from light and moisture.

SCOTCH BROOM FLOWERS

Mode of Administration: Since the efficacy for the claimed uses has not been documented, and considering the risks, a therapeutic application cannot be justified. To be used only under the supervision of an expert qualified in the appropriate use of this substance.

Preparation: To prepare an infusion, Pour 200 ml boiling water over 1 teaspoon of flowers and strain after 10 minutes.

Daily Dosage: Infusion dosage is 1 cup daily. For pathological edema, 1 liter infusion per day is administered in 4 portions during meals for 1 month.

Scotch Pine

Pinus species

DESCRIPTION

Medicinal Parts: The medicinal parts are the tar extracted from the trunks, branches and roots. The oil extracted from the fresh needles, branch tips or fresh twigs is also used medicinally, as are the pine tips from fresh and dried shoots. The purified oil from the resin balsam, the tar extracted from the wood, the young shoots and the flowering branches of male and female flowers with pollen are also used.

Flower and Fruit: The male flowers are sulfur-yellow in the form of ovate catkins. The female flowers are purple and long-pedicled in erect, 5 to 6 mm long cones that hang down after flowering. The ripe cones are ovate-clavate, matte brown and have rhomboid scales. The hilum is small, smooth and light brown. The seeds are 3 to 4 mm long, oblong with wings, which are 3 times as long as the seed.

Leaves, Stem and Root: The tree is 10 to 30 m high with a straight, slim, cylindrical trunk or a gnarled twisted one. It has a girth of 1.8 to 3.6 m. The crown is umbrella-shaped. The bark of the older trees is gray-brown on the outside and rust red on the inside. Bark of older trees is deeply fissured below and peeling. The bark of the young trees is fox-red and thinly peeling. The buds are reddish, 6 to 12 mm long, oblong-oval and somewhat resinous. The needles are in pairs and remain on the trees for 3 years. They are various lengths, rigid, twisted, bluish-green with interrupted rows on the outside and minimally dentate.

Habitat: *Pinus sylvestris* is found in Europe, Siberia, the Crimea, the Caucasus and Iran.

Production: Pine shoots (*Pini turiones*) consist of the fresh or dried, 3 to 5 cm long shoots of *Pinus sylvestris*. Pine shoots are collected at the beginning of spring. The essential oil (*Pini aetheroleum*) is obtained from fresh needles, tips of the branches or fresh branches with needles and tips of *Pinus sylvestris*, *Pinus mugo* ssp. *pumilio*, *Pinus nigra* or *Pinus pinaster*. The oil is recovered from the fresh needles and branch tips using steam distillation with a successful yield of 0.15-0.6%. Purified turpentine oil (*Terebinthinae aetheroleum rectificatum*) is the essential oil obtained from the turpentine of *Pinus* species, especially *Pinus palustris* (syn. *Pinus australis*), and *Pinus pinaster*.

Not to be Confused With: Pine shoots should not be confused with the shoots of *Picea abies* and *Abies alba*. Pine oil should not be confused with "pine oils" that are synthetically produced.

Other Names: Dwarf-Pine, Pine Oils, Pix Liquida, Pumilio Pine, Scotch Fir, Stockholm Tar, Swiss Mountain Pine

ACTIONS AND PHARMACOLOGY

COMPOUNDS: PINE SHOOTS

Volatile oil (0.2-0.5%): including among others bornyl acetate, cadinene, Delta3-carene, limonene, phellandrene, alpha-pinene

Resins

Bitter principles: pinicrin

Ascorbic acid (vitamin C)

EFFECTS: PINE SHOOTS

Pine shoots have secretolytic and mildly antiseptic effects and stimulate the peripheral circulation.

COMPOUNDS: PINE NEEDLE OIL

From *Pinus mugo*: chief components include Delta3-carene (up to 35%), alpha- and beta-pinene (20%), beta-phellandrene (15%)

From *Pinus nigra*: chief components include alpha-pinene (48-65%), beta-pinene (up to 32%), germacren D (up to 19%)

From *Pinus palustris*: chief components include alpha- and beta-pinene (95%)

From *Pinus sylvestris*: chief components include alpha-pinene (10-50%), Delta3-carene (up to 20%), camphene (up to 12%), beta-pinene (10-25%), limonene (up to 10%), additionally including among others myrcene, terpinolene, bornyl acetate

EFFECTS: PINE NEEDLE OIL

The essential oil is secretolytic, hyperemic and weakly antiseptic.

COMPOUNDS: TURPENTINE OIL, PURIFIED

Chief components of the raw turpentine oil yielded from turpentine from *Pinus sylvestris* include: (-)-alpha-pinene (ca. 39-87%), Delta3-carene (ca. 14-33%), (-)-beta-pinene (share up to 27%), limonene (6%), camphene (ca. 5%), from out of which and from out of the volatile oils of other pine species purified turpentine oil. *Terebinthinae aetheroleum rectificatum* is realized through fractional distillation. It must contain at least 90% pinenes, but no more than 0.5 % Delta3-carene.

EFFECTS: TURPENTINE OIL, PURIFIED

The essential oil is hyperaemic, antiseptic and increases bronchial secretion in animal tests.

INDICATIONS AND USAGE

PINE SHOOTS

Approved by Commission E:

- Blood pressure problems
- Common cold
- Cough/bronchitis
- Fevers and colds
- Inflammation of the mouth and pharynx
- Neuralgias
- Tendency to infection

Pine shoots are used internally for catarrhal conditions of the upper and lower respiratory tract. Externally, it is used for mild muscular pain and neuralgia.

Unproven Uses: In folk medicine, preparations of pine shoot are used internally for uncomplicated coughs and acute bronchial diseases and topically for nasal congestion and hoarseness.

Homeopathic Uses: Homeopathic uses include weak ligaments of the upper ankle joint, inflammation of the respiratory tract, chronic rheumatism, eczema and urticaria.

PINE NEEDLE OIL

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds
- Inflammation of the mouth and pharynx
- Neuralgias
- Rheumatism
- Tendency to infection

The essential oil is used internally and externally for congestive diseases of the upper and lower respiratory tract. Externally, it is used for rheumatic and neuralgic ailments.

TURPENTINE OIL, PURIFIED

Approved by Commission E:

- Cough/bronchitis
- Inflammation of the mouth and pharynx
- Rheumatism

Purified turpentine oil is used internally and externally for chronic diseases of the bronchi with profuse secretion. It is used externally for rheumatic and neuralgic ailments.

Unproven Uses: Folk medicine uses include bladder catarrh, gallstones and phosphorous poisoning. Externally, the oil is used for scabies, burns, frostbite and skin injuries.

CONTRAINDICATIONS

PINE SHOOTS AND PINE NEEDLE OIL

Contraindications include bronchial asthma and whooping cough.

PRECAUTIONS AND ADVERSE REACTIONS

PINE SHOOTS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Patients with extensive skin injuries, acute skin diseases, feverish or infectious diseases, cardiac insufficiency or hypertonia should not use the drug as a bath additive.

PINE NEEDLE OIL

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Signs of irritation could appear on skin and mucous membranes. Bronchial spasms could worsen. Patients with extensive skin injuries, acute skin diseases, feverish or infectious diseases, cardiac insufficiency or hypertonia should not use the drug as a bath additive.

TURPENTINE OIL, PURIFIED

General: No health hazards or side effects are known in conjunction with the proper external administration of designated therapeutic dosages. However, resorptive poisonings, such as kidney and central nervous system damage, are possible with large-area administration. Where large skin

injuries, severe feverish or infectious diseases, cardiac insufficiency or hypertonia are present, entire-body baths with the volatile oil added should be carried out only following consultation with a physician.

Kidney damage is conceivable with internal administration of therapeutic dosages. Inhalation should be avoided with acute inflammation of the breathing passages.

Pediatric Use: Cases of death, in particular among children, following intake of the oil have been reported in the scientific literature.

OVERDOSAGE

TURPENTINE OIL, PURIFIED

Severe poisonings are possible with the intake of large dosages. Symptoms include albuminuria, diarrhea, dyspnea, dysuria, feelings of vertigo, hematuria, intestinal colic, queasiness, reddening of the face, salivation, skin efflorescences, sore throat, staggering walk, strangury, thirst, twitching and vomiting. Poisonings can also occur through inhalation of the vapors or through skin contact. Fifty grams is the approximate lethal dosage for an adult. Cases of death, in particular among children, following intake of the oil are known from the scientific literature. Gastric lavage with bicarbonate of soda solution, intestinal emptying through administration of sodium sulphate, the administration of paraffin oil, activated charcoal and shock prophylaxis (suitable body position, quiet, warmth) should be instituted. Thereafter, therapy for poisonings consists of treating spasms with diazepam (i.v.), electrolyte substitution, and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

PINE SHOOTS

Mode of Administration: Pine shoot is available as a comminuted herb for internal use in teas, syrups and tinctures. Alcoholic solutions, oils or ointments are used externally.

Daily Dosage:

Internal — daily dose: 2 to 3 g drug several times a day.

External — as a bath additive: 100 g alcoholic extract in a full bath.

Semi-solid preparations — 20 to 50% ointment to be rubbed in several times a day.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1). The dose is different for children.

PINE NEEDLE OIL

Mode of Administration: The essential oil is administered in alcoholic solutions, ointments, gels, emulsions, oils or as an inhalant. It is used externally as bubble baths and bath salts.

Daily Dosage: For internal use. the daily dose is 5 gm drug. For inhalation therapy, add 2 g oil to 2 cups hot water and breathe in the vapors several times daily. When used externally, several drops of a liquid or semi-solid preparation containing 10 to 50% drug may be rubbed onto the affected area. To use as a bath additive, use 0.025 gm drug per liter water and bathe for 10 to 20 minutes at a temperature 35 to 38° C.

Storage: Keep protected from light in tightly sealed containers.

TURPENTINE OIL, PURIFIED

Mode of Administration: Purified turpentine oil is administered externally in the form of ointments, gels, emulsions, oils, as a plaster and as an inhalant.

Daily Dosage:

External Dose — Varies according to the type and severity of the condition as well as the instructions of manufacturer.

As a bath additive and plaster — Use as directed by manufacturer.

Ointment/gel — 20% ointment/gel to be applied to the affected area several times a day.

Inhalation — 5 drops oil in hot water 3 times a day, inhale.

Scotch Thistle

Onopordwn acanthium

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb and the root.

Flower and Fruit: The large, light-red composite flowers are terminal on the branches. The bracts are linear-lanceolate, thorny-tipped, splayed at the bottom and like cobwebs. The plant has only tubular androgynous flowers. The bristles of the hair calyx are reddish, short pinnate and almost twice as long as the fruit. The flower heads fall after the fruit ripens and the seeds fall out.

Leaves, Stem and Root: The plant is biennial and grows from 30 to 150 cm. The stem is erect and branched. It appears to be winged because of the downward leaves, which are broader than the stem. The leaves are rough, irregularly thorny and dentate to pinnatisect. When young they appear almost white.

Habitat: The plant is indigenous to almost all of Europe, with the exception of the far north; it was introduced to North America.

Production: Scotch Thistle is the aerial part of *Onopordum acanthium*.

Other Names: Woolly Thistle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpene lactones (bitter principles): including, among others onopordopicrin

Flavonoids: including luteolin-7-O-glucoside

Hydroxycoumarins: esculin

Caffeic acid derivatives

Betaine: stachydrine

Polyynes

EFFECTS

A cardiostimulant effect is questionable.

INDICATIONS AND USAGE

Unproven Uses: The drug is considered obsolete. In the religious system of anthroposophy, Scotch Thistle is used as a cardiac stimulant.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Scotch Thistle is available in the form of drops, ampules and tablets. In anthroposophic medicine, a preparation of the fresh leaves is used internally.

LITERATURE

Scrophularia nodosa

See Figwort

Scullcap

Scutellaria lateriflora

TRADE NAMES

Scullcap (available from numerous manufacturers), Wild American Scullcap, Wild Countryside Scullcap

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the herb.

Flower and Fruit: The pink or blue flowers are in short, chiefly lateral false spikes. The calyx is fluffy, dorsiventral and flattened, with 2 rounded, entire-margined lips. The lower lip has a helmet-shaped, concave appendage. The 4 ascending stamens have pairs of ciliated anthers. The fruit is a globular to flattened-ovoid warty nutlet.

Leaves, Stem and Root: The perennial herb grows to 60 cm in height and is thickly covered with simple and glandular hairs. The stem is erect and heavily branched. The foliage leaves are usually ovate to lanceolate or linear, petioled, entire-margined or crenate.

Characteristics: The herb has a bitter, slightly astringent taste.

Habitat: The plant is indigenous to North America and is cultivated in Europe.

Production: Scullcap is the aerial part of 3- to 4-year-old *Scutellaria lateriflora* and related species, which is harvested in June and then pulverized.

Other Names: Blue Pimpernel, Helmet Flower, Hoodwort, Mad-Dog Weed, Madweed, Quaker Bonnet

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids

Flavonoids: including among others, scutellarin

*Volatile oil**Tannins*

EFFECTS

Scullcap has sedative, antispasmodic (little research), anti-inflammatory, and also lipid peroxidation inhibitor effects.

INDICATIONS AND USAGE

Unproven Uses: The drug was formerly used for hysteria and nervous tension, epilepsy, chorea, and other nervous disorders. It has also been used as a bitter tonic and febrifuge.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is available as a powder and liquid extract for internal use.

How Supplied:

Capsules — 425 mg, 429 mg, 430 mg

Scurvy Grass

Cochlearia officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the harvested and dried basal leaves of the first or second year; the aerial parts harvested shortly before or during flowering in the second year; or the fresh aerial parts of the plant collected at the onset of flowering.

Flower and Fruit: The flowers are arranged in racemes that are initially tight and somewhat hanging, which then grow longer. The flower is large, white and fragrant. The sepals are about 1.5 to 2 mm long, narrowly elliptoid, with a white membranous edge. The petals are about 4 to 5 mm long, oblong-obovate. The stamens are yellow. The fruit is a 4 to 7 mm long, globular or ovate pod, crowned by the short style. The 2 to 4 seeds in each loculus are roundish-elliptoid, a little compressed and 1 to ? mm long. The seed shell is usually red-brown and finely warty.

Leaves, Stem and Root: The glabrous biennial or perennial plant is a 15 to 35 cm high evergreen. It has a fusiform, fibrous rhizome from which grows one or more stemmed shoots that are sterile and fertile. The leafy stems are ascending or almost erect, simple or branched, angular and grooved. The long-petioled basal leaves are in loose whorls. The fleshy, juicy cauline leaves are petiolate, ovate, angular-dentate, and the upper ones are stem-clasping.

Characteristics: The flowers have a strong taste and, when rubbed, a strong fragrance.

Habitat: The plant is found in central and northern Europe, Asia and North America.

Production: True Scurvy Grass consists of the dried basal leaves of *Cochlearia officinalis* harvested in the first year, or the aerial parts harvested during the flowering season in the second year. The cultivated plant is dried rapidly with artificial heat at temperatures below 35°C.

Not to be Confused With: Scurvy Grass is occasionally confused with *Ranunculus ficaria*.

Other Names: Scrubby Grass, Spoonwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glucosinolates: chief components in the freshly harvested, unbruised plant include glucocochlearin; with the destruction of the cells, the plants yield secretions of butyl mustard oil, and among others, glucotropaolin (yielding butyl mustard oil) and sinigrin (yielding allyl mustard oil).

Flavonoids

Tropane alkaloids: tropine, m-hydroxybenzoyl-tropine (cochlearin)

Vitamin C

EFFECTS

The mustard oil glycosides in the drug, in ethereal oil and in an ethanol solution are strong external skin and mucous membrane irritants.

INDICATIONS AND USAGE

Unproven Uses: Scurvy Grass is used internally for vitamin C deficiency, and was used in folk medicine primarily as an agent for scurvy and scrofula. However, it was also valued for nose bleeds, rheumatism, gonorrhea, "blood-cleansing or purification" cures, gout, rheumatism, stomachache and as a diuretic. External applications include use as a mouthwash for gum disease and as a poultice for ulcers.

Homeopathic Uses: Among uses in homeopathy are eye inflammation and stomach disorders.

Efficacy has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The administration of higher dosages can lead to irritation of the mucous membrane of the gastrointestinal tract.

DOSAGE

Mode of Administration: Alcoholic extracts of Scurvy Grass are used topically. Freshly pressed juice is for internal use.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules 1 to 3 times a day; or 1 ml injection solution sc twice weekly; as an eye drop: 1 drop 1 to 3 times daily (HAB1)

Scutellaria lateriflora

See *Scullcap*

Sea Buckthorn

Hippophae rhamnoides

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe, yellow-red berries.

Flower and Fruit: The plant is dioecious and has greenish-yellow, insignificant flowers in numerous, sturdy clusters in the axils of scales. There are 2 bracts and a simple calyx. The male calyx is divided in 2 down to the base, with brown-spotted ovate sepals; it has 4 stamens attached to the base. The female calyx is a tight tube clasping the ovary with erect, inward-inclined tips. The fruit is a bright orange, globular, ellipsoid, false berry.

Leaves, Stem and Root: The plant is an angular, thorny 1.5 to 4.5 m high shrub with numerous thorn-tipped and thorny branches. The leaves are 5 to 8 cm long, linear-lanceolate, short petioled, glabrous above, tomentose beneath. The plant spreads by underground runners.

Habitat: *Hippophae rhamnoides* is indigenous to Europe and some northern regions of Asia.

Production: Sea Buckthorn berries are the false fruit of *Hippophae rhamnoides*. The fatty oil is extracted from both the seeds and the fruit flesh. The harvest is from August to December, until the first snow. As soon as the fruit has been picked, it is immediately processed. The juice is produced without any contact with metal substances.

Other Names: Sallow Thorn

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fruit acids: chiefly malic acid, additionally acetic acid, quinic acid

Ascorbic acid (Vitamin C): 0.2-1.4%

Flavonoids: in particular kaempferol, isorhamnetin-as well as quercetin tri- and tetra-glycosides

Carotinoids: beta-carotene, gamma-carotene, lycopene

Fatty oil (in the seeds 12%): chief fatty acids oleic acid, isolinolenic acid, linolenic acid, stearic acid

Sugar alcohols: mannitol, quebrachit

EFFECTS

The drug is used as a vitamin C supplement. The vitamin C constituent encourages the healing of wounds and epithelization. It strengthens sight and inhibits sclerosis and the aging process.

The oil has a liver-protective, ulcer-protective, tumor-protective, anti-oxidative and wound-healing effect. The oil is said

to be anticoagulative. The flavones are said to improve the contractility and pumping ability of cardiac muscle, reduce peripheral resistance and promote vascular elasticity.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as an infection prophylaxis, in particular during the time just before spring and during periods of convalescence. It is used externally as a treatment for radiation damage, such as x-ray damage and sunburn, and as fatty oil for the treatment of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Buckthorn is an extract constituent in various vitamin C concentrates and juices.

Daily Dosage: The recommended daily dose is 5 to 10 gm of one of the Buckthorn products.

Self-Heal

Prunella vulgaris

DESCRIPTION

Medicinal Parts: The medicinal part is the whole flowering plant.

Flower and Fruit: The blue-violet or brownish-blue labiate flowers are clustered in semi-whorls at the end of stems and lateral branches. The accompanying leaves are red-brown. The upper lip of the calyx has 3 tips and the lower lip has 2 tips. The corolla is about 1 cm longer than the domed upper lip. The lower lip has 3 lobes. There are 4 stamens, the longer ones have a straight awl-shaped tip. The style is divided into two. The small fruit is flung out of the calyx.

Leaves, Stem and Root: The plant grows from 10 to 30 cm high. The stems are usually ascendant, sometimes creeping. The leaves are petiolate, ovate to lanceolate, dentate or entire-margined and crossed opposite.

Habitat: *Prunella vulgaris* is indigenous to Europe and Asia and practically all temperate regions of the world.

Production: Self-Heal is the complete plant in flower of *Prunella vulgaris*.

Other Names: Woundwort, Prunella, Hook-Heal, Slough-Heal, Brunelia, Heart of the Earth, Blue Curls, Heal-All, Brown wort, Carpenter's Herb, Carpenter's Weed, Sickle wort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Bitter principles

Flavonoids: including rutin, hyperoside.

Tannins

Triterpene saponins

Triterpenes, ursolic acid, oleanolic acid

EFFECTS

There is no information available.

INDICATIONS AND USAGE

Unproven Uses: Self-Heal is used for inflammatory diseases and ulcers in the mouth and throat, gastrointestinal catarrh, as a remedy for diarrhea, hemorrhage and gynecological disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Self-Heal is available as crude drug, as an extract and as a gargle solution.

Preparation: To prepare a tea, use 1 dessertspoon of the drug per cup of water.

Senburi

Swertia japonica

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaves and stems, which are used as an amaroid and tonic.

Flower and Fruit: The flowers are in dense apical panicles. The flowers are radial and fused, and their structures are in fives. The 5 calyx tips are up to 5 mm long and linear to lanceolate. The petals are 12 to 17 mm long, fused to a tube, with 5 broadened, elongate elliptical tips. The petals are white with reddish veins at the margin. Pairs of villous glandular scales are ciliate and twisted in the bud. There are 5 stamens and a superior, single-chambered ovary. The style is very short and the stigma 2-lobed. The fruit is a capsule; the seeds are ovate to clavate.

Leaves, Stem and Root: The herbaceous plant grows to approximately 20 cm high. The leaves are opposite and simple. The lower leaves are small and lanceolate. The cauline leaves are 1.5 to 3.5 cm long and 1 to 3 mm wide, linear to elongate-lanceolate, and acuminate with an involute margin. The stem is square in cross-section, 2 mm thick, dark green to dark red. The root is woody.

Characteristics: All parts of the plant taste very bitter.

Habitat: *Swertia japonica* is found in Korea, China and Japan.

Production: Japanese chirata is the dried herb of *Swertia japonica* harvested during its flowering season.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids (bitter substances): secoiridoid glycosides, including amarogentin (0.01 to 0.05%) and amaroswerin (0.05 to 0.3%), the representatives that are chiefly responsible for the bitter taste, as well as the less bitter representatives swertiamann (1.0 to 2.5%), gentiopicroside (0.5%) and sweroside (0.2%)

Flavonoids: including swertisin, isoswertisin, swertiajaponin, isovitexin

Xanthone derivatives (yellow): including swertianin, nor-swertianin, methyl swertianin, swertianol (bellidifolin)

Monoterpene alkaloids

EFFECTS

The use of the drug as an amarum is traceable to the bitter substances it contains (secoiridoid glucoside). The allergenic effect connected with topical application should be taken into consideration.

INDICATIONS AND USAGE

Unproven Uses: Uses in folk medicine include poor digestion and loss of appetite.

Chinese Medicine: Insomnia and poor digestion are considered indications for use in Chinese medicine. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole, cut and powdered drug.

How Supplied: Forms of commercial pharmaceutical preparations: Drops.

Daily Dosage: 30 to 50 mg of the powder.

Seneca Snakeroot

Polygala senega

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root.

Flower and Fruit: The raceme is 8 cm long and is smaller than the bracts. The petals are pale red, the wings are yellowish-white with green veins.

Leaves, Stem and Root: The plant is a perennial herb with up to 40 cm high stems, which sprout in the axils of the scale-like bracts of the previous year's growth. The leaves are 8 cm long and 3 cm wide, alternate, ovate-lanceolate to lanceolate, acuminate and denticulate. The upper surface is rich green; the under surface somewhat paler. The root varies in color from pale yellowish-gray to brownish-gray. It is usually twisted or almost spiral and has a thick, irregular, gnarled crown.

Habitat: *Polygala senega* is indigenous to the central and western U.S.

Production: Seneca Snakeroot consists of the dried root with remains of aerial stems of *Polygala senega* and/or other closely related species or a mixture of *Polygala* species.

Not to be Confused With: The roots of other *Polygala* species.

Other Names: Milkwort, Mountain Flax, Rattlesnake Root, Seneca, Senega Snake Root, Senega, Seneka, Snake Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SNAKEROOT (SENEGA SPECIES)

Triterpene saponins (6-12%): chief components senegins II to IV, chief aglycone presenegin

Oligosaccharide esters: senegosene A-I

Xanthone derivatives

Methyl salicylate (traces) and its glucoside

COMPOUNDS: SNAKEROOT (TENUIFOLIA SPECIES)

Triterpene saponins (6-12%): chief components onjisaponine aglycone presenegenin

Oligosaccharide esters: tenuifolosen A-P

Polygalite (*acerite*, *1,5-anhydrosorbite*) and its glycosides, for example *polygalite-2-alpha-galactoside*

EFFECTS

The rhizome is secretolytic and works as an expectorant.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

Unproven Uses: The drug is used for congestion of the respiratory tract, as an expectorant in cases of bronchitis with minor sputum output and tracheitis.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. With prolonged use, gastrointestinal irritation can occur.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Overdosage leads to nausea, diarrhea, gastric complaints and queasiness.

DOSAGE

Mode of Administration: As a comminuted root for decoctions and other galenic preparations for internal use or as an extract. It is a component of various standardized antitussive preparations.

Preparation: To make an infusion, place 0.5 gm comminuted drug in cold water, heat to a simmer and strain after 10 minutes (1 teaspoonful = 2.5 gm drug).

Daily Dosage: The daily dosage is 1.5 to 3.0 gm root or liquid extract (1:2) or 2.5 to 7.5 gm tincture (1:10). To use

the infusion as an expectorant, drink 1 cup of tea 2 to 3 times daily. In serious cases, the tea can be taken every two hours if the patient is observed for side effects.

Senna

Cassia species

TRADE NAMES

Senna Extract, Senna Leaf, Ex-Lax Regular Strength, Ex-Lax Maximum Strength, X-Prep Bowel Evacuant Liquid, SenokotXTRA, Senokot, Senokot Children's Syrup

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, fruit and flowers.

Flower and Fruit: The flowers are yellow, occasionally white or pink. They are located in axillary or terminal positions on erect racemes. The calyx is deeply divided with a short tube and 5 regular, imbricate sepals. There are 5 layered petals. The 4 to 10 stamens are often irregular and partially sterile. The ovary is sessile or short-stemmed with a short or oblong style. The pod can be cylindrical or flat, angular or winged and often with horizontal walls between the seeds. The seeds are numerous and either horizontally or vertically compressed.

Leaves, Stem and Root: The genus *Cassia* comprises shrubs, subshrubs, and herbaceous perennials with paired-pinnate leaves. There are axes with stem glands either between the leaflets or on the petiole. The stipules have varying shapes.

Habitat: *Cassia species* is found in the tropical and subtropical regions of all continents except Europe. Most varieties are indigenous to North, Central, and South America.

Other Names: Tinnevelly Senna, India Senna, Alexandrian Senna, Khartoum Senna

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (2.5-3.5%): chief components sennosides A, Al and B, as well as sennosides C and D

Naphthacene derivatives: including 6-hydroxymusizin glucoside (0.85% in *Cassia senna*), tinnevellin-6-glucosides (0.3% in *Cassia angustifolia*)

EFFECTS

Laxative Effects

Senna is an anthranoid-type stimulating laxative. The laxative effect is due to the action of sennosides and their active metabolite, rhein anthrone, in the colon. The **laxative** effect is realized by inhibition of water and electrolyte absorption from the large intestine, which increases the volume and pressure of the intestinal contents. This **will** stimulate colon motility resulting in propulsive contractions.

*

<J

TM

In addition, stimulation of active chloride secretion increases water and electrolyte content of the intestine. These changes in active electrolyte transport are dependent on calcium in the serosal surface (Donowitz, 1984; Yamauchi, 1993). The laxative action of Senna is partially via stimulation of colonic fluid and electrolyte secretion, and this secretion is mediated by stimulation of endogenous prostaglandin E₂ formation (Beubler, 1988; Yamauchi, 1993).

CLINICAL TRIALS

Laxative Effects

A randomized, single-blind study evaluated the efficacy of Senna compared to polyethylene glycol (PEG) for mechanical preparation for elective colorectal resection. Five hundred twenty-three patients included in the study were undergoing resection, followed by anastomosis. All patients received 5% providone iodine antiseptic enema before surgery, and ceftriaxone sodium and metronidazole were given at anesthesia induction. Senna was significantly better than PEG with regard to colonic cleanliness and less fecal matter in the colonic lumen. The risk for moderate or large intraoperative fecal soiling was lower with senna and overall clinical tolerance did not differ significantly between the treatment groups. Senna was better tolerated in patients with stenosis. There was no statistical difference between the treatment groups with postoperative infective complications or anastomotic leakage (Valverde, 1999).

A prospective randomized trial evaluated the efficacy of the addition of senna to a polyethylene glycol electrolyte lavage solution (PEG-ELS). One hundred and twenty patients received either a Senna extract with PEG-ELS or placebo with PEG-ELS before a total colonoscopy. Superiority by physician assessment was seen in the group with Senna. The colon was free of solid debris in 66.7% of patients after PEG-ELS and in 90% after Senna/PEG-ELS administration, which was a significant difference. Patient tolerance was similar in both groups, and significantly less lavage fluid was needed in the Senna/PEG-ELS treatment group (Ziegenhagen, 1991).

A randomized, open, parallel group study was conducted to determine the efficacy of senna compared to lactulose in terminal cancer patients treated with opioids. Ninety-one terminal cancer patients were treated with either senna (starting with 0.4 mL daily) or lactulose (starting with 15 mL daily) for a 27-day period. The main outcome measures were defecation-free intervals of 72 hr, days with defecation, general health status, and treatment cost. Both treatment groups had similar scores for defecation-free intervals and in days with defecation. The final scores for general health status were similar in both groups (Agra, 1998).

INDICATIONS AND USAGE

- Constipation

Senna is used for constipation and for evacuation of the bowel prior to diagnostic tests of the gastrointestinal and colorectal area.

Indian Medicine: The herb is used for constipation, liver disease, jaundice, splenomegaly, anemia, and typhoid fever.

Note: Stimulating laxatives must not be used over a period of more than 1 to 2 weeks without medical advice.

CONTRAINDICATIONS

The herb is not to be administered in the presence of intestinal obstruction, acute inflammatory intestinal diseases or appendicitis.

PRECAUTIONS AND ADVERSE REACTIONS

General: Spasmodic gastrointestinal complaints can occur as a side effect to the drug's purgative effect or from overdosage. In rare cases, prolonged use may lead to cardiac arrhythmias, nephropathies, edema and accelerated bone deterioration. Senna abuse has also resulted in tetany, aspartylglucosamine excretion, and hypogammaglobulinemia (Levine, 1981; Malmquist, 1980; Prior, 1978).

Electrolyte Abnormalities: Long-term use leads to loss of electrolytes, in particular potassium ions. As a result of hypokalemia, hyperaldosteronism, albuminuria, hematuria, inhibition of intestinal motility, and muscle weakness may occur. Enhancement of cardioactive glycosides and antiarrhythmics may also occur with hypokalemia.

Finger Clubbing: Senna abuse has resulted in finger clubbing, which was reversible upon discontinuation of the drug (Levine, 1981; Malmquist, 1980; Prior, 1978; Silk, 1975).

Cathartic Colon: Anatomic alteration of the colon is seen secondary to chronic use with Senna (more than three times weekly for 1 year or longer). The result is a loss of haustral folds, a finding that suggests neuronal injury or damage to colonic longitudinal musculature (Joo, 1998).

Carcinogenesis: Carcinogenic activity in the colon following long-term administration of anthracene drugs has not yet been fully clarified. Study findings are controversial regarding the correlation between the administration of anthracene drugs and the frequency of carcinomas in the colon (al-Dakan, 1995; Mereto, 1996).

Melanosis Coli: Prolonged use of Senna may lead to melanosis coli. Precursors of the melanic substance in melanosis coli may be derived from anthranoid laxatives (Benavides, 1997).

Occupational Sensitization: IgE-mediated allergy, asthma, and rhinoconjunctivitis have been reported after occupational exposure to senna products (Helin, 1996, Marks, 1991).

Tissue Damage: Chronic treatment with anthranoids in high doses reduces vasoactive intestinal polypeptide and somatostatin levels in the colon, which may represent damage to the enteric nervous tissue (Tzavella, 1985).

Drug Interactions:

Digitalis Glycosides — With prolonged use or abuse of Senna, loss of potassium may potentiate digitalis toxicity.

Antiarrhythmics — Loss of potassium associated with prolonged use of Senna may potentiate arrhythmias when given concomitantly with antiarrhythmic medications.

Estrogen — The serum level of estrogen is decreased when given concomitantly with Senna due to the effect of intestinal transit on the absorption of estrogens (Lewis, 1998).

Indomethacin (NSAIDS) — Indomethacin given concomitantly with Senna pod extract had a dose-dependent inhibition of net fluid transport due to the inhibition of prostaglandin E₂ (SEE EFFECTS), which decreases the therapeutic effect of the Senna (Beubler, 1985).

Nifedipine (calcium channel blocker) — Therapeutic effects induced by rhenin anthrone also involve the calcium channel which can be blocked by nifedipine, but not verapamil (SEE EFFECTS) (Yamauchi, 1993).

Pregnancy: The drug should not be used during pregnancy or while nursing.

Pediatric Use: Not to be used by children under 2 years of age. Children between the ages of 2-12 years should follow proper dosage recommendations.

Elderly: Elderly patients should initially take half of the normal prescribing dose.

DOSAGE

Mode of Administration: Comminuted herb, powder or dried extracts for teas, decoctions, cold macerates, or elixirs. Liquid or solid forms of medication exclusively for oral use.

How Supplied:

Capsule — 25 mg, 450 mg

Chewable tablet — 15 mg sennosides

Granules — 15 mg sennosides per teaspoon

Liquid — 2.5 oz. (alcohol 7% by volume), 8.8 mg sennosides per teaspoon

Tablet — 8.6 mg sennosides, 15 mg sennosides, 17 mg sennosides, 25 mg sennosides

Preparation: To prepare an infusion, pour hot water (not boiling) over 0.5 to 2 gm of comminuted drug, steep for 10 minutes, then strain; or steep in cold water for 10 to 12 hours, then strain. The cold water method, according to various authors, should result in a solution containing less resin, which is responsible for abdominal pain. The drug takes effect after a latency period of 10 to 12 hours.

Daily Dosage:

Constipation — The average dose is 20 to 60 mg sennosides.

Chewable Tab — Adults and children 12 years of age and over, chew 2 tabs once or twice daily. Children 6 to under 12 years of age, chew 1 tab once or twice daily (Prod Info Ex-Lax®, 1998).

Granules (15 mg sennosides per teaspoon) — Adults and children 12 years of age, administer 1 teaspoon once daily with a maximum of 2 teaspoons twice daily. Children 6 to 12 years of age, administer ^x/_h teaspoon once daily with a maximum of 1 teaspoon twice a day. Children 2 to 6 years of age, administer ¹/_U teaspoon daily with a maximum of ¹/_h teaspoon twice daily (Prod Info Senokot®, 1993).

Liquid (8.8 mg sennoside per teaspoon) — Children 6 to 12 years of age, administer 1 to ¹/_h teaspoon once daily with a maximum of ¹/_xh teaspoon twice daily. Children 2 to 6 years of age, administer ¹/_h to ³/_A teaspoon once daily with a maximum of ³/_A teaspoon twice daily (Prod Info Senokot®, 1991).

Pills — Adults and children 12 years of age and over should take 2 pills once or twice daily with a glass of water. Children 6 to under 12 years of age: take 1 pill once or twice daily with a glass of water. Children under 6 years of age: consult a doctor (Prod Info Ex-Lax®, 1998).

Tablets (8.6 mg sennosides) — Adults and children 12 years of age, administer 2 tablets once daily with a maximum of 4 tablets twice daily. Children 6 to 12 years of age, administer 1 tablet once daily, with a maximum of 2 tablets twice daily. Children 2 to 6 years of age, administer ^x/_h tablet once daily with a maximum of 1 tablet twice daily (Prod Info Senokot®, 1993).

Tablets (17 mg sennosides) — Adults and children 12 years of age, administer 1 tablet once daily with a maximum of 2 tablets twice daily. Children 6 to 12 years of age, administer ^x/_h tablet once daily with a maximum of 1 tablet twice daily (Prod Info SenokotXTRA®, 1993).

Bowel Evacuation:

Liquid (alcohol 7% by volume) — Adults and children 12 years of age and older should take one bottle between 2 and 4 p.m. on day prior to x-ray or other diagnostic procedures. Drink entire contents of bottle. A strong bowel action can be expected approximately 6 hours after drinking the preparation (Prod Info X-Prep®, 1998).

Storage: Senna should be protected from light (DAB 10 EUR), and stored for a maximum of 3 years (2.AB-DDR).

See Saw Palmetto

Sesame

Sesamum orientale

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the seed.

Flower and Fruit: The flowers are short-pedicled, single or in groups of 2 or 3 in the leaf axils. The "flowers are zygomorphic; the calyx 5-tipped, 2 to 5 mm long, pubescent and does not drop. The corolla is campanulate, 5-lobed and distinctly bilabiate. It is 1.5 to 3.5 cm long, white or reddish. The lower lobes are the longest. There are 4 stamens. The ovary is usually 2-chambered (but can be up to 10-chambered) with a false septum, 1 to 1.5 mm long and pubescent. The fruit is a square, brownish, 2 to 3 cm long and up to 1 cm wide, multi-seeded capsule. The seeds are yellowish-white, brownish, reddish or black, 1.5 to 4 mm long, 1 to 2 mm wide, 0.5 to 1 mm thick, and smooth or finely ribbed.

Leaves, Stem and Root: The herb grows upright to a height of 1.2 m. The lower leaves are opposite and the petiole is 3 to 11 cm long. The lamina 4 to 20 cm long and 2 to 10 cm wide. It is elongate-ovate, entire or 3-lobed, then dentate. The upper leaves are opposite or alternate. The petiole is up to 3 cm long. The lamina is 0.5 to 2.5 cm wide, lanceolate and usually entire. Young leaves are pubescent and sticky. The stem is square to hexagonal, either completely pubescent or only on the upper section. The taproot grows down to a depth of almost 1 m. The stem is branched or unbranched.

Characteristics: The plant's oily seeds are odorless with a sweet taste.

Habitat: Sesame orientale is cultivated worldwide in tropical and subtropical temperate zones, but the main sesame oil-producing countries are India, Sudan, Burma and China.

Production: Sesame oil is the oil of Sesamum orientale, which is pressed or extracted from the ripe seeds and refined.

Other Names: Beniseed, Gingelly, Oriental Sesame

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil (97 to 98%): chief fatty acids are oleic acid (35 to 50%), linoleic acid (35 to 50%), palmitic acid (7 to 12%), stearic acid (3 to 6%)

Lignarts (0.8 to 1.7%): including sesamine sesamolin

Steroids: sterols, including beta-sitosterol (0.4%), campesterol

EFFECTS

The lignan sesamine contained in the drug is immunosuppressive in vitro. In view of its oily nature, use as a clyisma for softening the stool and topically on dry skin diseases is plausible. Its effect as a purgative seems logical but has not been clinically proven. Sesame oil treated with lipase is cytotoxic in vitro. Because of its high levels of linoleic acid, sesame oil is a valuable dietetic.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine internal uses include treating constipation, especially dyschezia; external uses include removal of scabs and crust formations, for swellings, rheumatism and as a massage oil. Its use as a laxative is considered obsolete.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a limited potential for sensitization.

DOSAGE

Mode of Administration: Preparations are available for internal and external use.

Preparation: Sesame oil for parenteral application is produced from *Sesamum orientale* by heating in a drying chamber to 140°C or by means of germ filtration with the addition of 5% benzyl alcohol followed by heating at 120°C for 1 hour in the drying chamber.

Storage: Store in tightly sealed containers and protect from light.

Shepherd's Purse

Cap sella bursa-pastoris

DESCRIPTION

Medicinal Parts: The medicinal part is the aerial portion of the plant.

Flower and Fruit: The plant stays in bloom for almost the whole year. The flowers are white and about 4 to 6 mm long. The 4 sepals are 1 to 2 mm long and the 4 petals are 2 to 3 mm long. There are 6 stamens. The inflorescence is extended after flowering. The many-seeded pod is 4 to 9 mm long and almost as wide. It is glabrous, flattened, long-stemmed, triangular and obcordate. The seeds are 0.8 to 1 mm long and red-brown with a short style.

Leaves, Stem and Root: Shepard's purse is a 2 to 40 cm high plant with a simple fusiform root and a simple upright stem. The stem is glabrous or has scattered hairs on the lower section. The basal leaves form a rosette and are petioled, entire-margined or pinnatifid. The few cauline leaves are alternate, smaller, sessile, entire, very wrinkled and involute.

Habitat: Worldwide, except tropical regions.

Production: Shepherd's Purse herb consists of the fresh or dried aboveground parts of *Capsella bursa*, collected in the wild during the summer and dried rapidly.

Other Names: Shepherd's Scrip, Shepherd's Sprout, Lady's Purse, Witches' Pouches, Rattle Pouches, Case-Weed, Pick-Pocket, Blindweed, Pepper-and-Salt, Poor Man's Parmacetie, Sanguinary, Mother's Heart, Cocowort, St. James' Weed, Shepherd's Heart, Toy wort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroids: presumably only in the seeds

Glucosinolates, sinigrin: 9-methyl sulfinyl nonyl glucosinolate, 9-methyl sulfinyl decyl glucosinolate

Flavonoids: including rutin, luteolin-7-rutinoside

Caffeic acid derivatives: including chlorogenic acid.

The plant very often acts as a host to endophytic fungi (*Albugo Candida*, *Peronospora parasitica*), so the presence of mycotoxins is a possibility.

EFFECTS

A number of different studies have shown both a lowering and elevation of blood pressure, positive inotropic and chronotropic cardiac effects, and increased uterine contraction. Despite numerous studies a clear therapeutic use could not be identified.

INDICATIONS AND USAGE

Approved by Commission E:

- Nosebleeds
- Premenstrual syndrome (PMS)
- Wounds and burns

Unproven Uses: Internally, the plant is used for mild menstrual irregularities such as menorrhagia and metrorrhagia. Externally, it is used for nosebleeds and superficially bleeding skin injuries. Shepherd's Purse is seldom used in folk medicine today. In America it is used for headaches. In Spain a decoction of the fresh plant is used for bladder inflammation.

Homeopathic Uses: *Capsella bursa-pastoris* is used for uterine and mucous membrane bleeding as well as for calculosis.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Comminuted drug for tea and other galenic preparations for internal use and external administration.

Daily Dosage: Internally, the average daily dose is 10 to* 15 gm of drug. The liquid extract daily dose is 5 to 8 gm drug. The infusion may be drunk throughout the day. Externally an infusion is prepared by adding 3 to 5 gm drug to 150 ml water.

Homeopathic Dosage: 5 drops or 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml 3 times a day sc (HAB1)

Storage: Shepard's Purse should be protected from light and moisture.

Short Buchu

Barosma species

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves of *Barosma betulina*, *Barosma crenulata* and *Barosma serratifolia* gathered during the flowering season, as well as the ethereal oil extracted from the dried leaves of *Barosma betulina*.

Flower and Fruit: The pentamerous flowers of *Barosma betulina* form a white or pink corolla 12 mm in diameter with lanceolate petals. The fruit is a 7 mm long capsule with 5 chambers and one seed per chamber. The upper surface is greenish-brown and rough. The fruit springs open at the 5 valves. The seeds are ovoid, oblong, about 5 mm long and 2 mm wide, glossy black and hard with no endosperm. The flowers of *Barosma crenulata* are pink or white and attached to short leafy side branches.

Leaves, Stem and Root: *Barosma betulina* is a small shrub with light green to yellowish leaves. The leaves are 12 to 20 mm in length, opposite, rigid and coriaceous. They are rhomboid or obovate, short-petioled and slightly pubescent, blunt and revolute at the apex. Each indentation has an oil gland. The oil glands form small raised structures on the leaf surface. The stem is about 2 to 3 mm in diameter, reddish-brown and rough (due to the oil glands) with 4 long grooves. The internodes are 8 to 20 mm long.

Barosma crenulata is a slender glabrous bush 2 to 3 m high. It is branched somewhat angularly. The bark is violet-brown. The leaves of *Barosma crenulata* vary in form, and are opposite and pubescent on both surfaces. They reach up to 3 cm in length with an obtuse, but not a revolute, tip.

Barosma serratifolia bush is very similar to the above, although the leaves are longer, obtuse at the tip and narrowed

on both edges. The leaves are lanceolate, have a long, serrated, saw-shaped margin and a blunt apex. They are yellowish green and up to 4 cm long with an oil gland at the apex and indentations on the margin. There are smaller oil glands spread over the leaf blade.

Characteristics: The leaves have a peppermint odor.

Habitat: The plant is indigenous to the Cape region of South Africa.

Production: Short Buchu leaf consists of the dried leaves of *Barosma betulina* harvested when in flower and in fruit. In South Africa, collection of the leaves is strictly controlled by the government to prevent destruction of the plant in the wild.

Not to be Confused With: Other *Barosma* and *Diosma* species.

Other Names: Buchu

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components diosphenol and psi-diosphenol (as a mixture known as buccocamphor), limonene, (+)-menthone, 8-9-isomenthone, pulegone, furthermore (-)-cis- and (+)-trans-8-mercapto-p-menth-3-one (odor-determining, so-called cassis aroma)

Flavonoids: including rutin and diosmetin

EFFECTS

No studies of the drug are currently available.

INDICATIONS AND USAGE

Unproven Uses: Short Buchu leaf is used for inflammation and infection of the kidneys and urinary tract, for bladder irritation, as a disinfectant of the urinary tract and as a diuretic. In Europe the drug has been in use since the 16th century for the treatment of gout, various bladder disorders and rheumatism, and for the prostate gland. In South Africa it is still widely used, typically as a brandy made from the plant and used to treat stomach complaints.

CONTRAINDICATIONS

Short Buchu is not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages, but it is noted that the volatile oil could lead to signs of irritation.

DOSAGE

Mode of Administration: Since the claimed efficacy has not been documented, the application of Buchu leaf cannot be recommended. Buchu is used in various preparations and combinations.

How Supplied: Short Buchu is available as an extract, tincture and infusion.

Preparation: A fluid extract is prepared using 1000 parts powdered Buchu leaves plus 400 parts 90% ethanol (V/V) 7:3 water produce 1000 parts fluid extract (EB6).

Infusion —. fluid extract 1:1 90% ethanol (V/V) (BHP83).

Buchu leaf tincture — 1:5 60% ethanol (V/V) (BHP83).

Daily Dose: The daily dose of the drug is 1 g to 2 g. Fluid extracts of 0.3 to 1.2 ml are taken 3 times daily. Dosage for the tincture is 2 to 4 ml up to 3 times daily. Infusion usage is typically 1 g per cup.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml 3 times daily sc (HAB34).

Storage: The drug must be kept cool, dry and away from the light in sealed containers.

Siam Benzoin

Styrax tonkinensis

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the resin obtained from the trunk.

Flower and Fruit: *Styrax tonkinensis* is a tree that grows up to 20 m high. It is very similar to *Styrax benzoin*, but the flowers are smaller, the calyx is 3 to 4 mm long, the corolla is white and up to 9 mm long. The fruit is up to 12 mm long.

Leaves, Stem and Root: The leaves are oval, 4.5 to 10 cm long and 2 to 6 cm wide.

Habitat: Laos

Production: Siam Benzoin is the balsam of *Styrax tonkinensis*, or other related species, obtained by making cuts in the trunk. The optimal age of tree to be harvested is 7 years. The tree is cut, which stimulates it to exude resin to heal the cuts. The resin is then collected in a vessel, and left to melt to a homogenous mass in the sun.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Ester mixture (90%): bestehend aus coniferyl benzoate (60 to 70%), p-cumaryl benzoate (10 to 15%), as well as cinnamyl benzoate, cinnamyl cinnamate

Benzoic acid (10 to 20%)

Vanillin (0.5%)

Triterpenes: alpha-siarsinolic acid (5%)

EFFECTS

The expectorant effect with which the drug is credited could not be proven experimentally (it possibly originated in connection with an "aroma therapy," due to its vanilla content).

INDICATIONS AND USAGE

Unproven Uses: Siam Benzoin is used for respiratory catarrh.

Chinese Medicine: In China, preparations are used for stroke, syncope, post partial syncope due to heavy loss of blood, chest and stomach pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb, powdered drug and other galenic preparations for internal use.

Preparation: To prepare a tincture, use powder in 90% ethanol (V/V) 1:5 macerate (DAB9).

Daily Dosage: 0.5 gm; single dose: 0.05 gm

Storage: Should be tightly sealed, and protected from light.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Siberian Ginseng

Eleutherococcus senticosus

DESCRIPTION

Medicinal Parts: The medicinal parts are the pulverized root rind, the pulverized root and an alcoholic fluid extract of the rhizome and the roots.

Flower and Fruit: The flowers are in umbels. The central umbel is on a long, thick peduncle. The style is fused into a column to the tip and has 5 small stigma lobes.

Leaves, Stem and Root: Siberian Ginseng is a 1 to 3 m high shrub whose branches are thickly covered with pale, thorny bristles pointing downward at an angle. The leaves are in groups of 5 and are thorny-serrate. The petiole is covered in fine bristles.

Habitat: Siberian Ginseng grows in Siberia, northern China, Korea and Japan.

Production: Siberian Ginseng consists of the dried roots and/or rhizome of *Eleutherococcus senticosus* as well as their preparations in effective dosage.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Caffeic acid derivatives: including chlorogenic acid

Hydroxycoumarins: isofraxidin

Lignans: sesamine, eleutheroside D (epimeric diglucosides of syringaresinols)

Steroids: including beta-sitosterol-3-O-beta-D-glucoside (daucosterol, eleutheroside A, 0.1%)

Phenylacrylic acid derivatives: eleutheroside B (syringin)

Polysaccharides: immunostimulatingly effective polysaccharides (eleutherane A-G)

Steroid glycosides: eleutheroside A (daucosterol, beta-stigmasterol-3-O-beta-D-glucoside)

Triterpene saponins: eleutheroside I, eleutheroside K (beta-hederin), eleutheroside L, eleutheroside M (hederasaponin B), for all of these aglycone oleanolic acid

EFFECTS

The liquid extract of the drug has an immune-stimulating/immune-modulating and antiviral effect. In various stress models, e.g., immobilization test and coldness test, the endurance of rodents was enhanced. With healthy volunteers, the lymphocyte count, especially that of T-lymphocytes, increased following intake of liquid extracts.

Hypoglycemic effects have also been demonstrated with the herb along with enhancement of platelet aggregation-inhibiting effects (Hikino, 1986; Yun-Coi, 1987).

INDICATIONS AND USAGE

Approved By Commission E:

- Lack of stamina
- Tendency to infection

Unproven Uses: Siberian Ginseng is used as a tonic for invigoration and fortification in times of fatigue and debility or declining capacity for work and concentration, and during convalescence.

Chinese Medicine: Siberian Ginseng is used for kidney pain, retention of urine, impotence, sleep disturbance, loss of appetite, pain and weakness in the hip and knee joints, rheumatoid arthritis and as a stimulant for the immune system.

CONTRAINDICATIONS

The drug should not be administered to patients with hypertension.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Drug Interactions:

Digoxin — elevated serum levels (McRae, 1996)

Antidiabetic Agents/Insulin — may potentiate effects (Hikino, 1986)

Anticoagulants/Antiplatelets/Antithrombotics — may enhance effects (Yun-Choi, 1987)

DOSAGE

Mode of Administration: Powdered or cut root for teas, as well as aqueous-alcoholic extracts for internal use.

Preparation:

Extract (Siberian Ginseng) — root powder 1:7 75% ethanol extracted with back flow to which is added a 10% alpha-naphthol solution until there is no reaction. It is then evaporated to a paste (ChinP IX).

Liquid extract — medium fine root powder can be produced using a through flow procedure with 40% ethanol (V/V) (1000 gm drug to 1 Liter extract), (Ross XI).

Daily Dosage: 9 to 15 gm root bark; 9 to 27 gm root; 0.3 to 0.5 gm drug extract 3 times daily. The average daily dosage is 2 to 3 gm of root.

Storage: Should be stored in well-aired, dry place, protected from light

Simaruba

Simaruba amara

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root bark.

Flower and Fruit: The flowers grow in small racemes with dense matte-white petals.

Leaves, Stem and Root: *Simaruba amara* is a tree that grows over 18 m high. The roots are long and spread horizontally. The leaves are 22 to 27 cm long. The tree has numerous long, bent branches covered in smooth, grayish bark. The bark that is used commercially is thin and flat with a yellowish or grayish-yellow color. The bark is tough, fibrous and almost impossible to break.

Characteristics: The taste is very bitter and odorless.

Habitat: The plant grows on the Caribbean islands and the northern parts of South America.

Other Names: Dysentery Bark, Mountain Damson, Bitter Damson, Slave Wood, Stave Wood, Sumaruba

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Bitter substances: quassinoids (breakdown products of triterpenes), including among others simarubin (1%), simarubidin, simarolide, 13,18-dehydro-glaucarubinone

Tannins (20-27%)

Volatile oil (0.1-0.2%)

5-hydroxy-canthin-6-one

Alkaloids

EFFECTS

The active agents are tannin, simarubin, essential oil and fat. The drug has a sedative effect on the smooth muscle of the

intestine. It constricts the vessels of the intestinal tract. *Simaruba* is a tonic and febrifuge.

INDICATIONS AND USAGE

Unproven Uses: *Simaruba* was formerly used in the treatment of febrile illnesses and dysentery. Recent research indicates that it may be effective in treating malaria. The drug is used for unspecified enteritis, diarrhea and as a bitter. It may cause vomiting, and is also used as an abortive.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug triggers vomiting in high dosages.

DOSAGE

Mode of Administration: The drug is available as a liquid extract for internal use.

Daily Dosage: The average dose is 1 gm of the drug to be taken internally.

Storage: Protect against dampness.

Skirret

Sium sisarum

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The inflorescence has 10 to 30 rayed-umbels with 1 to 5 lanceolate-narrow involucral bracts. The petals are white, about 1 mm long and broad orbicular-elliptical. The fruit is broad-ovate, about 3.5 by 2 to 2.5 mm in diameter and brownish with light ribs. The fruit segments in cross-section are obtuse pentagons with thin walls.

Leaves, Stem and Root: *Sium sisarum* is a perennial glabrous plant on a stubby rhizome with clustered, often tuberous roots. The stem is about 30 to 80 cm high, round and branched. The lower leaves are simple pinnate, oblong and serrate. The upper leaves are narrower and more acuminate, and are usually lanceolate.

Habitat: The plant is indigenous to China; it is cultivated in Europe.

Production: Skirret root is the root of *Sium sisarum*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Oligosaccharides: saccharose (4-8%)

Starch (4-18%)

Mucilage

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for digestive disorders and loss of appetite.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Skirret root is available as cut drug for internal use.

Skunk Cabbage

Symplocarpus foetidus

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds, the rhizome and the roots.

Flower and Fruit: The plant has numerous small purple flowers in a red-brown, oval, high, spadix-like inflorescence.

Leaves, Stem and Root: The plant is a perennial and grows up to 75 cm high. It has a thick tuberous rhizome, which is truncate at both ends, dark brown and up to 4 cm in diameter. The rhizome is gnarled and woody and bears numerous roots and root scars. The roots are up to 8 cm long, 0.5 cm in diameter and transversely wrinkled. The leaves are similar to cabbage leaves and they surround the inflorescence.

Characteristics: The taste is hot and the odor is unpleasant.

Habitat: The plant is indigenous to the northern U.S.

Production: Skunk Cabbage root and rootstock are the rhizome and roots of *Symplocarpus foetidus*.

Other Names: Dracontium, Meadow Cabbage, Polecatweed, Skunkweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (bad-smelling)

Resins

The constituents of the drug have not been fully investigated.

EFFECTS

Skunk Cabbage is an antispasmodic, a diaphoretic, an expectorant and a sedative.

INDICATIONS AND USAGE

Unproven Uses: The plant is used for bronchitis and asthma.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

finishes flowering before the leaves unfold. The calyx is campanulate with long tips, which are twice as long as the tips of the 5 petals. The fruit is dark blue, frosted, globular, diameter approximately 10 mm.

Leaves, Stem and Root: Sloe is a bulky bush about 3 m high. The branches are velvet-haired when young. The numerous lateral branches are almost horizontal and end in sharp thorns. The bark is black-brown.

Characteristics: The fruit tastes exceptionally sour and is only really edible after several frosts.

Habitat: The plant grows in Europe and parts of Asia.

Production: Sloe fruit consists of the fresh or dried ripe fruit of *Prunus spinosa* as well as its preparations. Sloe flower consists of the dried flowers of *Prunus spinosa* as well as its preparations.

Not to be Confused With: May be confused with the flowers of *Prunus padus* syn. *Padus avium*.

Other Names: Blackthorn, Wild Plum

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SLOE FRUIT

Cyanogenic glycosides: amygdalin, only in the seeds

Fruit acids

Monosaccharides/oligosaccharides

Tannins

EFFECTS: SLOE FRUIT

Sloe fruit has an astringent effect.

COMPOUNDS: SLOE FLOWER

Cyanogenic glycosides: amygdalin (traces, likely only in the fresh blossoms)

Flavonoids: including quercitrin, rutin, and hyperoside

EFFECTS: SLOE FLOWER

There is no reliable information available.

INDICATIONS AND USAGE

SLOE FRUIT

Approved by Commission E:

- Inflammation of the mouth and pharynx

Sloe fruit is used externally for inflammation of the oral and pharyngeal mucosa (as a gargle).

Unproven Uses: In folk medicine the fruit juice is used as a gargle for mouth, throat, and gum inflammation. Syrup and wine are employed as a purgative or diuretic and as jam for a weak stomach.

