Contents

Foreword	iv
Alphabetical Index Lists all scientific, common, and brand names found in the herbal monographs.	i-i
Therapeutic Category Index Groups herbs by therapeutic or medicinal category. Listings are alphabetical by category and accepted common name. Herbs deemed effective by Commission E are flagged for quick recognition.	1-45
Indications Index Lists herbs by their primary indications. Entries are alphabetical by indication and accepted common name. Herbs deemed effective by Commission E are specially flagged.	1-81
Homeopathic Indications Index Catalogs herbal applications in homeopathy. Entries are alphabetical by indication and scientific name.	1-131
Asian Indications Index Groups herbs by their therapeutic uses in Chinese and Indian medicine. Listings are alphabetical by indication and accepted common name.	1-141
Side Effects Index Groups herbs by the adverse reactions with which they have been associated. Listings are alphabetical by reaction and accepted common name.	1-161
Drug/Herb Interactions Guide	1-179
Lists problem combinations alphabetically by the name of the drug and the name of the interacting herb, and provides a brief description of each combination's potential effect.	
Safety Guide	1-191
Lists herbs that must be avoided while pregnant or nursing, and herbs that should be used only under professional supervision. Includes all scientific, common, and brand names.	
Manufacturers Index	1-203
Provides contact information for each supplier whose products appear in the monographs.	
Herb Identification Guide	G-I
Permits rapid, positive identification of unknown botanicals. Includes nearly 400 full-color photos.	
Product Identification Guide	G-27
Present photos of a representative group of popular commercial formulations.	
Herbal Monographs	1
Profiles of 700 medicinal herbs, including trade names, description, actions, indications, contraindications, precautions, adverse effects, overdose, dosage, and literature citations. Organized alphabetically by accepted common name, and cross-referenced by scientific name.	
Glossary	849
A key to the specialized botanical nomenclature and other unfamiliar terminology employed in the herbal monographs.	
Poison Control Centers	855

Foreword

With 150,000 copies of its first edition in print, *PDR for Herbal Medicines* has almost instantly become one of the nation's leading pharmacological references. The reasons for its phenomenal reception are evident. Hundreds of herbal remedies now fill the shelves in virtually every supermarket and pharmacy, and the popularity of self-medication with "natural" supplements continues to rise, making the benefits—and risks—of these preparations an ever more compelling concern.

Now, to better address the host of questions that still surround most herbal remedies, *Physicians' Desk Reference*® is proud to present this completely revised and updated second edition of *PDR for Herbal Medicines*. Significantly enhanced and expanded, this new edition extends both the range and depth of the original volume. Among the many improvements you'll find:

- **Broader Coverage:** With some 100 new entries, the book now covers a total of 700 botanicals, including a wide selection of popular Chinese herbs.
- **More Research Data:** Hundreds of entries have been augmented with additional information on safety and efficacy.
- **Additional Adverse Effects:** The entries include new information on drug/herb interactions. The Side Effects and Interactions indices have been enriched and expanded.
- **Available Formulations:** Whenever applicable, the herbal monographs now list the names and suppliers of popular commercial preparations.
- **New Indices:** The index section has been enhanced with four additional indices:
 - Homeopathic Indications Index
 - Asian Indications Index
 - Safety Guide
 - Manufacturers Index
- **Better Organization:** In this edition, remedies appear under their more familiar common name, instead of their botanical designation. All monographs are cross-referenced by scientific name.

One important aspect of the first edition does, however, remain constant. Because it is still extremely hard to come by reliable information on the swarm of unregulated "dietary supplements" in today's marketplace, this new edition continues to provide you with the closest available analog to FDA-approved label-

ing—the findings of the German Regulatory Authority's herbal watchdog agency, commonly called "Commission E." This agency has conducted an intensive assessment of the peer-reviewed literature on some 300 common botanicals, weighing the quality of the clinical evidence and identifying the uses for which the herb can reasonably be considered effective. Its conclusions represent the best expert consensus on medicinal herbs currently available.

For the herbs not considered by Commission E, *PDR for Herbal Medicines* provides the results of an exhaustive literature review conducted by the respected PhytoPharm U.S. Institute of Phytopharmaceuticals under the direction of noted botanist, Dr. Joerg Gruenwald. These additional monographs, now some 400 in number, provide a detailed introduction to an array of exotic botanicals that you'll be hard pressed to find in any other source.

To make the information in the monographs as useful and accessible as possible, *PDR*® has echoed the structure of standard U.S. product labeling. Each monograph contains up to ten standard sections, covering considerations ranging from description to dosage. Here's a closer look at what you will find:

- **Title:** Each monograph begins with the herb's generally accepted common name, followed by its scientific name. In addition, all monographs are cross-referenced by their botanical designation.
- **Trade Names:** Listed here are common commercial preparations of the herb.
- **Description:** This section provides a detailed botanical overview of the herb, including information on its medicinal parts; flower and fruit; leaves, stem, and root; unique characteristics, habitat, production, related plants, and additional common names and synonyms.
- **Actions and Pharmacology:** Here you'll find data on the active compounds or heterogeneous mixtures found in the plant, followed by a summary of the herb's clinical effects. If various parts of the plant possess different pharmacological activity, the parts are discussed individually, here and throughout the remainder of the monograph.

• **Indications and Usage:** Information on the uses of the herb is listed under five categories, as applicable:

- Approved by Commission E
- Unproven Uses
- Chinese Medicine
- Indian Medicine
- Homeopathic

Approved uses are presented in list fashion. Other uses are described with provisos as necessary regarding route and form of administration.

• **Contraindications:** Although most natural remedies can be used under all medical circumstances, a few pharmacologically potent herbs must be avoided in the presence of certain medical conditions. If any such contraindications exist, they are summarized here.

• **Precautions and Adverse Reactions:** Found in this section are any cautions or special considerations regarding safe use of the herb, including any restrictions on use in pregnancy or childhood. Although most herbal remedies are notably free of known side effects, any reported in the available literature are noted here.

• **Overdosage:** As we all know, "natural" is not synonymous with "benign," and an overdose of many "healing" herbs can have serious—even fatal—consequences. Whenever adverse effects of overdose have been found in the literature, they are reported here, along with the appropriate medical interventions to be undertaken when an overdose occurs.

• **Dosage:** Listed here are common modes of administration, forms and strengths of available commercial preparations, methods for preparing the natural herb, and representative dosage recommendations drawn from the literature. Note, however, that dosage recommendations can be used only as a general guide. The potency of individual preparations and extracts is subject to substantial variation, so the manufacturer's directions should be consulted whenever available.

• **Literature:** This section provides you with a unique bibliography of the technical literature. Because German researchers have been particularly active in the herbal arena, you will find an unusual number of German-language citations. However, work in the English literature is included as well.

To assist you in quickly locating the information you require, the monographs have been indexed by name, therapeutic category, general indications, homeopathic indications, Asian indications, and side effects. To aid you in evaluating potential risk, a drug/herb interaction guide and a safety guide are also included. An index of manufacturers completes the set. Here's an overview of what each index provides: .

• **Alphabetical Index:** This index includes all scientific, common, and brand names found in the herbal monographs, together with appropriate page numbers.

• **Therapeutic Category Index:** This index lists the monographs and their page numbers, alphabetically by accepted common name, under appropriate therapeutic category headings. Herbs deemed effective by Commission E are flagged with a (•) symbol at their left. To facilitate comparison with prescription and nonprescription drugs, *PDR's* standard therapeutic categories are used throughout.

• **Indications Index:** This index lists herbs and their page numbers, alphabetically by accepted common name, under their various indications. Herbs deemed effective for the indication by Commission E are flagged with a (•) symbol at their left. To help you quickly identify conventional alternatives, the indication headings match those found in *PDR's* Indications Index, which appears in the *PDR Companion Guide*TM and the *PDR Electronic Library*TM CD-ROM.

• **Homeopathic Indications Index:** Included in this index are only the uses found in homeopathy. Herbs, which homeopaths typically prescribe by scientific name, are listed here in the same manner, followed by their accepted common name in parentheses. As in the main indications index, headings are chosen to match those in the *PDR Companion Guide*.

• **Asian Indications Index:** Entries in this index are limited to uses found in Chinese and Indian medicine. (Chinese entries are signified with a "C;" Indian entries with an "I.") Herbs are listed by accepted common name. Once again, indication headings employ the nomenclature used in the *PDR Companion Guide*.

• **Side Effects Index:** In this index, you'll find a list of all herbs associated with a given adverse reaction. Herbs are listed alphabetically by accepted common name, with the scientific name and page number

appended. Nomenclature employed in the side effect headings matches that used in PDR's Side Effects Index, another feature of the *PDR Companion Guide* and the *PDR Electronic Library* CD-ROM.

- **Drug/Herb Interactions Guide:** In this convenient reference, each potential interaction is listed under both the name of the drug and the name of the interacting herb. A brief description of the interaction's effect follows each item.

- **Safety Guide:** This section lists botanicals in three precautionary categories:

- Not for use during pregnancy

- Not for use while nursing

- For use only under supervision

Here, the scientific, common, and brand names of all herbs in each category are listed alphabetically, together with the appropriate page number for further information.

- **Manufacturers Index:** This index provides you with contact information for each supplier whose products appear in the herbal monographs. The names of the products, together with the page number of the monograph in which they appear, are included in each manufacturer's entry.

Following the indices, just as in *PDR* itself, you'll find an extensive full-color identification section. The first part of the section—the Herb Identification Guide—encompasses nearly 400 of the most widely used herbs. The second part—the Product Identification Guide—includes photos of some of the more popular commercial formulations. Together, these guides provide you with a truly unique reference unmatched in any other printed resource. We've also included a brief glossary of the unfamiliar terms found in the monographs.

PDR for Herbal Medicines is the product of one of the most thorough and inclusive examinations of the herbal literature ever undertaken. Nevertheless, it's important to remember that it merely summarizes and synthesizes key data from the underlying research reports, and of necessity includes neither every published report nor every recorded fact.

As in all scientific investigation, conclusions regarding the effectiveness of the herbs discussed in this compendium are based on the preponderance of current

evidence and cannot be considered firm or final. The publisher does not warrant that any herb will unfailingly and uniformly exhibit the properties ascribed to it by Germany's Commission E or any other scientific authority.

In the United States, herbal products are marketed under the provisions of the Dietary Supplement and Health Education Act of 1994, which prohibits their sale for the diagnosis, treatment, cure, or prevention of any disease. Enumeration of specific commercial preparations within an herbal monograph should not be construed as a claim or warranty of their efficacy for any purpose, by either the manufacturer or the publisher. Furthermore, it should be understood that, just as omission of a product does not signify rejection, inclusion of a product does not imply endorsement, and that the publisher is not advocating the use of any product or substance described herein.

Please remember, too, that dosing of herbal preparations is highly dependent on a variety of factors, such as cultivation and harvesting conditions, the specific parts of the plant to be processed, the extraction methods employed, and the dosage form chosen by the manufacturer. Since there are no official standards governing the production of herbal medicines in the United States, and the potency and the purity of herbal products are subject to substantial variation, dosage ranges set forth in the herbal monographs must be employed only as general guidelines.

In addition, the publisher does not guarantee that every possible hazard, adverse effect, contraindication, precaution, or consequence of overdose is included in the summaries presented here. The publisher has performed no independent verification of the data reported herein, and expressly disclaims responsibility for any error, whether inherent in the underlying literature or resulting from erroneous translation, transcription, or typography.

When patients approach you—as they surely will—for advice on the latest herbal "discovery" to hit the nightly news, we hope that *PDR for Herbal Medicines* will provide you with all the facts you need to offer sound, rational guidance firmly grounded in fact. Certainly such counseling is the aim of every dedicated health care professional. And at *PDR*, we fully share that goal.

Alphabetical Index

Listed here are all scientific, common, and brand names to be found in the herbal monographs. Generally accepted common names that serve as monograph titles appear in bold type. Scientific names are shown in italic type. Brand names are followed by the supplier's name in parentheses. If an entry lists two page numbers, the first refers to a photograph of the plant or product in the Identification Guide, the second to the herbal monograph.

 Queen Ann's-Lace G-25, 809

ALPHABETICAL INDEX

Queen of the Meadow G-17, 511
 Queen's Delight 729
Quercus infectoria. **550**
Quercus Marina 106
Quercus robur. G-18, 549
 Quickgrass G-25, 771
 Quick-in-the-Hand 436
 Quillai G-20, 624

QUILLAJA
(Quillaja saponaria). **G-20, 624**

Quillaja Bark G-20, 624
Quillaja saponaria. **G-20, 624**

QUINCE
(Cydonia oblongata) 625

QUININE
(Cinchona pubescens) G-20, 626

Quinsy Berries G-5, 94
 Quitch Grass G-25, 771

Rabbits 840
 Raccoon Berry G-17, 510

RADISH
(Raphanus sativus). **G-20, 628**

Rag Paper G-IS, 532
 Ragged Cup G-9, 238
 Ragweed G-20, 629

RAGWORT
(Senecio jacobaea). **G-20, 629**

Ragwort 354
 Rainbow Weed G-20, 620
 Ramp 46
 Ramsons 66
 Ramsted 840
 Ramsthorn G-6, 123
Ranunculus acris. 133
Ranunculus bulbosus. **128**
Ranunculus ficaria. **466**
Ranunculus sceleratus. **G-20, eoi**
 Rape G-19, 554
 Rape Seed G-19, 554
Raphanus raphanistrum **G-26, 814**
Raphanus sativus. G-20, 628

RASPBERRY
(Rubus idaeus). G-21, 630

Rati 435
 Rattle Pouches G-22, 690
 Rattle Snake Weed 261

Rattlebush G-26, 812
 Rattleroot G-S, 92
 Rattlesnake Root
(Polygala senega). **683**
 Rattlesnake Root
(Trillium erectum). G-4, 74
 Rattlesnake Violet 24
 Rattleweed G-S, 92

RAUWOLFIA
(Rauwolfia serpentina). **631**

Rauwolfia serpentina. **63i**

Ray-Grass G-24, 756
 Red Bay 490
 Red Bilberry G-3, 20

RED BRYONY
(Bryonia cretica). **632**

Red Chickweed G-22, 668

RED CLOVER
(Trifolium pratense). **G-21, 633**

Red Clover Blossom
 Capsules (Nature's Bounty) . . . 633
 Red Clover Herb Capsules
 (Frontier). 633
 Red Clover Herbal Capsules
 (Apothecary). 633
 Red Clover Liquid (McZand) . . . 633
 Red Cockscomb G-3, 22
 Red Cole G-14, 408
 Red Couchgrass 336

RED CURRANT
(Ribes rubrum). G-21, 634

Red Elder G-S, 96
 Red Elm 697
 Red Ginseng 636
 Red Gum
(Eucalyptus globulus) . . . **G-11, 283**
 Red Gum
(Liquidambar orientalis) . . **G-23, 734**
 Red Legs G-S, 82

RED MAPLE
(Acer rubrum). G-21, 635

Red Morocco G-3, 5
 Red Pepper G-8, ies
 Red Pimpernel G-22, 668
 Red Poppy 223
 Red Raspberry G-21, eso
 Red Raspberry Leaves
 Capsules
 (Frontier, Nature's Way). 630

RHODODENDRON PONTICUM /1-33

Red Raspberry Leaves
 Glycerine Extract Liquid
 (Nature's Way). 630
 Red Raspberry Liquid
 (McZand). 630
 Red Robin G-15, 448
 Red Root
(Ceanothus americanus). **541**
 Red Root
(Sanguinaria canadensis). . . . **108**
 Red Rot 740

RED SANDALWOOD
(Pterocarpus santalinus). **635**

Red Sanderswood 635
 Red Saunders 635
 Red Sedge 336
 Red Sorrel G-14, 394
 Red Thyme Oil (Aura Cacia) . . . 76i
 Red Weed G-20, 602
 Red Wine Extract Capsules
 (Sundown). 362
 Redberry Leaves G-25, 779
 Red-Ink Plant G-20, 602

RED-ROOTED SAGE
(Salvia miltiorrhiza). **636**

Red-Rooted Salvia 636

RED-SPUR VALERIAN
(Centranthus ruber). **G-21, 639**

Reed 639

REED HERB
(Phragmites communis). **639**

REHMANNIA
(Rehmannia glutinosa). **640**

Rehmannia glutinosa **640**

Remifemin Tablets
 (PhytoPharmica). G-30, 92
 Reseda G-14, 391
 Rest-Harrow G-23, 713
Rhamnus catharticus. G-6, **123**
Rhamnus frangula. G-12, 317
Rhamnus purshiana. G-7, **153**
 Rhatania 64i

RHATANY
(Krameria triandra). **641**

Rheum palmatum. G-8, 185
 Rheumatism Root G-26, SI7
 Rheumatism Weed 595
Rhododendron ferrugineum. **eso**
Rhododendron ponticum. **eo**

 Zanzibar Pepper. G-8, 165
Zea mays. 224
ZEDOARY
 (*Curcuma zedoaria*). **G-26, 846**
 Ze-Xie G-3, 13
 Zhi Mu. 31
Zingiber officinale. **G-12, 339**
 Zostrix Cream (Bioglan). 165
Zyzyphus jujube. 439

Therapeutic Category Index

Entries in this index are organized by prescribing category, enabling you to quickly identify botanicals with similar properties. Within each category, herbs are listed alphabetically by their accepted common name, with the scientific name shown in parentheses. Botanicals deemed effective by the German Regulatory Authority's "Commission E" are marked with a (•) symbol at their left. If an entry lists two page numbers, the first refers to a photograph of the plant in the Herb Identification Guide, the second to the herbal monograph. The index lists herbs by general category only. To locate botanicals considered appropriate for a specific indication, please consult the Indications Index.

ACNE PREPARATIONS

- Bittersweet Nightshade
(*Solanum dulcamara*) . . . G-S, 88
- Brewer's Yeast
{*Saccharomyces cerevisiae*}. lis
- Eucalyptus (*Eucalyptus globulus*). G-11, 283
- Heartsease (*Viola tricolor*) 382
- Tea Tree (*Melaleuca alternifolia*). 757

ADJUNCT ANTINEOPLASTIC THERAPY

- Cat's Claw (*Urticaria tomentosa*). ieo
- European Mistletoe (*Viscum album*). G-11, 291
- Green Tea (*Camellia sinensis*). G-13, 369
- Marijuana (*Cannabis sativa*). G-17, 500

ALCOHOL DEPENDENCE

- Cayenne (*Capsicum annum*). G-8, 165
- Congorosa (*Maytenus ilicifolia*). 218

AMEBICIDES

- Henna (*Lawsonia inermis*). G-14, 391

ANALGESIC AGENTS

- Aga (*Amanita muscaria*) . . . G-3, 8
- Alteris (*Aletris farinosa*). 11
- Ash (*Fraxinus excelsior*) . G-4, SO
- Barberry (*Berberis vulgaris*). G-4, 61
- Belladonna (*Atropa belladonna*). G-4, 69
- Beth Root (*Trillium erectum*). G-4, 74
- Black Bryony (*Tamus communis*). G-5, 90
- Black Cohosh (*Cimicifuga racemosa*). G-5, 92
- Black Currant (*Ribes nigrum*). G-5, 94
- Black Haw (*Viburnum prunifolium*). G-S, 96
- Black Pepper (*Piper nigrum*). G-6, 103
- Blue Cohosh
(*Caulophyllum thalictroides*). 109
- Borage (*Borago officinalis*). G-6, 114
- Bugleweed (*Lycopus virginicus*). G-6, 126
- Bulbous Buttercup
(*Ranunculus bulbosus*). 128

- Buttercup (*Ranunculus acris*). 133
- Cajuput (*Melaleuca leucadendra*). G-7, 136
- California Poppy
(*Eschscholtzia californica*). G-7, 140
- Catechu (*Acacia catechu*). 163
- Cayenne (*Capsicum annum*). G-8, 165
- Chaste Tree (*Vitex agnus-castus*). G-8, 176
- Clematis (*Clematis recta*) .G-8, 194
- Clove (*Syzygium aromaticum*). G-8, 195
- Comfrey (*Symphytum officinale*). G-9, 212
- Coriander (*Coriandrum sativum*). *. G-9, 221
- Corn Poppy (*Papaver rhoeas*). 223
- Cowhage (*Mucuna pruriens*). 230
- Cowslip (*Primula veris*). 231
- Cumin (*Cuminum cyminum*). G-9, 237
- Devil's Claw
(*Harpagophytum procumbens*). 247

- Digitalis** (*Digitalis purpurea*). G-IO, 248
- Dogwood (*Cornus florida*). **G-10, 256**
- Echinacea *Angustifolia* (*Echinacea angustifolia*) **261**
- English Chamomile (*Chamaemelum nobile*) **G-IO, 270**
- English Horsemint (*Mentha longifolia*). G-IO, 275
- English Ivy (*Hedera helix*). **G-10, 275**
- Eucalyptus (*Eucalyptus globulus*). **G-11, 283**
- European Five-Finger Grass (*Potentilla reptans*) . . . **G-11, 289**
- European Water Hemlock (*Cicuta virosa*). G-11, 297
- False Unicorn Root (*Veratrum luteum*). **301**
- Feverfew (*Tanacetum parthenium*). G-11, 306
- Fumitory (*Fumaria officinalis*). G-12, 322
- Garlic** (*Allium sativum*) **G-12, 327**
- German Ipecac (*Cynanchum vincetoxicum*). 335
- Ginkgo** (*Ginkgo biloba*) . **G-12, 342**
- Ginseng (*Panax ginseng*). 346
- Ground Ivy (*Glechoma hederacea*). 372
- Groundsel (*Senecio vulgaris*). 374
- Hemlock (*Conium maculatum*). G-13, 386
- Henbane** (*Hyoscyamus niger*). **G-14, 389**
- Herb Paris (*Paris quadrifolia*). G-14, 392
- Horehound** (*Marrubium vulgare*). G-14, 401
- Horse Chestnut (*Aesculus hippocastanum*). G-14, 403
- Horsemint (*Monarda punctata*). 407
- Horseradish (*Armoracia rusticana*). G-14, 408
- Hound's Tongue (*Cynoglossum officinale*) **410**
- Houseleek (*Sempervivum tectorum*). G-14, 411
- Iporuru** (*Alchornea floribunda*). 424
- Japanese Mint (*Mentha arvensis piperascens*). **431**
- Lady's Mantle (*Alchemilla vulgaris*). G-15, 456
- Larch (*Larix decidua*) . . . **G-15, 457**
- Lemon Balm (*Melissa officinalis*). G-i6, 461
- Levant Cotton (*Gossypium herbaceum*). G-16, 468
- Maidenhair (*Adiantum capillus-veneris*). **491**
- Male Fern (*Dryopteris filix-mas*). G-17, 493
- Marijuana (*Cannabis sativa*). G-17, 500
- Marsh Blazing Star (*Liatris spicata*). G-17, 503
- Martagon (*Lilium martagon*). 506
- Mezereon (*Daphne mezereum*). G-17, 515
- Monkshood (*Aconitum napellus*). G-18, 521
- Muskmallow** (*Abelmoschus moschatus*). 533
- Night-Blooming Cereus (*Selenicereus grandiflorus*). 543
- Onion (*Allium cepa*). G-19, 557
- Oregano** (*Origanum vulgare*). G-19, 559
- Parsnip** (*Pastinaca sativa*). G-19, 571
- Pasque Flower (*Pulsatilla pratensis*). 572
- Pellitory** (*Anacyclus Pyrethrum*). 577
- Peppermint (*Mentha piperita*). **G-19, 580**
- Petasites** (*Petasites hybridus*). G-19, 585
- Poplar** (*Populus species*) G-20, **607**
- Potentilla** (*Potentilla anserind*). G-20, 610
- Puff Ball** (*Lycoperdon species*). 618
- Quince** (*Cydonia oblongata*). 625
- Ragwort** (*Senecio jacobaea*). G-20, 629 I
- Reed Herb** (*Phragmites communis*). 639
- Rue** (*Ruta graveolens*) . . **G-21, 648**
- Rupturewort (*Herniaria glabra*). **G-21, 650**
- Rust-Red Rhododendron (*Rhododendron ferrugineum*). 650
- Scarlet Pimpernel (*Anagallis arvensis*) . . . **G-22, 668**
- Scotch Broom (*Cytisus scoparius*). G-22, 672
- Scotch Pine (*Pinus species*). G-22, 674
- Shepherd's Purse (*Capsella bursa-pastoris*). G-22, 690
- Sneezewort (*Achillea ptarmica*). 700
- Speedwell (*Veronica officinalis*). G-23, 710
- » Spruce (*Picea species*). 714
- St. John's Wort (*Hypericum perforatum*). G-23, 719
- Stavesacre** (*Delphinium staphisagria*). 726
- Sweet Vernal Grass (*Anthoxanthum odoratum*). G-24, 749
- Sweet Violet (*Viola odorata*). G-24, 750
- Tansy** (*Tanacetum vulgare*). G-24, 754
- Taumelloolch (*Lolium temulentum*). G-24, 756
- Thuja** (*Thuja occidentalis*). G-24, 759
- Tree of Heaven (*Ailanthus altissima*). 770
- Triticum** (*Agropyron repens*). G-25, 771
- Turmeric (*Curcuma domestica*). 775
- Valerian** (*Valeriana officinalis*). G-25, 783
- Vervain** (*Verbena officinalis*). G-25, 788
- Watercress** (*Nasturtium officinale*). 798
- White Fir (*Abies alba*). 802
- White Willow (*Salix species*). G-25, 807

- Wild Indigo (*Baptisia tinctoria*) **G-26, 812**
- Wild Mint (*Mentha aquatica*) **G-26, 813**
- Wild Thyme (*Thymus serpyllum*) **G-26, 815**
- Wild Yam (*Dioscorea villosa*) **G-26, 817**
- Winter's Bark (*Drimys winteri*) **820**
- Wintergreen (*Gaultheria procumbens*) **820**
- Wood Anemone (*Anemone nemorosa*) **824**
- Wormwood (*Artemisia absinthium*) **G-26, 829**
- Yellow Jessamine (*Gelsemium sempervirens*) **838**
- ANORECTAL PREPARATIONS**
- Bilberry** (*Vaccinium myrtillus*) **G-5, 75**
- Butcher's Broom (*Ruscus aculeatus*) **G-7, 132**
 - Poplar (*Populus species*) **G-20, 607**
 - Psyllium (*Plantago ovata*) **612**
 - Sweet Clover (*Melilotus officinalis*) **G-24, 744**
 - Tolu Balsam (*Myroxylon balsamum*) **G-24, 764**
 - Witch Hazel (*Hamamelis virginiana*) **G-26, 821**
- ANTACID PREPARATIONS**
- Barberry** (*Berberis vulgaris*) **G-4, 61**
- Congorosa** (*Maytenus ilicifolia*) **218**
- European Five-Finger Grass** (*Potentilla reptans*) . . . **G-11, 289**
- Lovage** (*Levisticum officinale*) **G-16, 482**
- Salep** (*Orchis species*) **657**
- Wood Betony** (*Betonica officinalis*) **G-26, 825**

THERAPEUTIC CATEGORY INDEX

Ox-Eye Daisy
{Chrysanthemum leucanthemum}. 563

- Peppermint *{Mentha piperita}*. G-19, SSO
- Petasites *{Petasites hybridus}*. G-19, 585
- Picrorhiza *{Picrorhiza kurroa}*. 589
- Pimpinella *{Pimpinella major}*. G-19, 591
- Pineapple *{Ananas comosus}*. 593
- Pleurisy Root *{Asclepias tuherosa}*. G-20, 598
- Poppy seed *{Papaver somniferum}*. G-20, 609
- Quebracho *{Aspidosperma quebracho-bianco}*. **623**
- Quillaja *{Quillaja saponaria}*. G-20, 624
- Radish *{Raphanus Sativiis}*. G-20, 628
- Raspberry *{Rubus idaeus}*. G-21, 630
- Red Bryony *{Bryonia cretica}*. 632
- Red Clover *{Trifolium pratense}*. G-21, 633
- Rupturewort *{Herniaria glabra}*. G-21, 650
- Scotch Broom *{Cytisus scoparius}*. G-22, 672
- Scotch Pine *{Pinus species}*. G-22, 674
- Seneca Snakeroot *{Polygala senega}*. 683
- Siam Benzoin *{Styrax tonkinesis}*. 692
- Skunk Cabbage *{Symplocarpusfoetidus}* **696**
- Sloe *{Prunus spinosa}* **G-22, 697**
- Soapwort *{Saponaria officinalis}*. G-22, 701
- Solomon's Seal *{Polygonatum multiflorum}*. G-22, 703
- Sorrel *{Rumex acetosa}*. 705
- Spanish-Chestnut *{Castanea sativa}*. 708
- Speedwell *{Veronica officinalis}*. G-23, 710

Spikenard *{Aralia racemosa}*. G-23, 711

- Spruce *{Picea species}*. 714
- Star Anise *{Illicium verum}*. G-23, 725
- Storax *{Liquidambar orientalis}*. G-23, 734
- Sumatra Benzoin *{Styrax paralleoneurum}*. **738**
- Sumbul *{Ferula sumbul}* . **G-23, 738**
- Sundew *{Drosera ramentacea}*. 740
- Sweet Cicely *{Myrrhis odorata}*. G-24, 743
- Sweet Violet *{Viola odorata}*. G-24, 750
- Tea Tree *{Melaleuca alternifolia}*. 757
- Thuja *{Thuja occidentalis}*. G-24, 759
- Thyme *{Thymus vulgaris}* **G-24, 761**
- Tolu Balsam *{Myroxylon balsamum}*. G-24, 764
- Tree of Heaven *{Ailanthus altissima}*. 770
- Turmeric *{Curcuma domestica}*. 775
- Vervain *{Verbena officinalis}*. G-25, 788
- Water Fennel *{Oenanthe aquatica}*. G-25, 796
- Water Germander *{Teucrium scordium}*. **797**
- Watercress *{Nasturtium officinale}*. 798
- White Bryony *{Bryonia alba}*. G-25, 800
- White Fir *{Abies alba}*. 802
- White Nettle *{Lamium album}*. G-25, 806
- Wild Cherry *{Prunus serotina}*. 810
- Wild Daisy *{Bellis perennis}*. G-26, 811
- Wild Service Tree *{Sorbus torminalis}*. 814
- » Wild Thyme *{Thymus serpyllum}*. G-26, 815
- Wintergreen *{Gaultheria procumbens}*. 820
- Witch Hazel *{Hamamelis virginiana}*. G-26, 821

SEDATIVES & HYPNOTICS /I-73

Wood Anemone *{Anemone nemorosa}*. 824

Wood Betony *{Betonica officinalis}*. G-26, 825

Wood Sage *{Teucrium scorodonia}*. G-26, 826

Yellow Dock *{Rumex CrispUS}*. 835

Yerba Santa *{Eriodictyon californicum}*. 841

REVITALIZING AGENTS

- Cola *{Cola acuminata}*. 235
- Mate *{Ilex paraguariensis}*. G-17, 508
- Siberian Ginseng *{Eleutherococcus senticosus}*. 693

SALIVA PRODUCTS

Betel Nut *{Piper betle}* G-4, 74

Moneywort *{Lysimachia nummularia}*. G-17, 520

Quassia *{Picrasma excelsa}* . . . **622**

SCABICIDES & PEDICULICIDES

Black Pepper *{Piper nigrum}*. G-6, 103

Burning Bush *{Dictamnus albus}*. G-7, 130

Celandine *{Chelidonium majlis}*. G-8, 169

Field Scabious *{Knautia arvensis}*. G-11, 310

Fish Berry *{Anamirta cocculus}*. 312

Henna *{Lawsonia inermis}*. G-14, 391

Pellitory *{Anacyclus Pyrethrum}*. 577

Picrorhiza *{Picrorhiza kurroa}*. 589

Poisonous Buttercup *{Ranunculus sceleratus}*. G-20, eoi

Pyrethrum *{Chrysanthemum cinerariifolium}* < **621**

Quassia *{Picrasma excelsa}* . . . **622**

SEDATIVES & HYPNOTICS

Bitter Orange *{Citrus aurantium}*. G-5, 86

Black Horehound *{Ballota nigra}*. G-5, 98

- Yellow Toadflax** (*Linaria vulgaris*). **840**

Indications Index

Entries in this index are organized by specific indication, enabling you to quickly review the botanical alternatives for a particular diagnosis. For ease of comparison with prescription and over-the-counter medications, the index employs the same nomenclature found in the *Indications Index of the PDR Companion Guide™*. Under each heading, herbs are listed alphabetically by accepted common name, with the scientific name shown in parentheses. Botanicals deemed effective by the German Regulatory Authority's "Commission E" are marked with a (•) symbol at their left. If an entry lists two page numbers, the first refers to a photograph of the plant in the *Herb Identification Guide*, the second to the herbal monograph. For more information on both proven and traditional remedies, be sure to check the appropriate underlying monograph.