SLOE FLOWER

Unproven Uses: Preparations of Sloe flower are used for common colds, diseases and ailments of the respiratory tract, as a laxative, for diarrhea, for prophylaxis and treatment of gastric spasms, flatulence, intestinal diseases and gastric insufficiency.

Homeopathic Uses: *Prunus spinosa* is used for cardiac insufficiency and 'nervous headaches'.

PRECAUTIONS AND ADVERSE REACTIONS

SLOE FRUIT AND FLOWER

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

SLOE FRUIT

Mode of Administration: Sloe fruit is available as crude drug for infusions and other galenic preparations for mouth rinses.

Daily Dosage: External use — 2 to 4 gm drug

SLOE FLOWER

Mode of Administration: Sloe flower preparations are -available in various commercial compounded preparations.

Preparation: Tea: pour boiling water over 1 to 2 heaped teaspoons, stir occasionally for 5 to 10 minutes and strain.

Daily Dosage: Drink 1 to 2 cups during the day or 2 cups in the evening. (1 teaspoon corresponds approximately to 1 gm drug)

Storage: Should be protected from light and moisture, at best not longer than 1 year.

Slippery Elm

Ulmus rubra

TRADE NAMES

Slippery Elm Bark

DESCRIPTION

Medicinal Parts: The medicinal part is" the dried inner rind separated from the outer bark.

Flower and Fruit: The flowers are in dense, almost sessile clusters. There are 5 to 9 tepals and the same number of stamens. The stigmas are bright red. The fruit is almost top-shaped to broad-elliptical, 1 to 2 cm long, wide and glabrous, except for the rust-red downy center. The seeds are inserted in the center.

Leaves, Stem and Root: The tree is medium-sized and grows up to 20 m tall with spread branches forming an open crown. The younger branches are red-brown or orange and more or less downy. The bark is deeply fissured. The buds are large, rust-red and downy. The leaves are obovate to oblong, 10 to 20 cm long and have a double-serrate margin. The lamina is long acuminate and sharply asymmetrical at the base. The leaves, are dark green above and very rough, densely downy beneath. They darken in autumn.

Characteristics: The texture is mucilaginous and the odor slight but characteristic. The powdered inner bark is used for its mucilaginous quality. Taken as a drink, it relieves irritation of the mucous membrane. The same water-retaining properties allow the powder to be used as an emollient poultice.

Habitat: The plant is indigenous to North America.

Production: Slippery Elm bark is the inner bark and wood of *Ulmus fulva*.

Other Names: Red Elm, Sweet Elm

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroids: sterols, including cholesterol, campesterol, beta-sitosterol

Sesquiterpenes: including 5-isopropyl-3,8-dimethyl-2-naphthol, 2-hydroxy-5-isopropyl-8-methyl-5,6,7,8-tetrahydro-3-naphthyl aldehyde

Tannins (very little)

EFFECTS

Slippery Elm is demulcent, emollient and soothing to the alimentary canal.

INDICATIONS AND USAGE

Unproven Uses: Internally, the drug is used in the treatment of gastritis and gastric or duodenal ulcers. Externally, it is used in the treatment of wounds, burns, skin conditions, swollen glands, gout, and rheumatism.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and cut drug is available in the form of a decoction for internal use and poultices for external use.

How Supplied: Capsules — 370 mg

Preparation: A decoction is made in a ratio of 1:8 with ethanol.

Daily Dosage: The dose for the decoction is 4 to 16 ml per day. Externally, the coarsely ground drug is used as a poultice.

Smilax species

See *Sarsaparilla*

Sneezewort

Achillea ptarmica

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root.

Flower and Fruit: The flowers are white, composite and in cymes at the tip of the stem. The bracts are lanceolate and short-haired. The ray florets are linguiform and female. The disc florets are tubular and androgynous. The chaff scales are lanceolate and hairy-tipped. The fruit is hairless.

Leaves, Stem and Root: The plant grows from 30 to 80 cm high. The rhizome is creeping, and the stem is upright and glabrous. The leaves are glabrous, alternate, simple, lanceolate, acute, sessile and finely serrated. They are slightly glossy and dark green.

Habitat: The plant is indigenous to northern and central Europe.

Production: The rhizome is dug up in the autumn of its second year of bearing fruit, washed, freed of any green areas and dried in the shade at a temperature of 35° C.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Polyyenes: including pontica epoxide, tridecatrien-(1,3,5)-triin-(7,9,11)-cis-dehydromatricaria ester

Alkamides: including trans-dehydromatricaria acid isobutyl amide

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: In the past, Sneezewort was used as a remedy for tiredness, loss of appetite, urinary tract complaints, nausea, vomiting, diarrhea, rheumatism and other painful disorders. Today it is considered a remedy for toothache, flatulence and problems with elimination; the herb also helps to regulate bowel movements.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages, although persons with compound allergies should avoid salves prepared from the drug.

DOSAGE

Mode of Administration: Sneezewort is available as a topical preparation and in alcoholic extracts.

Preparation: To prepare an infusion, use 2 teaspoonfuls of the comminuted drug to 2 cups of water.

Daily Dosage: A daily infusion can be drunk, or the fresh root can be chewed.

Snowdrop

Galanthus nivalis

DESCRIPTION

Medicinal Parts: Although disputed, some attribute medicinal properties to the bulb.

Flower and Fruit: The flowers are single on approximately 10 cm long peduncles, are campanulate, drooping and shorter than the hood-like bract. The perigone has 6 tepals, the outer 3 oval, white, 14 to 18 mm long and free. The inner 3 tepals are shorter, with an indentate tip, a green longitudinal stripe on the inside and a green half-moon-shaped spot on the outside. The 6 stamens are short and inclined toward each other. The ovary is barrel-shaped and has 1 style. The fruit is a yellowish-green, 3-chambered capsule with up to 12 seeds in each chamber. It is initially fleshy, and later springs open in folds. The seeds are elliptical, 3 to 4 mm long, with a thin membranous skin and a small and narrow horn-like appendage.

Leaves, Stem and Root: This bulb plant is hardy and grows to 10 to 25 cm high. There are only 2 basal leaves, up to 0.8 cm wide and up to 10 cm long, with a blue-green bloom.

Further information in:

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Madaus G, Lehrbuch der Biologischen Arzneimittel, Bde 1-3, Nachdruck, Georg Olms Verlag Hildesheim 1979.

Smartweed

Persicaria hydropiper

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and the whole plant harvested during the flowering season.

Flower and Fruit: The greenish pink flowers are in sparse, thin, hanging false ears. The 4-bract involucre is inconspicuous with a reddish tip and is glandular-punctate. The flowers are androgynous. There are 6 to 8 stamens, 2 of which have no function. The fruit has a flat and a domed side. It is black, punctate, nut-like, roughly bumpy and surrounded by a remaining epicalyx.

Leaves, Stem and Root: The plant grows from 30 to 50 cm high. The branched stems, which are from 60 to 90 cm long, are first creeping and later semi-erect and often tinged red. The leaves are oblong-lanceolate, short petioled, narrowed at both ends and alternate; they are glandular and ciliate on the under surface. The leaf sheaths at the base of the leaves are loose, glabrous and ciliated at the margin.

Characteristics: Smartweed has an extraordinarily hot, pepper-like taste and is often used as a pepper substitute. The plant has characteristic long, thinly curved, hanging, flowering branches.

Habitat: The plant is indigenous to large parts of Europe, Asian Russia and Arctic regions.

Production: Smartweed is the fresh plant, in flower, of *Polygonum hydropiper*. The flowering herb is cut and washed, the roots are removed and discarded and the herb is dried in the shade.

Not to be Confused With: *Polygonum hydropiper* is sometimes adulterated with *Polygonum persicaria*, *P. mite* and *P. minus*.

Other Names: Water Pepper, Arsesmart

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including rhamnazin, rhamnazin bisulfate, persicarin (isorhamnnetine sulfate) quercitrin, and hyperoside

P-cumaroyl glycosides: hydropiperoside

Sesquiterpenes: sesquiterpene aldehydes (pungent substances), polygoidal (tadeonal), and warburganal

Tannins

EFFECTS

Smartweed is a hemostyptic.

INDICATIONS

Unproven Uses: In folk medicine Smartweed is used internally for uterine bleeding, menstrual bleeding, bleeding of hemorrhoids (piles), gastrointestinal bleeding, rheumatic pain, as a diuretic, for bladder and kidney disease and gout; and used externally for poorly healing wounds, sprains, contusions, rheumatism and gout.

Chinese Medicine: Smartweed is used for severe digestive problems, vomiting, diarrhea, dysentery, scabies and external wounds in China.

Homeopathic Uses: *Polygonum hydropiper* is used to treat varicose veins.

PRECAUTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The consumption of larger quantities of the fresh kraut can lead to gastroenteritis. External use is not advisable because of the drugs irritant effect on the skin.

DOSAGE

Mode of Administration: Smartweed is available in crude powder form for oral intake and in parenteral form for homeopathic use.

Preparation: Tea — Pour 1/4 Liter hot water over 1 heaped teaspoon drug and strain after 10 minutes.

Daily Dosage: Tea — 3 times a day.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34)

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

They are linear and slightly keeled on the underside. The outer leaf has an open sheath, the inner leaf a closed sheath. The bulb is globose to ovoid and approximately 1.5 cm wide.

Habitat: The plant is native to Switzerland and Austria as well as other sections of southern Europe, but also has spread to other parts of Europe including Bulgaria and the Commonwealth of Independent States.

Production: The Snowdrop bulb is the fresh bulb of *Galanthus nivalis*, which is harvested in the flowering season.

ACTION AND PHARMACOLOGY

COMPOUNDS

Amaryllidaceae alkaloids (0.2 to 1.6%): including galanthamine, hemanthamin, narwedine, nivalidine, hippeastrine, lycorine, nivaline, narciclasine, pretazettine. The alkaloid spectrum depends greatly upon the variety.

Lectins

EFFECTS

The drug is now considered toxic. Previous use was based on the effect of the alkaloid galanthamine contained in the drug as a competitive inhibitor of true cholinesterase. The administration of this isolated alkaloid for decurarization in connection with anesthetics thus appeared plausible, as did use for postoperative atonia of the gastrointestinal tract and of the bladder, myasthenia and other conditions. The effects of other alkaloids contained in the drug are virostatic, tumor-inhibiting, positively inotropic and negatively chronotropic, as well as being respiratory analeptics.

INDICATIONS AND USAGE

Unproven Uses: Internal application: Snowdrop has been used for myasthenia, myopathy, symptoms resulting from polyneuropathy, neuritis, myelitis and injuries to the spine, as well as postoperative intestinal, gastric and bladder atonia. It has also been used in anesthetics, for thrombosis and thrombo-embolism, Glaucoma (rare) and Alzheimer's disease.

DOSAGE

The drug is no longer used therapeutically. The literature includes mention of previous use of an aqueous solution of Galanamine hydrobromide 0.15 to 0.35 mg per kg of body weight IV, IM, sc.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is toxic. Oral ingestion leads to symptoms resembling those of physostigmine poisoning: diarrhea, colic and vomiting (acetylcholine esterase inhibition through galanamine). Fatal poisonings have not been recorded.

Soapwort

Saponaria officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried roots, and the leaves harvested in summer before or during the flowering season of the first and second year of growth.

Flower and Fruit: The flowers generally are flesh-colored, sometimes white, grow in racemes and have a 5-tipped fused calyx. The petals have long stems. The ovary is superior and has 1 style. The fruit is a capsule with 4 teeth at the tip and bursts open when ripe. The seeds are reniform-globular and black-brown.

Leaves, Stem and Root: The perennial plant is leafy and grows about 100 cm high. The stems are round, erect, and finely downy. The leaves are crossed opposite, oblong to lanceolate, acute, entire-margined, 3-veined and taper to a short petiole.

Characteristics: The plant has a weak fragrance. The leaves and root contain bitter saponine and produce suds when rubbed under water.

Habitat: The plant is indigenous to the temperate regions of North America, Asia, and Europe.

Production: Soapwort herb consists of the dried, above ground parts of *Saponaria officinalis*. The herb is harvested in the summer before flowering in the first and second years of the plant's growth.

Soapwort root consists of the dried roots, rhizomes and runners of *Saponaria officinalis*. The roots are plowed up in

autumn, after the herb has been mown. The root is cleaned and then dried artificially at 50° C.

White Soapwort root consists of the dried, underground parts of Gypsophila species, particularly Gypsophila paniculata. The roots of Gypsophila radix are dried quickly under high temperatures or in direct sunlight. The roots are cut into 5 mm thick slices to avoid a separation of the sugars from the saponines.

Not to be Confused With: Saponaria officinalis should not be confused with Gypsophila species and Solanum dulcamara.

Other Names: Soapwood, Soap Root, Latherwort, Bouncing Bet, Fuller's Herb, Bruisewort, Crow Soap, Sweet Betty, Wild Sweet William, Dog Cloves, Old Maids' Pink

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SOAPWORT HERB

Triterpene saponins: chiefly aglycone quillaic acid

Flavonoids: including among others, saponarine (C-glycosyl-flavone)

Ribosome-inactivating proteins (in the seeds)

EFFECTS: SOAPWORT HERB

Because of the high saponin content, the drug is antibiotic, expectorant, antiphlogistic, cholesterol-lowering and spermicidal. In high doses, it becomes irritating to the mucous membrane, cytotoxic and emetic.

COMPOUNDS: SOAPWORT ROOT

Triterpene saponins (2 to 8%): aglycones quillaic acid, gypsogenic acid

EFFECTS: SOAPWORT ROOT

Because of the high saponin content, the Soapwort root is antibiotic, expectorant, antiphlogistic, cholesterol-lowering and spermicidal. The drug is expectorant because of its effect on the gastric mucosa. In high concentrations, it has been shown to be irritating to the mucous membranes, cytotoxic and emetic.

INDICATIONS AND USAGE

SOAPWORT HERB

Unproven Uses: In addition to uses as an expectorant for cough and other diseases of the respiratory tract, folk medicine internal uses also encompass constipation, gastrointestinal disorders, liver and kidney disorders, rheumatic gout, neurasthenia and oxyuriasis. External folk medicine indications include skin rashes, eczema and as a gargle for tonsillitis.

SOAPWORT ROOT

Approved by Commission E:

- Cough/bronchitis

The drug is used for inflammation of the mucous membranes of the upper respiratory tract.

Unproven Uses: In addition to respiratory applications, internal folk medicine uses occasionally include diseases of the liver, gallbladder and kidney, constipation, gout and as an emmenagogue. Among external uses are skin disorders, lingual mycoses and rheumatic complaints.

PRECAUTIONS AND ADVERSE REACTIONS

SOAPWORT HERB AND ROOT

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Localized skin and mucus membrane irritations are possible with the administration of larger dosages.

DOSAGE

SOAPWORT HERB

Daily Dosage: As an aqueous extract, take 1 to 2 g daily.

Constipation—2 glasses daily of a decoction, (Preparation instructions are not given.)

Storage: The herb should be stored in a container that protects it from light and moisture.

•SOAPWORT ROOT

Mode of Administration: Comminuted herb for teas and other galenic preparations for internal use. Drug extracts are contained in a few standardized preparations of antitussives.

Preparation: To prepare tea, use 0.4 g of medium fine cut (1 teaspoonful is approximately equal to 2.6 g of the drug).

Decoction—10 g/180 g drug with the addition of 1 g sodium carbonate and simple syrup to 200 g.

Daily Dosage: The average daily dose is 30 to 150 mg of the drug corresponding to 3 to 15 mg of gypsophila saponin. As an expectorant, 1 dessertspoonful of the decoction is taken every 2 hours.

Storage: The root should be stored tightly sealed and protected from light.

Solomon's Seal

Polygonatum multiflorum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried rhizome and roots.

Flower and Fruit: The odorless, greenish-white campanulate flowers are in 2 to 6 blossomed racemes, usually without an accompanying leaf. The perigone tube is tightly cylindrical, 9 to 20 mm long and 2 to 4 mm wide. It is drawn together over the ovary and opens out like a funnel at the top. The tepals at the tip are pubescent on the inside, and the filaments are softly pubescent. The fruit is a blue-black, frosted berry, 8 to 9 mm in diameter with a disgusting, sweet taste.

Leaves, Stem and Root: The plant is a perennial 30 to 80 cm high herb. The stems are sturdy, round and glabrous. The leaves are ovate to elliptical, 5 to 15 cm long and 3 to 7.5 cm

wide, narrowing suddenly at the base. They are glabrous, dark green above and gray-green frosted beneath.

Habitat: The plant is indigenous to Europe, the Near East, eastern Asia, the Himalayas, Siberia and North America.

Production: Solomon's Seal rhizome is the rhizome of *Polygonatum multiflorum*. The root-stocks should be dug up during the dormant seasons, autumn and spring. Earth and roots are removed and the rhizomes cut into pieces of a few centimeters in length.

Other Names: Dropberry, Lady's Seals, Sealroot, Sealwort, St. Mary's Seal

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins (2.5%): 1 unnamed saponins, aglycones diosgenin, or else (25R)-furost-5-en-3beta,22alpha,26-triole

Mucilages

Acetidin-2-carboxylic acid

EFFECTS

The steroid saponins may be responsible for the anti-inflammatory effect of the drug. It works as a tonic, and relieves and soothes upset stomach.

INDICATIONS AND USAGE

Unproven Uses: The plant was formerly used in the treatment of respiratory and lung disorders. It was used externally in the treatment of bruises, furuncles, ulcers or boils on the fingers, hemorrhoids, redness of the skin, and for edema and hematoma.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Extended administration of the drug in therapeutic dosages can lead to gastrointestinal irritation.

OVERDOSAGE

Overdosage leads to nausea, diarrhea, gastric complaints and queasiness.

DOSAGE

Mode of Administration: The drug has been used internally as an infusion and externally as a poultice, but is now obsolete.

Storage: Store in paper and cloth sacks.

Sophora japonica

See Pagoda Tree

Sorb Apple

Sorbus domestica

DESCRIPTION

Medicinal Parts: The medicinal part is the ripe fruit.

Flower and Fruit: The inflorescence is umbelliferous-racemous and tomentose. The sepals and petals are also tomentose. The petals are white to light red, and the carpels are pubescent. The dividing membranes are not split. There are 2 ovules in each ovary chamber. The fruit is false pear-shaped-globular, yellow, speckled red on the sun side. The seed is flat, brown and sharp-edged.

Leaves, Stem and Root: *Sorbus domestica* is a bush or tree up to 13 m high, with branches that are initially gray-tomentose, later glabrous. The winter buds are glabrous or have hairy tips, and are sticky. The leaves are pinnatifid with 13 to 21 sessile, serrate and acuminate leaflets. The serrate teeth are long and finely acuminate. The lower surface is bluish-green and initially villous-cobweb pubescent, later glabrous.

Habitat: The plant is cultivated in Europe and elsewhere.

Production: Sorb Apple berries are the fruit of *Sorbus domestica*.

Other Names: Service Tree, Cheque Tree, Ash

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sugar alcohols: sorbitol

The fruits do not contain parasorboside, in contrast to those of *Sorbus aucuparia*.

The drug has not been fully researched.

EFFECTS

The active agents are pectin, tannin, organic acids (sorbic acid) and sorbitol. The fruit has astringent, anti-inflammatory and pain-relieving properties.

INDICATIONS AND USAGE

Unproven Uses: Internally, the berries act as an astringent for the intestinal tract. Externally, preparations are used for skin cleansing.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Fresh juice from the berries and a decoction made from the dried fruit are used internally. The decoction is also applied externally as a wash to the affected areas. See also Mountain Ash Berry (*Sorbus aucuparia*).

Daily Dosage: Fresh juice: 50 to 80 gm; decoction: add 5 gm of drug to 100 ml of water and drink 1 to 2 cups.

LITERATURE

No literature is available.

Sorrel

Rumex acetosa

TRADE NAMES

Sorrel (available from a number of manufacturers), Sheep Sorrel

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh leaves and the whole herb.

Flower and Fruit: The plant has small greenish unisexual, dioecious flowers growing in narrow, loose panicles. There are 6 tepals. The 3 inner ones are longer, closer together, and turn red when the fruit ripens. When mature they are often red-tinged, membranous, entire-margined and have a scale-like downwardly curved welt at the base. The three outermost tips are revolute. There are 6 stamens and 3 styles with a paintbrush-like stigma. The fruit is a triangular, brown-black nut enclosed in the wing-like enlarged inner tepal.

Leaves, Stem and Root: The plant can grow up to 100 cm high. The leaves alternate on the erect, grooved stems, which are unbranched up to the panicles. The leaves are fleshy, grass green, hastate or spat-shaped. The lower leaves are long-petioled; the upper ones are short-petioled, sessile and clasping. There is a membranous, dentate or fringed cone at the base of the leaves.

Characteristics: The stem is red-tinged, and the herb has a sour taste. It gets its acidity from the same salt that is present in Rhubarb.

Habitat: The plant is common in Europe.

Production: Sorrel is the aerial part of *Rumex acetosa*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Oxalates: oxalic acid, calcium oxalate

Tannins (7-10%)

Flavonoids

Anthracene derivatives: anthranoids, aglycones, physcion, chrysophanol, emodin, aloe-emodin, rhein, and their glucosides, as well as aloe-emodin acetate

EFFECTS

Sorrel acts as a diuretic. It stimulates secretion, and improves resistance to infections (antibacterial), although some of these effects are questionable.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for acute and chronic inflammation of the nasal passages and respiratory tract. It is

also used as an adjuvant in antibacterial therapy. Folk medicine uses include stomach ailments, liver and biliary ailments and purification of the blood.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Oxalate poisonings are conceivable only with the consumption of very large quantities of the leaves as a salad.

DOSAGE

Mode of Administration: The drug is described as obsolete.

How Supplied:

Tablets

Liquid — 1:4

Daily Dosage: The dosage for adults is 2 coated tablets or 50 drops (drops with 19% Ethanol) taken 3 times daily.

LITERATURE

Ito H. Effects of the antitumor agents from various natural sources on drug-metabolizing system, phagocytic activity and complement system in sarcoma 180-bearing mice. *Jpn J Pharmacol*, 40:435-43, Mar 1986.

Southern Bayberry

Myrica cerifera

TRADE NAMES

Southern Bayberry is available from a number of manufacturers, sometimes labeled Bayberry Bark or Bayberry Root Bark.

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried root bark and the wax extracted from the berries.

Flower and Fruit: The flowers are unisexual and have no calyx or corolla. They are small and yellowish with scaly catkins. The fruit is small groups of round, gray-white berries containing numerous black seeds, which have a crust of usable greenish-white wax. The wax helps keep the berries in a suitable state for germination for a period of 2 to 3 years.

Leaves, Stem and Root: Southern Bayberry is an evergreen shrub or small tree that grows up to 10 m high. The bark has a white, peeling outer layer, which covers a red-brown inner layer. The leaves are lanceolate to oblong-lanceolate, glossy or resinous, and punctate on both sides. -

Characteristics: The taste is astringent and bitter. The leaves have an aromatic odor.

Habitat: The plant is found in the eastern and southern regions of the U.S. and around Lake Erie.

Production: Bayberry bark is the bark from the trunk and branches of *Myrica cerifera*.

Other Names: Bayberry, Candleberry, Tallow Shrub, Vegetable Tallow, Waxberry, Wax Ivyrtle, Myrica

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (traces)

Tannins

Resins

The constituents of the drug have not been extensively investigated.

EFFECTS

The active compounds have diaphoretic, stimulant and astringent effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for coughs and colds, and externally for skin diseases and ulcers.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Higher dosages of the drug are said to trigger vomiting, and are used as an emetic.

DOSAGE

Mode of Administration: The drug is available as a liquid extract for internal use, and in powder form.

How Supplied:

Capsules — 450 mg, 475 mg

Liquid Extract — IT

Southern Tsangshu (Cang-Zhu)

Atractylodes lancea

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the whole plant and roots.

Flower and Fruit: The composite flowers are surrounded by bracts. The capitulas are apical and upright, with a diameter of 1.5 to 2 cm. The calyx is double-rowed and double-pinnate. The lingual florets are in 7 or 8 rows, whitish and 1 to 1.2 cm long. The fruit is an achene. The pappus is brownish and 8 to 9 mm long.

Leaves, Stem and Root: Southern Tsangshu is an upright, herbaceous perennial with a rhizome that extends up to 1 m high. The basal leaves wilt rapidly, the upper cauline leaves are alternate, small, usually simple and sessile. The lower leaves are long-petiolate and 8 to 10 cm long. The lamina is pergament-like, single pinnate with 3 to 5 elongate-elliptical leaflets. The apical leaflet is larger with short thorns on the margin. The rhizome is elongate, gnarled, 2 to 3 cm thick and up to 8 cm long.

Habitat: Cang-Zhu is indigenous to Japan and China.

Production: Southern Tsangshu rhizome is the dried rhizome of *Atractylodes lancea*. The rhizome is dug up in spring or autumn and dried. In order to obtain the cut drug, the rhizome is soaked after being cleaned and cut into slices.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1.5%): components including p-cymol, beta-selinene, alpha curcumene, elemol, hinesol, beta-eudesmol

Sesquiterpenes: 3 beta-hydroxyatractylon, 3beta-acetoxyatractylon

Polynes: including atractylodin, atractylodinol, acetylratylodinol

EFFECTS

The sesquiterpenes and furanosesquiterpenes contained in the essential oil of the drug have hepatoprotective, immunostimulating and intestinal motility-enhancing effects, while also inhibiting the secretion of gastric juices. The smoke of the drug is said to have antiseptic characteristics, while the essential oil is additionally credited with a sedative effect, derived from its beta-eudesmol and hinesol content.

INDICATIONS AND USAGE

Unproven Uses: Southern Tsangshu is used for diarrhea, feelings of fullness in the lower abdomen, lack of strength including atrophy, rheumatic pain, colds and night blindness.

Chinese Medicine: The herb is used for gastroenteritis, edema, disturbances of renal function and generalized pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb, cut and powdered drug for internal use.

Preparation: The powder is prepared in accordance with Jap XI or ChinP IX. It is roasted using the Fuchao method.

Dosage: 3 to 9 of gm of drug

Storage: Should be stored in a dry and cool place and in tightly sealed containers.

Soybean

Glycine soja

DESCRIPTION

Medicinal Parts: The medicinal parts are the soya lecithin extracted from the soya bean, the soya oil and the soya seed.

Flower and Fruit: The flowers are small, inconspicuous, short pedicled, upright, axillary and in 3 to 8 blossomed clusters. The sepals are campanulate or tubular-campanulate and somewhat bilabiate. The corolla is usually purple, exceeding the calyx only slightly or not at all. The stamens are diadelphous or monadelphous. The style is glabrous. The pod is linear or oblong and constricted between the seeds. The pod is septate and dehiscent. There are 2 to 4 seeds, which are oblong-ovate, white, yellow or black-brown.

Leaves, Stem and Root: The soya plant is an erect or twining annual bushy plant. The stem and leaves are thickly villous. The leaves are trifoliate, the leaflets are large, ovate, entire-

margined and, particularly on the margins and on the ribs of the lower surface, pubescent.

Habitat: The soya plant is indigenous to east Asia but has never been found in the wild. Glycine soja is found in the Amur-Ussuri area, northern China, Taiwan, Korea and Japan.

Production: Lecithin consists of the phospholipid mixture from Glycine soja seeds and its preparations. Virgin Soybean oil is mixed with 2% water at 60° to 80° C. After the swelling times it is separated by centrifugation and the lecithin paste is evaporated at 100° C in a vacuum until the remaining water content is 0.2 to 0.8%.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Phospholipids (45-60%): in particular phosphatidylcholine, phosphatidylethanolamine, phosphatidylinositol

Fatty oil (30-35%)

Steroids: Phytosterols (2-5%)

EFFECTS

The phospholipids extracted from soya lecithin was shown to have lipid-reducing properties in animal experiments and clinical trials.

INDICATIONS AND USAGE

Approved by Commission E:

- Raised levels of cholesterol

Unproven Uses: Soybean is used for less severe forms of hypercholesterolemia when dietary measures are required. Soybean is also used for liver and gallbladder complaints, anemia, poor concentration, cerebral and nerve conditions, and general debility.

Chinese Medicine: Soybean is used for hyperhidrosis, night sweats, confusion and joint pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or major side effects are known in conjunction with the proper administration of designated therapeutic dosages. Minor side effects include occasional gastrointestinal effects, such as stomach pain, loose stool and diarrhea.

DOSAGE

Mode of Administration: Preparations for oral administration.

Daily Dosage: The average dose is 3.5 gm of phospholipids (phosphatidylcholine).

Storage: Soybean preparations must be protected from light and tightly sealed.

Spanish Chestnut

Castanea sativa

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves collected and dried in autumn, and preparations of the fresh leaves.

Flower and Fruit: The male, monoecious, yellowish-white flowers are in 12 to 20 cm long, erect catkins consisting of numerous, 7-flowered clusters. These are located in the leaf axils, of the upper branches. There are 3 to 6 female flowers at the base of unopened male catkins. When the fruit ripens in October, the outer soft thorny husk bursts into 4 lobes, revealing a brown-skinned sweet chestnut that needs "wine weather" to ripen.

Leaves, Stem and Root: The tree grows from 15 to 30 m high. The bark is smooth at first, olive green, later dark brown, and vertically reticulate. The leaves are 8 to 25 cm long, coriaceous, oblong-lanceolate with long, pointed, serrated teeth.

Habitat: Northern temperate hemispheres; prefers maritime climate.

Production: Spanish Chestnut leaves consist of the leaves of *Castanea sativa* collected from September to October. The leaves are collected and air-dried.

Other Names: Sweet Chestnut, Husked Nut, Jupiter's Nut, Sardinian Nut, Chestnut

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (6 to 8%): ellagitannins, including pedunculagin, tellimagrandin I and II, casuarictin, potentillin, castalagin, vescalagin

Flavonoids: including rutin, quercitrin, myricetin

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Spanish Chestnut leaves are used for complaints affecting the respiratory tract, such as bronchitis and whooping cough, leg pain, circulation and diarrhea, and as a gargle for sore throats.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: An infusion is prepared by pouring boiling water over 5 gm of comminuted drug and then straining it.

Daily Dosage: The average single dose is 5 gm of drug or 5 gm of liquid extract.

LITERATURE

Spearmint

Mentha spicata

DESCRIPTION

Medicinal Parts: The medicinal parts are the steamed distillation of the fresh, flowering, aerial parts, and the leaves collected during the flowering season and dried.

Flower and Fruit: The spike-like inflorescence consists of false whorls in the axils of the bracts. The 5-tipped calyx is campanulate; glabrous or pubescent and is surrounded by a 5-tipped, pale lilac, pink or white corolla, which is almost half as long again as the calyx. The nutlet is reticulate in pubescent plants and smooth in glabrous plants.

Leaves, Stem and Root: The plant is 30 to 60 cm during the flowering season. Runners grow from the buds at the base of the stem. The quadrangular stem is ascendent or erect and usually thickly pubescent. The leaves are oblong-ovate or lanceolate, decussate, smooth or wrinkled, regularly serrate, and glabrous to thickly pubescent. The upper leaves are sessile, the lower ones short petiolate.

Habitat: The plant probably originates from the Mediterranean region and is now naturalized in large parts of Europe and North America.

Production: Spearmint is the aerial part of *Mentha spicata*. Spearmint oil is the essential oil extracted from the plant.

Other Names: Curled Mint, Garden Mint, Mackerel Mint, Our Lady's Mint, Green Mint, Spire Mint, Sage of Bethlehem, Fish Mint, Lamb Mint

ACTIONS AND PHARMACOLOGY**COMPOUNDS: IN THE FOLIAGE**

Volatile oil (0.8-2.5%)

Flavonoids: thymonin

Caffeic acid derivatives: including among others rosmarinic acid in the volatile oil

Chief components: L-carvone (40-80%, aroma-carrier), (-)-limonene (5-15%), additionally including among others beta-bourbonene, cis- and transcarvylacetate, caryophyllene, 1,8-cineole, dihydrocarveol, trans-sabinene hydrate

EFFECTS

The oil produced contains a high proportion of carvone, which produces the spearmint smell. It has antispasmodic, carminative and stimulant effects.

In vitro, an antimicrobial effect was observed. The drug is insecticidal and shows a neurodepressive effect in animal experiments (increased duration of sleep).

INDICATIONS AND USAGE

Unproven Uses: Spearmint is used for digestive disorders and as a remedy for flatulence. The essential oil is used as an aromatic preparation. Spearmint leaves are used as carminative.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The volatile oil possesses a weak potential for sensitization due to its menthol and L-carvone content.

DOSAGE

Mode of Administration: Spearmint is mainly used internally in the form of an oil or concentrate.

Speedwell

Veronica officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried herb collected during the flowering season, the fresh aerial parts of the flowering plant and the dried aerial parts collected during the flowering season.

Flower and Fndt: The erect bright blue or lilac flowers are in axillary, peduncled, spike-like racemes. The flowers are small, pedicled and have 4 slightly fused sepals. The corolla has a very short tube, is flatly splayed and has 4 uneven tips. There are 2 stamens and 1 superior ovary. The fruit is a triangular capsule narrowed at the base. The fruit chambers each have 5 to 10 seeds. The seeds are about 1 mm long, oval and flat; the back of the seed is smooth.

Leaves, Stem and Root: The plant is a 10 to 20 cm high herbaceous perennial with runners that tend to form grass. The root system consists mainly of shoot-producing roots. The stem is creeping, and the flower-bearing branches are erect. The whole plant is roughly pubescent. The leaves are obovate-ovate, elliptical or oblong, short-petioled and serrate.

Habitat: The plant is indigenous to almost all of Europe, parts of Asia and North America. The sources of the drug are Bulgaria, die former Yugoslavia and Hungary.

Production: Speedwell consists of the above-ground parts of *Veronica officinalis* imported from Bulgaria, the former Yugoslavia and Hungary. Only the flowering herb is harvested (without roots or lower parts) and subsequently dried fully in the shade before it is cut.

Not to be Confused With: *Veronica chamaedrys* or *Veronica allionii*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes (0.5-1.0%): including among others aucubin, catalpol, catalpol esters (including among others minecoside, verminoside, veronicoside), mussaenoside, ladroside

Flavonoids (0.7%): including among others luteolin-7-O-glucosides (cinaroside), 6-hydroxyluteolin-7-monoglucoside

Triterpene saponins (10%)

Caffeic acid derivatives: chlorogenic acid (0.5%)

EFFECTS

Speedwell exhibits a protective effect against ulcers and accelerates ulcer healing. Its use as an astringent in the treatment of wounds and as a gargle for inflammations of the mouth and throat is plausible because of the amaroid-like properties of the drug.

INDICATIONS AND USAGE

Unproven Uses: Speedwell preparations are used for diseases and discomfort of the respiratory, gastrointestinal and lower urinary tracts. It is also used for the liver and kidneys, and to treat gout, rheumatoid arthritis and rheumatic complaints.

In addition, Speedwell is used internally to improve metabolism ("blood-purifying") and for nervous agitation. Externally, the herb is used as a gargle for inflammation of the oral and pharyngeal mucosa, promotion of wound healing, chronic skin complaints, itching and sweating of the feet.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is available as a whole, cut and powdered drug for internal and external use in compound preparations.

Preparation: To prepare a tea, pour 1 cup of boiling water over 1.5 gm of drug (1 gm is approximately 1 teaspoonful). For the preparation of external lavages and compresses for ulcers, wounds and eczema, add 1 handful of drug to 1 liter of water and boil for 10 minutes.

Daily Dosage: The average single dose is 1.5 gm of drug. The dose of the tea (used as an expectorant) is 1 cup taken 2 to 3 times daily.

Storage: Speedwell must be protected from light sources.

Spikenard

Aralia racemosa

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh and dried rhizome and roots.

Flower and Fruit: The inflorescence is a large panicle, each branch of which carries a simple, round, 10 to 15 flower umbel. The flowers are small and have greenish-white petals. The drupes are dark red to crimson, roundish and 5-ribbed. The seeds are compressed and have a similarly formed endosperm.

Leaves, Stem and Root: *Aralia racemosa* is a herbaceous, bushy, stiffly branched perennial with a woody base. The stem extends up to 2 m high and is glabrous and grooved. The leaflets are thin and oval. The leaflets can grow up to 20 cm long and 16 cm wide, but are usually much smaller and

cordate at the base. The rhizome is up to 15 cm long and has a diameter of roughly 2.5 cm with prominent concave scars. The roots are about 2 cm thick at the base, pale brown, and wrinkled. The root fracture is short and whitish.

Characteristics: Spikenard has an aromatic odor and taste.

Habitat: The plant grows in North America from central Canada southward to Virginia.

Production: The root and rhizome of *Aralia racemosa* are gathered from the wild in summer and autumn and chopped while fresh. The freshly chopped roots and rhizomes are either dried or processed immediately to form a thick paste.

Not to be Confused With: It is possible to confuse Spikenard with the *Aralia nudicaulis* root. However, Spikenard can be distinguished by its lack of spotted hypodermis cells, which are a feature of the *Aralia nudicaulis* root.

Other Names: Indian Root, Life of Man, Old Man's Root, Petty Morell, Spignet

ACTIONS AND PHARMACOLOGY

•COMPOUNDS

Polyynes: including faltarinole, faltarindiol

Triterpene saponins

Volatile oil (very little)

EFFECTS

Due to its saponin content, the drug's effectiveness as a reflex expectorant for colds seems plausible. It is also diaphoretic and stimulates tissue renewal. Its efficacy has not been proven.

INDICATIONS AND USAGE

Unproven Uses: Preparations are used internally for colds, chronic coughs and asthma. It is used as an alternative to Sarsaparilla in the treatment of skin diseases and for rheumatic conditions. North American Indians use Spikenard internally to treat backache and externally for bruises, wounds, swellings and inflammations.,

Homeopathic Uses: Spikenard is used for colds, hay fever and asthma. Efficacy for colds appears plausible; efficacy for other uses has not been documented.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Because of the polyne spectrum, sensitization and dermatoses connected with the plant are also possible through skin contact.

Pregnancy: The drug is not to be used during pregnancy.

DOSAGE

Mode of Administration: The drug is administered internally as a fluid extract.

Preparation: It is prepared as a liquid extract (1:1); information on the ethanol content is unavailable.

Daily Dosage: When the drug is prepared as an infusion, the recommended daily dosage is approximately 15 g per 500 ml, to be drunk, one cup at a time, during the course of the day. The recommended dosage of the liquid extract is 0.9 g to 1.8 g.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules, 1 to 3 times daily or 1 ml injection solution twice a week sc (HAB1).

Spinach

Spinacia oleracea

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves.

Leaves, Stem and Root: Spinach is an annual plant that can be planted at various times during the vegetation period to guarantee a year-round supply. The stems may grow up to 1 m or more, and are erect. The leaves are ovate to deltoid-hastate, entire or dentate. When the plant ripens, the bracteoles are almost orbicular-ovate, usually wider than long. They often have a divergent spine at the apex.

Habitat: The plant probably originated in Iran and is cultivated worldwide today.

Production: Spinach consists of the fresh or dried leaf of *Spinacia oleracea*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Triterpene saponins: including among others spinach saponins A and B

Oxalic acid (in young leaves 6-8%, in older leaves up to 16%)

Histamine (up to 140 mg/100 gm fresh weight)

Flavonoids: including among others patuletin, spinacetin, spinatoside

Chlorophyll (0.3-1.0%)

Vitamins: including among others ascorbic acid (vitamin C, 40-155 mg/100 g)

Nitrates (depending on the fertilizer, 0.3-0.6%)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Spinach preparations are used for ailments and complaints of the gastrointestinal tract, as a blood-generating remedy, to stimulate growth in children, as an appetite stimulant, for fatigue and for supporting convalescence.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The relatively high nitrate content makes it advisable to forgo consuming spinach as a foodstuff too often. Circumstances that lead to reduction (e.g., leaving spinach standing at room temperature) should also be avoided to prevent nitrite formation. In addition, the oxalate content of spinach could reduce calcium resorption.

Pediatric Use: Infants should not receive spinach as a foodstuff until after their fourth month (danger of methemoglobin formation through nitrites).

DOSAGE

No information is available.

Spiny Rest Harrow

Ononis spinosa

DESCRIPTION

Medicinal Parts: The medicinal parts are the roots and flowering branches.

Flower and Fruit: The pink flowers are solitary or in pairs in the leaf axils. The calyx is campanulate with 5 segments. The standard is large and has dark stripes. The ovoid, erect fruit is a pod as long as or longer than the calyx.

Leaves, Stem and Root: The plant is a low subshrub of about 30 to 60 cm with a long taproot. The branches are erect, spreading, villous and more or less densely covered in short shoots, which terminate in straight thorns. The leaves are trifoliate with 3 small, dentate, oblong leaflets. The upper leaves are entire.

Characteristics: The plant has an unpleasant smell.

Habitat: Spiny Rest Harrow is common in almost all of Europe, as well as in North Africa and western Asia.

Production: Spiny Rest Harrow root consists of the dried roots and rhizomes of *Ononis spinosa*. The plant is harvested in autumn.

Other Names: Cammock, Petty Whin, Stayplough, Rest-Harrow, Wild Liquorice, Stinking Tommy, Ground Furze, Land Whin

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoflavonoids: glycosides, including among others, trifoliarhizin (maackiain-7-0-glucoside), ononin (formononetin-7-0-glucoside), ononin-6-malonylester, homopterocarpin-7-0-glucoside

Free isoflavonoids: including among others, formononetin, genistein, biochanin

Volatile oil (0.02-0.2%): chief components anethole, carvone, menthol

Triterpenes: including among others, alpha-onocerin (alpha-onoceradiendiol)

Lectins

EFFECTS

In combination with sufficient liquid intake, the drug is said to be diuretic. The diuretic effect is disputed because it is not sufficiently documented and can be attributed neither to the essential oil nor to the flavonoids. In animal tests, an anti-edemic effect was proven. The genistein is mildly estrogenic.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Preparations of the drug are used for flushing-out therapy for inflammatory diseases of the lower urinary tract and also for prevention and treatment of kidney gravel.

Unproven Uses: Spiny Rest Harrow is popularly used for gout, rheumatic complaints, as a flushing-out therapy for inflammatory diseases of the lower urinary tract, and for prevention and treatment of kidney gravel.

CONTRAINDICATIONS

The drug should not be used in the presence of edema resulting from reduced cardiac or renal activity.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is ground for teas and other galenic preparations for internal use. Ample liquid intake (at least 2 liters per day) should accompany use of the drug.

Preparation: To prepare an infusion (tea), pour boiling water over 2 to 2.5 g finely cut or coarsely powdered drug and strain after 20 to 30 minutes (1 teaspoonful equals approximately 3 g).

Daily Dosage: 6 to 12 gm of drug.

Spruce

Picea species

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the needles, branch tips or branches and the fresh Spruce shoots.

Flower and Fruit: The male flowers are strawberry colored, the female are crimson or green. The male flowers are in short-stemmed, cylindrical catkins scattered over the crown. The female flowers are in elliptical-cylindrical cones at the top of the crown. The ripe cones are sessile, hanging, globular-clavate and covered in rhomboid scales, which are thin, undulating at the tip and dentate. The wings of the small seeds are 3 times as long as the seeds themselves.

Leaves, Stem and Root: *Picea excelsa* is a tree that grows from 30 to 60 m high and has a column-like trunk with brown-red bark and a girth of about 2 m. The trunk is usually branched. The branches are horizontal and flat. The young shoots are reddish-brown or orange-red. The crossed-opposite leaves are scaly and imbricate. The needles remain on the tree for a number of years. On the upper surface of the shoots they are pointed forward, on the lower surface they are pointed toward the sides. They are 1.3 to 2.5 cm long, rigid or curved, rich green and have a blunt horn-like tip.

Habitat: The tree is found in northern and central Europe.

Production: The essential oil is obtained from the fresh needles and twig tops or branches of *Picea abies* (Syn: *Picea excelsa*), *Abies alba*, *Abies sachalinensis* or *Abies sibirica*. The essential oil is recovered from the needles by a 5 to 6

hour continuous process of aqueous steam distillation on a sieve base of layered and crushed fresh twigs. Preparations from the fresh 10 to 15 cm long shoots of *Picea abies* and/or *Abies alba* (Syn.: *Abies pectinata*) are collected in the spring.

Other Names: Balm of Gilead Fir, Balsam Fir, Canada Balsam, Fir Tree, Hemlock Spruce, Norway Pine, Norway Spruce, Spruce Fir

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SPRUCE NEEDLE OIL

From *Picea abies*:

Bornyl acetate (5-25%)

Limonene (10-30%)

Camphene (10-25%)

Alpha-pinene (10-25%): additionally, including among others santene, beta-pinene, Delta3-carene, myrcene

From *Picea mariana*:

Bornyl acetate (37-49%)

Camphene (10-17%)

Alpha-pinene (10%): additionally, including among others beta-pinene, limonene, Delta3-carene, myrcene, santene

From *Abies alba*:

Bornyl acetate (2-10%)

Limonene (25-55%)

Camphene (9-20%)

Alpha-pinene (6-35%): additionally, including among others beta-pinene, beta-phellandrene, Delta-carene, myrcene, santene

EFFECTS: SPRUCE NEEDLE OIL

The plants are secretolytic, antibacterial and hyperemic.

COMPOUNDS: SPRUCE SHOOTS (FRESH)

Volatile oil (0.2-0.5%): chief components limonene, alpha-pinene, borneol, bornyl acetate

Ascorbic acid (vitamin C)

EFFECTS: SPRUCE SHOOTS (FRESH)

The essential oil has a secretory, mild antiseptic and hyperemic effect.

INDICATIONS AND USAGE

SPRUCE NEEDLE OIL

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds

- Inflammation of the mouth and pharynx
- Neuralgias
- Rheumatism
- Tendency to infection

Unproven Uses: The essential oil is used internally for catarrhal conditions of the respiratory tract. Externally, it is used for catarrhal conditions of the respiratory tract, rheumatic and neuralgic pain, and tension states.

SPRUCE SHOOTS (FRESH)

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds
- Inflammation of the mouth and pharynx
- Muscular and nerve pains
- Tendency to infection

Unproven Uses: The drug is used internally as a respiratory-tract catarrh and externally for muscle pains and neuralgia. In folk medicine, it is used internally for tuberculosis and externally as a bath additive for patients with neurological illnesses,

CONTRAINDICATIONS

Contraindications include bronchial asthma and whooping cough. Patients with extensive skin injuries, acute skin diseases, feverish or infectious diseases, cardiac insufficiency or hypertonia should not use the drug as a bath additive.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages, although bronchial spasms could be worsened.

DOSAGE

SPRUCE NEEDLE OIL

Mode of Administration: Embrocations of alcohol solutions, ointments, gels, emulsions and oils are available, as well as bath additives and inhalants.

Daily Dosage:

Infusion — Place 4 drops of oil on a lump of sugar or in a little water and take 3 times a day.

Inhalation — Add 2 gm of oil to hot water and inhale several times a day.

External application — A 20 to 30% ointment is rubbed onto the affected area several times a day.

Bath additive — Add 5 gm oil to a full bath at a temperature of 35 to 38° C.

Storage: Store in a cool place, in a tightly sealed container, protected from light.

SPRUCE SHOOTS (FRESH)

Mode of Administration: In galenic preparations for internal and external application.

Preparation: For inhalation therapy, place 2 gm of oil in hot water and inhale the vapors. To make a bath additive, boil 200 to 300 gm drug in 1 liter water and strain after 5 minutes; add to a full bath. Make sure it is possible to relax after the bath.

Daily Dosage: For internal use: 5 to 6 gm of drug is administered per day.

Four drops of the essential oil may be placed in a little water or on a lump of sugar and taken 3 times a day.

The inhalation therapy mentioned in the *Preparation* section can be used several times a day.

Spurge

Euphorbia resinifera

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the milky resin that is exuded when cuts are made into this plant.

Flower and Fruit: The inflorescence is arranged in a dichasium above the thorn-bearing scales. They are typical cyathia of the Euphorbia species, which have one female and a number of male flowers surrounded by 5 greenish-yellowish, tubularly fused bracts. The female flower has a 3-carpeled ovary with 3 styles; the male flower consists of only 1 stamen. The fruit separates into 3 mericarps.

Leaves, Stem and Root: This diclinous, monoecious leafless shrub has the appearance of cactus and grows to a height of up to 2.5 m. The trunk is thick at the base, and only slightly branched higher up. The diameter of the 3- or 4-edged, fleshy branches is approximately 2 cm. There are scales at intervals of 1 cm at the edges, each with 2 short thorns, which are splayed and approximately 5 mm long.

Characteristics: The plant produces a milk latex when the surface is scored.

Habitat: The shrub grows in the folds of the Great Atlas Mountains in Morocco and also in North America and the Canary Islands.

Production: Gum euphorbium or Spurge is the air-dried latex of Euphorbia resinifera. The plant is cut in late summer to produce the latex.

Other Names: Poisonous Gum-Thistle, Dergmuse, Darkmous, Gum Euphorbium

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: diterpene esters of the ingenan-, tiglic- and daphnan-types (0.1 to 2%): resinifera factors RL 1 to RL 23, among them resiniferatoxin, 12-desoxyphorbol-13-isobutyrate-20-acetate, 12-Desoxyphorbol-13-phenylacetate-20-acetate

Triterpenes: particularly alpha- and beta-euphorbol, beta-amyrin, resiniferol

Fruit acids: including malic acid, succinic acid, citric acid

Resins (40%)

Polyterpenes

EFFECTS

The diterpene esters contained in the drug have laxative and non-specific immunostimulating effects. Severe skin and

mucous membrane irritation arises in conjunction with topical administration.

INDICATIONS AND USAGE

Use of the medication has been discontinued because of the related dangers. Because of its harsh effects, the plant's resin is no longer administered internally despite its properties as a strong emetic and laxative.

Unproven Uses: External uses in folk medicine have included application to remove proliferating flesh, warts and malignant ulcers, as well as for chronic inflammatory conditions. It was also used as a plaster for gout. Internal uses included the treatment of dropsy, chronic headaches, and ear or eye complaints.

Homeopathic Uses: The drug is used homeopathically for acute inflammation of the respiratory tract and skin.

Indian Medicine: Uses include constipation and menstrual complaints and also as an abortifacient. Because of the danger of rapid intoxication, the drug's use is not advised. Efficacy for these indications has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely irritating to mucous membranes and skin. Ingestion leads to salivation, burning pains in the stomach, colic, diarrhea and nephritis. One case of death has been reported. Chronic application of the drug promotes tumor formation, so its administration in human medicine is no longer advised.

DOSAGE

Mode of Administration: Administration of preparations of Spurge are no longer recommended.

How Supplied: Skin stimulating ointment: 5% drug content

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute from D4) and 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc; IV; IM acute: 3 times daily; chronic once a day (HAB1); children are given special doses.

Storage: Due to the plant's poisonous nature, store securely.

Squill

Urginea maritima

DESCRIPTION

Medicinal Parts: The medicinal parts come from the bulbs of the white latex variety collected after flowering and the fresh, fleshy bulb scales of the white variety and of the red variety.

Flower and Fruit: The flowering stem is erect and 50 to 150 cm high. It is often a washed purple color and glabrous. The flowers, which often number 100, are arranged in richly flowered, dense racemes up to 60 cm long. The bracts are membranous and pointed. They are shorter than the pedicles and drop early. The pedicles are up to 3 cm long, thin and smooth. The flowers are white, radial and star-shaped. The ovary is ovate to oblong triangular. The capsule is ovate to oblong, 3-valved, obtuse or almost pointed. Each chamber has 1 to 4 seeds, which are elongate, flattened, smooth, glossy and winged.

Leaves, Stem and Root: The plant is a perennial bulb plant. The bulbs are pear-shaped, about 15 to 30 cm in diameter. They are rarely sold whole commercially, as they tend to start growing. The fracture is short, tough and flexible.

Characteristics: The taste is bitter and acrid.

Habitat: Indigenous to the Mediterranean and is cultivated there too.

Production: Squill consists of the sliced, dried, fleshy middle scales of the onion of the white variety of *Urginea maritima*, harvested during the flowering season. It is collected mostly from uncultivated regions.

Other Names: Scilla

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (bufadienolides, 1-3%): chief components glucoscillarene A, proscillaridin A, scillar-ene A; including among others, scillicyanoside, scilliglaucoside

Mucilage

EFFECTS

The drug is inotropic on myocardial work capacity and negatively chronotropic. The overall effect is economy of heart action. There is a lowering of increased, left ventricular diastolic pressure and pathologically elevated venous pressure.

INDICATIONS AND USAGE

Approved by Commission E:

- Cardiac insufficiency NYHA I and II

- Arrhythmia
- Nervous heart complaints
- Venous conditions

Unproven Uses: Squill is used for reduced kidney capacity. In folk medicine it is used for catarrhal conditions of the upper respiratory tract, bronchitis, asthma and whooping cough, also for wounds and fractures, back pain and hemorrhoids and for the disinfection of septic wounds.

CONTRAINDICATIONS

The drug and pure glycosides, among others, should not be administered in the presence of second or third degree atrioventricular block, hypercalcemia, hypokalemia, hypertrophic cardiomyopathy, carotid sinus syndrome, ventricular tachycardia, thoracic aortic aneurysm or WPW-syndrome.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Because of the narrow therapeutic range of cardioactive steroid glycosides, side effects could appear even with therapeutic dosages. Side effects include tonus elevation of the gastrointestinal area, loss of appetite, vomiting, diarrhea, headache and irregular pulse.

Contact with the juice of the fresh bulb can lead to skin inflammation (squill dermatitis). The administration of pure glycoside is preferable due to the difficulties of standardizing the drug (proscillaridin A).

Drug Interactions: Increase of effectiveness and thus also of side effects is possible with concomitant administration of quinidine, calcium, saluretics, laxatives and extended therapy with glucocorticoids.

Squill potentiates the positive inotropic and negative chronotropic effects of digoxin.

The simultaneous administration of arrhythmogenic substances (sympathomimetics, methylxanthines, phosphodiesterase inhibitors, and quinidine) increases the risk of cardiac arrhythmias.

OVERDOSAGE

Besides the already-mentioned symptoms, overdosage can lead to cardiac rhythm disorders, life-threatening ventricular tachycardia, atrial tachycardia with atrioventricular block, stupor, vision disorders, depression, confused states, hallucinations and psychosis. Fatal dosages lead to cardiac arrest or asphyxiation.

Treatment of poisoning includes gastric lavage and instillation of activated charcoal. All other measures are to be carried out according to the symptoms. In case of potassium loss, careful replenishment; for ectopic impulse formation in the ventricle, administration of phenytoin as antiarrhythmic

drug; lidocaine for ventricular extrasystole; for pronounced bradycardia, atropine or orciprenaline. The prophylactic use of a pacemaker is recommended. Hemoperfusion for eliminating the glycosides or the administration of cholestyramine for interrupting the enterohepatic circulation are possible.

DOSAGE

Mode of Administration: Comminuted drug and other galenic preparations for internal use.

Preparation: Stabilized powder is standardized according to content, there are no more exact specifications in the literature, standardization according to DABIO.

Squill Extract — Evaporated extract 1:4; drug: diluted spirit of wine (EB6)

Acetum Scillae — drug: spirit of wine 1:1 (EB6)

Oxymel Scillae — 5 parts Acetum Scillae: 10 parts purified honey evaporated in a water bath to 10 parts

Daily Dosage: Single dose: 60 to 200 mg; Daily dose: 180 to 200 mg; Average daily dosage: 0.1 to 0.5 gm of standardized sea onion powder.

Squill Extract: 1.0 gm; Liquid extract: 0.03 to 2.0 ml; Tincture: 0.3 to 2.0 ml; Acetum Scillae: 1.0 gm; Acetic acid maceration: 0.6 to 2.0 ml

Oxymel Scillae: 2.5 gm

Storage: Squill should be protected from light and moisture at temperatures below 25 °C.

St. John's Wort

Hypericum perforatum

TRADE NAMES

St. John's Wort (available from numerous manufacturers and as combination product), St. John's Wort Extract, Alterra, Advanced St. John's Wort, St. John's Wort Herb, St. John's Wort High Potency, St. John's Wort Preferred, St. John's Wort Standardized Extract, St. John's Power Time Release, Mood Support, KIRA, Centrum St. John's Wort, Hypericalm, St. John's Powder 0.3%, Tension Tamer, Hypericalm, St. John's Powder, St. John's Extra Strength

DESCRIPTION

Medicinal Parts: The medicinal parts include the fresh buds and flowers separated from the inflorescences, the aerial parts collected during the flowering season and dried, and the entire fresh flowering plant.

Flower and Fruit: The golden yellow flowers are in sparsely blossomed terminal cymes. The 5 sepals are ovate-lanceolate to lanceolate and very pointed. The sepals are also smooth, serrate at the tip, and marked by many light and dark glands. The 5 petals and numerous stamens are fused into 3 bundles. The ovary has a broad or narrow oval shape. The fruit is a 3-valvular capsule, which is triangular and oval. The seeds are cylindrical and shortly pointed at both ends. The seeds are 1 to 3 mm long, either black or dark brown, and covered in small warts.

Leaves, Stem and Root: The perennial plant is 30 to 60 cm and contains a long-living branched root and rhizome, which tapers toward each end. The reddish stem is erect, includes 2 raised edges and can reach 100 cm in height. The oval-

shaped, translucent, punctate leaves are attached directly at the base and often covered in black glands.

Characteristics: The flowers release an odorless red juice when squeezed, which tastes weakly bitter and irritating.

Habitat: The plant is indigenous to all of Europe, western Asia and northern Africa. It has been introduced to eastern Asia, Australia and New Zealand, and it is cultivated in Poland and Siberia.

Production: St. John's Wort consists of the dried above-ground parts of *Hypericum perforatum* gathered during flowering season. The herb is cut at the start of the flowering season and dried quickly in bunches in order to preserve the oil and secreted contents.

Not to be Confused With: The plant may be mistaken for other *Hypericum* species, such as *Hypericum barbatum*, *Hypericum hirsutum*, *Hypericum maculatum*, *Hypericum montanum* and *Hypericum tetrapterum*.

Other Names: Hardhay, Amber, Goatweed, Klamath Weed, Tipton Weed, Saint John's Wort, St. Johnswort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (0.1-0.15%): favoring naphthodianthrones, especially hypericin, pseudohypericin

Flavonoids (2-4%): in particular hyperoside, quercitrin, rutin, isoquercitrin, and also biflavonolids including amentoflavone

Xanthenes (0.15-0.72%): 1,3,6,7-tetrahydro-xanthone

Acylphloroglucinols: hyperforin with small quantities of adhyperforin

Volatile oil: chief components aliphatic hydrocarbons, including, among others, 2-methyloctane, undecane, furthermore dodecanol, mono- and sesquiterpenes: including, among others, alpha-pinene, caryophyllene, additionally also 2-methyl-3-but-3-en-2-ol

Oligomers

Procyanidines and other catechin tannins (6.5-15%)

Caffeic acid derivatives: including chlorogenic acid

EFFECTS

The main active principles of the herb are the flavone and flavonol derivatives, xanthenes and naphthodianthron (hypericins). A mild antidepressant, sedative and anxiolytic action of the herb and its preparations has been documented in clinical studies. Historically, hypericin was thought to have a weak MAO inhibitor effect. However, recent literature suggests hypericin is devoid of MAO inhibitory activity (Bladt, 1994).

More recent studies have indicated that the antidepressive effect may be largely due to the ability of the herb to inhibit the reuptake of serotonin and other neurotransmitters. The activity of the herb could be attributable to the combined contribution of several mechanisms, each one too weak by itself to account for the overall effect (Bennett, 1998). A study concluded that hydroalcoholic hypericum extract inhibits the reuptake of serotonin, norepinephrine and dopamine with similar affinities, which leads to a significant down-regulation of cortical beta- adrenoceptors and serotonin (5HT-2) receptors. This data suggested hyperforin is the active principle of hypericum extracts in biochemical models of antidepressant activity (Muller, 1998). The antidepressive action not only results from the effect on adrenergic transmitter systems (norepinephrine, dopamine, serotonin), but also from an endocrine effect (melatonin).

Oily Hypericum preparations demonstrate an anti-inflammatory action due to their high flavonoid content. Antiviral (retroviruses) properties of the herb have not been proven. No antiretroviral activity determined by virologic markers and CD4 cell count of hypericin was seen in a study of HIV-infected patients (Gulick, 1999).

The antibacterial effect of hyperforin was demonstrated in a recent study. Hyperforin inhibited the growth of gram positive bacteria, such as *Streptococcus pyogenes* and *Streptococcus agalactiae*. Hyperforin also demonstrated efficacy against penicillin-resistant *Staphylococcus aureus* (PRSA) and methicillin-resistant *Staphylococcus aureus* (MRSA). These data indicate the possible use of the herb for local treatment of infected wounds and eczematous skin lesions (Schempp, 1999).

CLINICAL TRIALS

A meta-analysis of 23 randomized trials consisting of 1757 outpatients with mild to moderately severe depressive disorders was conducted to determine the effectiveness of Hypericum perforatum. Although Hypericum was significantly superior to placebo with fewer adverse effects (19.9% with Hypericum compared to 52.8% with standard antidepressants), there was little standardization and a lack of information with regard to the diagnostic criteria, compliance control, and dosage regimen of Hypericum and standard antidepressants (Linde K, 1996).

The equivalence between St. John's Wort and fluoxetine was demonstrated in a randomized, double-blind, comparative trial involving 149 outpatients with mild or moderate depressive episodes (according to International Statistical Classification of Diseases and Related Health Problems). Patients were treated for 6 weeks. A daily dose of 800 mg St. John's Wort extract LoHyp-57 (dry extract of St. John's Wort, drug extract ratio 5-7:1, solvent, ethanol

60% [w/w]) was found to be equivalent in efficacy to 20 mg fluoxetine (Harrer, 1999).

The effectiveness and tolerance of Hypericum extract LI 160 with a dosage of 300 mg three times daily was compared to imipramine 25 mg three times daily in a double-blind, clinical study. The study involved 135 depressed patients (according to DSM-III-R criteria) treated over a 6-week period. The analysis demonstrated comparable results between the treatment groups, with fewer and milder side effects in the Hypericum group (Vorbach, 1994).

INDICATIONS AND USAGE

Approved by Commission E: " "

- Anxiety
- Depressive moods
- Inflammation of the skin
- Blunt injuries
- Wounds and burns

Internally, the drug is used for psychovegetative disturbances, depressive moods, anxiety and nervous unrest. Externally, the oily Hypericum preparations are used for treatment and post-therapy of acute and contused injuries and for first-degree burns.

Unproven uses: The herb has been used for worm infestation, bronchitis and asthma, gallbladder disease, gastritis (also diarrhea), nocturnal enuresis, gout and rheumatism. Oily Hypericum preparations are used internally for dyspeptic complaints, and externally for the treatment of myalgia.

Chinese Medicine: In a gargle solution, the herb is used externally for tonsillitis. The herb is also administered externally as a lotion for dermatoses.

Homeopathic Uses: The herb has been used for treatment of peripheral and central nervous system injuries, depressive moods, asthma and cerebral-vascular calcification.

CONTRAINDICATIONS

Simultaneous use of a MAO inhibitor: St. John's Wort contains some weak monoamine oxidase inhibitor (MAOI) properties that may add to the effects of other MAOI drugs, therefore theoretically increasing the risk for hypertensive crisis (Hoelzl & Ostrowski, 1986; Muller & Schaefer, 1996; Suzuki, 1984).

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The tannin content of the drug can lead to digestive complaints, such as feeling of fullness or constipation. Patients with a previous history of photosensitization to various chemicals should be cautious of direct sun exposure (Wheatley, 1998).

Central Nervous System Effects: Restlessness (0.3%) and fatigue (0.4%) occurred in 3250 patients in one study of depressed patients (Woelk, 1994). In another study, fatigue/tiredness was reported in 5% of subjects, and restlessness in 6% (Vorbach, 1997). Symptoms are difficult to evaluate since the herb is being used to treat depression, which may have similar symptoms. Headache was noted in 7% of studies reviewed (Wheatley, 1998).

Fertility Effects: High concentrations of St. John's Wort *in vitro*, was mutagenic to sperm cells and adversely effected oocytes. The data suggests St. John's Wort given at high concentrations damages reproductive cells (Ondrizek, 1999).

Gastrointestinal Effects: Gastrointestinal effects were noted in 0.6% of patients in one study. Anorexia occurred in 0.55% (n=18), diarrhea occurred in 0.55% (n=18), nausea occurred in 0.55% (n=18), and gastrointestinal pain or stomachache occurred in 0.55% (n=18) of 3250 patients taking Hypericum extract 300 milligrams 3 times daily (Woelk, 1994). Three percent of patients in one study developed dry mouth and 5% had gastrointestinal complaints (Vorbach, 1997). Constipation was reported in 5% of cases reviewed (Wheatley, 1998).

Dermatologic Effects: Photosensitization has been observed in animals following intakes of large quantities of the drug (starting at 3 g per kg body weight, which would be 150 g for a person weighing 50 kg). St. John's Wort photosensitization is dose-related, and has occurred with plasma concentrations of 50 meg of hypericin per ml, according to Schulz' Rational Phytotherapy—six orders of magnitude above that of patients taking an extract of 300 mg of 0.6% hypericin three times a day. Hypericism is defined as a sensitivity to light seen in animals who have ingested certain Hypericum species. The Hypericum pigments are carried to the skin, and in the unpigmented, unhaired portions of the skin of sheep, cattle, horses, goats and swine may produce sunlight induced rash and blisters (Giese, 1980; Southwell & Campbell, 1991). However, such a reaction is unlikely with administration of therapeutic dosages in humans.

1. Hypericum extract, especially at higher doses or with long-term use, may cause photosensitivity with sunburn-like lesions and inflammation of the mucous membranes, at least in animals (Duran & Song, 1986). Photosensitization has been demonstrated in a controlled clinical trial using metered doses of hypericin and subsequent exposure to UVA/UVB radiation (Roots, 1996).

2. Significant phototoxicity did occur in HIV-infected persons administered intravenous hypericum, 0.25-0.5 mg/kg twice weekly, or 0.25 mg three times weekly, or oral hypericin 0.25 mg/kg daily (Gulick, 1999).

3. Pruritus and exanthema occurred in 17 of 3250 patients (0.52%) taking Hypericum extract 300 milligrams three times a day (Woelk, 1994). Pruritus was found in 2% of patients taking Hypericum for depression (Wheatley, 1998).

4. A case report involved one patient taking St. John's Wort who developed subacute polyneuropathy after sun exposure (Bove, 1998).

Drug Interactions:

MAOI—Although there is poor documentation, concomitant administration of St. John's Wort and a MAOI, such as tranylcypromine, phenelzine, may lead to increased effects and possible toxicity (hypertensive crisis)—See~Contraindications (Hoelzl & Ostrowski, 1986; Mueller & Schaefer, 1996; Suzuki, 1984). It is prudent to avoid concomitant use with beta-sympathomimetic amines, e.g., ma huang or pseudoephedrine (Miller, 1998).

SSRFs—St. John's Wort taken concomitantly with an SSRI, such as fluoxetine, paroxetine, sertraline, fluvoxamine or citalopram, may lead to an increased effect and possible toxicity "serotonin syndrome", e.g., sweating, tremor, flushing, confusion and agitation. St. John's Wort has slight serotonin reuptake properties. A case report suggests that co-administration of St. John's Wort with paroxetine has resulted in a clinical syndrome resembling a sedative/hypnotic intoxication (Gordon, 1998).

Tannic acids present in St. John's Wort may inhibit the absorption of iron (Miller, 1998).

Concomitant use with other photosensitizers, such as tetracyclines, sulfonamides, thiazides, quinolones, piroxicam and others should be avoided (Miller, 1998).

Hypericum extract has been reported to significantly prolong narcotic-induced sleeping times and to antagonize the effects of reserpine (Okpanyi, 1987).

Cyclosporine — Decreased serum concentrations have occurred with use of St. John's Wort (Bon, 1999). Acute cellular transplant rejection in heart transplant patients due to an interaction between St. John's Wort and Cyclosporine has been reported. St. John's Wort has been proven to induce the cytochrome P450 enzyme system, the major pathway for cyclosporine metabolism. Heart transplant rejection has been reported as soon as 3 weeks after St. John's Wort is added to the drug regimen of heart transplant patients maintained on cyclosporine therapy (Ruschitzka, et al., 2000).

Indinavir — An open label study was conducted involving healthy volunteers that were administered 800 mg indinavir every 8 hours along with 300 mg St. John's Wort standardized to 0.3% hypericin 3 times daily. Results showed a 57% reduction in the area under the curve for the protease

inhibitor and an 81% decrease of the extrapolated 8-hour indinavir trough value. The authors concluded that a reduction of this magnitude could lead to development of drug resistance and treatment failure (Piscitelli, et al., 2000). Clinicians are warned that St. John's Wort may significantly affect plasma concentrations of any drug that is metabolized by the cytochrome P450 system.

Ethinylloestradiol and desogestrel (combined oral contraceptive) — Breakthrough bleeding has occurred with concomitant use of St. John's Wort (Bon, 1999).

Hypericin causes a reduction in barbiturate-induced sleeping times (Ozturk, 1992).

Theophylline — The herb has decreased theophylline levels on a patient stabilized on theophylline therapy (Nebel, 1999).

Co-administration of St. John's Wort extract (LI 160) with digoxin resulted in a significant decrease in digoxin C_{max}, AUC (0-24), and C_{min} values compared to placebo. Therefore, St. John's Wort may reduce efficacy of digoxin and make a patient a nonresponder, whereas increased toxicity may be anticipated after withdrawal of the herb (Andreas, 1999). ...

St. John's Wort (600-900 mg/day) taken concomitantly with sertraline (50-75 mg/day) after 2 to 4 days, resulted in a presumed serotonin syndrome consisting of dizziness, nausea, vomiting, headache, epigastric pain, anxiety, confusion, and/or feelings of restlessness and irritability. Cyproheptadine was used to reverse the symptoms and after discontinuation of the herb-drug therapy, all symptoms resolved (Lantz, 1999).

Nefazadine (100 mg BID) and St. John's Wort (300 mg TID) taken simultaneously resulted in nausea, vomiting and restlessness after 3 days of therapy. The symptoms improved after stopping the nefazadine and continuing with St. John's Wort (Lantz, 1999).

DOSAGE

Mode of Administration: Comminuted drug, herb powder, liquid and solid preparations for internal use; liquid and semi-solid preparations for external use; preparations made with fatty oils for external and internal use.

How Supplied:

Capsules—(standardized at 0.3% hypericin) 125mg, 150mg, 250mg, 300mg, 350mg, 370mg, 375mg, 400mg, 424mg, 434mg, 450mg, 500mg, 510mg

Capsules, Extended Release—(standardized at 0.3% hypericin) 450mg, 900mg, 1000mg

Dried Herb

Extract—I.T

Injection—1%

Liquid—300 mg/5ml, 250 mg/ml

Liquid Dilutions—3x, 6x, 30x, 12c, 30c

Pellets—3x, 6x, 12x, 12c, 30c

Tablets—(standardized at 0.3% hypericin) 100mg, 150mg, 300mg, 450mg

Tincture—1:10

Transdermal—900mg/24hr

Preparation: To prepare an infusion, use 2 teaspoonfuls of drug in 150 ml boiling water and steep for 10 minutes.

Daily Dosage: In general, a range of 200 to 1000 micrograms/day of hypericin is recommended for treatment of depression (Anon, 1996). Total hypericin concentrations of Hypericum extracts may vary widely, therefore caution should be taken in determining dosage (Fachinfo Helarium Hypericum, 1996; Fachinfo Remotiv, 1996; Hansgen, 1993; Schmidt & Sommer, 1993; Vorbach, 1994; Woelk, 1994).

For depressive moods, it is recommended the herb be administered for the duration of 4 to 6 weeks; if no improvement is apparent, a different therapy should be initiated.

Depression:

Capsules/tablets — 300 mg of the standardized extract should be administered three times daily (Clausson & Muller, 1997; Fachinfo Helarium Hypericum, 1996).

Dried herb — 2 to 4 grams taken 3 times daily (Fachinfo Helarium Hypericum, 1996; Fachinfo Remotiv, 1996; Hansgen, 1993; Schmidt & Sommer, 1993; Vorbach, 1994; Woelk, 1994).

Tea — St. John's Wort as a tea is the traditional method of administration, with a single dose of 2-3 grams dried herb placed in boiling water. If dried herb of 2 grams is used, and the dried herb to extract ratio is 6, a usual dose of the extract would be 300 milligrams (Schultz, 1997).

Liquid extract 1:1 in 25% ethanol — 2 to 4 milliliters taken 3 times daily (Fachinfo Helarium Hypericum, 1996; Fachinfo Remotiv, 1996; Hansgen, 1993; Schmidt & Sommer, 1993; Vorbach, 1994; Woelk, 1994).

Tincture: (1:10) in 45% ethanol — 2 to 4 milliliters, 3 times a day (Fachinfo Helarium Hypericum, 1996; Fachinfo Remotiv, 1996; Hansgen, 1993; Schmidt & Sommer, 1993; Vorbach, 1994; Woelk, 1994).

Wounds, bruising and swelling: The herb is applied topically and locally for treatment. The activity of the topical preparations is based on the hyperforin content, which is highly variable depending on the method of oil preparation. The preparation may be stable for a few weeks up to 6 months. (Maisenbacher & Kovar, 1992)

Homeopathic Dosage: The daily dosage for homeopathic indications is 5 drops, 1 tablet or 10 globules every 30 to 60 minutes for acute therapy, and 1 to 3 times daily for chronic use. Parenterally, 1 to 2 ml subcutaneously administered three times daily for acute therapy and once daily for chronic therapy. The ointment is applied 1 to 2 times daily for acute and chronic use (HAB1).

Storage: Store at room temperature, away from heat, moisture and direct light. Hyperici oleum has a limited shelf life. One study showed that a sample containing 62 milligrams of hyperforin (the active ingredient in the oil) contained no hypericin in 14 days. If sunlight is not used to prepare the oil, then the breakdown is slower, but still less than 30 days. Various oil preparation methods have been described, including one with eutanol G, which showed stability for 6 months. Researchers evaluated 6 commercial samples of oil of *Hypericum* containing 2.2 to 20.8 milligrams/deciliter. All hyperforin was gone by the end of five weeks (Maisenbacher, 1992).

LITERATURE

Stachys palustris

See Woundwort

Star Anise

Illicium verum

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the ripe fruit, the whole dried fruit and the seeds.

Flower and Fndt: The flowers are yellowish or reddish-white. The follicles have a diameter of about 2 cm. They are star-like and formed from eight cybiform carpels. The follicles open when ripe, each containing one smooth, polished, brown seed. The pericarp of the seed is brown and wrinkled below.

Leaves, Stem and Root: The plant is an evergreen tree up to 10 m tall with white, birch-like bark. The leaves are 7.5 cm long, entire-margined, glossy, elliptic-lanceolate and acuminate.

Habitat: The plant is only known in its cultivated form. It is cultivated in China and Vietnam.

Production: Star anise consists of the ripe syncarp of *Illicium verum*, as well as its preparations in effective dosage. The fruit is harvested shortly before it is fully ripe (August to October).

Not to be Confused With: Should not be confused with the smaller Japanese star anise (*I. lanceolatum* or *I. religiosum*), which is poisonous.

Other Names: Aniseed Stars, Badiana

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief constituent trans-anethol, chavicol methyl ether (estragole), d-limonene, l-limonene, d-fenchone, d-pinene, dl-limonene, anisaldehyde

Fatty oil

Flavonoids: including rutin, kaempferol-3-O-rutinoside

Tannins

EFFECTS

Star Anise is a bronchial expectorant and antispasmodic for the gastrointestinal tract. The essential oils (star anise oil) and flavonoids act on the smooth muscle of the gastrointestinal tract and the mucous membrane of the respiratory tract.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Cough/bronchitis

Unproven Uses: Star Anise is used for catarrh of the respiratory tract and peptic discomfort.

Indian Medicine: Star Anise is used for dyspeptic complaints, flatulence, spasmodic colon pain, dysentery, facial paralysis, hemiparesis and rheumatoid arthritis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Sensitization has occurred very rarely in cases of repeated administration. Berries of *UHciuni anisatum* are similar, but contain spasmogenic sesquiterpene lactones; confusions with Star Anise have been observed.

DOSAGE

Mode of Administration: Herb, ground fresh just prior to use, and other galenic preparations for internal use.

Daily Dosage: 3 gm of drug or 0.3 gm of essential oil. Single dose: 0.5 to 1 gm prepared as tea.

Storage: Keep Star Anise protected from light.

Stavesacre

Delphinium staphisagria

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe, dried seeds.

Flower and Fruit: The flowers are deep blue. The sections of the involucre are 13 to 20 mm long. The limb of the lateral honey-leaves gradually narrows to a claw. The follicles are 8 to 11 mm wide and swollen. The seeds are grayish-black, wrinkled and pitted. They are triangular or square and convex at the back. The seeds are about 2 cm long.

Leaves, Stem and Root: The plant is annual and has a 30 to 100 cm high stem that is stout and sparsely pubescent. The leaves are palmatifid digitate with 5 to 7 lobes, pubescent on both surfaces with a mixture of very short and longer hairs. The segments are entire-margined or are made up of ovate-lanceolate or oblong, sharp-edged lobes.

Characteristics: The seeds are poisonous. They taste bitter and tingling, and are odorless.

Habitat: The plant is found in Asia Minor and Europe, and is cultivated in Italy and France.

Production: Stavesacre seeds are the seeds of *Delphinium staphisagria*.

Other Names: Lousewort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpene alkaloids: main alkaloid delphinine, including among others the bi-diterpene alkaloids staphisine, staphisagroine

EFFECTS

Stavesacre is arrythrogenic and has an effect similar to aconitine.

INDICATIONS AND USAGE

Unproven Uses: The herb is used in washes and ointments to kill lice.

Homeopathic Uses: Stavesacre is used for the treatment of anxiety, urinary tract diseases, acute or acutely recurring hordeolum or chalazion, seborrheal skin with a tendency to

inflammation, odorous perspiration, nervous exhaustion, neurasthenia with poor memory and hypochondria, sexual neurasthenia, gonorrhoea, melancholia, hysteria, leukorrhoea, headaches, general debility and delicate health, weak bladder, scrofulous and swollen glands, hair loss, rheumatism, nervous diarrhoea, habitual obstipation, gastric ulcer, gastritis, trigeminal neuralgia and conditions of the eyelids.

PRECAUTIONS AND ADVERSE REACTIONS

External administration of extracts of the drug leads to reddening, inflammation and eczema. Internal administration could lead to inflammation of the throat, salivation, nausea, ructus, skin itching, and urinary and stool urgency.

OVERDOSAGE

The intake of 2 teaspoonfuls of seeds leads to weakened pulse, stomach pain, labored breathing and collapse.

Treatment of poisoning consists of stomach and intestinal emptying (gastric lavage, sodium sulphate), and the administration of activated charcoal. Further treatment should proceed symptomatically (i.e. diazepam for spasms, sodium bicarbonate for acidoses, intubation and oxygen respiration may also be required).

DOSAGE

Mode of Administration: An extract from the seeds is used in homeopathic dilutions.

Storage: The drug should be stored cautiously, as it is poisonous.

Stevia

Stevia rebaudiana

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the dried leaves.

Flower and Fruit: The composite flowers are surrounded by an involucre. The capitula are in loose, irregular, sympodial cymes. There are 5 overlapping epicalyx sepals, with 5 tubular florets per composite flower. The flowers have light purple rhacis, white tips and 5 stamens. The fruit is a 5-ribbed, spindle-shaped achene with 15 to 17 awns.

Leaves, Stem and Root: *Stevia rebaudiana* is a semi-shrub that grows up to 30 cm high. The leaves are sessile, 3 to 4 cm long with an elongate-lanceolate or spatulate, blunt-tipped lamina. The leaves are serrate from the middle to the tip and entire below. The upper surface of the leaf is slightly glandular pubescent. The stem is weakly downy-pubescent at the bottom and woody. The tough rhizome has slightly branching roots.

- *Characteristics:* All plant parts taste intensively sweet.

Habitat: The plant is indigenous to Paraguay.

Production: *Stevia* leaves are the dried leaves of *Stevia rebaudiana*.

Other Names: Sweet Herb, Sweetleaf

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: diterpene glycosides, particularly stevioside (5 to 10%), rebaudioside A (2 to 4%), including as well rebaudioside C and dulcoside A

Volatile oil (0J%): chief components nerolidol and caryophyllene oxide

Flavonoids: including apigenin-4'-O-glucoside, luteolin-7-O-glucoside

EFFECTS

The use of the drug as a sweetener is based upon the glycosidal diterpenes present (stevioside's sweetening power is 300 times that of saccharose). In animal experiments, stevioside significantly elevated the glucose clearance while at the same time increasing both salt excretion and urine flow (measured in percentage of glomerular filtration rate), which led to a significant lowering of blood pressure.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include hypertension, diabetes and as a contraceptive. •

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper use of the drug as a sweetener.

DOSAGE

Mode of Administration: Stevia is available as cut drug for oral administration.

Stevia rebaudiana

See Stevia

Stillingia

Stillingia sylvatica

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh or dried root.

Flower and Fruit: The yellow flowers are in terminal spikes and are apetalous. The fruit is a 3-seeded capsule.

Leaves,- Stem and Root: The plant is a-perennial herb up to 100 cm tall. It has an angular, smooth stem, which contains a milky latex. The leaves are sessile, coriaceous and narrow at the base. They are variable in form and color and are 3 to 11 cm long. The root is usually reddish-white on the outside and has numerous resin glands.

Characteristics: The taste is bitter and acrid, the smell is characteristic and unpleasant.

Habitat: The plant is indigenous to the southern U.S.

Production: Stillingia root is the root of *Stillingia sylvatica*.

Other Names: Cockup Hat, Marcory, Silver Leaf, Queen's Delight, Yaw Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: diterpene esters of the tiglic or daphnan type, including diesters of 12-deoxyphorbol, of 12-deoxy-5(3-hydroxyphorbol, of 5p, 12p-dihydroxyresiniferonol-6a,7oc-oxide, referred to as stillingia factors S1 to S9 (S6 = gniditilactin, yuanhuacin, S7 = prostratin)

Volatile oil

Tannins (10 to 12%)

EFFECTS

The juice of the green root causes inflammation of the skin and swelling. The drug has laxative, tonic and diuretic properties.

INDICATIONS AND USAGE

Unproven Uses: The herb is used as a 'blood purifier', for digestive disorders, and for the treatment of liver, biliary and skin diseases.

Homeopathic Uses: *Stillingia sylvatica* is used for secondary and tertiary syphilis.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drug is strongly irritating to skin and mucous membranes. Taken internally, it triggers vomiting (it is used as an emetic) and diarrhea (it is used as a laxative). Skin contact leads to inflammation and swelling. The diterpenes cause inflammation and are likely to be carcinogenic and virus-activating.

Nursing Mothers: *Stillingia* should not be administered to nursing mothers.

DOSAGE

Mode of Administration: As a liquid extract or tincture.

Storage: The drug should not be kept longer than 2 years.

Stinging Nettle

Urtica dioica

TRADE NAMES

Alcohol Free Nettles Leaf, Basics Stinging Nettle, Certified Organic Netties Leaf, Nettle Leaf, Nettle Herb, Nettle Power

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh and dried flowering plant and the roots.

Flower and Fruit: The flowers are greenish-white in axillary, clustered, hanging panicles. The perigone has 4 tepals. There are 4 stamens and 1 ovary with a brush-like stigma. The flowers are dioecious. The male flowers have only stamens and the female flowers only a style or a seed-producing organ. The male flower consists of a perianth of 4 segments, which enclose an even number of stamens. The stamens curve inward in the bud stage and spring back at the end of flowering for the anthers to fling out the pollen. The fruit is a small 1-seeded nutlet.

Leaves, Stem and Root: The plant grows from 60 to 150 cm high and has a winter hard rhizome. The leaves are opposite, oblong-cordate and roughly serrate. The whole plant is covered in stinging hairs.

Habitat: The plant is common in most temperate regions of the world.

Production: Stinging Nettle herb consists of the fresh or dried above-ground parts of *Urtica dioica*, *Urtica urens* and/or hybrids of these species, collected during flowering season. Stinging nettle leaf consists of fresh or dried leaves of *Urtica dioica*, *Urtica urens* and/or hybrids of these species, gathered during flowering season.

Not to be Confused With: The leaves of *Laminum album*.

Other Names: Nettle

ACTIONS AND PHARMACOLOGY

COMPOUNDS: STINGING NETTLE FLOWERING PLANT

In the stings of the fresh plant: histamine, serotonin, acetylcholine, formic acid, leukotriens (LTB₄, LTC₄, LTD₄)

Flavonoids (0.7-1.8%): including rutin, isoquercitrin (0.02%), astragaln, kaempferol-3-O-rutinoside

Silicic acid (1-4%): partially water-soluble

Volatile oil: chief components are ketones, including, among others, 2-methylhept-2-en-6-on

Potassium-ions (0.6% in the fresh foliage)

Nitrates (1.5 to 3%)

EFFECTS: STINGING NETTLE FLOWERING PLANT

The fresh leaves contain acetylcholine, serotonin and histamine. The pressed juice (main active principles scopoletin, beta-sitosterol and caffeoyl malic acid) is diuretic in combination with sufficient fluid intake. In animal experiments, a local anaesthetic and analgesic effect has been observed. Caffeoyl acid in vitro, inhibits 5-lipoxygenase-

dependent leukotriene synthesis. In various studies, an antirheumatic and anti-arthritic effect was demonstrated.

Anti-inflammatory Effect - In one study, an extract from Stinging Nettle leaves (IDS 23) was tested for the ability to inhibit the biosynthesis of arachidonic acid metabolites in vitro. IDS 23 showed a strong concentration dependent inhibition of cyclooxygenase derived reactions. A phenolic acid isolate from the extract inhibited the synthesis of leukotriene B₄ in a concentration dependent manner. The authors concluded that the combination of these effects may account for the antiphlogistic effects of this extract of Stinging Nettle (Obertreis, 1996.)

COMPOUNDS: STINGING NETTLE ROOT

Steroids: sterols, including beta-sitosterol (0.03 to 0.06%), beta-sitosterol-3-O-beta-glucoside (0.03 to 0.5%), (6'-Palmitoyl)-sitosterol-3-O-beta-D-glucoside (0.003%), 7alpha-hydroxysitosterol (0.001%), 7eta-Hydroxysitosterol (0.001%), stigmaterol, campesterol, stigmast-4-en-3-one

Lectins (0.1%): UDA (*Urtica dioica* Agglutinin, isolectine mixture)

Polysaccharides: glucans, glucogalacturonans, acidic arabinogalactans water-soluble with immunostimulating effect)

Hydroxycoumarins: scopoletin

Lignans: including secoisolariciresinol-9-O-glucoside (0.004%), neo-olivil (0.003%), neo-olivil-4-O-glucoside (0.004%)

Ceramides

EFFECTS: STINGING NETTLE ROOT

Effects on Prostate Tissue - The root has been shown to cause an increase in the volume of urine, increase of maximum urinary flow and reduction of residual urine. One study found that an aqueous extract of the root was the most effective in treating benign prostatic hyperplasia. The extract inhibited the binding of sex hormone-binding globulin (SHBG) to its receptor on human prostatic membranes in a dose related manner. Inhibition was noted at 0.6 mg/ml and complete inhibition was achieved at 10 mg/ml (Hryb et al, 1995.) In a second study, most ligands that were tested were found to have an affinity for SHBG. The affinity of (-)-3,4-divanillyltetrahydrofuran was found to be extremely high (Schottner, 1997.)

Viral Inhibition - The (N-acetylglucosamine) n-specific lectin from Stinging Nettle was found to be inhibitory to HIV-1, HIV-2, CMV, RSV and influenza A virus in-vitro at an EC-50 (50% inhibitory concentration) ranging from 0.3 to 0.9 micrograms/ml (Balzarini, 1992.)

Effects on Systemic Lupus Erythematosus-like Pathology - *Urtica dioica* agglutinin (UDA) treated MRL lpr/lpr mice

were shown to be protected from developing clinical signs of lupus and nephritis (Musette, 1996.)

CLINICAL TRIALS

One randomized, reference-controlled, multicenter double blind clinical trial compared therapeutic efficacy of a Sabal and Urtica extract (PRO 160/120) with finasteride in benign prostatic hyperplasia (Aiken stages I to II). The study involved 543 patients that were treated for 48 weeks with either the PRO 160/120 extract or finasteride in a double blind design. The primary marker was the change of maximum urinary flow after 24 weeks of therapy. Secondary markers included average urinary flow, miction volume and miction time. Urinary symptoms were recorded by the International-Prostate-Symptom-Score (I-PSS). There was also a quality of life questionnaire that was developed by the American Urological Association Measurement Committee (1991). Results were similar for both groups. There was an increase in urinary flow rate (1.9 ml with PRO 160/120; 2.4 ml with finasteride). Urinary flow increase and miction time decreases were comparable for both groups. The I-PSS decreased from 11.3 at the start to 8.2 at 24 weeks and 6.5 by week 48 for the PRO 16/120 group, and went from 11.8 to 8.0 and 6.2 respectively for the finasteride group. The life quality scores went from 7.5 at the start of treatment, to 4.2 in the PRO 160/120 group, and from 7.7 to 4.1 in the finasteride group. The most notable differences between the groups were in the lower adverse events categories where the PRO 160/120 group reported less events, in particular in the areas of diminished ejaculation volume, erectile dysfunction and headache (Sokeland & Albrecht, 1997.)

INDICATIONS AND USAGE

STINGING NETTLE FLOWERING PLANT

- Infections of the urinary tract
- Kidney and bladder stones
- Rheumatism

The drug is used internally and externally as supportive therapy for rheumatic ailments. It is used internally as flushing-out therapy for inflammatory diseases of the lower urinary tract. Also used as irrigation therapy for prevention and treatment of kidney stones.

Unproven Uses: In folk medicine, the plant is used internally as a hematogenic remedy, diuretic for arthritis, rheumatism of the joints and muscles, and as a component of diabetic teas (this indication is not recommended). Externally, the drug is used as a hair and scalp remedy against oily hair and dandruff.

STINGING NETTLE ROOT

- Prostate complaints, irritable bladder

Preparations of the root are used for micturition disorders in prostate adenoma stages I to II. This drug only relieves the symptoms of an enlarged prostate without eliminating the enlargement itself.

Unproven Uses: In folk medicine, the root is used for edema, rheumatism, gout and prostatitis.

CONTRAINDICATIONS

STINGING NETTLE FLOWERING PLANT

The drug is contraindicated when there is fluid retention resulting from reduced cardiac or renal function.

PRECAUTIONS AND ADVERSE REACTIONS

STINGING NETTLE FLOWERING PLANT

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Possible allergic reactions (skin afflictions, edema) have been observed in rare cases following intake of the drug. Contact urticaria frequently occurs when skin is exposed to the plant. The urticaria is accompanied by a stinging sensation that may last as long as 12 hours post exposure (Oliver, 1991.)

Drug Interactions: Studies have demonstrated that leaf extracts of Stinging Nettle when used along with diclofenac, enhance the anti-inflammatory effect of diclofenac.

STINGING NETTLE ROOT

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Occasional, mild gastrointestinal complaints may occur as side effects of drug intake.

DOSAGE

STINGING NETTLE FLOWERING PLANT

Mode of Administration: Comminuted herb for infusions and other galenic preparations for internal use; as stinging nettle spirit for external application. Drug extracts are contained in diuretic tea mixtures and in blood-purifying teas.

Preparation: To prepare an infusion, use 1.5 g finely cut herb in cold water, briefly bring to a boil and steep for 10 minutes, then strain.

Daily Dose: The average daily dose is 8 to 12 g of drug. Observe ample intake of liquid (minimum 2 liters/day). One cup several times daily as a diuretic (1 teaspoonful = 0.8 g drug). For external application, a tincture/spiritus (1:10) may be administered.

STINGING NETTLE ROOT

Mode of Administration: Comminuted drug from the root for infusions as well as other galenic preparations for oral use.

Preparation: To prepare an infusion use 1.5 g coarse powdered drug in cold water, heat to boiling point for 1

minute, then steep, covered, for 10 minutes, and strain.
(1 teaspoonful = 1.3 g drug)

Daily Dose: 4 to 6 g drug.

Tea — 1.5 g coarse powdered drug to water

Dry Extract — 120 mg twice daily

Stone Root

Collinsonia canadensis

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh or dried roots and rhizomes.

Flower and Fruit: The flowers are dirty yellow, labiate, with red venation on the inside in richly blossomed panicles. The upper lip has an obtuse tip. The side tips of the lower lip are small and rounded; the middle tips are larger and fringed. The calyx is acuminate and has 2 stamens. The fruit is a small globose nutlet.

Leaves, Stem and Root: The plant is a perennial that grows 90 to 120 cm high. The rhizome is grayish-brown, very hard, fibrous and up to 8 cm long. The shoots are glabrous, often tinged red, with few side shoots. The bark is very thin. The leaves are light green above and pale green, glabrous, broad, cordate or ovate below, becoming narrower and shorter above.

Characteristics: The smell is strongly aromatic, unpleasant, and numbing in large amounts. The taste is unpleasantly bitter.

Habitat: The plant is indigenous to North America from Canada to the Carolinas in the U.S. It is also found in central Europe.

Production: Stone Root, the rhizome and root of *Collinsonia canadensis*, is gathered and dried in autumn.

Other Names: Hardhack, Horsetweed, Heal-All, Knob Grass, Knob Root, Richweed, Richleaf, Knobweed, Hardback

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components are caryophyllene, germa-crene D, limonene, alpha- and beta-pinenes

Caffeic acid derivatives: including rosmarinic acid

EFFECTS

Stone Root has stomachic, tonic and diuretic effects, probably due to the presence of the essential oil and rosmarinic acid.

INDICATIONS AND USAGE

Unproven Uses: Stone Root is used for calculi, kidney stones, urea (bladder semolina), bladder inflammation, dropsy and gastrointestinal disorders.

Homeopathic Uses: Preparations of *Collinsonia canadensis* are used for hemorrhoids and constipation.

DOSAGE

Mode of Administration: The drug is used internally as an extract, infusion or tincture.

Preparation: Liquid extract (1:1) 1 ml to 4 ml; tincture (1:5) 2 ml to 8 ml.

Daily Dosage: The drug is generally used as a single dose, 1 to 4 g, internally as an infusion.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily; or 1 ml injection solution sc twice weekly (HAB1).

Storax

Liquidambar orientalis

DESCRIPTION

Medicinal Parts: The medicinal part is the balsam from the trunk and the inner bark.

Flower and Fruit: The flowers and inflorescences are unisexual, monoecious and arranged in small, round solitary capitula. The flowers are yellow. The male flowers' show no signs of a calyx or corolla. The female flowers have tiny scaly sepals, and the floret rubes are fused. There are numerous stamens, and the ovary is semi-inferior. The fruit is a hard globular schizocarp.

Leaves, Stem and Root: *Liquidambar orientalis* is a deciduous tree about 12 m tall with many branches and a thick

reddish-gray bark. It has alternate, usually 5-lobed leaves. The leaf blades are usually roughly toothed.

Characteristics: Raw Storax is a thick, viscous, sticky, aromatic and somewhat bitter-tasting gray-brown mass. When stored, the drug becomes clearer, an effect caused by a reduction in the water content.

Habitat: The tree is indigenous from Asia Minor to Syria.

Production: Storax (amber tree balm) is extracted from *Liquidambar orientalis*. To extract the balsam, the trunk is beaten, causing the bark to soak up the exuding resin. The bark is then boiled and the resulting decoction further refined.

Not to be Confused With: Fir resin, turpentine, colophony, olive oil

Other Names: Balsam Styracis, Sweet Gum, Copalm, Gum Tree, Liquid Amber, Opossum Tree, Red Gum, White Gum

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Aromatic alcohols: phenylpropyl-, cinnamic-, benzyl alcohol

Cinnamic acid (up to 30%): cinnamic acid esters, including among others cinnamylcinnamate (styracine), cinnamic acid ethyl esters

Styrene

Triterpenes: oleanolic acid, 3-epioleanolic acid (resin fraction)

Vanillin (up to 2%)

Volatile oil (depending upon source, 1 to 20%): with styrol, benzyl alcohol, cinnamic alcohol

EFFECTS

Storax has anti-inflammatory, diaphoretic and stimulant effects.

INDICATIONS AND USAGE

Unproven Uses: Storax is used for coughs and bronchitis as an inhalation, externally for wounds and ulcers.

Chinese Medicine: In China, Storax is used in the treatment of syncope, epilepsy and lactose intolerance in young children.

Indian Medicine: In India, Storax is used for itching, suppurating wounds, leprosy, chronic coughs and fever.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Internal administration of the drug occasionally leads to diarrhea. Storax can also trigger contact allergies.

OVERDOSAGE

External administration over large areas can lead to absorptive poisonings that are characterized by kidney damage (albuminuria, hemorrhagic nephritis).

DOSAGE

Mode of Administration: Storax is used in combination preparations for coughs and bronchitis as an inhalation, externally for wounds and ulcers.

Strawberry

Fragaria vesca

DESCRIPTION

Medicinal Parts: The medicinal parts are dried leaves collected during the flowering season, the dried rhizome and ripe fruit.

Flower and Fruit: The small white flowers are arranged on a repeatedly bifurcated pedicle. They are usually androgynous. There are 5 sepals and 5 petals. The sepals are triangular, pointed or briefly acuminate appressed pubescent. The petals are orbicular or ovate, glabrous and pure white. There are 20 stamens and numerous ovate, glabrous carpels and a style at the side. After flowering the receptacle turns into a fleshy false fruit. The receptacle is 2 cm long, ovate, globular or clavate, carmine red when ripe. The nutlets are ovate, 0.8 to 1.5 mm long, brown and matte.

Leaves, Stem and Root: The perennial, herbaceous plant grows from 20 to 30 cm high. The rhizome is cylindrical, horizontal or crooked and thickly covered with the residual dried off leaves and stipules. Long runners grow from the axils of the basal leaves. The stem is erect and is slightly longer than the basal leaves. The cauline leaves are trifoliate and roughly serrate from the first quarter upward. The petioles are very long and, like the stem have patent hairs. The stipules are lanceolate, long-acuminate, entire-margined, reddish brown, glabrous above and hairy beneath.

Habitat: Found in almost all of the temperate zones of Europe and Asia.

Production: Strawberry leaf consists of the dried leaf of *Fragaria* species, mainly *Fragaria vesca*. The leaves are collected in the wild and air-dried in a shady place.

Not to be Confused With: Other *Fragaria* species, although they have the same value.

Other Names: Wild Strawberry, Mountain Strawberry, Wood Strawberry, Alpine Strawberry

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Caffeic acid derivatives: including chlorogenic acid

Flavonoids: including rutin, quercetin

Tannins: ellagic acid tannins, oligomeric proanthocyanidins

EFFECTS

Strawberry leaf has astringent and diuretic properties; but no studies are available.

INDICATIONS AND USAGE

Unproven Uses: Preparations of strawberry leaf are used externally as compresses for rashes, and internally for catarrh of the gastrointestinal tract, diarrhea, intestinal sluggishness, liver disease, jaundice, catarrh of the respiratory tract, gout, rheumatoid arthritis, nervous tension, kidney ailments involving gravel and stones and as a diuretic. Because of the tannin content, its efficacy in treating mouth and throat inflammation and diarrhea is plausible.

PRECAUTIONS AND ADVERSE REACTIONS

Healuh risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug should not be taken in presence of strawberry allergy.

DOSAGE

Mode of Administration: Strawberry leaves are only used occasionally in folk medicine, the berries are used more commonly.

Preparation: Pour boiling water over 1 gm of comminuted drug and strain after 5 to 10 minutes.

Decoction — boil 375 gm green leaves with 1.15 Liter water until only 550 ml remain.

Infusion — add 4 gm drug to 150 ml boiling water.

Extract — boil 20 gm drug with 500 ml water until only half remains.

Daily Dosage: Tea: As an antidiarrheal agent, several cups per day.

Decoction — for diarrhea, 1 teaspoon every 3 to 4 hours.

Extract — for diarrhea, a spoonful before bed and on rising.

Infusion — one dose only for children with diarrhea. The decoction is used as a gargle.

Strophanthus

Strophanthus species

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe seeds, which have been freed from their appendages and dried. Most of the species are poisonous.

Flower and Fruit: The flowers are in terminal or lateral panicles with few flowers or in richly blossomed, umbelliferous panicles. Their parts are in fives. They are white or yellowish, radially symmetrical and sometimes fragrant. The calyx has 5 elliptical-lanceolate to obovate sepals and a short tube with a campanulately splayed upper part, which has 10 scales on the margin. The anthers are acute with a partly tailed middle section. The ovary is 2-valved, semi-inferior and has numerous ovules. The fruit has 1 to 2 follicles, which are oblong, 8 to 58 cm long, splayed or horizontal on one level. The greenish-brown seeds are 8 to 25 mm long, fusiform and often flattened. The seeds have an awn-like appendage and a long tuft of hair at the base, which eventually drops off.

Leaves, Stem and Root: The plants are climbing lianes, occasionally erect shrubs, subshrubs or trees. They contain milky latex. The leaves are opposite, ovate to elliptical, short-petioled, simple, entire-margined and usually coriaceous.

Habitat: *Strophanthus* is indigenous to tropical Africa.

Production: *Strophanthus* seeds are the seeds of *Strophanthus gratus*. *Kombe-Strophanthus* seeds are the seeds of *Strophanthus kombe*. The plant is harvested mostly by

African tribes in the wilderness or in protected areas in the vicinity of African settlements.

Not to be Confused With: *Strophanthi* semen should not be confused with African *Strophanthus* species.

Other Names: *Kombe*

ACTIONS AND PHARMACOLOGY

COMPOUNDS: STROPHANTHUS GRATUS SEEDS

Cardioactive steroid glycosides (cardenolides, 3-8%): chief glycoside strophanthin-G (ouabain, over 80%), further including acolongifloroside K, strogoside, among others

Saponins (0.2%)

Fatty oil (35%)

EFFECTS: STROPHANTHUS GRATUS SEEDS

The active agent, Strophanthin-G, is a cardioactive glycoside that has actions similar to digitalis, but is milder. No clinical test results are available. The drug is poorly absorbed by the gastrointestinal tract.

COMPOUNDS: STROPHANTHUS KOMBE SEEDS

Cardioactive steroid glycosides: (cardenolides, 4.0-4.5%, the mixture known as Strophanthin-K) chief glycoside K-strophanthoside (60-80%), erysimoside (15-25%), strophoside, (10-15%)

Saponins (0.2%)

Fatty oil (35%)

EFFECTS: STROPHANTHUS KOMBE SEEDS

The effects are similar to *Strophanthus gratus*, but milder.

INDICATIONS AND USAGE

STROPHANTHUS GRATUS SEEDS

Unproven Uses: *Strophanthus* is used for arteriosclerosis, cardiac insufficiency, gastrocardial symptoms, hypertension and neurodystonia.

Homeopathic Uses: *Strophanthus gratus* is used for cardiac insufficiency and anxiety.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Queasiness, vomiting, headache, stupor, disturbance of color vision and cardiac arrhythmias could occur as side effects, in particular through overdosages connected with parenteral administration of strophanthin-G or glycoside mixtures.

Drug Interactions: Simultaneous administration of quinine, calcium salts, saluretics, laxatives and glucocorticoids enhance both effects and side effects.

OVERDOSAGE

Queasiness, vomiting, headache, stupor, disturbance of color vision and cardiac arrhythmias are the most likely consequence of overdosage. Overdosage is more likely to occur with parenteral administration of strophanthin-G or glycoside mixtures.

For a review of symptoms of an acute poisoning and therapy, see *Digitalis folium*. The danger of poisoning after oral administration is relatively low, due to the poor absorption of the glycosides.

DOSAGE**STROPHANTHUS GRATUS SEEDS**

Mode of Administration: The drug is available as injection solutions and capsules and in combination preparations.

Preparation: A tincture is prepared by using 1 part coarsely ground powder (previously specially treated) stabilized for content with 10 parts 70% ethanol (V/V) (DAB6)

Daily Dosage: Tincture daily dose is 1.5 g. The single dose is 0.5 g.

Homeopathic Dosage: From D4: 5 drops, 1 tablet or 10 globules (from D2): Tincture: single dose: 0.5 g and daily dose: 1.5 g.

STROPHANTHUS KOMBE SEEDS

Mode of Administration: The drug is available in mono-preparations, and is rarely used in combinations.

Homeopathic Dosage: From D4: 5 drops, 1 tablet or 10 globules (from D2) every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Styrax tonkinensis

See Siam Benzoin

Sumatra Benzoin

Styrax paralleloneurum

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the balsamic resin obtained from the damaged trunk.

Flower and Fruit: *Styrax paralleloneurum* is a tree that grows up to 35 m high. The flowers are small, the corolla is violet, and the calyx is 3 to 4.5 mm high. The fruit is 5 to 9 mm in diameter.

Leaves, Stem and Root: The leaves are ovate or lanceolate and 6 to 16 cm long.

Habitat: Sumatra

Production: Sumatra Benzoin (Gum Benzoin) is the balsamic resin from the damaged trunk of *Styrax benzoin* and *Styrax paralleloneurum*. The optimal age of a tree to be harvested is 7 years. The tree is cut which causes it to exude resin to heal the cuts. The resin is then collected in a vessel and left to melt to a homogenous mass in the sun.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Ester mixture (70 to 80%): composed of coniferyl benzoate and cinnamyl benzoate, as well as cinnamyl cinnamate (styracine), propyl cinnamate

Phenylacrylic acids: cinnamic acid (10 to 20%)

Vanillin (0.4 to 0.6%)

Triterpenes: including sumaresinolic acid

EFFECTS

Sumatra Benzoin has a mild expectorant effect possibly due to its vanilla content.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the resin have been used for respiratory catarrh.

Chinese Medicine: Sumatra Benzoin preparations are used for stroke, syncope, postpartum syncope due to heavy loss of blood, chest and stomach pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb preparations for internal use.

Storage: Should be tightly sealed and stored below 25° C.

LITERATURE

Sumbul

Ferula sumbul

DESCRIPTION

Medicinal Parts: The medicinal part is the rhizome with the roots.

Leaves, Stem and Root: The plant is a 2.5 m tall shrub. It has a solid, cylindrical, thin stem, which produces about 12 branches. The fern-like leaflets are blue-gray. The basal leaves are about 50 cm long and triangular while the cauline leaves reduce gradually in size until they are little more than sheath leaves. The roots are 2.5 to 7.5 cm thick. They are covered on the outside with a blackish-brown, paper-like, horizontally folded cork, which is sometimes fibrous. The fracture is spongy and roughly fibrous with white spots and resin drops.

Characteristics: The odor is strong and musk-like; the taste is bitter and aromatic.

Habitat: The plant is found in some parts of Russia, Turkestan, and northern India.

Production: Sumbul or Musk root is the root of *Ferula moschata* (Reinsch, Kozo) or *Ferula sumbul*.

Other Names: Ferula, Musk Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.3-0.5%)

Resins (17%)

Bitter substances

Hydroxycoumarins: including among others, umbelliferone

Short-chained acids: butyric acid, angelic acid, methylcrotonic acid, and valeric acid

EFFECTS

The active agents include essential oil, resin, angelic acid, umbelliferone.

The effects are unclear; and sedative effect has not been proven

INDICATIONS AND USAGE

Indian Medicine: Sumbul root is used for states of debility, asthma, bronchitis, pneumonia, dysmenorrhea, diarrhea, hypertension and excessive excitability

Homeopathic Uses: *Ferula sumbul* is used to treat nervous cardiac symptoms.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Sumbul is used as liquid extract or tincture.

LITERATURE

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8: Springer Verlag Berlin, Heidelberg, New York, 1969.

Summer Savory

Satureja hortensis

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh or dried plant harvested during the flowering stage.

Flower and Fruit: The lilac or whitish labiate flowers are in axillary, 5-blossomed, false whorls. The calyx is tubular-

campanulate, regular, and has 5 tips. The corolla does not have a ring of hair. The upper lip is straight and margined. The lower lip has 3 divisions and is red-spotted at the mouth of the tube.

Leaves, Stem and Root: The herb grows 30 to 45 cm in height with erect, heavily branched, and shortly pubescent stems. The leaves are crossed opposite, up to 3 cm long, short-petioled, lanceolate to linear-lanceolate and entire-margined. They are rather thick with a ciliate margin and are glandular punctate on both surfaces.

Characteristics: Summer Savory has a spicy scent and a taste that is spicy and peppery. - :_

Habitat: The plant is indigenous to southern Europe and northern Africa, and is extensively cultivated elsewhere.

Production: Summer Savory is the aerial part of *Satureja hortensis*.

Other Names: Bean Herb, Savory

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.2-3.0%): chief components carvacrol (30%), p-cymene (20-30%), alpha-thujene, alpha-pinene, beta-myrcene, alpha- and beta-terpinene, beta-caryophyllene, thymol

Caffeic acid derivatives: rosmarinic acid (0.2 to 1.3%), chlorogenic acid

EFFECTS

The tannin content of the drug provides astringent qualities. Summer Savory also has a mild antiseptic effect due to the presence of cymol and carvacrol in the essential oil. An aqueous extract of the herb has antiviral properties.

INDICATIONS AND USAGE

Unproven Uses: Savory is used for acute gastrointestinal enteritis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally as an infusion that is prepared from ground plant.

Daily Dosage: Three teaspoonfuls of the drug can be taken daily in the form of a hot tea. To prepare the tea, do not boil but leave the drug to steep in scalding hot water.

Sundew

Drosera ramentacea

DESCRIPTION

Medicinal Parts: The medicinal part is the whole herb.

Flower and Fruit: Size: The plant is from 7 to 20 cm tall. The flowers are white and arranged in racemes turned to one side. There are 5 sepals, 5 petals and 1 ovary with 3 to 5 styles. The fruit is capsular.

Leaves, Stem and Root: The leaves are basal rosette, long-petioled and thickly covered in red glandular hairs. The thickened ends have a drop of viscid juice to trap insects.

Characteristics: The herb has a sour, bitter, hot taste.

Habitat: Europe, India, China, North and South America, on wet and peat ground.

Production: Sundew consists of the dried, above- and below-ground parts of *Drosera ramentacea*.

Not to be Confused With: Asian varieties.

Other Names: Dew Plant, Lustwort, Youthwort, Red Rot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Naphthoquinone derivatives:

If the source is *Drosera rotundifolia*: plumbagin, ramentaceone

If the source is *Drosera ramentacea*: ramentone, ramentaceone, biramentaceone, plumbagin

If the source is *Drosera madagascariensis*: 7-methyl juglone, plumbagin

If the source is *Drosera peltata*: plumbagin, droserone, 8-hydroxydroserone

EFFECTS

The drug has secretolytic, broncho-spasmodic, and antitussive effects.

The pharmacological mode of action can be traced to 1, 4 naphthoquinone and plumbagin. Plumbagin showed an anti-phlogistic effect in vitro through the inhibition of prostaglandin synthesis and an antimicrobial and cytostatic effect in animal experiments.

A possible immune-stimulant effect is the subject of recent studies, the results of which are not yet available.

INDICATIONS AND USAGE

Approved By Commission E: " "

- Cough/Bronchitis

Sundew is used for respiratory problems, particularly for coughing fits and dry coughs.

Unproven Uses: In folk medicine, Sundew is used for asthma and warts.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Liquid and solid preparations for external and internal application. The plant is a protected species and is in danger of extinction.

Preparation: To prepare an infusion, pour boiling water over 1 to 2 gm drug and strain after 10 minutes.

Daily Dosage: The average daily dose is 3 gm drug. The dosage of the infusion when used as a broncholytic is 1 cup, 3 to 4 times daily.

Sunflower

Helianthus annuus

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the ray florets, the leaves, the ripe fruit, the oil extracted from the seeds and the mature flower heads.

Flower and Fruit: The very large, composite flowers are solitary or in small clusters, usually nodding, and 10 to 40 cm wide on the stems. The bracts in a number of rows are leaf-like, ovate, acute and sparsely bristly. The 20 to 70 asexual, linguiform golden-yellow ray florets are 3 to 10 cm long and 1 to 3 cm wide. The numerous tubular disc florets are androgynous. They may be brown, purple or yellow, with black or purple anthers. There are small 3-pointed paleas on the base of the capitula. The fruit is compressed at the sides, obovate to almost wedge-shaped; it is an achene. It is densely appressed, downy and whitish, straw yellow or gray to black.

Leaves, Stem and Root: The sunflower is a 1 to 3 m high annual plant with a long primary root and numerous lateral roots. The stem is erect, branchless or branched higher up, densely covered in hairs, and filled with thin white pith. The leaves are alternate, cordate-triangular, long-petioled, irregularly crenately serrate and covered with short bristles on both sides.

Habitat: *Helianthus annuus* is indigenous to central and eastern North America and is cultivated worldwide.

Production: Sunflower oil is the fatty oil of the achenes of *Helianthus annuus*, which is recovered from the fruits, excluding the shell, by cold pressing. The ray florets and leaves are collected at the beginning of the flowering season.

Other Names: Corona Solis, Marigold of Peru

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SUNFLOWER OIL

Triglycerides: chief fatty acids linoleic acid (35-62%), oleic acid (25-42%), palmitic acid (4-7%)

Steroids: Sterols including campesterol, cholesterol, beta-sitosterol

EFFECTS: SUNFLOWER OIL

Useful as a dietary supplement.

INDICATIONS AND USAGE

SUNFLOWER OIL

Sunflower oil is used internally to alleviate constipation (as a lubricant). It is used externally as massage oil, for poorly healing wounds (as an oil dressing) and in the treatment of skin lesions, psoriasis and rheumatism. Sufficient information on the efficacy of the drug is not available.

PRECAUTIONS AND ADVERSE REACTIONS

SUNFLOWER OIL

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

SUNFLOWER OIL

Mode of Administration: In folk medicine, the drug is mainly for external use. In other areas, it is used as an inactive ingredient in pharmaceutical preparations.

Storage: Keep protected from light, in tightly sealed containers. Oils from different deliveries should not be mixed.

Surinam Cherry

Eugenia uniflora

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark of the plant's main stem, the leaves and its fruit.

Flower and Fruit: The flowers are radial, in clusters of 1 to 8. The sepals are fused; the calyx has 4 or 5 points and a tube approximately 1.5 mm long. The sepals are ovate-elliptical, revolute and up to 4 mm long. The 4 or 5 petals are white, elongate-ovate and 8 to 12 mm long. There are numerous very conspicuous stamens. The ovary is an inferior coenocarp. The fruit is a red, juicy berry with 8 vertical grooves and a diameter of 1 to 3 cm; it is usually 1-seeded.

Leaves, Stem and Root: The plant grows as a shrub or low evergreen tree, which reaches a height of 3 to 10 m. The leaves are opposite, 2.5 to 7 cm long and 1.5 to 4.5 cm wide, short-petiolate, elliptical-ovate, blunt-tipped, slightly cordate at the base, entire, densely and translucently punctate. The trunk is slim (about the thickness of an arm), the bark is smooth and light brown.