ABDOMINAL CRAMPS

{See under Cramps, abdominal,
symptomatic relief of)

ABDOMINAL DISTRESS, SYMPTOMATIC RELIEF OF

English Lavender
{*Lavandula*
angustifolia). G-IO, 277

Homeopathic Indications Index

Entries in this index are organized by specific indication, enabling you to quickly review the botanicals used by homeopaths for a particular diagnosis. For ease of comparison with prescription and over-the-counter medications, the index employs the same nomenclature found in the Indications Index of the PDR Companion Guide™. Under each heading, herbs are listed alphabetically by scientific name, with the accepted common name shown in parentheses. If an entry lists two page numbers, the first refers to a photograph of the plant in the Herb Identification Guide, the second to the herbal monograph. For more information on any of these botanicals, be sure to check the appropriate underlying monograph.

HOMEOPATHIC INDICATIONS INDEX

Delphinium staphisagria
(Stavesacre) 726

HAY FEVER
(See under Pollinosis)

HEADACHE
Anamirta cocculus
(Fish Berry) 312
Camellia sinensis
(Green Tea) **G-13**, 369

Delphinium staphisagria
(Stavesacre) 726

Fagopyrum esculentum
(Buckwheat) G-6, 124

Ginkgo biloba (Ginkgo) . . . **G-12**, 342

Iris species (Orris) **G-19**, 561

Paris quadrifolia
(Herb Paris) **G-14**, 392

Paullinia cupana (Guarana) . . . 376

Primula veris (Cowslip) 231

Prunus spinosa (Sloe) **G-22**, 697

Pulsatilla pratensis
(Pasque Flower) 572

Spigelia anthelmia
(Wormwood Grass) 831

Strychnos mix vomica
(Nux Vomica) **G-IS**, 547

HEADACHE, MIGRAINE
Cicuta virosa (European
Water Hemlock) G-H, 297

Cyclamen europaeum
(Cyclamen) 240

Digitalis purpurea
(Digitalis) **o-io**, 248

Paris quadrifolia
(Herb Paris) **G-14**, 392

Senecio bicolor
(Dusty Miller) 258

HEADACHE, TENSION
(See under Pain, unspecified)

HEADACHE, VASCULAR
(See under Headache, migraine)

HELMINTHIASIS
Artemisia cina (Wormseed) 827

Artemisia vulgaris
(Mugwort) **G-18**, 530

Chelone glabra (Balmomy) . . **G-4**, 59

Cicuta virosa (European
Water Hemlock) **G-II**, 297

Linum catharticum
(Mountain Flax) 526

Quassia amara (Amargo) . . . G-3, 23

Spigelia anthelmia
(Wormwood Grass) 831

HEMORRHAGE, UNSPECIFIED
Achillea millefolium
(Yarrow) **G-26**, 833

Claviceps purpurea (Ergot) **280**

HEMORRHOIDAL PAIN
(See under Pain, anorectal)

HEMORRHOIDS
Aesculus hippocastanum
(Horse Chestnut) **G-14**, 403

Aloe ferox (Cape Aloe) ie

Collinsonia canadensis
(Stone Root) **G-23**, 733

Erigeron canadensis
(Canadian Fleabane) G-7, 144

Glechoma hederacea
(Ground Ivy) 372

Hamamelis virginiana
(Witch Hazel) **G-26**, 821

Linum catharticum
(Mountain Flax) 526

Paeonia officinalis
(European Peony) **G-11**, 295

Strychnos nux vomica
(Nux Vomica) **G-18**, 547

HEMOSTASIS, AN AID IN
Geranium maculatum
(Cranesbill) 233

Vinca minor (Periwinkle) 5 8 4

HEPATITIS, UNSPECIFIED
Erigeron canadensis
(Canadian Fleabane) G-7, 144

Leptandra virginica
(Black Root) 104

HERPES ZOSTER INFECTIONS
Daphne mezereum
(Mezereon) **G-17**, 515

Kalmia latifolia
(Mountain Laurel) **G-IS**, 528

HYPERHIDROSIS
Salvia officinalis (Sage) . . . **G-21**, 655

HYPERTHYROIDISM
Hedera helix (English Ivy) **G-10**, 275

Leonurus cardiaca
(Motherwort) **G-18**, 524

Lycopus virginicus
(Bugleweed) G-6, 126

INFECTIONS, URINARY TRACT/1-133

HYPNOTIC
(See under Sleep, induction of)

HYPOTENSION
Nicotiana tabacum
(TobaCCO) **G-24**, 762

Veratrum album
(White Hellebore) **G-25**, 803

HYPOTHYROIDISM, ORDINARY
(See under Hypothyroidism,
replacement or supplemental
therapy in)

HYPOTHYROIDISM, PRIMARY
(See under Hypothyroidism,
replacement or supplemental
therapy in)

**HYPOTHYROIDISM, REPLACEMENT OR
SUPPLEMENTAL THERAPY IN**

Brassica oleracea
(Cabbage) G-7, 134

HYPOTHYROIDISM, SECONDARY
(See under Hypothyroidism,
replacement or supplemental
therapy in)

HYPOTHYROIDISM, TERTIARY
(See under Hypothyroidism,
replacement or supplemental
therapy in)

HYSTERIA, ACUTE
Delphinium staphisagria
(Stavesacre) 726

IMMUNODEFICIENCY, UNSPECIFIED
(See under Infection, tendency to)

INDIGESTION
(See under Digestive disorders,
symptomatic relief of)

INFECTION, TENDENCY TO
Scrophularia nodosa
(Figwort) **G-11**, 311

INFECTIONS, NON-SPECIFIC
Baptisia tinctoria
(Wild Indigo) **o-26**, 812

Datura stramonium
(Jimson Weed) **G-IS**, 436

Veratrum album
(White Hellebore) **G-25**, 803

INFECTIONS, URINARY TRACT
Agropyron repens
(Triticum) **G-25**, 771

- Anagallis arvensis*
(Scarlet Pimpernel). **G-22**, 668
- INFECTIONS, VENEREAL**
(See under Gonorrhea)

Asian Indications Index

Entries in this index are organized by specific indication, enabling you to quickly review the botanicals used in Asian medicine for a particular diagnosis. For ease of comparison with prescription and over-the-counter medications, the index employs the same nomenclature found in the Indications Index of the PDR Companion Guide™. Under each heading, herbs are listed alphabetically by accepted common name, with the scientific name shown in parentheses. An "I" in parentheses indicates Indian usage; a "C" denotes Chinese medical applications. If an entry lists two page numbers, the first refers to a photograph of the plant in the Herb Identification Guide, the second to the herbal monograph. For more information on any of these botanicals, be sure to check the appropriate underlying monograph.

ABORTION

{See under Pregnancy, termination of}

ACHES, MUSCULAR

{See under Pain, muscular, temporary relief of}

ACID INDIGESTION

{See under Hyperacidity, gastric, symptomatic relief of}

ACNE, UNSPECIFIED

Duckweed

Side Effects Index

Presented here is an alphabetical list of every side effect cited in the herbal monographs. Under each heading, herbs associated with the reaction are listed alphabetically by accepted common name, with the scientific name shown in parentheses. For ease of comparison with prescription and over-the-counter medications, the index employs the same nomenclature found in the Side Effects Index of the PDR Companion Guide™. If an entry lists two page numbers, the first refers to a photograph of the plant in the Herb Identification Guide, the second to the herbal monograph.

- ABDOMINAL DISCOMFORT**
(See under Distress, abdominal;
Distress, gastrointestinal)

Drug/Herb Interactions Guide

This section catalogs potentially adverse drug/herb combinations by both the generic name of the drug or drug category and the accepted common name of the herb. Under each bold-face drug entry you 'll find a list of the herbs with which the agent may interact. Likewise, under a bold-face herb entry you 'll find a list of potentially interactive drugs. A description of the interaction's effect follows each item in the list. Further information on each drug can be found in Physicians' Desk Reference®. Information on each herb appears in the Herbal Monographs section of this book.

ADONIS

Calcium

(Increases action of Adonis)

Digoxin

(Increases action of Adonis)

Glucocorticoids

(Increases action of Adonis)

Laxatives

(Increases action of Adonis)

Quinidine

(Increases action of Adonis)

Saluretics

(Increases action of Adonis)

ADONIS VERNAL/S

{See under Adonis}

AESCULUS HIPPOCASTANUM

{See under Horse Chestnut}

ALCOHOL

German Chamomile

(May increase sedative effect)

Rauwolfia

(Increases impairment of motor skills)

Valerian

(Additive depressive effects with Valerian)

White Willow

(Enhances toxicity of salicylates)

ALKALINE DRUGS

Green Tea

(Decreased absorption of alkaline drugs due to tannin component in tea)

Oak

(Absorption of alkaline drugs may be reduced or inhibited)

ALKALOIDS

Oak

(Absorption of alkaloids may be reduced or inhibited)

ALOE

Antiarrhythmics

(Aloe-induced hypokalemia may affect cardiac rhythm)

Cardiac Glycosides

(Increases effect of cardiac glycosides)

Corticosteroids

(Increased potassium loss)

Licorice

(Increased potassium loss)

Thiazide Diuretics

(Increased potassium loss)

ALOE BARBADENSIS

{See under Aloe}

ALOE CAPENSIS

{See under Aloe}

ALOE VERA

{See under Aloe}

ALPHA ADRENERGIC BLOCKERS

Saw Palmetto

(Saw Palmetto has an additive alpha adrenergic blocking effect when given in combination with alpha blockers)

ALPINE CRANBERRY

Medication and Food that Increase Uric Acid Levels

(Decreases effect of Alpine Cranberry)

AMANTADINE HYDROCHLORIDE

Belladonna

(Increases anticholinergic effect of herb)

Henbane

(Increased anticholinergic action)

Scopolia

(Increased effect when given simultaneously with herb)

ANDROGENS

Saw Palmetto

(Saw Palmetto antagonizes the effect of androgens)

ANTIARRHYTHMICS

Aloe

(Aloe-induced hypokalemia may affect cardiac rhythm)

- Buckthorn**
(Increased effect due to potassium loss with chronic use of herb)
- Cascara Sagrada**
(Potentiates arrhythmias with prolonged use of Cascara)
- Licorice**
(Licorice-induced hypokalemia increases risk of arrhythmias)
- Senna**
(Senna-induced hypokalemia may increase risk of arrhythmia)
- ANTICHOLINERGICS**
- Jimson Weed**
(Co-administration of Jimson Weed with other anticholinergic drugs may increase the frequency and/or severity of anticholinergic side effects such as dry mouth, constipation, drowsiness, and others)
- ANTICOAGULANT DRUGS, UNSPECIFIED**
- Arnica**
(Coumarin component in Arnica may increase anticoagulant effect)
- Astragalus**
(Astragalus may potentiate anticoagulant effects)
- Horse Chestnut**
(Horse Chestnut has a coumarin component and may interact with warfarin, salicylates and other drugs with anticoagulant properties)
- ANTICONVULSANTS**
- Evening Primrose**
(Evening Primrose oil may lower seizure threshold and decrease effectiveness of anticonvulsant medications)
- ANTIHISTAMINES**
- Henbane**
(Increased anticholinergic action)
- ANTIHYPERTENSIVE AGENTS, UNSPECIFIED**
- Yohimbe Bark**
(May need to adjust antihypertensive medications due to hypertensive effect of Yohimbe)
- ANTIPLATELET DRUGS**
- White Willow**
(Additive effect with salicylates)
- ANTITHROMBOLYTIC DRUGS**
- Ginkgo**
(Increases effect of antithrombolytic drugs)
- ARCTOSTAPHYLOS UVA-URSI**
(See under Uva-Ursi)
- ARNICA**
- Anticoagulant drugs, unspecified**
(Coumarin component in Arnica may increase anticoagulant effect)
- Warfarin Sodium**
(Additive anticoagulant effect)
- ARNICA MONTANA**
(See under Arnica)
- ARTEMISIA ABSINTHIUM**
(See under Wormwood)
- ASPIRIN**
- Cayenne**
(Decreased bioavailability of aspirin)
- Feverfew**
(Increased antithrombotic effect)
- ASTRAGALUS**
- Anticoagulant drugs, unspecified**
(Astragalus may potentiate anticoagulant effects)
- Immunosuppressants**
(Decreased effectiveness of immunosuppressive effect due to immunostimulant effect of Astragalus)
- ASTRAGALUS SPECIES**
(See under Astragalus)
- ATROPA BELLADONNA**
(See under Belladonna)
- BARBITURATES**
- Rauwolfia**
(Synergistic effect)
- White Willow**
(Enhances toxicity of salicylates)
- BELLADONNA**
- Amantadine Hydrochloride**
(Increases anticholinergic effect of herb)
- Quinidine**
(Increases anticholinergic effect of herb)
- Tricyclic Antidepressants**
(Increases anticholinergic effect of herb)
- BENZODIAZEPINES**
- German Chamomile**
(May increase sedative effect)
- BILBERRY**
- Salicylates**
(Increases prothrombin time; caution should be observed when used concurrently)
- Warfarin Sodium**
(Increases prothrombin time; caution should be observed when used concurrently)
- BLADDERWRACK**
- Hypoglycemic Drugs**
(Herb may have an additive hypoglycemic effect when taken with other hypoglycemic drugs)
- BREWER'S YEAST**
- MAO Inhibitors**
(Increase in blood pressure)
- BUCKTHORN**
- Antiarrhythmics**
(Increased effect due to potassium loss with chronic use of herb)
- Cardiac Glycosides**
(Increased effect due to potassium loss with chronic use of herb)
- Corticosteroids**
(Increases hypokalemic effects)
- Digoxin**
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- Licorice Root**
(Increases hypokalemic effects)
- Thiazide Diuretics**
(Increases hypokalemic effects)
- BUGLEWEED**
- Diagnostic Procedures Using Radioactive Isotopes**
(Herb interferes with these isotopes)
- Thyroid Preparations**
(Effect not specified)

- CALCIUM**
 Adonis
 (Increases action of Adonis)
 Lily-of-the-Valley
 (Increases the effect of Lily-of-the-Valley)
 Squill
 (Increases effectiveness and side effects of herb)
- CALCIUM SALTS**
 Kombe Seed
 (Increases effects and side effects of herb)
 Oleander
 (Increased efficacy and side effects when given simultaneously with herb)
 Strophanthus
 (Simultaneous administration with herb enhance both effects and side effects)
 Strophanthus Gratus
 (Simultaneous administration with herb enhance both effects and side effects)
- CAMELLIA SINENSIS**
 (See under Green Tea)
- CAPSICUM ANNUUM**
 (See under Cayenne)
- CARBONIC ANHYDRASE INHIBITORS**
 White Willow
 (Potentiates action of salicylates)
- CARDIAC GLYCOSIDES**
 Aloe
 (Increases effect of cardiac glycosides)
 Buckthorn
 (Increased effect due to potassium loss with chronic use of herb)
 Cascara Sagrada
 (Increased effect due to potassium loss with chronic use of herb)
 Chinese Rhubarb
 (Increased effect due to potassium loss with chronic use of herb)
 Frangula
 (Increased effect due to potassium loss with chronic use of herb)
 Guarana
 (Increased effect due to potassium loss with chronic use of herb)
- Ma-Huang
 (Disturbance of heart rhythm)
- CARDIOACTIVE STEROIDS**
 Castor Oil Plant
 (Increased effect due to potassium loss with chronic use of herb)
- CARICA PAPAYA**
 (See under Papaya)
- CASCARA SAGRADA**
 Antiarrhythmics
 (Potentiates arrhythmias with prolonged use of Cascara)
 Cardiac Glycosides
 (Increased effect due to potassium loss with chronic use of herb)
 Corticosteroids
 (Increases hypokalemic effect)
 Digoxin
 (Herb may cause hypokalemia, which may increase digoxin toxicity)
 Indomethacin
 (Decreases therapeutic effect of Cascara)
 Thiazide Diuretics
 (Increases hypokalemic effect)
- CASSIA SENNA**
 (See under Senna)
- CASTOR OIL PLANT**
 Cardioactive Steroids
 (Increased effect due to potassium loss with chronic use of herb)
- CAYENNE**
 Aspirin
 (Decreased bioavailability of aspirin)
- CENTRAL NERVOUS SYSTEM STIMULANTS**
 Ma-Huang
 (Ma-Huang has an additive effect on the CNS when combined with CNS stimulants)
- CHASTE TREE**
 Dopamine Antagonists
 (Decreased dopaminergic effect of herb)
- CHINESE RHUBARB**
 Cardiac Glycosides
 (Increased effect due to potassium loss with chronic use of herb)
- Digoxin
 (Herb may cause hypokalemia, which may increase digoxin toxicity)
- CINCHONA PUBESCENS**
 (See under Quinine)
- COFFEA ARABICA**
 (See under Coffee)
- COFFEE**
 Drugs, unspecified
 (Herb can hinder (or decrease) resorption of other drugs)
- CONVALLARIA MAJALIS**
 (See under Lily-of-the-Valley)
- CORTICOSTEROIDS**
 Aloe
 (Increased potassium loss)
 Buckthorn
 (Increases hypokalemic effects)
 Cascara Sagrada
 (Increases hypokalemic effect)
 Echinacea Angustifolia
 (Echinacea may potentially interfere with the anti-cancer chemotherapeutic effect of corticosteroids)
- CYCLOSPORINE**
 St. John's Wort
 (The herb induces the cytochrome P450 enzyme system and will lower cyclosporine serum levels)
- CYTISUS SCOPARIUS**
 (See under Scotch Broom)
- DATURA STRAMONIUM**
 (See under Jimson Weed)
- DIAGNOSTIC PROCEDURES USING RADIOACTIVE ISOTOPES**
 Bugleweed
 (Herb interferes with these isotopes)
- DIGITALIS**
 Methylxanthines
 (Increases risk of cardiac arrhythmias)
 Phosphodiesterase Inhibitors
 (Increases risk of cardiac arrhythmias)

- Quinidine
(Increases risk of cardiac arrhythmias)
- Sympathomimetic Agents
(Increases risk of cardiac arrhythmias)
- DIGITALIS GLYCOSIDE PREPARATIONS**
- Licorice
(Licorice-induced hypokalemia increases risk of digitalis toxicity)
- Rauwolfia
(Severe bradycardia when used in combination with digitalis glycosides)
- Senna
(Senna-induced hypokalemia may increase toxicity of digitalis preparations)
- DIGITALIS LANATA**
- Methylxanthines
(Risk of cardiac arrhythmias)
- Phosphodiesterase Inhibitors
(Risk of cardiac arrhythmias)
- Quinidine
(Risk of cardiac arrhythmias)
- Sympathomimetic Agents
(Risk of cardiac arrhythmias)
- DIGITALIS PURPUREA**
(See under Digitalis)
- DIGOXIN**
- Adonis
(Increases action of Adonis)
- Buckthorn
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- Cascara Sagrada
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- Chinese Rhubarb
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- Frangula
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- Guarana
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- Lily-of-the-Valley
(Increases the effect of Lily-of-the-Valley)
- Squill
(Squill potentiates the positive inotropic and negative chronotropic effects of digoxin)
- St. John's Wort
(Co-administration of the herb with digoxin has resulted in a significant decrease in the digoxin area under the curve)
- Uzara
(Herb contains cardiac glycosides and may have additive effect when taken with digoxin, possibly increasing digoxin toxicity)
- DIOSCOREA VILLOSA**
(See under Wild Yam)
- DIURETICS**
- Kombe Seed
(Increases effects and side effects of herb)
- DOPAMINE ANTAGONISTS**
- Chaste Tree
(Decreased dopaminergic effect of herb)
- DRUGS THAT CAUSE THROMBOCYTOPENIA**
- Quinine
(Herb increases risk of thrombocytopenia)
- DRUGS, UNSPECIFIED**
- Coffee
(Herb can hinder (or decrease) resorption of other drugs)
- Flax
(Absorption of other drugs may be delayed when taken simultaneously)
- Niauli
(Co-administration may result in decreased effect of drugs that undergo liver metabolism)
- Psyllium
(Absorption of other drugs may be decreased if taken simultaneously with herb)
- Psyllium Seed
(Absorption of other drugs may be decreased if taken simultaneously with herb)
- ECHINACEA ANGUSTIFOLIA**
- Corticosteroids
(Echinacea may potentially interfere with the anti-cancer chemotherapeutic effect of corticosteroids)
- Immunosuppressants
(The immune-stimulating effect of Echinacea may interfere with drugs that have immunosuppressant effects)
- EPHEDRA SINICA**
(See under Ma-Huang)
- ESTROGEN**
- Senna
(Senna decreases estrogen levels when taken with estrogen supplements)
- Wild Yam
(Additive effect)
- ETHANOL**
- Yohimbe Bark
(Increased anxiogenic effects)
- EVENING PRIMROSE**
- Anticonvulsants
(Evening Primrose oil may lower seizure threshold and decrease effectiveness of anticonvulsant medications)
- FENUGREEK**
- Hypoglycemic Drugs
(Herb may have an additive hypoglycemic effect when taken with other hypoglycemic drugs)
- FEVERFEW**
- Aspirin
(Increased antithrombotic effect)
- Warfarin Sodium
(Increased antithrombotic effect)
- FLAX**
- Drugs, unspecified
(Absorption of other drugs may be delayed when taken simultaneously)
- FRANGULA**
- Cardiac Glycosides
(Increased effect due to potassium loss with chronic use of herb)

- Digoxin**
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- FUCUS VESICULOSUS*
(See under Bladderwrack)
- GALEGA OFFICINALIS*
(See under Goat's Rue)
- GERMAN CHAMOMILE**
Alcohol
(May increase sedative effect)
- Benzodiazepines
(May increase sedative effect)
- Warfarin Sodium
(Hydroxycoumarin component in Chamomile may elevate prothrombin times)
- GINKGO**
Antithrombotic Drugs
(Increases effect of antithrombotic drugs)
- GINKGO BILOBA*
(See under Ginkgo)
- GINSENG**
Hypoglycemic Drugs
(Increases hypoglycemic effect)
- Loop Diuretics
(Increases diuretic resistance)
- MAO Inhibitors
(Combination increases chance for headache, tremors, mania)
- GLUCOCORTICOIDS**
Adonis
(Increases action of Adonis)
- Kombe Seed
(Increases effects and side effects of herb)
- Licorice
(Licorice potentiates effect of glucocorticoids)
- Lily-of-the-Valley
(Increases the effect of Lily-of-the-Valley)
- Oleander
(Increased efficacy and side effects when given simultaneously with herb)
- Squill
(Increases effectiveness and side effects of herb)
- Strophanthus**
(Simultaneous administration with herb enhance both effects and side effects)
- Strophanthus Gratus**
(Simultaneous administration with herb enhance both effects and side effects)
- GLYCYRRHIZA GLABRA*
(See under Licorice)
- GOAT'S RUE**
Hypoglycemic Drugs
(Herb may have an additive hypoglycemic effect when taken with other hypoglycemic drugs)
- GREEN TEA**
Alkaline Drugs
(Decreased absorption of alkaline drugs due to tannin component in tea)
- GUANETHIDINE**
Ma-Huang
(Increased sympathomimetic effects)
- GUARANA**
Cardiac Glycosides
(Increased effect due to potassium loss with chronic use of herb)
- Digoxin
(Herb may cause hypokalemia, which may increase digoxin toxicity)
- HALOPERIDOL**
Milk Thistle
(Silymarin in combination with haloperidol causes a decrease in lipid peroxidation)
- HALOTHANE**
Ma-Huang
(Disturbance of heart rhythm)
- HENBANE**
Amantadine Hydrochloride
(Increased anticholinergic action)
- Antihistamines
(Increased anticholinergic action)
- Phenothiazines
(Increased anticholinergic action)
- Procainamide
(Increased anticholinergic action)
- Quinidine**
(Increased anticholinergic action)
- Tricyclic Antidepressants
(Increased anticholinergic action)
- HORSE CHESTNUT**
Anticoagulant drugs, unspecified
(Horse Chestnut has a coumarin component and may interact with warfarin, salicylates and other drugs with anticoagulant properties)
- HYOSCYAMUS NIGER*
(See under Henbane)
- HYPERICUM PERFORA TUM*
(See under St. John's Wort)
- HYPNOTICS**
Valerian
(Additive effect when taken with Valerian)
- HYPOGLYCEMIC DRUGS**
Bladderwrack
(Herb may have an additive hypoglycemic effect when taken with other hypoglycemic drugs)
- Fenugreek
(Herb may have an additive hypoglycemic effect when taken with other hypoglycemic drugs)
- Ginseng
(Increases hypoglycemic effect)
- Goat's Rue
(Herb may have an additive hypoglycemic effect when taken with other hypoglycemic drugs)
- IMMUNOSUPPRESSANTS**
Astragalus
(Decreased effectiveness of immunosuppressive effect due to immunostimulant effect of Astragalus)
- Echinacea Angustifolia
(The immune-stimulating effect of Echinacea may interfere with drugs that have immunosuppressant effects)
- INDIAN SQUILL**
Methylxanthines
(Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)

Phosphodiesterase Inhibitors

(Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)

Quinidine

(Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)

Sympathomimetic Agents

(Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)

INDINAVIR SULFATE**St. John's Wort**

(The herb induces the cytochrome P450 enzyme system and will lower indinavir serum levels)

INDOMETHACIN**Cascara Sagrada**

(Decreases therapeutic effect of Cascara)

Senna

(Decreased therapeutic effect of Senna)

Wild Yam

(Wild Yam may decrease the anti-inflammatory effect of indomethacin)

INSULIN**Psyllium**

(Effect unspecified; insulin dose should be decreased)

JIMSON WEED**Anticholinergics**

(Co-administration of Jimson Weed with other anticholinergic drugs may increase the frequency and/or severity of anticholinergic side effects such as dry mouth, constipation, drowsiness, and others)

KOMBE SEED**Calcium Salts**

(Increases effects and side effects of herb)

Diuretics

(Increases effects and side effects of herb)

Glucocorticoids

(Increases effects and side effects of herb)

Laxatives

(Increases effects and side effects of herb)

Quinidine

(Increases effects and side effects of herb)

LAXATIVES**Adonis**

(Increases action of Adonis)

Kombe Seed

(Increases effects and side effects of herb)

Lily-of-the-Valley

(Increases the effect of Lily-of-the-Valley)

Oleander

(Increased efficacy and side effects when given simultaneously with herb)

Squill

(Increases effectiveness and side effects of herb)

Strophanthus

(Simultaneous administration with herb enhance both effects and side effects)

Strophanthus Gratus

(Simultaneous administration with herb enhance both effects and side effects)

LEVODOPA**Rauwolfia**

(Decreased effect; increases in extra-pyramidal symptoms)

LICORICE**Aloe**

(Increased potassium loss)

Antiarrhythmics

(Licorice-induced hypokalemia increases risk of arrhythmias)

Digitalis Glycoside Preparations

(Licorice-induced hypokalemia increases risk of digitalis toxicity)

Glucocorticoids

(Licorice potentiates effect of glucocorticoids)

Loop Diuretics

(Additive effect of hypokalemia)

Thiazide Diuretics

(Additive effect of hypokalemia)

LICORICE ROOT**Buckthorn**

(Increases hypokalemic effects)

LILY-OF-THE-VALLEY**Calcium**

(Increases the effect of Lily-of-the-Valley)