Characteristics: The plant produces a shiny red, cherry-sized vitamin-rich fruit, whose strongly acidic taste is like that of a nectarine.

Habitat: The plant grows abundantly in the tropics, especially in Brazil, Uruguay and Paraguay.

Production: Surinam Cherries are the fresh fruit of *Eugenia uniflora*, and Surinam Cherry leaves are the dried leaves of the same plant.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SURINAM CHERRY LEAVES

Volatile oil (0.2 to 1%): composition very dependent on the variety.

Components of an African variety include: furanodien (20%), selina-1,3,7(II)-trien-8-one (17%), oxidoselina-1,3,7(II)-trien-8-one (14%), in addition to caryophyllene, germacrene B, germacrene D, cis- and trans-ocimene, beta-selinene, spathulenol and viridiflorol

In a South American variety, the chief components include carvone, pulegone, nerolidol, limonene and verbenone, flavonoids: including quercitrin, myricitrin, and tannins.

EFFECTS: SURINAM CHERRY LEAVES

The flavonoids quercitrin and myricitrin contained in the drug have an inhibiting effect on the xanthine oxidase; the essential oil exhibits antimicrobial and antimycotic effect. A possible protective effect in relation to hyperlipidemia has been proposed. The drug may also exhibit astringent effects

due to tannins and flavonoids whose identities have not yet been determined.

COMPOUNDS: SURINAM CHERRY FRUIT

Volatile oil: components including isofuranodiene, germacrene B, selina-4(14),7(U)-diene

Monosaccharides/oligosaccharides (6%): L-fructose, D-glucose, saccharose

Carotinoids: including lycopine, gamma-carotene, beta-cryptoxanthine

Fatty oil (in the seeds and the pulp)

Fruit acids: citric acid (2%)

EFFECTS: SURINAM CHERRY FRUIT

The fruit contains vitamin C, tannins and citric acid, which explain its use as a dietetic. The essential oil of the fruit is said to have an antimicrobial effect.

INDICATIONS AND USAGE

SURINAM CHERRY LEAVES

Unproven uses: Folk medicine practices include use of the bark as an astringent in the treatment of diarrhea, gout, fever, hypertension, gastrointestinal complaint, edema and eye infections. The leaves have been made into a tea and as a component of a distilled oil, used for treating chronic inflammation of the mucous membranes of the respiratory organs, primarily rhinitis.

SURINAM CHERRY FRUIT

Unproven Uses: Folk medicine includes use as a dietetic, but efficacy for that use has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages of either drug.

DOSAGE

There is no information in the literature.

LITERATURE

Swamp Milkweed

Asclepias incarnata

DESCRIPTION

Medicinal Parts: The medicinal parts are the rhizome with roots.

Flower and Fruit: The flowers are reddish-purple. They are located on terminal umbels in clusters of 2 to 6 on a 5 cm long peduncle. The umbels consist of 10 to 20 small florets. The fruit is a long pod.

Leaves, Stem and Root: The herbaceous plant is up to 80 cm high. The stem is erect and smooth. The upper part of the stem is branched and very leafy. The leaves are opposite, petiolate, oblong, lanceolate, hairy, acute and cordate at the base. They are 10 to 18 cm long, 2.5 to 5 cm wide and sharp-edged. The rhizome is about 2 to 3 cm in diameter, yellowish-brown, irregularly globular or oblong, hard and knotty. The rhizome is covered with a thin, tough bark and is surrounded by light brown rootlets that are about 10 cm long.

Characteristics: The taste is sweetish, acrid and bitter. The plant's roots exude latex that is typical of the genus (and giving rise to the name Milkweed,) which is slightly acrid and has a strong odor that decreases on drying.

Habitat: Swamp Milkweed is indigenous to America, Canada and Asia.

Other Names: Swamp Silkweed, Rose-Colored Silkweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroids (cardenolids): including asclepiadin

EFFECTS

The root is said to contain asclepiadin (cardiac glycoside), which is positively inotropic and emetic.

INDICATIONS AND USAGE

Unproven Uses: Similar to other Asclepiadaceae, Swamp Milkweed is mainly used for digestive disorders.

Homeopathic Uses: The main importance of medicinal use of the American varieties is in homeopathy, but further details are not available.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug has an emetic effect in higher dosages, and digitalis-like poisonings are possible due to the cardioactive steroid content. For possible symptoms and treatments for poisonings, see *Digitalis folium*.

Sweet Cicely

Myrrhis odorata

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the entire herb and the seeds.

Flower and Fruit: The white flowers appear in early summer. The complex umbels are flattened on top, many-rayed and more cyme-like at the end of the branches. The rays of the androgynous flowers are covered in thick down. The pedicles of the male flowers are hollow. In the flowering season, the umbels are erect and closed. The fruit is elongate-pyramid-shaped, 2 to 2.5 cm long, compressed at the sides and brown to glossy black.

Leaves, Stem and Root: The plant is a perennial with a thick, gnarled, brown, branched and polycephalous rhizome. The stem is erect, 50 to 200 cm high and, higher up, is glabrous or villous and branched. The nodes are covered in long, fine hairs. The 2- to 4-pinnatisect leaves are large, soft, triangular and covered underneath with short, soft bristles.

Characteristics: The leaves smell like garden lovage and taste like anise.

Habitat: The herb is found in mountainous regions from the Pyrenees to the Caucasus and is cultivated elsewhere.

Production: Sweet Cicely root and herb are the whole plant of *Myrrhis odorata*.

Other Names: Sweet Chervil, Sweet Bracken, Sweet-Fern, Sweet-Cus, Sweet-Humlock, Sweets, The Roman Plant, Shepherd's Needle, British Myrrh

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components are trans-anethole, additionally germacrene-D, anisaldehyde, limonene, chavicolmethyl ether, beta-caryophyllene, alpha-pinene, alpha-farnesene, myrcene. Also, in the roots, trans-isoosmorhizol.

Flavonoids: apigenine-7-O-glucoside, luteolin-7-O-glucoside

EFFECTS

The drug is said to be a carminative, digestive and expectorant.

INDICATIONS AND USAGE

Unproven Uses: The herb is used as a blood purifier and an expectorant, as well as for asthma and other breathing difficulties. Balms and salves made from it are used to treat fresh wounds and sores and relieve the pains of gout.

The roots are used to treat chest and throat complaints and also urinary complaints. The fresh herb is used externally for gout swelling and indurations. Previous folk medicine uses also included use of a decoction from the roots for snake and dog bites.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Ground root is used to make tonics and infusions for internal and external use. Salves are used externally.

LITERATURE

Hegnauer R, Chemotaxonomie der Pflanzen, Bde 1-11, Birkhiuser Verlag Basel. Boston. Berlin 1962-1997.

Sweet Clover

Melilotus officinalis

DESCRIPTION

Medicinal Parts: The medicinal part is the flowering herb.

Flower and Fruit: The small yellow flowers are in many-blossomed, long-peduncled racemes. The standard and wings are the same length, but longer than the carina. Of the 10 stamens, 9 are fused. The fruit is an obtuse, glabrous, light brown to black, thorny-tipped, horizontally wrinkled and usually one-seeded pod.

Leaves, Stem and Root: The plant is perennial and 60 to 120 cm high. The smooth ascending or decumbent stems are heavily branched. The leaves are alternate, glabrous, trifoliate and long petioled. The leaflets are obovate and dentate. The stipules are awl-like bristly.

Characteristics: The plant has a fragrance similar to woodruff or hay.

Habitat: The plant is found all over Europe, Australia and North America, as well as in temperate regions of Asia.

Production: Sweet Clover consists of the dried or fresh leaf and flowering branches of *Melilotus officinalis*, and/or *Melilotus altissimus*.

Other Names: Melilot, King's Clover, Yellow Sweet Clover, Hay Flowers, Sweet Lucerne, Wild Laburnum, Hart's Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FRESH PLANT

Coumarinic acids glycosides: including melilotoside

COMPOUNDS: IN THE DEHYDRATED DRUG

Free coumarin (0.4-0.9%): formed from the coumarinic acids during dehydration, furthermore 3,4-dihydrocoumarin, melilotol, melilotin

Hydroxycoumarins: including among others umbelliferone, scopoletin, herniarin, fraxidin

Flavonoids: including, among others, kampferol- and quercetin glycosides

Triterpene saponins: including azuki saponin-V-carboxylate, azuki saponin II, aglycones soya sapogenols B and E, melilotigenin

Volatile oil: traces of very complex composition

COMPOUNDS: IN THE SEEDS

Canavanin

Trigonelline

EFFECTS

The drug has an antiphlogistic, antiexudative and anti-edematous effect, which explain its use for inflammatory and congestive edema. It increases venous reflux and improves lymphatic kinetics.

Animal experiments showed an increase in healing wounds.

INDICATIONS AND USAGE

Approved by Commission E:

- Blunt injuries
- Hemorrhoids
- Venous conditions

The drug is used internally for problems arising from "chronic venous insufficiency, such as pain and heaviness in legs, night cramps in the legs, itching and swelling; for the supportive treatment of thrombophlebitis, postthrombotic syndromes, hemorrhoids and lymphatic congestion. Externally, the drug is used for contusions, sprains and superficial effusions of blood.

Unproven Uses: In folk medicine, Sweet Clover is used as a diuretic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Administration of the drug in higher dosages can lead to headache and stupor, transitory liver damage is possible for a very small number of particularly susceptible patients. Elevation of liver enzyme values usually disappears following discontinuance of the drug. (Monitoring of the liver enzyme values is recommended.)

DOSAGE

Mode of Administration: Comminuted drug for infusions and other galenic preparations for oral use; liquid forms of medication for parenteral application; ointments, liniments, cataplasms and herbal sachets for external use; ointments and suppositories for rectal use.

Preparation: To prepare an infusion, pour boiling water over 1 to 2 teaspoonfuls of comminuted, cut drug, then strain after 5 to 10 minutes.

Daily Dosage: The average daily dose of the herb or preparation in amounts corresponding to 3 to 30 mg of coumarin; parenteral application corresponding to 1.0 to 7.5 mg of coumarin.

Infusion — As a therapy for varicose veins, 2 to 3 cups daily.

External — As a poultice for hemorrhoids.

Storage - The drug must be stored away from light in sealed containers to prevent loss of coumarin.

Sweet Gale

Myrica gale

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and branches as well as the wax extracted from the catkins.

Flower and Fruit: Sweet Gale plants are either male or female. The male plants produce groups of stemless catkins on the leafless branches of the previous year's growth. The fruit catkins are about the same size but somewhat thicker and grow in closely packed resinous nutlets. They are dry and compressed.

Leaves, Stem and Root: The plant is usually dioecious, but plants may change sex from year to year. Sweet Gale is a deciduous shrub up to 2.5 m high. The branches have scattered yellowish glands. The leaves are 2 to 6 cm long,

almost lanceolate, cuneate at the base and more or less serrate near the apex. They are pubescent beneath with shiny yellow, fragrant glands on both surfaces.

Characteristics: The branches and leaves are fragrant when bruised.

Habitat: Sweet Gale is indigenous to the higher latitudes of the northern hemisphere.

Production: Sweet Gale is the aerial part of *Myrica gale*.

Other Names: Bog Myrtle. Dutch Myrtle, Bayberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.4-0.7%): including among others alpha-pinene, delta-cadinene, gamma-cadinene, limonene, beta-myrcene, alpha-phellandrene, beta-phellandrene, 1,8-cineole, nerolidol, p-cymene, alpha-copaene, beta-caryophyllene

Flavonoids: including myricitrin

Triterpenes: including ursolic acid, oleanolic acid

EFFECTS

Sweet Gale has an astringent and aromatic effect.

INDICATIONS AND USAGE

Unproven Uses: Sweet Gale has been used in digestive disorders. A strong brew of dried bark is also, used in Sweden as a vermifuge and to cure itching.

PRECAUTIONS AND ADVERSE REACTIONS

The volatile oil of the drug is considered toxic. Mixing plant extracts with beer, as practiced in the Middle Ages, is said to have led to manic episodes.

DOSAGE

Mode of Administration: The drug is ground. Information on preparations is not available.

Sweet Marjoram

Origanum majorana

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaves and flowers, the fresh aerial parts of the flowering plant and the whole of the fresh, flowering plant.

Flower and Fruit: The inconspicuous, sessile flowers barely extend above the gray tomentose bracts surrounding them. The calyx appears to have only 1 sepal because the 2 lower sepals are almost non-existent and the upper 3 are completely fused. The calyx is 2.5 cm long and otherwise resembles the bracts. The corolla is white to pale lilac or pink, 4 mm long, with a few uneven, pointed tips. The 2 upper tips are fused together to form a lip. The stamens are enclosed in the corolla or extend above it. The fruit is a smooth, light brown nutlet, 0.75 to 1 mm long.

Leaves, Stem and Root: The plant is biennial with a main shoot that is heavily branched. It grows 20 to 25 cm high. The downy to tomentose shoots are gray-green to whitish, and sometimes tinged with red. The leaves are spatulate, short-petioled, 0.5 to 2 cm long and 0.5 to 1 cm wide, entire-margined and rounded. They are gray-tomentose on both surfaces, somewhat thick and usually without distinct ribs. The false whorls are mostly covered by the 3 to 4 wide, circular, gray-green bracts, which are fused to globular, racemous or paniced capitula.

Characteristics: The plant has a distinctive tangy odor and a bitter taste.

Habitat: The plant is indigenous to the southeastern Mediterranean region and is cultivated in Germany.

Production: Marjoram herb consists of the dried leaf and flower of *Origanum majorana* (synonymous with *Majorana hortensis*), gathered during the flowering season and stripped off the stems. Drying must be fast to avoid blackening of the leaves. Marjoram oil consists of the essential oil of *Origanum majorana* obtained by aqueous steam distillation of the fresh or dried leaves and flowers stripped from the stems and harvested during flowering season. Depending on the area of cultivation, there may be two crops of the aerial plant parts per year.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: MARJORAM HERB

Chief components in the volatile oil of the foliage: cis-sabinene hydrate (40 to 50%), cis-sabinene hydrate acetate (20 to 30%), sabinene (10%) and trans-sabinene hydrate (2%); cis-sabinene hydrate acetate transforms itself with steam distillation into (among others) terpinene-4-ol (in volatile oil yielded through steam distillation, 15 to 40%),

gamma-terpinene (in volatile oil yielded through steam distillation, 2 to 12%), alpha-terpinene, limonene and terpinols, that leads to change of aroma

COMPOUNDS: MARJORAM OIL

Volatile oil (1 to 3%)

Flavonoids: including diosmetin, luteolin, apigenin and their C- and O-glycosides, including vitexin, orientin, thymonine

Hydroquinone glycosides: including arbutin (0.15 to 0.45%), methyl arbutin

Caffeic acid derivatives: rosmarinic acid, chlorogenic acid

Water soluble polysaccharides (13%)

Triterpenes: including ursolic acid (0.5%), oleanolic acid (0.2%)

EFFECTS: MARJORAM HERB AND OIL

In vitro, Marjoram is antimicrobial, antiviral and insecticidal.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for rhinitis and colds in infants; rhinitis in small children and gastritis. In folk medicine, Majoram herb and oil are used for cramps, depression, dizziness, gastrointestinal disorders, migraine, nervous headaches, neurasthenia, paralysis, paroxysmal coughs, rhinitis and as a diuretic.

Homeopathic Uses: Homeopathy sometimes uses Marjoram to increase sexual excitability.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug is not suitable for longer-term use because of its arbutin content.

Pediatric Use: Marjoram salve should not be administered to infants or small children.

DOSAGE

Mode of Administration: Marjoram herb is used as an infusion for teas, mouthwashes and poultices (5% infusion). The oil is used in ointments and a few compound preparations.

Preparation: To prepare a tea, pour 250 ml boiling water over 1 to 2 teaspoonfuls of Marjoram herb and strain after 5 minutes. An ointment is prepared by leaving 20 parts Marjoram herb to stand with 1 part ammonia and 10 parts spirit of wine for a few hours. It is then heated with 100 parts Vaseline in a water bath until the spirit of wine and ammonia have evaporated. Then the ointment is filtered (EB6).

Daily Dosage: Sip 1 to 2 cups of tea throughout the day.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or 1 ml injection solution sc twice weekly (HAB1).

Storage: Dried Marjoram herb may be stored for up to 2 years in air-tight containers.

Sweet Orange

Citrus sinensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh and dried peel as well as the oil extracted from the peel.

Flower and Fruit: The fragrant flowers are arranged singly or in short, limp racemes. The fruit is depressed-globose to shortly ovoid, 10- to 13-locular. The peel is thin to rather thick, nearly smooth, orange to orange-yellow. When ripe. The pulp is sweet. The core remains solid when ripe.

Leaves, Stem and Root: Citrus sinensis is an evergreen tree with rounded crown. The branches are angular when young, then become terete, with a few slender, rather flexible axillary spines. The leaves are acute, rounded below; the petioles are narrowly winged.

Habitat: Like other Citrus varieties, the plant is indigenous to Asia and is cultivated in the Mediterranean and other subtropical regions in many parts of the world.

Production: Orange peel consists of the fresh or dried outer peel of ripe fruits of *Citrus sinensis*, separated from the white pith layer, as well as its preparations in effective dosage.

Other Names: Orange, China Orange, *Citrus dulcis*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components in the fresh pericarp include (+)-limonene, furthermore citral (as an odor-bearer), citronellal, nootkatone, sinesal, n-nonanal, n-decanal, n-dodecanal, linalyl acetate, geranyl acetate, citronellyl acetate, methyl anthranilate. Pressed oils also contain lipophilic flavonoids and furocoumarins.

Flavonoids

EFFECTS

Sweet Orange promotes gastric juice secretion.

INDICATIONS AND USAGE

- Dyspeptic complaints
- Loss of appetite

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There is a low potential for sensitization through skin contact with the volatile oil.

DOSAGE

Mode of Administration: Comminuted herb for teas and other bitter-tasting galenic preparations for oral administration.

Daily Dosage: 10 to 15 gm of drug.

Sweet Sumach

Rhus aromatica

>DESCRIPTION

Medicinal Parts: The medicinal parts are the dried and fresh root bark.

lower and Fruit: The flowers are in 1 to 1.5 cm long, false umbels. They are yellow-green and often appear before the

leaves are fully developed. The fruit is a globular, yellow-red, pubescent drupe.

Leaves, Stem and Root: The plant is a fragrant 1 to 2.4 m high shrub with glabrous red-brown annual growth and small to 10 cm-long trifoliate leaves. The leaflets are oval and the middle one is cuneate at the base. The leaflets are irregularly dentate and initially pubescent on both sides. Later the leaflets turn glabrous on the upper surface and eventually pubescent only on the ribs of the lower surface.

Habitat: The plant is indigenous to Atlantic North America.

Production: Sweet Sumach root-bark is the, root-bark of *Rhus aromatica*.

Other Names: Polecat-Bush, Smooth, Sumach, Sweet Fragrant Sumach, Sumac

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Phenol glycosides: orcin-O-beta-D-glucoside

Steroids: sterols, including beta-sitosterol, stigmast-7-en-3beta-ol

Tannins

Triterpenes: including oleanolic aldehyde

Volatile oil (0.01 to 0.07%); very complex in mixture, with constituents including delta-cadinene, camphene, delta3-carene, beta-elemene, farnesyl acetone, alpha- and beta-pinene, fatty acids

EFFECTS

The drug has an antimicrobial and antiviral effect due to the tannins (gallic acid). In animal experiments it increased contraction of the smooth muscles of ileum. Two older studies describe an improvement in the symptoms of urinary incontinence.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine Sweet Sumach is used for irritable bladder, urinary incontinence, enuresis nocturna and uterine bleeding.

Homeopathic Uses: *Rhus aromatica* is used for weak bladder conditions.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Sweet Sumach is available in crude powder form and in compounded preparations for oral intake. It is also available in parenteral form for homeopathic use.

Daily Dosage: Single dose is 1 gm.

Bed-wetting—5 to 20 drops depending on age, to be taken 2 to 3 times daily, over an extended period.

Homeopathic Dosage: 5 drops. 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34)

Storage: Should be stored in dry place, protected from direct light.

Sweet Vernal Grass

Anthoxanthum odoratum

DESCRIPTION

Medicinal Parts: The whole plant is considered to have medicinal properties.

Flower and Fruit: The green, solitary, flowered spikelet has 4 spelts, the lower half of which are as large as the upper and taller than the flowers. Both of the upper spelts are awned, with 2 stamens. The style is long, the stigma pinnate, and spikelets form an oblong false ear.

Leaves, Stem, and Root: The plant-size ranges from 15 to 50 cm. The plant grows as thick grass. The leaves are ciliate at the base of the lamina. The leaf sheath is deeply grooved and hairy.

Characteristics: Sweet Vernal Grass has a scent of dried woodruff or new-mown hay and a tangy taste.

Habitat: The plant is indigenous to Britain, Europe and temperate Asia.

Production: Sweet Vernal Grass is the whole *Anthoxanthium odoratum* plant in flower.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Hydroxy cinnamic acid glycosides: in the fresh plant

Melilotoside and coumarin: triggered by a beta-glucosidase during dehydration of the plant

Iridoids: asperuloside, monotropein, scandoside

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for headache, nausea, sleeplessness and conditions of the urinary tract.

PRECAUTIONS AND ADVERSE REACTIONS

The freshly harvested plant contains glycosidic precursors of coumarin, which release coumarin in the process of dehydration (the drug contains up to 1.5% coumarin). No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

The administration of higher levels of the drug can lead to headache and dizziness. Liver injuries are possible among susceptible patients during long-term treatment. The abnormal liver values disappear when the drug is discontinued, but on going observation of liver enzyme values of the blood is recommended.

DOSAGE

Mode of Administration: The drug is used externally as an extract.

Sweet Violet

Viola odorata

DESCRIPTION

Medicinal Parts: The medicinal parts are the essential oil from the leaves, the dried flowers, the air-dried leaves collected during the flowering season, the flowering herb, the dried rhizome, the fresh aerial parts collected during the flowering season and the whole plant.

Flower and Fruit: The dark violet flowers are solitary on 3 to 7 cm long pedicels. The flowers are 1.5 to 2 cm long and fragrant. The 5 sepals are obtuse, glabrous and have an appendage. There are 5 uneven petals, which are unevenly spurred and which have a broad margin. The 5 stamens have an appendage at the tip. The flower has 3 fused ovaries. The fruit is a globular capsule, approximately 7.5 mm. It is 3 to 6 sided, clearly and densely short-pubescent and often violet. It can be found pressed to the receptacle.

Leaves, Stem and Root: The Violet is 5 to 10 cm high. It is a rosette plant with a short, thick but soft ground axis. The rooting runners are 10 to 20 cm long and 1.5 mm thick. They produce flowers in the second year. The shoots are a strong dark green with scattered appressed hairs or almost glabrous. The leaves are petiolate, broadly cordate, obtuse or short-acuminate and crenate. The leaves, which appear first, are reniform-cordate and the younger ones are rolled up. There are lanceolate stipules at the base of the leaves.

Characteristics: The plant is strongly scented.

Habitat: The plant is indigenous to or naturalized in large parts of Europe and the Middle East as far as central Asia; it is also found in North America.

Production: Sweet Violet root consists of the dried root of *Viola odorata*. Sweet Violet herb is the dried plant section of *Viola odorata*. The rhizome is imported from the former Czechoslovakia and Romania. The rootstock is dug up, pounded to remove any soil residue, washed and air-dried.

Other Names: Garden Violet

ACTIONS AND PHARMACOLOGY

COMPOUNDS: SWEET VIOLET RHIZOME AND HERB

Volatile oil (0.04%): salicylic acid methyl ester (formed out of glycosidic precursors during plant drying), beta-nitropropionic acid

Saponins

Alkaloids

EFFECTS: SWEET VIOLET RHIZOME AND HERB

The drug acts as an expectorant due to its saponin content. The alkaloid violin has an emetine-like effect.

COMPOUNDS: SWEET VIOLET FLOWER

Volatile oil (0.003%): aroma-carrier trans-alpha-ionone (p-menthone), chief constituents (-)-zingiberene, (+)-curcumene, dihydro-beta-ionone, 2,6-nonadien-1-al, undecan-2-one, isoborneol

EFFECTS: SWEET VIOLET FLOWER

The drug has antimicrobial and broncho-secretolytic effects due to the saponin content.

INDICATIONS AND USAGE

SWEET VIOLET RHIZOME AND HERB

Unproven Uses: The rhizome is used for conditions of the respiratory organs, particularly for dry catarrh, and rheumatism of the minor joints; it is additionally used for fever, skin diseases, inflammation of the oral mucosa, nervous strain, headache and insomnia.

The herb is used internally for coughs, hoarseness, pneumonia, throat inflammations, bronchitis accompanied by fixed mucous, nervous strain, insomnia and hysteria. It is also used to induce sweating. Externally, the herb is used to treat various skin diseases.

SWEET VIOLET FLOWER

Unproven Uses: The flowers are used to prepare an infusion tea, which is used as an expectorant for bronchial catarrh; as an antitussive for chronic bronchitis; and for whooping cough, asthma and migraine. Sweet Violet syrup is used as an expectorant and to lessen irritation for bronchial catarrh (children's remedy).

Homeopathic Uses: The flowers are used for inflammation of the respiratory tract and rheumatism of the wrist.

PRECAUTIONS AND ADVERSE REACTIONS

SWEET VIOLET RHIZOME, HERB, AND FLOWER

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

SWEET VIOLET RHIZOME AND HERB

Preparation: An herbal tea is prepared by adding 2 teaspoonfuls Sweet Violet herb with 1/4 liter water. ☞

Daily Dosage: The average single dose of the rhizome is 1 gm orally. The 5% rhizome decoction dosage is 20 gm. The 5% rhizome infusion dosage is 1 dessertspoonful 5 to 6 times daily. The herbal tea dosage is 1 cup 2 to 3 times daily.

SWEET VIOLET FLOWER

Preparation: To prepare an infusion, decoction or tea, use 1 heaping teaspoonful of drug with 1 cup of water.

Daily Dosage: The dosage for the infusion, decoction or tea is 1 cup twice daily, or taken in sips 1 to 2 times per hour.

The dosage of Sweet Violet syrup is 1 to 2 dessertspoonfuls every 2 hours.

Homeopathic Dosage: 5 drops. 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB34).

Sweet Woodruff

Galium odoratum

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried or fresh aerial parts collected during or shortly before the flowering season.

Flower and Fruit: The flowers are in loose terminal cymes. The petals are fused to a funnel-shaped, white, 1.5 mm long tube. The border of the tube is divided in 4 and is 2 to 3.5 mm long. The 4 stamens are fused with the corolla. The involucre bracts are small, lanceolate or almost bristle-like.

The 2-seeded indehiscent fruit is globular. 2 to 3 mm long and thickly covered with white barbed bristles.

Leaves, Stem and Root: Sweet Woodruff is a 10 to 35 cm herbaceous perennial with a thin cylindrical circular rhizome. The stem is erect, quadrangular, smooth and, apart from the bristly nodes, glabrous and glossy. The leaves are in false whorls of 6 to 9, the lower ones are obovate-oblong, the middle and upper ones are lanceolate to oblong-lanceolate. They are entire-margined, thorny tipped, glabrous and rough-edged.

Characteristics: Sweet Woodruff is aromatic when dried; the taste is bitter and tangy.

Habitat: The plant grows in northern and central Europe, Siberian and northern Africa.

Production: Sweet Woodruff herb is the fresh or dried aerial part of *Galium odoratum*. It is gathered during or shortly before flowering. The herb must be turned regularly while being dried.

Not to be Confused With: *Gallium mollugo* or *Gallium sylvaticum*

Other Names: Master of the Wood, Woodwrad, Woodruff

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FRESH PLANT

O-hydroxycinnamic acid glucoside: melilotoside

COMPOUNDS: IN THE DRIED PLANT

Coumarin (0.4-1%)

Iridoids: asperuloside (0.05-0.3%), monotropein (0.04%), scandoside

EFFECTS

The coumarin content may impart antiphlogistic, antiedemat-ic, spasmolytic and lymphokinetic properties. However, due to the low level of coumarin, the therapeutic effect is doubtful.

INDICATIONS AND USAGE

Unproven Uses: Sweet Woodruff is used as a treatment for nervous agitation, sleeplessness, nervous menstrual disorders, congested liver, jaundice, hemorrhoids, circulation disorders and venous conditions.

PRECAUTIONS AND ADVERSE REACTIONS

The freshly harvested plant contains melilotoside as glycosidic precursor of coumarins. In the process of dehydration, coumarin is released (content up to 1% coumarin in freshly dried drug). Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Headache and stupor can occur with the administration of higher dosages of the drug. Susceptible patients could experience liver damage following long-term adminis-

tration. This effect is reversible following discontinuation of the drug. Liver enzyme values should be monitored.

DOSAGE

Mode of Administration: The herb is obsolete as a drug in many countries, and since 1981 is not allowed to be used in the manufacture of aroma or flavoring in German-speaking countries.

Preparation: To make a tea, place 2 teaspoonfuls (1.8 gm drug) in one glass water. An infusion of 5% drug is used for insomnia, and a forehead poultice made of crushed herb is used for headache.

Daily Dosage: The average single dose is 1.0 gm drug. The preparations can be taken during the day or shortly before going to bed.

Storage: The drug should be protected from light sources to avoid brown coloring.

Tamarind

Tamarindus indica

DESCRIPTION

Medicinal Parts: The medicinal parts are the fruit pulp and the dried seeds.

Flower and Fruit: The flowers form a terminal raceme and have three, 1 cm long petals which are initially whitish, then yellowish with light-red stripes. They have a calyx with a narrow, top-shaped base and 4 thickly covered segments. The stamens are fused in a sheath, which is open at the top. The fruit is a 20 cm long and 3 cm wide, matt-brown, slightly compressed, indehiscent, bean-like pod. The fruit has 3 to 12 seeds that are very hard and glossy brown. The seeds are 14 mm long and have an irregular, roundish-quadrangular shape. The mesocarp is odorless, mushy and sweet-tasting.

Habitat: The plant is indigenous to tropical Africa and is naturalized in North and South America from Florida to Brazil. It is cultivated in subtropical China, India, Pakistan, Indochina, on the Philippines and in Java and Spain.

Production: Tamarind paste is derived from the fruit of *Tamarindus indica*. The fruit is fermented for a long time in the sun. The initially red-brown fruit attains a black or black-brown hue and becomes more aromatic and sour. The paste is boiled to a glutinous mass, which is the finished product.

Other Names: Imlee

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fruit acids: tartaric acid (3-10%); including among others, malic acid, citric acid, lactic acid

Invert sugar (25-30%)

Pectin

Pyrazines and thiazols (aromatic substances)

EFFECTS

The drug, which contains organic acids and pectine, is said to be laxative; however, the mode of action has not been documented.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for chronic or acute constipation and liver and gallbladder ailments.

Indian Medicine: The drug is used for bilious vomiting, alcohol intoxication, fever, pharyngitis, stomatitis, constipation and hemorrhoids.

Homeopathic Uses: *Tamarindus indica* is used for stomachaches.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Tamarind is taken orally and is usually used in combination with other laxatives, such as figs.

Preparation: To make a clean paste, soften the raw tamarind paste in hot water, strain through a sieve, and steam to a soft consistency in a water bath; mix the paste with sugar.

Daily Dosage: 10 to 50 gm of cleaned tamarind paste, pure or with other purgatives, is taken in fruit cubes.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules, every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB34).

Storage: Store in a tightly sealed container. •

Tansy

Tanacetum vulgare

DESCRIPTION

Medicinal Parts: The medicinal part consists of the dried flowering herb.

Flower and Fruit: The inflorescences are flat, round and button-like composite flowers in cymes. The bright golden yellow flowers consist only of tubular flowers. The fruit has 5 ribs without tufts of hair.

Leaves, Stem and Root: The plants grow from 60 to 120 cm high. The stem is erect, glabrous, angular, red-tinged and leafy. The leaves are alternate, simple or double pinnatifid, 15 cm long and 12 cm wide and have a long emarginate tip.

Characteristics: The herb has a strong aromatic smell. The taste is bitter and camphor-like. The plant is poisonous.

Habitat: The plant is indigenous to Europe.

Production: Tansy flower consists of the inflorescence of *Chrysanthemum vulgare* (syn. *Tanacetum vulgare*). Tansy herb consists of the above-ground parts of *Chrysanthemum vulgare* (syn. *Tanacetum vulgare*). Tansy oil is the oil extracted from *Tanacetum vulgare*.

Other Names: Buttons, Daisy, Hindheal, Parsley Fern

ACTIONS AND PHARMACOLOGY

COMPOUNDS: TANSY FLOWER AND HERB

Volatile oil (0.5 to 0.9% in the foliage, 0.8 to 1.8% in the blossoms): constituents of the volatile oil vary greatly according to variety. The following could appear as main constituents: artemisia ketone, (-)-thujone, (-)-isothujone, 1,8-cineole, alpha-pinene, alpha-terpinyl acetate, borneol, bornyl acetate, davanone, germacrene D, L-camphor (+) umbellulone, camphor, lyratol (+) lyratol acetate, piperitone, sabinene, thuj-4-en-2-ylacetate (+) trans-Carveyl acetate, trans-chrysanthenol (+) trans-chrysanthenyl acetate, umbellulone, as well as (+)-vulgarol A (8%), vulgaron B (up to 12%). Hybrid varieties exist.

Sesquiterpenes: sesquiterpene lactones, including crispolid, deacetyl crispolid, tatrindins A and B, tavulin, artemorin, parthenolide (in some varieties), reynosine, arnefoline, dentatin A, santamarin, chrysanthemine

Flavonoids: including cosmosiin, apigenin-7-O-glycoside, cynaroside, luteolin-7-O-glucoside, quercimetrin, eupatilin, acacetin-7-glucobioside

Hydroxycoumarins: including scopoletin

Polyynes: including ditherthiophene, triterthiophene (phototoxic)

EFFECTS: TANSY FLOWER AND HERB

The oil, which contains thujone, is an insect repellent. The sesquiterpenes in the leaves are antimicrobial. A leaf extract has displayed an anti-edemic effect, and the polysaccharide fraction is said to have an ulcer-protective effect in rats.

COMPOUNDS: TANSY OIL

Constituents of the volatile oil vary greatly according to variety. The following could appear as chief constituents: artemisia ketone, (-)-thujone, (+)-isothujone, 1,8-cineole, alpha-pinene, alpha-terpinyl acetate, borneol, bornyl acetate, davanone, germacrene D, L-camphor (+) umbellulone, L-camphor, lyratol (+) lyratol acetate, piperitone, sabinene, thuj-4-en-2-ylacetate (+) trans-carveyl acetate, trans-chrysanthenol (+) trans-chrysanthenyl acetate, umbellulone, among others. Hybrid varieties exist.

EFFECTS: TANSY OIL

The thujone-type oil is antimicrobial, anthelmintic, and repellent to various insects.

INDICATIONS AND USAGE

TANSY FLOWER AND HERB

Unproven Uses: Tansy preparations are used as an anthelmintic, for migraine, neuralgia, rheumatism, bloating and loss of appetite.

TANSY OIL

Unproven Uses: Tansy oil is used internally for gout, rheumatic complaints, joint pains, stomach cramps, gastrointestinal infections, intermittent fever, dizziness and dysmenorrhea. It is used externally for rheumatism, gout, contusions, sprains and wounds.

CONTRAINDICATIONS

The drug should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

TANSY FLOWER AND HERB

The administration of therapeutic dosages of drugs that have a high thujone content (see *Tanacetum aetheroleum*) can lead to poisoning. Beyond that, there is a medium potential for sensitization via skin contact with the drug. Internal administration of the drug in allopathic dosages is to be avoided.

TANSY OIL

Particularly toxic are volatile oils with high thujone content. Poisonings occur chiefly through the misuse of the drug as an abortifacient. Administration in allopathic dosages is to be avoided.

OVERDOSAGE

TANSY OIL

Symptoms of poisoning include vomiting, abdominal pain, gastroenteritis, severe reddening of the face, mydriasis, fixed pupil, tonic-clonic spasms, cardiac arrhythmias, uterine bleeding, kidney damage and liver damage. Death occurs after 1 to 3.5 hours. The lethal dosage is approximately 15-30 gm. The treatment for poisonings can only proceed symptomatically.

DOSAGE

TANSY FLOWER AND HERB

Daily Dosage: Administration in allopathic dosages is to be avoided.

TANSY OIL

Mode of Administration: The drug is found in extract form in a small number of combination preparations.

Daily Dosage: Administration in allopathic dosages is to be avoided. The documented single dose is 0.1 gm.

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe seeds.

Flower and Fruit: The spikes are uninterrupted, 30 cm long and green. The 5 to 7 spikelets form the ear. The glume is longer than the spikelet, which has 7 ribs and no awn. The husk is cartilaginous, with 5 ribs and a stiff, straight awn.

Leaves, Stem and Root: The stalk is rigid and erect. The leaf sheaths are rough and weakly bulbous on the upper leaves.

Characteristics: The spikelets have their narrow sides turned toward the main axis (in contrast to the couch grass). A parasitic fungus, which is often present on the plant, forms an alkaloid, making the plant poisonous.

Habitat: The plant grows in Europe and Mediterranean regions.

Production: Taumelloolch seeds are the ripe seeds of *Lolium temulentum*.

Other Names: Bearded Darnel, Cheat, Drake, Ray-Grass, Tare

ACTIONS AND PHARMACOLOGY

COMPOUNDS

The active ingredients are not known. However, the toxicity of *Lolium rigidum* is caused by bacterial toxins, the so-called kidney toxins, which are unusual nucleosides with uracil as the base.

EFFECTS

The active agents are temulentin, temulentinic acid, free fatty acids, tannin and glycosides. The fruit has been suspected of poisoning for some time; however, the toxic principle generally remains unexplained. The drug's ability to relieve gastroenteritis can possibly be attributed to the free fatty acids.

INDICATIONS AND USAGE

Unproven Uses: Taumelloolch is used for dizziness, nerve pain, nose bleeds, sleeplessness, stomach cramps and urinary incontinence.

PRECAUTIONS AND ADVERSE REACTIONS

The drug can be toxic. In earlier times, poisonings were frequently caused by the presence of the plant's berries in grain. No cases of poisoning are known in recent times. The plant has now become extremely rare through intensive seed-corn purification.

OVERDOSAGE

Symptoms of poisoning include dizziness, headache, colic, confusion, staggering, vision and speech disorders, somnolence, and, in rare cases, death through respiratory failure. The treatment of poisoning consists of gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulphate), administration of activated charcoal and shock prophylaxis (quiet, warmth). Further management consists of treating spasms with careful administration of diazepam (i.v.) and icepacks for fever. Phenothiazines and analeptics should not be administered. Intubation and oxygen therapy may be required.

DOSAGE

Mode of Administration: The plant is administered ground and as a liquid extract.

Taxus baccata

See *Yew*

Tea Tree

Melaleuca alternifolia

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaves and branch tips from which an oil is extracted by steam distillation.

Flower and Fruit: The inflorescence is a 3 to 5 cm long spike. The flowers are sessile with a campanulate epicalyx on which the sepals sit like tips. The tips are 3 to 4 mm long. The petals are free, approximately twice as large as the calyx tips. There are numerous conspicuous stamens, in 5 bundles approximately 2 cm long. The ovary is inferior and partially fused with the hollow receptacle. It is in 3 parts with a thick pistil and a capitular stigma. The fruit is a woody, cylindrical capsule with a diameter of 3 to 4 mm.

Leaves, Stem and Root: This tree reaches heights up to 7 m. The leaves are simple, coriaceous, 1 to 2.5 cm long, acute-lanceolate, and sometimes slightly sickle-shaped with oil glands. The young shoots are tomentose, the older branches glabrous. The trunk has a paper-like, whitish bark.

Habitat: *Melaleuca alternifolia* is indigenous to Australia.

Production: Tea tree oil is the essential oil extracted from the leaves and branch tips of *Melaleuca alternifolia*, *Melaleuca dissitifolia* and other *Melaleuca* species by aqueous steam distillation. Ideally, the leaves and shoots have first been stored for six weeks.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Terpenes: Primarily terpinene-4-ol (45%), gamma-terpinene (18%), alpha-terpinene (8%), **1,8-cineole (6%)**, **alpha-terpineol (5%)**, as well as alpha-pinene, **limonene**, **p-cymol**, terpinolene, viridiflorene

EFFECTS

The terpenes present in the essential oil exhibit efficacy that is antimicrobial, possibly antiviral and weakly antimycotic.

INDICATIONS AND USAGE

Tea Tree Oil is used for conditions of **the respiratory tract** and for skin conditions. It is also used as **a disinfectant**. The oil's administration against acne has been demonstrated in at least one clinical test.

Unproven Uses: Folk medicine internal uses have included tonsillitis, pharyngitis, colitis and sinusitis. **Externally**, Tea Tree Oil is used for ulcers of the oral mucous membrane, gingivitis, root canal treatment, mycosis **of the nail**, skin infections, ulcers, burns and insect bites.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

In several cases involving children, overdosage (10 ml for a child) led to coordination weakness and a state of confusion. A very high dosage (70 ml) led to coma.

DOSAGE

Mode of Administration: Preparations of the oil are used internally and externally.

Storage: Store tightly sealed and protected from light.

Teazle

Dipsacus silvestris

DESCRIPTION

Medicinal Parts: The medicinal part is the whole **flowering plant with root**.

Flower and Fruit: The flowers are lilac with **8 cm long, cylindrical capitula**. The bracts are lanceolate-awl-shaped.

curved upward, thorny and longer than the capitulum. The outer bracts with their straight, flexible, thorny tips are longer than the flowers. The calyx is basin-shaped, and the corolla is fused with 4 tips. There are 4 stamens and 1 inferior ovary. The fruit is a nutlet.

Leaves. Stem and Root: The plant is a biennial that grows 80 to 150 cm high. The stem is erect, angular and thorny. The basal leaves are rosette-like, crenate-serrate. The cauline leaves are oblong with a thorny midrib underneath.

Habitat: With the exception of northern Norway, Sweden and Finland, wild Teazle is grown throughout all of Europe, North Africa and Asia Minor.

Production: Common Teazle root is the underground part of *Dipsacus silvestris*.

Other Names: Barber's Brush, Brushes and Combs, Card Thistle. Church Broom, Venus' Basin

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes: including cantleyoside, loganin, sweroside, sylvestroside III and IV

Caffeic acid derivatives: including chlorogenic acid

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Teazle is used externally for small wounds, fistulae, eczema and as a rub in the treatment of rheumatism.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Teazle is used externally in alcoholic extracts.

Thuja

Thuja occidentalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the leaves and branch tips, the young dried branches, the fresh, leafy annual branches and the fresh, leafy branches collected in spring.

Flower and Fruit: The male flowers are dark brown, the female flowers are yellow-green. They are monoecious. The male flowers are arranged in small, terminal catkins and the female flowers are almost star-shaped. The ripe cones are brown-yellow, 6 to 8 mm long, ovate and covered in coriaceous, obtuse scales. The lower ones are patent at the tips. The seeds are brown-yellow, 3 to 5 mm long and approximately 1 mm wide. They are narrowly winged the whole way around.

Leaves, Stem and Root: The plant is a narrowly clavate, 12 to 21 m high tree with short horizontally spread branches and red-brown, striped peeling trunk. The trunk is usually branched from the base up. The leaves are scale-like, crossed opposite, imbricate, flattened on the branch side and folded at the margins. They are dark green above and matte-green beneath. The scales on the upper part of the branches have a globular glandular swelling.

Habitat: The plant originated from eastern North America and is found in Europe mainly as an ornamental plant and is partly naturalized.

Production: Thuja herb is the young branch tips and young shoots of *Thuja occidentalis*. The harvest should take place in spring when the content of the active agents is optimal. The herb should be dried in the shade and handled with care.

Not to be Confused With: Other forms of Thuja.

Other Names: Arborvitae, Hackmatack, Swamp Cedar, Tree of Life, White Cedar

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Water-soluble immuno stimulating polysaccharides and glycoproteins

Water-soluble immunostimulating glycoproteins

Volatile oil (1.4-4%): chief components (-)-thujone (alpha-thujone, 59%), (+)-isothujone (beta-thujone, 7-10%), fenchone (10-15%)

Flavonoids: including among others, quercitrin, mearusitrin, the biflavonoids hinoki flavone, amentoflavone, bilobetin-procyanidins

Lignans

Tannins

EFFECTS

The antiviral effect of the drug is attributed to many reasons. The topical use for viral wart growth is plausible. Proliferation of T cells caused by polysaccharides (esp. CD-4 and T-helper/inducer-cells) and an increase in the production of interleukin-2 has been demonstrated.

The essential oil, because of its thujone content, causes spasm and leads in high doses to clonic-tonic convulsions, severe metabolism disturbances through fatty degeneration of the liver, and damage of the renal parenchyma.

INDICATIONS AND USAGE

Unproven Uses: Thuja is used for respiratory tract infections and in conjunction with antibiotics in the treatment of bacterial skin infections and *herpes simplex*. Other possible uses include the treatment of rheumatism, trigeminal neuralgia, strep throat, gout, pruritus, blepharitis, conjunctivitis, otitis media, pertussis, tracheitis, kidney and bladder complaints, enuresis, psoriasis, amenorrhea, and cardiac insufficiency. The drug is used externally as an ointment for treating pains in the joints, arthritis, and muscle rheumatism, as well as infected wounds and burns.

Homeopathic Uses: *Thuja occidentalis* is used for rheumatism, depressive states, poor digestion, and skin and mucous membrane conditions.

CONTRAINDICATIONS

The drug should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drug's toxic effect is due to the thujone content. The doses should be strictly followed because of the toxicity of the drug. Allopathic preparations do not contain any thujone.

The toxicological limit, up to which thujone can be administered orally without risk to health, has been established at 1.25 mg/kg body weight. Only poisonings connected with the consumption of the leaves and shoots of fresh plants have been recorded since 1980. In therapeutic dosages of medications, the thujone content is far below the toxicological limit.

Use in Pregnancy: The drug is misused as an abortifacient. Thuja should not be taken during pregnancy.

OVERDOSAGE

Symptoms of poisoning, often seen after misuse of the drug as an abortifacient, include queasiness, vomiting, painful diarrhea, and mucous membrane hemorrhaging. Instances of death have been reported.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium per-

manganate solution, sodium sulphate), administration of activated charcoal, and shock prophylaxis (appropriate body position, quiet, warmth), the treatment for poisoning consists of treating spasms with diazepam (i.v.), colic with atropine, administering electrolytes and treating possible cases of acidosis with sodium bicarbonate infusions. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Whole, cut, and powdered drug is found in compound preparations. *« -

Preparation: To make an extract of 1:1, use 50% ethanol; for an extract of 1:10, use 60% ethanol. To make a tincture, mix 100 parts Thuja powder and 1,000 parts diluted spirit of wine (EB6).

Daily Dosage: The daily dose for the extract is 1 to 2 ml 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Storage: Mark the container as "poisonous" and protect from light and excessive heat.

Thyme

Thymus vulgaris

TRADE NAMES

Red Thyme and White Thyme, Thyme Herb, Thyme Leaf and Flower

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the fresh, flowering herb: the dried leaves; the striped and dried leaves; and the fresh aerial part of the flowering plant.

Flower and Fruit: "The blue-violet to bright red labiate flowers are arranged in 3 to 6 blossomed axillary clusters. The calyx is bilabiate with a 3-tipped upper lip and a 2-tipped lower lip. The upper lip of the corolla is straight and the lower lip is divided in 3. The stamens are splayed from the base.

Leaves, Stem and Root: The plant is a dwarf shrub that grows up to 50 cm high with an erect, woody and very branched-bushy and downy stem, which never roots. The leaves are short-petioled, linear or oblong-round, acute, glandular-punctate with an involute margin and a tomentose under surface.

Characteristics: The odor is aromatic and the taste tangy, somewhat bitter and camphor-like.

Habitat: The plant is indigenous to the Mediterranean region and neighboring countries, northern Africa and parts of Asia. It is extensively cultivated.

Production: Thyme consists of the stripped and dried leaves and flowers of *Thymus vulgaris*, *Thymus zygis*, or both species.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (LO-2.5%): chief components thymol (20-55%), p-cymene (14-45%), carvacrol (1-10%), gamma-terpinene (5-10%), borneol (up to 8%), linalool (up to 8%)

Caffeic acid derivatives: rosmarinic acid (0.15-1.35%)

Flavonoids: including among others, luteolin, apigenin, naringenin, eriodictyol, cirsilineol, salvigenin, cirsimaritin, thymonine, thymusine, partially present as glycosides

Triterpenes: including among others, ursolic acid (1.9%), oleanolic acid (0.6%)

EFFECTS

Thyme is a bronchial antispasmodic, an expectorant, and an antibacterial agent. In animal experiments, a spasmolytic effect was demonstrated for the flavone fraction and an expectorant effect on ciliary activity for the terpenes.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough
- Bronchitis

Unproven Uses: The herb is used internally for catarrh of the upper respiratory tract, dyspeptic complaints, asthma, laryngitis, chronic gastritis and whooping cough. Externally, it is used as a mouthwash and gargle for inflammations of the mouth and throat, pruritus, and dermatoses. It is also used externally for tonsillitis and poorly healing wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a low potential for sensitization.

DOSAGE

Mode of Administration: Thyme is available as a comminuted drug, powder, liquid extract or dry extract for infusions and other galenic preparations. Liquid and solid medicinal forms for internal and external application are available. Combinations with other herbs, which have expectorant action, are also available. Extracts of the drug are components of standardized preparations of antitussive and cough remedy teas.

How Supplied:

Oil — 100%

Liquid — 1:1, 1:5

Preparation: To prepare a tea, use 1.5 to 2 gm drug with boiling water, steep for 10 minutes, then strain. (1 teaspoonful is equivalent to 1.4 gm drug.) To prepare an infusion, add 1 to 2 gm drug to 150 ml of water. For a bath, add a minimum of 0.004 gm thyme oil to 1 liter of water, filter, then add to bath water drawn at a temperature of 35-38° C. Alternatively, add 500 gm of drug to 4 liters of boiling water, filter, then add to bath water.

Daily Dosage: The recommended daily dosage is 10 gm drug with 0.03% phenol, calculated as thymol. When using a liquid extract, 1 to 2 gm is taken 1 to 3 times daily. The single dose for the infusion is 1.5 gm drug, or 1 to 2 gm drug per cup of water taken several times a day. The dose for the powder is 1 to 4 gm drug twice daily.

The tea can be taken several times a day as needed. A 5% infusion can be used for compresses. Baths should be taken for 10 to 20 minutes.

Storage: Keep the herb in a tightly sealed container, and protect from light and moisture.

Tobacco

Nicotiana tabacum

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves.

Flower and Fruit: The numerous flowers are in many-branched panicles. The sepals are 12 to 25 mm long and tubular to tubular-campanulate. The tips are triangular, pointed and unequal. The corolla is 30 to 55 mm long, funnel-shaped, pale greenish-cream and often pinkish distal. The limb is 10 to 15 mm with pointed lobes, which are sometimes subentire. The four stamens are unequal and sometimes slightly exerted. The capsule is 15 to 20 mm long, ellipsoid to globose.

Leaves, Stem and Root: Tobacco is an annual or biennial plant, 1 to 3 m in height. The plant has a long fibrous root and an upright, round, pubescent and stick stem, which is heavily branched at the top. The leaves are up to 50 cm in length. They are ovate to elliptical or lanceolate, pointed, alternate and sessile. They sometimes have a short, winged petiole.

Habitat: The plant originates from tropical America and is cultivated worldwide, in particular in the U.S., China, Turkey, Greece, Holland, France, Germany and most sub-tropical countries.

Production: Tobacco leaves are the cultivated, unfermented leaves of *Nicotiana tabacum*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Pyridine alkaloids (0.5-8.0%, among select cultivars 1.5%): chief alkaloid nicotine (30-60% share of the alkaloid mixture) including among others N-formyl nor-nicotine, cotinine, myosmine, nicotyrine, anabasine, nicotelline

EFFECTS

In small doses, Tobacco increases blood pressure and the activity of the gastric mucous membrane. In larger doses, it reduces blood pressure and lowers muscle tone of the

gastrointestinal tract. Tobacco is a stimulant to the respiratory and central nervous system.

INDICATIONS AND USAGE

Unproven Uses: Nicotine is used to help break the smoking habit.

Apache Indians use the drug to treat toothache, mosquito bites and bee stings. In Brazil and Guyana, Tobacco is used for worm infestation, skin parasites and biliary flow disturbances. The drug's use in these conditions is not advised because of the risk of toxicity.

Indian Medicine: Tobacco is used for toothache, dental caries, earache, suppurating rhinitis, hernias, and painful swellings.

Homeopathic Uses: Tobacco is used for angina pectoris, low blood pressure and vomiting with diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

Tobacco leaves are severely poisonous. The chief toxin is nicotine, a liquid alkaloid, that can be resorbed through the skin.

OVERDOSAGE

The lethal dosage for nicotine for an adult is 40 to 100 mg, although this can be considerably elevated through habituation (with smoking Tobacco, 2 to 7 g of the drug; one cigarette contains 10 mg nicotine, of which 1 to 2 mg are inhaled during smoking). Symptoms of an acute poisoning include dizziness, salivation, vomiting, diarrhea, trembling of the hands and feelings of weakness in the legs; very high dosages can lead rapidly to spasms, unconsciousness, cardiac arrest and respiratory failure. Poisonings occur in particular through the ingestion of cigarettes by children, the handling of insecticides containing nicotine (through skin contact) and in connection with the harvesting of Tobacco (also through cutaneous resorption). Nicotine patches also represent a danger for children.

Following gastric lavage with burgundy-colored potassium permanganate solution, instillation of activated charcoal and sodium sulphate solution, the therapy for poisonings consists of treating spasms with diazepam (i.v.), chloral hydrate for children (rectal); cardiac massage; administration of orciprenaline; and atropine for severe sympathetic excitation. Intubation and oxygen respiration may also be necessary. No centrally effective analeptics are to be given.

DOSAGE

Mode of Administration: The nicotine alkaloid is used internally as a gum and externally as a transdermal patch.

Preparation: Nicorette (chewing gum); also as transdermal patches.

Daily Dosage: Nicotine as a pure alkaloid in smoker's remedies; nicotine (2 to 4 mg) bound by polacrillin (8 to 16 mg). Nicorette is an ion exchanger and therefore causes the slow release of nicotine, which is absorbed in the saliva over and over again. Eventually, the doses are reduced as the breaking of the habit progresses.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Tolu Balsam

Myroxylon balsamum

DESCRIPTION

Medicinal Parts: The medicinal parts are the balsam from the sweltered trunks, the hardened resin balsam that has been extracted from damaged trunks, softened and purified through a process of melting and sweltering.

Flower and Fruit: The androgynous flowers grow on pedicles approximately 12 cm long on simple, richly blossomed racemes. The calyx is inferior, broadly tubular or oblong-campanulate, dark green with short, rough hairs. The 5 petals are white and stemmed. The standard is almost circular. The stamens are bright red and the 1-valve ovary is on a long stem. The fruit is a 1-seeded, indehiscent, winged pod. The seeds are distinctly curved, brown-red and reniform.

Leaves, Stem and Root: These balsam trees grow to 25 m tall with a round, spreading crown that only starts to branch at a height of 13 to 19 m. The bark is smooth, yellow-gray or brown with numerous lenticles. The leaves are usually odd-pinnate and have 4 to 7 obovate, acuminate, coreaceous, short-petioled leaflets. The upper surface is dark green and the lower surface pale green.

Characteristics: Before drying, the resin smells strongly of vanilla or benzoin.

Habitat: Myroxylon balsamum is indigenous to South and Central America, Sri Lanka and Jamaica.

Production: Peruvian balsam consists of the balsam generated from scorched tree trunks of Myroxylon balsamum. The bark of 10-year-old trees is removed just above ground level and this area is scorched with a flame, after which the balsam is collected in cloths placed on the scorched area.

Tolu Balsam consists of the balsam generated from the incised tree trunks of Myroxylon balsamum. The balsam is purified by melting, straining and solidifying. A V-shaped incision is made in the tree trunk, and a vessel is secured under the incision to collect the resin, which is then cleaned.

Other Names: Balsam Tree, Peruvian Balsam, Tolu Opobalsam

ACTIONS AND PHARMACOLOGY

COMPOUNDS: PERUVIAN BALSAM

Ester mixture, so-called cinnamein (50-70%): made up of benzyl benzoate and benzyl cinnamoate

Resins (20-30%): chief constituent cinnamic acid ester of the so-called peruresitannols (polymer)

Volatile oils: including some with nerolidol

EFFECTS: PERUVIAN BALSAM

The drug has an antibacterial/antiseptic effect, promotes the granulation process and is antiparasitic (especially for scabies). The main active constituent is an ester mixture that mainly contains benzyl benzoate.

COMPOUNDS: TOLU BALSAM

Ester mixture (10-20%): made up of benzyl benzoate and benzyl cinnamoate

Free benzoic acid/free cinnamic acid (10 to 30%)

Resins (up to 80%)

Volatile oil

EFFECTS: TOLU BALSAM

The undiluted oil showed antibacterial and fungicidal effects in the diffusion test. The drug also acts as an expectorant. The effect on the respiratory tract appears to work in the field of aromatherapy.

INDICATIONS AND USAGE

PERUVIAN BALSAM

Approved by Commission E:

- Wounds and burns
- Hemorrhoids

External Use: for infected and poorly healing wounds, for burns, decubitus ulcers, frostbite, leg ulcers, bruises caused by prostheses and hemorrhoids.

Unproven Uses: Although no longer used internally, it was used previously for fevers, colds, coughs, bronchitis, inflammation of the mouth and pharynx, and a tendency to infection. External folk medicine uses are the treatment of eczema and itching. Outdated uses include* treatment of scabies; as a liniment for headaches, toothache and rheumatic symptoms; and use of the resin for uterine and umbilical venous bleeding.

Homeopathic Uses: Indications in homeopathy include chronic mucous membrane inflammation of the respiratory and urinary organs.

TOLU BALSAM

Approved by Commission E:

- Cough
- Bronchitis

Tolu Balsam is used to treat inflammation of the mucous membranes of the respiratory tract.

Unproven Uses: Folk medicine external uses include the approved indications above, as well as the treatment of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

PERUVIAN BALSAM

Peruvian balsam often causes contact allergies. Urticaria, recurring aphthoid oral ulcers, Quincke's disease and diffuse purpura can all occur, among other ailments (possibly also following internal administration, for example, of foods containing Peruvian Balsam). Photodermatoses and phototoxic reactions are possible without ingestion. Kidney damage has been observed following internal as well as external use of large dosages (such as albuminuria, pyelitis and necroses of the canaliculus epithelia).

TOLU BALSAM

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. However, just as is the case with Peruvian Balsam, allergic reactions are possible.

DOSAGE

PERUVIAN BALSAM

Mode of Administration: Galenic preparations for external use.

How Supplied: Commercial pharmaceutical preparations include ointments and suppositories.

Homeopathic Dosage: 5 drops. 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute. 3 times daily; chronic: once a day (HAB34).

Daily Dosage: Galenic preparations containing 5 to 20% Peruvian Balsam, for extensive surface application not more than 10% Peruvian Balsam. Duration of application should not exceed 1 week.

Storage: Store Peruvian Balsam in a container that seals "tightly and prevents exposure to light.*

TOLU BALSAM

Mode of Administration: Various preparations of Tolu Balsam are used internally.

Preparation: To prepare Tolu Balsam syrup, dissolve the drug in 96% alcohol in a water bath with reflux; add 85% glycerol and water, then warm the mixture. Let stand for a week before adding saccharose. Prepare a 1000 ml tincture with 200 g Tolu Balsam and 92.3% ethanol.

Daily Dosage: Average daily dosage is, 0.6 g of drug, depending on the preparation.

Storage: Store protected from light in tightly sealed containers with a suitable drying agent. Do not store Tolu Balsam in powder form.

Tomato

Lycopersicon esculentum

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh leaves, the fresh herb collected during the flowering season or the whole plant.

Flower and Fruit: The flowers are in lateral, cyme-like coils. The tips of the calyx are linear-lanceolate. The corolla is yellow, as long as the calyx and has a very short tube. It is divided into pointed, lanceolate lobes. The stamens are fused to the tube. The stigma is greenish and capitular. The fruit is a large, juicy, smooth, round to ovoid berry with a short, obtuse tip. It is scarlet, occasionally yellow or whitish with a diameter of 2 to 10 cm. The seeds are reniform, flattened, whitish-gfay-yellow and villous-tomentose.

Leaves, Stem and Root: The tomato plant is an annual with a fusiform, fibrous root. The stem grows to 120 cm, and is leafy, heavily branched and glandular-haired. The leaves are broad-petiolate, odd-pinnate, petiolate, ovate-lanceolate, pinatifid, dentate and slightly involute leaflets. The leaves have a gray-green underside.

Habitat: The plant probably originated in southern or Central America; today it is only cultivated.

Production: Tomato tincture is the homeopathic mother tincture of the whole plant *Lycopersicon esculentum*.

Other Names: Love Apple

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid alkaloid glycosides: chief alkaloid alpha-tomatine

EFFECTS

The tomatin content has been shown to be antibacterial. In animal experiments, a lowering of blood pressure was observed after IV administration of tomatin hydrochloride. Lectin isolated from the fruit is said to have an effect on cell division and DANN synthesis in human leukocyte cultures.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, Tomato is used externally for sore eyes (extract) and inflammations of the mouth and throat (decoction).

Indian Medicine: Tomato is used for 'flu' infections (tea), also for flatulence, atonic dyspepsia and anorexia.

Homeopathic Uses: *Lycopersicon esculentum* is used to treat rheumatic conditions, colds, chills and digestive disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Signs of poisoning are not to be expected with less than 100 gm of the fresh leaves (or green tomatoes) and for that reason is unlikely. Symptoms would be severe mucous membrane irritation (vomiting, diarrhea, and colic). Following absorption, dizziness, stupor, headache, bradycardia,

respiratory disturbances, mild spasms and, in very severe cases, death through respiratory failure could occur.

Case studies are not known.

DOSAGE

Mode of Administration: The drug is commonly used in homeopathic dilutions.

Preparation: The mother tincture is produced by maceration or percolation of the fresh or dried drug, with an ethanol content of 45%.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

LITERATURE

Tomaten als Krebschutz. In: DAZ 134(6):485. 1994.

lead to slight liver damage (elevated liver enzyme values in the blood) in a very small number of patients, that is, however, reversible following discontinuance of the drug.

OVERDOSAGE

The intake of very high dosages (4 gm coumarin, equivalent to 150 gm of the drug) could bring about stupor, headache, nausea and vomiting.

DOSAGE

Mode of Administration: Tonka Beans are obsolete as a drug.

Tonka Beans

Dipteryx odorata

DESCRIPTION

Medicinal Parts: The medicinal part is the seeds.

Flower and Fruit: The beans are usually 2 to 5 cm long and 1 cm in diameter. They have a grayish or black color.

Characteristics: The bean has a characteristic odor, like new-mown hay of coumarin.

Habitat: South America

Production: Tonka Beans are the seeds of *Dipteryx odorata*.

Other Names: Tonquin Bean

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Coumarin (1-3% to 10%)

Fatty oil

9 EFFECTS

Tonka Beans have a tonic and aromatic effect.

INDICATIONS AND USAGE

Unproven Uses: Whooping cough (no longer used).

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The therapeutic administration of drugs containing coumarin can

Tragacanth

Astragalus gummifer

DESCRIPTION

Medicinal Parts: The medicinal product of the plant is the gum-like exudation from the trunk and branches.

Flower and Fruit: The axillary flowers are solitary or in groups of 2 or 3 and are sessile. The calyx is 6 to 7 mm long and densely pubescent. The corolla is yellowish to white and sometimes has bluish or reddish veins. The standard, wings and carina are each 9 to 10 mm long. The fruit is ovoid, 4 mm long with dense, silky hairs. The seed is oval, smooth and about 3 mm long.

Leaves, Stem and Root: *Astragalus gummifer* is a low shrub that grows up to 30 cm high and has gray branches that become glabrous. The older branches have scale-like remains of the stipules from the previous year, which disappear later, and a 1 to 4 cm long perennial, thorny leaf column. The 8 to 14 leaflets are folded, oblong-ovate, 2.5 to 6 mm long and 0.7 to 2.5 mm wide, blue-gray and glabrous or sparsely pubescent beneath.

Habitat: The plant grows in Turkey, Syria, Lebanon, northwest Iraq and the border area between Iran and Iraq.

Production: Tragacanth is the latex that exudes primarily from immediately under the bark of *Astragalus gummifer* and other varieties. It is extracted by making an incision in the trunk and branches of shrubs growing in the wild. When dried, it forms flakes that swell in water to form a gelatinous mass.

Other Names: Gum Dragon

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Polysaccharides (water-soluble part, approximately 40%): tragacanthine, which can decompose into tragacanthic acid (galacturonane with side chains consisting of D-xylose, L-fucose, D-galactose)

Arabino-galactane-protein complex (non-water soluble part, approximately 60%): containing bassorin, a composition similar to that of tragacanthine

EFFECTS

Tragacanth has a laxative effect, primarily due to stimulating stretching of the intestinal wall, which results in increased peristalsis.

INDICATIONS AND USAGE

Unproven Uses: Tragacanth is used as a laxative. Folk medicine uses in Europe and the Arab world have included treatment for tumors of the eyes, liver and throat. Efficacy has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Allergic reactions have been observed in rare cases. Insufficient fluid supply following intake of large quantities of tragacanth can lead to obstruction ileus, as well as to esophageal closure.

DOSAGE

Mode of Administration: Tragacanth is used in various combinations and preparations.

Daily Dosage: Recommended daily dosage is not specified. A typical single dose is 1 tsp. granulated drug (approximately 3g) added to 250 to 300 ml liquid for oral administration.

Storage: Tragacanth cannot be stored for any significant length of time because of its instability.

Trailing Arbutus

Epigae repens

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried leaves.

Flower and Fruit: The flowers are in apical dense racemes. They are white with a reddish tinge and are very fragrant. They are divided at the tip into 5 segments which open in a star shape.

Leaves, Stem and Root: The plant is a fragrant evergreen branching shrub with rust-colored, pubescent, round stems. Roots develop at the stem nodes, which spread quickly. The leaves are petioled, broadly ovate, 2.5 to 4 cm long and about 2 cm wide, coriaceous, entire-margined, reticulate, with a cordate base and short pointed apex and short hairs on the undersurface. The branches, petioles and leaf nerves are very pubescent.

Characteristics: The plant has a similar action to Buchu on the urinary system.

Habitat: Indigenous to North America, established as an ornamental plant in Europe.

Production: Trailing Arbutus is the aerial part of *Epigae repens*.

Other Names: Eleuthero, Gravel Plant, Ground Laurel, Mountain Pink, Water Pink, Winter Pink

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Arbutin (hydroquinone glucoside)

Tannins

EFFECTS

Eleuthero has astringent and diuretic properties.

INDICATIONS AND USAGE

Unproven Uses: Trailing Arbutus is used for urinary tract conditions.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Nausea and vomiting can also occur with stomach sensitivity in children. Liver damage, cachexia, hemolytic anemia and depigmentation of the hair is possible with long-term use of the drug.

OVERDOSAGE

Overdosages could lead to inflammatory reactions of the mucous membranes of the bladder and urinary passages, accompanied by strangury and possible blood in the urine.

DOSAGE

Mode of Administration: Trailing Arbutus is available as an infusion or extract for internal use.

LITERATURE

Kem W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Traveller's Joy

Clematis vitalba

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh leaves.

Flower and Fruit: The flowers are arranged in leafy cymes. The blossoms are small and white with 4 downy, revolute or splayed bracts. The stamens and ovaries are numerous. The fruit is a red-brown, long-tailed nut.

Leaves, Stem and Root: The plant grows to about 1.5 to 5 m high. The leaves are petiolate and 5-pinnate. The leaflets are ovate or slightly cordate, acute and lobed. The petioles are clinging and the stems climbing, grooved, at first leafy then woody.

Characteristics: The flowers have a slight scent resembling white thorn. The plant is poisonous if ingested in large amounts.

Habitat: The plant is indigenous to Europe.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Protoanemonine-forming agents: In the freshly harvested plant, it is presumably the glycoside ranunculin that changes enzymatically when the plant is cut into small pieces, and probably also when it is dried. It then changes into the pungent, volatile protoanemonine that is severely irritating to skin and mucous membranes but quickly dimerizes to anemonine; when dried, the plant is not capable of protoanemonine formation.

Saponins

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The drug causes blistering and was formerly used to treat diseases of the male genitals, as well as for poorly healing wounds. Today, it is used in small doses, both internally and externally, for migraine.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug.

Extended skin contact with the freshly harvested, bruised plant can lead to treatment-resistant blisters and cauterizations due to the release of protoanemonine, which is severely irritating to skin and mucous membranes. If taken internally, severe irritation to the gastrointestinal tract, combined with colic, diarrhea and irritation of the urinary drainage passages, are possible. Symptomatic treatment for external contact should consist of irrigation with diluted potassium permanganate solution followed by mucilage.

OVERDOSAGE

Ingestion of the drug should be treated with gastric lavage followed by activated charcoal. Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments. The toxicity of this plant is less than that of many other Ranunculaceae (*Anemones nemorosae*) due to the, relatively low levels of protoanemonine-forming agents.

DOSAGE

Mode of Administration: The drug is used topically and is also available in alcoholic extracts.

Tree of Heaven

Ailanthus altissima

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried trunk and root bark.

Flower and Fruit: The small, greenish-yellow flower is branched, axillary or terminal panicles. Some of the flowers are male, some female and some androgynous. The calyx is short and has 5 glandular, fused sepals. The sepals are much longer than the corolla and have 5 hollow, splayed petals. There are 10 stamens, often only 5 in the androgynous and rudimentary remains in the female flowers. There are 5 obovate, compressed ovaries with 5 splayed stigmas. There is a narrow, oblong-lanceolate schizocarp, 4 to 5 cm by 1 cm. It is winged above and below, first green then brown-red and finally brown. The seed is orbicular and found in the middle of the fruit section. It is thin-skinned, without any recognizable endosperm and has an ovate, flat cotyledon.

Leaves, Stem and Root: *Ailanthus altissima* is a beautiful, fast-growing tree, up to 30 m high. The bark is smooth, pale and vertically striated. The branches are initially fine-haired, yellow or red-brown. The leaves are up to 1 m long and odd-pinnate. The upper surface of the leaves is dark green and the under-surface is light gray-green. Both sides of the leaf are glandular-haired. The leaflets are ovate to oblong-lanceolate. The shallow, cordate base of the leaflets has 1 to 3 small lobes at either side, each with 1 gland. The wood surface is satin-like and white.

Characteristics: The flowers have a strong elder flower scent. The fresh bark and leaves give off an unpleasant, nauseating smell.

Habitat: The tree was originally indigenous to China. Today it grows in the wild and is cultivated in tropical and subtropical eastern Asia, northern Europe and North America.

Production: Tree of Heaven bark is the trunk and branch bark of *Ailanthus altissima*. The bark is gathered year-round. The outer bark is removed and dried in the sun. After drying, there is a process of sorting and removing foreign bodies, washing, macerating and a second drying.

Other Names: Ailanto, Chinese Sumach, Vernis de Japon

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Quassinoids: including ailanthone, quassin

Indole alkaloids of the beta-carbolic type

Tannins

EFFECTS

An antimalarial action is being tested in an in-vitro trial. The active agents also have astringent, antipyretic, and antispasmodic properties.

INDICATIONS AND USAGE

Unproven Uses: In Africa, Tree of Heaven is used for cramps, asthma, fast heart rate, gonorrhea, epilepsy and tapeworm infestation. It is increasingly used in the treatment of malaria.

Chinese Medicine: The drug is used for pathological leukorrhea, diarrhea, chronic diarrhea, chronic dysentery and dysmenorrhea.

PRECAUTIONS AND ADVERSE REACTIONS

Large doses of the drug are said to lead to queasiness, dizziness, headache, tingling in the limbs and diarrhea.

OVERDOSAGE

Fatal poisonings have been observed in animal experiments. Treatment of poisonings should be conducted symptomatically, following stomach and intestinal emptying.

DOSAGE

Mode of Administration: Tree of Heaven is still being researched as a drug; up until now it has only been used in folk medicine.

Daily Dosage: 6 to 9 gm of drug

Storage: Keep in a dry, well-ventilated area away from moths.

Trifolium pratense

See Red Clover

Trigonella foenum-graecum

See Fenugreek

Trillium erectum

See Beth Root

Triticum

Agropyron repens

DESCRIPTION

Medicinal Parts: The medicinal part is the rhizome collected in spring or autumn.

Flower and Fruit: Five to 7 flowered spikelets in groups of 20 form a 10 cm-long ear. The ears are usually short, upright and usually dense green and inconspicuous grass with 5 veined, lanceolate, sharply keeled glume. The spike stem is glabrous. The glume is 8 to 11 mm long, acuminate or awned. The anthers are 5 to 6 mm. The fruit is 6 to 7 mm long, flat to the front with 1 groove.

Leaves, Stem and Root: Triticum is a 0.2 to 1.5 m perennial plant with a hardy creeping rhizome. The rhizome has long white runners, is segmented and hollow. The leaves are thin, flat, grass-green or gray-green. The upper surface is rough and often covered in solitary, long hairs.

Characteristics: The spikelets have their broad side turned toward the wave-like curved main axis. The plant is odorless; the taste sweetish.

Habitat: Indigenous to the temperate regions of the Northern Hemisphere. Introduced to Greenland, South America, Australia and New Zealand.

Production: Triticum rhizome consists of the rhizome, roots and short stems of *Agropyron repens*, harvested in spring before the blade develops, as well as its preparations. The rhizomes are collected after the fields are harrowed. They are cleaned, washed and dried at approximately 35° C.

Not to be Confused With: The rhizomes of *Cynodon dactylon*, Poaceae and *Carex* species (a frequent occurrence).

Other Names: Couch Grass Quitch Grass, Witch Grass, Twitch-Grass, Scotch Quelch, Dog-Grass, Quickgrass, Cutch, Durfa Grass, Quack Grass, *Elytrigia repens*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages

Triticin (polyfructosan)

Sugar alcohols

Soluble silicic acid

Volatile oil: including carvacrol and carvone-containing P-hydroxyalkyl cinnamic acid alkyl ester

EFFECTS

The essential oil has an antimicrobial effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Unproven Uses: Triticum is used as a flushing-out therapy, for inflammatory diseases of the urinary tract and the prevention of kidney gravel. The drug is also used for cystitis, kidney stones, gout, rheumatic pain and chronic skin disorders. Due to the high mucilage content, the drug is used as a soothing cough remedy. The infusion is used for constipation. It is also used as fructose-containing additive for diabetics.

Homeopathic Uses: Agropyron repens is used to treat urinary tract infections.

CONTRAINDICATIONS

No flushing-out therapy if edema is present due to cardiac or renal insufficiency.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. For flushing-out therapy, ensure copious fluid intake.

DOSAGE

Mode of Administration: Comminuted herb decoctions and other galenic preparations for internal use.

Preparation: Liquid extract: 1:1; Tincture: 1:5; Tea: Pour boiling water over the drug and strain after 10 minutes.

Daily Dosage: The average single dose is 3 to 10 gm of drug in 1 cup of boiling water; average daily dose is 6 to 9 gm of drug.

Tea: 12 to 24 gm drunk fresh several times a day; Liquid extract: 4 to 8 ml 3 times daily; Tincture: 5 to 15 ml 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); Parenterally: 1 to 2 ml sc acute, 3 times daily; Chronic: once a day (HAB1).

Storage: The drug must be kept in sealed containers, protected from light and moisture.

Tropical Almond

Terminalia chebula

DESCRIPTION

Medicinal Parts: The medicinal part of the tree is the fruit.

Flower and Fruit: The flowers are arranged in 5 to 7 cm long, axillary spikes. The flowers are small and fused. Their structures are arranged in fives. The sepals are almost glabrous and yellowish-white; the calyx tube is 5-tipped. There are no petals, but there are 10 stamens and a single-chambered, inferior ovary. The style is long and projects out of the bud. The fruit is a glabrous, ovoid drupe, yellow to orange-brown when ripe and 2 to 4 cm long.

Leaves, Stem and Root: Tropical Almond is a tree that grows up to 25 m high. The leaves are alternate or opposite, 7 to 18 cm long, 4 to 6 cm wide and coriaceous. The petiole is approximately 2.5 cm long, with 2 glands at the upper end. The lamina is ovate or elliptical, blunt and orbicular at the base. It is finely crenate and woolly pubescent beneath. The branches are rust colored, woolly or glabrous, and the trunk has a brown, longitudinally fissured bark.

Habitat: India

Production: Tropical Almond fruit is the dried ripe fruit of *Terminalia chebula*.

Not to be Confused With: Can be confused with *emblica* and *Terminalia bellirica*.

Other Names: Black Myrobalan, Chebulic Myrobalan, Myrobalan

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (20 to 45%): gallotannins, including terchebulin, terflavin A, punicalagin, corilagin, chebulic acid, and chebulinic acid

Monosaccharides/oligosaccharides (9%): including D-glucose, D-fructose, saccharose

Fruit acids: including quinic acid (1.5%), shikimic acid (2%)

Fatty oil (in the seeds, to 40%)

EFFECTS

Its high tannin content explains the use of the drug as an astringent. A variety of experiments have demonstrated antibacterial, cardiotoxic and antiarteriosclerotic (lowering of cholesterol levels) effects for the drug.

INDICATIONS AND USAGE

Chinese Medicine: Tropical Almond is used for chronic diarrhea, chronic dysentery, rectal prolapse, loss of voice because of chronic coughs, blood in the stool, leucorrhea, night sweats and undesired discharges.

Indian Medicine: The drug is used in the treatment of wounds, ulcers, gingivitis, excitation, gastric complaints, anorexia, worm infestation, flatulence, hemorrhoids, jaundice, for liver and spleen disease, pharyngodynia, hiccups, coughs, epilepsy, eye disease, skin changes, leprosy, intermittent fever, cardiac dysfunction, gastritis and neuropathy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages, although even therapeutic dosages could lead to constipation, due to the high tannin content (administration as an antidiarrheal).

OVERDOSAGE

The administration of extremely high doses (25% of the fodder) over a period of 4 weeks to rats led to kidney and liver damage; mice developed liver tumors in a related experiment (750 mg/kg body weight of the tannin fraction over a period of 12 weeks).

DOSAGE

Mode of Administration: Whole herb preparations for internal and external use.

Daily Dosage: 3 to 9 gm

Storage: Should be stored in a dry and cool place.

Tsuga canadensis

See Pinus Bark

Tulip Tree

Liriodendron tulipifera

DESCRIPTION

Medicinal Parts: The bark is said to have medicinal properties.

Flower and Fruit: The flowers are apical, single with 3 revolute, greenish-white sepals. There are 6 petals, 4 to 5 cm long, greenish-yellow with orange bands near the base on the inside similar to the tepals of the tulip. The flower has numerous stamens and numerous apocarpic ovaries on a spindle-shaped column. The small, 1-seeded nut with pointed wings is in a 6 to 8 cm long, cone-like, aggregate fruit that is light green when ripe.

Leaves, Stem and Root: *Liriodendron tulipifera* is a tree, up to 60 m high. The leaves are alternate with saddle-shaped middle lobes and 2 large lateral lobes, almost square in outline, 8 to 15 cm long and wide, and usually rounded at the base. The upper leaf surface is fresh green, the lower surface a weak blue. The petioles are 5 to 10 cm long. The young branches are yellow-green in summer and reddish-brown in winter and spotted with lenticles. The young trunks are dark green to gray and spotted white with lenticles. The trunks (up

to 3 m thick) of older trees have a brown, deeply grooved bark.

Characteristics: The leaves are bright golden-yellow in autumn.

Habitat: Indigenous to North America, Europe and China.

Production: The Tulip Tree bark is the peeled and dried branch bark of *Liriodendron tulipifera*.

Other Names: Yellow Poplar

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids (0.1%), particularly of the aporphine type: including remerine, lycicamine, liriodenine, lanugosine

Lignans (0.1%): including liriodendrin

Volatile oil (0.1%): chief components cis-beta-ocimene, beta-pinene, bornyl acetate

Hydroxycumarins: esculetin methyl and dimethyl esters

EFFECTS

The alkaloids contained in the drug are antimicrobial in effect, and a positively inotropic effect has been described. Its usefulness as a tonic and a stimulant appears to be plausible, based upon its qualities as a bitter substance.

INDICATIONS AND USAGE

Unproven Uses: According to Hoppe's 1958 work on drugs, *Linodendron tulipifera* is used as a febrifuge and antiperiodic. Folk medicine indications have included fever, menstrual complaints, insomnia and malaria.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is considered toxic, due to its alkaloid content. Administration in animal experiments led to coma (exact details unavailable). No case of poisoning among humans has been recorded.

DOSAGE

Preparation: There is no information in the literature.

Daily dosage: Powder: 4 to 8 g daily; decoction (30:500) 60 g daily.

LITERATURE

Doskotch RW, el-Feraly FS, Antitumor agents. II. Tulipinolide, a new germacranolide sesquiterpene, and constunolide. Two cytotoxic substances from *Liriodendron tulipifera* L. *J Pharm Sci.* 28:877-80, 1969 Jul.

Turkey Corn

Dicentra cucullaria

DESCRIPTION

Medicinal Parts: The medicinal part is the dried tuber.

Flower and Fruit: The inflorescence is racemous. The 4 to 10 flowers are odorless, white and often tinged pink. The flowers are hanging, with yellow to yellow-orange tips and widely splayed spurs. The fruit is oval and 9 to 13 mm long. The seeds are reniform, 2 mm long, black and glossy.

Leaves, Stem and Root: Turkey Corn is a delicate, glabrous, 15 to 40 cm high plant on a tawny yellow, tuberous rhizome. The rhizome has subglobular, pink, smaller tubers about 0.5 cm in diameter, with a scar on both depressed sides. All the leaves are basal and almost triangular in outline. They are 3-pinnate and bluish-green on the underside.

Characteristics: The taste of the tuber is bitter.

Habitat: Canada and U.S.

Production: Turkey Corn root is the root of *Dicentra cucullaria*.

Other Names: Squirrel Corn, Staggerweed, Bleeding Heart, Corydalis, Dutchman's Breeches

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids: including bicuculline, corlumine, protopine, cryptopine, cularine

EFFECTS

Diuretic and tonic

INDICATIONS AND USAGE

Unproven Uses: Turkey corn is used for digestive disorders, urinary tract diseases, menstrual disorders and skin rashes. Formerly it was used for syphilis.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Bicuculline is a centrally acting, spasmogenic antagonist of gamma-aminobutyric acid (GABA). Due to the bicuculline component, poisonings are possible if higher dosages are consumed, but none have been reported to date.

DOSAGE

Mode of Administration: The drug is available as a liquid extract.

Turmeric

Curcuma domestica

DESCRIPTION

Medicinal Parts: The medicinal parts are the stewed and dried rhizome.

Flower and Fruit: The inflorescence is cone-like, 10 to 15 cm long, and is attached to a stem enclosed in a sheathing petiole. The flower has 2 pale green bracts, which are 5 to 6 cm long. The covering bracts are whitish, often red-tinged. The individual flowers are yellowish-white or yellow. The flowers have a tubular, 3-lobed calyx and funnel-shaped, 3-tipped corolla. The fruit is a globular capsule.

Leaves, Stem and Root: *Curcuma domestica* is a perennial, erect and leafy plant with very large, lily-like leaves up to 1.2 m long. The leaf blade is ovate-lanceolate, thin, entire-margined and narrows to a long sheath-like petiole. The main rhizome is thickened to a tuber and has numerous roots. The roots in turn terminate in partially elliptical tubers. The secondary rhizomes are digit-shaped with no roots. All rhizomes are yellowish-brown with stipules and appear transversely ringed when they die.

Habitat: Turmeric is probably indigenous to India; it is cultivated today in India and other tropical regions of southeast Asia.

Production: Turmeric root consists of the finger-like, often tuber-like, scalded and dried rhizomes of *Curcuma longa*. It

is harvested from February to April. The rhizomes are boiled in water for 5 to 10 minutes and then dried in the sun.

Adulterations: The synthetic color pigments azo and anilin are sometimes added to the herb.

Not to be Confused With: *Curcuma xanthorrhiza*, *Curcuma aromatica* and *Curcuma zedoaria*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (3-5%): alpha- and beta-tumerone (aroma source), artumerone, alpha- and gamma-atlantone, curlone, zingiberene, curcumul

Curcuminoids (3-5%): including curcumin, demethoxy curcumin, bidemethoxy curcumin

1,5-diaryl-penta-1,4-dien-3-one derivatives

Starch (30-40%)

EFFECTS

Turmeric has antihepatotoxic, antihyperlipidemic and anti-inflammatory effects. It is also antioxidative (inhibits lipid peroxide formation in the liver), antitumoral and antimicrobial (in particular, the sesquiterpene derivatives). It has insect repellent and antifertile effects. It also inhibits prostaglandin formation, *in vitro*.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

Unproven Uses: Turmeric is used for dyspeptic disorders, particularly feelings of fullness after meals and regular abdominal distention due to gas. The drug is also used for diarrhea, intermittent fever, edema, bronchitis, colds, worms, leprosy, kidney inflammation and cystitis. Other uses include headaches, flatulence, upper abdominal pain, chest infections, colic, amenorrhea and blood rushes. It is used externally for bruising, leech bites, festering eye infections, inflammation of the oral mucosa, inflammatory skin conditions and infected wounds.

Chinese Medicine: Turmeric is used for pains in the chest, ribs, abdomen, liver and stomach; nose bleeds; vomiting with bleeding; and heat stroke.

Indian Medicine: Turmeric is used for inflammation, wounds and skin ulcers, itching, stomach complaints, flatulence, conjunctivitis, constipation, ringworm infestation and colic.

CONTRAINDICATIONS

General: The drug should not be used by people with obstructed biliary ducts; those with gallstones should take it only under the supervision of a physician.

Pregnancy: Turmeric should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Stomach complaints can occur following extended use or in the case of overdose.

DOSAGE

Mode of Administration: Whole, cut and powdered drug available as capsules, solution, coated tablets and compound preparations.

Preparation: To prepare a tea, scald 0.5 to 1 gm drug in boiling water, cover, draw for 5 minutes and then strain. The tincture strength is 1:10.

Daily Dosage: The average dose is 1.5 to 3 gm of drug. The powder should be taken 2 to 3 times daily after meals; the tea (2 to 3 cups) should be taken between meals. The tincture dose is 10 to 15 drops 2 to 3 times daily.

Storage: Turmeric should be protected from light.

Usnea

Usnea species

DESCRIPTION

Medicinal Parts: Research into this species is not yet complete, making it difficult to establish which lichens are used for the extraction of which drug, and which lichens have been described by earlier botanists.

Flower and Fruit: Mycelia flourishes on a variety of trees (on the trunk, branches branchlets) as a whitish, reddish, or black lichen.

Habitat: Usnea is found worldwide in cool, damp places.

Production: Usnea consists of the dried thallus of Usnea species, primarily of *Usnea barbata*, *Usnea florida*, *Usnea hirta* and *Usnea plicata*.

Other Names: Tree Moss, Old Man's Beard, Beard Moss

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Lichen acids (polyketides): including among others (+)-usnic acid, thamnolic acid (hirtellic acid), usnaric acid (salazinic acid), lobaric acid, stictinic acid, protocetraric acid, evernicic acid, barbatinic acid (rhizonic acid), diffractaic acid (dirhizonic acid), barbatolic acid. The lichen acid spectrums of the different species vary from one another, with usnic acid the chief constituent.

Mucilage

EFFECTS

The drug is antimicrobial.

INDICATIONS AND USAGE

Approved by Commission E:

- Inflammation of the mouth and pharynx

Unproven Uses: The species are used for mild inflammation of the oral and pharyngeal mucosa.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Following overdosage, signs of poisoning could appear. These signs have yet to be described.

DOSAGE

Mode of Administration: The drug is available as lozenges and equivalent solid forms of medication.

Daily Dose: The daily dose is 600 mg. For lozenge preparations, use the equivalent of 100 mg of herb; take 1 lozenge 3 to 6 times daily.

Uva-Ursi

Arctostaphylos uva-ursi

TRADE NAMES

Uva-Ursi (available from numerous manufacturers). Uva-Ursi Leaf, Uva Ursi Leaves, Standardized Uva-Ursi Extract

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried leaves and preparations of the fresh leaves.

Flower and Fruit: The flowers are on 3 to 12 short, hanging stalks, where they are in clusters at equal length and distance on the terminal end of the stalks. The pedicle has 2 small, ciliate, oval-shaped leaves at the base with the subtending flower clusters. The calyx is 1 mm long, palmate and has 5 membranous tips. The corolla (fused petals of the inner whorl) is ovoid to jug-shaped, white or reddish with a red border, 5 to 6 mm long with 5 short tips rolled backward. The 10 stamens are half in length as the corolla tube. The filaments are heavily thickened at the base. The crimson anthers have porous openings and a long whip-like, curling appendage. The ovaries are 5- to 7-valved, and the style is longer than the stamens. The fruit is a globular, pea-sized, scarlet, floury drupe. The fruit has 5 to 7 stone seeds, 4 mm in length, which are kidney-shaped and also compressed at the sides.

Leaves, Stem and Root: The plant is a decumbent (reclining on the ground with ascending extremities), up to 1.5 m long, creeping espalier with elastic, red-brown branches. The leaves are alternate, coriaceous, short-petioled, spatulate-obovate or wedge-shaped, entire-margined and slightly revolute. They are 12 to 30 mm long by 4 to 15 mm wide, glabrous, glossy and evergreen. The underside is distinctly reticulate, and the midrib and the margins are often downy.

Characteristics: The leaves have a bitter, astringent taste. They are distinguished from the cranberry by the reticulate vein structure and non-glandular spots beneath.

Habitat: The plant has spread from the Iberian Peninsula across Central Europe north to Scandinavia and east to Siberia. The plant is also found in the Altai mountains, the Himalayas and North America.

Production: Uva-Ursi (Bearberry) leaves consist of the fresh or dried leaves of *Arctostaphylos uva-ursi*, which are gathered in the wild. The arbutin content is highest in December and January and also when the leaves are dried rapidly. The main sources are Spain, Italy, Austria, Switzerland, Scandinavia, Poland, Russia and Bulgaria.

Not to be Confused With: The leaves are sometimes confused with the leaves of other Ericaceae, such as *Buxus sempervirens*.

Other Names: Arberry, Bearberry, Bear's Grape, Kinnickinick, Mealberry, Mountain Box, Mountain Cranberry, Red-Berried Trailing Arbutus, Redberry Leaves, Rockbeery, Sagackhomi, Sandberry, Upland Cranberry, Red-Beery, Upland Cranbeery, Common Bearberry, Arbutus Uva-Ursi, Red Bearberry, Kinnickinick

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Hydroquinone glycosides: arbutin (arbutoside, hydroquinone-O-beta-D-glucoside, 5-16%), methyl arbutin (O-methyl hydroquinone-O-beta-D-glycoside, up to 4%), galloyl derivatives of arbutin (0.05%): O-galloyl hydroquinone-O-beta-D-glucoside (p-galloyl oxyphenyl-O-beta-D-glucoside), 2'-O-galloyl arbutin, 6'-O-galloyl arbutin, free hydroquinone (usually under 0.3%) as decomposition product of arbutin, emerging as the leaves age or during dehydration

Piceoside: (4-hydroxyacetophenone-O-beta-D-glucopyranoside)

Phenol carboxylic acids: including gallic acid (free 180 mg/100 g), p-coumaric acid (18.0 mg/100 g), syringic acid (16.8 mg/100 g), salicylic acid (12.0 mg/100 g), p-hydroxybenzoic acid (9.6 mg/100 g), ferulic acid (6.0 mg/100 g), caffeic acid (6.0 mg/100 g), lithospermic acid (dimeric caffeic acid)

Tannins (15-20%): gallo tannins including penta-O-galloyl-beta-D-Glucose and hexa-O-galloyl-beta-D-glucose; ellagitannins, including corilagin (1-O-galloyl-3,6-di-O-hexahydroxydophenol-beta-D-glucoside); condensed tannins, chiefly proanthocyanidins and their monomers, including cyanidin, delphinidin

Iridoide: monotropein (0.025%)

Flavonoids: flavonol glycosides, including hyperoside (0.8-1.5%) which is the chief flavonol glycoside, quercitrin-3-

beta-D-0-6'-galloyl galactoside, quercitrin, isoquercitrin, myricitrin, myricetin-3-O-beta-D-galactoside, 2 isomeric quercetin arabinosides, aglycones of these compounds

Enzymes: including a beta-glucosidase (arbutase), that is rendered inactive with dehydration and processing of the drug, due to the high tannin content

Triterpenes: including among others ursolic acid (0.4-0.8%), alcohol uvaol, beta-amyirin

EFFECTS

The tannins in Uva-Ursi act as an astringent, and the phenol glucosides and their aglyca have an antibacterial effect. The antimicrobial effect is associated with the aglycon hydroquinone released from arbutin (transport form) or arbutin waste products in the alkaline urine. The drug has urine-sterilizing properties that are attributed to bacteriostatic hydroquinones, conjugates of glucuronic acid and sulfuric acid. The maximum antibacterial effect is expected 3 to 4 hours after administration. There are no clinical studies available that have been definitively evaluated.

CLINICAL TRIALS

Nephrolithiasis

The effects of Uva-Ursi with prevention and treatment of kidney stone formation was studied in rats. It concluded that beneficial effects from Uva-Ursi on urolithiasis can be attributed to some disinfectant action (Grases, 1994).

Diuresis

The aqueous extract of *Arctostaphylos uva-ursi* was studied in rats involving diuresis. The pharmacological evaluation revealed an increase in urine flow without an increase in urinary sodium excretion (Beaux, 1999).

Antibacterial Properties

The effect of aqueous extracts of Uva-Ursi leaves to decrease surface hydrophobicity of 155 *Escherichia coli* strains was determined in cattle. The adhesion of microbes on host cells is important for development of Gram-negative microbe-induced infections and is influenced by the surface hydrophobicity of the microbial cell. Bactericidal action of Uva-Ursi was low, but the decrease in cell surface hydrophobicity may influence the bacteria's virulent properties (Turi, 1997). The aqueous extract of Uva-Ursi leaves was also studied in *Helicobacter pylori* (*H. pylori*) strains to determine possible changes in cell surface hydrophobicity. The tannic acid in the Uva-Ursi was determined to have the highest activity of decreasing cell surface hydrophobicity as well as antibacterial activity against *H. Pylori* (Annuck, 1999)

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract

Uva-Ursi is used for inflammatory disorders of the efferent urinary tract.

Unproven Uses: In folk medicine, the herb is used for all forms of urogenital and biliary tract disease.

Homeopathic Uses: The herb is used for inflammations of the efferent urinary tract.

CONTRAINDICATIONS

The drug is contraindicated in pregnant women, nursing mothers and children under 12 years of age.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Individuals with gastric sensitivity may experience nausea and vomiting following intake of preparations made from the drug due to its high tannin content.

Pregnancy: The drug is contraindicated during pregnancy.

Nursing Mothers: The drug is contraindicated in nursing mothers.

Pediatric Use: Liver damage is conceivable in connection with administration of the drug over extended periods, particularly with children, due to the possible hepatotoxicity of the hydroquinones released. The drug is contraindicated in children under 12 years of age.

Drug Interactions: Uva-Ursi preparations should not be administered with any substance that causes acidic urine since this reduces the antibacterial effect. Because the urine-disinfecting effect of the hydroquinones released in the urinary tract only occurs in an alkali environment, the simultaneous administration of medication or food that increase uric acid levels in the bladder is to be avoided.

The sodium sparing effect of Uva-Ursi may offset the diuretic effect of thiazide and loop diuretics.

Uva-Ursi may add to the gastrointestinal irritation that occurs with NSAID use.

OVERDOSAGE

Overdosage can lead to inflammation and irritation of the bladder and urinary tract mucous membranes. Liver damage is conceivable in connection with administration of the drug over extended periods, particularly with children, due to the possible hepatotoxicity of the hydroquinones released.

DOSAGE

Mode of Administration: Uva-Ursi is available as comminuted drug, drug powder or dried extract for infusions or cold

macerations, and also as extracts and solid forms for oral administration. It is also a component of urologic combination and single-component preparations.

How Supplied:

Capsules—150 mg, 455 mg, 505 mg

Teas

Solutions

Preparation: To make a tea, pour boiling water over 2.5 gm finely cut or coarse powdered drug (1 teaspoonful is equivalent to 2.5 g drug.), or place the drug in cold water that is rapidly brought to a boil. The tea should draw (to extract the essence) for 15 minutes and then be strained. Teas may contain up to 30% Uva-Ursi in combination with other drugs. For higher Uva-Ursi content, prepare cold macerate (over 6 to 12 hours) to lower the tannin content.

Daily Dosage: The daily dosage of finely cut or powdered drug is 10 g (corresponding to arbutin content of 400 to 840 mg) or 0.4 g dry extract in a single dose. A single dose of liquid extract is 2 g. Daily dosages of an infusion or cold maceration are 3 g drug to 150 ml water as an infusion or cold maceration up to 4 times a day or 400 to 840 mg hydroquinone derivatives calculated as water-free arbutin. The urine should be alkaline.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution twice weekly sc (HAB1).

Storage: Store in well-sealed containers protected from light.

Uzara

Xysmalobium undulatum

DESCRIPTION

Medicinal Parts: Different varieties are used for drug extraction depending on the area. The drug is therefore easier to categorize according to its definitive active substances (bitters) than to its particular varieties.

Flower and Fruit: The root has a weak and unusual odor. The taste is bitter with a burning effect after it has been chewed for a long time.

Habitat: South Africa

Production: Uzara root consists of the dried, underground parts of 2- to 3-year-old plants of *Xysmalobium undulatum*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolides, mixture referred to as uzarone or xysmalobin): including among others uzarin (5.5%), xysmalorin (1.5%), allo-uzarine, allo-xysmalobin, urezin, uzaroside, ascleposide, glucoascleposide

Pregnane derivatives: delta5-pregnene-3beta-ol-20-one glucoside, 5alpha-pregnane-3beta-ol-20-one glucoside

EFFECTS

Uzara inhibits intestinal motility. In high dosages, it has digitalis-like effects on the heart.

INDICATIONS AND USAGE

Approved by Commission E:

- Diarrhea

Unproven Uses: Uzara is used as a treatment for dysentery.

CONTRAINDICATIONS

Uzara should not be administered concomitantly with other cardioactive glycosides.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Drug Interactions: Because Uzara contains cardioactive glycosides, there is a potential for interaction with digoxin and other cardiac glycosides. This interaction has not been reported in the literature for orally administered Uzara. The lack of reports may be due to the fact that the glycosides are not well absorbed from the gut.

OVERDOSAGE

Because the glycosides are absorbed only with difficulty and because their cardiac effect is minimal, poisonings following oral intake are unlikely, although conceivable. There have been cases of fatalities following parenteral application of Uzara drugs.

DOSAGE

Mode of Administration: The drug is available as ethanol-water extracts in liquid form or as dry extracts for internal use. Pharmaceutical forms include coated tablets, drops and compound preparations.

Daily Dose: The daily dose should be equivalent to 45 to 90 mg of total glycosides, calculated as uzarin. Follow the manufacturer's dosing instructions.

Valerian

Valeriana officinalis

TRADE NAMES

Valerian Root (available from numerous manufacturers,) Herbal Sure Valerian Root, NuVeg Valerian Root, Valerian Root Alcohol Free, Valerian Power Time Release, Valerian Root Power, Standardized Valerian, Natural Herbal Valerian Root, Nature's Root Nighttime, Quanterra Sleep

DESCRIPTION

Medicinal Parts: The medicinal parts are the carefully dried underground parts and the dried roots.

Flower and Fruit: The androgynous, bright, pink-to-white flowers are in paniced cymes. The calyx consists of 10 revolute tips. The corolla is funnel-shaped with a 5-sectioned margin. The tube has a bump at the base. There are 3 stamens. The ovary is inferior and has 3 chambers. The fruit is ovate-oblong, yellow, indehiscent and has a 10-rayed tuft of white hair.

Leaves, Stem and Root: The plant is 50 to 100 cm high and has a short, cylindrical rhizome with finger-length, bushy round roots. The stem is erect and unbranched. The leaves are odd-pinnate with 11 to 23 lanceolate, indented-dentate leaflets. The lower ones are petiolate and the upper ones sessile and clasping with a white sheath.

Characteristics: The flowers are fragrant and the rhizome smells strongly when dried. The odor is not present in the fresh plant. Hydrolysis of components in the root form isovaleric acid which is responsible for the offensive smell.

Habitat: The plant is found in Europe and in the temperate regions of Asia. It is cultivated mainly in central Europe, England, France, eastern Europe, Japan and the U.S.

Production: Valerian root, consisting of fresh underground plant parts, or parts carefully dried below 40° C of the species *Valeriana officinalis*. Cultivation is possible in low-lying, sandy, humus soil that is well supplied with lime and situated in a damp area. The root is harvested in September. The fresh roots are washed, chopped, and carefully dried in circulating air under 40³ C.

Not to be Confused With: Confusion with other species seldom occurs since the plant is primarily supplied via cultivation. The most dangerous adulteration of the plant occurs by the addition of the roots of *Veratrum album*.

Other Names: Ail-Heal, Amantilla. Setwall, Setewale. Capon's Tail, Heliotrope, Vandal Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids: valepotriates (valeriana-epoxy-triacylates, iridoide monoterpenes, 0.5-2.0%) chief components (50-80%). isovaltrate (up to 46%), isovalerohydroxy didrovaltrate (IVDH-valtrate, 10-20%), including among others, didrovaltrate, acevaltrate

Volatile oil (0.2-1.0%): chief components (-)-bornyl isovalerenate and isovaleronic acid (both aroma-carriers), including among others, (-)-bornyl acetate, isoeugenyl valerenate, isoeugenyl isovalerenate, also with some strains valerenal, valeranone, cryptofaurinol

Sesquiterpenes: valerenic acid (0.1-0.9%), 2-hydroxyvaleronic acid, 2-acetoxy-valeronic acid

Pyridine alkaloids (traces, cat pheromone): actinidine, valerianine, alpha-methylpyrrolketone

Caffeic acid derivatives: chlorogenic acid.

The subspecies within the collective species differ in their constituent substances spectra.

EFFECTS

In animal experiments, the interaction of the various constituents are centrally depressive, sedative, anxiolytic, spasmolytic, muscle relaxing and anti-ulcerogenic. The pharmacological efficacy is heavily dependent on the quality of the extract used. The main effect in humans is to reduce sleep induction time. In vitro the valerenic acid components have been shown to decrease the degradation of gamma-aminobutyric acid (GABA.) Animal experiments have demonstrated an increase of GABA at the synaptic cleft via inhibition of re-uptake and an increase in secretion of the neurotransmitter. The increase of available GABA is one factor that may be responsible for the sedative properties of

Valerian root (Houghton, 1998; Santos et al, 1994.) One other mechanism that may contribute to the sedative properties of Valerian could be the high levels of glutamine present in the extract. Unlike GABA, glutamine more effectively crosses the blood-brain barrier where it can be taken up by the nerve terminals and converted to GABA (Santos, Fero, 1994.)

CLINICAL TRIALS

Improvements in sleep quality ratings were demonstrated in a well constructed, randomized, placebo-controlled, multicenter study involving 121 patients. Subjects were given either 600 mg of a 70% ethanol extract (5:1, n = 61) of Valerian root that was standardized to 0.4 - 0.6% valerenic acid or placebo (n = 60) one hour before bedtime for 28 consecutive nights. Patients were given two standardized sleep questionnaires; one that measured the depression/mood scale and another global clinical impression scale. Sixty-six percent of the Valerian treatment arm rated the therapeutic effect as either good or very good at the end of the 28 day trial. This compared to only a 29% equally positive rating by the placebo participants. (Vorbach, 1996).

INDICATIONS AND USAGE

Approved by Commission E:

- Nervousness and insomnia

Unproven Uses: Valerian is used for restlessness, sleeping disorders based on nervous conditions, mental strain, lack of concentration, excitability, stress, headache, neurasthenia, epilepsy, hysteria, nervous cardiopathy, menstrual states of agitation, pregnancy, menopause, neuralgia, fainting, nervous stomach cramps, colic, uterine spasticity and states of anxiety.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Gastrointestinal complaints can occur in rare cases, contact allergies in very rare ones.

With long-term administration, the following can occasionally appear: headache, restless states, sleeplessness, mydriasis, disorders of cardiac function.

When large skin injuries or acute skin illnesses, severe feverish or infectious diseases, cardiac insufficiency or hypertonia are present, entire-body baths with the addition of the volatile oil or of extracts from the drug should be avoided.

Drug Interactions: Valerian may potentiate the effect of other CNS depressants. Animal studies have shown that Valerian has an additive effect when used in combination with barbiturates and benzodiazepines (Leuschner, 1993; Hiller, 1996.) Though there has been no evidence of

potentiation of the CNS depressive effect when combined with alcohol, it is not recommended that Valerian be used in conjunction with alcohol. Because of the sedative effect of Valerian, operation of machinery or motor vehicles should be avoided for several hours after ingesting Valerian products.

Pregnancy: Use of Valerian during pregnancy or in nursing mothers is not recommended.

DOSAGE

Mode of Administration: Valerian is used internally as expressed juice from fresh plants, tincture, extracts, and other galenic preparations. Externally, it is used as a bath additive, though efficacy is Unproven for this indication.

How Supplied:

Capsules — 100 mg, 250 mg, 380 mg, 400 mg, 445 mg, 450 mg, 475 mg, 493 mg, 495 mg, 500 mg, 530 mg, 550 mg, 1000 mg.

Liquid — 1:1

Tablets — 160 mg, 550 mg

Tea Bags

Preparation: To prepare an infusion, use 2 to 3 g of drug per cup. A tea is prepared by adding 1 teaspoonful (3 to 5 g) of drug to 150 ml of hot water and strain after 10 to 15 minutes. An extract is prepared by mixing 2 parts root powder to 6 parts spirit of wine and 9 parts water. For external use, 100 g of comminuted drug is mixed with 2 liters hot water; this is then added to the bath.

Daily Dosage: The daily dose of Valerian extract is 100 mg to 3800 mg. Total internal daily dose is 15 g of root powder.

Infusion — One cup one to several times per day

Tea — One cup (150 ml) 2 to 3 times daily and before bedtime.

Tincture — 1/2 to 1 teaspoonful (1 to 3 ml) one to several times per day.

Tincture (1:5) — several times daily 15 to 20 drops in water.

Extract — equivalent 2 to 3 g drug, one to several times per day.

Plant juice — Adults take 1 tablespoonful 3 times daily. Children take 1 teaspoonful 3 times daily.

External use — As a bath according to preparation instructions above.

Sleep Aid — 400 mg to 900 mg of the extract 30 minutes before bedtime

Restlessness — 220 mg extract three times daily

Storage: Must be kept from sources of light; tinctures and extracts should be stored at room temperature in tightly closed, non-plastic containers.

Valeriana officinalis

See Valerian

Venus Flytrap

Dionaea muscipula

DESCRIPTION

Medicinal Parts: The entire fresh plant is used medicinally.

Flower and Fruit: The peduncles are leafless, up to 45 cm long with 3 to 10 radial flowers arranged in an umbelliferous raceme. The sepals are fused, and the 5 petals are free and white. There are 15 to 20 stamens and 5 superior carpels. The styles are fused to a column with 5 stigmas on the tip. The fruit is an ovoid capsule, which splits when ripe. The numerous seeds are ovoid, black and smooth.

Leaves, Stem and Root: This herbaceous perennial grows up to 45 cm high with leaves that are arranged in a basal rosette. The leaves are 6.5 to 13 cm long, have a cuneiform broadened petiole and an orbicular lamina with 2 sides forming a trap. The leaf sides have 15 to 20 stiff bristles on the edge and 3 sensitive bristles on the surface. The nectar glands are on the periphery and the digestive glands toward the center. When the sensitive bristles are stimulated, the lamina halves snap shut and the bristles on the edge lock together. Digestion of the trapped insect takes approximately 6 days after which the trap slowly opens again. There are only adventitious roots on the fully grown plant.

Characteristics: The plant is carnivorous.

Habitat: *Dionaea muscipula* is native to North America.

Production: Venus flytrap herb is the whole fresh, aerial plant of *Dionaea muscipula*, which is harvested shortly before the flowering season and processed immediately.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Naphthalene derivatives: naphthoquinones, including hydroplumbagin-4-O-beta-glucoside, (0.6%), plumbagin (0.2%)

Flavonoids: including quercetin-3-O-galactoside, quercetin-3-O-glucoside, kaempferol-3-O-galactoside, kaempferol-3-O-glucoside

Phenol carboxylic acids: glucosides of gallic acid, ellagic acid, 3-O-methyl-ellagic acid and 3,3-dimethyl ellagic acid

Enzymes (in the secretions of the digestive glands): proteases, phosphatases, nucleases

EFFECTS

The pressed fresh plant (chief active ingredient plumbagin) is immunostimulating, antineoplastic and spasmogenic due to the lysophosphatidinic acid component.

INDICATIONS AND USAGE

Unproven Uses: The drug extracted from the plant is used chiefly in the treatment of malignant conditions such as tumors in advanced stages (mammary carcinoma, bladder carcinoma, prostate carcinoma and osteosarcoma) and also for hematological systemic conditions (such as Hodgkin and non-Hodgkin lymphoma) as well as solid tumors.

PRECAUTIONS AND ADVERSE REACTIONS

Parenteral administration of medicinal preparations made from the fresh plant led to elevated body temperature, chills and circulatory damage. Circulatory collapse, possibly as a result of contamination with endotoxins is possible. Skin contact with the fresh plant may cause irritation.

DOSAGE

Mode of Administration: Preparations of the pressed juice have been administered orally, by inhalation and parenterally.

How Supplied: Availability of the pressed juice of the fresh plant in two commercial preparations was halted in 1986.

Daily Dosage: Juice from the fresh plant used orally and as an inhalant: 50 to 60 drops 5 times daily p.o.: 25 drops with 1 ml physiological NaCl in a cold atomizer. Injection solution: initial dose is 2 ml ampule daily for 14 days. Maintenance dose: 1 ampule every second to third day I.M.

Vervain

Verbena officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts collected during the flowering season, the fresh, flowering herb, the flowers and the whole fresh plant.

Flower and Fruit: The small flowers are pale lilac and arranged in thin panicle spikes. The calyx is fused to a short, 5-tipped tube. The corolla has a 5-tipped, bent tube and a bilabiate margin. The mouth of the tube is closed by a cross of hairs. There are 4 stamens and 1 ovary, which breaks up into four, 1-seeded mericarps. These are oblong-cylindrical, 1.5 to 2 mm long, warty on the inside, reticulately grooved and light brown on the outside. The seeds are grooved on the inside and have very little endosperm.

Leaves, Stem and Root: The true variety is an annual or biennial to perennial with a fusiform, branched, whitish root. The stem is erect, rigid, quadrangular and branched above. The leaves are opposite, dull green, ovate-oblong and have a short broad petiole. They are deeply divided in 3 with notched, crenate tips. They are wrinkled and roughly bristled.

Habitat: The plant is probably indigenous to the Mediterranean region. It is cultivated worldwide, but mainly in eastern Europe.

Production: Verbena herb consists of the above-ground parts of *Verbena officinalis*. The herb is predominantly cultivated in eastern Europe. It is collected in the wild and harvested in southeastern Europe. After being cut, the drug is hung in bunches to dry.

Note: Improper drying leads to hydrolytic decomposition of verbenalin.

Not to be Confused With: *Lippia triphyllae* folium

Other Names: Enchanter's Plant, Herb of the Cross, Juno's Tears, Pigeon's Grass, Pigeonweed, Simpler's Joy, Herb of Grace

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes (0.2-0.5%): including among others verbenalin (cornin, 0.15%), hastatoside (0.08%), dihydro-verbenalin (0.01%)

Flavonoids: including among others luteolin, scutellarin and 6-hydroxy-luteolin glycosides, artemitin, sorbifolin, pedalitin, nepetin (eupafolin)

Caffeic acid derivatives: verbascoside (0.8%), eucovoside, martynoside

EFFECTS

The amaroid-like affect of the iridoid glycosides explains its use as an astringent. The drug is weakly anti-edemic, analgesic, cytotoxic and antitumoral. The verbenalin has antitussive, secretolytic, and lactation-promoting properties.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Vervain are used for diseases and ailments of the oral and pharyngeal mucosa, such as sore throat, and for diseases of the respiratory tract, such as coughs, asthma and whooping cough.

In addition, the drug is used internally for pain, cramps, fatigue, nervous disorders, digestive disorders, liver and gallbladder diseases, jaundice, kidney and urinary tract complaints, menopausal complaints and irregular menstruation. It is also used to promote lactation and to treat rheumatic diseases, gout, metabolic disorders, chlorosis and edema. The drug is used externally as a gargle for cold symptoms and for diseases of the oral and pharyngeal cavity.

Vervain is also used for antipruritic treatment of skin diseases and minor topical burns (in France) and for arthritis, rheumatism, dislocations and contusions.

Chinese Medicine: The herb is used for edema, chronic malaria, dysmenorrhea and carbuncles.

Homeopathic Uses: The herb is used for bruising and cerebral convulsions. ^

CONTRAINDICATIONS

Vervain should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Vervain is available as whole, cut and powdered drug for internal and external use.

Preparation: The ratio for the liquid extract is 1:1 in 25% ethanol; the tincture should be mixed with 40% ethanol. An infusion is prepared by adding 5 to 20 gm drug to 1 liter water.

Daily Dosage: For the liquid extract, take 2 to 4 ml daily. For the tincture, take 5 to 10 ml up to 3 times per day. For the infusion, take 2 to 4 gm up to 3 times per day.

Chinese Medicine Dosage: The daily dose is 4.5 to 9 gm of the drug.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily; parenterally: 1 ml injection solution sc twice weekly (HAB34).

M

Storage: Vervain must be stored in a dry environment to avoid hydrolytic decomposition of verbenalin.

Viola

Viola theiodora

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the bark.

Flower and Fruit: The flowers are in panicles. The male inflorescence has numerous flowers and is brown, gold-yellow and pubescent. The female flowers are either single or in clusters of 2 to 10 flowers. They are fused and have 3 to 5 stamens. The ovary develops from only 1 carpel with 1 ovule. The fruit is orbicular-oval, 10 to 20 mm long and 8 to 15 mm wide.

Leaves, Stem and Root: *Viola theiodora* is a diclinous tree that grows up to 23 m high. The leaves are alternate, 9 to 35 cm long and 4 to 12 cm wide; the lamina is simple, elongate to wide oval, acute, entire and paper-like. The trunk is approximately 0.5 m thick and cylindrical with a smooth, brown-speckled bark with gray spots.

Characteristics: The flowers have sharply astringent fragrance.

Habitat: Amazon region

Production: *Viola* bark is the dried bark of *Viola theiodora*.