Digoxin

(Increases the effect of Lily-of-the-Valley)

Glucocorticoids

(Increases the effect of Lily-of-the-Valley)

Laxatives

(Increases the effect of Lily-of-the-Valley)

Quinidine

(Increases the effect of Lily-of-the-Valley)

Saluretics

(Increases the effect of Lily-of-the-Valley)

LINUM USITATISSIMUM

(See under Flax)

LOOP DIURETICS**Ginseng**

(Increases diuretic resistance)

Licorice

(Additive effect of hypokalemia)

Uva-Ursi

(The sodium-sparing effect of Uva-Ursi may antagonize the diuretic effect of the loop diuretics)

LYCOPUS VIRGINICUS

(See under Bugleweed)

MA-HUANG**Cardiac Glycosides**

(Disturbance of heart rhythm)

Central Nervous System Stimulants

(Ma-Huang has an additive effect on the CNS when combined with CNS stimulants)

Guanethidine

(Increased sympathomimetic effects)

Halothane

(Disturbance of heart rhythm)

MAO Inhibitors

(Increases sympathomimetic effects of ephedrine)

- Oxytocin
(Development of high blood pressure)
- MAO INHIBITORS**
- Brewer's Yeast
(Increase in blood pressure)
- Ginseng
(Combination increases chance for headache, tremors, mania)
- Ma-Huang
(Increases sympathomimetic effects of ephedrine)
- Scotch Broom
(Increased risk of hypertensive crisis)
- MATRICARIA RECUTITA**
(See under German Chamomile)
- MEDICATION AND FOOD THAT INCREASE URIC ACID LEVELS**
- Alpine Cranberry
(Decreases effect of Alpine Cranberry)
- Uva-Ursi
(Decreases effect of herb)
- MELALEUCEA VIRIDIFLORA**
(See under Niauli)
- METHYLXANTHINES**
- Digitalis
(Increases risk of cardiac arrhythmias)
- Digitalis Lanata
(Risk of cardiac arrhythmias)
- Indian Squill
(Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)
- Squill
(Increases risk of cardiac arrhythmias)
- MILK THISTLE**
- Haloperidol
(Silymarin in combination with haloperidol causes a decrease in lipid peroxidation)
- Phenothiazines
(Silymarin in combination with phenothiazines causes a decrease in lipid peroxidation)
- Phentolamine Mesylate
(Silymarin antagonizes the effect of phentolamine)
- Yohimbine Hydrochloride
(Silymarin antagonizes the effect of yohimbine)
- MORPHINE SULFATE**
- Yohimbe Bark
(Potentiates effects of morphine)
- NALTREXONE HYDROCHLORIDE**
- Yohimbe Bark
(Potentiates Yohimbe side effects)
- NERIUM OLEANDER**
(See under Oleander)
- NEUROLEPTICS**
- Rauwolfia
(Synergistic effect)
- NIALI**
- Drugs, unspecified
(Co-administration may result in decreased effect of drugs that undergo liver metabolism)
- NIFEDIPINE**
- Senna
(Inhibits activity of Senna via calcium channel blockade)
- NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**
- Uva-Ursi
(Uva-Ursi may potentiate the gastrointestinal irritation caused by NSAIDs)
- White Willow
(Use with caution; effect not specified)
- OTC STIMULANTS**
- Yohimbe Bark
(Potentiates hypertensive effect)
- OAK**
- Alkaline Drugs
(Absorption of alkaline drugs may be reduced or inhibited)
- Alkaloids
(Absorption of alkaloids may be reduced or inhibited)
- OENOTHERA BIENNIS**
(See under Evening Primrose)
- OLEANDER**
- Calcium Salts
(Increased efficacy and side effects when given simultaneously with herb)
- Glucocorticoids
(Increased efficacy and side effects when given simultaneously with herb)
- Laxatives
(Increased efficacy and side effects when given simultaneously with herb)
- Quinidine
(Increased efficacy and side effects when given simultaneously with herb)
- Saluretics
(Increased efficacy and side effects when given simultaneously with herb)
- ORAL CONTRACEPTIVES**
- St. John's Wort
(Breakthrough bleeding has been reported with concomitant use of the herb with oral contraceptives)
- OXYTOCIN**
- Ma-Huang
(Development of high blood pressure)
- PANAX GINSENG**
(See under Ginseng)
- PAPAYA**
- Warfarin Sodium
(Increased INR levels)
- PAULLINIA CUPANA**
(See under Guarana)
- PAUSINYSTALIA YOHIMBE**
(See under Yohimbe Bark)
- PHENOTHIAZINES**
- Henbane
(Increased anticholinergic action)
- Milk Thistle
(Silymarin in combination with phenothiazines causes a decrease in lipid peroxidation)
- Wormwood
(Wormwood preparations should not be administered with drugs known to lower the seizure threshold)
- PHENTOLAMINE MESYLATE**
- Milk Thistle
(Silymarin antagonizes the effect of phentolamine)

PHOSPHODIESTERASE INHIBITORS	Digitalis (Increases risk of cardiac arrhythmias)	Levodopa (Decreased effect; increases in extra-pyramidal symptoms)
Digitalis	Digitalis Lanata (Risk of cardiac arrhythmias)	Neuroleptics (Synergistic effect)
Digitalis Lanata	Henbane (Increased anticholinergic action)	Sympathomimetic Agents (Increases blood pressure)
Indian Squill (Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)	Indian Squill (Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)	RAUWOLFIA SERPENTINA (See under Rauwolfia)
Squill (Increases risk of cardiac arrhythmias)	Kombe Seed (Increases effects and side effects of herb)	RESERPINE St. John's Wort (Hypericum antagonizes the effect of reserpine)
PHOTOSENSITIZING AGENTS	Lily-of-the-Valley (Increases the effect of Lily-of-the-Valley)	RHAMNUS CATHARTICUS (See under Buckthorn)
St. John's Wort (An additive photosensitizing effect is expected when the herb is used with photosensitizing drugs such as tetracyclines, sulfonamides, and thiazides)	Oleander (Increased efficacy and side effects when given simultaneously with herb)	RHAMNUS FRANGULA (See under Frangula)
PLANTAGO AFRA (See under Psyllium Seed)	Scopolia (Increased effect when given simultaneously with herb)	RHAMNUS PURSHIANA (See under Cascara Sagrada)
PLANTAGO OVATA (See under Psyllium)	Squill (Increases risk of cardiac arrhythmias; increases effectiveness and side effects of herb)	RHEUM PALMA TUM (See under Chinese Rhubarb)
PROCAINAMIDE	Strophanthus (Simultaneous administration with herb enhance both effects and side effects)	RICINUS COMMUNIS (See under Castor Oil Plant)
Henbane (Increased anticholinergic action)	Strophanthus Gratus (Simultaneous administration with herb enhance both effects and side effects)	SACCHAROMYCES CEREVISIAE (See under Brewer's Yeast)
PSYLLIUM	QUININE Drugs that Cause Thrombocytopenia (Herb increases risk of thrombocytopenia)	SALICYLATES Bilberry (Increases prothrombin time; caution should be observed when used concurrently)
Drugs, unspecified (Absorption of other drugs may be decreased if taken simultaneously with herb)	RAUWOLFIA Alcohol (Increases impairment of motor skills)	White Willow (Use with caution; effect not specified)
Insulin (Effect unspecified; insulin dose should be decreased)	Barbiturates (Synergistic effect)	SALIX SPECIES (See under White Willow)
PSYLLIUM SEED	Digitalis Glycoside Preparations (Severe bradycardia when used in combination with digitalis glycosides)	SALURETICS Adonis (Increases action of Adonis)
Drugs, unspecified (Absorption of other drugs may be decreased if taken simultaneously with herb)		Lily-of-the-Valley (Increases the effect of Lily-of-the-Valley)
QUERCUS ROBUR (See under Oak)		Oleander (Increased efficacy and side effects when given simultaneously with herb)
QUINIDINE		Squill (Increases effectiveness and side effects of herb)
Adonis (Increases action of Adonis)		
Belladonna (Increases anticholinergic effect of herb)		

Strophanthus
(Simultaneous administration with herb enhance both effects and side effects)

Strophanthus Gratus
(Simultaneous administration with herb enhance both effects and side effects)

SAW PALMETTO

Alpha Adrenergic Blockers
(Saw Palmetto has an additive alpha adrenergic blocking effect when given in combination with alpha blockers)

Androgens
(Saw Palmetto antagonizes the effect of androgens)

SCOPOLIA

Amantadine Hydrochloride
(Increased effect when given simultaneously with herb)

Quinidine
(Increased effect when given simultaneously with herb)

Tricyclic Antidepressants
(Increased effect when given simultaneously with herb)

SCOPOLIA CARNIOLICA

(See under Scopolia)

SCOTCH BROOM

MAO Inhibitors
(Increased risk of hypertensive crisis)

SELECTIVE SEROTONIN REUPTAKE INHIBITORS

St. John's Wort
(Concomitant use with the herb will result in an additive serotonin effect and possible toxicity)

SENNA

Antiarrhythmics
(Senna-induced hypokalemia may increase risk of arrhythmia)

Digitalis Glycoside Preparations
(Senna-induced hypokalemia may increase toxicity of digitalis preparations)

Estrogen
(Senna decreases estrogen levels when taken with estrogen supplements)

Indomethacin
(Decreased therapeutic effect of Senna)

Nifedipine
(Inhibits activity of Senna via calcium channel blockade)

SERENOA REPENS

(See under Saw Palmetto)

SIL YBUM MARIANUM

(See under Milk Thistle)

SQUILL

Calcium
(Increases effectiveness and side effects of herb)

Digoxin
(Squill potentiates the positive inotropic and negative chronotropic effects of digoxin)

Glucocorticoids
(Increases effectiveness and side effects of herb)

Laxatives
(Increases effectiveness and side effects of herb)

Methylxanthines
(Increases risk of cardiac arrhythmias)

Phosphodiesterase Inhibitors
(Increases risk of cardiac arrhythmias)

Quinidine
(Increases risk of cardiac arrhythmias; increases effectiveness and side effects of herb)

Saluretics
(Increases effectiveness and side effects of herb)

Sympathomimetic Agents
(Increases risk of cardiac arrhythmias)

ST. JOHN'S WORT

Cyclosporine
(The herb induces the cytochrome P450 enzyme system and will lower cyclosporine serum levels)

Digoxin
(Co-administration of the herb with digoxin has resulted in a significant decrease in the digoxin area under the curve)

Indinavir Sulfate
(The herb induces the cytochrome P450 enzyme system and will lower indinavir serum levels)

Oral Contraceptives
(Breakthrough bleeding has been reported with concomitant use of the herb with oral contraceptives)

Photosensitizing Agents
(An additive photosensitizing effect is expected when the herb is used with photosensitizing drugs such as tetracyclines, sulfonamides, and thiazides)

Reserpine
(Hypericum antagonizes the effect of reserpine)

Selective Serotonin Reuptake Inhibitors
(Concomitant use with the herb will result in an additive serotonin effect and possible toxicity)

Sympathomimetic Agents
(St. John's Wort may have MAO inhibitor properties and caution should be used with sympathomimetic agents)

Theophylline
(The herb induces the cytochrome P450 enzyme system and will lower theophylline serum levels)

STROPHANTHUS

Calcium Salts
(Simultaneous administration with herb enhance both effects and side effects)

Glucocorticoids
(Simultaneous administration with herb enhance both effects and side effects)

Laxatives
(Simultaneous administration with herb enhance both effects and side effects)

Quinidine
(Simultaneous administration with herb enhance both effects and side effects)

Saluretics «
(Simultaneous administration with herb enhance both effects and side effects)

STROPHANTHUS GRATUS

Calcium Salts

(Simultaneous administration with herb enhance both effects and side effects)

Glucocorticoids

(Simultaneous administration with herb enhance both effects and side effects)

Laxatives

(Simultaneous administration with herb enhance both effects and side effects)

Quinidine

(Simultaneous administration with herb enhance both effects and side effects)

Saluretics

(Simultaneous administration with herb enhance both effects and side effects)

STROPHANTHUS KOMBE

(See under Strophanthus)

STROPHANTHUS GRATUS

(See under Strophanthus Gratus)

STROPHANTHUS HISPIDUS

(See under Kombe Seed)

SYMPATHOMIMETIC AGENTS

Digitalis

(Increases risk of cardiac arrhythmias)

Digitalis Lanata

(Risk of cardiac arrhythmias)

Indian Squill

(Can increase the risk of cardiac arrhythmias when given simultaneously with this herb)

Rauwolfia

(Increases blood pressure)

Squill

(Increases risk of cardiac arrhythmias)

St. John's Wort

(St. John's Wort may have MAO inhibitor properties and caution should be used with sympathomimetic agents)

TANACETUM PARTHENIUM

(See under Feverfew)

THEOPHYLLINE

St. John's Wort

(The herb induces the cytochrome P450 enzyme system and will lower theophylline serum levels)

THIAZIDE DIURETICS

Aloe

(Increased potassium loss)

Buckthorn

(Increases hypokalemic effects)

Cascara Sagrada

(Increases hypokalemic effect)

Licorice

(Additive effect of hypokalemia)

Uva-Ursi

(The sodium-sparing effect of Uva-Ursi may antagonize the diuretic effect of thiazide diuretics)

THYROID PREPARATIONS

Bugleweed

(Effect not specified)

TRAZODONE HYDROCHLORIDE

Wormwood

(Wormwood preparations should not be administered with drugs known to lower the seizure threshold)

TRICYCLIC ANTIDEPRESSANTS

Belladonna

(Increases anticholinergic effect of herb)

Henbane

(Increased anticholinergic action)

Scopolia

(Increased effect when given simultaneously with herb)

Wormwood

(Wormwood preparations should not be administered with drugs known to lower the seizure threshold)

TRIGONELLA FOENUM-GRÆCUM

(See under Fenugreek)

URGINEA INDICA

(See under Indian Squill)

URGINEA MARITIMA

I (See under Squill)

URINARY TRACT ACIDIFIERS

Uva-Ursi

(Drugs or foods that acidify the urine will decrease the antibacterial effect of Uva-Ursi)

UVA-URSI

Loop Diuretics

(The sodium-sparing effect of Uva-Ursi may antagonize the diuretic effect of the loop diuretics)

Medication and Food that Increase Uric Acid Levels

(Decreases effect of herb)

Non-Steroidal Anti-Inflammatory Drugs

(Uva-Ursi may potentiate the gastrointestinal irritation caused by NSAIDs)

Thiazide Diuretics

(The sodium-sparing effect of Uva-Ursi may antagonize the diuretic effect of thiazide diuretics)

Urinary Tract Acidifiers

(Drugs or foods that acidify the urine will decrease the antibacterial effect of Uva-Ursi)

UZARA

Digoxin

(Herb contains cardiac glycosides and may have additive effect when taken with digoxin, possibly increasing digoxin toxicity)

VACCINIUM MYRTILLUS

(See under Bilberry)

VACCINIUM VITIS-IDAEA

(See under Alpine Cranberry)

VALERIAN

Alcohol •

(Additive depressive effects with Valerian)

Hypnotics

(Additive effect when taken with Valerian)

VALERIANA OFFICINALIS

(See under Valerian)

VITEX AGNUS-CASTUS

I (See under Chaste Tree)

WARFARIN SODIUM

- Arnica
(Additive anticoagulant effect)
- Bilberry
(Increases prothrombin time; caution should be observed when used concurrently)
- Feverfew
(Increased antithrombotic effect)
- German Chamomile
(Hydroxycoumarin component in Chamomile may elevate prothrombin times)
- Papaya
(Increased INR levels)

WHITE WILLOW

- Alcohol
(Enhances toxicity of salicylates)
- Antiplatelet Drugs
(Additive effect with salicylates)
- Barbiturates
(Enhances toxicity of salicylates)
- Carbonic Anhydrase Inhibitors
(Potentiates action of salicylates)

Non-Steroidal Anti-Inflammatory Drugs

- (Use with caution; effect not specified)
- Salicylates
(Use with caution; effect not specified)

WILD YAM

- Estrogen
(Additive effect)
- Indomethacin
(Wild Yam may decrease the anti-inflammatory effect of indomethacin)

WORMWOOD

- Phenothiazines
(Wormwood preparations should not be administered with drugs known to lower the seizure threshold)
- Trazodone Hydrochloride
(Wormwood preparations should not be administered with drugs known to lower the seizure threshold)

Tricyclic Antidepressants

- (Wormwood preparations should not be administered with drugs known to lower the seizure threshold)

XYSMALOBIUM UNDULATUM
{See under Uzara}

YOHIMBE BARK

- Antihypertensive agents, unspecified
(May need to adjust antihypertensive medications due to hypertensive effect of Yohimbe)
- Ethanol
(Increased angiogenic effects)
- Morphine Sulfate
(Potentiates effects of morphine)
- Naltrexone Hydrochloride
(Potentiates Yohimbe side effects)
- OTC stimulants
(Potentiates hypertensive effect)

YOHIMBINE HYDROCHLORIDE

- Milk Thistle
(Silymarin antagonizes the effect of yohimbine)

Safety Guide

This guide lists botanicals in three precautionary categories:

- Not for use during pregnancy
- Not for use while nursing
- For use only under supervision

All common, scientific, and brand names of each potentially harmful botanical are listed alphabetically. Generally accepted common names that serve as monograph titles appear in bold type. Scientific names are shown in italic type. Brand names are followed by the supplier's name in parentheses. If an entry lists two page numbers, the first refers to a photograph of the plant or product in the Identification Guide, the second to the herbal monograph. For additional information on potential adverse effects, be sure to check the appropriate underlying monograph.

Not for use during pregnancy

Manufacturers Index

This index provides you with contact information for each supplier whose products appear in the herbal monographs. The names of the products follow the company's contact information. If an entry lists two page numbers, the first refers to a photograph of the product in the Identification Guide, the second to the herbal monograph in which the product appears.

Herb Identification Guide

In this full-color photo section, you'll find hundreds of pictures of herbs and leading commercial preparations.

The first part of the section is an Herb Identification Guide with photos of over 380 common medicinal plants. Each herb is labeled with its generally accepted common name immediately above the photo, and its scientific name immediately below. The pictures are arranged alphabetically by common name.

Following these photos is a Product Identification Guide in which you'll find a representative selection of popular commercial formulations. The pictures on these pages are arranged alphabetically by manufacturer and product name.

Please note that the plants are not reproduced in actual size, and that the scale of the photos varies. For the average dimensions of the plant and its component structures, please check the Description section of the corresponding herbal monograph.

Herbal Monographs

This section contains comprehensive profiles of some 700 medicinal herbs, including the findings of the German Regulatory Authority's herbal watchdog agency, commonly called "Commission E." This agency has conducted an intensive assessment of the peer-reviewed literature on some 300 common botanicals, weighing the quality of the clinical evidence and identifying the uses for which the herb can reasonably be considered effective. Its conclusions represent the best expert consensus on medicinal herbs currently to be found.

For those herbs not considered by Commission E, *Physicians' Desk Reference* has augmented this section with the results of an exhaustive literature review conducted by the respected PhytoPharm U.S. Institute of Phytopharmaceuticals under the direction of noted botanist, Dr. Joerg Gruenwald. These monographs, some 400 in number, provide a detailed introduction to an array of exotic botanicals that you'll be hard pressed to find in any other source.

To make the information in the monographs as useful and accessible as possible, *PDR* has echoed the structure of standard U.S. product labeling. Each monograph contains up to ten standard sections, covering considerations ranging from description to dosage. Specifically, here's what you will find:

- **Title:** Each monograph begins with the herb's generally accepted common name, followed by its scientific name. In addition, all monographs* are cross-referenced by their botanical designation.
- **Trade Names:** Listed here are common commercial preparations of the herb.
- **Description:** This section provides a detailed botanical overview of the herb, including information on its medicinal parts; flower and fruit; leaves, stem, and root; unique characteristics, habitat, production, related plants, and additional common names and synonyms.
- **Actions and Pharmacology:** Here you'll find data on the active compounds or heterogeneous mixtures found in the plant, followed by a summary of the herb's clinical effects. If various parts of the plant possess different pharmacological activity, the parts are discussed individually, here and throughout the remainder of the monograph.
- **Indications and Usage:** Information on the uses of the herb is listed under five categories, as applicable:
 - Approved by Commission E
 - Unproven Uses
 - Chinese Medicine
 - Indian Medicine
 - Homeopathic

Approved uses are presented in list fashion. Other uses are described with provisos as necessary regarding route and form of administration.

- **Contraindications:** Although most natural remedies can be used under all medical circumstances, a few pharmacologically potent herbs must be avoided in the presence of certain medical conditions. If any such contraindications exist, they are summarized here.

- **Precautions and Adverse Reactions:** Found in this section are any cautions or special considerations regarding safe use of the herb, including any restrictions on use in pregnancy or childhood. Although most herbal remedies are notably free of known side effects, any reported in the available literature are noted here.

- **Overdosage:** As we all know, "natural" is not synonymous with "benign," and an overdose of many "healing" herbs can have serious—even fatal—consequences. Whenever adverse effects of overdose have been found in the literature, they are reported here, along with the appropriate medical interventions to be undertaken when an overdose occurs.

- **Dosage:** Listed here are common modes of administration, forms and strengths of available commercial preparations, methods for preparing the natural herb, and representative dosage recommendations drawn from the literature. Note, however, that dosage recommendations can be used only as a general guide. The potency of individual preparations and extracts is subject to substantial variation, so the manufacturer's directions should be consulted whenever available.

- **Literature:** This section provides you with a unique bibliography of the technical literature. Because German researchers have been particularly active in the herbal arena, you will find an unusual number of German-language citations. However, work in the English literature is included as well.

PDR for Herbal Medicines is the product of one of the most thorough and inclusive examinations of the herbal literature ever undertaken. Nevertheless, it's important to remember that it merely summarizes and synthesizes key data from the underlying research reports, and of necessity includes neither every published report nor every recorded fact.

As in all scientific investigation, conclusions regarding the effectiveness of the herbs discussed in this compendium are based on the preponderance of current evidence and cannot be considered firm or final. The publisher does not warrant that any herb will unfailingly and uniformly exhibit the properties ascribed to it by Germany's Commission E or any other scientific authority.

In the United States, herbal products are marketed under the provisions of the Dietary Supplement and Health Education Act of 1994, which prohibits their sale for the diagnosis, treatment, cure, or prevention of any disease. Enumeration of specific commercial preparations within an herbal monograph should not be construed as a claim or warranty of their efficacy for any purpose, by either the manufacturer or the publisher. Furthermore, it should be understood that, just as omission of a product does not signify rejection, inclusion of a product does not imply endorsement, and that the publisher is not advocating the use of any product or substance described herein.

Please remember, too, that dosing of herbal preparations is highly dependent on a variety of factors, such as cultivation and harvesting conditions, the specific parts of the plant to be processed, the extraction methods employed, and the dosage form chosen by the manufacturer. Since there are no official standards governing the production of herbal medicines in the United States, and the potency and the purity of herbal products are subject to substantial variation, dosage ranges set forth in the herbal monographs must be employed only as general guidelines.

In addition, the publisher does not guarantee that every possible hazard, adverse effect, contraindication, precaution, or consequence of overdose is included in the summaries presented here. The publisher has performed no independent verification of the data reported herein, and expressly disclaims responsibility for any error, whether inherent in the underlying literature or resulting from erroneous translation, transcription, or typography.

Abscess Root

Polemonium reptans

DESCRIPTION

Medicinal Parts: The medicinal part is the dried root.

Flower and Fruit: The hanging blue flowers are in loose terminal, glandular-haired panicles.

Leaves, Stem and Root: The plant grows to about 25 cm. It has creeping roots and a thin rhizome, which produces numerous stems and numerous pale, thin, glabrous and brittle roots. The glabrous stems are heavily branched and bear alternate or opposite, pinnatifid leaves with 6 or 7 pairs of leaflets.

Habitat: The plant is found in the U.S.

Production: Abscess Root is the rhizome of *Polemonium reptans*.

Not to be Confused With: The plant is known as False Jacob's Ladder because it has an astringent action similar to true Jacob's Ladder.

Other Names: American Greek Valerian, Blue Bells, False Jacob's Ladder, Sweatroot

ACTIONS AND PHARMACOLOGY

gL COMPOUNDS

Triterpene saponins

EFFECTS

Abscess root has astringent, diaphoretic and expectorant effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for febrile and inflammatory disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: It is ground as a drug for infusion.

LITERATURE

Hegnauer R, Chemotaxonomie der Pflanzen, Bde 1-11, Birkhauser Verlag Basel, Boston, Berlin 1962-1997.

Acacia

Acacia arabica

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark, the gum and the fruit of the plant.

Flower and Fruit: The flowers are yellow and sweetly scented. Two to 6 inflorescence peduncles with capitula-like inflorescences grow from the axils of the upper leaflets. The flowers have short calyces with numerous overlapping sepals. The completely fused petals are almost twice as large as the sepals. The fruit is a 12 to 16 cm long and 1.5 cm wide pod. The pod is straight or lightly curved, flat to convex, and pinched in to create segments. It is matte-black to dark-red. The seeds are 7 x 6 mm and the same color as the pod.

Leaves, Stem and Root: *Acacia arabica* is a 6 m high tree with a compact, round to flat crown. Older branches are bare, younger ones measuring 15 to 20 mm in diameter are covered in hairy down. The bark is black and fissured; the coloring in the fissure changes to red-brown. There are stipule thorns at the nodes. The leaflets of the double-pinnate leaves are in 3 to 12 pairs on the bare to downy petiole, which is covered with glands. The leaflets are oblong, blunt, and bare or thinly ciliate.

Habitat: The plant is indigenous to the Nile area, Ethiopia, East Africa, Angola, Mozambique, South Africa, Arabia, Iran, Afghanistan and India.

Production: The bark is collected from plants that are at least 7 years old and then left to mature for a year.

Not to be Confused With: The bark of the Australian species *Acacia decurrens*, which is commercially available under the same name.

Other Names: Acacia Bark, Babul Bark, Wattle Bark, Indian Gum, Black Wattle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins

EFFECTS

The drug has an astringent effect.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as a decoction for gum disease and inflammations of the mucous membrane of the mouth and throat (rarely used today).

Indian Medicine: Acacia is used as a decoction in the treatment of diarrhea and vaginal secretions, and as an enema for hemorrhoids.

PRECAUTIONS AND ADVERSE REACTIONS

Large doses taken internally can lead to indigestion and constipation.

Adam's Needle

Yucca filamentosa

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and the roots of non-flowering plants.

Flower and Fruit: The flowers are ivory-colored and located in nodding, many-blossomed terminal panicles. The perigone is simple, campanulate, tinged greenish on the outside, with 6 tepals. The flower has 6 stamens, and the stigma is 3-sectioned.

Leaves, Stem and Root: The plant is 120 to 240 cm in height. The leaves are in a basal rosette. They are sword-shaped and erect with a recurved tip. They are short-thorned, broadly grooved and covered on the margin with long, twisted, whitish or yellowish threads.

Habitat: The plant is indigenous to the southern United States and is cultivated mainly as an ornamental plant in Europe.

Production: Adam's Needle leaves are the leaves of *Yucca filamentosa*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins (from the roots; the saponins from the leaves remain uninvestigated): protoyuccoside C, yuccoside B, yuccoside E, yuccoside C, aglycones including sarsapogenin, tigogenin

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The plant is used for liver and gallbladder disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Intake can lead to stomach complaints because of the saponin content.

DOSAGE

Mode of Administration: Adam's Needle is available in ground form and in extracts.

Adiantum capillus-veneris

See Maidenhair

Adonis

Adonis vernalis

DESCRIPTION

Medicinal Parts: The medicinal part is derived from the aerial parts of the herb, which are collected during the flowering season and dried.

Flower and Fruit: The erect, solitary, terminal flower is 4 to 7 cm in diameter and the 5 broad-ovate, downy sepals are half as long as the petals. The 10 to 20 petals are narrow, wedge-shaped, simple or finely serrated at the tip. They are 20 to 40 mm long and lemon-yellow, splayed, glossy, reddish on the outside or greenish-tinged. There are numerous stamens and carpels. The small fruit forms a globose capitulum. The fruit is tomentose, wrinkled, laterally veined and keeled with a sideways-facing, hook-shaped beak. The fruit are arranged on the spindle-shaped, oblong receptacle.

Leaves, Stem and Root: The plant is 10 to 40 cm high with a sturdy, black-brown rhizome. The stem is erect, undivided, covered with scales at the base, vertically grooved and succulent. There are few branches. The leaves have many slits and a curved, glabrous or sparsely haired tip. The middle leaves are half-clasping.

Characteristics: Adonis is a poisonous plant.

Habitat: This Siberian/east European plant is found in the north as far as the central Urals and southwest Sweden. In central Europe, it is limited to the basins of the Weichsel and the Oder as far as the Main and Rhine.

Production: The drug is gathered in forests and should be dried quickly.

Not to be Confused With: Other Adonis species may be added to Adonidis herba.

Other Names: False Hellebore, Yellow Pheasant's Eye, Ox-eye, Sweet Vernal, Pheasant's Eye, Red Morocco, Rose-a-Rubie

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolids): including adonitoxin, k-strophanthoside, k-strophanthoside-3 and cymarin

Flavonoids: including vitexin and luteolin

EFFECTS

Adonis has a positive inotropic effect. Animal tests demonstrated a tonic effect on the veins. The adonitoxin component is slightly more toxic than coumarin.

The drug is insufficiently documented.

INDICATIONS AND USAGE

Approved by Commission E:

- Arrhythmia
- Nervous heart complaints

Unproven Uses : The drug is used for mild impairment of heart functions (NYHA I and II), especially when accompanied by nervous symptoms.

In Russian folk medicine, the drug is used for dehydration, cramps, fever and menstrual disorders, but efficacy is unproven.

Homeopathic Uses: Preparations of Adonis vernalis are used for cardiac insufficiency.

CONTRAINDICATIONS

Adonis is contraindicated in conjunction with digitalis glycoside therapy and also in potassium deficiency.

PRECAUTIONS AND ADVERSE REACTIONS

General: Despite the strong efficacy of the drug's cardioactive steroid glycosides in parenteral application, serious poisoning in the course of per oral administration is hardly to be expected due to the low resorption rate.

Drug Interactions: Enhancement of efficacy, and thus also of side effects, with simultaneous administration of quinidine, digoxin, calcium, saluretics, laxatives and extended therapy with glucocorticoids.

OVERDOSAGE

For possible symptoms of overdose and treatment of poisonings see *Digitalis folium*.

DOSAGE

Mode of Administration: Comminuted herb and preparations thereof for internal use.

Daily Dosage: The average daily dose is 0.5 gm of standardized Adonis powder. The maximum single dose is 1.0 gm; maximum daily dose is 3.0 gm.

Homeopathic Dosage: From D2: 5 to 10 drops, 1 tablet or 5 to 10 globules, 1 to 3 times daily; Injection solution: 1 ml once a week sc. From D4: Injection solution: 1 ml twice weekly sc.

Storage: Adonis herb and powder should be stored carefully. Adonis powder should be stored away from light in tightly sealed containers.

Adrue

Cyperus articulatus

DESCRIPTION

Medicinal Parts: Adrue root is used in the West Indies for its anti-emetic properties.

Flower and Fruit: The tubers are blackish and top-shaped, with bristly remains of former leaves. The plant is sometimes connected in twos or threes by narrow underground stems. The transverse section is pale, showing a central column with darker vascular bundles.

Characteristics: Adrue has an aromatic odor and a bitter taste, reminiscent of Lavender.

Habitat: Turkey, region of the river Nile, Jamaica.

Production: Adrue root is the root of *Cyperus articulatus*. The roots are collected in the autumn, scalded or steamed, and then dried in the sun.

Other Names: Guinea Rush

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: containing above all sesquiterpene hydrocarbons and sesquiterpene alcohols, including cyperenone

EFFECTS

Adrue has anti-emetic, carminative and sedative properties.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the root are used for digestive disorders, nausea and flatulence.

Chinese Medicine: Used for pre- and post-natal headaches, epigastric pain, vomiting with bleeding, hematuria, leucorrhea, menstrual irregularities, tension and pain in the breasts and amenorrhoea.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Available as a liquid extract for internal use.

Daily Dosage: 6 to 9 gm of drug

Storage: Should be stored in a cool and dry place, protected from insects.

Hypoxis rooperi

DESCRIPTION

Medicinal Parts: The medicinal part is the plant's rhizome tuber.

Flower and Fruit: Four to 10 flowers are arranged in racemes on a long peduncle; the pedicles are 1.2 to 2.5 cm long. The 6 tepals are approximately 18 mm long, elongate, free and yellow. There are 6 stamens, and the ovary is inferior, 3-chambered, top-shaped and thickly pubescent. The fruit is a densely pubescent capsule approximately 12 mm long and split in the middle. The seeds are black and warty.

Leaves, Stem and Root: The plant is a herbaceous perennial with 12 to 18 leaves that are 30 to 60 cm long, 2.4 to 4 cm wide, lanceolate, acuminate, firm with a ciliate margin and short hairs underneath. The leaves grow from a globose

shoot, which has a diameter of 5 to 8 cm and is crowned with a ring of bristle-like hairs.

Habitat: Hypoxis rooperi is indigenous to South Africa.

Production: Bantu tulip is the fresh or dried rhizome tuber of Hypoxis rooperi. The plant is collected in the wild, cut and then dried in the sun.

Other Names: Bantu Tulip, Sterretjie

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Lignans (3.5 to 4.5%): particularly hypoxoside (norlignan glucoside)

Steroids: sterols, including beta-sitosterol (ca. 0.2%), beta-sitosterol glucoside

Polysaccharides: starch

EFFECTS

The phytosterols, which have not as yet been more closely identified (beta-sitosterol is possibly the chief active ingredient), are said to have anti-exudative effects in animal experiments. The positive effect of the drug on benign prostate hyperplasia (reduction of the residual urine volume, increase of the uroflow, improvement of subjectively experienced complaints) is explained by the phytosterols' inhibition of local prostaglandin synthase.

INDICATIONS AND USAGE

Unproven Uses: Used internally for micturition complaints resulting from benign prostate hyperplasia, cystitis (South Africa/decoction) and lung disease (Botswana). It is used externally as a vulnerary (Africa). Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and cut drug preparations for internal and external use.

How Supplied: Commercially produced capsules.

LITERATURE

Brauer H, Schomann C, Tolerance of beta-sitosterin from Hypoxis rooperi in patients with limited liver function. Results of a controlled double-blind study, Fortschr Med, 96:833-4, 1978 Apr 20.

Aga

Amanita muscaria

DESCRIPTION

Medicinal Parts: The fungus is used to prepare homeopathic dilutions.

Flower and Fruit: Aga belongs to the group of lamella fungi, genus Amanita. The hymenium in the inside of the fruiting body is exposed by unfolding the cap on the underside.

Characteristics: The poisonous fungus has a basidia which is dirty white, as are the cuffs and underside of the cap. The mushroom's cap is orange at first, then strong red with a few dirty white to yellow spots.

Habitat: Aga grows in the Northern Hemisphere as far north as the tundra and thrives in sandy, acid soils.

Production: Aga is the above-ground part of Amanita muscaria.

Other Names: Fly Agaric

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Ibotenic acid (0.17% to 1%)

Muscimol

Muscarine (traces)

Muscazone

Betalains (skin pigment): muscaflavin, muscaaurins and muscapurpurins

Amavandin (compound containing vanadium)

EFFECTS

The drug, containing ibotenic acid, has a psychotropic and hallucinogenic effect and is toxic in higher doses. The decarboxylation product muscimol is similar in structure to the neurotransmitter GAB A and attaches itself to the latter's receptor complex as a selective and direct antagonist. The drug is initially stimulating then paralyzing in its effect.

INDICATIONS AND USAGE

Homeopathic Uses: The fungus is used to treat neuralgias, fever, anxiety, alcohol poisoning and joint pains.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is highly toxic. Signs of poisoning include dizziness, vomiting, abdominal pain, movement disorders, muscle cramps and psychic stimulation, followed by deep sleep.

OVERDOSAGE

The intake of more than 10 g of the fresh mushroom can lead to coordination disorders, confusion, illusions and manic

attacks. Higher dosages (over, 100 g of fresh mushrooms) lead to unconsciousness, asphyxiation, coma and death.

The treatment of poisoning includes emptying the gastrointestinal tract and the use of sedatives. In case of shock, a plasma volume expander should be used. Artificial respiration should be administered for respiratory arrest.

DOSAGE

Mode of Administration: In homeopathy, dilutions of the mother tincture are used.

Agar

Gelidium amansii

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the seaweed's gelatinous extract known as Agar or Agar-Agar.

Flower and Fruit: This perennial seaweed grows up to 1 m long. The thallus sprouts from a permanent base every year and is heavily branched. It is cylindrical or flattened, pinnately subdivided and tough. The brownish-white, translucent thallus has prickly appendages on the branchings. The fruit is spherical.

Characteristics: Agar is colorless and tasteless. It is capable of absorbing up to 200 times its volume of water to form a jelly.

Habitat: The plant is indigenous to the Pacific coasts of Japan and China, Sri Lanka and also the South African coasts.

Production: Agar, or Agar-Agar, is the purified and bleached gel derived from algae mucilage of the Rhodophyceae *Gelidium amansii* (Lamour), which has been dried and cut into thread-like strips. An aqueous extract is obtained from the algae through autoclaving (pressure-cooking), using over-heated steam. It is then chilled in ice cells and cooled into ice-blocks, which are crushed and thawed. Water separates from the gel during the thawing process. The gel mass is dried using warm air.

Other Names: Agar-Agar, Japanese Isinglass

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Heteropolysaccharides: made up of D-galactose- and 3,6-anhydro-L-galactose- components, partially bearing sulfate or pyruvic acid residues, low-sulfate fraction designated agarose

EFFECTS

The drug has a laxative effect due to its ability, similar to that of cellulose, to absorb and retain large quantities of water and swell in the intestine. The mucilaginous substances cause an increase in the bulk of the content of the intestine that stimulates the intestinal muscles, thereby aiding peristalsis.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as a mild laxative.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally.

Daily Dosage: Laxative: Take 1 to 2 teaspoons of the powder, always with some liquid, fruit or jam before meals, 1 to 3 times daily. Never take dry!

Storage: Dried Agar can be kept tightly sealed for up to 5 years without being opened and tested.

Agrimonia eupatoria

See *Agrimony*

Agrimony

Agrimonia eupatoria

DESCRIPTION

Medicinal Parts: The drug consists of the flowering plant, which is cut a few fingers width above the ground and dried.

Flower and Fruit: The flowers are yellow, arranged along small, spike-like racemes. They have an epicalyx and 5 sepals, 5 ovate petals. 5 to 20 stamens and 2 ovaries. The calyx is rough-haired with deep furrows. The fruit is obconical and thorny (burdocks).

Leaves, Stem and Root: The plant is fifty to 100 cm high, with a villous, erect stem. The leaves are alternate and irregularly pinnate. The leaflets are deeply serrate and downy beneath.

Characteristics: Agrimony has a slight pleasant fragrance and a tangy, bitter taste.

Habitat: The plant is indigenous to middle and northern Europe, temperate Asia and North America.

Production: Agrimony herb consists of the dried, above-ground parts of *Agrimonia eupatoria* and/or *Agrimonia procera* gathered just before or during flowering, as well as its preparations in effective dosage.

Other Names: Stickwort, Cocklebur, Liverwort, Common Agrimony, Philanthropos, Church Steeples, Sticklewort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Catechin tannins

EFFECTS

Agrimony is an astringent.

INDICATIONS AND USAGE

Approved by Commission E:

- Diarrhea
- Inflammation of the skin
- Inflammation of the mouth and pharynx

Unproven Uses: Agrimony is used internally for mild, nonspecific, acute diarrhea, cholestasis, inflammation of oral and pharyngeal mucosa, inflammation of kidney and bladder, diabetes and childhood bedwetting; externally for poorly healing wounds, chronic pharyngitis, psoriasis, seborrhoeic eczema as well in hip-baths for lower abdominal conditions.

Chinese Medicine: Agrimony is used as a hemostyptic. It is also used for certain forms of cancer and as an anthelmintic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Because of the constituent tannins, the intake of larger quantities could lead to digestive complaints and constipation.

DOSAGE

Daily Dosage: Internally, the average daily dose is 3 to 6 gm of herb or equivalent preparations. Externally, a poultice prepared from a decoction (10%) several times a day is applied.

Aletris

Aletris farinosa

DESCRIPTION

Medicinal Parts: The medicinal part is the dried Aletris farinosa rhizome with roots. Fresh underground parts dug up after flowering are also used.

Flower and Fruit: The plant has numerous white, tubular-oblong, campanulate flowers. The flowers, with a few small

bracts, are in terminal, spike-like racemes on stalks that reach up to 1 m. The perianth is tubular, covered in scales and shrinks when ripe. Later, the perianth springs open in a beak shape. The fruit is an ovoid capsule containing many oblong ribbed seeds.

Leaves, Stem and Root: The leaves are erect-oblong, lanceolate and 2 to 20 cm long. The rhizome is brownish-gray, flattened and has a diameter of up to 1 cm, but usually measures less. The upper part is covered in leaf bases and stem scars. The fracture is floury and white.

Characteristics: The plant has a sweet taste, becoming bitter and soapy. The odor is mild.

Habitat: The plant is found in the northeast U.S., south to Gulf of Mexico, southern Canada.

Production: Aletris root is the rhizome of Aletris farinosa. It is gathered in the wild and air-dried in the shade.

Other Names: Star Grass, Colic-Root, Starwort, Blazing Star, Ague-Root, Aloe-Root, Ague Grass, Black-Root, Bitter Grass, Crow Corn, Bettie Grass, Devil's Bit, True Unicorn Star-Grass, True Unicorn Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins

Volatile oil

Resins

Bitter principles

Starch

EFFECTS

The active agents increase motility and act as a tonic. There may be an estrogenic principle but a possible estrogenic effect has not been sufficiently researched.

INDICATIONS AND USAGE

Unproven Uses: In the U.S., the plant is used for gynecological disorders or "female complaints," in particular dysmenorrhea, amenorrhea and complaints associated with prolapses vaginae.

Preparations of Aletris are also used for loss of appetite, venous dyspepsia, flatulence and nervous digestive complaints. In Argentina, it is used to treat chronic bronchitis.

Homeopathic Uses: Prolapsed uterus, gastrointestinal complaints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Available in the forms of powdered root, liquid extract and infusions for internal use.

Preparation: To prepare an infusion, 15 gm of the drug is added to 100 ml of water. A fluid extract (1:1) is produced with ethanol water (45%).

Daily Dosage: Approximately 6 gm. The recommended single dose is 0.3 to 0.6 gm to be taken 3 times daily. *Infusion:* 1.5 gm of the drug to 100 ml water. Fluid extract (1:1), produced with ethanol water (45%).

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules; *Injection solution:* 1 ml once a week sc (HAB1).

Alfalfa

Medicago sativa

TRADE NAMES

Alfalfa, Alfalfa Concentrate, Alfalfa Fortified, Alfalfa Natural, Alfalfa Organics, Alfalfa Whole Juice Concentrate Alfamin

DESCRIPTION

Medicinal Parts: The medicinal parts are the whole flowering plant or the germinating seeds.

Flower and Fruit: The clover-like flowers can be yellow to violet-blue. They are 9 to 10 mm long and appear in oblong, many-blossomed racemes. The fruit is a spiralled pod with 2 or 3 twists; the center is hollow and not thorny.

Leaves, Stem and Root: The annual, succulent plant grows from 45 to 100 cm high. The stems are erect, smooth and

sharply angled. The leaves are trifoliolate, petiolate, and alternate. The leaflets are thorny-tipped, dentate toward the front, obovate, and villous beneath. The stipules are ovate, lanceolate, slightly dentate and acuminate.

Characteristics: The taste is unpleasantly salty, bitter and dry.

Habitat: The plant is indigenous to the Mediterranean region and has been widely cultivated elsewhere for centuries.

Other Names: Lucerne, Purple Medick, Purple Medicle, Buffalo Herb, Purple Medic

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FOLIAGE

Carotinoids: including among others, lutein

Triterpene saponins: sojasapogenols A-E aglycones medicagenic acid, hederagenin

Isoflavonoids: including among others, formononetin glycosides, genistein, daidzein

Coumestans: coumestrol, 3'-methoxy coumestrol, lucernol, sativol, trifoliol

Triterpenes: including among others, stigmasterol, spinasterol

Cyanogenic glycosides: (corresponding to less than 80 mg HCN/100 g)

COMPOUNDS: IN THE SEEDS

L-canavaine

Betaine: stachydrine, homostachydrine

Trigonelline

Fatty oil

EFFECTS

The saponin contents act on the cardiovascular, nervous, and digestive systems.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug is used in the treatment of diabetes and malfunctioning of the thyroid gland.

Alfalfa has isolated use as a diuretic and aromatic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Alisma plantago-aquatica

See *Alisma (Ze-Xie)*

Alisma (Ze-Xie)

Alisma plantago-aquatica

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh rhizome.

Flower and Fruit: The peduncle is triangular. There are long-pedicled, white or reddish flowers in leafless, loose panicles. There are 3 sepals, 3 petals and 3 stamens in the flower. The fruit is small and obtuse and is formed by 15 to 30 ovaries.

Leaves, Stem and Root: The water leaves are ribbon-like. There are long-stemmed, swimming leaves. The aerial leaves are basal, long-stemmed, cordate or oblong-ovate, and spoon-like.

Characteristics: The rootstock of *Alisma* has a bitter taste; it is poisonous when fresh.

Habitat: The plant is distributed widely throughout Europe, northern Asia and North America.

Other Names: Mad-Dog Weed, Water Plantain, Ze-Xie

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpenes: including alisol-A, alisol-B, alisol-C and their monoacetates

Sesquiterpenes (guaian type): alismol, alismol oxide

Flavone sulfate

Caffeic acid derivatives: chlorogenic acid sulfate

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: *Alisma* is used for diseases of the bladder and urinary tract.

Chinese Medicine: The drug is used to lower blood sugar, blood pressure and cholesterol levels; it is also used as a diuretic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is available as an extract for oral use. The root is also used in homeopathy.

Alkanet

Alkanna tinctoria

DESCRIPTION

Medicinal Parts: The medicinal part is the root of the plant (the dried roots and rhizomes).

Flower and Fruit: The calyx is 4 to 5 mm in the flower, 5 to 6 mm in the fruit and eglandular. The corolla is blue and glabrous outside. The funnel is as long as or slightly longer than the calyx. The limb is 6 to 7 mm in diameter. There are 5 stamens, and the anthers are fused with the corolla tube. The nutlets are 2 mm in diameter, irregularly reticulate and tuberculate.

Leaves, Stem and Root: Alkanet is a short-bristled, perennial half-rosette shrub. The stems are 10 to 20 cm, procumbent or

ascending and glandular. The basal leaves are 6 to 15 cm by 0.7 to 1.5 cm, linear-lanceolate; the lower ones are cauline, oblong-linear and cordate at base. The bracts are slightly longer than calyx and oblong-lanceolate. The neck of the root is covered with the remains of leaves and the stems. The root is spindle-shaped, curved, up to 25 cm long and 1.5 cm thick, with purplish root bark.

Habitat: The plant is indigenous to southeastern Europe and some parts of Turkey and Hungary. It is cultivated in other parts of Europe, Britain and northern Africa.

Production: Alkanna rhizomes are the dried roots and rhizomes of *Alkanna tinctoria* Tausch.

Other Names: Anchusa, Dyer's Bugloss, Spanish Bugloss, Alkanet Root, Alkanna

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Naphthazarine derivatives: including the ester of the (-)-alkannin (stained red)

Pyrrrolizidine alkaloids

Tannins

EFFECTS

Antimicrobial action: In the agar diffusion test, Alkanet root extracts and Alkannin esters impaired the growth of *Staphylococcus aureus* and *Staphylococcus epidermidis*, however Alkannin worked only against *Candida albicans*.

Healing action for wounds: In a double-blind study, 72 patients suffering from ulcers of the leg (Ulcus cruris) caused by varicose veins, were treated with Histoplastin Red® over a period of three years. After 5 to 6 weeks of daily administration, 80% of the patients' ulcers had healed or were considerably reduced in size.

The results are difficult to assess, as details concerning the patients, the treatment pattern and control groups are unavailable.

INDICATIONS AND USAGE

Unproven Uses: Used by the ancient Greeks to heal wounds; also for skin diseases and diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

Hepatotoxicity and carcinogenicity are expected, due to the pyrrolizidine alkaloids with 1,2-unsaturated necic parent substances in its makeup. Alkanna should not be taken internally for this reason and is recommended for external use only.

DOSAGE

Mode of Administration: Seldom used as a drug. Internal administration is not recommended, due to the drugs toxic

characteristics and its uncertain efficacy." Alkannin and extracts of the root are used externally in pharmacy.

Preparations: Extractum alcannae: almost black, green glistening mass (no extraction information).

Histoplastin Red® Ointment: The ointment approved in Greece, contains 76.5 gm loosely defined ethereal oily Alkanet root extract with lipophil ointment base (beeswax, mastic rubber and olive oil q.s. ad 100 gm).

Daily Dosage: Maximum 0.1 meg pyrrolizidine alkaloids with 1.2 unsaturated necin framework and their N-oxides.

DESCRIPTION

Medicinal Parts: The medicinal part is the ripe fruit.

Flower and Fruit: The flowers are very short-petioled in pairs and appear before the leaves. The petals are 19 to 20 mm long, pale pink to whitish with dark veins. The fruit is oblong-ovoid, compressed. 3.5 to 4.6 cm long by 2.5 to 3 cm wide, gray-green, velvet-downy and pubescent. The nut shell is yellow, hard, compressed, broad- and sharp-edged, punctate externally with irregular grooves, smooth and glossy inside and thick- or thin-skinned. The seed is cinnamon brown, flattened, and 2 cm long by 1.2 to 1.5 cm wide.

Leaves, Stem and Root: The plant is of medium height, seldom reaching 12 m. It is a tree or shrub with mildly red-tinged branches, thorny in its wild form but not in the cultivated form. The leaves have a 1.2 to 1.5 cm long, glandular petiole and glabrous, oblong-lanceolate-acuminate or serrate, tough, glossy, dark green blades.

Habitat: The tree is indigenous to Western Asia and is extensively cultivated in many regions.

Production: Bitter almonds are the fruits of *Prunus dulcis* var. *amara* (also of *Prunus armeniaca*).

Sweet almonds are the fruits of *Prunus amygdalus* var. *dulcis*.

Other Names: Greek Nuts, Jordan Almond, Bitter Almond, and Sweet Almond

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BITTER ALMONDS

Cyanogenic glycosides, amygdalin, 0.2 to 8.5% (corresponding to 12 to 500 mg prussic acid per 100 gm)

Fatty oil (non-dehydrating, 38 to 60%): chief fatty acids oleic acid (77%) and linoleic acid (17 to 20%)

Mucilages (3 to 3%): arabinogalactans

Proteic substances (25 to 35%)

EFFECTS: BITTER ALMONDS

There is no reliable information available.

COMPOUNDS: SWEET ALMONDS

Fatty oil (non-dehydrating, 43 to 57%): chief fatty acids oleic acid (77%) and linoleic acid (17 to 20%)

Mucilages (3 to 4%): arabinogalactans

Proteic substances (20 to 25%)

EFFECTS: SWEET ALMONDS

Sweet Almonds have a demulcent effect.

INDICATIONS AND USAGE

BITTER ALMONDS

Unproven Uses: Bitter Almonds were used in the past as a remedy for coughs, vomiting and nausea in the form of bitter almond water.

SWEET ALMONDS

Unproven Uses: Sweet Almonds are used topically in skin care and liniments.

PRECAUTIONS AND ADVERSE REACTIONS

BITTER ALMONDS

To be used only under the supervision of an expert qualified in the appropriate use of this substance.

SWEET ALMONDS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic topical dosages.

OVERDOSAGE

BITTER ALMONDS

10 bitter almonds are said to be fatal for a child, 60 for an adult (a fatal dosage would presumably be already reached at a lower level, given disadvantageous conditions - higher cyanide level in the almonds, intensive chewing). Recommended antidotes include injection of solutions of dicobalt-EDTA or thiosulfates or else application of methemoglobin-forming substances, such as amyl nitrite. At the same time, vomiting should be induced or the stomach emptied.

Circulation support measures and/or artificial respiration may be required.

DOSAGE

BITTER ALMONDS

Mode of Administration: The drug is obsolete and no longer used.

SWEET ALMONDS

Mode of Administration: Sweet Almonds fatty oil is used as an ointment base and in the production of natural cosmetics.

Aloe

Aloe barbadensis/capensis/vera

TRADE NAMES

Aloe Vera (available from numerous manufacturers), Herbal Sure Aloe Vera, Aloe Vera Mild Stimulant Laxative, Aloe 99 Gel, Sundance Aloe Vera Gel, Chantal Aloe Vera Cream, Palmers Aloe Vera Formula Cream, Aloe Vera Super Strength, Herbal Sure Aloe Vera

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is dried juice of the leaves.

Flower and Fruit: The inflorescence is forked once or twice and is 60 to 90 cm high. The raceme is dense, cylindrical and narrows toward the top. The terminal raceme is up to 40 cm high while the lower ones are somewhat shorter. The bracts are almost white, and the flowers are yellow, orange or red, and are 3 cm long.

Leaves, Stem and Root: The lily-like succulent-leafed rosette shrub either does not have a stem or has a 25 cm stem. The stem has about 25 leaves in an upright dense rosette. The lanceolate leaf is thick and fleshy, 40 to 50 cm long and 6 to 7 cm wide at the base. The upper surface is concave, gray-green, often with a reddish tinge, which sometimes appears in patches in the young plants. The leaf margin has a pale pink edge and 2 mm long pale teeth.

Habitat: Aloe is thought to have originated in the Sudan and the Arabian Peninsula. Today the species is cultivated and found in the wild in northern Africa, the Near East, Asia, and in the southern Mediterranean region. The plant is cultivated in subtropical regions of the United States and Mexico, and on the Dutch Antilles, as well as coastal regions of Venezuela.

Production: Curacao Aloe consists of the dried latex of the leaves of *Aloe barbadensis* (syn. *Aloe vera*), as well as its preparations. Aloe is harvested from August until October. The juice is dried using various methods.

Not to be Confused With: Confusion sometimes arises with *Agave americana*, known as American Aloe, which is not a true Aloe.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ALOE BARBADENSIS

Anthracene derivatives: particularly anthrone-10-C-glycosyls, including aloin A, aloin B, 7-hydroxyaloin A and B, and 1,8-dihydroxy ions, including aloe-emodin, and 6'-cinnamic acid esters of these compounds

2-alkylchromones: including aloe resins B, C and D

Flavonoids

COMPOUNDS: ALOE CAPENSIS

Anthracene derivatives: particularly an throne- 10-C-glycosyls, including aloin A, aloin B, 5-hydroxyaloin, and 1,8-dihydroxy anthraquinones, including aloe-emodin, and mixed anthrone-C- and O-glycosides, including aloinosides A and B

2-alkylchromones: including aloe resins A, B, C and D

Flavonoids

EFFECTS

Laxative Effects

Aloe anthranoids such as 1,8-dihydroxy-anthracene derivatives exert a laxative effect. The laxative action is due to anti-absorption osmotic properties. The compounds induce active secretion of electrolytes and water in the lumen of the bowel. Absorption of electrolytes and water from the colon is inhibited resulting in a volume increase. The volume increase of the bowel content leads to an increase in pressure and stimulates intestinal peristalsis. There is some evidence that endogenous nitric oxide modulates the diarrhea effect of aloe. Studies demonstrate a laxative effect 9 hours after ingestion (Izzo, 1999).

Antibacterial/Antiviral Effects

Aloe-emodin exerts dose-dependent growth inhibition of *H. pylori* through inhibition of arylamine N-acetyltransferase (NAT) activity (Wang, 1998). Aloe-emodin has shown antibacterial effects on four strains of methicillin-resistant *Staphylococcus aureus* (Hatano, 1999). Aloe emodin inactivates enveloped viruses and is directly viracidal to herpes simplex virus type 1 and type 2, varicella-zoster virus, *pseiidorabies virus*, and influenza virus (Sydiskis, 1991).

Antineoplastic Effects

Emodin suppresses tyrosine kinase activity of HER-2/neu-encoded p185neu receptor tyrosine kinase resulting in antineoplastic effects. This is beneficial in controlling HER-2/neu overexpressing cancer cells (Zhang, 1998).

Effects of topical Aloe plants

Aloe vera depresses action potential generation and conduction at neuromuscular junction processes which result in analgesic and anti-inflammatory effects (Friedman, 1999). Ultraviolet radiation (UV) suppresses delayed type hypersensitivity (DTH) by altering the function of immune cells in the skin and causing the release of immunoregulatory cytokines. Extracts of crude Aloe barbadensis gel inhibits this photo-suppression by preventing suppression of DTH responses and reducing the amount of keratinocyte derived immunosuppressive cytokines (IL-2) (Byeon, 1998; Strickland, 1999). Aloe vera gel contains small molecular modulators that prevent UVB-induced immune suppression in the skin. The immunomodulators restore the UVB-induced damages on epidermal Langerham cells (Lee, 1999).

Aloe vera increases collagen content of the granulation tissue and its degree of crosslinking to contribute to wound healing (Chithra, 1998). Aloe vera acts as a modulatory system toward wounds with anti-inflammatory effects (Davis, 1991). The use of Aloe vera has been associated with a delay in wound healing compared to standard treatment (Schmidt,

1991). Aloe vera gel exerts anti-inflammatory activity through its inhibitory action on the arachidonic acid pathway via cyclooxygenase (Vazquez, 1996). Due to its anti-thromboxane effects, Aloe vera decreases the morbidity of progressive dermal ischemia in frostbite (Hegggers, 1987). Aloe vera contains a carboxypeptidase that inactivates bradykinin, salicylates, and a substance that inhibits thromboxane formation (Fujita, 1976; Klein, 1988).

CLINICAL TRIALS

Psoriasis

A double-blind, placebo-controlled study was conducted to evaluate the clinical efficacy and tolerability of topical Aloe vera extract 0.5% (in hydrophilic base) in patients with psoriasis vulgaris. There were 60 patients with slight to moderate chronic plaque-type psoriasis determined by the Psoriasis Area and Severity Score (PASI). The extract was applied topically three times daily for 5 consecutive days per week with a maximum of 4 weeks active treatment. The study period was for 16 weeks with monthly check-ups for a period of 12 months. Aloe vera extract cream had a significantly higher cure rate and clearing of psoriatic plaques compared to placebo. The PASI score was also decreased in the Aloe treatment group compared to placebo. The Aloe-treatment group had no adverse drug related symptoms and the drug was well tolerated (Syed, 1996).

Radiation-Induced Skin Toxicity

A phase III, double-blind, placebo-controlled study evaluated Aloe vera gel for use as a prophylactic agent for radiation-induced skin toxicity. A total of 194 women receiving breast or chest wall irradiation were included in the study. Skin dermatitis was scored weekly during the trial by patients and by health care providers. Aloe vera gel did not protect against radiation therapy-induced dermatitis (Williams, 1996).

INDICATIONS AND USAGE

ALOE BARBADENSIS AND CAPENSIS

Approved by Commission E:

- Constipation

ALOE BARBADENSIS

Unproven Uses: The drug is used for evacuation relief in the presence of anal fissures after recto-anal operations. In European folk medicine the drug is employed for its ability to influence digestion.

Chinese Medicine: The most common use in Chinese medicine is for treatment of fungal diseases.

Indian Medicine: Uses in Indian medicine include stomach tumors, constipation, colic, skin diseases, amenorrhea, worm infestation, and infections.

ALOE CAPENSIS

Unproven Uses: Aloe capensis has been used as a stool softener in the presence of anal fissures, hemorrhoids, and after recto-anal operations. The fresh juice is used for eye inflammations and for syphilis in South Africa.