There are various methods of production. Either the bark is scraped off, dried over a fire and powdered, or the outer bark is peeled off before sunrise and the inner bark with the resin is scraped off and cooked to a syrup. The syrup is pulverized after drying in the sun.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tryptamine derivatives: particularly N,N-dimethyl tryptamine, 5-methoxy-NN-dimethyl tryptamine (5-MeO-DMT)

EFFECTS

Due to its psychotropic and narcotic-hallucinogenic characteristics (tryptamine alkaloids), the drug is chiefly used in the form of a snuff powder in connection with ritual and religious ceremonies. The resin is also administered topically to yeast infections of the skin and for the promotion of the healing of wounds.

INDICATIONS AND USAGE

Unproven Uses: *Viola* is used for skin disease and fungal skin diseases, to speed the healing of wounds, and to clean infected wounds (South America).

PRECAUTIONS AND ADVERSE REACTIONS

The drug is not used as a medication. The drug has a psychomimetic effect when administered through the nasal mucous membrane.

OVERDOSAGE

Signs of poisoning include nausea, increased irritability, numbness in the limbs, coordination disorders and hallucinations, among others. The tryptamine derivatives are resorbed only to a very limited extent following oral administration.

DOSAGE

Preparation: There is no information in the literature.

Wafer Ash

Ptelea trifoliata

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, the young bark and the root bark. The plant is also used in homeopathic medicine.

Flower and Fruit: The small, greenish-white flowers are in loose, terminal cymes and are dioecious. The 4- to 5-sepalled calyx and the 4 to 5 petals are downy on the outside. There are 4 to 5 stamens whose filaments are hairy at the base. The compressed ovary has a short style and stigma which is divided in two. The fruit is circular and winged with a broad, greenish-white, later ochre-colored margin.

Leaves, Stem and Root: The plant is a bush or small tree up to 4 m high with glabrous, smooth, dark or red-brown branches. The younger branches, leaves and petioles are downy. The leaves are large, 3-lobed, lanceolate narrowing to both ends, entire, dark green above, lighter beneath and covered with numerous fine glandular spots.

Characteristics: The flowers are pleasantly perfumed and the fruit is bitter-tangy.

Habitat: The plant is indigenous to Eastern North America and is cultivated in Europe as an ornamental bush.

Production: Wafer Ash is the root-bark of *Ptelea trifoliata*.

Other Names: Pickaway Anise, Prairie Grub, Scubby Trefoil, and Stinking Prairie Bush, Swamp Dogwood, Hop Tree, Three-Leafed, Wingseed

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Furoquinoline alkaloids: including kokusaginine, skimmianine (beta-fagarine), ptelein, dictamnine, and maculosidine

Furanocoumarins: including isopimpinellin, marmesin, and phellopterin

EFFECTS

Wafer Ash is antimicrobial. The alkaloid content acts against microbes; pteleatin chloride acts against *mycobacteriwn tuberculosis* and yeast fungus.

INDICATIONS AND USAGE

Unproven Uses: Wafer Ash is used for stomach complaints, gallstones, and rheumatism. It's root bark is used as a tonic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The plant could trigger phototoxicosis through skin contact, possibly also through internal ingestion of larger quantities.

DOSAGE

Mode of Administration: Wafer Ash is available as an extract.

LITERATURE

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis. 4. Aufl., Bde. I-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Wahoo

Euonymus species

DESCRIPTION

Medicinal Parts: The medicinal parts are the trunk and root bark and the fruit.

Flower and Fruit: The flowers are yellowish-green, small and flat in double cymes with few blossoms. There are 4 sepals, 4 petals, 4 stamens and 4 styles on a glandular disc, which surrounds the ovary. The fruit is a 4-lobed, obtuse, pink capsule which bursts open at the tip showing the seeds covered in an orange-yellow skin.

Leaves, Stem and Root: The plant is an unwieldy shrub up to 3 m high with green rectangular young branches. The older branches are light gray. The leaves are opposite, oblong-lanceolate or elliptical, acuminate, finely serrate and glabrous.

Characteristics: The seeds are poisonous.

Habitat: The plant grows in the Eastern and Central U.S. and Canada.

Production: Wahoo root bark is the bark of the root and young branches of *Euonymus atropurpureus*. Wahoo fruit is the fruit of *Euonymus europaeus*.

Other Names: Burning Bush, Fusanum, Fusoria, Gadrose, Gatten, Gatter, Indian Arrowroot, Pigwood, Prickwood, Skewerwood, and Spindle Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS: WAHOO ROOT BARK {EUONYMUS ATROPURPUREUS)

Cardioactive steroids (cardenolides) in the root: including euatroside, euatromonoside

COMPOUNDS: WAHOOO FRUIT (EUONYMUS EUROPAEUS)

Cardioactive steroids (cardenolides) in the seeds: including evonoside, evobioside, evomonoside, evolonoside, glucoevonololide, glucoevonogenin

Alkaloids: polyester from a sesquiterpene polyol with pyridine carbon acids (for example, evonine)

Peptide alkaloids: including frangula amine, franganin, frangufolin

-benzyl-tetrahydro-isoquinoline alkaloids

Purine alkaloids: caffeine, theobromine

EFFECTS: WAHOO ROOT BARK AND FRUIT

The drug is reported to be a laxative and a choleric. Larger doses have an effect on the heart.

INDICATIONS AND USAGE

Unproven Uses: In the past, the drug was used as a cholagogue, laxative, diuretic and tonic, and for dyspepsia. Today, it is used in homeopathy.

PRECAUTIONS AND ADVERSE REACTIONS

Poisonings caused by the berries have been recorded. Thirty-six berries of *Euonymus europaeus* are said to be enough to kill a person. After a latency period of several hours, intestinal colic, severe, sometimes bloody diarrhea, elevation of body temperature, shortness of breath and circulatory disorders with signs of collapse occur. Often there is elevation of cerebrospinal pressure with increasing stupor that may progress unconsciousness. The first measures to be taken with poisonings are gastric lavage, intestinal emptying, the instillation of activated charcoal and shock prophylaxis (which includes quiet, heat and the possible administration of a plasma volume expander). All other measures depend on the symptoms. For loss of potassium, careful replenishment of potassium should be undertaken. Lidocaine can be administered for ventricular extrasystole; atropine for partial atrioventricular block. For elimination of the glycosides hemoperfusion is possible, as is the administration of cholestyramine to interrupt enterohepatic circulation. Intubation and oxygen respiration may also be necessary in cases of asphyxiation.

DOSAGE

Mode of Administration: Wahoo root bark and fruit are not recommended for use. as the drug is considered too dangerous.

Wallflower

Cheiranthus cheiri

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried flowers, the dried ripe seeds and the fresh aerial parts of the erect plant before flowering.

Flower and Fruit: The flowers are golden yellow to orange-yellow in dense racemes on 10 to 14 cm long, pubescent, erect stems. The sepals are 9 to 11 mm long, linear-lanceolate, with a membranous border. The stigma is curled back. The fruit is a pod, which has no beak but has distinct ribs*. The seeds are arranged in 1 row, are 3 mm long, oblong, narrowly winged and light brown.

Leaves, Stem and Root: The plant grows from about 30 to 70 cm. The stems are woody below and semi-shrub-like with gray-appressed hairs and thick foliage above. The leaves are lanceolate with revolute tip, short-petioled, entire-margined and hairy.

Characteristics: The plant has a pleasant fragrance.

Habitat: The plant is probably only indigenous to the eastern Mediterranean region, but is cultivated today in Europe, northern Africa, western Asia, Japan and New Zealand.

Production: Wallflower can be obtained from commercial growers (cultivated regions).

Other Names: Gillyflower, Wallstock-Gillofer, Giroflier, Handflower, Keiri, Beeflower

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Cardioactive steroid glycosides (cardenolids): in particularly high concentration in the seeds (0.5%), including cheirotoxin, erysimoside, glucoerysimoside, cheiroside A

Glucosinolates: glucocheiroline, glucoiberin, which yield the isothiocyanates cheiroline and iberin

Fatty oil (in the seeds)

EFFECTS

The drug has cardiac effects similar to digitaloid drugs, due to the cardenolide glycosides. Its application for constipation is plausible because of the inhibition of Na⁺ and H₂O absorption and the stimulating effect on the smooth muscles of the gastrointestinal tract.

INDICATIONS AND USAGE

Unproven Uses: Wallflower is used for cardiac insufficiency, as a laxative and to encourage menstruation.

Homeopathic Uses: The herb is used for wisdom tooth pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

For possible symptoms of overdose and treatment of poisonings see *Digitalis folium*. Despite the strong efficacy of the drug's cardioactive steroid glycosides in parenteral application, serious poisoning is not expected due to the presumably low resorption rate following oral administration.

DOSAGE

Mode of Administration: Wallflower is used internally in drops and an infusion as well as in some combination preparations.

Preparation: To make an infusion from the flowers, mix 2 to 3 gm of drug per 100 ml of water.

Daily Dosage: Drink 3 to 4 cups of the infusion daily.

Walnut

*Juglans regia***DESCRIPTION**

Medicinal Parts: The medicinal parts are the feathery leaflets without the rachis and the green fruit shells.

Flower and Fruit: The flowers are green and appear before the leaves. They are monoecious. The male flowers are 10 cm long, sessile, globular-cylindrical, limp, hanging catkins. The female flowers are in groups of 1 to 3 at the tip of annual growth. They are greenish with a glandular pubescent calyx and 2 large, curved, warty, reddish stigmas. The fruit is globular or oblong-globular with a smooth, green, white-spotted outer shell and a wooden, wrinkled inner shell.

Leaves, Stem and Root: The plant grows to 25 m and has a broad, loose-branched crown. The bark is smooth and ash gray at first; later dark and fissured. The leaves are large, long petioled, odd-pinnate with 7 to 9 oblong or ovate, entire-margined leaflets. The leaflets are spotted with glands when young. The terminal leaflet is the largest and is petiolate.

Characteristics: The leaves are aromatic when rubbed. The taste is bitter.

Habitat: The walnut is indigenous to the Middle East and Iran. Today, it is cultivated in many regions.

Production: Walnut leaf consists of the dried leaf of *Juglans regia*.

Other Names: English Walnut, Caucasion Walnut, Circasian Walnut, Persian Walnut

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Tannins (galloylglucose, ellagitannins)

Naphthalene derivatives: The fresh leaves and the fruit peels contain 1,4,5-trihydroxynaphthalene-4-beta-D-glucoside, which is transformed into juglone through bruising or drying. Juglone polymerizes readily into yellow or brown products (that stain the skin), so there can be hardly any juglone present in the drug itself.

Flavonoids: including, among others, hyperoside, quercitrin

EFFECTS

Walnut is astringent and fungistatic. The juglone content in the walnut hulls has been linked to mutagenic action. The topical use of walnut hulls has been linked to cancer of the tongue and leukoplakia of the lips. The main active principles are the tannins and juglone. There is an astringent effect because of the tannins. The antifungal effect comes from the juglone content and the essential oil.

INDICATIONS AND USAGE

Approved by Commission E:

- Inflammation of the skin
- H Excessive perspiration

Unproven Uses: Externally, Walnut is used for mild, superficial inflammation of the skin and excessive perspiration. Internally, the drug is used for gastrointestinal catarrh and as an anthelmintic (so-called blood purifier).

Chinese Medicine: In China, Walnut is used to treat asthma, lumbago, beriberi, impotence and constipation.

Indian Medicine: In India, Walnut is used for alternating rheumatic complaints, and the oil of the seeds is used for tapeworms. The seeds are said to have an aphrodisiac effect and are also used for dysentery and colic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Comminuted drug for decoctions and other galenic preparations for external use.

Preparation: To prepare a decoction, soak 2 teaspoonfuls of drug in 1 cup of water, boil and strain. An infusion is prepared by using 1.5 gm of finely cut drug, soaked in cold water, brought to simmer and strained after 3 to 5 minutes.

Daily Dosage: The average daily dose for external use is 3 to 6 gm of drug.

Water Avens

Geum rivale

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried, underground parts of the plant, the fresh, flowering plant and the roots.

Flower and Fruit: The flowering peduncle usually sprouts singly from the axils of the rosette leaves, rarely from the ends of the stems. It is often tinged red-brown and is downy. The flowers and subinflorescences are on long, dense and glandular-haired pedicles. The 5 sepals are red-brown. The 5 petals are pale yellow and tinged dirty pink. The flower remains attached long after flowering. The carpel axis is stemmed and villous, and stretches when mature. The fruit is hooked at the tip.

Leaves, Stem and Root: The plant is a 30 to 100 cm high semi-rosette shrub with the primary root replaced by adventitious roots. The rhizome is simple, thick, cylindrical and crooked with a terminal rosette. The rosette leaves are long-petioled, irregularly lyre-shaped and pinnate. The upper surface is glandular and hairy. The underside is heavily ciliated along the veins.

Habitat: The plant is found in Europe, temperate Asia and North America.

Production: Water Avens root is the root of *Geum rivale*.

Other Names: Cure All, Water Flower, Indian Chocolate, Chocolate Root, Throat Root, Water Chisch

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FRESHLY HARVESTED RHIZOME

Gein (eugenol vicinonide): transformed into eugenol through drying or cutting into small pieces

Tannins

COMPOUNDS: IN THE DRIED RHIZOME AND ROOT

Volatile oil (traces): chief component eugenol

Tannins (15-20%)

EFFECTS

See Geum urbanum; overall, Water Avens has very weak action.

INDICATIONS AND USAGE

Unproven Uses: Uses are the same as for *Geum urbanum*.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

No information is available.

LITERATURE

Water Dock

Rumex aquaticus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried roots.

Flower and Fruit: The inflorescence is a large, dense panicle. The pedicles are filiform and up to 2.5 times as long as the capsules. The capsules are 6 to 8 mm long, ovate-triangular, more or less acute, longer than wide and entire-margined.

Leaves, Stem and Root: The herb is perennial and has an erect 100 to 200 cm high stem. The leaves are 7.5 to 10 cm wide with curly margins. The basal leaves are triangular, acute, deeply cordate at the base and 1.5 to 2.5 times as long as they are wide. The petiole is at least as long as the leaf blade. The rhizome is dark brown to blackish on the outside and porous.

Habitat: The plant is common in Europe.

Production: The root material is sliced and then dried in the shade.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Oxalates: oxalic acid, calcium oxalate

Tannins

Anthracene derivatives: including anthranoids

EFFECTS

The active agents are quercitrin, protein, fat, starch, essential oil and tannin. The herb acts as an aid to digestion.

INDICATIONS AND USAGE

Unproven Uses: Water Dock is used for blood purification and constipation. The powdered form is also useful for cleaning the teeth or for mouth ulcers. It is used externally for sores and scorbutic conditions.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Oxalate poisonings are conceivable, but only with the consumption of very large quantities of the leaves as salad.

DOSAGE

Mode of Administration: The drug is used internally and externally as a liquid extract or as a powder. Use of the herb went out of favor during the 18th century.

Water Dropwort

Oenanthe crocata

DESCRIPTION

Medicinal Parts: The medicinal part is the rhizome.

Flower and Fruit: The flowers are in terminal umbels. The flowering shoots are longer than the 10 to 40 pedicled rays, which do not micken in the fruiting phase. The cylindrical fruit is 4 to 6 mm long.

Leaves, Stem and Root: The plant is a branched, stout perennial up to 150 cm high. The roots are fleshy and pale yellow. They have obovoid or ellipsoid tubers close to the point of attachment to the stem. The stems are hollow, striate and grooved. The basal leaves are 3- to 4-pinnate. The lobes of the basal leaves are ovate to suborbicular, cuneate at base. The lobed, crenate, cauline leaves are 2- to 3-pinnate and almost sessile. The lobes of the cauline leaves are ovate to linear, and the segments are closer and sharper than the basal leaves.

Characteristics: The plant is extremely poisonous.

Habitat: The plant grows around ditches and ponds in the U.S., and parts of Europe, excluding Scandinavia, Holland, Germany, Russia, Turkey and Greece.

Production: Water Dropwort is the root of *Oenanthe crocata*, which is collected in the wild.

Other Names: Hemlock, Dead Men's Fingers, Horsebane, Dead Tongue, Five-Fingered Root, Water Lovage

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Polyynes: including among others the highly toxic oenanthotoxin as well as oenanthetol, oenanthetone, dihydrooenanthotoxin

EFFECTS

The pharmacologically active substances of the root drug are the toxic oenanthotoxin and the less toxic polyacetylenes oenantheol and oenantheton. Oenanthotoxin caused an irreversible inhibition of loading transfer and sodium inflow at the nerve fibers of frogs.

INDICATIONS AND USAGE

Unproven Uses: Water Dropwort was formerly used in the treatment of epilepsy, but this use can no longer be recommended.

Homeopathic Uses: Homeopathic uses include epilepsy and cerebral convulsions.

PRECAUTIONS AND ADVERSE REACTIONS

Use of the drug can no longer be recommended because of its severe toxicity, due to the oenanthotoxin content.

OVERDOSAGE

Symptoms of poisoning include a burning sensation in the mouth and nose, dizziness, weakness, chill, mild twitching and speech disorders. Higher dosages may produce tonic-colonic spasms, temporarily slowed cardiac activity, unconsciousness, bloody foam at the mouth and death through respiratory failure.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution and sodium sulfate), and the administration of activated charcoal, the therapy for poisonings consists of treating spasms with thiobarbiturates (diazepam is said to be less effective); hemodialysis or hemperfusion have been applied successfully.

DOSAGE

Mode of Administration: The drug is obsolete except in homeopathy. . .

Homeopathic Dosage: Adult dosages are 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); from D4 parenterally: 1 to 2 ml sc i.v., i. m. acute, 3 times daily; chronic: once a day. Children up to 6 years old are given a maximum of half the adult dose; children up to 12 are given a maximum of two-thirds the adult dose (HAB34).

Water Fennel

*Oenanthe aquatica***DESCRIPTION**

Medicinal Parts: The medicinal parts of the plant are the ripe seeds.

Flower and Fruit: The flowers are white and grow in many-rayed compound umbels opposite the leaves. They have no involucre but there is a small epicalyx. The calyx is distinct with an irregular corolla and petals that have a distinct border. The calyx narrows at the base and has an involute tip. The style is long. The fruit is 5 mm long, 1.5 mm wide, with 5 broad obtuse ribs.

Leaves, Stem and Root: The plant grows from 30 to 120 cm high. The stem is angularly branched, hollow and soft. The lower end of the 3 cm thick stem, which grows underwater, has long roots at the nodes. When the stem end reaches above water, it grows to only 6 mm thick. The leaves are double pinnate, pinnatifid to pinnatisect with splayed leaflets, which are often turned backward and have lanceolate, deeply indented-serrate tips. The underwater leaves have a thread-like tip.

Habitat: Found near ponds and ditches in both the U.S. and Europe.

Production: Water Fennel fruit are the ripe seeds of *Oenanthe aquatica*, which are collected in the wild.

Not to be Confused With: Mistaken identity can occur with *Cicuta virosa*, *Sium latifolium* or *Perculanum palustre*.

Other Names: Water Dropwort, Horsebane

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (1-2.5%): including among others (+)-beta-phellandrene, dillapiol. myristicin, 1-nonen-3-ol (androle), volatile polyynes, undecen-4-ole, camphene, isopropyl cyclohexene-2-ole-

Polyynes: including among others all-trans-pentadeca-2,8,10-trien-4,6-diin-12-on

Fatty oil (20%)

Lignans: including arctigenin, matairesinol, dimethyl matairesinol, secoisolariciresinol

EFFECTS

The drug's expectorant and antitussive effects are probably due to the essential oil. The active agents are the essential and fatty oil, resin, wax, galacton, and mannan and rubber substances. There is no further information available.

INDICATIONS AND USAGE

Unproven Uses: Water Fennel is used in folk medicine as an expectorant and for the relief of coughs due to inflammation of the bronchial mucus membranes or asthma and suppurating or festering inflammation of the lungs, as well as a diuretic and carminative.

Homeopathic Uses: Inflammation of the respiratory tract and breast pain in nursing mothers are considered indications for use in homeopathy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Ground, as an extract and as a tea.

Preparation: A tincture is prepared using the drug in a 1:5 ratio with 70% ethanol (m/m)

Daily Dosage: The recommended daily dose is 4 to 5 g drug.

Homeopathic Dosage: Adult dosage is 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); from D4 parenterally: 1 to 2 ml sc i.v., i.m. acute, 3 times daily; chronic: once a day. Children up to 6 years are given half the dose, children up to 12 are given a maximum of two-thirds the adult dosage (HAB1).

Water Germander

*Teucrium scordium***DESCRIPTION**

Medicinal Parts: The medicinal parts are the herb harvested during or shortly before the flowering season and the fresh flowering herb.

Flower and Fruit: The flowers are light red, 8 to 10 mm long, with short pedicles. They are in inconspicuous clusters in 1 to 4 blossomed cymes between bracts, which are longer than the flowers. The calyx has 5 tips and is campanulate-tubular with a touch violet. The tips of the deeply divided upper lip lie on the lower lip in such a way as to make it appear 5-lobed. After flowering, the head drops. There are 4 stamens. The nutlets are 1 mm long and punctate-reticulate.

Leaves, Stem and Root: The plant is a perennial, downy herb smelling of garlic. The rhizome creeps in mud and produces overground runners, which immediately turn into leaves and flower shoots. The stems are unbranched or branched, erect, round and villous with soft-hairs. The leaves are sessile, oblong-oval and crossed opposite.

Characteristics: The plant has a garlic-like odor and a bitter taste.

Habitat: The plant is indigenous to most of Europe as far as northern Africa and central Asia.

Production: Water Germander is the aerial part of *Teucrium scordium*. It is picked during or shortly before flowering.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Diterpenes: including among others, 6,20-bisdeacetylteupyreinidin, 6-deacetylteupyreinidin, 2beta, 6beta-dihydroxyteuscordin, 2beta,6beta-dihydroxyteuscordin, dihydroteugin, teufliidin, teucrin E, teugin, 2-keto-19-hydroxyteuscordin

EFFECTS

See other *Teucrium* species.

INDICATIONS AND USAGE

Unproven Uses: The herb is used for the treatment of festering and inflamed wounds, bronchial ailments, diarrhea, fever, hemorrhoids, and intestinal parasites.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Water Germander is used internally and externally.

Daily Dosage: Four teaspoonfuls of the herb (7.2 gm) is taken daily as an infusion. The same preparation can be used internally or externally.

Watercress

Nasturtium officinale

TRADE NAMES

Watercress (available from numerous manufacturers and as combination product)

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial parts collected during the flowering season and the entire flowering plant.

Flower and Fruit: On the leading and side shoots there are terminal, raceme-like inflorescences, which are slightly umbelliferous and consist of small, white, solitary flowers. The 4 white sepals are 2 to 3 mm long and glabrous. The 4 white petals are 2.5 to 5 mm long and turn lilac. There are 2 to 4 stamens with yellow anthers and filaments, which also turn lilac. The fruit is 13 to 18 mm long, with a glabrous pod on an 8 to 12 cm stem. The seeds are flat, ovate, 1 mm long, 0.8 to 0.9 mm wide and roughly reticulate. There are about 25 sections on each seed surface.

Leaves, Stem and Root: The plant is a perennial that grows from 25 to 90 cm and has creeping runners. The stem is angular, hollow, decumbent, rooting and branched. The somewhat fleshy leaves are alternate, usually odd-pinnate, lyrate and petiolate. They remain grass-green in winter. They have broad-elliptical, entire-margined or sweeping-crenate leaflets and roundish, broadly cordate terminal leaflets.

Characteristics: The plant has a radish-like taste and smells tangy when rubbed.

Habitat: The plant is found almost all over the world and is cultivated in many regions.

Production: Watercress consists of the fresh or dried above-ground parts of *Nasturtium officinale*. The fresh herb is collected in the wild and dried in shady, well-aired conditions.

Not to be Confused With: *Berula erecta* or *Cardamine amara*

Other Names: Indian Cress

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glucosinolates in the fresh, unbruised plant (0.9% of fresh weight): chief components gluconasturtiin (80%), which releases in the course of cell destruction the mustard oil phenyl ethyl isothiocyanate, from which 3-phenyl propionitrile, among other substances, spontaneously arises; additionally glucotropaeolin (yielding benzyl isothiocyanate), as well as 7-methyl thioheptyl glucosinolate, 8-methyl thiooctyl glucosinolate

Flavonoids

Vitamin C (80 mg/100 gm)

EFFECTS

Watercress has antibiotic, antitumoral and diuretic actions. The diuretic effect is probably due to the mustard oil content. As an amaroid drug, it stimulates appetite and digestion.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

Unproven Uses: Internally, the plant is used for catarrh of the respiratory tract, as an appetite stimulant and for digestion complaints. Externally, a decoction of the leaves in poultices and compresses is used for arthritis.

Homeopathic Uses: Watercress is used to treat irritation of the efferent urinary tract.

CONTRAINDICATIONS

Contraindications include stomach or intestinal ulcers and inflammatory renal diseases.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The intake of large quantities of the freshly harvested plant (e.g., in salad) could lead to gastrointestinal complaints due to the mucous membrane-irritating effect of the mustard oil.

Pediatric Use: The drug should not be administered to children under 4 years old.

Pregnancy: The drug should not be used during pregnancy.

DOSAGE

Mode of Administration: The comminuted herb, freshly pressed juice, as well as other galenic preparations of the plant, are for internal use.

How Supplied:

Capsules — 500 mg

Preparation: To make a tea, pour 150 ml boiling water over 2 gm drug (1 to 2 teaspoonfuls), cover for 10 to 15 minutes and strain.

Daily Dosage: The daily dosage is 2 to 3 cups of the tea before meals, 4 to 6 gm of the dried herb, 20 to 30 gm of the fresh herb or 60 to 150 gm of freshly pressed juice. Externally, the drug is applied as a poultice or a compress.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute, 3 times daily; chronic: once a day (HAB1).

Wheat

Triticum aestivum

DESCRIPTION

Medicinal Parts: The medicinal parts are the fruit wall, seed shell and outer layers of the endosperm.

Flower and Fruit: The inflorescence is a 4 to 18 cm long, more or less 4-sided and double-rowed awnless spike (occasionally with an awn up to 16 cm long). The spikelet has 2 to 6 flowers, 2 to 4 of which are sterile. Each spikelet has 2 glumes at the base, is approximately 10 mm long, blunt, keeled at the tip with a blunt or acute tooth. The flowers are surrounded by 2 bracts; the first is bulbous and coriaceous, the second smaller and membranous. There are 3 stamens and an ovary with 2 feather-like styles. The fruit is a yellowish, reddish or brownish orbicular to elongate oval caryopse.

Leaves, Stem and Root: The herb grows up to 1.5 m high. The leaves are arranged in two rows, are parallel-veined and 5 to 15 mm wide. The leaf base clasps the stem, the ligule is short with a ciliate eyelet. The stem is thin-walled, hollow and glabrous at the nodes.

Habitat: Asia, North America and Europe

Production: Wheat bran is the fruit wall, seed shell and outer layers of the endosperm of *Triticum aestivum*. Wheat germ oil is the fatty oil derived from cold-pressing the embryo of *Triticum aestivum* in a filter press.

Not to be Confused With: Wheat bran is sometimes confused with rye bran; wheat germ oil with other oils such as sesame oil.

Other Names: Wheat Bran, Wheat Germ Oil

ACTIONS AND PHARMACOLOGY

COMPOUNDS: **WHEAT BRAN**

Polysaccharides

Glucans: starch (15 to 20%), cellulose (30 %)

Heteroglycans (10%): complex arabinoxylans, to some extent water-soluble

Fatty oil (2%)

Phospholipids (1%)

Glycolipids (0.5%): particularly acyldigalactosyl glycerols

Steroids (0.3%): sterol esters

Proteins (20%)

Lignin

Alkyl resorcinols (0.1 to 0.2%): chiefly with C21- or C17-side chains

EFFECTS: **WHEAT BRAN**

Wheat bran is laxative in effect through expanding polysaccharides, which, through an increased level of fullness pressure, stimulate intestinal peristalsis and markedly shorten the transition time. At the same time, a measurable bonding of bile acids and their elimination from the enterohepatic

circulation takes place. In addition, a significant reduction of postprandial lipid levels is exhibited. The topical application of the drug as a bath additive for injured or irritated skin (due to the carbohydrates and proteins it contains) leads to milieu changes in the epidermis and thus to a reconstitution of the callous layer.

COMPOUNDS: WHEAT GERM OIL

Fatty oil: triacylglycerols (60 to 75%), diacylglycerols (to 4%): chief fatty acids linoleic acid (50 to 65%), oleic acid (15 to 22%), palmitic acid (7 to 18%), linolenic acid (5 to 8%)

Phospholipids (9 to 14%)

Glycolipids (0 to 2%): particularly acyldigalaktosyl glycerols

Free fatty acids (1 to 2%)

Steroids: sterol esters (2.5 to 3%), particularly those of beta-sitosterol and campesterol

Tocopherols (vitamin E, 0.2 to 0.3%): particularly alpha-tocopherol (share 60 to 70%), as well as beta-tocopherol, gamma-tocopherol, alpha-tocotrienol, beta-tocotrienol

Carotinoids (0.15 to 0.25%)

EFFECTS: WHEAT GERM OIL

Wheat germ oil protects and nurtures the skin, is a laxative and reduces lipids. It is a valuable dietetic because of the high level of polyunsaturated fatty acids and vitamin E.

INDICATIONS AND USAGE

WHEAT BRAN

Unproven Uses: Folk medicine internal uses include constipation. Externally, bran has been used for itching and inflammatory dermatoses (as a bran bath).

Chinese Medicine: Used to treat spontaneous night sweats.

Indian Medicine: Flatulence, constipation, itching and menorrhagia are considered to be indications for use in Indian medicine. Efficacy for constipation and dermatoses seems plausible, but efficacy for the other indications has not been sufficiently proven.

WHEAT GERM OIL

Unproven Uses: Used as a dietary agent because of the high level of polyunsaturated fatty acids and vitamin E.

PRECAUTIONS AND ADVERSE REACTIONS

WHEAT BRAN AND WHEAT GERM OIL

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

WHEAT BRAN

Mode of Administration: Whole drug preparations are for internal and external use.

Daily Dosage: As a laxative, the dose is 15 to 40 g 1 to 2 times daily, taken with meals and plenty of liquid. For a full/partial bath: minimum 0.34 g aqueous extract to 1 L water

Chinese Medicine Daily Dosage: 9 to 15 g drug

WHEAT GERM OIL

Mode of Administration: Soft gelcaps or oil for internal and external use.

Storage: Store tightly sealed in a cool place.

LITERATURE

Blaschek W, Hansel R, Keller K, Reichling J, Rimpler G, Schneider G, (Eds) Hagers Handbuch der Pharmazeutischen Praxis. Folgebande 1 und 2. Drogen A-Z. Springer. Berlin, Heidelberg 1998.

Goff DJ, Kull FJ, The inhibition of human salivary alpha-amylase by type II alpha-amylase inhibitor from *Triticum aestivum* is competitive, slow and tight-binding. *J Enzyme Inhib*, 252:163-70, 1995.

White Bryony

Bryonia alba

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The plant is monoecious, occasionally dioecious. The male flowers are in long-peduncled racemes, which are 10 to 12 mm wide and shed easily. The female flowers are in short-stemmed umbel-like clusters. The sepals are almost as long as the corolla. The 5-petaled corolla is yellowish-white and has green veins. The S[^]styles are almost completely free. The stigmas are glabrous. The 2 fused, inferior ovaries are 3-valved. The fruit is a 1- to 2-seeded, thin-skinned, 7 to 8 mm thick, globose black berry.

Leaves, Stem and Root: White Bryony is an extremely fast-growing perennial. It has a thick, tuberous root. The root is fleshy, wrinkled horizontally, yellowish-gray on the outside and white and slimy on the inside. The grooved, angular stems are climbing, branched and have long internodes and simple screw-like climbers. They grow up to 4 m long. The leaves are short-petioled, broadly cordate, pentagonal to 5-lobed and covered with short bristles on both sides.

Characteristics: The root is bitter and spicy. The plant is categorized as extremely poisonous.

Habitat: Indigenous from northeastern and southeastern Europe and also Iran.

Production: Bryonia root consists of the dried taproot of *Bryonia alba*, which is cultivated.

Other Names: Devil's Turnip, English Mandrake, Ladies' Seal, Tamus, Tetterberry, Wild Hops, Wild Nep, Wild Vine, Wood Vine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cucurbitacins: including cucurbitacins B, D, E, I, J, K, L, 23,24-dihydro-cucurbitacins, 1,2,23,24-tetrahydrocucurbitacins, 22-deoxycucurbitacins and bryodulcigenin; cucurbitacin glycosides, including bryonin, elaterinide, bryonosid, bryodulcigenin, cucurbitacin glycosides

Triterpenes with unusual structure: for example, bryonolic acid

Steroids: including sterols like C-4- and/or C-24-methylated or ethylated cholest-7-en-3-beta-oles

Polyhydroxy fatty acids: including 9,12,13-trihydroxy-oc-tadeca-10 (E)-15(Z)-dienic acid.

Lectins

EFFECTS

The mainly glycosidically bonded cucurbitanes contained in the drug have a strong toxic and cytotoxic effect; in topical application they are irritating to the skin and mucous membrane. Various aqueous extracts of the drug display an antitumoral effect in animal tests. The resin is a drastic purgative. The methanol extracts have a strong hypoglycemic affect. Use of the drug as an emetic and purgative has become obsolete because of the toxicity.

INDICATIONS AND USAGE

Unproven Uses: Because of its strong purgative and emetic effect, use of the drug cannot be recommended. Bryonia root has been used as a laxative, emetic **and** diuretic in the treatment of various disorders of the gastrointestinal tract and respiratory tract and for rheumatic disorders. It has also been used prophylactically and therapeutically for metabolic disorders, liver disease, and acute and chronic infectious disease.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is highly toxic when freshly harvested. The toxicity of the drug declines rapidly with dehydration and storage because of the instability of the cucurbitacins. Due to the cucurbitacin content, the drug has a severely irritating effect on skin and mucous membranes. Contact between skin and the juice of the plant can lead to rash, infection, blister formation and necroses.

OVERDOSAGE

The intake of toxic dosages can lead to vomiting, bloody diarrhea, colic, kidney irritation, anuria, collapse, spasms, paralysis and, under certain conditions, to death.

Following gastric lavage, the treatment for poisonings should proceed symptomatically. Consumption of 40 berries is presumed fatal for an adult; 15 for a child.

DOSAGE

Mode of Administration: Since the efficacy of Bryonia preparations for the claimed applications is not documented, and since the use of it as a drastic laxative and emetic is obsolete, a therapeutic administration cannot be justified because of the risks involved.

Bryonia is found occasionally in some pharmaceutical preparations.

Preparation: A decoction is prepared by adding 0.5 to 1 g drug to 1 cup water.

Daily Dosage: Dosage of the powder is 0.3 to 0.5 g as an emetic and purgative.

White Fir

Abies alba

DESCRIPTION

Medicinal Parts: The medicinal part of the trees is the timber of the Fir.

Flower and Fruit: The ovules are in pairs on the upper surface of the seed scales, in axils of the spirally arranged covering scales, which are in turn fused into cones. The cones are 10 to 16 cm long and 3 to 5 cm thick, with protruding surface scales that are green and tinged brown-red before ripening. The stamens are arranged like catkins. The fruit is declinuous, monoecious. The seeds are long-winged on one side.

Leaves, Stem and Root: The tree grows up to 50 m and occasionally up to 75 m tall. The needles are 1 to 3 cm long, 1.8 to 2.3 mm wide. The needles are dark green on the upper surface with two white stripes on the lower surface. They are divided with a blunt apex indented at the tip. The trunk is initially grayish, later scaly.

Habitat: White Fir is found in the Balkan countries. It originated from former Yugoslavia, Bulgaria, Poland, Romania and Albania.

Production: The essential oil of White Fir is extracted from the needles and branch tips by aqueous steam distillation for 5 to 6 hours,

Not to be Confused With: May occur with turpentine oils, cone oils, fir needle oils, camphors, bornyl acetate and various Pinaceae oils.

Other Names: Common Silver Fir, Swiss Pine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Limonene (25 to 55%)

Alpha-pinene (6 to 35%)

Camphene (9 to 20%)

Bornyl acetate (2 to 10%)

Santene (2 to 3%)

Tricyclene (1.0 to 2.5%): including among others beta-pinene, beta-phellandrene and delta³-carene

EFFECTS

The essential oil has secretolytic and mildly antiseptic effects on the bronchial mucous membrane area and hyperemic effects on the skin. The constituents' camphene, limonene and alpha-pinene are responsible for the strong expectorate effect connected with its inhalation.

INDICATIONS AND USAGE

Approved by Commission E:

- Neuralgia
- Rheumatism

Unproven Uses: Internally, the drug is used for catarrh of the respiratory tract. Externally, it can be used for nervous unrest and neuralgic pain. It can also be used for sprains, strains, contusions, bruising and as a prophylactic treatment for bedsores.

CONTRAINDICATIONS

The plant is contraindicated for conditions like bronchial asthma, other obstructive bronchial diseases and whooping cough. Whole-body baths involving the essential oil should only be undertaken in consultation with a physician in the presence of larger skin injuries, severe feverish or infectious diseases, cardiac insufficiency or hypertonia. Inhalation is to be avoided when the patient suffers from acute infections of the respiratory passages.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Bronchial spasms could become worse following administration of the drug.

OVERDOSAGE

Poisonings are possible in connection with overdose and large-area external administration, including injuries to the kidneys and the CNS. The use of outdated essential oils with unsaturated terpene carbohydrates could lead to severe irritation of the skin and mucous membranes.

Severe poisonings are possible following the ingestion of very large doses, leading to nausea, vomiting, reddening of the face, salivation, throat soreness, thirst, diarrhea, intestinal colic, dyspnea, dizziness, staggering walk, twitching, stranguria, dysuria, hematuria, albuminuria and skin efflorescence. It should be followed with gastric lavage with sodium sulfate solutions, intestinal emptying through administration of sodium sulfate, instillation of paraffin oil and medicinal charcoal, and shock prophylaxis (suitable body position, quiet, warmth).

The treatment for poisonings consists of the treatment of spasms with diazepam (I.V.), electrolyte substitution and the countering of any acidosis imbalance that may appear through sodium bicarbonate infusions. In the event of shock,

plasma volume expanders should be infused. Monitoring of kidney function is necessary. Intubation and oxygen respiration may also be required.

DOSAGE

Mode of Administration: Liquid preparations for internal and external use.

Daily Dosage:

Drops — 4 drops, 3 times daily in water or with sugar

Inhalation — add a few drops to hot water; and inhale several times daily

Lotion — rub into the affected parts

Storage: Keep sealed tightly and protected from light.

White Hellebore

Veratrum album

DESCRIPTION

Medicinal Parts: The medicinal parts are the rhizome and root.

Flower and Fruit: The flowers are in racemes forming a 30 to 60 cm long panicle. The pedicles are much shorter than the flowers. The yellowish-white flowers consist of 6 similar tepals, which are oblong-lanceolate, acute, denticulate and broadly splayed. There are 6 stamens, which are shorter than the perigone, and 3 styles. The fruit is capsule-like.

Leaves, Stem and Root: The plant is roughly 60 to 120 cm high. The rhizome is short, cylindrical and stunted. It has numerous, long, thick and fleshy root fibers. The round, cane-like, glabrous stem is almost completely surrounded by the tight sheaths of the basal leaves. The basal leaves are whorled, broad, elliptical to linear-lanceolate and heavily ribbed.

Habitat: The plant is found from Lapland to Italy but not on the British Isles.

Production: White Hellebore root-stock is the rhizome of *Veratrum album*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Steroid alkaloids (mixture is referred to as veratrine, 0.8-2.5%): C-nor-D-homo-sterane type-including protoverine, protoveratrine A and B, germerine, jervine. protoverine, veratroyl zygadenine

Solidane type-including isorubijervine, rubijervine

EFFECTS

Internally, the drug reduces blood pressure and heart rate, inhibits respiration in higher doses, and has an aconitine-like effect on the conductor system. Externally, the drug causes severe irritation to the skin, including numbing and poisoning through absorption.

INDICATIONS AND USAGE

Unproven Uses: Internally, White Hellebore is used for the treatment of vomiting, cramps, diarrhea, cholera, bradycardia and Graves' disease. Externally, the drug is used for neuralgia, rheumatism, joint pain and gout pain.

Homeopathic Uses: White Hellebore is used for neuralgia, infections, diarrhea, low blood pressure and as a stimulant.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely toxic and has numerous severe side effects, even at therapeutic dosages. It is no longer administered in allopathic medicine for that reason. The veratrum alkaloids severely irritate mucous membranes. By inhibiting inactivation of sodium ion channels, the resorption of alkaloids has a paralyzing effect on numerous excitable cells, particularly those governing cardiac activity.

OVERDOSAGE

The first symptoms of poisoning are sneezing, lacrimation, salivation, vomiting, diarrhea, a burning sensation in the mouth and pharyngeal cavity, and inability to swallow. Then, following resorption, paresthesia, vertigo, possible blindness, paralysis of the limbs, mild convulsions, lowering of cardiac frequency, cardiac arrhythmias and hypotension occur. Death occurs either through systolic cardiac arrest or through asphyxiation. The lethal dosage is between 10 and 20 mg of

the alkaloid mixture, corresponding to 1 to 2 gm of the drug. The alkaloids can be absorbed through uninjured skin.

Treatment of poisoning consists of gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulphate), administration of activated charcoal and shock prophylaxis (appropriate body position, quiet, warmth). Thereafter, spasms should be treated with diazepam or barbiturates (i.v.), bradycardia should be treated with atropine, hypotension should be treated with peripherally active circulatory medications, electrolyte substitution should be employed, and possible cases of acidosis should be treated with sodium bicarbonate infusions. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: The drug is used in powders, tinctures and homeopathic dilutions for internal use; preparations made with fatty oils are used externally.

Preparation: Mix 5 gm drug with 10 gm lanolin and 20 gm fat for topical application.

Daily Dosage: Internally, the drug is administered as 0.02 to 0.1 gm of powder or 20 to 60 drops of tincture. Externally, the drug is applied as a poultice or compress.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 to 2 ml s.c., acute: 3 times daily; chronic: once a day (HAB34). The globules are from D2; all others are from D4.

White Lily

Lilium candidum

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh and dried bulb.

Flower and Fruit: The inflorescence has 5 to 20 blossoms. The flowers are white, occasionally striped crimson or spotted and very fragrant. They are on erect pedicles, the lower ones nodding. The tepals are obtuse, the anthers yellow. The style is as long as the sepals. The fruit is obovate and is seldom developed.

Leaves, Stem and Root: The plant is perennial, 60 to 150 cm high. It has a broad, ovate, scaled and yellow bulb. The stem is rigid, erect and leafy. The leaves are oblong to linear-lanceolate and glabrous. The leaves survive winter, as does the rest of the plant, which is hardy. The bulb consists of imbricate, fleshy, lanceolate and bent scales, which are 3.25 cm long and 2.5 cm wide at the broadest point.

Characteristics: The bulbs are odorless and have a mildly bitter and unpleasant flavor.

Habitat: The plant is indigenous to Mediterranean regions and is cultivated in many other regions.

Production: Baurenlilien (Farmer's Lily) root is the subterranean part (onion) of *Lilium candidum*.

Other Names: Meadow Lily, Madonna Lily

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including isorhamnetin glycosides

Gamma-methylene glutamic acid

Soluble polysaccharides: glucomannans

Starch

Tuliposide

The constituents of the drug have not been investigated extensively.

EFFECTS

The plant has astringent, anti-inflammatory, pain reliever, diuretic and expectorant properties.

INDICATIONS AND USAGE

Unproven Uses: Internally for gynecological disorders and externally for ulcers, inflammation, furuncles, finger ulcers, reddened skin, burns and injuries.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: An infusion made from the ground drug is used internally. The drug is also used externally as a wet compress (paste).

Daily Dosage: Apply a thick paste, made from fresh or cooked onions, in the middle of a compress or poultice, to the affected area. This should be done several times during the day.

White Mustard

Sinapis alba

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried seeds.

Flower and Fruit: The flowers form an umbelliferous-racemous inflorescence. The flowers are on 3 to 7 mm long, stiff-haired pedicels. When in bloom the 4 narrow, obtuse sepals lie horizontal. There are 3 green, ovate nectaries at the base of the stamens. The fruit is a 2 to 4 cm long bristly pod, divided into two chambers. Each chamber contains two to three 2.5 mm thick seeds. The chamber ends as a large curled lip. The seeds vary from brown to white and are arranged in opposite rows.

Leaves, Stem and Root: *Sinapis alba* is an annual plant. The lower part of the plant is covered in stiff, single hairs. The thin root is yellow to white and branched. The root produces a 30 to 60 cm high, erect, grooved and branched stem. The leaves are 4 to 10 cm long, petiolate, lyrate, pinnatifid to pinnatesect and always have 2 to 3 indented-dentate lobed pinna.

Habitat: The plant has been introduced and naturalized in all of Europe and in Siberia, east Asia and America. The areas of cultivation are western and northern Europe and the northern U.S.

Production: White Mustard seed consists of the ripe, dried seed of *Sinapis alba*.

Not to be Confused With: Other *Sinapis* or *Brassica* species. Artificial colorings such as butter yellow or turmeric may be added.

Other Names: Mustard

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glucosinolates: chiefly sinalbin (p-hydroxybenzylglucosinolates, 2.5%), grinding the seeds into powder and then rubbing with warm water (not with hot water — enzymes would be destroyed), as well as chewing, releases the non-volatile mustard oil p-hydroxybenzyl isothiocyanate

Fatty oil (20-35%)

Proteins (40%)

Phenyl propane derivatives: including among others sinapine (choline ester of sinapic acid, 1.5%)

EFFECTS

The p-hydroxybenzyl mustard oil that results from fermentation of sinalbin is bacteriostatic, irritating to the skin and hyperemic (as an additive in 35° to 40° C baths).

INDICATIONS AND USAGE

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Rheumatism

Unproven Uses: Externally, White Mustard is used in poultices for congestion of the respiratory tract, for topical hyperemization of the skin as well as for segment therapy of chronic degenerative diseases affecting the joints and soft tissue. Mustard baths are used in the treatment of paralytic symptoms.

In folk medicine, Mustard is used to clear the voice. It is also used in Mustard plasters and poultices as a counter-irritant. Mustard is used in footbaths, and for the treatment of paralytic symptoms in the form of Mustard baths.

Chinese Medicine: In China, White Mustard is used to treat painfully swollen ribs and chest, coughs, vomiting, regurgitation, ulcerous swelling and rheumatic pains.

Homeopathic Uses: Sinapis alba is used to treat inflammation of the gastrointestinal tract and the respiratory tract.

CONTRAINDICATIONS

White Mustard is contraindicated in gastrointestinal ulcers and inflammatory kidney diseases. The drug should not be given to children under 6 years of age.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The danger of nerve damage exists with long-term intake. Long-term external application carries the danger of skin injury. The drug possesses minimal potential for sensitization (possible cause of food allergies).

Pediatric Use: White Mustard preparations should not be used in children under 6 years of age.

OVERDOSAGE

Gastrointestinal complaints could appear following the intake of large quantities, due to the mucous membrane-irritating effect of the Mustard oil.

DOSAGE

Mode of Administration: The drug is used internally as well as externally. Ground or powdered seeds are used for poultices.

Preparation: To prepare an external foot bath, 20 to 30 gm of the Mustard flour in 1 liter of water is used. To prepare a Mustard bath, 150 gm of the Mustard flour in a pouch is used in the bathwater.

Daily Dosage: The average daily dose of the drug is 60 to 240 gm. To brighten and clear the voice, Mustard flour is

stirred with honey and formed into balls. 1 to 2 are taken orally on an empty stomach.

For external use, just prior to application, mix 50 to 70 gm of the powdered seeds with warm water to prepare a poultice. The poultice is applied for 10 to 15 minutes for adults and for 5 to 10 minutes for children, except for those with sensitive skin where the usage should be shortened. Treatment should not exceed 2 weeks.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB34)

Storage: The drug must be protected from light and moisture.

White Nettle

Lamium album

DESCRIPTION

Medicinal Parts: The medicinal parts are the flowers and leaves.

Flower and Fruit: The white, fairly large bilabiate flowers are in axillary false whorls of 6 to 16 flowers. The campanulate calyx is green and has 5 tips. The tube of the corolla is bent like a knee and the upper lip is curved like a helmet with a ciliate margin. The lower lip is gordate. The tube has 1 large and 1 small tip at the edge. There are 2 long and 2 short stamens under the upper lip. The calyx remains

after flowering and protects the small nut. When the nut is ripe, slight pressure is sufficient to fling out the seeds.

Leaves, Stem and Root: The plant is 30 to 50 cm high with an underground creeping stem from which the aerial stems grow. These are erect, quadrangular, grooved, hollow and noded. The leaves are crossed opposite, petiolate, ovate to cordate, acuminate and serrate. The plant has no nettle hairs. The plant is similar to the stinging nettle but has a different stem.

Characteristics: The flowers have a weak honey-like fragrance and a slimy-sweet taste.

Habitat: The plant is common in Europe and central and northern Asia.

Production: White Nettle flower consists of the dried petal with attached stamens of *Lamium album* as well as its preparations.

Other Names: Blind Nettle. Dumb Nettle, Dead Nettle, Deaf Nettle, Bee Nettle, Archangel. Stingless Nettle, White Archangel

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpene: including among others lamalbid, caryoptoside, alboside A and B

Triterpene saponins

Caffeic acid derivatives: including among others rosmarinic acid, chlorogenic acid

Flavonoids: including among others kaempferol glycosides

Mucilages

EFFECTS

Because of the mucins and saponins the drug is expectorant. It is astringent because of the tannins.

INDICATIONS AND USAGE

Approved by Commission E:

- Inflammation of the skin
- Cough/bronchitis
- Inflammation of the mouth and pharynx

Unproven Uses:

Internally — catarrh of the upper respiratory passages, gastrointestinal disorders such as gastritis, sensation of bloating and flatulence.

Externally — mild inflammation of the mucous membranes of the mouth and throat, non-specific fluor albus (leukorrhea) mild, superficial inflammation of the skin. In folk medicine used for climacteric complaints and complaints of the urogenital tract.

Chinese Medicine: In Chinese medicine, White Nettle is used for fractures, carbuncles, lumbago and inflammation of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Comminuted drug for infusions and other galenic preparations for internal applications, rinses, baths and moist compresses; occasionally used as a constituent of sedative teas and bronchial teas.

Preparation:

Infusion — Pour one cup of water over 1 gm drug, leave to draw for 5 minutes and strain.

Extract for poultices — Scald 50 gm of flowers with 500 ml of water, draw for 5 minutes and strain.

Daily Dosage: For internal use, the average daily dose is 3 gm drug. For external use, 5 gm drug is added to a bath.

White Willow

Salix species

TRADE NAMES

Alcohol Free White Willow Bark, Standardized White Willow Bark, Wild Countryside White Willow

DESCRIPTION

Medicinal Parts: The medicinal part is the bark. *Salix nigra* is American Willow.

Flower and Fruit: The male flowers are yellow and the female green. They are dioecious and appear at the same time as the leaves on leafy stems in erect catkins. The male catkins are densely blossomed and cylindrical, up to 6.5 cm by 1 cm and have 2 stamens. The female catkins are cylindrical, 4.5 cm by 7 mm. The seeds have a tuft of hair.

Leaves, Stem and Root: Silver Willow is a 6 to 18 m high tree or bush with fissured gray bark. The leaves are short-petioled, lanceolate, acuminate and become cuneate at the base. They are finely serrate, silky-haired tomentose underneath and blue-green matte.

Characteristics: The annual twigs are not easy to break off at the base.

Habitat: The plant is indigenous to central and southern Europe.

Production: White Willow bark consists of the bark of the young, 2 to 3 year old branches harvested during early spring of *Salix alba*, *Salix purpurea*, *Salix fragilis* and other comparable *Salix* species.

Other Names: Willow, Salicin Willow, Withe Wither, Black Willow, Cartkins Willow, Pussywillow

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Glycosides and esters yielding salicylic acid (1.5-12%): salicin (0.1-2%), salicortin (0.01-11%) and salicin derivatives acylated to the glucose residue (up to 6%, including, among others, fragilin, populin)

Tannins (8-20%)

Flavonoids

EFFECTS

The efficacy of the drug is due mainly to the proportion of salicin present. After splitting of the acyl residue, the salicin glycosides convert to salicin, the precursor of salicylic acid. Salicylic acid is antipyretic, antiphlogistic and analgesic. White Willow bark is the phytotherapeutic precursor to acetylsalicylic acid (aspirin).

The salicin component is responsible for the anti-inflammatory and antipyretic effects. The tannin content has astringent properties on mucous membranes.

INDICATIONS AND USAGE

Approved by Commission E:

- Rheumatism
- Pain

Salicin is useful in diseases accompanied by fever, rheumatic ailments, headaches and pain caused by inflammation.

CONTRAINDICATIONS

Willow Bark is contraindicated in patients that have a hypersensitivity to salicylates. Salicylates should not be used in children with flu-like symptoms due to the association of salicylates with Reyes Syndrome.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Stomach complaints could occur as a side effect due to the tannin content.

Drug Interactions: Due to the salicin component, caution should be exercised when used in combination with salicylates and other non-steroidal anti-inflammatory drugs. There are reports that salicylate decreased serum naproxen concentrations markedly and increased serum naproxen clearance by as much as 56% (Furst, 1987).

Though there are no reports of interactions with drugs that affect blood clotting times, and some studies suggest that thrombocyte inhibition is unlikely. Anti-platelet medications and any medication that prolongs the PT time should not be used with Willow Bark (Wichtl & Bisset, 1994).

Alcohol and barbiturates may mask the symptoms of salicylate overdose and may enhance the toxicity of salicylates.

There have been reports of metabolic acidosis in children with normal renal and hepatic function that were treated with salicylates and carbonic anhydrase inhibitors for joint pain and glaucoma. This combination should be avoided (Cowan, 1984).

Disease Interactions: Patients with an active gastric or duodenal ulcer should avoid Willow Bark preparations. Hemophiliacs or anyone with a bleeding disorder should not use Willow Bark. Willow Bark should be avoided in asthmatics and diabetics.

Pregnancy: Salicylates should be avoided during pregnancy.

Nursing Mothers: Salicylates have been associated with rashes in breast-fed infants; use is not recommended.

DOSAGE

Mode of Administration: Liquid and solid preparations for internal use. Combinations with diaphoretic drugs could be considered. Drug extracts are contained in some standardized preparations of analgesics/antirheumatics, hypnotics/sedatives, and gastrointestinal remedies.

Preparation: To prepare an infusion, use 2 to 3 gm of finely cut or coarsely powdered drug in cold water, boil, allow to steep for 5 minutes, then strain.

Daily Dosage: Average daily dose corresponding to 60-120 mg total salicin.

Infusion—1 cup 3 to 5 times daily. (1 teaspoonful = 1.5 gm drug)

Liquid Extract—(1:1 in 25% alcohol) 1 to 3 ml 3 times daily.

Wild Carrot

Daucus carota

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The flowers are in compact, terminal umbels or flattened, compound capitula. The peduncle divides in ray-like fashion from one particular point. Each ray divides and forms further umbels with white flowers. The outer flowers are irregular and larger than the others. The florets are small. When in bloom, the flower head is flattened or slightly convex. When they are ripe, the flowers draw together to form a cup-like structure. The double achenes are formed in the fruit umbel. They are slightly flattened and have numerous bristles arranged in 5 rows.

Leaves, Stem and Root: The Wild Carrot is a biennial, 30 cm to 1 m high cultivated plant with a fusiform, usually red root and numerous pinnate, segmented, hairy leaves. In the second year, the plant produces a branched, angular stem with alternate jointed leaves, which terminates in the flowering umbels.

Habitat: Now found in its cultivated form all over the world.

Production: Wild Carrots are the roots of *Daucus carota*. The ripe roots are harvested.

Other Names: Carrot, Bird's Nest, Birds' Nest, Bees' Nest, Queen Anne's Lace, Philtron

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Carotenoids: including alpha-, beta-, gamma-, zeta-carotene, lycopene

Volatile oil (very little): including among others p-cymene, limonene, dipenten, geraniol, alpha- and beta- caryophyllene

Polyynes: including falcarinol (carotatoxin)

Mono and oligosaccharides: glucose, saccharose

EFFECTS

Wild Carrot has anthelmintic and antimicrobial activity. It is also a mild vermifuge. The essential oil has an initially stimulating, followed by a paralyzing, effect on worms. In controlled animal tests, a temporary reduction of arterial blood pressure was observed. The pectin content is probably responsible for the severe constipating effect of the Carrot. The essential oil has a mild bactericidal effect, especially on gram-positive bacteria. The drug has a positive effect on visual acuity and scotopic (twilight) vision, as well as being a mild diuretic.

INDICATIONS AND USAGE

Unproven Uses: The Wild Carrot is an unreliable adjuvant in the treatment of oxyuriasis. It is a useful drug in pediatrics for tonsillitis, nutritional disorders and as a dietary agent for digestive disorders. It is also used in medicinal preparations for dermatological conditions such as photodermatitis and pigment anomalies. It is used in teas for intestinal parasites.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug has a low potential for sensitization through skin contact.

DOSAGE

Mode of Administration: The drug is taken in a ground form or consumed as a juice or vegetable. It is found in ready-made medicinal preparations.

Preparation: The Carrot is finely grated and made into a juice or syrup.

Wild Cherry

Prunus serotina

DESCRIPTION

Medicinal Parts: The medicinal part is the inner tree bark, which has an almond-like smell, which dissipates on drying.