Homeopathic Uses: The herb is used for gastrointestinal disorders, hemorrhoids, and constipation.

CONTRAINDICATIONS

Aloe is contraindicated in cases of intestinal obstruction, acutely inflamed intestinal diseases (e.g., Crohn's disease, ulcerative colitis), appendicitis and abdominal pain of unknown origin.

PRECAUTIONS AND ADVERSE REACTIONS

General: If cramping of the gastrointestinal tract after single dosing occurs, the dosage should be reduced. Spasmodic gastrointestinal complaints are a side effect to the drug's purgative effect. Heart arrhythmias, nephropathies, edema and accelerated bone deterioration may occur in rare cases. Prolonged use of Aloe may lead to pigmentation in the intestinal mucosa (pseudomelanosis coli), a harmless side effect, which usually reverses upon discontinuation of the drug. Long-term use can also lead to albuminuria and hematuria.

Hypersensitivity: Hypersensitivity, manifested by generalized nummular eczematous and papular dermatitis, have been reported after long-term use of oral and topical Aloe preparations (Morrow, 1980).

Loss of Electrolytes: Long-term use can cause loss of electrolytes, in particular potassium. The loss of potassium can result in hyperaldosteronism, inhibition of intestinal motility and enhancement of the effect of cardioactive medications.

Malignancy: Prolonged use of anthracene drugs increases the relative risk of colon carcinoma (Siegers, 1993). Recent studies fail to demonstrate a connection between the administration of anthracene drugs and frequency of carcinomas in the colon (Schorkhuber, 1998). Low molecular weight compounds found in Aloe vera gel are cytotoxic (Avila, 1997). The component 1,8-dihydroxyanthraquinone inhibits the catalytic activity of topoisomerase II resulting in genotoxicity and mutagenicity (Mueller, 1999).

Tissue Damage: Chronic treatment with high doses of Aloe reduces vasoactive intestinal peptide and somatostatin levels, which may damage enteric nervous tissue (Tzavella, 1995).

Drug Interactions:

Cardiac glycosides and antiarrhythmic drug—Chronic use of Aloe can lead to potassium loss, which can increase the actions of cardiac glycosides and antiarrhythmic drugs.

Thiazide diuretics, loop diuretics, licorice and corticosteroids—There is an increase in the possibility of potassium deficiency when Aloe is used along with these agents.

Pregnancy: Aloe should not be used during pregnancy.

Pediatric Use: Aloe should not be prescribed to children under 12 years of age.

DOSAGE

Mode of Administration: Due to the side effects of the drug, it is rarely used and is not recommended. Aloe powder, aqueous- and aqueous-alcoholic extracts in powdered or liquid form are available for oral use.

How Supplied:

Capsule—250 mg, 470 mg

Cream

Gel—99%, 72%

Softgel—1000 mg

Preparation: A stabilized aloe extract is prepared with hot water. The extract will have a content of 19% to 21% aloin.

Daily Dosage: The recommended daily dosage is 20 to 30 mg hydroxyanthracene derivatives/day, calculated as anhydrous aloin. The recommended single dosage is 0.05 g aloe powder from Aloe barbadensis or 0.05 to 0.2 g aloe powder of Aloe capensis in the evening. Aloe capensis can be given as a single dose of 0.1 g in the evening.

Homeopathic Dosage: For Aloe capensis, administer 5 drops, 1 tablet, 10 globules, or parenterally 1-2 ml three times daily (HAB1).

Note: The smallest dosage needed to maintain a soft stool should be used. Stimulating laxatives must not be used over an extended period of time (1 to 2 weeks) without medical advice.

Storage: Aloe should be protected from light and moisture.

Alpine Cranberry

Vaccinium vitis-idaea

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves and the ripe dried fruit.

Flower and Fruit: The white to reddish-tinged flowers are in clusters of various sizes. The 10 stamens are pubescent at the base and the anthers are two-tipped and have no appendage. The white berries initially turn scarlet and contain numerous rust-brown seeds that are 1.5 to 2 mm long.

Leaves, Stem and Root: The plant is a low shrub up to 30 cm high with scaly underground runners. The shoots sprout from the axillary buds of the runners. The sprouts are downy when young and later become glabrous. The leaves are alternate, short-petioled, obovate and coriaceous. The upper surface is dark green and the under surface pale green and covered in glandular hairs.

Habitat: The plant is common in the Northern Hemisphere.

Production: Cranberry leaves are the foliage leaves of *Vaccinium vitis-idaea*. Collection takes place in uncultivated

regions (Scandinavia, England). The leaves are dried in the open air.

Other Names: Cowberry, Red Bilberry, Whortleberry

ACTIONS AND PHARMACOLOGY *

COMPOUNDS

Hydroquinone glycosides: arbutin (3-5%), pyroside (6'-acetyl-arbutin), hydroquinone gentiobioside, 2-O-caffeoyl arbutin

Tannins (10-20%): chiefly condensed tannins, proanthocyanidine

Flavonoids: including among others, avicularin, hyperoside, quercitrin, isoquercitrin

Triterpenes: including among others, beta-amyrin, oleanolic acid, ursolic acid

EFFECTS

The drug is antiviral and a urine disinfectant due to the tannin fraction. It also raises cyclooxygenase activity through the flavonol glycosides.

INDICATIONS AND USAGE

Unproven Uses: Alpine Cranberry is used to treat urinary tract irritation, gout, rheumatism, and calculus (stone complaints). It is also considered a substitute for Bearberry leaves.

CONTRAINDICATIONS

The drug is contraindicated in pregnancy, nursing, and in children under 12 years of age.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Individuals with gastric sensitivity may experience queasiness and vomiting following intake of preparations made from the drug with high tannin content. Liver damage is conceivable with administration of the drug over extended periods, particularly with children, due to the possible hepatotoxicity of the hydroquinones released.

Because the urine-disinfecting effect of the hydroquinones released in the urinary tract only occurs in an alkali environment, the simultaneous administration of medication and food that increases uric acid concentration in the bladder should be avoided.

DOSAGE

Mode of Administration: Available as whole, cut, and powdered drug.

Daily Dose: The internal dose is 2 gm as a single dose; as a decoction, the concentration is 2 gm per cup.

Storage: Store the drug in a tightly sealed container and protect it from light.

* Alpine Ragwort

Senecio nemorensis

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The composite flower heads are in a dense, usually heavily blossomed corymb. The involucre bracts are grass- or olive-green and often tinged greenish-black at the tips. The florets are yellow. The fruit is 4 mm long, long-stemmed and glabrous. During flowering, the pappus is only as long as the disc florets. By the time the fruit ripens, the pappus is 3 times as long as the fruit.

Leaves, Stem and Root: This geophytic perennial has runners that are fleshy, 20 cm long and 5 cm thick. The stem is erect, 40 to 140 cm high with rounded ribs. The stem is green or, in particularly sunny locations, reddish-brown. The stem is glabrous to sparsely pubescent or short-downy. The foliage leaves are lanceolate-ovate, oblong-elliptic to oblong-lanceolate, acute or acuminate and serrate to double-serrate-dentate.

4] The upper cauline leaves are usually petiolate, almost glabrous above to sparsely pubescent. The lower surface of the leaf is sparsely or moderately scattered and appressed pubescent.

Habitat: The plant grows in many regions of southern and western Europe and is cultivated in some eastern European countries.

Other Names: Squaw Weed, Life Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrrolizidine alkaloids (0.01-0.1%): including among others, senecionine, fuchsisencionine. 7-angeloylretronecin, bulgarsenine, nemorensin, platyphyllin, sarracin

Sesquiterpenes of the eremophilane-type: including among others, nemosenine A-D

Flavonoids: including among others, rutin, quercitrin

Hydroxycoumarins: including among others, esculetin

Volatile oil (0.1%)

EFFECTS

The drug is hemostyptic and hypoglycemic. The pyrrolizidine alkaloids are hepatotoxic and carcinogenic.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses of Life Root have included diabetes mellitus, hemorrhage, high blood pressure, spasms and as a uterine stimulant. The drug is also used in bleeding as a result of tooth extraction.

PRECAUTIONS AND ADVERSE REACTIONS

Life Root should not be taken internally. Hepatotoxicity and carcinogenicity are possible due to the presence of pyrrolizidine alkaloids with 1,2-unsaturated necic parent substances.

DOSAGE

Mode of Administration: Internal use is not recommended.

How Supplied: Forms of commercial pharmaceutical preparations include drops.

Preparation: To prepare a tea, pour boiling water over 1 teaspoonful (approximately 1 g) of finely cut drug, steep for 5 to 10 minutes, then strain.

Daily Dosage: A cup of the tea may be taken several times a day. (See precautions and adverse reactions).

Amaranth

Amaranthus hypochondriacus

DESCRIPTION

Medicinal Parts: The entire plant is used medicinally

Flower and Fruit: The inflorescence is bifurcated, solitary and oblong-spicate in dense spike-like terminal clusters with very short internodes, often composed of twigs. In some species they are all in the leaf axils. The plant is monoecious, dioecious or mixed. Bracteoles are 4 to 6 mm, ovate, with a mucro that is about twice as long as the perianth. The perianth segments are narrowly ovate, usually acute and about as long as the fruit. The segments are dry-skinned, whitish- or reddish-green to red. The ovary is ovate. The fruit is one-seeded, ovate, dry-skinned, and forms a trans-

versely dehiscent capsule. Seeds are lentil-shaped, erect, circular, smooth and usually black.

Leaves, Stem and Root: The plant is a tall, glabrous annual, occasionally perennial, and grows up to 2 m tall. It is erect, glabrous or sparsely pubescent above. The leaves are rhomboid-ovate and alternate, with occasionally undulating or ruffled margins.

Habitat: Amaranth is common in temperate and warm climates.

Production: Amaranth is the complete plant in flower of *Amaranthus hypochondriacus*.

Other Names: Lady Bleeding, Lovely Bleeding, Love-Lies-Bleeding, Red Cockscomb, Velvet Flower, Pilewort, Prince's Feather

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins

Betacyans

Protoalkaloids

EFFECTS

The drug is said to have an astringent effect (possibly due to the saponins, betacyans and protoalkaloids). There are no studies available on efficacy.

INDICATIONS AND USAGE

Unproven Uses: Amaranth has been used for diarrhea, ulcers, and inflammation of the mouth and throat.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Amaranth is administered orally as a liquid extract.

LITERATURE

Amaranthus hypochondriacus

See Amaranth

Amargo

Quassia amara

DESCRIPTION

Medicinal Parts: The medicinal part is the wood of the trunk and branches.

Flower and Fruit: The flowers are small and pale yellowish green. The sepals are round to ovate, fused at the base and imbricate. There are 5 petals, 10 stamens and 5 carpels. The style is fused from bottom to top. The fruit is a pea-sized drupe, which ripens from December to January. They are black, glossy, solitary, clavate and have a thin skin.

Leaves, Stem and Root: The plant is a 15 to 30 m high tree with a diameter of 1 m. The bark is smooth and grayish. The alternate leaves are odd pinnate. The leaflets are opposite, oblong, acuminate and uneven at the base.

Habitat: The plant grows in Jamaica

Production: Quassia Wood is the wood of *Quassia amara* or *Picrasma excelsa*.

(p) *Not to be Confused With:* The wood of *Rhus metopium*

Other Names: Bitter Wood, Jamaica Quassia, Surinam Quassia, Japanese Quassia, Bitter Ash

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpenes: decanor-triterpenes (picrasan derivatives, quassinoids, simaroubolides) chief components quassin (nigakilactone D, 0.1 to 0.2%), isoquassin (picrasmine), neoquassin and 18-hydroxyquassin

Indole alkaloids of:

-beta-carboline type, including 1-vinyl-4,8-dimethoxy-beta-carboline

-canthinone type, including 2-methoxy-6-one, 3-methylcanthinone-5,6-dione

EFFECTS

The amaroid drug (quassinoids) stimulates secretion of gastric juices, increases appetite and aids digestion. It may also have a choleric effect.

INDICATIONS AND USAGE

Homeopathic Uses: Quassia amara is used for gallbladder complaints, as bitter tonic, purgative and as anthelmintic (for ascarid and threadworms).

CONTRAINDICATIONS

Contraindicated in pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Internal administration can be followed occasionally by dizziness and headache, as well as by uterine pain.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Overdosage could lead to mucous membrane irritation, followed by vomiting. Use over prolonged periods of time may lead to weakened vision and total blindness.

DOSAGE

Mode of Administration: Quassia Wood is used in homeopathic dilutions and in commercial pharmaceutical preparations.

Daily Dosage: 500 mg

Storage: Quassia should be protected from light and kept dry.

American Adder's Tongue

Erythronium americanum

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and tubers.

Flower and Fruit: The flowers are terminal, large, hanging, lily-like and are 2.5 cm in diameter. The bracts of the involucre are sharply revolute, bright yellow and often tinged purple and sprinkled at the base. There are 6 stamens. The fruit is a fusiform nodule about 2 cm long.

Leaves, Stem and Root: The plant grows from a small, ovate fern-colored corm to between 2 and 2.5 cm long. It is perennial with a bulbous light brown root. The stem is thin and about 25 cm high. There are only 2 leaves which are lanceolate, and pale green. They have purplish or brownish spots, are about 6 cm long by 2 to 3 cm wide, minutely wrinkled and with parallel veins. The petioles are 5 to 7.5 cm long.

Characteristics: The fresh leaves have emollient and antiscrofulous properties when applied as a poultice.

Habitat: The plant grows in the eastern U.S. as far south as Florida and as far north and west as Ontario and Arkansas.

Production: American Adder's Tongue leaves are the fresh leaves of *Erythronium americanum*.

Other Names: Dog's Tooth Violet, Erythronium, Lamb's Tongue, Rattlesnake Violet, Serpent's Tongue, Snake Leaf, Yellow Snakeleaf, Yellow Snowdrop

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alpha-methylene-gamma-butyrolactones: tuliposides

EFFECTS

When used internally, the drug is emetic. Externally it is an emollient.

INDICATIONS AND USAGE

Unproven Uses: The plant is used externally for ulcers.

PRECAUTIONS AND ADVERSE REACTIONS

The plant has a strongly sensitizing effect. Reciprocal reactions occur with tulip, fritallaria, lily, alstroemeria and Bomarea species. Nothing is known regarding health hazards or side effects in connection with the administration of the drug.

DOSAGE

Mode of Administration: Fresh leaves are applied topically as a poultice or administered internally as an infusion.

American Bittersweet

Celastrus scandens

DESCRIPTION

Medicinal Parts: The medicinal parts are the root and the bark of the plant.

Flower and Fruit: The twining shrub is up to 8 m tall. The leaves are 5 to 12.5 cm long, ovate to ovate-lanceolate and serrate. There are numerous very small greenish flowers on terminal racemes 10 cm long. The orange-yellow seed capsules are 1 cm in diameter.

Habitat: The plant is indigenous to North America.

Production: American Bittersweet root and bark are the root and bark of *Celastrus scandens*.

Other Names: Waxwork, False Bittersweet

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins

Celastrol (yellow quinoide nortriterpene)

EFFECTS

American Bittersweet has diuretic and diaphoretic effects.

INDICATIONS AND USAGE

Unproven Uses: The drug has been used for rheumatism, menstrual disorders and liver disorders, but is rarely used today.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

No information is available.

LITERATURE

Hegnauer R. *Chemotaxonomie der Pflanzen*. Bde 1-11, Birkhauser Verlag Basel, Boston, Berlin 1962-1997.

American Hellebore

Veratrum viride

** DESCRIPTION

Medicinal Parts: The medicinal parts are the dried rhizome and the roots.

Flower and Fruit: The terminal inflorescence is a panicle made up of spike-like racemes. The flowers are short-pedicled and often unisexual. The perigone has 6 tepals and is almost free. The anther is reniform. The fruit is capsule-like with numerous seeds and dividing membranes. The seeds are flattened, light-brown and winged all around. The embryo is small and set in the tip of the fusiform endosperm.

Leaves, Stem and Root: The species are perennial herbs with strong leafy stems. The leaves are spiralled, broadly elliptical to linear-lanceolate, heavily ribbed and drawn together in a broad sheath. The leaves of *Veratrum viride* are oval to linear.

Characteristics: Characteristics of the species *Veratrum viride* is very similar to *Veratrum album*.

Habitat: The herb is indigenous to the swamps and moist ground from Canada to Georgia and westward to Minnesota.

Production: American Hellebore root is the rhizome of *Veratrum viride*.

Not to be Confused With: The rhizome from *Symplocarpus foetidus* is thicker than that of *Veratrum viride* and more porous.

Other Names: Bugbane, Devil's Bite, Earth Gall, Indian Poke, Itchweed, Tickleweed

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Steroid alkaloids (!%): including among others, some of the solanidane-type, isorubijervine, rubijervine- C-nor-D-homosterane-type: including among others, protoverine, protoveratrine A and B. In contrast with *Veratrum album*, the less toxic alkaloids of the solanidane-type are here in the majority.

EFFECTS

The herb reduces blood pressure and slows down the pulse due to the alkaloid germitrin. When used externally, it is hyperemic, hyperalgetic, and locally anaesthetic. The drug is extremely toxic.

INDICATIONS AND USAGE

Unproven Uses: The drug is obsolete due to the high risk of side effects. Historically, American Hellebore was used internally to treat pneumonia, peritonitis, epilepsy, pain, asthma, colds, cholera, croup, consumption, dyspepsia, fever, hypertension, herpes, gout, headache, inflammation, neuralgia, whooping cough, puerperal fever, scarlet fever, sciatica, rheumatism, shingles, toothache, scrofulous, tumors, and typhus. It was used externally for throat infections and tonsillitis (as a gargle solution), neuralgia, and skin irritations.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely toxic and has numerous severe side effects, even in therapeutic dosages. It is no longer administered in allopathic medicine. The alkaloids are severely mucous membrane-irritating, and because they inhibit inactivation of the sodium ion channels after resorption, the alkaloids have a paralyzing effect on numerous excitable cells, in particular those governing cardiac activity.

OVERDOSAGE

The first symptoms of poisoning are sneezing, lacrimation, salivation, vomiting, diarrhea, burning sensation in the mouth and pharyngeal space, and inability to swallow; then, following resorption: paresthesia, vertigo, possible blindness, paralysis of the limbs; also mild convulsions, lowering of cardiac frequency, cardiac arrhythmias and hypotension. Death occurs either through systolic cardiac arrest or through asphyxiation. The alkaloids can also be absorbed through uninjured skin.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulphate), installation of activated charcoal and shock prophylaxis (appropriate body position, quiet, warmth), the therapy for poisoning consists of treating spasms with diazepam or certain barbiturates (i.v.), bradycardia with atropine and hypotension with peripherally active circulatory medications. Electrolyte sub-

stitution may be necessary and possible cases of acidosis should be treated with sodium bicarbonate infusions. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: The herb can be found in whole and powdered forms.

Daily Dose: The daily dose is 100 mg.

Storage: The drug should be clearly labeled as "poisonous" and stored in a safe place.

American Ivy

Parthenocissus quinquefolia

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark, the branch tips, the fresh leaves, the berries and the resin.

Flower and Fruit: The inflorescences are fairly small and appear in yellowish-green racemes. They produce dark-purple, pea-sized berries; the seeds are cordate.

Leaves, Stem and Root: American Ivy is a high-climbing shrub with dark green branches, which sometimes develop adventitious roots. The flowering branches turn into regular, double-rowed creepers, which diminish toward the top. The leaves are long-petioled and divided into 5 elliptical, ovate or obovate, roughly serrate or dentate leaflets. The leaflets have broad, suddenly acuminate and usually somewhat rounded-off teeth. The upper surface is dark green, and the undersurface is whitish-green and matte.

Habitat: *Parthenocissus quinquefolia* originated in North America and is cultivated worldwide.

Production: American Ivy bark is the bark of the trunk and branches of *Parthenocissus quinquefolia*.

Other Names: American Woodbine, Creeper, False Grapes, Five Leaves, Ivy, Virginia Creeper, Wild Woodbine, Wild Woodvine, Woody Climber

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Up to 2% oxalic acid is contained in the berries, however there is no information available on the constituents of the rind.

EFFECTS

The plant is diaphoretic, astringent and tonic.

INDICATIONS AND USAGE

Unproven Uses: American Ivy is used for digestive disorders.

PRECAUTIONS AND ADVERSE REACTIONS

The berries are considered poisonous, however no health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Older scientific literature describes the death of a child following intake of the berries (Lewin, 1992).

DOSAGE

Mode of Administration: The drug is ground for use as an infusion.

American Liverleaf

Hepatica nobilis

DESCRIPTION

Medicinal Parts: The drug is the herb, without roots, harvested at flowering season.

Flower and Fruit: The flowering stems are axillary, numerous, pubescent and erect. They are usually reddish and have 3 entire-margined, ovate, unpetiolate, calyx-like bracts, up to 1 cm long, directly under the upright flower. The 6 to 8 bracts are sky blue, paler on the outside, occasionally pink or white, narrow-ovate, entire-margined and drooping. There are no nectaries. The stamens are almost white with red

connective. The stigma is head-like. The fruit is oblong with a short beak fitted into the semi-globular receptacle.

Leaves, Stem and Root: The herb is a 7 to 15 cm high, hardy perennial with a short, fibrous, dark brown rhizome. The numerous leaves are basal, long-petioled, coriaceous, green above and usually more or less violet beneath. They are cordate and 3-lobed at the base, deeply indented, broadly ovate, with blunt to acute lobes. The young leaves, including the stems, are densely covered in silky white hairs. The leaves later become glabrous and appear after flowering. Liverwort is a protected species in Germany, Austria, Switzerland, Italy, the Czech Republic, Slovakia and Hungary.

Habitat: The plant is indigenous to almost all of Europe except the Atlantic regions, Denmark and northwest Germany. It is also indigenous to Korea, Japan and temperate North America.

Production: American Liverleaf consists of the fresh or dried above-ground parts of *Hepatica nobilis*. The herb is harvested when in bloom and air-dried in the shade. The roots must be left in the ground because they are a protected species.

Other Names: Herb Trinity, Kidneywort, Liverleaf, Liverweed, Round-Leaved *Hepatica*, Trefoil

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Protoanemonine-forming agents (0.07% in the freshly harvested plant, based on weight): presumably, the glycoside ranunculin changes enzymatically when the plant is cut into small pieces (and probably also during dehydration) into the pungent, volatile protoanemonine that quickly dimerizes to anemonine. Once dried, the plant is not capable of protoanemonine formation.

Flavonoids: including isoquercitrin, astragalín, quercimeritrin

Saponins

EFFECTS

The main active agents are lactone-forming glycosides, flavo-glycosides and anthocyanes. The fresh plant contains K* protoanemonine, which causes skin irritation.

INDICATIONS AND USAGE

Unproven Uses: Preparations of American Liverleaf herb are used for liver ailments, liver diseases of all origins, jaundice, gallstones and gravel.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Extended skin contact with the freshly harvested, bruised plant can lead to blister formation and cauterizations that are difficult to heal due to the resulting protoanemonine, which is severely irritating to the skin and mucous membranes. If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritation of the urinary drainage passages, are possible.

Symptomatic treatment for external contact consists of mucilaginous, following irrigation with diluted potassium permanganate solution. In case of internal contact, administration of activated charcoal should follow gastric lavage.

DOSAGE

Mode of Administration: The drug can be taken internally or used externally as a rinse.

Preparation: To make a rinse, a cataplasm can be made of the squeezed fresh plant; alcohol can be used if necessary. A liniment can be made with added fats, oils or alcohol.

Daily Dosage: When used internally, a single dose consists of 2 to 4 gm as an infusion, or 2 to 3 cups from a 3 to 6% infusion. The daily dosage is 4 teaspoonfuls, or 3.8 gm drug.

American Pawpaw

Asimina triloba

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds, bark and leaves.

Flower and Fruit: The axillary flowers are dull purple and solitary. They are about 3.5 cm wide. The petals are round, ovate and marbled. The outer ones are almost circular and 3 to 4 times as long as the sepals. The fruit is yellowish, oblong-ovoid. The fleshy pods are about 7.5 by 2.5 cm and contain 3 flat, brown seeds. The seeds are slightly polished with darker brown lines on the surface. They are oblong-oval, with a grayish hilum at one end. The taste and smell are resinous.

Leaves, Stem and Root: The American Pawpaw grows up to 6 m in height. The young shoots and leaves are covered in rust-colored down and later become glabrous. The leaves are thin (20-25 cm long and 7 cm wide), smooth, entire, ovate and acuminate. The plant's leaves and flowers appear simultaneously.

Characteristics: The fruit has an unpleasant smell when unripe, but when it ripens after a frost, it smells, faintly of custard. This characteristic gives rise to one of its common names—Custard Apple.

Habitat: The plant is found in the west, south and central U.S., also India and parts of Asia and Africa.

Production: American Pawpaw seeds are the seeds of *Asimina triloba*.

Other Names: Custard Apple

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Benzyl isoquinoline alkaloids: including anolobine

Polyketides: including asimicine

Fatty oil

EFFECTS

No information is available.

INDICATIONS AND USAGE

Homeopathic Uses: In homeopathy, American Pawpaw is used in the treatment of scarlet fever, fevers and vomiting, as well as for mouth and throat inflammation.

PRECAUTIONS AND ADVERSE REACTIONS

The drug has a nauseant effect. Allergic individuals may be susceptible to severe urticaria.

DOSAGE

Mode of Administration: The mother tincture is used in homeopathic dilutions.

American White Pond Lily

Nymphaea odorata

DESCRIPTION

Medicinal Parts: The medicinal parts are the cut and dried rhizome, the fresh rhizome and the rhizome with the roots.

Flower and Fruit: The androgynous flowers are solitary, 7 to 15 cm across and radial-symmetrical. They grow from the rhizome and extend above the water by means of a long stem. The 4 sepals are almost free, oblong-ovate, pale green on the outside and greenish-white on the inside. The pure white 23 to 32 petals are free, elliptical-lanceolate, narrower than the sepals and arranged on the axis like a screw. The numerous carpels are sunk into the beaker-shaped axis in a ring and are partially fused with it. The fruit is a berry-like capsule, which ripens under water. The seeds are small, ovate, approximately 2.5 mm long, smooth and have an aril. The flowers open as the sun rises, close a few hours later (before the intense midday heat) and remain closed until the next morning. The size of the plant varies according to depth of water.

Leaves, Stem and Root: The fragrant water lily is an aquatic plant with a strong horizontal rhizome, which grows under water. The leaves are swimming, alternate, long-petioled and have 4 air channels in the petiole. The lamina is oval-orbicular, large (15-30 cm long) and has a wedge-shaped deep indentation at the base. It is entire-margined, coriaceous, green above and purple-brown beneath. The petiole is

greenish and is usually purple-tinged. The stipules are triangular to reniform.

Characteristics: The flowers have a sweet fragrance.

Habitat: The plant is indigenous to the eastern part of North America. It is found as far south as Mexico, El Salvador and the West Indies, and has been naturalized in parts of western Europe.

Production: American White Pond Lily root is the rhizome of *Nymphaea odorata* and other varieties. The drug is derived from the cut and dried rhizome and, in powdered form, is yellowish to gray-brown.

Other Names: Water Cabbage, Cow Cabbage, Water Lily, Water Nymph

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (gallotannins, ellagitannins)

Only a very small amount of research work has been carried out on the drug, but American White Pond Lily root is known to contain large amounts of gallic and ellagic tannins.

EFFECTS

The astringent and antiseptic effects of the American White Pond Lily can be attributed to the high tannin content. Only limited amounts of research have been carried out on the drug.

INDICATIONS AND USAGE

Unproven Uses: Chronic diarrhea is a common internal application. Externally, the plant has been used in the treatment of vaginal conditions and as a gargle in the treatment of diseases of the mouth and throat. Traditional folk medicine uses also included dysentery, gonorrhea and leukorrhea, and the leaves and roots were applied as a mash poultice for boils, tumors, scrofulous sores and inflamed skin.

Homeopathic Uses: Morning diarrhea is one use in homeopathy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

No poisonings have yet been observed among humans but animal experiments have been performed with fatal results. Even though very high dosages were used with the animals, these results should be taken as a warning to exercise care.

DOSAGE

Mode of Administration: As a decoction or liquid extract used for washes, poultices and gargles or taken internally.

Preparation: The fluid extract is produced by percolation: 1:1 using ethanol 25%.

Daily Dosage: Internally: in a single dose of 1 to 2 g drug as an infusion; 1 to 4 ml of liquid extract.

Homeopathic Dosages: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Ammi Visnaga

See Bishop's Weed

Ammoniac Gum

Dorema ammoniacum

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is a resin exuded from the flowers and stems.

Flower and Fruit: The inflorescence is an umbel which grows from the axils of the upper leaves. Because of the very short flower stems, the individual inflorescences appear very globular. The flower structures are in fives, the flowers radial and small, the calyx teeth indistinct, the petals white with revolute tips. There are 5 stamens. The ovary is inferior, 2-chambered, densely haired, with a conical style cushion with 2 styles. The fruit is double achene.

Leaves, Stem and Root: This herbaceous perennial grows up to 2.5 m high. The leaves are arranged in spirals, with clearly developed sheaths, and the lamina is often only rudimentary. The stem is hollow, gnarled, blue-striped, and up to 5 cm thick. The taproot is tuberous.

Habitat: The plant is found growing in areas from Iran to southern Siberia.

Production: Ammoniac gum is the naturally-exuding gum resin latex of *Dorema ammoniacum* hardened in the air and collected in the wild.

Not to be Confused With: Confusion may occur with North African and Cyrenian ammoniac.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Resin (60 to 70%): chief component ammosinol

Water-soluble polysaccharides (10 to 20%)

Volatile oil (0.1 to 0.3%): chief components linalool, linalyl acetate, citronellyl acetate

EFFECTS

The drug is credited with being mildly diuretic, sudorific, spasmolytic, expectorate and menstruation-promoting in its effect, although research data regarding these effects is not available.

INDICATIONS AND USAGE

Unproven Uses: Uses dating back to ancient times include ingestion for its expectorant effect in chronic bronchitis, especially in the elderly. Because of the resin's purported diuretic, antispasmodic and stimulant properties, it was often employed internally as a diaphoretic and emmenagogue as well as externally as a plaster for swellings of the joints and indolent tumors. In the late 19th century, it was used as an expectorant for chronic catarrh and externally in plasters to relieve hyperadenosis and in compresses for abscesses. More recently, internal folk medicine uses include chronic bronchitis, asthma, sciatica and joint pain as well as conditions of the liver and spleen. Among external uses are treatment of wounds and abscesses as well as lymph node swelling.

Homeopathic Uses: Homeopathic uses include bronchitis.

CONTRAINDICATIONS

The drug is contraindicated during pregnancy due to the existence of indications of a menstruation-inducing effect.

PRECAUTIONS AND ADVERSE REACTIONS

According to older sources, repeated visual disorders and glaucoma-like states appeared following ingestion of the drug, however no health hazards have been verified in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Preparations for internal and external use

Preparation:

Ammoniacum depuratum — 1000 parts coarse ammoniac powder are heated with 1500 parts ethanol 60% in a steam bath while being constantly stirred until an emulsion is

fogged. It is then pressed through linen and evaporated until a few drops can be worked in the hand without becoming sticky.

Combination — Ammoniac emulsion: toluene: distilled water; 1:2:30

Daily Dosage: 0.3 to 1 g drug

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 to ml sc acute: 3 times daily; chronic: once a day (HAB1); special doses for children

Storage: The drug should be stored over chalk in a container that protects it from light.

Anemarrhena (Zhi-Mu)

Anemarrhena asphodeloides

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the rhizome.

Flower and Fruit: The inflorescence is spike-like, and the flowers are clustered and radial. The perianth structures are in sixes. The tepals are free and all the same. There are 3 stamens and a 3-carpeled, fused ovary, with 1 to 3 seeds in each chamber. The fruit is a globose capsule, which opens on 3 sides.

Leaves, Stem and Root: *Anemarrhena asphodeloides* is a herbaceous perennial, and extends up to 60 cm high. The leaves are grass-like and clustered at the base.

Habitat: The plant is native to northern China, Korea and Japan.

Production: Zhi-Mu is the dried rhizome of *Anemarrhena asphodeloides*. It is best harvested in the third year of cultivation in spring or autumn. The rhizome is then air-dried.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins (6%): aglycones sarsapogenin, markogenin, neogitonin, particularly sarsapogenin-3-timobioside and markogenin-3-timobioside

Water-soluble polysaccharides: anemarans A to D

Lignans: hinoki resinol, among others

W *Xanthones:* mangiferin (1.3%)

EFFECTS

A variety of experiments have been able to demonstrate antipyretic and cortisone-like effects for the drug with its steroid saponin content. In addition, inhibitions of platelet aggregation, of Na, K-ATP-ase and of DNA-polymerase were observed. The timosaponin A-III isolated from the drug reduced the serum levels of a 1-fetoprotein in animal experiments.

INDICATIONS AND USAGE

Unproven Uses: Zhi-Mu is used for agitation (in Oriental medicine).

Chinese Medicine: In China, Zhi-Mu is used for febrile conditions and inflammation, diabetes, dry cough, "bone fever" and general dehydration, painful stool or strangury. It is also as a decoction for typhus, scarlet fever and tuberculosis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

The ingestion of large dosages of the drug may lead to gastroenteritis, intestinal colic and diarrhea, due to the saponin content. The drug is not to be administered in the presence of diarrhea.

DOSAGE

Mode of Administration: Whole and cut drug preparations for internal use.

Daily Dosage: 6 to 12 gm of drug often used with other herbs in teas.

Storage: Should be stored in a dry and well-aired place.

Angelica

Angelica archangelica

TRADE NAMES

Nature's Answer Angelica Root Liquid

DESCRIPTION

Medicinal Parts: The medicinal parts are the seed, whole herb and root.

Flower and Fruit: The flowers are greenish-white to yellowish and are arranged in 20 to 40 rayed compact umbels without an involucre. The tiny epicalyx has numerous sepals with minute tips. The petals have an indented, indistinguishable tip. The elliptic fruit is 7 mm long by 4 mm wide and winged. The outer fruit membrane separates from the inner one.

Leaves, Stem and Root: The plant is 50 to 250 cm tall. The rhizome is short, strong, fleshy and has long fibrous roots. The stem is erect, often as thick as an arm at the base. It is round, finely grooved, hollow and tinged reddish below. The leaves are very large, 60 to 90 cm and tri-pinnate with a hollow petiole. Leaflets are ovate and unevenly serrate. The leaf sheaths are large and swollen.

Characteristics: The plant has a strong tangy odor. The taste is sweetish to burning tangy.

Habitat: Angelica is thought by some botanists to be indigenous to Syria, Holland or Poland. Today it is found growing in the wild on the coasts of the North and Baltic Seas as far north as Lapland. It is a protected species in Iceland, and is cultivated in other regions. Other species are found in America (*A. atropurpurea*), in Europe (*A. sylvestris*) and in China/Asia (*A. sinensis*).

Production: Angelica seed consists of the fruit of *Angelica archangelica*, which is harvested from July onward. After

drying in the air or in ovens, the umbels are threshed to separate the seeds. Angelica herb consists of the above-ground parts of *Angelica archangelica*. Angelica root is the dried root and rhizome of *Angelica archangelica*.

Other Names: European Angelica, Garden Angelica, Angel's Wort

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ANGELICA FRUIT

Volatile oil: constituents include hexylmethyl phthalate, alpha-pinene, beta-phellandrene, borneol, camphene, beta-bisabolene, beta-caryophyllene, macrocyclic lactones (odor-determining) such as 15-oxypentadecenolactone

Furanocoumarins: including angelicin, bergaptene, imperatorin, oxypeucedanin, xanthotoxin

Fatty oil

Phytosterols: including beta-sitosterol, stigmasterol

EFFECTS: ANGELICA FRUIT

The furanocoumarins in the fruit are cytostatic and phototoxic. The spasmolytic, gastric juice-stimulating and cholagogic effect of the herb could be explained by the aromatic-amaroid structure.

COMPOUNDS: ANGELICA LEAVES

Volatile Oil (0.015 to 0.1%): chief constituents myrcene (17 to 29%), p-cymene, limonene, cis- and trans-ocimene, alpha-phellandrene, beta-phellandrene, alpha-pinene

Furanocoumarins: including angelicin, bergaptene, imperatorin, isoimperatorin, oxypeucedanin, archangelicin

EFFECTS: ANGELICA LEAVES

The essential oils and furanocoumarins from the leaves have a strong irritant effect on the skin and mucous membranes (angelica dermatitis). The spasmolytic, gastric juice-stimulating and cholagogic effect of the herb could be explained by the aromatic-amaroid structure.

COMPOUNDS: ANGELICA ROOT

Volatile oil: chief components are alpha- and beta-phellandrenes, alpha-pinenes, macrocyclic lactones, including penta- and heptadecanolide

Furanocoumarins: including bergaptene, xanthotoxin, scopoletin, umbelliferone

Caffeic acid derivatives: including chlorogenic acid

Flavonoids

EFFECTS: ANGELICA ROOT

The root acts as an antispasmodic, cholagogue and stimulatory for secretion of gastric juices.

INDICATIONS AND USAGE

ANGELICA FRUIT

Approved by Commission E:

- Fevers and colds
- Infections of the urinary tract
- Dyspeptic complaints
- Loss of appetite

Unproven Uses: Preparations of angelica seed are used internally for conditions of the kidneys and efferent urinary tract, the intestinal tract and the respiratory tract, as well as for rheumatic and neuralgic complaints. Preparations are also used as a diaphoretic and have been used in the past for malaria. Externally, an ointment from the seeds is used for body lice.

ANGELICA LEAVES

Unproven Uses: Preparations from the leaves have been used as a diuretic and diaphoretic.

ANGELICA ROOT

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

Unproven Uses: In folk medicine, preparations of the root are used as a mild rubefacient, for coughs, bronchitis, menstruation complaints, loss of appetite, dyspeptic complaints with mild gastrointestinal cramps, liver and biliary duct conditions.

PRECAUTIONS AND ADVERSE REACTIONS

ANGELICA FRUIT AND HERB

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Photodermatosis is possible following contact with the plant juice.

Pregnancy: Preparations are not to be used during pregnancy.

ANGELICA ROOT

No health hazards or side effects are known in conjunction with the proper administration of designated **therapeutic** dosages. The furocoumarins contained in angelica **root** sensitize the skin to light and can lead to inflammation of **the** skin in combination with UV rays. It is therefore advisable **to** avoid sunbathing and intensive UV radiation for the duration of treatment with Angelica or its preparations.

DOSAGE

ANGELICA ROOT

Mode of Administration: Comminuted herb and other oral galenic preparations for internal use.

How Supplied:

Fluid Extract — 1:1

Oil

Tincture — 1:5

Preparation: There is no information on preparation in the literature.

Daily Dosage: 4.5 gm of drug, 0.5 to 3.0 gm of liquid extract (1:1); 1.5 gm of tincture (1:5); 10 to 20 drops of essential oil.

Angelica archangelica

See *Angelica*

Angostura

Galipea officinalis

DESCRIPTION

Medicinal Parts: The medicinal part is the dried bark of the tree.

Flower and Fruit: The flowers are in terminal, peduncled and closed racemes. The fruit is a 5-valved capsule, of which 2 or 3 are often sterile. There are 2 round, black seeds in each capsule and usually only one seed is fertile.

Leaves, Stem and Root: *Galipea officinalis* is a small 4 to 5 m high tree, which is 7.5 to 12.5 cm in diameter and has a straight trunk and irregular branches. The bark is smooth and gray. It is slightly curved or quilled. The outer layer is sometimes soft and spongy; the inner surface is yellowish-gray. The transverse section is dark brown. The bright green leaves are smooth, glossy, alternate and petiolate. They sometimes have white spots. The 3 leaflets are oblong, pointed and 4 cm long.

Characteristics: The flowers have a strong scent, which initially resembles that of tobacco. The taste is bitter.

Habitat: Angostura is indigenous to Venezuela and tropical regions of South America.

Production: Angostura is the whole or ground bark of *Galipea officinalis*.

Other Names: Cusparia Bark, True Angostura

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief constituents galipol, (-)- cadinene, galipene

Quinolin alkaloids: including cusparine including galipine, galipoline, quinaldine, cuspareine, galipoidine, 1-methyl-2-quinolone

Angustorine (bitter iridoid glycoside)

EFFECTS

Angostura stimulates gastric juices and acts as a tonic. In larger doses, the drug also has an emetic and strong laxative effect.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine indications include diarrhea; it is also used as a febrifuge.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The administration of larger doses can lead to nausea and vomiting.

Anise

Pimpinella anisum

DESCRIPTION

Medicinal Parts: The medicinal parts are the essential oil from the ripe fruit and the dried fruit.

Flower and Fruit: The inflorescences are medium-sized umbels with about 7 to 15 scattered pubescent rays. There is usually no involucre, but sometimes there is a single bract. There are barely any sepals. The petals are white, about 15 mm long, and have a ciliate margin. They have small bristles on the outside and a long indented tip. The fruit is downy, ovate to oblong and flattened at the sides.

Leaves, Stem and Root: The plant is an annual herb about 0.5 m high; it is downy all over. The root is thin and fusiform, and the stem is erect, round, grooved and branched above. The lower leaves are petiolate, orbicular-reniform, entire and coarsely dentate to lobed. The middle leaves are orbicular and 3-lobed, or 3-segmented with ovate or obovate segments. The upper leaves are short-petioled to sessile with narrow sheaths; they are pinnatisect with narrow tips.

Characteristics: The taste is sweet and the odor characteristic.

Habitat: The origin of the plant is unknown but it probably came from the Near East. Today, it is cultivated mainly in southern Europe, Turkey, central Asia, India, China, Japan, Central and South America.

Production: Anise consists of the dried fruits of *Pimpinella anisum*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (2 to 6%): chief constituent trans-anethole (94%), including as well chavicol methyl ether (estragole, 2%), anis aldehyde (1.4%)

Caffeic acid derivatives: including chlorogenic acid (0.1%), other caffeoyl quinic acids

Flavonoids: including apigenin-7-O-glucoside, isoorientin, isovitexin, luteolin-7-O-glucoside

Fatty oil (30%)

Proteic substances (20%)

EFFECTS

The drug is said to have an expectorant, mildly spasmolytic and antibacterial effect based on the essential oil. The data is empirical and there are no recent studies available.

Aniseed oil (main constituent trans-anethol) has an antibacterial, antiviral, insect repellent effect and in animal experiments it has been shown to be expectorant, spasmolytic and estrogenic.

INDICATIONS AND USAGE

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds
- Inflammation of the mouth and pharynx
- Dyspeptic complaints
- Loss of appetite

The drug is used internally for dyspeptic complaints. It is used both internally and externally for catarrhs of the respiratory tract.

Unproven Uses: In folk medicine, Anise is used internally for whooping cough, flatulence, colic-like pain, as a digestive, for menstruation disturbances, liver disease and tuberculosis.

Homeopathic Uses: *Pimpinella anisum* is used for shoulder pain and lumbago.

CONTRAINDICATIONS

Anise is contraindicated in patients allergic to anise and anethole.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Sensitization has been observed very rarely.

DOSAGE

Mode of Administration: As a comminuted drug for infusions and other galenic preparations for internal use or for

inhalation. The purpose of an external application of an Anise preparation is the inhalation of essential oil.

Daily Dosage: Internal average daily dose is 3 g drug (depending on the preparation).

Tea — Drink 1 cup mornings and/or evenings (expectorant); 1 dessertspoon per day (gastrointestinal complaints); infants 1 teaspoon (added to the bottle).

Infusion — single dose: 0.5 to 1 g before meals.

External application — inhalation of the essential oil.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Apple Tree

Malus domestica

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh false fruit, the dried fruit peels, and the inflorescences with their leaves and solid peduncles.

Flower and Fruit: The flowers are umbelled racemes with only a few blossoms. The petals are obovate, up to 2.5 cm long, stemmed, white, pink, or pink on the outside and white on the inside. The carpels are fused with the false fruit.

Leaves, Stem and Root: The plant is a 6 to 10m high tree or shrub. Boughs and branches are initially villous-haired, later becoming glabrous. The leaves are alternate, ovate, usually shortly acuminate and finely crenate-serrate.

JP Habitat: The plant is cultivated in the temperate regions of the Northern Hemisphere, and occasionally grows wild.

Production: Medicinal and pharmaceutical preparations of apples come in liquid and dried pectin forms. The source material is the apple residue with 10% to 20% pectin in the dried mass. The residue is extracted at pH 1.5 to 3 and 60° to 100° C.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FRUIT PULP

Fruit acids: the chief acid is malic acid (0.2 to 1.5%); in unripe apples quinic acid; including as well citric acid, succinic acid, lactic acid

Caffeic acid derivatives: including 5-caffeoyl quinic acid

Aromatic substances: in particular 2-trans-hexenal, 3-cis-hexenal, 2-trans-hexenol, 3-cis-hexenol, beta-damascenone, ethyl butyrate, methyl butyric acid hexylester; in some strains, 1-methoxy-4-(2-propenyl)benzole

A, *Pectins*

Tannins

Vitamins: in particular ascorbic acid (3 to 30 mg/100 gm)

COMPOUNDS: IN THE SEEDS

Cyanogenic glycoside: amygdalin (0.5 to 1.5%, corresponding to 30 to 90 mg HCN/100 gm)

Fatty oil

I EFFECTS

Pectin is a swelling agent. Apple pectins have a mild binding effect.

INDICATIONS AND USAGE

Unproven Uses: Finely ground fruit or preparations that contain liquid or dry pectin are used for milder forms of dyspepsia, diarrhea and digestive complaints, especially in children.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The fruit is available for oral use in the grated or chopped form. The skin peel can be used in teas. Medicinal and pharmaceutical preparations of apples come in liquid and dried pectin forms.

Areca catechu

See *Areca Nut*

Areca Nut

Areca catechu

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the nut.

Flower and Fruit: The plant is an erect palm growing up to 30 m high. The trunk has a girth of about 50 cm. The numerous feathery leaflets are 30 to 60 cm long, confluent and glabrous. The flowers are on branching spadix. The male flowers are numerous and above, the female solitary and below. The ovoid drupe has a fibrous layer under the yellow shell and one-seeded stone. The seeds are conical or nearly spherical and about 2.5 cm in diameter. They are very hard, and contain a deep brown testa showing fawn marbling.

Characteristics: The taste is slightly acrid and astringent, and the odor faint.

Habitat: The plant is found in the East Indies, cultivated in parts of Asia and eastern Africa.

Production: Areca or Betel Nuts are the fresh seeds of *Areca catechu*.

Not to be Confused With: Piper Betel, also called Betel, the leaf of which is chewed.

Other Names: Betel Nut, Pinang

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyridine alkaloids: arecoline, guvacoline (ester alkaloids), as well as arecaidine, guvacine

Tannins: catechin type

EFFECTS

The drug acts on the parasympathetic nervous system with an effect that is more muscarinic than nicotinic. It stimulates secretion in the salivary, bronchial and intestinal glands and

causes tremors and bradycardia. Chewing mouthfuls of betel leads to a saponification of the ester alkaloids and the resulting arecaidine produces euphoria. The drug also causes cramps in the muscles of intestinal parasites and stimulates the vagus nerve. Central nervous system stimulation has been observed in mice.

INDICATIONS AND USAGE

Unproven Uses: Betel Nut is no longer frequently prescribed in human medicine. However, the nuts are chewed as a recreational drug by an estimated 450 million people because of their intoxicating qualities. Fresh slices of the seed are part of the "betel titbit" used in eastern Asia. (Arecoline is converted in the central nervous system to the stimulant arecaidine through chewing.) That practice is being discouraged because of its link with some forms of oral cancer. In veterinary medicine, the drug is used as a vermifuge for tape worms in cattle and dogs, as well as for intestinal colic in horses.

Chinese Medicine: Uses in Chinese medicine include chronic hepatitis, edema, oliguria, diarrhea and digestive problems.

Indian Medicine: The juice of young seeds is used as a laxative in Indian medicine. A decoction of the root is used for cracked lips.

PRECAUTIONS AND ADVERSE REACTIONS

Due to its arecoline content, the drug appears parasymphathomimetic. It leads to increased salivation, in high doses to bradycardia, tremor, reflex excitability, spasms and eventual paralysis. Long-term use of the drug as a stimulant can result in malignant tumors of the oral cavity through formation of nitrosamines. When the nuts are chewed, the mouth and lips are stained red, as are the feces.

OVERDOSAGE

The toxic dose for humans is 8 to 10 g of the drug. Atropine is given as the antidote. Chewing the "nut" leads to a saponification of the ester alkaloids. The resulting arecaidine produces euphoria.

DOSAGE

Mode of Administration: In the past, Areca Nut was used in chewing balm for gum disease and as a vermifuge. Today, it is only used as a vermifuge in veterinary medicine for house pets. Therapeutic use is insignificant.

Storage: Must be stored separately, protected from light and in well-sealed containers.

Arenaria Rubra

Spergularia rubra

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The bracts of the inflorescence are almost as large as the leaves. The sepals and petals are 3 to 4 mm. The petals are usually pink, sometimes white. There are 5 to 10 stamens. The capsule is 4 to 5 mm and about equal in size to the sepals. The seeds are 0.45 to 0.55 mm, unwinged, dark brown, subtrigonal and more or less flattened.

Leaves, Stem and Root: The plant is annual to perennial with a slender to somewhat woody taproot, which is smooth and somewhat sticky. From beneath, it produces numerous, 5 to 22 cm long, diffuse, decumbent or procumbent stems. The leaves are narrow, linear and have very short, lanceolate, acute, silver, scarious stipules.

Habitat: The plant is common in Europe, Russia, Australia, North America and Asia.

Production: Arenaria Rubra is the aerial part of *Spergularia rubra*.

Other Names: Common Sandspurry, Sabline Rouge, Sandwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins

Resins

EFFECTS

The herb has diuretic effects.

INDICATIONS AND USAGE

Unproven Uses: Arenaria Rubra is used for conditions of the urinary tract, such as cystitis, dysuria and urinary calculus.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is used internally as a liquid extract.

Arjun Tree

Terminalia arjuna

DESCRIPTION

Medicinal Parts: The medicinal parts of the tree are the bark and fruit.

Flower and Fruit: The flowers are arranged in upright, apical panicles. The upper flowers of the panicles are usually only male. The flowers are small and fused; their structures are in fours or fives. The sepals are almost glabrous; the calyx tube has 4 to 5 short, triangular lobes. The petals are inconspicuous. There are 10 stamens and inferior, single-chambered, brownish or reddish pubescent ovary. The style is long and projects above the bud. The fruit is an over 2-cm long, glabrous, ovoid 4- to 5-sided drupe with 5 thick, narrow wings.

Leaves, Stem and Root: Arjun tree grows up to 30 m high. The leaves are opposite, 12 to 30 cm long and coriaceous with approximately 6-mm long petioles, which have 2 glands at the upper end. The lamina is elongate-elliptical, blunt or

with a short tip. The base is narrow or cordate and has a finely crenate margin. The trunk is grooved with a thick bark.

Habitat: India

Production: Arjun Tree bark is the dried trunk bark of Terminalia arjuna. It is collected in wild areas.

Other Names: White Murda

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins: gallotannins, ellagitannins

Steroids: sterols, including beta-sitosterol

Triterpenes: arjunolic acid and its glucosides, oleanolic acid

Flavonoids: including arjunolon, baicalein

EFFECTS

Clinical experiments with the bark powder have demonstrated efficacy against congestive cardiac insufficiency and hypertonia. Various extracts caused lowered blood pressure, bradycardia and positively inotropic effects in animal experiments. Spasmolytic and hemostyptic qualities have also been described. The substance is said to be sedative and potentiates the activity of barbiturates.

INDICATIONS AND USAGE

Indian Medicine: Arjun tree is used for fractures, ulcers, discharge of the urethra, leucorrhea, diabetes, anemia, cardiopathy, hyperhydrosis, asthma, bronchitis, states of exhaustion, tumors, dysentery, internal and external hemorrhaging, liver cirrhosis and high blood pressure.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Powdered drug and liquid preparations for internal use.

Preparation: The following basic forms are used in Indian medicine in many compound preparations.

Arjunatvagadi — An aqueous decoction.

Pardhadyaristam — An aqueous decoction with grapes and final fermentation.

Arjunaghrtam — A paste of the powdered drug with purified butter, heated and filtered.

Arjunatvak — The powdered drug.

Daily Dosage: Since the Indian medicine is dosed according to the individual patient, there is no exact information

available. There was, however, one study carried out with a daily dose of 3.88 gm powdered drug.

Armoracia rusticana
See Horseradish

Arnica

Arnica montana

DESCRIPTION

Medicinal Parts: The medicinal parts of Arnica are the ethereal oil of the flowers, the dried flowers, the leaves collected before flowering and dried, the roots, and the dried rhizome and roots.

Flower and Fruit: The terminal composite flower is found in the leaf axils of the upper pair of leaves. They have a diameter of 6 to 8 cm, are usually egg yolk-yellow to orange-yellow, but occasionally light yellow. The receptacle and epicalyx are hairy. The 10 to 20 female ray flowers are linguiform. In addition, there are about 100 disc flowers, which are tubular. The 5-ribbed fruit is black-brown and has a bristly tuft of hair.

Leaves, Stem and Root: Arnica is a herbaceous plant growing 20 to 50 cm high. The brownish rhizome is 0.5 cm thick by 10 cm long, usually unbranched, 3-sectioned and sympodial. The rhizome may also be 3-headed with many yellow-brown secondary roots. Leaves are in basal rosettes. They are in 2 to 3 crossed opposite pairs and are obovate and entire-margined with 5 protruding vertical ribs. The glandular-haired stem has 2 to 6 smaller leaves, which are ovate to lanceolate, entire-margined or somewhat dentate.

Characteristics: The flower heads are aromatic; the taste is bitter and irritating.

Habitat: Arnica is found in Europe from Scandinavia to southern Europe. It is also found in southern Russia and central Asia.

Production: Arnica flower consists of the fresh or dried inflorescence of *Arnica montana* or *Arnica chamissonis*. The flower should be dried quickly at 45° to 50°C.

Not to be Confused With: Other yellow-flowering Asteracea.

Other Names: Arnica Flowers, Arnica Root, Leopard's Bane, Mountain Tobacco, Wolfsbane

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpene lactones of the pseudo-guaianolid-type: particularly esters of the helenalin- and 11,13-dihydrohelenalins with short-chained fatty acids such as acetic acid, isobutyric acid, 2-methyl-butyric acid, methylacrylic acid, isovaleric acid or tiglic acid

Volatile oil: with thymol, thymol esters, free fatty acids

Polyynes: including tri-dec-1-en-penta-3,5,7,9 11-in

Hydroxycumarines

Caffeic acid derivatives: including chlorogenic acid, 1,5-dicaffeoyl quinic acid

Flavonoids: numerous flavone and flavonol glycosides and their aglycones

EFFECTS

Arnica preparations have an antiphlogistic, analgesic and antiseptic effect when applied topically, due to the sesquiterpene lactone component. The flavonoid bonds, essential oils and polyynes may also be involved. In cases of inflammation, Arnica preparations also show analgesic and antiseptic activity. The sesquiterpenes (helenalin) in the drug have an antimicrobial effect in vitro and an antiphlogistic effect in animal tests. A respiratory-analeptic, uterine tonic and cardiovascular effect (increase of contraction amplitude with simultaneous increase in frequency, i.e. positive inotropic effect) was demonstrated.

INDICATIONS AND USAGE

Approved by Commission E:

- Fever and colds
- Inflammation of the skin
- Cough/bronchitis
- Inflammation of the mouth and pharynx
- Rheumatism
- Common cold
- Blunt injuries
- Tendency to infection

Unproven Uses: External folk medicine uses include consequences of injury such as traumatic edema, hematoma, contusions, as well as rheumatic muscle and joint problems. Other applications are inflammation of the oral and throat region, furunculosis, inflammation caused by insect bites and phlebitis. In Russian folk medicine, the drug is used to treat uterine hemorrhaging. Furthermore, the drug is used for myocarditis, arteriosclerosis, angina pectoris, exhaustion, cardiac insufficiency, sprains, contusions and for hair loss due to psychological causes. While some uses are plausible, most are unproven.

PRECAUTIONS AND ADVERSE REACTIONS

General: The risks connected with the external, appropriate administration of therapeutic dosages of the drug are minimal. Frequent administration, in particular of the undiluted tincture, as well as with contacts with the plant, can nevertheless lead to sensitization.

Allergy-related skin rashes with itching, blister formation, ulcers and superficial necroses can result from repeated contact with, among other things, cosmetics containing Arnica flowers or other composites (for example tansy, chrysanthemums, sunflowers). External application of very

high concentrations can also result in primary blister formation and necroses.

Drug Interactions: The coumarin component may theoretically interact with warfarin, resulting in an additive anticoagulant effect.

OVERDOSAGE

Overdoses taken internally can lead to poisonings, characterized by severe mucous membrane irritation (vomiting, diarrhea, mucous membrane hemorrhage) and a brief stimulation of cardiac activity followed by cardiac muscle palsy. For that reason, internal administration of the drug is strongly discouraged.

DOSAGE

Mode of Administration: Arnica is used in the form of the whole herb, cut herb or herb powder for infusions, extracts, and tinctures; gel, oil and poultice for external application.

How Supplied: Commercial pharmaceutical preparations include gels, ointments, tinctures, oils and plasters.

Preparation: Arnica tincture (3x to 10x dilutions with water) is used to prepare a poultice. A tincture is prepared using 1 part Arnica flowers and 10 parts ethanol 70% v/v (according to DAB 10). Arnica oil is an extract of 1 part herb and 5 parts slightly warmed fatty oil. Ointments are made up with up to 15% Arnica oil or with 10 to 25% tinctures in a neutral ointment base. Mouthwashes are prepared as a tincture in 10x dilution.

Daily Dose: Tincture for cataplasm: tincture in 3x to 10x dilution. For mouth rinses: tincture in 10x dilution. Ointments should contain a maximum of 15% Arnica oil.

Storage: When stored, the drug should be tightly sealed and protected from light.

Arrach

Chenopodium vulvaria

DESCRIPTION

Medicinal Parts: The whole fresh, flowering plant has medicinal properties.

Flower and Fruit: The flowers are small, yellow-green and inconspicuous. They grow in clusters in leafless, compact spikes at the tip of the stem. The fruit is enclosed by the involucre. The seeds are black and glossy.

Leaves, Stem and Root: The plant is 15 to 40 cm high. The stems are branched from low down. The leaves are broad, rhomboid, entire-margined and petiolate. The whole plant is floury-dusty.

Characteristics: Arrach has a distinctive unpleasant smell of musty herring brine.

Habitat: Europe, northern Africa and the Caucasus

Production: Arrach is the complete flowering plant of *Chenopodium vulvaria*.

Other Names: Stinking Arrach, Stinking Goosefoot, Dog's Arrach, Goat's Arrach, Goosefoot, Stinking Motherwort, Netchweed, Oraches

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mono-, di- and trimethylamine : only in the fresh plant due to their volatility

Betaine

Tannins

EFFECTS

No substantiated information is available.

INDICATIONS AND USAGE

Unproven Uses: Arrach is used internally and externally to relieve cramps and as an emmenagogue.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The offensive smell often precludes continued use.

DOSAGE

Mode of Administration: Arrach is used externally and as an extract.

LITERATURE

Roth L, Daunderer M, Kormann K, *Giftpflanzen, Pflanzengifte*, 4. Aufl., Ecomed Fachverlag Landsberg Lech 1993.

Arrowroot

Maranta arundinacea

DESCRIPTION

Medicinal Parts: The medicinal parts are the starch from the rhizome tubers and the dried rhizome.