Flower and Fruit: The racemes are 6 to 15 cm long with about 30 flowers. The perianth remains when the fruit ripens. The 3 to 4 tepals are denticulate and creamy white. The fruit is 8 mm across, depressed-globose and purple-black. The endocarp is smooth.

Leaves, Stem and Root: Wild Cherry is a deciduous tree up to 20 m high with aromatic bark. The leaves are obovate to elliptical-oblong, acute, finely serrate with flattened, with forwardly directed teeth. The leaves are dark, glossy green above, paler and slightly pubescent beneath.

Habitat: *Prunus serotina* originates from North America but is cultivated in Europe.

Production: Wild Cherry bark is the bark of *Prunus serotina*.

Other Names: Wild Black Cherry, Virginian Prune, Black Choke, Choke Cherry, Rum Cherry

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Cyanogenic glycosides: prunasin yielding 0.05 to 0.15%. 5 to 15 mg HCN/100 g

*Tannins***EFFECTS**

Wild Cherry bark is an astringent, antitussive, and sedative.

INDICATIONS AND USAGE

Unproven Uses: Wild Cherry bark is used for coughs, bronchitis and whooping cough, also used in the treatment of nervous digestive disorders and diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Cyanide poisonings from the drug are unlikely, due to both its low cyanogenic glycoside content and the lack of incitement to ingest it.

DOSAGE

Mode of Administration: Wild Cherry bark is available as syrup or tincture for internal use and also available in commercial compounded preparations.

Wild Daisy

Bellis perennis

DESCRIPTION

Medicinal Parts: The medicinal part is the whole flowering plant.

Flower and Fruit: The flower heads are usually found singly at the end of the sharply angular stem. The flower is small- to medium-sized and heterogamous. The epicalyx is semi-spherical to bell-shaped. The sepals of the epicalyx are more or less double-rowed. The receptacle is conical and glabrous when bearing fruit. The 1- to 2-rowed female ray flowers are linguiform, white, pink, purple or bluish and distinctly longer than the epicalyx. The disc flowers are androgynous, tubular and 5-tipped. The achenes are obovate, very flattened, ribless, and have side veins. The flower has no pappus but may have short, brittle bristles.

Leaves, Stem and Root: Wild Daisy is a 10- to 15-cm high perennial plant that has basal leaves in rosettes or alternate leaves at the lower part of the stem; its roots are short and cylindrical. The rosette leaves are circular to spatulate or heart-shaped, dentate and occasionally entire-margined with a single rib; they have vertical hairs on both sides.

Habitat: The plant is distributed from Portugal to the Moscow region and Asia Minor. It is also found from Great Britain to Ireland and southern Scandinavia, and as far south as the Mediterranean, with the exception of the Balearic Islands and the islands of Sardinia, Sicily, Crete and Cyprus.

Production: The capitula and short stems of the plant are picked and dried in either the sun or shade.

Other Names: Bruisewort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins (2.7%): bisdemosides of the bayogeninic and polygalic acid (the latter acylated)

Polyyenes: including trans-lachnophyllum ester

Flavonoids: including cosmosiin

EFFECTS

The drug acts as an astringent, reduces mucous production, and also has anti-inflammatory and fever-reducing effects, possibly due to the triterpene saponin content.

INDICATIONS AND USAGE

Unproven Uses: Wild Daisy is used as an expectorant and for easing diarrhea and gastrointestinal catarrh. It is also used for treating wounds, skin diseases, coughs and bronchitis, disorders of the liver and kidneys, and inflammation.

Homeopathic Uses: Wild Daisy is used for bruises, bleeding, muscular pain (after injuries), purulent skin diseases and rheumatism.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used topically—as an extract, in teas and in poultices of pressed leaves—for the treatment of skin diseases. A decoction can be used for wound poultices.

Preparation: An infusion or cold extract is prepared by adding 2 teaspoonfuls of drug to 2 cups of water, then allowing it to draw for 20 minutes. A decoction is made from the green leaves.

Daily Dosage: The daily dose of the infusion is 2 to 4 cups per day.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily; parenterally: 1 ml sc injection solution twice weekly; ointments: 1 to 2 times daily (HAB1).

Wild Indigo

Baptisia tinctoria

TRADE NAMES:

Health From The Sun Wild Indigo Fresh Root Liquid.
Nature's Answer Alcohol Free Wild Indigo Root Liquid

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root.

Flower and Fruit: The flowers are terminal and axillary in 7 to 10 cm long, lightly flowered racemes. The pedicles are 3 to 5 cm long. The calyx is 4 to 5 mm long and glabrous but has a slight fringe. The corolla is yellow. The standard is circular with convoluted sides and is slightly shorter than the oblong wings. The 10 stamens are freestanding. The ovary is stemmed, elliptoid, drawn together at the style and stigma. and is glabrous. The fruit is a blue-black, ovoid, slightly swollen pod, 7 to 15 mm long, with a sharp tip. The seeds are yellowish-brown, kidney-shaped and 2 mm long.

Leaves, Stem and Root: The shrub is many-branched and grows to 1 m high with woody rootstock and knotty branches. The stem is 1 to 3 mm thick, round, slightly grooved and glabrous. The alternating leaves are trifoliate and have a 1 to 3 mm long petiole. The stipules are small and arrow-shaped, and drop early. The leaflets are 1 to 4 cm long, and 0.6 to 1 cm wide, ovate, almost sessile and entire-margined. They are wedge-shaped at the base and rounded at the tip. The distinct midrib on the lower surface is pubescent. The leaves are brittle. The roots vary in diameter from 0.2 to 1.5 cm. The outer surface is brownish, vertically wrinkled and grooved. It is also warty due to root fibers sticking to the surface. The tissue is solid and fibrous. The transverse fracture shows a thick bark and whitish wood with concentric rings.

Characteristics: The taste is bitter and acrid; the odor is faint. The leaves yield an indigo dye; the wood a red dye.

Habitat: Wild Indigo is indigenous to southern Canada and the eastern and northeastern U.S.

Production: Wild indigo root is the underground part of *Baptisia tinctoria*, which is collected and dried in autumn from plants growing in the wild.

Not to be Confused With: Wild Indigo can be confused or adulterated with the root of *Baptisia australis* (false blue indigo) and *Baptisia alba*.

Other Names: Horse-Fly Weed, Indigo Broom, Rattlebush

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Water-soluble polysaccharide: in particular arabinogalactans

Glycoproteins

Quinolizidine alkaloids: including cytisine, N-methyl cytisine, anagyrine, sparteine

Isoflavonoids: formononetin baptigenin, pseudobaptigenin, (-)-maackiain, formononetin and their glycosides baptisin, pseudobaptisin, trifolirhizin

Hydroxycumarins: including scopoletine

EFFECTS

The ethanol extract has had a significantly positive effect on the phagocytosis of human erythrocytes. It has also been found to raise the leukocyte count and to improve the endogenous defense reaction. Wild Indigo has a mild estrogenic effect. In animal experimentation, the polysaccharide and glycoprotein fraction contained in the drug demonstrated an immune-stimulating effect. Changes in mice included an increase of phagocytosis activity of Kupffer's cells; a significant, dose-dependent stimulation of lymphocytes; and release of interleukin-1 macrophages.

INDICATIONS AND USAGE

Unproven Uses: Wild Indigo root is used for septic and typhoid cases with prostration and fever, such as diphtheria, influenza, malaria, septic angina and typhus. It is used internally for infections of the upper respiratory tract, the common head cold, tonsillitis, stomatitis, throat and mouth inflammation of the mucous membranes (catarrh), fever, lymphadenitis and furunculosis. It is used externally as an ointment for painless ulcers, inflamed nipples, and as a douche for leucorrhea. The efficacy of the drug has not been proven. Native America Indians traditionally have used the root to make a tea to treat fever, scarlet fever, typhoid and pharyngitis and externally as an ointment for sores. Water in which the root has been soaked is used to clean open and inflamed wounds. Canadian Indians used the plant for treating gonorrhea and disease of the kidneys and as an expectorant.

Homeopathic Uses: Uses in homeopathy include severe febrile infections, states of confusion and blood poisoning.

CONTRAINDICATIONS

Use of the drug is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Only very high dosages (for example, 30 g of the drug) lead to signs of poisoning (vomiting, diarrhea, gastrointestinal complaints, spasms), due to the quinolizidine alkaloid content.

DOSAGE

Mode of Administration: Wild Indigo is not common as a drug, but is found in combination preparations; taken internally as a tea and tincture; and used externally as an ointment.

How Supplied:

Drops

Injection solutions

Liquid — I:I and 1:2, with and without alcohol.

Suppositories

Tablets

Preparation: To prepare an ointment, use 1 part liquid extract to 8 parts ointment base. A tincture may be prepared using the liquid extract in 60% alcohol 1:1.

Daily Dosage: Dosage for a single dose is 0.5 g to 1 g of the dried drug as decoction, to be taken 3 times daily.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution twice weekly sc (HAB34).

Wild Mint

Mentha aquatica

DESCRIPTION

Medicinal Parts: The medicinal part is the dried leaf.

Flower and Fruit: The flowers are in 2 to 3 dense false axillary whorls with inconspicuous bracts. The upper ones are fused into a terminal, globular or ovate capitulum. The calyx is tubular, with 13 ribs and glabrous inside. The tips are awl-shaped to triangular. The pedicles are pubescent. The corolla is violet with a ring of hair in the tube. The fruit is hard with an ovoid, light brown nutlet.

Leaves, Stem and Root: Wild Mint is a perennial, 20 to 80 cm high plant with a branched underground rhizome and an erect stem with alternate sessile curly leaves. The stem is branched in the upper half and terminates in spikes of blue flowers. The leaves are ovate and serrated.

Characteristics: The whole plant smells of caraway. The plant is a result of many cross-breedings in gardens and fields.

Habitat: The plant grows in Europe, northern Africa and western Asia. It has been introduced to America, Australia and Madiera.

Production: Wild Mint is the aerial part of *Mentha aquatica*. The drug is derived from the dried leaves.

Other Names: Water Mint, Marsh Mint, Hairy Mint

ACTIONS AND PHARMACOLOGY
COMPOUNDS

Volatile oil: chief components - menthofurane, beta-caryophyllene, 1,8-cineole, germacren D, limonene, viridiflorol, a chemotype contains isopinocampone as chief constituent (according to older references, also linalool, linalyl acetate, cineole, menthone)

Tannins

EFFECTS

The drug is an astringent and a stimulant.

INDICATIONS AND USAGE

Unproven Uses: Water Mint is used for diarrhea and dysmenorrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Ground drug is used as an infusion.

Preparation: Add approximately 30 gm of the drug to 500 ml of water.

Daily Dosage: As a daily dose, drink a wineglassful during the course of the day.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Wild Radish

Raphanus raphanistrum

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh plant before flowering.

Flower and Fruit: The flowers are bright yellow, sometimes white with violet veins. The form of the flower corresponds to that of the Cruciferae. The calyx is erect. The pods are cylindrical with vertical grooves between which the seeds are tied (like a string of pearls). The pods fall apart at these points.

Leaves, Stem and Root: The leaves are petiolate and lyrate, the upper ones are lanceolate. The leaves and lower part of the stem are stiff-haired.

Habitat: The plant has been cultivated for a very long time and is grown in all parts of the world, especially in temperate regions.

Production: Wild Radish is the fresh plant of *Raphanus raphanistrum* before flowering.

Other Names: Jointed-Podded Charlock

ACTIONS AND PHARMACOLOGY
COMPOUNDS

Glucosinolates in the freshly harvested, unbruised plant: chief component glucoputranjivine, which yields isopropyl mustard oil as the cells are destroyed.

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Wild Radish is used for skin conditions and stomach disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Administration of high dosages of the freshly harvested plant can lead to mucous membrane irritation of the gastrointestinal tract.

DOSAGE

Mode of Administration: Wild Radish is administered ground and as an alcoholic extract.

LITERATURE

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8: Springer Verlag Berlin, Heidelberg, New York, 1969.

Wild Service Tree

Sorbus torminalis

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe fruit. It is always the fruit that is used in the various preparations.

Flower and Fruit: The flowers are in erect, loose umbelliferous panicles on loosely tomentose, later glabrous pedicles. The petals are white and the anthers light yellow. The false fruit is orbicular-oblong and 1.5 cm long. The fruit is initially reddish-yellow, later brown and speckled. The 4 seeds are oblong, deltoid, 7 mm long and dark red-brown.

Leaves, Stem and Root: The plant is at times a small tree, but may sometimes grow up to 22 m tall tree with a widely domed crown. The bark is dark brown or gray. It is cracked into scaly plates to fairly high up. The older branches are glabrous, gray-brown, glossy and angular with lighter lenticles. The younger branches are loosely tomentose, greenish, later reddish-brown. The buds are broad ovoid and glabrous with shiny green scales. The buds are brown at the edge and loosely pubescent or glabrous. The leaves have 5 cm long, thin, downy, loosely tomentose petioles, which are fresh green. The petioles turn blood-red in autumn.

Habitat: The plant is common in northern temperate zones. It is cultivated in many regions.

Production: Wild Service Tree berries are the fruits of *Sorbus torminalis*.

Other Names: Wild Sorvice, Ash

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sugar alcohols: sorbitol

The fruits do not contain parasorboside, in contrast to those of *Sorbus aucuparia*.

The drug has not been fully researched.

EFFECTS

No information is available.

INDICATIONS AND USAGE

See Mountain Ash Berry (*Sorbus aucuparia*).

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: See Mountain Ash Berry (*Sorbus aucuparia*).

LITERATURE

There is no literature available.

Wild Thyme

Thymus serpyllum

DESCRIPTION

Medicinal Parts: The medicinal parts are the steamed distillation of the dried aerial parts, the aerial shoots collecting during the flowering season and dried, the fresh aerial parts of the flowering plant and the whole plant.

Flower and Fruit: The inflorescence is globular to very elongated, often interrupted in false whorls, which are separate from each other. The calyx is tubular-campanulate with 10 distinct ribs. The 3 tips of the upper lip are short and ciliate. The 2 lower tips are awl-shaped, longer than the upper tips and ciliate. The corolla is 3 to 6 cm long with a short tube. It is light to dark purple, occasionally white.

Leaves, Stem and Root: The plant is a slightly woody subshrub that grows from 10 to 30 cm high. The flowering stems are erect. The non-flowering stems are decumbent, round, or mildly quadrangular, pubescent all around and rooting at all points. The leaves are small, linear or elliptical and obtuse. The leaves are also flat, narrowing to the petiole, ciliate at the base, glabrous or rough-haired with protruding nerves.

Characteristics: The odor is aromatic.

Habitat: The plant is found in all temperate regions of Eurasia.

Production: Wild thyme consists of the dried, flowering, above-ground parts of *Thymus serpyllum*.

Not to be Confused With: Herba Thymi (thymian)

Other Names: Mother of Thyme, Serpyllum, Shepherd's Thyme

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.2-0.6%): as a collective species, *Thymus serpyllum* (over 20 subspecies) encompasses a large number of chemical strains with different volatile oil make-up; chief component is usually carvacrol, further containing, among others, borneol, isobutyl acetate, caryophyllene, 1,8-cineole, citral, citronellal, citronellol, p-cymene, geraniol, geranyl acetate, linalool, linalyl acetate, alpha-pinene, gamma-terpinene, alpha-terpineol, terpinyl acetate and thymol

Flavonoids: including among others scutellarenine-7-O-glucoside-4-O-rhamnoside

Caffeic acid derivatives: in particular rosmarinic acid (2.3%)

EFFECTS

In animal experiments, an antihormonal and thyroid hormone-like effect on the pituitary has been demonstrated. The

herbs efficacy for treating conditions of the upper respiratory tract is due to the presence of the aromatic and spicy smelling essential oil.

INDICATIONS AND USAGE

Approved by Commission E:

m Cough

- Bronchitis

Unproven Uses: The herb is used internally for catarrhs of the upper respiratory tract, kidney and bladder disorders, and as a stomachic, carminative, and expectorant. It is also used internally for dysmenorrhea, colic-like pain, and whooping cough. The herb is used externally in herbal cures, baths (especially for respiratory tract conditions), and alcoholic extracts, as well as in embrocations for rheumatic disorders and sprains.

Chinese Medicine: The herb is used for vomiting, diarrhea, flatulence, coughs, toothache, itching and general pain syndrome.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Wild Thyme is administered as a comminuted drug for infusions, teas, and other preparations internally. The drug is a component of various standardized preparations of antitussives. Alcoholic extracts of the herb are contained in cough drops.

Preparation: To make an infusion, pour boiling water over 1.5 to 2 gm finely cut drug, steep for 10 minutes, then strain (1 teaspoonful = 14 gm drug). For a liquid extract, use a ratio of 1:1 with either 45% ethanol or 20% ethanol. For a tincture, use a ratio of 1:10 with 70% ethanol. To make a bath, add 1 gm drug (or equivalent of 0.004 gm Wild Thyme oil) to 1 liter water, filter, then add to bath water.

Daily Dosage: The average daily dosage is 4 to 6 gm of herb. As a stomachic, drink one cup of tea before meals. Other daily dosages are as follows: powder: take 2 gm drug mixed with honey; infusion: single dose, 0.6 to 4 gm, 2 to 3 cups per day; liquid extract: single dose, 0.4 to 4 ml 3 times daily; liquid extract: daily dose, 5 to 15 gm (1 gm or 30 drops).

Storage: Protect from light.

Wild Turnip

Brassica rapa

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root.

Flower and Fruit: The flowers are in racemes. There are 4 almost horizontally splayed sepals. The 4 petals are yellow, 11 to 14 mm long, approximately 1.5 times as long as the calyx, with an orbicular-elliptical plate. There are 2 short and 4 long stamens. The 4-carpeled ovary is superior and fused. The fruit is a 4.5 to 6.5 cm long, dehiscent pod opening on 2 sides, with a septum and 15 to 25 seeds. The seeds are globose and reticulate with a diameter of approximately 1.5 to 3 mm.

Leaves, Stem and Root: Turnip is an annual or biennial herb, and grows up to 0.8 m high. The leaves are alternate, grass-green, with a slight bluish bloom and always bristly pubescent. The lower ones are petiolate, pinnatisect with a not-very-large terminal lobe; the middle arid upper ones are sessile, simple, dentate or entire. The stem of the larger plants is branched. The root is thin and spindle-shaped.

Habitat: Europe, North Africa, U.S.

Production: The seeds are cold-pressed and then refined. Rapeseed oil is the cold-pressed and refined oil from the ripe seeds of *Brassica napus* and *Brassica rapa*.

Other Names: Field Mustard, Oilseed Turnip, Turnip Rape, Turnip Greens, Chinese Cabbage

Not to be Confused With: Rapeseed oil may be adulterated with resins and mineral oil. *Sinapis arvensis* is a permitted substitute.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil: chief fatty acids: oleic acid (45 to 65%), linoleic acid (18 to 32%), linolenic acid (10%), including as well palmitic acid, stearic acid, eicosanoic acid, behenic acid;

varieties with high erucic acid content (40 to 50%) are no longer cultivated (reduction of the erucic acid content in the Common Market countries to below 5%)

Sterols: beta-sitosterol, campesterol, brassicasterol, esterified to some extent

EFFECTS

Rapeseed oil, when ingested in high dosages over an extended period of time, is cardiotoxic. The drug is chiefly used as a substitute for olive oil and in the manufacture of salves and liniments.

INDICATIONS AND USAGE

No medicinal indications

PRECAUTIONS AND ADVERSE REACTIONS:

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages of the oil, which is low on erucic acid.

DOSAGE

Storage: Store in the dark, in well-filled containers.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Wild Yam

Dioscorea villosa

TRADE NAMES

Wild Yam Extract, Mexican Wild Yam Power, Wild Yam, Wild Yam Root & Rhizome Extract, Wild Yam Root (available from numerous manufacturers and as a combination product)

DESCRIPTION

Medicinal Parts: The medicinal part is the dried rhizome with the roots.

Flower and Fruit: The plant has small greenish-yellow flowers. The male flowers are in drooping panicles; the female ones in drooping spicate racemes.

Leaves, Stem and Root: *Dioscorea villosa* is a perennial vine. It has a pale brown, cylindrical, twisted, tuberous rhizome and a thin, woolly, reddish-brown stem that measures up to 12 m long. The leaves are broadly ovate, usually alternating, cordate and 6 to 14 cm long. The upper surface of the leaves

is glabrous and they are pubescent beneath. The fracture is short and hard.

Characteristics: The taste is insipid at first, then acrid. The leaves are odorless.

Habitat: The plant is indigenous to the Southern U.S. and Canada. It is now widely cultivated in many parts of the world in tropical, subtropical and temperate regions.

Production: Wild Yam root is the root and rhizome of *Dioscorea villosa*.

Other Names: China Root, Colic Root, Devil's Bones, Rheumatism Root, Yuma

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins: including dioscin (aglycone diosgenin)

Isoquimiclidine alkaloids: including dioscorin

Pyridinal alkaloids: including dioscorine

EFFECTS

Wild Yam has an antispasmodic, and a mild diaphoretic effect. The root of the plant is used as a precursor for manufacturing progesterone and estrogen. Though the diosgenin component has been promoted as a "natural progesterone," diosgenin does not have any progesterone-like effects. The body does not convert diosgenin into estrogen or any other steroid.

Anti-Inflammatory Effect:

In the rat model, diosgenin has been found to decrease the intestinal inflammation that accompanies indomethacin use (Yamada et al, 1997).

Biliary Cholesterol Elimination Effect:

Diosgenin has been shown to markedly increase the biliary output of cholesterol and lipid lamellar structures in the rat model. Diosgenin also has a cytoprotective effect on the rat liver that is subjected to obstructive cholestasis (Accatino et al, 1998).

Estrogenic Effect:

Diosgenin has been found to have an estrogenic effect on mouse mammary epithelium. Ovariectomized mice that received diosgenin (sc) at dosage levels between 20 and 40 mg/kg for 15 days had significant increases in mammary development scores. When administered estrogen and diosgenin, an augmentation of the estrogenic effect was recorded (Aradhana et al, 1992).

INDICATIONS AND USAGE

Unproven Uses: Wild Yam is used for rheumatic conditions, gallbladder colic, dysmenorrhea and cramps.

Wild Yam is used industrially as an active agent in the half-synthesis of steroid hormones and for the manufacture of homeopathic preparations.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Drug Interactions: There is evidence that the diosgenin component of Wild Yam may decrease the anti-inflammatory effect of indomethacin by increasing the elimination constant and reducing plasma levels of indomethacin (Yamada et al, 1997). Wild Yam may have an additive estrogenic effect when administered with estrogen containing drugs.

OVERDOSAGE

Poisoning is conceivable with overdoses because of the picrotoxin-like effect of dioscorin (see *Cocculi fructus*).

DOSAGE

Mode of Administration: Liquid extract.

How Supplied:

Capsules—200 mg, 400 mg, 505 mg, 535 mg

Liquid—1:1; 1:2; 250 mg/ml

Willow Herb

Epilobium species

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb and the roots of the drug containing *Epilobium* varieties.

Flower and Fruit: The flowers are arranged in long clusters of crimson flowers. The receptacle extends over the ovary. There are 4 sepals that are often colored and 8 stamens. The petals are purple to pink seldom white or yellow. The style is erect or curved downwards. The stigma is capitular or club-like and has 4 grooves or is divided into 4. The fruit is long, linear capsule-like, quadrangular, 4-valved and opens with 4 bending valves. The seeds are numerous and smooth or they may be covered in tiny warts with a white, often short-stemmed, tuft of hair.

Leaves, Stem and Root: The species includes perennial herbs and occasionally up to 2 m high sub-shrubs with underground creeping rhizomes. The stems are erect, glabrous or covered with simple hairs or glandular hairs. The leaves are entire-margined or dentate. They are alternate or opposite and in whorls of 3, which are flat or occasionally with a turned-back border.

Habitat: The plant is found all over Europe, Asia, Africa and America. Australia, Tasmania and New Zealand.

Production: Willow Herb is the aerial part of *Epilobium parviflorum* and other small-blossomed Willow Herbs. The herb is dried in the open air in the shade.

Other Names: Blood Vine, Blooming Sally, Rose Bay Willow Herb, Willow-Herb

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ANGUSTIFOLIUM VARIETY

Flavonoids: in particular myricitrin, isoquercitrin, quercitrin, guaiaverin, quercetin-3-O-beta-D-glucuronide

Palmitate

Steroids: in particular beta-sitosterol and its ester, including among others beta-sitosterol caproate

Tannins

COMPOUNDS: HIRSUTUM VARIETY

Flavonoids: in particular guaiaverin, hyperoside, myricitrin, quercetin-3-O-beta-D-glucuronide, quercetin-3-O-alpha-L-arabinofuranoside

Steroids: in particular beta-sitosterol

Tannins

COMPOUNDS: PARVIFLORUM VARIETY

Flavonoids: in particular guaiaverin, quercetin-3-O-beta-D-glucuronide, quercitrin

Palmitate

Steroids: in particular beta-sitosterol and its ester, including among others beta-sitosterol caproate

Tannins

EFFECTS

Willow Herb is reported to have antiphlogistic and antiexudative effects. A watery infusion revealed a significant inhibitory effect on edema in rat paws. The methanol infusion had a distinctly weaker effect.

Antimicrobial effects have also been demonstrated. A suspension of the fresh drug in ethanol stunts the growth of the bacteria of *Pseudomonas pyocyanea*. Tincture and the liquid extract showed anti-microbial effect against *Candida albicans*, *Staphylococcus albus* and *Staphylococcus aureus*.

The dried residue of a maceration, which is fixed on filter paper, shows a weak effect against *Bacillus subtilis*, *Escherichia coli*, *Mycobacterium smegmatis*, *Shigella flexneri*, *Shigella sonnei* and *Staphylococcus aureus*. An extra fraction of the drug (insufficiently chemically defined) showed a tumor-inhibiting effect on transplanted tumors in mice and rats. The drug was helpful in treating benign prostate hyperplasia and certain micturition disorders.

INDICATIONS AND USAGE

Unproven Uses: Willow Herb is used internally for micturition problems associated with prostatic hyperplasia (Stages I to II), and for gastrointestinal disorders and mucous membrane lesions of the mouth. Native Americans use the drug for rectal bleeding; the Chinese use it for menstrual disorders. The watery extract is used externally to improve the healing of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: The drug is not available as a ready made medicinal preparation; only as a tea, watery extract or as a vegetable.

Winter Cherry

Physalis alkekengi

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe fruit and the leaves.

Flower and Fruit: The whitish, long-pedicled flowers are solitary and nodding. The calyx is fused and 5-tipped. The

corolla is fused with a slightly 5-tipped margin. There are 5 stamens and 1 superior ovary. The fruit is a cherry-sized, globular, scarlet berry, enclosed in the swollen, orange-red calyx. It contains numerous flat, reniform seeds.

Leaves, Stem and Root: The plant is a perennial and grows from 30 to 60 cm. The stems are erect or ascending and angular with opposite, long-petioled, entire-margined leaves.

Characteristics: Winter Cherry has a lantern-like, enlarged calyx when the fruit is ripe.

Habitat: The plant is indigenous to central and southern Europe, China and Indochina and is naturalized in the U.S.

Production: Winter Cherry fruits are the ripe fruits of *Physalis alkekengi*.

Other Names: Cape Gooseberry, Coqueret, Strawberry Tomato

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Whitasteroids: among others physalines A-C, F, L-0

Carotenoids: including zeaxanthine dipalmitic acid ester (red)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Winter Cherry is used as a diuretic in kidney and bladder conditions and in the treatment of gout and rheumatism.

PRECAUTIONS AND ADVERSE REACTIONS

The ripe fruit is edible, but unripe fruit can cause poisoning in animals. ;

DOSAGE

Mode of Administration: The drug is administered in a ground form and as an extract.

Winter's Bark

Drimys winteri

DESCRIPTION

Medicinal Parts: The medicinal part is the dried bark of the trunk and larger branches.

Flower and Fruit: The flowers are solitary or in umbels and often in clusters at the tips of the branches. They are fragrant and white. The sepals are membranous, broadly ovate to reniform. The 4 to 14 petals are also membranous, oblong to narrow-ovate. The 15 to 40 stamens are in 2 to 4 rows. The 2 to 10 carpels are free, ovate or elliptical. There are 9 to 18 ovules on a short seed stalk. The fruit is berry-like, black to violet, fleshy and usually contains 2 or 3 seeds.

Leaves, Stem and Root: The plant is an evergreen tree or shrub, with brownish or gray wrinkled branches. The bark is aromatic and smooth. The leaf blade is coriaceous, oblong-ovate to elliptical, with a somewhat revolute margin. The undersurface is usually punctate.

Characteristics: Winter's Bark has an astringent taste and mild smell.

Habitat: The plant is found from central Chile to Cape Horn and in neighboring Argentina.

Production: Genuine Winter's Bark is the bark of *Drimys winteri*. The bark is collected from the dried trunk or produced from the stronger branches. It is collected in uncultivated regions.

Not to be Confused With: The drug is often confused with *Cortex Canellae albae* and with the bark of *Cinnamodendron corticosum*.

Other Names: Pepper Bark, Winter's Cinnamon, Wintera Aromatica, Wintera

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpenes: including drimenol, drimenin, confertifoline, polygodial, isodrimenine, winterin, valdiviolide, fuegin, futranolide, cryptomeridiol, 1 beta-p-cumaroyloxypolygodial, a trimeric sesquiterpene lactone

Volatile oil: chief components eugenol, caryophyllene, 1,8-cineol, pinenes

EFFECTS

The drug has carminative, stomachic, and tonic effects due to the sesquiterpenes (bitter effect) and tannins.

INDICATIONS AND USAGE

Unproven Uses: In South America, the drug is used for toothache, as a stomachic and for dermatitis. Other uses include digestive disorders, flatulence and colic.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: As an infusion and domestic herb.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4-6 (Drogen): Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Wintergreen

Gaultheria procumbens

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaves and the oil extracted from them, as well as the fruit.

Flower and Fruit: The 7.5 mm long, solitary, hanging flowers grow from the base of the leaves. They are white or pale pink and campanulate. The fruit is the enlarged calyx. The scarlet berries are dull red and about 0.5 cm in diameter when dried. They are fleshy, globular, bilocular, and contain numerous whitish, ovoid, flattened seeds.

Leaves, Stem and Root: *Gaultheria procumbens* is a bushy evergreen plant with procumbent stems and upright rigid branches up to 15 cm high. It grows best under trees and shrubs. The branches bear clusters of leaves at their tips. The

leaves are coriaceous, oval, 3 to 5 cm long, glabrous and glossy above, paler beneath, long and solitary.

Characteristics: Wintergreen has an aromatic odor; the taste of the whole plant is astringent.

Habitat: *Gaultheria procumbens* is indigenous to the northern United States and Canada.

Production: Wintergreen leaves are the leaves of *Gaultheria procumbens*.

Other Names: Canada Tea, Checkerberry, Deerberry, Ground Berry, Hillberry, Mountain Tea, Partridge Berry, Spiceberry, Wax Cluster, Boxberry, Teaberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS: FRESHLY HARVESTED PLANT

Monotropitoid (*Gaultherin*): changing into methyl salicylate when the plant is dried

COMPOUNDS: DRIED PLANT

Volatile oil: chief component methyl salicylate (96-98%), in addition to oenanthic alcohol (n-heptan-1-ol) and its ester (which contributes to the odor of the volatile oil)

EFFECTS

The essential oil has a rubefacient effect.

INDICATIONS AND USAGE

Unproven Uses: Wintergreen was previously used as a carminative, tonic, antiseptic and aromatic. The drug was also used for neuralgia (particularly sciatica), gastralgias, pleurisy, pleurodynia (especially for medium stage pain), ovarialgia, orchitis, epididymitis, diaphragmitis, uratic arthritis and dysmenorrhea. Folk medicine indications also include asthma and use of wintergreen as an antiseptic. The drug is administered externally in the treatment of rheumatoid arthritis and related conditions.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug and its volatile oil can, however, trigger contact allergies.

OVERDOSAGE

Signs of poisoning such as severe stomach and kidney irritation appear with overdoses of the drug. Fatal poisonings can occur through oral and percutaneous administration of the pure volatile oil, often following are signs of central nervous system distress, lung edema and collapse. Poisonings with fatal results have been observed following the oral intake of as little as 4 to 6 g of the volatile oil.

DOSAGE

The drug is seldom used today. The active ingredient, methyl salicylate, is produced synthetically at a lower cost. Methyl salicylate is a constituent of liniments and bath additives.

Witch Hazel

Hamamelis virginiana

TRADE NAMES

Witch Hazel (available from numerous manufacturers),
Witch Hazel Leaf

DESCRIPTION

Medicinal Parts: The medicinal parts are the plant's hamamelis water, which is distilled from various plant parts; the bark; the fresh and dried leaves; the fresh bark of the roots and branches; and the dried bark of the trunk and branches.

Flower and Fruit: The androgynous and unisexual flowers grow in light to golden yellow, short-stemmed clusters on the trees before the leaves come out. The inflorescence is a small, head-like spike in the axils of the dropping leaves, with 5 to 8 flowers. The 4 sepals are ovate or triangular, curved outward, yellow-brown to brown on the inside. The petals are bright yellow, long, narrow-linear, rolled to a spiral in the bud and crushed like tissue paper when open. The ovary is villous, bivalvular with 2 anatropic ovules. Fertilization takes place during the spring that follows 5 to 7 months after pollination. The fruit capsule is woody, ovate, sectioned and divided, hazelnut-like, 12 to 15 mm long and

thickly pubescent. It bursts so dramatically in autumn that the 2 dark seeds are projected up to 4 m away from the plant.

Leaves, Stem and Root: The plant is a tree-like deciduous bush that typically grows 2 to 3 m high (but sometimes reaches heights up to 10 m) with a trunk diameter of 40 cm. The bark is thin, brown on the outside, reddish on the inside. The older branches are bushy, divided and silver-gray to gray-brown. The younger branches are yellowish-brown with hairs. The alternate leaves have stipules. The leaf margin is roughly crenate, bluntly indented to irregularly sweeping.

Habitat: Witch Hazel originated in the deciduous forests of Atlantic North America. The tree is common in European gardens and parks, and is also cultivated in subtropical countries.

Production: Witch Hazel leaf is obtained from the leaves of *Hamamelis virginiana*, which are collected in autumn and dried rapidly. Witch Hazel bark is the dried bark of the trunk and branches of *Hamamelis virginiana*.

Not to be Confused With: Witch Hazel is sometimes confused with Hazelnut bark, to which it bears a resemblance. Confusion can arise between Witch Hazel leaves and the leaves of *Corylus avellana* (hazelnut leaves), which are sometimes substituted as an adulteration.

Other Names: Hamamelis. Hazel Nut, Snapping Hazel, Spotted Alder, Striped Alder, Tobacco Wood, Winterbloom

ACTIONS AND PHARMACOLOGY

COMPOUNDS: WITCH HAZEL BARK

Tannins (up to 12%): including hamamelitannin, monogalloyl hamameloses

Catechins: including (+)-catechin, (+)-gallo catechin, (-)-epicatechin gallate(III), (-)-epigallocatechin gallate(III)

OUgomic procyanidins

EFFECTS: WITCH HAZEL BARK

Witch Hazel bark is astringent, anti-inflammatory and locally hemostatic.

COMPOUNDS: WITCH HAZEL LEAF

Tannins (5%): including hamamelitannin

Catechins: including (+)-catechin, (+)-gallo catechin, (-)-epicatechin gallate(III), (-)-epigallocatechin gallate(III)

OUgomic procyanidins

Volatile oil (0.01 to 0.5%): steam distillate, consisting chiefly of aliphatic carbonyl compounds, for example hex-2-en-1-ale, 6-methyl-hepta-3,5-dien-2-one aliphatic alcohols, aliphatic esters

Flavonoids: including quercitrin, isoquercitrin

EFFECTS: WITCH HAZEL LEAF

The tannins and tannin elements have an astringent, anti-inflammatory and locally hemostatic effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Hemorrhoids
- Inflammation of the mouth and pharynx (leaf only)
- Inflammation of the skin
- Venous conditions
- Wounds and bums

Unproven Uses: Witch Hazel leaf and bark are used internally in folk medicine for non-specific diarrheic ailments (such as inflammation of the mucous membrane of the large intestine and colon), hematemesis, hemoptysis and also for menstrual complaints. Efficacy in the treatment of diarrhea seems plausible because of the tannin content. Witch Hazel is used externally for minor injuries of the skin, localized inflamed swelling of the skin and mucous membranes, hemorrhoids and varicose veins. It is also used in folk medicine for inflammation of the mucosa of the colon, hematemesis and hemoptysis.

Homeopathic Use: Applications for use of Witch Hazel bark in homeopathy include hemorrhoids, varicose veins, skin inflammation and bleeding of the mucous membranes.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks following the proper administration of designated therapeutic dosages are not recorded. If taken internally, the tannin content of the drug can lead to digestive complaints. Liver damage is conceivable following long-term administration, but rare.

DOSAGE

WITCH HAZEL BARK

Mode of Administration: Witch Hazel Bark is available as comminuted drug or extract for internal and external use as galenic preparations. A steam distillate of the fresh leaves and bark is used for internal and external application.

How Supplied: Forms of commercial pharmaceutical preparations include: cream; gel; ointment; suppositories.

Preparation: Various formulations of Witch Hazel are prepared as follows:

External—aqueous steam distillate (Witch Hazel water) undiluted, or diluted 1:3 with water.

For poultices—20 to 30% in semi-solid preparations.

Extract preparations—semi-solid and liquid preparations, corresponding to 5 to 10% drug.

Compresses and rinses—decoctions of 5 to 10 g of herb per cup (250 ml) of water.

Ointment/gel—5 g Witch Hazel extract in 100 g ointment base.

Suppositories—Use 0.1 to 1 g drug.

Daily Dosage: Suppositories can be used 1 to 3 times a day.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day, suppositories 2 to 3 times per day and ointment 1 to 2 times daily (acute and chronic); for the external application, 1 dessertspoonful to be mixed with 250 ml water and then used as a wash or poultice (HAB1).

Storage: Store Witch Hazel bark protected from exposure to light.

WITCH HAZEL LEAF

Mode of Administration: Witch hazel leaf is available as comminuted drug or extract for internal and external use as galenic preparations. A steam distillate of the fresh leaves and bark is used for internal and external applications.

How Supplied:

Liquid —1:1 liquid

Preparation:

Liquid extract—1:1 with 45% ethanol (PF X).

Stabilized liquid extract—100 g of leaf powder are moistened with 45 g 1:2 90% ethanol:water and subsequently percolated with 540 g 1:2 90% ethanol:water. Separation into 85 g forerun and the residue, which is evaporated until dry. The dried substance is dissolved with 15 g ethanol:water and is then mixed with the forerun. This solution is kept for 8 days at 2 to 8° C and then filtered at the same temperature. Tea: pour 150 ml boiling water over 2 to 3 g drug and strain after 10 minutes.

Daily Dosage:

Decoction—250 ml water with 5 to 10 g drug for washes or poultices; 2 to 3 g to 150 ml water as a gargle solution.

Suppositories—0.1 to 1 g drug/supp. 3 times daily.

Tea—1 cup 2 to 3 times daily between meals.

Liquid extract—2 to 4 ml 3 times daily.

Storage: Protect Witch Hazel leaf from light and moisture when stored.

Wood Anemone

Anemone nemorosa

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh plant gathered shortly before the flowers open and the dried aerial parts of the plant.

Flower and Fruit: The white flowers are solitary and located at the end of a long stem. The stem is erect when in flower, white to reddish-violet, and has a diameter of 1.5 to 4 cm. The usually 6 (but possibly 5 to 9) bracts are oblong-ovate, entire-margined and glabrous. The flowers have numerous yellow stamens. The 10 to 20 carpels are oblong with a short curved beak. They are downy and 4 to 5 mm long. The fruit is a drooping compound with a roughly haired fruitlet.

Leaves, Stem and Root: *Anemone nemorosa* is a perennial plant, 6 to 30 cm high with a horizontally creeping, yellow to dark brown, roundish rhizome. The stems are usually solitary, erect, glabrous or sparsely pubescent. There is usually a long-stemmed basal leaf. The leaf is tri-pinnate and pinnatifid-serrate. The first row of pinna are stemmed and have horizontal pinna sections, each with 1 pinna of the second level. There are cauline rosettes of 3 leaf-like bracts, which have a 2-cm long petiole. The bracts do not generally have axillary buds, and are palmate and pinnatifid-serrate.

Habitat: The plant is spread almost all over Europe as far as the Volga region except in the Mediterranean and northern Lapland.

Production: Wood Anemone is the aerial part of *Anemone nemorosa*, collected shortly before the flowers open.

Other Names: Pasque Flower, Crowfoot, Wind Flower, Smell Fox

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Protoanemonine-forming agents (yielding approximately 300 mg protoanemonine per gram of fresh weight): presumably, the glycoside ranunculin, which changes enzymatically when the plant is cut into small pieces (and probably also when it is dried) into the pungent, volatile protoanemonine that quickly dimerizes to anemonine; when dried, the plant is not capable of protoanemonine formation

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for stomach pains, delayed menstruation, gout, whooping cough and asthma.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Prolonged skin contact with the freshly harvested plant can lead to slow-healing blisters and cauterizations due to the formation of protoanemonine, which is severely irritating to skin and mucous membranes. If taken internally, severe irritation to the gastrointestinal tract and urinary drainage passages, as well as colic and diarrhea, are possible.

Symptomatic treatment for external contact should consist of irrigation with diluted potassium permanganate solution followed by mucilage.

OVERDOSAGE

In case of internal contact, administer gastric lavage followed by activated charcoal. Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments. The ingestion of 30 freshly harvested plants is considered the fatal level for humans.

DOSAGE

Mode of Administration: The drug can be found in dilute homeopathic preparations of the mother tincture.

Wood Betony

Betonica officinalis

TRADE NAMES

Wood Betony Herb Liquid

DESCRIPTION

Medicinal Parts: The medicinal part is the herb, including the basal leaves.

Flower and Fruit: The flowers are crimson and labiate in terminal, spike-like, irregular formation. The calyx, with 5 even, triangular tips, has long ciliate hairs and is shorter than the corolla tube. The corolla is curled downward, and the white tube has no ring of hair. The upper lip is erect, and the lower lip is 3-lobed with a broad middle lobe. There are 4 stamens.

Leaves, Stem and Root: The plant grows to a height of about 30 to 100 cm. The stem is erect, unbranched, quadrangular, bristly-haired and usually only has 2 distal pairs of leaves. The basal leaves are rosette-like. The leaves are elongate-ovate with a cordate base and crenate. The lower ones are larger and long-petioled, and the upper ones are smaller and shorter.

Habitat: The plant grows in Europe.

Production: Wood Betony is the flowering plant of *Betonica officinalis* collected from June to August at flowering time. The herb, including the basal leaves, is collected and dried in the shade at a maximum temperature of 40° C.

Not to be Confused With: *Stachys alpina*

Other Names: Betony, Bishopswort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Betaine: including betonine [(-)-oxystachydrine], (-)-stachydrine), ((+)oxystachydrine]

Caffeic acid derivatives: including chlorogenic acid, isochlorogenic acid, rosemary acid iridoid glycosides

Diterpene lactone

Iridoids: iridoid glycosides, including harpagide

Flavonoids

EFFECTS

The drug is said to act as a tranquilizer, a disinfectant and an astringent. It contains glycosides with hypotensive characteristics.

INDICATIONS AND USAGE

Unproven Uses: Wood Betony is an astringent. As an expectorant, it is used for coughs, bronchitis and asthma. It is

contained in combination preparations as a sedative and for the treatment of neuralgia and anxiety. In folk medicine, it is used as an antidiarrheal agent, a carminative, and a sedative, and for catarrh, lung catarrh, heartburn, gout, nervousness, bladder and kidney stones, and inflammation of the bladder.

Homeopathic Uses: *Betonica officinalis* is used in homeopathy for asthma and general states of debility.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is used topically, as an extract and an infusion. The fresh leaves are also used.

Daily Dosage: The infusion can be taken daily. The total daily dosage of the powder is 1 to 2 gm, to be taken in 3 separate doses. The fresh leaves may be boiled and used for wounds and swelling.

Wood Sage

Teucrium scorodonia

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb, the fresh aerial parts of the flowering plant and the whole flowering plant.

Flower and Fruit: The flowers are approximately 1 cm long, pale yellow or greenish-yellow. They are solitary or in pairs on short pedicles in one-side-inclined, terminal racemes. The calyx of the labiate flower is tubular-campanulate and bilabiate with an undivided upper and a 4-tipped lower lip. The stamens are pubescent and the anthers are violet. The nutlet is round, about 2mm long, and almost smooth.

Leaves, Stem and Root: The plant is erect, 30 to 60 cm high and has far-reaching runners. The stem is erect, paniculate-branched above, quadrangular and soft-pubescent. The leaves are petiolate, opposite, wrinkled, ovate or oblong, unevenly crenate and have a shallowly cordate base.

Characteristics: The plant smells faintly of leeks when being dried.

Habitat: The plant is common to large parts of western and central Europe including the Mediterranean region. It is rarely found in eastern Europe and Scandinavia but it has naturalized there.

Production: Wood Sage is the aerial part of *Teucrium scorodonia*.

Other Names: Ambroise, Garlic Sage, Hind Heal, Large-Leaved Germander

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.3%): containing among others, alloaromadendrene, aristolene, beta-caryophyllene, alpha-caryophyllene (humulene), spathulenone, caryophyllene epoxide

IriUoide monoterpenes: including among others, acetyl harpagide, reptoside

Diterpenes: the spectrum varies greatly according to strain, including among others teuscorodal, teuscorodin, teuscorodol, teuscorodonin, teufin, teuscorolide, teupolin I

Flavonoids: including among others, cirsiol, cirsimaritin, luteolin

EFFECTS

The expectorant effect attributed to the drug may be due to the amaroids and the essential oil. See other *Teucrium* species for the toxic effect.

INDICATIONS AND USAGE

Unproven Uses: Wood Sage is used for the treatment of tuberculosis, chronic bronchial catarrh, inflammation of mucous membranes of the nose and throat, spasms, hypertension, wounds and liver disorders.

Homeopathic Uses: The herb is used for chronic inflammation of the respiratory tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Wood Sage is obsolete as a drug in most countries, but it can be found as cut drug in capsules and drops.

Preparation: To treat bronchitis, a tea is made using 2 teaspoons of herb per cup.

Wood Sorrel

Oxalis acetosella

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh flowering plant with the root.

Flower and Fruit: The solitary flower is white or reddish-white and red-veined with yellow spots. The pedicle is longer than the leaves. There are 5 sepals and 5 petals, 10 stamens and 1 ovary with 5 styles. The fruit is an ovate capsule. It is pentangular, tearing open in long slits when ripe, thus freeing the seeds.

Leaves, Stem and Root: The plant grows to a height of between 5 and 12 cm tall. The leaves are basal, tender, long-petioled and trifoliate. The leaflets are broad, obovate-cordate, downy and often tinged red underneath. The stem is leafless apart from bracts above the middle, which are fused at the base.

Characteristics: The plant has a pleasant, rather sour odor.

Habitat: The plant is commonly found in woods and forests throughout Europe.

Production: Wood Sorrel is the aerial part of *Oxalis acetosella*, which is harvested while the plant is in blossom.

Other Names: Cuckoo Bread, Cuckowes Meat, Fairy Bells, Green Sauce, Hallelujah, Shamrock, Sour Trefoil, Stickwort, Stubwort, Surelle, Three-Leaved Grass, Wood Sour

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Oxalic acid (0.3-1.25%): especially present as potassium salt

EFFECTS

The drug, including the green parts of the plant, contains clover acid that, in small amounts, affects gallbladder

activity by acting as a diuretic. The fresh plant provides a substantial source of vitamin C.

INDICATIONS AND USAGE

Unproven Uses: Wood Sorrel is no longer used as a remedy, but previously was used for liver and digestive disorders. Also, in the past, the fresh leaves were used to treat scurvy, wounds and inflammation of the gums.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Oxalic acid poisonings could occur only through the ingestion of very large quantities of the leaves, for example as in salad. The poisonings mentioned in older scientific literature seem dubious.

DOSAGE

Mode of Administration: Ground and as an extract. Wood Sorrel is no longer used as a remedy.

Wormseed

Artemisia cina

DESCRIPTION

Medicinal Parts: The medicinal parts are closed flowerbuds, that have not yet blossomed.

Flower and Fruit: The numerous flower heads are about 2 mm long with a diameter of 1.5 mm. They are ovoid and greenish-yellow when fresh, later brownish-green. They contain three to five minute, tubular, androgynous florets with a slim, cylindrical and glabrous receptacle. The epicalyces have numerous oblong-obtuse, imbricate scales.

Leaves, Stem and Root: Artemisia cina is an evergreen, perennial semi-shrub, 30 to 60 cm high with many slim sprouting stems. The gnarled rhizome produces numerous leaf and flower branches. The stems are smooth and woody and the leaves pinnatifid on the non-flowering branches. The leaves on the flowering branches are small and entire-margined.

Characteristics: The odor is aromatic and the taste bitter.

Habitat: The plant is indigenous to Iran, Turkestan and the Kirghizin Steppes around Buchara.

Production: Wormwood flowers are the inflorescent buds of Artemisia cina (occasionally incorrectly called Wormseed), which are cultivated and gathered in the wild.

Not to be Confused With: Refined mustard flour

Other Names: Levant, Santonica, Sea Wormwood

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpene lactones: especially alpha-santonin, in addition to artemisin and beta-santonin

EFFECTS

The anthelmintic and antipyretic effect of the drug can be attributed to its alpha-santonin content. The drug acts as a vermifuge action for ascarids, including intestinal parasitic worms, whose muscles are paralyzed by the santonin. The worms are then forced into the large intestine where they are removed by means of a laxative. In rats, the rectal temperature was lowered during fevers that had been induced by brewer's yeast injections. This leads to the speculation that santonin effects body temperature in a similar manner to dopamine.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for ascarid and oxyuris infestations.

Homeopathic Uses: Uses in homeopathy include fevers, tendency to convulsions and worms.

PRECAUTIONS AND ADVERSE REACTIONS

Even with the therapeutic dose there is a danger of poisoning. Side effects may resemble those of the alpha-santonins: kidney irritation, gastroenteritis, stupor, visual disorders (xanthopsia), muscle twitching and epileptiform spasms. Administration in allopathic dosages is to be avoided.

OVERDOSAGE

Deadly poisonings following the intake of less than 10 g of the drug are known.

DOSAGE

Preparation: Wormwood is considered completely obsolete as a drug, occasionally available as a powder for use when more modern antihelminthic agents fail. Symptoms of poisoning are possible even in therapeutic dosages.

Daily Dosage: The drug is always used in combination with a laxative. The average single dose is 0.025 g for adults. For children, take the child's age in years, and double this amount in milligrams of the drug. According to the Austrian pharmacopoeia, the single dose is 1 to 2 g. The powder is administered in the morning and followed later by castor oil or sodium sulfate. The remedy is repeated on the following day.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules, 1 to 3 times a day or 1 ml injection solution twice weekly sc (HAB34).

Wormseed Oil

Chenopodium ambrosioides

DESCRIPTION

Medicinal Parts: The plant's medicinal parts are the seeds and the herb, including the flowers.

Flower and Fruit: The numerous small flowers are yellowish-green and form small racemes or roundish spikes in the axils of the apical leaves. The calyx is divided into 5; the lobes are ovate and pointed. There are 5 stamens. The ovary has small, oblong, stemmed glands at the tip. The angular fruit is enclosed in the calyx. The small seeds are achenes, smooth and black.

Leaves, Stem and Root: The plant is an annual that grows to about 1 m in height with a branched, reddish stem. The stem is covered in alternate-linear to lanceolate leaves.

Characteristics: The whole plant gives off a pleasant fragrance. The oil is dangerously explosive.

Habitat: Wormseed originated in Mexico and South America but has spread to the eastern U.S.

Production: Wormseed Oil is the seed oil of *Chenopodium ambrosioides*.

Other Names- Mexican Tea, American Wormseed, Jesuit's Tea

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Ascaridiol (chief constituent - up to 80%): including, according to variety and breed, p-cymene, L-pinocarvone, alpha-pinene and/or alpha-terpenes, limonene. The combination creates a volatile, explosive oil.

EFFECTS

Wormseed Oil acts as an anthelmintic that causes flight and defensive reactions in worms. This is due to the main constituent of the terpene fraction, which is ascaridole, a monoterpene. This constituent is highly toxic.

INDICATIONS AND USAGE

Unproven Uses: Although considered obsolete as a drug, Wormseed Oil is used against roundworms and hookworms, if other, more modern anthelmintic drugs fail. The leaves and seeds have long been used in South American medicine as a vermifuge, stimulant, anti-asthmatic and abortifacient for cramps, paralysis and asthmatic complaints.

Chinese Medicine: The Chinese have used Wormseed Oil for rheumatism of the joints, metrorrhagia, eczema and bites.

PRECAUTIONS AND ADVERSE REACTIONS

Even the administration of therapeutic dosages can lead to disorders of the central nervous system, including spasms, signs of paralysis, Pachymeningitis haemorrhagica. Damage to the Nervus cochlearis is frequent, leading to buzzing in the ears and hearing impairment (sometimes lasting for years). In addition, the oil is dangerously explosive.

OVERDOSAGE

Cases of death have been observed following intake of 10 mg of the oil by adults, and much less for children. For that reason, an administration in allopathic dosages is to be avoided.

DOSAGE

Mode of Administration: Wormseed Oil is obsolete as a drug. In clinically described cases, which are exceptional, it

can be used in combination with a fast-acting and powerful purgative.

Daily Dosage: Typical adult daily dosage is 20 drops taken in the morning on an empty stomach. Two hours later, a purgative is taken. Pediatric dosage is two single doses of drops taken one hour apart. Each dose has one drop per year of the child's age.

Wormwood

Artemisia absinthium

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial shoots and leaves of the plant.

Flower and Fruit: The numerous flower heads are short-stemmed and hang in a many-flowered panicle. The capitula are small, globular, inclined and nearly as long as their 3 to 4 mm width. The bracts are gray, silky-pubescent with a rounded tip. The outer bracts are linear-oblong and pubescent, while the inner ones are ovate, obtuse, broad and have a transparent, membranous margin. The receptacle is rough-haired. The flowers are yellow and fertile. The disc florets are androgynous; the ray florets are female with an extending style stem. The fruit is about 1.5 mm long.

Leaves, Stem and Root: This semi-shrub grows from 60 to 120 cm in height with a woody, hardy rosette and a high-branch bearing stem. The stem is usually erect and leafy. The alternate, long-petioled leaves are silky pubescent on both sides. The lower leaves are abrupt pinnate and the upper ones simple. The leaf tips are lanceolate to linear-lanceolate, obtuse to acuminate and 2 to 3 mm wide.

Characteristics: The plant has an aromatic odor and a very bitter taste.

Habitat: Wormwood grows in Europe, northern Africa, parts of Asia, and North and South America.

Production: Wormwood consists of the fresh or dried upper shoots and leaves, the fresh or dried basal leaves, or a mixture of the aerial plant parts from *Artemisia absinthium*, that is harvested during flowering season from cultivated or wild plants.

Other Names: Green Ginger, Absinthe

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: with a high level (varies a great deal among different strains) of (+)-thujone, cis-epoxy ocimene, trans-sabinyl acetate or chrysanthenyl acetate

Sesquiterpene bitter principles: including absinthine, anabsinthine, artabsine and matricine

EFFECTS

The cholagogic, digestive, appetite-stimulating and wound-healing effects ascribed to the drug are attributed to the essential oils and amaroids. A significant increase of alpha-amylase, liapse, bilirubin and cholesterol has been observed during the 70 to 100 minutes during which patients with liver disorders were given a suspension of 20 mg extract in 10 ml water via a duodenal probe. In rabbits, fever induced through yeast injection was reduced by using an esophageal probe to administer diverse fractions of the drug. In vitro, a watery extract of the whole drug is supposed to retard the growth of *Plasmodium falciparum*. The essential oil of the drug may possess an antimicrobial effect. The drug also stimulates the bitter receptors in the taste buds of the tongue. When bitter agents are introduced into the mouth, they trigger a reflexive increase of stomach secretion with higher acid concentration.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints
- Liver and gallbladder complaints

Unproven Uses: In folk medicine, wormwood preparations are used internally for gastric insufficiency, intestinal atonia, gastritis, stomachache, liver disorders, bloating, anemia, irregular menstruation, intermittent fever, loss of appetite and worm infestation. Externally, the drug is applied for poorly healing wounds, ulcers, skin blotches and insect bites. Efficacy in the above-mentioned popular uses is insufficiently documented.

PRECAUTIONS AND ADVERSE REACTIONS

General: Due to the drug's thujone content, the internal administration of large doses can lead to vomiting, stomach and intestinal cramps, headache, dizziness and disturbances

of the central nervous system. Continuous use is not advisable. The use of volatile oils and spirituous extracts from the drug for the manufacture of alcoholic drinks is forbidden in many countries because of possible injuries to health.

Drug Interactions: The thujone component may lower the seizure threshold. Caution must be exercised when administering this herb to patients that have a predisposition to seizures. Drugs that are used to control seizures may have decreased effectiveness. Wormwood preparations should not be administered in conjunction with drugs that are known to lower the seizure threshold.

DOSAGE

Mode of Administration: Comminuted herb is used for infusions and decoctions. Powdered herb, extracts and tinctures in liquid or solid forms are used for oral administration. Combination with other bitters or aromatics is common.

Preparation: To prepare an infusion, pour 150 ml boiling water over 1/2 teaspoonful of the drug, strain after 10 minutes. A decoction is prepared by adding 1 handful of drug to 1 liter of boiling water for 5 minutes. To prepare a tea, use 1 g drug in 1 cup water.