Flower and Fruit: The flowers are in pairs, 3.5 cm long and pedicled. They have 3 green, lanceolate sepals and a white, tubular-fused corolla with 1 hanging and two erect tips. The stamens are in 2 circles; the first consists of 2 petal-like staminoids, the second of 1 hood-like. There is 1 thickened stamen partly developed like a petal. The ovary is inferior and 3-sectioned. Only 1 carpel is developed. The fruit is 1-valved and has 1 seed.

Leaves, Stem and Root: The plant is a herbaceous perennial, 1 to 2 m high with thin, reed-like, branched and cane-like stems. The rhizome produces, along with the usual root, a sturdy, fusiform, swollen, up to 8 cm thick and 35 cm long tuber. The tuber is thickly covered with whitish, scaly stipules. The leaves are obovate, light green, lightly pubes-

cent and short-petioled. They have long sheaths and up to 13 cm long and 6 cm ovate-lanceolate leaf blades.

Habitat: The plant is indigenous to Central America and is found today in all tropical regions around the world.

Production: Arrowroot is the rhizome of *Maranta arundinacea*. The drug itself is a white powder extracted from the rhizome. The rhizome is washed, peeled and macerated, and the starch is then extracted, using water in a process of elutriation. The resulting starch mass is purified by repeated sieving and dried in the sun.

Not to be Confused With: Cheaper starches, such as potato, maize, wheat, or rice starch. These are often used as substitutes.

Other Names: Maranta

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Starch (25-27%, with respect to the fresh bulbs): as *Marantae amyllum*, maranta starch, medicinal arrowroot

Other constituent elements are not known.

EFFECTS

Animal tests: In rats that received a *Marantae*-rich diet, a reduction in the increase of the cholesterol levels in the aorta and heart muscle was reported. The effect was put down to an increased elimination of bile acids.

In humans, the drug is a demulcent and soothing agent.

INDICATIONS AND USAGE

Unproven Uses: Arrowroot is used as a nutritive (nutritional food stuff) for infants and convalescents, a dietary aid in gastrointestinal disorders, and also for diarrhea, especially in pediatrics. In folk medicine, it is used in acute diarrhea.

Indian Medicine: Arrowroot is used in dysentery, diarrhea, dyspepsia, bronchitis, coughs and as a particularly nourishing food for children, the chronically ill and convalescents.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The powder is boiled with water.

Storage: Arrowroot should be stored in tightly sealed containers.

Artichoke

Cynara scolymus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried whole or cut basal leaves and the dried or fresh herb from the artichoke.

Flower and Fruit: Globose, thorny capitulum of lingual florets grows at the end of the stem. The epicalyx is ovate to globose. The bracts are fleshy and taper into a flattened greenish or purple tip. The petals are blue, lilac or white. The fruit is a pubescent achene 4 to 5 mm in diameter and 7 to 8 mm long. It is flecked brown and glossy.

Leaves, Stem and Root: *Cynara scolymus* is a perennial plant with a short rhizome and a strong, erect, glabrous stalk. The stalk is up to 2 m high, thickly covered in lanceolate, prickly pinnate to double pinnate leaves. The upper surface is bare and light green; the lower surface is gray and tomentose.

Habitat: The plant is found in the Mediterranean region, the Canary Islands and South America. It is cultivated elsewhere.

Production: Artichoke root is the dried root of *Cynara scolymus*. Artichoke leaf consists of the fresh or dried basal leaves of *Cynara scolymus*. Artichoke is cultivated and dried with extreme care.

Other Names: Garden Artichoke, Globe Artichoke

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ARTICHOKE LEAF

Caffeic acid derivatives: chlorogenic acid, neochlorogenic acid, cryptochlorogenic acid, cynarin

4£ *Flavonoids (0.5%):* in particular rutin

Sesquiterpene lactones (0 to 4%): cynaropicrin, dehydrocynaropicrin, grossheimin, cynaratriol

COMPOUNDS: ARTICHOKE ROOT

Caffeic acid derivatives, including chlorogenic acid sesquiterpene lactones, are not contained in the rhizome.

EFFECTS: ARTICHOKE LEAF AND ROOT

The main active principles are sesquiterpenes (amaroids), hydroxy cinnamic acid and flavonoids. The drug has a cholagogic, hepatotoxic and lipid-reducing effect. A choleric effect has been observed in rats (effect of the cinnamic acid). The cholesterol levels were reduced in the rats; a hepatostimulating and bitter effect on the gastrointestinal tract has also been documented.

INDICATIONS AND USAGE

ARTICHOKE LEAF

Approved by Commission E:

- Liver and gallbladder complaints
- Loss of appetite

ARTICHOKE LEAF AND ROOT

Unproven Uses: Artichoke is used for dyspeptic problems and also for prophylactic treatment against the return of gallstones.

In folk medicine, Artichoke is also used for digestion complaints and as a tonic in convalescence.

CONTRAINDICATIONS

ARTICHOKE LEAF AND ROOT

Because of the stimulating effect of the drug upon the biliary tract, it should not be administered if there is a bile duct blockage. Colic can occur where the patient suffers from gallstones.

PRECAUTIONS AND ADVERSE REACTIONS

ARTICHOKE LEAF AND ROOT

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The plant possesses a medium potential for sensitization through skin contact. Allergic reactions occur in particular when there is frequent on-the-job contact with artichokes. There are cross-reactions with other composites (including chrysanthemes, arnica Pyrethrum).

DOSAGE

ARTICHOKE LEAF

Mode of Administration: Dried, comminuted drug, pressed juice of fresh plant and other galenical preparations for internal use.

Daily Dosage: The average daily dose is 6 gm of drug; single dose is 500 mg of dry extract.

Storage: Artichoke should be protected from light and insects in well-sealed containers.

Arum

Arum maculatum

DESCRIPTION

Medicinal Parts: The medicinal part is the root of the plant.

Flower and Fruit: The flowers are pale yellowish-green. They are surrounded by a bulbous spathe and therefore are not visible. A violet or brown-red spadix emerges from the bract with 2 circles of bristles underneath. Under the bristles are the male flowers, and under these are the female flowers. The spathe doubles the length of the spadix. The whole

structure forms a typical insect trap. The fruit is a scarlet berry.

Leaves, Stem and Root: *Arum maculatum* is a 30 to 60 cm spit- to arrow-shaped plant. It is long-stemmed, glossy, often brown-speckled and basal. The petiole is spread to a sheath at the base. The root-stock is tuberous, ovoid and floury-fleshy, varying in size between that of a hazelnut and a pigeon's egg.

Characteristics: *Arum maculatum* bears attractive scarlet berries that yield an acrid juice that is poisonous and can be fatal if ingested by small children.

Habitat: The plant is indigenous to parts of Europe, to Britain and the U.S.

Production: *Arum* root is the fresh rhizome of *Arum maculatum* collected before removing the leaves.

Other Names: Adder's Root, Bobbins, Cocky Baby, Cuckoo Pint, Cypress Powder, Dragon Root, Friar's Cowl, Gaglee, Kings and Queens, Ladysmock, Lords and Ladies, Parson and Clerk, Portland Arrowroot, Quaker, Ramp, Wake Robin

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages: glucomannane

Starch

Lectins

EFFECTS

The glucomannans, bassorin and starch contained in the drug have a strong irritant and swelling effect on the mucous membranes. The diaphoretic and expectorant effect attributed to the drug may be due to the strong actions of these constituents.

INDICATIONS AND USAGE

Unproven Uses: *Arum* is used for colds and inflammation of the throat.

PRECAUTIONS AND ADVERSE REACTIONS

The intake of plant parts leads to severe mucous membrane irritations (swelling of the tongue, bloody vomiting, bloody diarrhea), presumably due to lesions of the membrane from the very sharp-edged oxalate needles and the introduction of impurities into the wounds. Decoctions of the roots in therapeutic dosages can be taken without risk. Caution is advised even though the level of cyanogenic glycosides is too low to be able to bring about signs of poisoning and other soluble poisonous substances have not been shown to be present.

DOSAGE

No dosage information is available.

Asa Foetida

Ferula foetida

DESCRIPTION

Medicinal Parts: The medicinal part is the oily gum-resin extracted from the plant.

Flower and Fruit: The flowers appear after 5 years in yellow umbels on a 10 cm thick naked stem. They are numerous, pale greenish-yellow to white. The fruit is ovate, flat, thin, flaky, reddish-brown with distinct oil marks.

Leaves, Stem and Root: The plant is a herbaceous monoecious perennial, 1.5 to 2 m high with a large, fleshy rhizome, which is 14 cm thick at the crown. The leaves are large, bipinnate, and radical.

Characteristics: The fruit has milky juice and a strong smell.

Habitat: Afghanistan and eastern Iran.

Production: *Asa foetida* is the gum resin of *Ferula foetida*.

Other Names: Devil's Dung, Food of the Gods, Gum Asafoetida

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief constituent is sec-propenyl-isobutyl disulphide

Gum resin: consisting mainly of ferulic acid esters, farnesiferol A, B, C and bassorin-like mucilage

Sesquiterpenoide coumarins: including asafoetida

EFFECTS

Asa foetida has a mild intestinal disinfectant effect; its sedative effect is uncertain. In animal experiments it has antitumoural and mild mutagenic effect on *Salmonella typhimurium*.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for chronic gastritis, dyspepsia and irritable colon.

Chinese Medicine: In China, the drug is used for infestation with intestinal parasites.

Indian Medicine: In India, *Asa foetida* is used to treat asthma, whooping cough, flatulence, constipation, diseases of the liver and spleen and for epilepsy.

Homeopathic Uses: *Ferula foetida* is used for low acid levels in the stomach, stomach pressure, flatulence and loose stools.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The intake of larger dosages can lead to swelling of the lips, digestive complaints (belching, flatulence, diarrhea), discomfort and headache. Convulsions are possible in susceptible individuals. Swelling of the genital organs has been observed following external administration on the abdomen.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: The drug is available as an extract.

Preparation: Gum-resin is obtained by incising the roots, which contain a fetid juice. This solidifies to a brown resin, sometimes with a pinkish tint, in sticky lumps. The final product has a pungent, acrid, persistent, alliaceous odor.

Daily Dosage: Tincture: 20 drops as a single dose.

Homeopathic Dosage: D3 and D4 dilutions.

Asarum

Asarum europaeum

DESCRIPTION

Medicinal Parts: The primary medicinal part is the root of the plant. However, the leaves have been used to a lesser extent.

Flower and Fruit: The end of the stem forms a short-pedicled, slightly hanging flower. The perigone forms a campanulate tube with a 3 to 4 lobed margin. It is brownish on the outside, dark and purple on the inside. There are 2 groups of 6 stamens on the ovaries, which are fused with the

tube and are flattened above. The style is thick, short and not hollow; the stigma is 6-rayed. The fruit is a many-seeded, indehiscent capsule divided into many chambers by false membranes. In each capsule there are numerous boat-shaped seeds with a spongy appendage.

Leaves, Stem and Root: *Asarum europaeum* is a shaggy-haired perennial growing 4 to 10 cm high. It has a thin, creeping rhizome that is branched and usually has 3 to 4 scale-like, brownish-green stipules. It has an ascending short-scaled stem, with the terminal flower at the tip. There are 2 to 4 long-petioled, almost opposite, broad, reniform leaves. They are entire-margined, coriaceous, dark-green glossy above, pale and matte beneath, deeply reticulate and evergreen.

Characteristics: The rhizome has a pepper-like smell; the leaves and flowers have an unpleasant camphor smell. *Asarum europaeum* is a protected species.

Habitat: The plant is indigenous to the northern parts of southern Europe, central and east-central Europe as far as the Crimea and eastward into western Siberia as well as an enclave in the Atai. *Asarum* is cultivated in the U.S.

Production: *Asarum* root is the root of *Asarum europaeum*, which is gathered in August and air-dried in the shade. *Asarum* is primarily collected in the wild, but is cultivated in the U.S.

Not to be Confused With: Can be confused with other valerian types and with *Arnica montana*, *Genum urbanum*, *Valeriana officinalis* and *Viola odorata*. The mistaken powder can be identified by the presence of fibers, stone cells, oxalate filament agglomerations and the absence of starch.

Other Names: *Asarabacca*, *Coltsfoot*, *False Coltsfoot*, *Fole's Foot*, *Hazelwort*, *Public House Plant*, *Snakeroot*, *Wild Ginger*, *Wild Nard*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: composition depends upon breed but possible constituents include asarone trans-isoasarone, trans-iso Eugenol methyl ether, trans-iso eulemicin or eudesmol, possibly in addition to sesquiterpene hydrocarbons, -alcohols, -furans, -carbonyl compounds

Caffeic acid derivatives: including chlorogenic acid, isochlorogenic acid

Flavonoids

EFFECTS

Asarum acts as an expectorant, bronchial spasmolytic, superficial relaxant and local anesthetic. Studies of the plant's emetic action exist for *Asari* root and herb. However,

self-experiment with 100 gm trans-isoasaron taken orally caused severe vomiting.

The surface-tension-reducing effect of trans-isoasaron and trans-isomethyleugenol was studied in vitro, using stalagmometry. Both substances showed a concentration-dependent surface activity, which surpassed the effect of the control substance tyloxapol in a normal treatment concentration.

In studies of Asarum's spasmolytic effect, bronchial spasms induced in a guinea pig by histamine were inhibited in vivo by trans-isoasaron, depending on the dose. The survival rate was determined subsequent to the addition of a histamine-containing aerosol 30 minutes after trans-isoasarin had been administered. The control substance here was clemizole hydrochloride, which has a similarly inhibiting effect.

The action of trans-isoasaron and of isomethyleugenol as a local anesthetic was tested on 10 volunteer subjects, in order to compare it with benzocaine (anesthetic index AI = 1). The results showed a dose-related action for both drugs, with the following anesthetic indexes of AI = 0.72 for trans-isoasarin and AI = 0.47 for trans-isomethyleugenol.

The only available studies of Asarum's antibacterial effect are those carried out on Asari root and herb. A double-blind clinical trial with a placebo as alternative was carried out on 30 patients with acute bronchitis, 30 with chronic bronchitis and an additional 30 with bronchial asthma. Eighty percent of the patients with acute bronchitis, 58% of the patients with chronic bronchitis and 68% of the patients with bronchial asthma were cured or showed improvement in both their subjective and objective states. The contrast with the placebo groups was significant. The treatment consisted of a daily dose of 3 x 2 tablets, purified dry (GB) or powdered (US) extract (30 mg phenylpropanol derivatives) taken over an average of 7 days. However, to obtain conclusive results, further trials are needed over a longer period and with more patients. The drug's efficacy was also tested in a multicentric field trial, a clinically controlled study and an open bicentric study. However, the results are only useful to a small extent, as there is an absence of details about placebo groups, trial parameters, and statistical analysis.

INDICATIONS AND USAGE

Unproven Uses: The purified dry extract of Asarum europaeum rootstock is used for inflammatory conditions of the lower respiratory system (acute and chronic bronchitis), for various causes of bronchial spasms and for bronchial asthma. Asari root and Asari root with herb are used for similar indications in folk medicine. In the past, the drugs were used as emetics. Some other uses are as antitussives (cough remedies), sneezing-powder for chronic rhinitis, for inflammation of the eye, for pneumonia, angina pectoris, migraines, liver disease and jaundice, for dehydration, as an

emmenagogue (menstrual stimulant) and for artificial abortion. The dried, powdered leaves have been used as an ingredient of some snuffs, helping to expel mucus from the respiratory passages.

Homeopathic Uses: Homeopathic uses include diarrhea, irritation of mucous membranes and exhaustion.

PRECAUTIONS AND ADVERSE REACTIONS

Older scientific literature contains reports of signs of poisoning including burning of the tongue, gastroenteritis, diarrhea, erysipeloid skin rashes and hemiparesis. An extremely susceptible mouse strain developed hepatoma after exposure to asarone. Administration of the drug is not advised.

CONTRAINDICATIONS

Asarum is not to be used during pregnancy.

DOSAGE

Mode of Administration: Asarum is taken as a sneezing-powder, or orally as a purified dry extract in the form of coated tablets and pills. It is obsolete as a drug.

How Supplied: Commercial pharmaceutical preparations include coated tablets and confectionery tea mixtures.

Preparation: The air-dried rootstock is extracted with an organic solvent, which can be mixed with water. The liquid extract is separated from the solvent by means of vacuum distillation. The watery portion remaining is diluted with an equal amount of distilled water, and further extraction takes place. Then the organic liquid extract is mixed with a suitable excipient according to the desired percentage of trans-isoasaron. Afterward, the extract is dried and rubbed. Trans-isoasaron can also be produced from asarylaldehyde by means of Perkin's cinnamic synthesis. As sneezing-powder, the average content of the drug is 20%.

Daily Dosage: The average daily oral dose of the dry extract for adults and children aged 13 and over is 30 mg, which corresponds to 30 mg phenylpropane derivatives and should be spread over 2 to 3 doses per day. Children aged 2 and over can take an extract corresponding to 5 mg phenylpropanol derivatives 3 times daily. The average single dose of the drug is 0.1 gm.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules 1 to 3 times daily or 1 ml injection solution twice weekly sc; ointments 1 to 2 times daily; D1 and D2 should not be taken for longer than 1 month (HAB1).

Storage: Coated tablets and pills that contain the purified dry extract or the tincture from the rhizome can be stored for a period of 28 days in conditions of high temperature, humidity and light. Under preferred storage conditions (i.e.

brown glass, away from light), they can be stored for up to 2 years, after which period stability should be checked.

Ash

Fraxinus excelsior

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the fresh bark, the branch bark, and the fresh leaves.

Flower and Fruit: The flowers are in richly blossomed panicles, the terminal ones appearing on the new flowering branches. They are usually androgynous, occasionally male, polygamous or dioecious. They have no calyx or corolla. The anthers of the male flowers are dark purple and are on short filaments. The female flowers consist of 1 inferior ovary with a 2-lobed stigma and 2 split staminoids. The fruit is a narrow lanceolate to oblong-obovate nutlet hanging on a thin stem. The fruit is 25 to 50 mm long and 7 to 10 mm wide, glossy brown, 1-seeded with a veined winged border.

Leaves, Stem and Root: The ash is an impressive 15 to 30 m tall tree with a gray-brown, smooth, later fissured and wrinkled bark and large, black-brown, pubescent buds. The leaves are entire-margined, opposite and odd pinnate. There are 9 to 15 leaflets. The leaflets are sessile, usually 5 to 11 cm long by 1 to 3 cm wide, oblong-ovate to lanceolate, long acuminate, finely and sharply serrate. They are glabrous above, rich green, loosely tomentose or almost glabrous, and greenish brown beneath.

Habitat: The plant is distributed in most parts of Europe except the northern, southern and eastern edges.

Production: Ash bark consists of the bark of young branches of *Fraxinus excelsior*. Ash leaf consists of the leaf of *Fraxinus excelsior*. The leaves are harvested in spring and air-dried.

Not to be Confused With: It may be confused with *Ailanthus glandulosa*.

Other Names: Bird's Tongue, European Ash, Common Ash, Weeping Ash

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ASH LEAF.

Flavonoids: including rutin (0.1-0.9%)

Tannins

Mucilages (10-20%)

Mannitol (16-28%)

Triterpenes, phytosterols

Iridoide monoterpene: including syringoxide, deoxy-syringoxidin

COMPOUNDS: ASH BARK

Hydroxycoumarins: aesculin, fraxin, aesculetin, fraxetin, fraxidin, isofraxidin, fraxinol, scopoletine

Tannins

Atridoide monoterpenes: including 10-hydroxylogstroside

EFFECTS: ASH BARK

The main active principle is coumarin. Preparations of fresh ash bark showed an analgesic, anti-oxidative, and antiphlogistic action. Cyclo AMP phosphodiesterase is inhibited and an anti-oxidative (radical trapping action) effect was proven for scopoletine, isofraxin and fraxin.

INDICATIONS AND USAGE

ASH LEAF

Unproven Uses: Preparations of Ash leaf are used for arthritis, gout, bladder complaints, as well as a laxative and diuretic. In folk medicine Ash leaf is used internally for fever, rheumatism, gout, edema, stones, constipation, stomach symptoms and worm infestation; and externally for lower leg ulcers and wounds.

ASH BARK

[^] *Unproven Uses*: Preparations of Ash bark are used for fever and as a tonic.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Since the efficacy for the claimed applications has not been documented, therapeutic application cannot be recommended. The efficacy of Ash in fixed combinations must be verified specifically for each preparation.

Storage: Should be protected from light.

Asiatic Dogwood

Cornus officinalis

DESCRIPTION

Medicinal Parts: The medicinal part of the tree is the fruit.

Flower and Fruit: The umbels contain 20 to 30 flowers surrounded by 4 yellow-green, 6 to 8 mm long, elliptical-acuminate bracts. The flower structures are in fours and the diameter of the flower is 4 to 5 mm including the disc. The calyx is fused and has 4 tips. There are 4 free petals, 4 stamens and a 2-chambered ovary, with 1 ovule per chamber. The drupe is elongate-elliptical, approximately 15 mm long and red with an elongate, 2-chambered stone kernel.

Leaves and Branches: *Cornus officinalis* is shrub or tree, that grows up to 4 m high. The leaves are opposite, simple and 4 to 10 cm long. The petiole is 6 to 10 cm long. The lamina is ovate-elliptical or ovate, long acuminate, rounded at the base, yellow-brown and pubescent beneath. The branches are smooth, bluish-green and the bark peels off.

Habitat: China, Japan

Production: *Cornus* fruit is the dried fruit pulp of *Cornus officinalis*. Fruits are harvested in the late autumn or the beginning of winter. They are scalded with boiling water or gently heated. Cleaning of the raw drug follows kernel extraction and drying.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids: iridoid glycosides, including loganin, cornuside, sweroside, morronoside

Tannins: gallotannins, including cornusiens-A to -G, tellimagrandin I and II, camptothins-A and -B

Triterpenes: including oleanolic acid, ursolic acid

Anthocyanins

EFFECTS

The drug has an astringent effect due to its tannin content. It has exhibited diuretic, blood pressure-lowering and leukocytopoiesis-promoting effects in clinical tests.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug has been used for impotency, loss of semen, lumbago-sciatica syndrome, night sweats and vertigo.

Chinese Medicine: In China, Asiatic Dogwood is used for liver and renal disorders, tinnitus, hyperhidrosis, impotency and low back and knee pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb preparations and liquid preparations for internal use

Preparation: The fruit is boiled or steamed with wine until all the liquid has been drawn out.

Daily Dosage: 5 to 12 gm of drug.

Chinese Medicine Dosage: 3 to 9 gm of drug daily.

Storage: The herb should be protected from insects and stored in dry place.

Asparagus

Asparagus officinalis

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the herb and the rhizome with roots.

Flower and Fruit: Thin pedicles measuring from 2 to 20 mm long, grow 1 to 3 flowers from the nodes. The plants are usually dioecious. The perigone of the male flowers is about 5 mm long, funnel-shaped and whitish to greenish-yellow.

The perigone is longer than the cauline leaves and has oblanceolate sections that are twice as long as the perigone tube. The stamens are oblong and almost as long the filaments. The perigone of the female flowers is much smaller. The fruit is a pea-sized, brick-red round berry that is up to 8 mm thick. The seeds are black with wrinkly stripes and are 3 to 4 mm wide.

Leaves, Stem and Root: *Asparagus officinalis* is a perennial with a short, woody rootstock. In the wild, the plant typically reaches heights of 30 to 100 cm, but cultivated plants may grow to 150 cm. The stem is erect, glabrous and smooth, later inclined with numerous erect to leaning branches. The scale sections at the base have short spurs. The round, needle-like phylloclades are in clusters of 4 to 15 that are 5 to 25 cm long and about 0.5 cm thick. The root-stock is short and thick. It produces a few ascending shoots that are as thick as a finger, fleshy, white, and red or blue-reddish tinged. (This is the edible asparagus.) The female plants are often slimmer than the male, which are shorter and stockier.

Characteristics: The fruit is considered to be poisonous, but that has not been substantiated.

Habitat: The plant grows in central and southern Europe, the Middle East, western Siberia and northern Africa. It is cultivated in many places.

Production: *Asparagus* herb consists of the above-ground parts of *Asparagus officinalis*. *Asparagus* root consists of the rhizome with roots of *Asparagus officinalis*, which are dug up and air-dried in autumn, and also the fresh underground shoots.

Not to be Confused With: This variety is sometimes confused with other types of asparagus cultivated in the Mediterranean region.

Other Names: Sparrow Grass

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ASPARAGUS HERB

Flavonoids: including rutin, hyperoside, isoquercitrin

Steroid saponins

EFFECTS: ASPARAGUS HERB

Animal experiments indicate the herb has a mild diuretic action.

COMPOUNDS: ASPARAGUS RHIZOME AND ROOT

Steroid saponins: including asparagosides A, B, D, F, G, H, I, the bitter steroid saponins, aspartic saponin I

Amino acids: among them sulphur-containing aspartic acid, the esters 3-mercapto- butyric acid, 3-methylthio-isobutyric acid, diisobutyric acid disulphide

Fructans: asparagose, asparagosine

EFFECTS: ASPARAGUS RHIZOME AND ROOT

Animal tests indicate that the root has a diuretic effect. The main active principles are flavonol glycoside and furostanol and spirostanol glycosides, mainly derivatives of sarsapogenin. The distinctive odor of the urine after an individual has eaten asparagus is said to be caused by methylmercaptan.

INDICATIONS AND USAGE**ASPARAGUS HERB**

Unproven Uses: Preparations of Asparagus are used as a diuretic, although the effectiveness for the claimed application has not been sufficiently documented.

ASPARAGUS RHIZOME AND ROOT

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Unproven Uses: Traditional uses of the root include application for non-specific inflammatory diseases of the efferent urinary tract and for prevention of kidney and bladder stones (irrigation therapy). Among other folk medicine uses are J^, dropsy, rheumatic conditions, liver disease, bronchial asthma and gout. These applications have not been proven.

Chinese Medicine: The root is used to treat irritable cough, coughing with blood, dry mouth and throat, and constipation.

Homeopathic Uses: Uses in homeopathy include kidney stones and cardiac insufficiency.

CONTRAINDICATIONS**ASPARAGUS RHIZOME AND ROOT**

Because of the irritating effect of saponin, the drug should not be administered in the presence of kidney diseases. In the case of reduced cardiac and/or kidney function, irrigation therapy should not be attempted.

PRECAUTIONS AND ADVERSE REACTIONS**ASPARAGUS HERB**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The plant has a low sensitization potential through skin contact. The berries are considered poisonous, although there is no proof of this.

ASPARAGUS RHIZOME AND ROOT

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. When used in irrigation therapy, ensure ample fluid intake. There is a low sensitization potential, particularly among workers in canning factories who can become prone to asparagus scabies.

DOSAGE**ASPARAGUS RHIZOME AND ROOT**

Mode of Administration: The cut rhizome is used for teas, as well as other galenic preparations for internal use. When used in flushing-out therapy, ensure ample fluid intake.

How Supplied: Commercial pharmaceutical preparations of Asparagus root are available in tablet form.

Daily Dosage: The daily dosage is 45 to 80 g. A typical single dose is 800 mg of the drug.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily, or 1 ml injection solution twice weekly sc (HAB1).

See *Tragacanth*

Astragalus (Huang-Qi)

Astragalus species

TRADE NAMES

Astragalus (available from numerous manufacturers), Astragalus Root, Superior Chinese Astragalus, Astragalus Vegi-caps, Astragalus Extract, Alvita Astragalus Root

DESCRIPTION

Medicinal Parts: The primary medicinal parts of the herb are the roots.

Flower and Fruit: The flower racemes are apical, and most are axillary. The inflorescences have many small, blue, purple or blue-purple flowers. Two to three days following bloom, pods will develop in a square shape of a cross section with two chambers. There are 10 dark brown seeds in each chamber. The seeds are 6 to 13 mm long.

Leaves, Stem and Root: The plant is a perennial and has several stems 1.5 to 2.0 m in height. The stems are covered with pinnate leaves with T-shaped soft hairs. The primary root is thick, long and contains many lateral roots. There is a secondary root beginning 20 to 30 feet below the soil surface.

Characteristics: The plant is cold tolerant and also able to grow in high temperatures.

Habitat: *Astragalus australis* is an endemic plant of the Olympic Mountains, Washington. Other species are grown in northern and southern parts of China, Japan, and Korea.

Other Names: Beg Kei, Bei Qi, Hwanggi, Membranous Milk Vetch, Astragali, Tragacanth

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene glycosides: brachyosides A, B, and C, and cyclocephalosite II, astrachryoside A

Saponins: astragalosides I, II, and IV, isoastragaloside I, 3-O-beta-D-xylopyranosyl-cycloastragenol, cyclocanthoside E, soyasaponin I and cycloastragenol

Tragacanth (from the sap)

Sterols: daucosterol and beta-sitosterol

Fatty acids: including heptenoic acid, tetradecanoic acid, pentadecanoic acid, hexadecanoic acid, octadecenoic acid, octadecanoic acid, octadecadienoic acid, linolenic acid, eicosanoic acid, eicosenoic acid and docosanoic acid

Isoflavonoid compounds: astrasieversianin XV (II), 7,2'-dihydroxy-3',4'-dimethoxy-isoflavane-7-O-beta-D-glucoside (III)

Amino acids: gamma-L-glutamyl-Se-methyl-seleno-L-cysteine, Se-methylseleno-L-cysteine

Polysaccharides

EFFECTS

Antiviral—*Astragalus membranaceus* inhibits the replication of coxsackie B-3 virus (CB3V)-RNA, a virus that causes myocarditis in animal models (Peng, 1995). The herb demonstrated significantly higher survival rates and lower

abnormal action potential in animal models infected with CB3V, suggesting its possible use for prevention and treatment of acute myocarditis involving CB3V (Rui, 1994).

Antioxidant—Astragalus membranaceus inhibits lipid peroxidation in rat heart mitochondria (Hong, 1994).