Daily Dose: The total daily dose is 3 to 5 g of the herb as an aqueous extract. Internal dose of the infusion is 1 cup freshly prepared tea taken 30 minutes before each meal. The tincture dosage is 10 to 30 drops in sufficient water taken 3 times daily. The liquid extract dosage is 1 to 2 ml taken 3 times daily.

Externally, a decoction is used for healing of wounds and insect bites.

Storage: Wormwood must be kept in sealed containers and protected from light.

Wormwood Grass

Spigelia anthelmia

DESCRIPTION

Medicinal Parts: The whole fresh plant, the juice prepared from the fresh plant and the dried leaves are used medicinally.

Flower and Fruit: The inflorescences are terminal or axillary, 5 to 12 cm long spikes turned to one side. They are often involute. The flowers in the axils of the bracts are sessile. The flowers are radial and their structures are in fives. The sepals are free, linear-lanceolate and 2 to 5 mm long. The 5 petals are fused with a 6.5 to 15 mm long, lilac, pink or white, funnel-shaped corolla. There are 5 stamens and a 2-chambered ovary. The fruit is a capsule approximately 5 mm long and 5 mm wide. The seeds are 2 to 3 mm long, elliptical or ovoid, dark brown and warty.

Leaves, Stem and Root: The herb grows upright to a height of up to 60 cm. The leaves are opposite and, because of short internodes, appear to be in whorls. They are 4 to 18 cm long, 2 to 6 cm wide, very short petiolate, simple, entire, ovate-lanceolate to elongate-ovate and long acuminate. The stipules are fused, membranous, broad and triangular. The stem and lateral branches are almost leafless, usually terminating in a 4-leafed whorl.

Habitat: *Spigelia anthelmia* is indigenous to North, Central and South America.

Production: Wormwood Grass herb is the dried aerial part of *Spigelia anthelmia*, which is collected in the wild and cultivated in tropical and subtropical regions of America.

Other Names: Annual Wormwood Grass, American Wormwood Grass, Pink Root, Demerara Pinkroot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including hyperoside, quercetin-di-O-glucoside, quercetin-O-rhamnoglucoside

Phenol carboxylic acids: vanillic acid, dihydroxy benzoic acid, caffeic acid

Caffeic acid derivatives: chlorogenic acid

Amines: isoquinoline

Monoterpene alkaloids: actinidine

EFFECTS

The choline esters contained in the drug are possibly hypertensive in effect. Depending upon the dosage level, isoquinoline is positively inotropic in effect on isolated gerbil hearts. The experimental results in this area require further testing. The vermifugal action mechanism credited to the drug has not yet been proven. The isoquinoline found in the drug is not present at levels required for protoplasma-destroying effect.

INDICATIONS AND USAGE

Unproven Uses: Traditional folk medicine has included use for worm infestation.

Homeopathic Uses: Homeopathic uses include angina pectoris, neuralgia and headache, acute carditis and worm infestation.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drug is considered to be severely poisonous. Animal poisonings were described in older literature sources, as was deliberate use to poison humans. The toxin is said to be a non-volatile alkaloid. Human consumption of large quantities of the drug is said to lead to vomiting, myositis, dyspnea and spasms.

Homeopathic Precautions: No health hazards are known in conjunction with the proper administration of designated homeopathic dosages.

DOSAGE

How Supplied: Whole and cut drug.

Daily Dosage: The literature has no information.

Woundwort

Stachys palustris

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh and dried herb.

Flower and Fruit: The closely sessile flowers have very small bracteoles. They are arranged in false whorls of 6 florets joined in groups of 10 to 20 into a spike. The calyx is tubular-campanulate, violet-tinged with awned tips. The corolla is dull violet and the style pink. The nutlet is globular, 2 mm long, lightly striped and glossy dark brown.

Leaves, Stem and Root: The plant is a perennial, with long runners and barrel-like white swellings between the nodes. The shoots are usually loose and have partly appressed, partly patent silky hairs. They are pubescent or almost glabrous and almost odorless. The stems are erect or ascendent from the ground, 30 to 60 cm high, simple or branched, tough, usually with pubescent edges. The internodes are 2 to 10 cm long. The leaves are sessile or very short-petioled, usually clasping, ribbed, matte green and loosely appressed pubescent on both surfaces.

Habitat: The plant is common in Europe.

Production: Woundwort is the aerial part of *Stachys palustris* or *Stachys sylvatica*.

Not to be Confused With: *S. palustris* is Marsh Woundwort and *S. sylvatica* is Hedge Woundwort. Several other plants have the name Woundwort, among them, *Prunella vulgaris* and *Achillea millefolium*.

Other Names: Marsh *Stachys*

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Iridoide monoterpenes

Betaines: (-)- and (+)stachydrine

Flavonoids: including among others palu[^]trin

EFFECTS

Woundwort is said to be a disinfectant, an antispasmodic and a cure for wounds.

INDICATIONS AND USAGE

Unproven Uses: The herb is used externally for the treatment of wounds and internally for abdominal pain, cramps, dizziness, fever, gout and menstrual disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As an extract or poultice for external application.

Yage

Banisteriopsis caapi

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the bark.

Flower and Fruit: The inflorescence is multi-flowered. The flowers are 10 to 15 mm wide with pale pink petals. Their structures are arranged in fives. The fruit, which resembles that of the maple, is up to 4 mm long and 0.4 mm wide. Each of the 3 schizocarps has an 18 to 42 mm long and 8 to 22 mm wide wing.

Leaves and Stem: *Banisteriopsis caapi* is a hardy tree. The leaves are opposite, 8 to 18 cm long, 3.5 to 8 cm wide, ovate and entire. The stem is woody with a brown, smooth bark.

Habitat: The plant is native to jungle areas of the Amazon basin.

Production: Yage bark is the dried or fresh trunk bark of *Banisteriopsis caapi*.

Other Names: Ayahuasca, Vine of the Souls

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (beta-carboline type): particularly harmine (0.5 to 5.9%), harmaline (0.5 to 3.8%), tetrahydroharmine (0.3 to 3.3%), harmol (0.05 to 1.2%), harmalol (up to 0.4%)

Pyridine alkaloids: shinunine, dihydroshinunine

EFFECTS

The alkaloid-containing drug is psychotropic and hallucinogenic in effect, due to the harmine and harmaline it contains (pronounced MAO-inhibition in vitro and in animal experiments). Lower dosages bring on euphoric states in humans, while higher dosages have hallucinogenic effects.

INDICATIONS AND USAGE

Unproven Uses: The plant contains psychoactive substances, which intensify dreams and experiences.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is not in medicinal use. Extracts of the drug (ayahuasca, 5 mg alkaloids/ml), ingested orally in low doses, have hallucinogenic and euphoric effects. These effects are primarily due to monoamine oxidase inhibition; later the effect becomes sedative.

OVERDOSAGE

The intake of higher dosages (corresponding to levels starting at approximately 0.3 gm alkaloids) leads to vomiting, nausea, ringing of the ears and tendency to collapse.

DOSAGE

Mode of Administration: Fresh or dried herb powder and liquid preparations for internal use.

Preparation: The fresh or dried cut bark is macerated for several hours resulting in a bitter syrup, which is then consumed in small amounts. In addition, some of the bark is pulverized, mixed with water and then consumed in larger amounts. The juice can be kept for up to 6 months in tightly sealed containers.

Yarrow

Achillea millefolium

TRADE NAMES

Yarrow Flowers, Yarrow Extract, Alcohol-Free Yarrow Flowers

DESCRIPTION

Medicinal Parts: The dried flower clusters and above-ground parts of the herb are used medicinally.

Flower and Fruit: The plant has white, pink or purple composite flowers in dense cymes with small capitula. The bracts are imbricate, long, thorn-tipped and taper to a point. There are 5 white female florets. The disc florets are tubular,

yellowish-white and androgynous. The fruit is 1.5 to 2 mm long.

Leaves, Stem and Root: *Achillea millefolium* are 0.1 to 1.5 m high plants with hardy, horizontal rhizomes, which grow from underground runners. The stem is simple, erect and hairy. The leaves are lanceolate and multi-pinnate with short acute tips.

Habitat: The numerous subspecies of the *Achillea millefolium* group are found in various regions. They mainly grow in regions of eastern, southeastern and central Europe, as well as on the southern edge of the Alps from Switzerland to the Balkans.

Production: Yarrow herb consists of the fresh or dried, above-ground parts of *Achillea millefolium*, harvested at flowering season. Yarrow flower consists of the dried inflorescence of *Achillea millefolium*.

Other Names: Band Man's Plaything, Bloodwort, Carpenter's Weed, Devil's Nettle, Devil's Plaything, Milfoil, Nose Bleed, Old Man's Pepper, Sanguinary, Soldier's Woundwort, Stauchweed, Thousand Weed, Yarroway, Thousand Seal, Noble Yarrow, Knight's Milfoil

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.2-1.0%): chief components (rendered through steam distillation) are chamazulene (blue, 6-19%, maximum 40%), camphor (up to 20%), beta-pinene (up to 23%), 1,8-cineole (up to 10%), caryophyllene (up to 10%), alpha-pinene (up to 5%), isoartemisiaketone (up to 8%). The composition depends greatly on the variety, and the volatile oil of some strains is free of chamazulene.

Sesquiterpene lactones: Mainly guaianolides including, achillicin, 8-alpha-angeloyloxy-10-epi-artabsin, 2,3-dihydro-desacetoxy-matricin, alpha-peroxyachifolide. There are also germacranolides such as millefoild and 3-oxaguaianolides. Some sesquiterpenes are transformed through steam distillation into chamazulene (proazulenes).

Polyynes: including pontica epoxide

Alkamids: including tetradeca-4,6-diin-10,12-dien acetyl isobutylamides

Flavonoids: including apigenine-7-O-glucoside, luteolin-7-O-glucoside, rutin

Betaine: including L-stachydrine, L-hydrostachydrine (betonicine)

EFFECTS

The herb has a cholagogue (stimulates the flow of bile) effect due to the guaianolide and germacranolide content. The flavonoid content exerts a spasmolytic effect, while the

proazulene fraction has an anti-edema and anti-inflammatory effect. The effect probably results from the interaction of various structured bonds with the chamazulene and flavonoids. The plant has similar effects to those observed in Chamomile flowers, since some of their components are identical.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints
- Liver and gallbladder complaints

Unproven Uses: Externally, the herb is used as a sitz bath for painful, cramp-like conditions of psychosomatic origin in the lower part of the female pelvis. Yarrow is also used externally as a palliative treatment for liver disorders and for the healing of wounds. In folk medicine, it is used for bleeding hemorrhoids, menstrual complaints, and as a bath for the removal of perspiration. It is contained in other cholagogic preparations and biliary tract therapeutic agents. It is also used as an adjuvant in preparations for many other indications such as laxatives, cough treatments, gynecological agents, cardiac agents and preparations for varicose veins.

Homeopathic Uses: *Achillea millefolium* is used in varicose veins, arterial bleeding, convulsions.

CONTRAINDICATIONS

Contraindications include allergy to Yarrow and other composites.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a weak to medium-severe potential for sensitization resulting in contact dermatitis. The main compound responsible for the sensitization is a sesquiterpene lactone, alpha-peroxyachifolid (Hausen, 1991; Rucker, 1991).

Pregnancy: The drug is not to be used during pregnancy.

DOSAGE

How Supplied:

Capsules — 340mg, 350 mg

Liquid[^] — 1:1, 250 mg/ml

Mode of Administration: As a comminuted drug for teas and other galenical preparations for internal use and for sitz baths. The pressed juice of fresh plants is used internally. The drug is contained in standardized preparations of cholagogic and gallbladder therapeutics and as an adjunct in many other preparations, such as laxatives, antitussives,

gynecological products, cardiac remedies and preparations for varicose veins.

Preparation: To make a tea, place 2 gm of finely cut drug in boiling water, cover, leave to steep for 10 to 15 minutes, and then strain. For sitz baths, use 100 gm Yarrow per 20 liters of water.

Daily Dosage:

Infusion — 4.5 gm Yarrow herb or 3 gm Yarrow flowers.

Tea — A cup of freshly made tea to be drunk 3 to 4 times daily between meals.

External application — 100 gm Yarrow to be drawn in 1 to 2 liter of water for 20 minutes and added to the bath water.

Homeopathic Dosage: 5 to 10 drops 1 to 3 times daily; 1 tablet or 5 to 10 globules: injection solution 1 ml 1/week sc (HAB1).

Storage: The herb must be protected from light and moisture. The essential oil should not be stored in synthetic containers.

Yellow Dock

Rumex crispus

TRADE NAMES

Yellow Dock (available from a number of manufacturers), Yellowdock, Alcohol Free Yellow Dock, Yellow Dock Root, Wild Countryside Yellow Dock Root

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh and dried roots.

Flower and Fruit: The green androgynous flowers are in panicles. The inner tips of the perigone are entire-margined, orbicular or ovate. When the fruit ripens they are slightly longer than wide. Otherwise the flower is the same as *R. acetosa* in that there is a 6-tepalled perigone. The inner tepals are longer than the outer ones and grow closer together. When the fruit ripens they are usually red-tinged, membranous, entire-margined and have a downward curved, scale-like welt at the base. The outer 3 tips are revolute. There are 6 stamens and 3 styles with paintbrush-like stigmas. The

fruit is a triangular, brown-black nut, which is enclosed by the wing-like enlarged inner tepal.

Leaves, Stem and Root: The plant is about 100 cm high and has a carrot-like rhizome. The roots are 20 to 30 cm long, about 1.25 cm thick, fleshy and are not usually branched. The roots are rusty brown on the outside, whitish on the inside and have a relatively thick bark. The stems are angular, grooved and usually branched from the base up. The lower leaves are large and have flat petioles. They are supported at the base or almost cordate, lanceolate acute, undulate-curlly at the margins and alternate. The upper leaves are smaller and narrow-lanceolate.

Habitat: The plant is indigenous to Europe and Africa, but grows wild in many regions of the world.

Production: Yellow Dock root is the fresh root harvested in spring from *Rumex acetosa*.

Other Names: Curled Dock

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Oxalates: oxalic acid, calcium oxalate

Tannins (3-6%)

Flavonoids: including among others, quercitrin

Anthracene derivatives (0.9-2.5%): anthranoids, aglycones physcion, chrysophanol, emodin, aloe-emodin, rhein, their glucosides

Naphthalene derivatives: neopodin 8-glucoside, lapodin

EFFECTS

No documentation is available, but laxative, alterative and mildly tonic characteristics have been attributed to *Rumex crispus*.

INDICATIONS AND USAGE

Unproven Uses: Yellow Dock is used for acute and chronic inflammation of the nasal passages and respiratory tract. It is also used as an adjuvant in antibacterial therapy. The plant has traditionally been used like the Red Dock (*R. aquatica*) for its similar properties, in decoctions for scurvy and other skin eruptions, and as a 'blood cleanser.' It is also used as an astringent for hemorrhoids and pulmonary bleeding. It has been used as a remedy for jaundice and a tonic for the stomach.

Homeopathic Uses: Uses in homeopathy include inflammation of the mucous membranes of the respiratory tract, asthmatic conditions, tracheal cough and morning diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic

dosages. However, mucus membrane irritation, accompanied by vomiting is possible following intake of the fresh rhizome, due to its anthrone content. The anthrones are oxidized to anthraquinones after dehydration and storage.

OVERDOSAGE

Oxalate poisonings are conceivable primarily with the consumption of numerous leaves eaten as salad. One case of death following consumption of a soup made from the leaves of the curled Yellow Dock has been described (see Frohne).

DOSAGE

Mode of Administration: Preparations are available in ground form or as an extract.

How Supplied:

Capsules — 500 mg, 505 mg

Yellow Gentian

Gentiana lutea

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried or fresh underground plant organs.

Flower and Fruit: The flowers are yellow, terminal, pedicled and axillary in cyme-like false whorls. The calyx is deeply divided in 2. The corolla is rotate and divided almost to the base into 5 or 6 lanceolate tips. There are 5 stamens with 8 mm long anthers and 1 superior ovary. The fruit is 6 cm long

and capsule shaped. The numerous seeds are flat, oblong or round, with a membranous edge.

Leaves, Stem and Root: Yellow Gentian is a completely glabrous perennial plant that grows to 140 cm high. The rhizome has a number of heads, and the top of the rhizome can attain the thickness of an arm. The main root is a taproot, which grows up to 1 m long. The stem is round, unbranched, hollow and grooved in the upper region to finger thickness. The leaves are elliptical, bluish-green, have strongly curved ribs and grow up to 30 cm long and 15 cm wide.

Characteristics: The drug has a weak, sweetish odor. It tastes metallic/sweet at first, then bitter.

Habitat: The plant is indigenous to the mountainous regions of central and southern European, and cultivated in many other regions.

Production: The roots are collected from spring through October, cleaned and swiftly dried. Extended, slower drying causes the roots to ferment. The roots become brittle through drying, swollen and spongy through contact with moisture.

Not to be Confused With: The roots of *Rumex alpinus* or *Gentiana asclepiadea*

Other Names: Bitter Root, Bitterwort, Gentian Root, Pale Gentian

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoid monoterpenes (bitter principles): amarogentin (determines the value), gentiopicroside, swertiamarin, sweroside

Monosaccharides/Oligosaccharides: saccharose, gentianose (somewhat bitter), gentiobiose (bitter)

Pyridine alkaloids

Xanthone derivatives (colored yellow): including gentisin, gentisein, isogentisin, 1,3J-«imefhoxyxanthone

Volatile oil (traces)

EFFECTS

The essential active principles are the bitter substances contained in the herb. These bring about a reflex stimulation of the taste receptors, leading to increased secretion of saliva and the digestive juices. Gentian root is therefore considered to be not simply a pure bitter, but also a roborant and tonic. There is also a possible cholagogic effect, although it is not clear if the mode of action is sensory-reflexive. In addition, a fungistatic effect has been proven for the gentian extract.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints

- Loss of appetite

Unproven Uses: Folk medicine uses of the drug include as a tonic and in teas to stimulate bile secretion and alleviate loss of appetite, fullness and flatulence.

Homeopathic Uses: Yellow Gentian is used in homeopathy for digestive disorders.

CONTRAINDICATIONS

The drug's stimulation of gastric juice secretion rules out its administration in the presence of stomach or duodenal ulcers.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Comminuted drug and dried extracts for infusions and teas. Forms of commercial pharmaceutical preparations include digestives, drops and coated tablets.

Preparation: Tea is prepared by pouring boiling water over 1/2 teaspoon of the drug (1 to 2 g) and allowing it to steep for 5 to 10 minutes. The tea may be sweetened with honey to alleviate the bitter taste. Decoctions are made using 1 g of the drug to 1 cup boiled water.

Daily Dosage: The average single dose is 1 g of the drug; daily dose is 2 to 4 g. The average daily dose of tincture is 1 to 4 ml 3 times daily. Liquid extract: 2 to 4 g; root: 2 to 4 g. A one-cup dose of cold or lukewarm tea is taken several times a day, including 1/2 hour before meals.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times, daily: chronic: once a day (HAB1)

Storage: The drug must be stored away from light sources.

Yellow Jessamine

Gelsemium sempervirens

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the dried rhizome with the roots.

Flower and Fruit: Yellow, strongly perfumed, 2.5 to 4 cm, funnel-shaped, long flowers grow in axillary or terminal cymes of 2 to 5 blooms. The fruit consists of 2 separable, connected pods containing numerous flat-winged seeds.

Leaves, Stem and Root: The plant is a perennial evergreen vine on a tortuous, smooth root with a thin bark and woody center, showing broad medullary rays. The stem is slender, woody and up to 6 m high. The leaves are opposite, lanceolate to ovate-lanceolate, short-stemmed, entire-margined, 2.5 to 10 cm long, dark green above and paler green beneath.

Habitat: The plant is indigenous to southern North America, along the coast from Virginia to Florida and Mexico.

Production: *Gelsemium* root consists of the rhizome and roots of *Gelsemium sempervirens*.

Not to be Confused With: The plant should not be confused with yellow flowering Jasmine (*Jasminum odoratissimum*), which is also called True Yellow Jasmine or *Gelsemium*.

Other Names: Gelsemin, Woodbine, Yellow Jasmine, False Jasmin

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids: main alkaloid gelsemin, including among others 21-oxygelsemine, gelsemicin, gelsidin, gelsevirin, sempervirin

Hydroxycoumarins: including scopoletine (gelseminic acid), fabiatriin

Anthracene derivatives: emodin monomethyl ether

Volatile oil

EFFECTS

In animal tests, the following effects on the autonomic nervous system have been documented: inhibition of cholinesterase; cardiac-circulatory effects (vasodilatory, hypotensive); a bronchodilatory effect on respiration; an effect on the smooth muscle; and an analgesic effect, as well as mydriasis on rabbits' eyes.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for neuralgia, headache, gastric disorders, nervous stomach, feelings of fullness and heartburn.

CONTRAINDICATIONS

Particular dangers are associated with administration of the drug in the presence of cardiac weakness.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks following the proper administration of designated therapeutic dosages are not recorded. The following side effects could appear: heaviness of the eyelids, inhibition of movement of the eyeball, double vision, hypocyclosis, dryness of the mouth and vomiting. Particular dangers lie with administration in the presence of cardiac weakness.

OVERDOSAGE

Poisonings through overdosages, sometimes with fatal outcome, are possible. Extracts corresponding to approximately 0.5 g of the drug can kill a child, 2 to 3 g can be fatal for an adult. Initial side effects can include heaviness of the eyelids, inhibition of movement of the eyeball, double vision, hypocyclosis, dryness of the mouth, swallowing difficulties or vomiting. They may progress to symptoms of poisoning that can include headache, dizziness, loss of speech ability, vision weakness or double vision, pupil enlargement, trembling of the limbs, paralysis or stiffening of the muscles, cyanosis, shortness of breath and coma.

The therapy for poisonings, following stomach emptying (gastric lavage with burgundy-colored potassium permanganate solution), consists of prophylaxis for shock, diazepam for spasms, electrolyte replenishment and sodium bicarbonate infusions for any acidosis that may arise. Intubation and oxygen respiration may also be necessary.

DOSAGE

Medicinal preparations are obsolete. Yellow Jessamine is currently used in homeopathic dilutions only.

Yellow Lupin

Lupinus luteus

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds and the aerial parts of the plant.

Flower and Fruit: The terminal flowers are almost sessile. They are arranged in numerous, distinct whorls. They have drooping, silky-haired bracts. The corolla is bright yellow with a blunted boat-shaped tip. The fruit is an oblong-lanceolate, 5 to 7 cm by 1 cm, densely pubescent pod with nodes. It contains 4 to 7 yellowish, reddish-white, black or dark violet marbled seeds 5.5 to 6.5 mm long.

Leaves, Stem and Root: The plant is an annual with up to a 1 m long taproot, which contains numerous lateral roots. The stem is light green and pubescent with numerous side shoots. The 5 to 10 leaves are oblong-obovate to lanceolate, 4 to 8 cm long, acuminate and pubescent on both sides.

Habitat: The plant is indigenous to Europe, Asia, and North and South America.

Production: Lupin herb and seeds are the aerial part and seeds of *Lupinus luteus* and other *Lupinus* species.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FOLIAGE

Quinolizidine alkaloids (0.6-1.6%): sparteine (55-70%), lupinine (20-30%), p-cumaroyllupinine (10%); in cultivated strains (sweet lupins), alkaloid content is 0.01-0.8%

COMPOUNDS: IN THE SEEDS

Quinolizidine alkaloid (0.4-3.3%): lupinine (60%), sparteine (30%); in some cultivated strains, gramine; in cultivated strains (sweet lupins), alkaloid content is less than 0.1%

Fatty oil (4-6%)

Carbohydrates: including stachyose (6%)

Proteins (36-48%)

EFFECTS

There has been no research on the effects of the drug; however, an anthelmintic effect has been established for the constituents lupinin and benzoyllupinin.

INDICATIONS AND USAGE

Unproven Uses: Yellow Lupin is used externally for ulcers. It is used internally for urinary tract disorders and worm infestation.

PRECAUTIONS AND ADVERSE REACTIONS

See Overdosage section.

OVERDOSAGE

Symptoms of poisoning include salivation, swallowing difficulties, vomiting, diarrhea, headaches, hypocyclosis, double vision, cardiac rhythm disorders and pricking sensation in the extremities. In cases of severe poisoning, symptoms include ascending paralysis and possible death through respiratory failure within a few hours. The intake of a single seed of a bitter lupin is said to be toxic for a child. In one case, a small child died following intake of several seeds. The intake of more than one pod of the plant or 10 seeds by an adult is said to trigger vomiting and should be treated with administration of activated charcoal. Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) and installation of activated charcoal, the therapy for severe poisonings consists of electrolyte substitution, treating possible cases of acidosis with sodium bicarbonate infusions, and administering orciprenaline or lidocaine for cardiac rhythm disorders. In case of shock, plasma volume expanders should be administered. Intubation and oxygen respiration may also be necessary.

The lupinosis seen in animals is caused by mycotoxins that are formed from the fungus *Phomopsis leptostromiformis*, which can live as an endophyte in lupins.

DOSAGE

Mode of Administration: The drug is used internally as an infusion, and externally in poultices.

Yellow Toadflax

Linaria vulgaris

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh or dried herb.

Flower and Fruit: The flowers are in terminal dense racemes. They are sulfur yellow and remain closed until a bee gains entry. The calyx is only fused at the base and is 5-tipped. The corolla has a long sharp spur and is bilabiate with orange edges. There are 2 large and 2 small stamens and 1 superior ovary. The fruit is an orbicular, dry capsule with some chambers, which open when ripe, flinging out the seeds. The seeds are flattened and are in the middle of a circular wing.

Leaves, Stem and Root: A number of slim, glabrous, erect, simple stems 30 to 60 cm high grow from a perennial creeping root. The numerous leaves are alternate, sessile, very long and narrow. The leaves and stems are pale blue and completely glabrous.

Habitat: The plant is indigenous to the northern hemisphere and the southwest U.S.

Production: True Toadflax is the flowering herb of *Linaria vulgaris*.

Other Names: Fluellin, Pattens and Clogs, Flaxweed, Ramsted, Snapdragon, Churnstaff, Dragon-Bushes, Brideweed, Toadpipe, Yellow Rod, Larkspur Lion's Mouth, Devil's Ribbon, Eggs and Collops, Devil's Head, Pedlar's Basket, Gallwort, Rabbits, Doggies, Calves' Snout, Eggs and Bacon, Buttered Haycocks, Monkey Flower, Butter and Eggs, Pennywort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes: chief component - antirrhinoside

Flavonoids: including among others linarin, pectolinarin, liniarin (pectolinarigenin-7-rhamnoglucoside- acetate) *

Aurones: including among others aureusin, bracteatin-6-O-glucoside

Quinazoline alkaloids: peganine (vasicin)

EFFECTS

The main active agents are the flavon glycosides linarin and pectolinarin, pectin, phytosterol, tannic acid and vitamin C.

The drug is anti-inflammatory. Diaphoretic and diuretic effects have been documented.

INDICATIONS AND USAGE

Unproven Uses: Yellow Toadflax is used internally to aid digestion problems and urinary tract disorders.

Externally, the herb is used for hemorrhoids, ablation of festering wounds, skin rashes and ulcer cruris.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The powdered form and the extract are used as a diuretic and a mild laxative (tea). Externally the herb is used in poultices.

Preparation: Tea infusion is prepared from 1 to 2 teaspoonfuls of the drug and 2 to 4 cups of boiling water left to draw for 18 minutes.

Daily Dosage: Drink the tea during the course of the day.

Yerba Santa

Eriodictyon californicum

TRADE NAMES

Yerba Santa Resin-Rich Leaf (available from numerous manufacturers and as combination product)

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves.

Flower and Fruit: The flowers are tubular to funnel-shaped, lavender or white and clustered at the top of the plant. The calyx is ciliate. The fruit is a small, oval, grayish-brown seed capsule containing shriveled, almost black seeds.

Leaves, Stem and Root: The plant is a 2.5 m high, sticky, evergreen shrub, with woody rhizomes. The trunk is smooth and usually branched near the ground. It is completely covered in sticky resin. The leaves are up to 15 cm long and about 2 cm broad. They are thick, coriaceous, glabrous, greenish white, lanceolate and irregularly dentate at the margins. The upper surface appears to be varnished with resin, the lower surface is reticulate and tomentose.

Characteristics: The taste is balsamic and the odor, pleasant and aromatic.

Habitat: The plant grows in California, Oregon and parts of Mexico.

Production: Yerba Santa is the aerial part of *Eriodictyon californicum*.

Other Names: Bear's Weed, Consumptive's Weed, Eriodictyon, Gum Bush, Holy Herb, Mountain Balm, Sacred Herb, Tarweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including eriodictyonin, eriodictyol, chrysoeriodictyol, xanthoeriodictyol

Resinous substances: made up of flavanone and flavone aglycones

Volatile oil (very little)

Tannins

EFFECTS

Yerba Santa is mildly diuretic and masks bitter tastes.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as a constituent of anti-asthmatic treatments and application by brush (painted on) to counteract bitter tastes.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: As an additive to mask bitter flavors and for painting on as Tinctura Eriodictyonis.

How Supplied:

Liquid — 1:5

Yew

Taxus baccata

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh leaves, the branch twig tips, and the branches.

Flower and Fruit: The flowers are inconspicuous and dioecious. The male florets appear in autumn in yellowish catkins in the axils of the annual needle. The female florets, with only 1 pistil, are on short pedicles, which have scale-like high leaves. The hard, pea-sized, dark-brown seed is surrounded by a crimson, pulpy, beaker-shaped, sweet and edible aril.

Leaves, Stem and Root: The Yew may be a bush or small tree approximately 17 m high with a trunk diameter of over 1 m. The trunk has red-brown bark. The numerous branches are crowded and evergreen. The needles are 2 to 3 cm long, arranged in double rows, soft and acute. They are glossy dark green above, have a distinct midrib, and are lighter green beneath, matte, with no resin.

Characteristics: Yew is poisonous.

Habitat: The plant is common in large areas of Europe as far as Anatolia and Sicily.

Production: Yew leaves are the needles of *Taxus baccata*.

Other Names: Chinwood

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Diterpene esters of the taxane-type (mixture is known as taxine, 0.6-2.0%): including among others, taxine A, taxine B, taxol

Flavonoids: including among others, sciadopitysin, ginkgetin, sequoia flavone (biflavonoids)

EFFECTS

In animal experiments, the taxin, a mixture of different ester alkaloids, leads to an improvement in cardiac metabolism. The motility-inhibiting effect may be attributable to the biflavonoid fraction. In higher doses the drug is cardiotoxic and can cause tachycardiac arrhythmia leading to diastolic cardiac arrest.

INDICATIONS AND USAGE

Unproven Uses: The cooked Yew leaves are used to promote menstruation; to treat diphtheria, epilepsy, tapeworm, and tonsillitis; and as an abortifacient. The plants are highly toxic and their use is not recommended.

Homeopathic Uses: The drug is used for poor digestion and skin pustules.

CONTRAINDICATIONS

The drug is considered an abortifacient and therefore should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drug is severely toxic: 50-100 gm Yew needles (fresh weight) are fatal for an adult. The red seed coat of the berries—although not the green seed—is free of toxic taxane derivatives.

Use in Pregnancy: The drug is used as an abortifacient.

OVERDOSAGE

Symptoms of poisoning include queasiness, vomiting, severe abdominal pain, and feelings of vertigo, followed later by unconsciousness, mydriasis, reddening of the lips, tachycardia, and superficial breathing. Death results from asphyxiation and diastolic cardiac arrest.

Following gastrointestinal emptying, (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulphate), and use of activated charcoal, treatment for poisonings consists of treating spasms with diazepam or barbital (i.v.). In case of shock, plasma volume expanders should be infused. The administration of lidocaine has proven effective in cardiac rhythm disorders. Monitoring of kidney function, blood coagulation and liver values is necessary. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Yew is used in homeopathic dilutions of the mother tincture.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules, every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); *M* parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Storage: The mother tincture should be protected from light.

Yohimbe Bark

Pausinystalia yohimbe

TRADE NAMES

Yohimbe, Yohimbe Super Potent, Yohimbized 1000, Yocon Tablets, Actibine, Aphrobine, Testomar, Yohimex, Super Yohimbe Plus, Yohimbe Power Max 1500, Yohimbe Power Max for Women, Yohimbe Power Max 2000.

DESCRIPTION

Medicinal Parts: The medicinal part is the bark.

Flower and Fruit: The inflorescence consists of racemes of yellow blooms.

Leaves, Stem and Root: The evergreen tree grows up to 30 m in height. The bark is gray-brown, fissured and split, and is often spotted. The inner fracture is reddish brown and grooved. The leaves are oblong or elliptical.

Characteristics: The taste is bitter, and the plant is odorless.

Habitat: The plant grows in the jungles of west Africa, Cameroon, Congo and Gabon.

Production: Yohimbe bark consists of the dried bark of the trunk and/or branches of *Pausinystalia yohimbe*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (2.7-5.9%): including among others yohimbine (quebrachine) and its stereoisomers alpha-yohimbine (rauwolscine), beta-yohimbine, and allo-yohimbine. Including also, ajamalicine, dihydroyohimbine, corynantheine, dihydrocorynantheine, corynanthine (rauhimbin)

Tannins

EFFECTS

Alpha 2-adrenergic Antagonist/Norepinephrine Release: Rauwolscine is a selective alpha 2-adrenergic receptor antagonist. Yohimbine increases plasma norepinephrine (NE) levels by stimulating the rate of norepinephrine release from sympathetic nerves (alpha 2-adrenergic antagonist

(Murburg, 1991). Plasma concentrations of 3-methoxy-4-hydroxyphenylglycol (MHPG), the major central nervous system metabolite of NE, also increases with yohimbine (Piletz, 1998). Central noradrenergic stimulation of yohimbine results in the enhancement of recall and recognition of emotional material (O'Carroll, 1999).

Analgesic Effects: Yohimbine significantly enhanced the overall analgesic effect of morphine with postoperative dental pain (Gear, 1995).

Clonidine Antagonism: Traditionally, yohimbine was thought to reverse the therapeutic effects of clonidine. One study demonstrated yohimbine reversed sedation and shortened the duration of analgesia associated with clonidine administered postoperatively. There was no effect on hypotension and bradycardia related to clonidine administration with yohimbine (Liu, 1993).

Epinephrine Effects: Yohimbine causes an increase in epinephrine release from the adrenals and results in a dose-dependent increase in plasma epinephrine (Murburg, 1991).

Improves Sexual Function: Because of the alpha-2 adrenergic blockade, the drug may be an effective treatment for sexual side effects, such as decrease libido and decreased sexual response, caused by selective serotonin reuptake inhibitors (Jacobsen, 1992; Hollander, 1992). There was no therapeutic response to yohimbine in women with hypoactive sexual desire (Piletz, 1998).

Cardiovascular/Pressor Effects: Yohimbine given in moderate doses increases systolic blood pressure in patients with orthostatic hypotension due to primary autonomic failure (Jordan, 1998). Yohimbine-induced enhancement of sympathetic tone in patients with neurally mediated syncope improves orthostatic tolerance (Mosqueda-Garcia, 1998).

Salivary Effects: Yohimbine (18 mg daily) increases salivary flow in patients treated with psychotropic drugs (tricyclic antidepressants or neuroleptics) suffering from xerostomia (Bagheri, 1997).

Miscellaneous Effects: Through enhancing inhibitory sympathetic input, yohimbine attenuates increases in colonic tone (Bharucha, 1997).

CLINICAL TRIALS

Non-organic Erectile Dysfunction

A double-blind, placebo-controlled clinical trial was conducted to determine the safety and efficacy of yohimbine hydrochloride in the treatment of nonorganic erectile dysfunction. Eighty-three patients were included in the intention-to-treat analysis. Yohimbine (10 mg three times daily) was administered orally for eight weeks. Subjective criteria included improvement in sexual desire, sexual satisfaction,

frequency of sexual contacts, and quality of erection (penile rigidity) during sexual contact or intercourse. Objective criteria were based on improvement in penile rigidity determined by use of polysomnography in the sleep laboratory. Yohimbine was overall significantly more effective than placebo for response rate and was well tolerated (Vogt, 1970).

Mixed-type Erectile Dysfunction

The effect of yohimbine hydrochloride was evaluated in the treatment of mixed-type impotence. A randomized, double-blind, placebo-controlled, crossover trial included 29 patients administered either yohimbine hydrochloride 36 mg daily or placebo. The two groups received therapy for 25 days, then a washout period of 14 days, and finally, a switch of treatment groups for an additional 25 days. Positive clinical results were seen in 44% and 48% of patients in the yohimbine and placebo groups, respectively, with no significant difference between the groups (Kunelius, 1997).

Pressor Effects with Autonomic Failure

In 35 patients with severe orthostatic hypotension due to multiple system atrophy or pure autonomic failure, the effect was determined on seated systolic blood pressure (SBP) of placebo, phenylpropranolamine (12.5 mg and 25 mg), yohimbine (5.4 mg), indomethacin (50 mg), ibuprofen (600 mg), caffeine (250 mg), and methylphenidate (5 mg). The pressor response was significant for phenylpropranolamine, yohimbine, and indomethacin compared with placebo. In a subgroup of patients, the pressor effect was confirmed of phenylpropranolamine, yohimbine, and indomethacin corresponding to a significant increase in standing SBP. The pressor responses to ibuprofen, caffeine, and methylphenidate were not significantly different from placebo, and phenylpropranolamine and midodrine exerted similar pressor responses (Jordan, 1998).

INDICATIONS AND USAGE

FDA Approved Indications: Yohimbine Hydrochloride is indicated as a sympatholytic and mydriatic. Impotence has been successfully treated with Yohimbine in male patients with vascular or diabetic origins and psychogenic origins.

Unproven Uses: Yohimbe bark is used as an aphrodisiac, and for debility and exhaustion.

CONTRAINDICATIONS

Yohimbe bark is contraindicated in liver and kidney diseases.

PRECAUTIONS AND ADVERSE REACTIONS

General: Side effects that can appear include anxiety states, elevated blood pressure, exanthema, nausea, insomnia, tachycardia, tremor, and vomiting.

Posttraumatic Stress Disorder (PTSD): Yohimbine was reported to exacerbate anxiety/panic and PTSD-specific symptoms after oral ingestion of the drug (Southwick, 1999). Patients with PTSD consists of 2 subgroups, one with a sensitized noradrenergic system, and the other with a sensitized serotonergic system, and is why yohimbine-induced panic attacks occur in different patients (Southwick, 1997).

Hypertension: Yohimbine induced a significant increase in diastolic pressure, but only in hypertensive patients due to an alpha 2-adrenoreceptor desensitization or an alteration in the balance of alpha-adrenoreceptors in human hypertension (Musso, 1995).

Auditory Effects: The drug has been associated with a transient impairment in auditory sensory gating (Adler, 1994).

Salivation: Yohimbine significantly increases salivary flow in patients treated with psychotropic drugs (tricyclic antidepressants or neuroleptics) suffering from xerostomia (Bagheri, 1997).

Panic Disorder: Patients with agoraphobia with panic attacks had greater autonomic anxiety symptoms, increase in SBP and Cortisol responses to yohimbine than healthy patients. Yohimbine also induced panic episodes in these patients (Gurguis, 1997).

Parkinson's Disease: Patients with Parkinson's Disease have demonstrated a vulnerability to yohimbine-induced somatic symptoms such as panic attacks (Richard, 1999).

Drug Interactions:

Naltrexone — Clinically used naltrexone doses alter sensitivity to yohimbine, and potentiates the drug's side effects, such as nervousness (Rosen, 1999).

Anti-hypertensive Medications — Because of the increase in diastolic pressure in hypertensive patients, caution should be taken with concomitant use of anti-hypertensive medications (Musso, 1995).

Ethanol — Intoxicating and anxiogenic effects of acute ethanol administration may be associated with increase norepinephrine turnover when administered concomitantly with yohimbine (McDougle, 1995).

OTC stimulants — These may have alpha-1 adrenergic receptor activity to potentiate hypertension when yohimbine is given concomitantly.

Morphine — The overall analgesic effect of morphine was significantly enhanced in the presence of yohimbine in one study (Gear, 1995).

OVERDOSAGE

Overdosage leads to salivation, mydriasis, evacuation, hypotension and disorders of the cardiac impulse-conducting system with negative-inotropic effect. Death occurs through cardiac failure.

Treatment of overdosage includes gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) and administration of activated charcoal. For cardiac rhythm disorders, treat with lidocaine; possibly using physostigmine for its anticholinergic effect and electrolyte substitution. For cases of acidosis, treat with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused.

DOSAGE

How Supplied:

Capsule — 500 mg

Liquid — 1000mg/ml

Tablet — 5.4 mg, 800 mg

Daily Dosage:

Erectile Dysfunction — Yohimbine hydrochloride was effective for nonorganic erectile dysfunction administered as 30 mg daily (10 mg three times daily). Given up to 30 mg daily and 36 mg daily, yohimbine, showed no effect for mixed-type impotence and erectile problems (Kunelius, 1997; Rowland, 1997). For erectile impotence, yohimbine 5.4 mg (1 tablet) three times daily is recommended, and if side effects of nausea, dizziness or nervousness are reported, reduce to one-half tablet three times daily. Gradually increase to 1 tablet three times daily and therapy should not exceed 10 weeks (Prod Info Yocon®, 1985).

Xerostomia Treatment — Yohimbine 6 mg three times daily has been effective for increasing salivary flow in patients treated with psychotropic drugs suffering from xerostomia (Bagheri, 1997).

Zedoary

Curcuma zedoaria

TRADE NAMES

Turmeric Power, Turmeric Whole Rhizome, Turmeric Extract (available from numerous manufacturers and as a combination product)

DESCRIPTION

Medicinal Parts: The medicinal part is the dried tuberous part of the rhizome, cut in transverse slices or in longitudinal quarters.

Flower and Fruit: The inflorescences are on 5 to 15 cm long, obtuse and silky involucre bracts. The spike-like inflorescences are 7.5 to 12.5 cm long and 5 to 7.5 cm wide. The bracts bearing the flowers are ovate with revolute tips, pale green with a reddish border, densely punctuated with glands. There are more or less stiff hairs on the surface, in particular at the tip. The bracts at the tip of the inflorescence are 5 cm long, initially white, then pink to crimson. The flowers are pale yellow. The calyx is 8 mm long, obtuse and 3-tipped. The tips of the corolla are broadly triangular and pale pink at the extreme tips. The labellum is light yellow, fluorescent yellow in the center with very slightly reddish tinged borders at the lower part. The ovary is 4 to 5 mm long and very weakly pubescent. The fruit is an ovate, thin, smooth and irregularly opening capsule. The elliptical seeds have a white aril.

Leaves, Stem and Root: *Curcuma zedoaria* is a perennial, erect and leafy plant. The rhizome has a grayish outer surface and is ovate to pear-shaped, thick and palmately branched downwards. It is whitish-yellow, with numerous thin roots, and it has a strong smell of camphor. The roots are partially thickened to ovate, white tubers. The leaves, in groups of 4 and 6 on the rhizome, are up to 1 m long. The 20 to 60 cm long and 8 to 10 cm wide leaf blade is oblong-ovate, glabrous, and has a purple mark in the middle of the leaf.

Characteristics: The taste is bitter; The smell is like camphor and is reminiscent of cardamom and ginger.

Habitat: The plant is indigenous to northeast India and is also found in the Moluccas, the Philippines and New Guinea.

Production: Zedoary rhizome consists of the dried rhizome of *Curcuma zedoaria* and its preparations. After the root tubers have been harvested they are washed, cut and dried.

Other Names: Turmeric

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (1.0-1.5%): chief components zingiberene, 1,8-cineole, D-camphor, D-camphene, D-borneol, alpha-pinene, also including among others curcumol, zederone, curcume-neol, curculone, furanodienone, isofuranodienone

Curcuminoids: curcumin, desmethoxycurcumin, bisdes-methoxycurcumin

Starch (50%)

EFFECTS

Main active principles: essential oil, tannins, mucilage, small-grained starch. In animal tests, the drug has a choleric, mildly antacid and spasmolytic effect, as well as increasing intestinal transit time. The ethanol extract (main active principle p-methoxy cinnamic acid ethyl ester) is a strong fungicide. An anti-tumoral effect has also been proven.

INDICATIONS AND USAGE

Unproven Uses: Zedoary is used as a stomachic for digestive debility, colic and spasms (stomachic, carminative). In folk medicine, it is also used as a remedy for nervous diseases.

Indian Medicine: In India, the drug is used for loss of appetite, tuberculosis, wounds, leukoderma, fever, bronchi-tis and asthma.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Zedoary is available as solid and liquid dosage forms for oral intake.

How Supplied: Capsules: 300 mg, 450 mg; liquid: 1:4.

Preparation: Extracts of the drug are contained in numerous combination preparations for gastrointestinal indications and as cholagogues. To prepare an infusion, pour boiling water over 1 to 1.5 gm of comminuted or powdered drug, or put in cold water and strain after 3 to 5 minutes (1 teaspoonful = 3 gm of drug).

Daily Dosage: Drink 1 cup as an aromatic bitter at meals.

Arzneibuch der DDR. 2nd Ed. Akademie-Verlag, Berlin.

abortifacient A drug or chemical that induces abortion.

achene A small 1-seeded fruit which has a pericarp attached to the seed at only one point.

acuminate Pointed or to taper to a slender point

adaptogen A preparation that acts to strengthen the body and increase resistance to disease.

alterative Any drug used to favorably alter the course of an ailment and to restore health. To improve the excretion of wastes from the circulatory system.

amarum Bitters.

androgynous In botany, flowers with stamen and pistil in the same bunch.

annual A plant that completes its growth cycle in one year.

anthelmintic An agent or drug that is destructive to worms.

anther The part of the stamen that contains pollen.

antiphlogistic An agent that prevents or counteracts inflammation and fever.

antisialagogue An agent that prevents or counteracts the formation or flow of saliva.

Arg 66 6 Farmacopea Argentina 1966.

autumnalis In botany, referring to producing, gathering or harvesting in the autumn.

- bracteole** A small leaf arising from the floral axis.
- Brasil 1** Farmacopeia dos Estados Unidos do Brasil (1926).
- Brasil 2** Farmacopeia dos Estados Unidos do Brasil (1959).
- Brasil 3** Farmacopeia dos Estados Unidos do Brasil (1976).
- brightening agent** A substance added to the active constituents.
- C1 10 parts mother tincture and 90 parts ethanol.
- C2 (C3, C4, ...) C2 is 1 part C1 and 99 parts ethanol (the dilutions continue in a 1:99 fashion, each starting with the previous dilution as the 1 part fraction and adding 99 parts).
- calculosis** The condition or formation of calculi.
- calyx** The outer set of floral leaves consisting of fused or separate sepals.
- campanulate** Shaped like a bell.
- capitulum** A rounded or flattened cluster of sessile flowers.
- capsule** A closed container that contains seeds or spores.
- carminative** An aid to relieve gas from the alimentary canal. An agent that acts to relieve colic.
- carpel** A small pistil or seed vessel comprising the innermost whorl of a flower.
- cataplasma** A poultice or soft external application.
- catarrh** An inflammation of the air passages usually involving the nose, throat, or lungs.
- catkin** An ament or cattail-like spicate inflorescence bearing scaly bracts.
- cauline** Growing on the upper portion of a stem.
- CF 49 Codex Francais** = Pharmacopoea Gallica = Pharmacopec Francaise VII (1949).
- ChinPIX** The Pharmacopoeia Commission of PRC (1988), Pharmacopoeia of the People's Medical Publishing House, Beijing.
- choiagogue** An agent that stimulates the flow of bile from the gallbladder to the duodenum.
- choloretic** An agent that stimulates the production of bile by the liver.
- climacteric** The syndrome of physical and psychic changes that occur during the transition to menopause.
- comminuted** To break or crush into small pieces.
- Commission E** Indications relating to the Commission E monographed as published by the German Federal Health Agency (BfArM).
- cordate** A heart-shaped leaf.
- coriaceous** Tough, strong, and leather-like.
- corolla** The inner set of floral leaves that consist of separate or fused leaves.
- cortex** In botany, the bark of a tree or the rind of a fruit.
- cotyledon** A seed leaf, or the first set of leaves from the embryo in seed plants.
- crenate** In reference to leaf structure, having a margin cut into rounded scallops.
- CsL 2** Pharmacopoea Bohemoslovenica IT (1954) + Suppl.
- CsL 3** Pharmacopoea Bohemoslovenica HI (1970) + Suppl. (1976).
- cyme** An inflorescence where the axes always end in a single flower.
- D1 (2, 3, 4 ...) Mother tincture.
- D2 1 part mother tincture and 9 parts ethanol.
- D3 (D4, D5, ...) D3 is 1 part D2 and 9 parts ethanol (the dilutions continue in a 1:9 fashion, each starting with the previous dilution as the 1 part fraction and adding 9 parts).

- DAC 86** Bundesvereinigung Deutscher Apothekerverbände (1986), Deutscher Arzneimittel-Codex 1986 mit Ergänzungen. Deutscher Apotheker Verlag. Stuttgart, Govi-Verlag, Frankfurt/Main.
- Dan IX** Pharmacopoea Danica IX (1948) + Suppl.
- deciduous** A tree that sheds its leaves at the end of the growing season.
- decoction** A liquid substance prepared by boiling plant parts in water or some other liquid for a period of time.
- decumbent** A plant, stem, or shoot that lays on the ground but terminates with an ascending apex.
- dentate** Tooth-like projections on the margin of a leaf.
- dessertspoonful** A unit of measure equal to about *Th.* fluidrams.
- diaphoretic** An agent that causes sweating or excessive perspiration.
- dioecious** In botany, when a plant has either a stamen or a pistil on each flower.
- downy** Covered with soft hairs.
- dromotropic** An effect on nerve fiber conduction.
- dropsy** An abnormal accumulation of fluid in body tissues or cavities usually related to an underlying disease.
- drupe** A one-seeded fruit; as in olive or peach.
- EB 6** Ergänzungsbuch zum Deutschen Arzneibuch, 6. Ausg. (1941), Dr. Hans Hosel, Deutscher Apotheker Verlag, Berlin.
- Egypt 84** Egyptian Pharmacopoeia 1984.
- embrocation** An external medication applied as a liniment or other liquid form.
- emmenagogue** A substance that renews or stimulates the menstrual flow.
- endosperm** The albumin of the seed.
- epicalyx** An external accessory calyx located outside the true calyx of the flower.
- eructation** The act of belching.
- ESCOP** European Scientific Cooperation on Phytotherapy, Elburg, Holland.
- exocarp** The outer wall of a fruit covering.
- extraction** The portion of a plant that is removed by solvents and used in drug preparations in solid or liquid form.
- febrifuge** An agent that counteracts fever: an antipyretic.
- floret** A little flower; one of the small individual flowers that form a cluster or head.
- flos** Flower.
- fluidextract** A hydroalcoholic preparation of a botanical drug where 1 ml of the preparation contains 1 gm of the standard botanical.
- folium** The leaf of a plant.
- fructus** Fruit.
- furuncle** A boil or sore caused by bacterial infection of the subcutaneous tissue.
- galenic preparation** Medications prepared from plants as opposed to refined chemicals.
- glabrous** Having a smooth surface; without hair or down.
- globular** Spherical.

globule A small round pill of compressed sucrose that has been saturated with an alcoholic tincture of a specified homeopathic dilution (commonly 1:100).

- OAB 90** Osterreichisches Arzneibuch (1990) und 1. Suppl., Verlag der Osterreichischen Staatsdruckerei, Wien.
- obstipation** Persistent or intractable constipation.
- panicle** A loose, multiple flower cluster usually formed from numerous branches.
- pedicel** The stalk that supports a single flower in an inflorescence of flowers arranged upon a common peduncle.
- peduncle** A stalk that bears a flower or flower cluster.
- percolation** A liquid containing the soluble portion of a drug that has been filtered or separated from the plant matter.
- perennial** A plant that grows for three or more years.
- perianth** The external envelope of a flower which does not include the calyx and corolla if they are distinguishable.
- pericarp** The wall of the ripened ovary of a flower containing the germ of the fruit.
- petal** One of the leaves of the corolla.
- petiolate** The footstalk of a leaf.
- PF IX** Pharmacopee Francaise IX (1973).
- PF VIII** Pharmacopee Francaise = Codex Francaise VDI (1965).
- PF X** La Commission Nationale de Pharmacopee (1988), Pharmacopee Francaise X. L' Adrapharm, Paris, + Suppl.
- PhEur** Euroaisches Arzneibuch. 2. Ed.
- PI Ed 1/1** Pharmacopoea Internationalis I (1955), Internationales Arzneibuch, Vol. I, Wissenschaftliche Verlagsgesellschaft mbH, Stuttgart.
- pinnate** Compound leaves or leaflets that have a feather-like arrangement with leaves arranged on both sides of a common axis.
- pinnatisect** Cleft pinnately or almost to the midrib.
- pistil** The seed-bearing organ of flowering plants consisting of the ovary and the stigma; usually with a style.
- plaster** A viscous substance that is spread on linen or cloth and applied to a part of the body for healing purposes.
- Pol IV** Farmakopea Polska IV (1965).
- Portug 35** Pharmacopeia Portuguesa (1935).
- Portug 46** Farmacopeia Portuguesa VI (1946) + Suppl. 1961, 1967.
- poultice** A soft, moist mass of plant parts that are wrapped in muslin or gauze and applied warm or hot to the skin.
- pubescent** In botany, having a fuzzy surface; covered with soft fine short hairs.
- raceme** An inflorescence where flowers are borne on stalks at an almost equal distance apart along an elongated axis that continues to grow with flowers opening in succession from below.
- radix** The root of a plant.
- reniform** When describing a leaf, kidney or bean shaped.
- resin** An amorphous, solid or semi-solid substance produced by plants usually as a result of terpene oxidation.
- reticulate** Veins, fibers, or lines crossing like a network across the surface of a leaf.

- rhizome** An underground stem.
- roborant** A tonic or substance that gives strength.
- Rom IX** Farmacopeea Romana, Editia A, IX-A (1976), Editura medicala.
- Ross 10** Gosudarstvviennaja Farmakopoea X SSSR, National Farmakopoea Nr. 10 der UdSSR.
- Ross 9** Gosudarstviennaja Farmakopoea IX SSSR, National Farmakopoea Nr. 9 der UdSSR.
- runners** A plant that spreads or forms by means of runners.
- scape** A flower stalk or peduncle arising from the surface or below the ground.
- Schizocarp** A dry fruit that splits at maturity into several one-seeded carpels.
- scrofulous** Having an ulcerous or diseased appearance on the surface.
- secretagogue** An agent that promotes secretion.
- secretolytic** To inhibit or dry secretions.
- semen** A seed or seed-like fruit.
- sepal** One of the modified leaves comprising a calyx; usually positioned outside and surrounding the carpels.
- serrate** Having notched, teeth-like protrusions along the margin of a leaf that point toward the apex.
- sessile** Attached directly to the base of a main stem or branch without the aid of an intervening stalk.
- stamen** The organ of the flower that comprises the anther and filament and gives rise to the male gamete.
- stipule** A stalk.
- stomachic** An agent that promotes digestion and improves appetite.
- subshrub** A perennial plant which has woody stems with the exception of the terminal portion of new growth, which drops off annually.
- sudorific** Causing or inducing sweat.
- tendrill** The portion of a stem, leaf, or stipule that modified into a slender, spiral-shaped, touch-sensitive specialized appendage which acts as an anchor to aid in the plant's ability to climb.
- tepal** Any of the modified leaves that combine to make up the perianth.
- testa** The hard outer coating of a seed: the exocarp.
- tincture** An alcoholic or hydroalcoholic mixture prepared from plant parts.
- tomentose** Covered with densely matted hairs.
- tonic** A medication used to fortify and provide increased vigor.
- turiones** A shoot or sprout which develops from a bud on a subterranean rootstock.
- umbel** Numerous flower stalks arising from the same point at the apex of the main stalk and terminating at equal distance from the joining point.
- undulate** A wavy formation at the margin of a leaf, or bending in a gradual curve.
- USP 23-NF 18** United States Pharmacopeial Convention (1995), The United States Pharmacopeia USP 23-NF 18 + Suppl. 1-7.
- USP XIX** United States Pharmacopeial Convention (1975), The United States Pharmacopeia USP XLX.
- USP XX** United States Pharmacopeial Convention (1980), The United States.
- USP XXI** United States Pharmacopeial Convention (1985), The United States Pharmacopeia USP XXI-NF XVI.
- USPXXII** United States Pharmacopeial Convention (1989), The United States Pharmacopeia USP XXH-NF XVII.
- villous** Having long, soft hairs.
- vulnery** A preparation applied externally.
- wineglassful** A measure equal to four fluid ounces.

Poison Control Centers

Many of the centers listed below are certified by the American Association of Poison Control Centers. Certified centers are marked by an asterisk after the name. Each has to meet certain criteria. It must, for example, serve a large geographic area; it must be open 24 hours a day and provide direct-dial or toll-free access; it must be supervised by a medical director; and it must have registered pharmacists or nurses available to answer questions from the public.

The centers have a wide variety of toxicology resources, including a computerized database of some 750,000 substances maintained by MICROMEDEX, INC., an affiliate of

PDR. Staff members are trained to resolve toxic situations in the home of the caller, though hospital referrals are given in some instances. The centers also offer a range of educational services to both the public and healthcare professionals. In some states, these larger centers exist side by side with smaller centers offering a more limited range of services.

Within each state, centers are listed alphabetically by city. Telephone numbers designated "TTY" are teletype lines for the hearing-impaired. "TDD" numbers reach a telecommunication device for the deaf.