Cardiovascular Effects—Astragalus membranaceus increases cardiac output in patients with angina pectoris (Lei, 1994). Astragaloside IV improves left ventricular end-diastolic volume, left ventricular end-systolic volume and slows heart rate in heart failure. The compound also alleviates chest distress and dyspnea associated with heart failure (Luo, 1995). The herb has therapeutic effects on sodium and water retention in aortocaval fistula-induced heart failure, improving cardiac and renal functions in heart failure. The mechanism is partly through correction of abnormal mRNA expressions of hypothalamic arginine vasopressin system and aquaporin-2, and amelioration of blunted renal response to atrial natriuretic peptide (Ma, 1998).

Fibrinolytic—Astragaloside IV increases the fibrinolytic potential of endothelial cells by upregulating the expression of tissue-type plasminogen activator and by downregulating the expression of plasminogen activator inhibitor type 1 (Zhang, 1997).

Gastrointestinal Effects—The herb strengthens the movement and muscle tonus in the intestine, especially the jejunum, to increase movements in the digestive tract, as evidenced by positive effects on the cycle duration of interdigestive myoelectric complex (Lei, 1994).

Hepatoprotective—An ethanol extract of the root of Astragalus membranaceus alleviated liver injury through a reduction of elevated SGPT levels and subacute toxicity. The herb also decreased loss of righting reflex and protected hepatic cells from pathological changes (Zhang, 1990).

Immuno-modulating—The herb stimulates macrophages, promotes antibody formation, and increases T lymphocyte proliferation. F3, an immuno-regulatory component of the herb reverses macrophage suppression induced by urological tumors (Rittenhouse, 1991). Astragalus membranaceus extracts enhance the antibody response to a T-dependent antigen associated with an increase of Th cell activity in normal and immunodepressed animal models (Zhao, 1990). A fractionated extract of Astragalus membranaceus potentiates lymphokine-activated killer (LAK) cell cytotoxicity generated by low-dose recombinant interleukin-2 (rIL-2). This immune response occurs through a 10-fold potentiation of rIL-2 activity manifested by tumor cell killing activity resulting from LAK cell generation (Chu, 1990).

Memory Improvement—Aqueous extracts of Astragalus demonstrated improvement of anisodine-induced impairment

on memory acquisition as well as the alcohol-elicited deficit of memory retrieval (a reduction in errors and prolonged latent period) (Hong, 1994).

CLINICAL TRIALS

Immune-stimulating

The effect of pure Astragalus preparation (PAP) in treating 115 patients with leukopenia was determined after 8 weeks of therapy. Group I was treated by a concentrated PAP (10 ml, equivalent to 15 grams of Astragalus), and group II was treated with a different concentrated PAP (10 ml, equivalent to 5 grams of Astragalus). Both treatment groups received a dose of 10 ml twice daily. The effectiveness was statistically different between the groups with 82.76% and 47.37% in Group I and II, respectively. The total effective rate was 65.22%. The average WBC count of group I was significantly higher than that of group II with a significant rise of the WBC counts in both groups after treatment (Weng XS, 1995).

Cardiovascular Effects

The effect of Astragalus membranaceus on left ventricular function and oxygen free radicals was evaluated in 43 cardiac patients. All patients in the treatment group had experienced their myocardial infarction within the past 36 hours. The herb demonstrated a strengthening of left ventricular function and an effect of anti-oxygen free radicals for a cardiogenic action. The herb decreased the ratio of pre-ejection period/left ventricular ejection time, increased the superoxide dismutase activity of red blood cells and reduced lipid peroxidation content (Chen, 1995).

INDICATIONS AND USAGE

Unproven Uses: The herb has been used for respiratory infections, immune depression, cancer, heart failure, viral infections, liver disease and kidney disease. Astragalus has also been used as a diuretic.

Chinese Medicine: The herb has been used alone and in combination for liver fibrosis, acute viral myocarditis, heart failure, small cell lung cancer, amenorrhea, and antiviral.

PRECAUTIONS AND ADVERSE REACTIONS

General: Caution should be taken with patients receiving immunosuppressive therapy, such as transplant patients, or patients with autoimmune diseases. Extracts of Astragalus lusitanicus in animal models resulted in toxic excitatory cardiac effects and respiratory depression, involving skeletal muscle and neurological systems (Abdennebi, 1998).

Neurological Dysfunction: Due to the selenium content in Astragalus, toxic doses may result in neurological dysfunction leading to paralysis (Panter, 1996).

Drug Interactions:

Cyclophosphamide—Although enhancement of the antibody response through an increase of Th cell activity was seen in cyclophosphamide immunosuppressed animal models, another study demonstrated the herb does not prevent cyclophosphamide-induced myelosuppression. *Astragalus membranaceus* given concomitantly with cyclophosphamide showed no difference in terms of nadir count, time to nadir and time to recovery for both the ANC and the platelet counts (Khoo, 1995; Zhao, 1990).

Anticoagulants/Antiplatelets/Antithrombotic Agents—Due to the increased fibrinolysis effect of astragaloside IV, concomitant use with anticoagulants, antiplatelets or antithrombotic agents may potentiate the risk of bleeding (Zhang, 1997).

DOSAGE*How Supplied:*

Capsule—200 mg, 250 mg, 400 mg, 450 mg, 470 mg, 500 mg, 520 mg

Liquid

Tea Bag

Daily Dosage: The dried root is administered as 2-6 grams daily, and the fluid extract as 4 to 12 milliliters daily (Bone, 1997). The powdered root capsule (250 mg-500 mg) has been administered as two capsules three times daily (Foster, 1998).

Avocado

Persea americana

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the fresh leaves, the whole fruit including the seed and the oil extracted from the leaves.

Flower and Fruit: The flowers are in compact or loose racemes. They are 5 to 8.2 mm long and greenish. The inner and outer perianth circles are 4 to 6 mm long and elliptical to oval-elliptical. The anthers are 3.5 mm long, and the filaments are 2.3 mm. The ovary is oval or pear-shaped and downy. It develops into a drupe, which is green and fleshy and up to 18 cm long. The drupe is smooth with thick oily flesh and a very large seed.

Leaves, Stem and Root: The avocado is a tree up to 40 m in height and with a trunk 60 cm in diameter. The leaves are 6 to 30 cm long and 3.5 to 19 cm wide. They are narrow to broadly elliptical. The leaf surface is sticky, while the lower surface is downy.

Habitat: The plant originated in central and southern South America and is cultivated in all tropical and subtropical regions today.

Production: Avocado oil comes from the fruit of *Persea americana*. Avocado oil is recovered from the pericarp of *Persea americana* and refined if necessary.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil: chief fatty acids oleic acid, palmitic acid, linoleic acid, palmitoleic acid (tocopherols, vitamin E)

EFFECTS

Avocado oil is an emollient, which improves rough ichthyotic skin.

INDICATIONS AND USAGE

Avocado is a main ingredient in so-called natural cosmetics.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As an active or inactive ingredient in various preparations (bath oils, ointments, etc.).

Storage: Oils from different batches should not be mixed. The drug should be stored in a sealed container away from light and moisture.

Bael

Aegle marmelos

DESCRIPTION

Medicinal Parts: The medicinal parts are the unripe fruit, the root, the leaves and the branches.

Flower and Fruit: The plant has greenish-white flowers. The yellow fruit is globular or ovoid, with a hard shell. The fruit is divided internally like an orange. The flesh is reddish, with numerous seeds covered in a layer of latex.

Characteristics: The taste is mucilaginous and slightly sour.

Habitat: This plant is native to India but has spread over wide areas of southeast Asia.

Other Names: Bel, Bengal Quince

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins

Saccharides

Starch

Fatty oil

Furocoumarins

Furoquinolin alkaloids

EFFECTS

Bael has a digestive and an astringent effect.

INDICATIONS AND USAGE

Indian Medicine: Bael is used, especially in Indian medicine, for constipation and diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Digestive complaints and constipation are possible with the intake of large quantities, due to the constituent tannins.

DOSAGE

Mode of Administration: Available as a liquid extract for internal use.

LITERATURE

Oliver-Bever B (Ed., 1986), Medicinal Plants of Tropical West Africa, Cambridge University Press UK.

Sharma BR and Sharma P, (1981) Planta Med 43:102.

Balloon-Flower (Jie-Geng)

Platycodon grandiflorum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the main and secondary roots.

Flower and Fruit: The flowers are at the tip of the leading shoot. The flower structures are in fives and are fused. The calyx tube is appressed to the ovary; the corolla is 5-lobed, blue, occasionally white with a diameter of approximately 5 cm. The 5 stamens are free and the ovary inferior with numerous ovules. The fruit is an obovoid, multi-chambered, dehiscent capsule. The seeds are ovoid, light to dark brown, smooth, 1.7 to 2.2 mm long, 1 to 1.2 mm wide and flattened.

Leaves, Stem and Root: The plant is a herbaceous perennial growing to 90 cm high. The leaves are almost sessile with a simple lamina, bluish-green above and gray-green beneath, irregularly crenate-serrate and entire at the base. The plant has a hardy (approximately 3 cm thick) taproot and hardy <JL secondary roots.

Habitat: Balloon-Flower is indigenous to China, Japan, Korea and Siberia.

Production: The plant is collected in the wild and air-dried. Balloon-Flower root is the dried main and secondary root of *Platycodon grandiflorum*.

Other Names: Chinese Bell-Flower, Japanese Bell-Flower

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins (1.7%): including platycodin, platycodside C, aglycone platycodigenin, including glycosides of polygalic acid, platycogenic acids A to C

Volatile oil (0.2 to 0.3%)

Steroids: sterols, including delta7-stigmasterol, alpha-spinasterol

* BPPHCTS

The saponin fraction contained in the drug has inhibiting effects upon gastric secretion and exhibits both ulcer-protective and ulcer-healing effects. In addition, a mild antibacterial effect was able to be demonstrated. The plant is said to have a sedative effective on the respiratory organs and to encourage expectoration. The antitussive, anti-inflammatory and sedative effects require further clinical testing for verification.

INDICATIONS AND USAGE

Chinese Medicine: Jie-Geng is mainly used as an expectorant for bronchitis, sore throat, tonsillitis and other conditions of the respiratory tract. Efficacy as an expectorant is plausible due to the saponin content; efficacy for the other indications has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Preparations of whole, cut and powdered drug are for internal use.

Preparation: Liquid extract: root powder 1:1 25% ethanol

Daily Dosage:

Powder — 6 g daily; 0.5 g as a single dose

Decoction — 1 g daily; 0.2 g as a single dose

Storage: Store tightly sealed and protected from light.

Balmoney

Chelone glabra

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh herb picked during the flowering season

Flower and Fruit: The inflorescence is a short terminal spike of bilabiate white, purple, cream or pink flowers. The lower lip is awned in the tube and the cordate anthers are downy. The seeds are round and bitter.

Leaves, Stem and Root: The plant is small and erect, and may reach up to 60 cm in height. It is a perennial herb with angular, smooth stems and a horizontally spreading root system. The leaves are opposite, oblong-lanceolate, on short petioles.

Characteristics: The leaves have a tea-like smell and an extremely bitter taste.

Habitat: Northeastern U.S. and Canada

Production: Balmoney is the above-ground part of *Chelone glabra*.

Other Names: Turtlebloom, Turtle Head, *Chelone*, Shell-flower, Salt-Rheum Weed, Bitter Herb, Hummingbird Tree, Snakehead

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes: catalpol

Resin: (bitter-tasting)

EFFECTS

No information available.

INDICATIONS AND USAGE

Homeopathic Uses: *Chelone glabra* is used in the treatment of liver disorders, digestive disorders and worm infestation.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is available in homeopathic dilutions.

LITERATURE

Belofsky G et al., PH 28:1601. 1989.

Kern W, List PH, Horhammer L (Hrsg.), *Hagers Handbuch der Pharmazeutischen Praxis*, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York. 1969.

Bamboo

Arundinaria japonica

DESCRIPTION

Medicinal Parts: The medicinal parts are the young shoots of the plant.

Flower and Fruit: Greenish-yellow, round culms exceeding 3 m in height are surrounded at the culm nodes by dry leaf sheaths, which do not fall off. The upper surface of the leaves are shiny and dark green; the underside is matte and gray-green. The leaf margins are sharply serrated.

Habitat: The plant is indigenous to the tropics, southern subtropics and Asia.

Production: Bamboo sprouts are the young shoots of *Arundinaria japonica*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Soluble mono-, oligo-, and polysaccharides

Silicic acid: to some extent water-soluble

EFFECTS

No information is available.

INDICATIONS AND USAGE

Bamboo is seldom used for medicinal purposes in Western medicine.

Chinese Medicine: The drug is used for asthma, coughs and disorders of the gallbladder.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The juice from the young shoots is hardened as bamboo sugar and used internally.

LITERATURE

No literature is available.

Baneberry

Actaea spicata

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The white flowers are in ovate racemes. They have 4 to 6 bracts, white stamens and 1 ovary. The fruit is a black, many-seeded berry.

Leaves, Stem and Root: The plant grows 30 to 60 cm tall. It is large, long-petioled, trifoliate and pinnate. The leaflets are pinnatisect and serrate. The stem is erect and glabrous.

Characteristics: Baneberry is poisonous, as are several other plants with similar qualities.

Habitat: The plant grows in most of Europe and in moderate and arctic regions of Asia.

Production: Baneberry or Herb Christopher root is the root of *Actaea spicata*.

Not to be Confused With: *Helleborus niger* is occasionally used as a substitute by mistake.

Other Names: Bugbane, Herb Christopher, Toadroot

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids: magnoflorine, corytuberine

Triterpene glycosides: including actein

Trans-aconitic acid

EFFECTS

The drug, which contains alkaloids (magnoflorine) and saponins, was shown to inhibit growth of *Mycobacterium tuberculosis*. An antirheumatic effect is being investigated.

INDICATIONS AND USAGE

Unproven Uses: Baneberry is used as an emetic and purgative.

Homeopathic Uses: The drug is used in homeopathy for w/ rheumatic conditions, especially those of the smaller joints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: In homeopathy, Baneberry is available as dilutions of the mother tincture.

Barberry

Berberis vulgaris

DESCRIPTION

Medicinal Parts: The medicinal part is the fruit and the root bark.

Flower and Fruit: The flowers are 5 to 7 cm long in yellow, dense, hanging clusters. The 6 sepals are yellow and the 6 petals have orange-colored honey glands at the base. The 6 stamens burst open at the side. The ovary is superior with a flat stigma. The edible fruit is a bright scarlet, oblong-cylindrical berry, 10 to 12 mm long and 6 mm thick. The exocarp is membranous-coriaceous. There are usually 2 seeds.

Leaves, Stem and Root: Barberry is a deciduous, heavily branched, thorny bush up to 2 m high. The thorny branches are angular, deeply grooved, initially brownish yellow, later more white-gray. The thorns are 1 to 2 cm long and stick out horizontally. The leaves are in bunches and are obovate to elliptoid, 2 to 4 cm long and narrow. They are dark green and reticulate, the margin is dentate.

Characteristics: The flowers have a repulsive smell; the stamens lie on the carpels at the slightest touch. The flesh of the fruit is juicy and sour.

Habitat: Europe, northern Africa, parts of America and central Asia.

Production: Barberries are the ripe fruit of *Berberis vulgaris*. Barberry root bark or berberis bark is the dried root bark of *Berberis vulgaris*. *Berberis aquifolium* is a closely-related American variety that is often used in commercially available Oregon Grape products.

Not to be Confused With: There is a possibility of confusion with the fruits of other berberidis types. The commercial drug often consists of admixtures; between 15% and 50% of branch and trunk bark.

Other Names: Berberry, Pipperidge, Jaundice Berry, Sow Berry, Mountain Grape, Oregon Grape

ACTIONS AND PHARMACOLOGY**COMPOUNDS: BARBERRY FRUIT**

Isoquinoline alkaloids (at the most, traces)

Anthocyanins

Chlorogenic acid

Malic acid, acetic acid

EFFECTS: BARBERRY ROOT BARK

Source of vitamin C. In various metabolic processes, vitamin C increases immune system activity, stimulates iron absorption, and prevents scurvy. There is a mild diuretic effect due to the acid content.

COMPOUNDS: BARBERRY ROOT BARK

Isoquinoline alkaloids: in particular berberine, berbamine, oxyacanthin, further to include columbamine, palmatine, jatrorrhizine, magnoflorine.

EFFECTS: BARBERRY ROOT BARK

Cardiovascular effect: Fractions from the root extracts, which contain 80% berberine and other alkaloids, have been shown to reduce the blood pressure of cats for several hours. With varying doses, both positive and negative inotropic effects on the cats' hearts were recorded.

Cholagogue effect: A homeopathic mother tincture increased the bile flow in guinea pigs by an average of 20%. An extract with 80% berberine and additional alkaloids stimulated the bile excretion of rats by 72%.

Antipyretic effect: Aqueous tinctures have an anti-febrile effect on a feverish rabbit.

*Antibiotic effect**Stimulation of intestinal peristalsis*

INDICATIONS AND USAGE

BARBERRY FRUIT

Unproven uses: Decoction or alcoholic extract for lung, spleen and liver diseases. Jam or wine made from the fresh berries can relieve constipation and stimulate the appetite. Alcoholic extracts have been used for heartburn and stomach cramps. Extracts have also been used for susceptibility to infection, feverish colds, and diseases of the urinary tract. Used in the pharmaceutical industry as a syrup for masking flavor.

BARBERRY ROOT BARK

Unproven uses: Barberry has been used for opium or morphine withdrawal. In folk medicine, the bark is used for liver malfunctions, gallbladder disease, jaundice, splenopathy, indigestion, diarrhea, tuberculosis, piles, renal disease, urinary tract disorders, gout, rheumatism, arthritis, lumbago, malaria, and leishmaniasis.

PRECAUTIONS AND ADVERSE REACTIONS

BARBERRY FRUIT AND ROOT BARK

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

BARBERRY ROOT BARK

Dosages over 4 mg will bring about light stupor, nosebleeds, vomiting, diarrhea and kidney irritation. The treatment for poisonings is to be carried out symptomatically.

DOSAGE

BARBERRY FRUIT

Mode of Administration: Barberry is used internally in tea mixtures and combination preparations.

Preparation: To prepare a tea infusion, pour approximately 150 ml of hot water into 1 to 2 teaspoons of whole or squashed Barberries and strain after 10 to 15 minutes.

BARBERRY ROOT BARK

How Supplied:

Liquid—1:1, 1:5

Tea

Preparation: A tincture 1:10 is prepared according to the German Pharmacopeia 10th ed.

To extract the pure alkaloids from berberis roots, use 0.3% sulphuric acid mixed with 10% sodium chloride. The precipitated berberine hydrochloride is washed with mildly hydrochloric water and dried. It is then dissolved in water (pH 8) and filtered. The filtrate is heated to 70° C and set to pH 2.0 using hydrochloric acid. The precipitate of pure berberine hydrochloride is then washed and dried.

Daily Dosage: The dosage of the infusion is 2 g in 250 ml water, to be sipped. The tincture dosage is 20 to 40 drops daily.

Hordeum distichon

TRADE NAMES

Barley (available from numerous manufacturers and as combination product), Barley Grain

DESCRIPTION

Medicinal Parts: The medicinal part is the polished grain without the husk.

Flower and Fruit: The spike is 7 to 15 cm long. The long form is nodding and the shorter one erect and compressed at the side that does not bear spikelets. The spike spindle is tough and loosens the spikelets when ripe. The lateral spikelets are unbearded, male or sexless. The middle spikelet is seed-bearing with a beard up to 15 cm long.

Leaves, Stem and Root: The plant is an annual that grows 60 to 130 cm high. It has a long hollow stalk and lanceolate leaves. The leaflets are very wide, long and glabrous.

Habitat: Barley is cultivated worldwide.

Production: Barley seeds are the seeds of *Hordeum distichon*.

Other Names: Pearl Barley, Pot Barley, Scotch Barley

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Polysaccharides: starch (50%), fructans

Mono- and oligosaccharides: saccharose, raffinose, glucodi-fructose, glucose, fructose

Proteins (10%): including, among others, prolamines: hordein- glutelins: hordenine (not to be confused with the amine of the same name, see below)- albumins and globulins

Prolamines: hordein

Glutelins: hordenine (not to be confused with the amine of the same name, see below)

Albumins and globulins

Fatty oil (2%): chief fatty acids linoleic and oleic acid

Vitamins: Vitamin E, nicotinic acid, pantothenic acid, vitamins B6, B2, folic acid

Hydroxycoumarins (only in the stalks): including, among others, umbelliferone, scopoletin, nermann, aesculetin (in the sprouts)

Amines: tyramine, hordenine (dimethyltyramine), gramine also with certain strains (dimethyl- laminomethylindol)

EFFECTS

Barley is soothing on the alimentary tract.

INDICATIONS AND USAGE

Unproven Uses: Barley has been used for convalescents and in the treatment of diarrhea, gastritis and inflammatory bowel conditions.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: Barley is used as a malt extract, in preparations and in combinations.

How Supplied:

Capsules - 450 mg

Basil

Ocimum basilicum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh or dried herb as well as the oil extracted from the dried aerial parts.

Flower and Fruit: The white, labiate flowers are in 6-blossomed, pedicled, almost sessile axillary false whorls. The calyx is bilabiate, and the corolla is 4-lobed. The lower lip is simple; the 4 stamens lie on it.

Leaves, Stem and Root: The plant grows from 20 to 40 cm high. The stem is erect, branched from the base up and downy. The leaves are ovate or oblong. They are long-petioled, acuminate, irregularly dentate or entire-margined.

Characteristics: Basil has a characteristic odor and sharp taste.

Habitat: The plant probably originated in India, Afghanistan, Pakistan and northern India, and now is cultivated worldwide.

Production: Basil herb consists of the dried, above-ground parts of *Ocimum basilicum*. Oil of basil is the essential oil extracted from the dried aerial parts of *Ocimum basilicum* by steam distillation.

Other Names: St. Josephwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BASIL HERB

Volatile oil: chief constituents are chavicol methyl ether (estragole), linalool and eugenol

Caffeic acid derivatives

Flavonoids

EFFECTS: BASIL HERB

In vitro, Basil is antimicrobial.

COMPOUNDS: BASIL OIL

Chief constituents: estragole (chavicol methyl ether), linalool, eugenol

EFFECTS: BASILOIL

In vitro, the oil demonstrates an antimicrobial effect.

INDICATIONS AND USAGE

BASIL HERB

Unproven Uses: Preparations of basil are used for supportive therapy for feelings of fullness and flatulence, for the stimulation of appetite and digestion, and as a diuretic.

Chinese Medicine: Basil herb is used for disturbances of renal function, gum ulcers and as a hemostyptic both before and after birth.

Indian Medicine: Among uses in Indian medicine are earaches, rheumatoid arthritis, anorexia, itching and skin diseases, amenorrhea and dysmenorrhea, malaria and other febrile illnesses.

BASIL OIL

Unproven Uses: Among traditional uses for the oil are wounds, rheumatic complaints, colds and chills, contusions, joint pains and depression.

PRECAUTIONS AND ADVERSE REACTIONS

BASIL HERB

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: The herb contains about 0.5% essential oil with up to 85% estragole. Because of the high estragole content in the essential oil, the herb should not be taken during pregnancy.

BASIL OIL

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. However, pending final determination of the drug's carcinogenic potential, one should completely forgo administration of the drug.

Pregnancy: Because a mutagenic effect *in vitro* and a carcinogenic effect in animal experiments have been demonstrated for estragole, oil of basil should not be administered during pregnancy or while nursing.

Pediatric Use: Basil oil should not be given to infants or small children.

DOSAGE

Until the final determination of the drug's carcinogenic potential, one should completely forgo its administration.

Bean Pod

Phaseolus vulgaris

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe, dried pods and the beans.

Flower and Fruit: The white, pink and lilac flowers are in lightly blossomed, peduncled racemes, which are shorter than their leaves. The calyx is bilabiate. The carina, stamens and style are twisted in a spiral. The fruit is a straight, smooth, hanging pod with a number of reniform seeds.

Leaves, Stem and Root: The annual plant grows from 30 to 60 cm high. It is heavily branched but not twining. The leaves are trifoliate, the leaflets are broad ovate and acuminate. The terminal leaflet is rhomboid.

Habitat: The plant is indigenous to America and is cultivated worldwide today.

Production: The seed-free pods of *Phaseolus vulgaris* are collected during the harvest season.

Other Names: Common Bean, Green Bean, Kidney Bean, Navy Bean, Pinto Bean, Snap Bean, String Bean, Wax Bean

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Lectins: complex termed phytomitogen (tetrameric glycoproteins)

Saponins

L-pipecolic acid

Flavonoids

EFFECTS

A weak diuretic action has been demonstrated in animal and human experiments. Chromium salts present in the Bean Pod may produce an antidiabetic effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Unproven Uses: Bean Pod is used as a supportive treatment for inability to urinate. In folk medicine, it is used as a diuretic and antidiabetic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages, in the form of heated infusions.

OVERDOSAGE

Poisonings following the intake of large quantities of fresh green bean husks (or of raw green beans) are not to be entirely ruled out, due to the lectins content, which varies greatly among the individual species. Symptoms include vomiting, diarrhea and gastroenteritis. The lectins are destroyed in the process of cooking.

DOSAGE

Mode of Administration: As a comminuted herb for decoctions and other galenic preparations for internal use. The drug is a component of various kidney and bladder teas and of standardized preparations of natural diuretics and antidiabetics.

Preparation: To make an infusion, pour boiling water over 2.5 gm drug and strain after 10 to 15 minutes while still covered (1 teaspoonful = 1.5 gm drug).

Daily Dosage: The recommended daily dosage is 5 to 15 gm of herb.

Bear's Garlic

Allium ursinum

DESCRIPTION

Medicinal Parts: The fresh herb and fresh bulb are the medicinal parts of the plant.

Flower and Fruit: The sheath of the terminal inflorescence is made up of 3 ovate-lanceolate, acute, early-falling leaves, which are almost as long as the peduncle. The inflorescence is a loose, flat, 2.5 to 6 cm wide cyme with 6 to 20 florets. The florets are erect, outward-inclined, pointed or blunt. They are pure white and have 6 star-shaped, splayed petals. Six stamens are wedge-shaped, only fused at the base and only half as long as the involucre. One superior ovary is formed out of 3 carpels and 3 deep grooves. The 3-valved capsule contains black, angular seeds.

Leaves, Stem and Root: The plant's compact stem is upright, 10 to 50 cm high, double-edged, half-cylindrical or triangular-to-round in shape. The leaf blade is flat, narrow-elliptical-lanceolate to narrow-ovate and acute. It is 6 to 20 cm long and thin, with a base that is rounded to cordate and narrows suddenly to a 5 to 20 cm long petiole. The leaf's dark-green underside is covered with irregular horizontal veins that face upward, leaving the paler upper surface facing toward the ground. The bulb is almost cylindrical, 2 to 6 cm long, about 1 cm wide and surrounded by transparent or white skins.

Characteristics: Bear's garlic forms many onions and has a distinctive leek odor.

Habitat: Bear's Garlic is indigenous to almost all of Europe and Turkey, but not in the Hungarian plain and the evergreen Mediterranean region. It is also found in the Caucasus and Siberia as far as Kamtschatka.

Production: Bear's garlic is fresh or dried herb of *Allium ursinum*.

Not to be Confused With: One case was reported of confusion with *Colchicum* leaves.

Other Names: Ramsons, Broad-Leaved Garlic

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alliins (alkyleysteine sulphoxides): in particular methyl alliin (methyl-L-(+)-cysteine sulphoxide) and allylalliin (allyl-L-(+)-cysteine sulphoxide) and presumably their gamma-glutamyl conjugates, that readily transform into the so-called alliaceous oils, for example into dimethyl-disulphide-mono-S-oxide, allicin (diallyl-disulphide-mono-S-oxide) and allyl-methyl-disulphide mono-S-oxide and the corresponding dialkyldi- or oligosulphides

EFFECTS

The diverse sulphur bonds are said to be lipid-reducing, anti-oxidative, aggregation inhibiting and ACE inhibiting.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for gastrointestinal complaints, fermentative dyspepsia, flatulence, high blood pressure and arteriosclerosis; externally for chronic rashes.

Homeopathic Uses: Uses in homeopathy include digestive disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally as well as externally.

Preparation: Extract of Bear's Garlic.

Daily Dosage: Due to low concentration of the active substance, the drug must be administered in higher doses than *Allium sativum*.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes for acute conditions, and 1 to 3 times daily for chronic; parenterally: 1 to 2 ml daily sc (HAB1).

Beet

Beta vulgaris

DESCRIPTION

Medicinal Parts: The root is the medicinal part.

Flower and Fruit: The flowers bloom in clusters of 2 to 4 in panicle-like leafy inflorescences.

Leaves, Stem and Root: The beet is a 0.5 to 1.5 m perennial with a swollen, edible tuber that is red or white. The large, upright leaves have long stalks and grow in rosettes that arise basally from the top of the tuber. They are deep green and tinged with red.

Habitat: The Beet is indigenous to the coastal regions of Europe, North Africa, and Asia from Turkey to India. Red Beets, Sugar Beets and the white variety are all widely cultivated.

Other Names: Chard

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saccharose (up. to 27% in the pressed sugar beet)

Other oligosaccharides: refined sugar, ketose

Polysaccharides: including galactans, arabans, pectin

Fruit acids: including L(-)-malic acid, D(+)-tartaric acid, oxaluric acid, adipic acid, citric acid, glycolic acid, glutaric acid

Amino acids: including asparagine, glutamine

Betaine (trimethylglycine)

Triterpene saponins

EFFECTS

Beet is said to have antihepatotoxic effects; in animal tests, the drug effectively keeps fat from depositing in the liver. This is probably due to the herb's concentration of betaine, which is a methyl group donor in the liver's transmethylation process.

INDICATIONS AND USAGE

Unproven Uses: Beet is used as supportive therapy in diseases of the liver and fatty liver.

Indian Medicine: The drug is used for coughs and infections.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Taking very large quantities could lead to hypocalcemia and kidney damage because of the drug's oxaluric acid content.

DOSAGE

Mode of Administration: Beet is available as a granular powder in standardized form.

Daily Dosage: For the first 14 days, take 10 gm of drug after meals throughout the course of the day. For long-term treatment, the dose is 5 gm per day for at least 3 months.

LITERATURE

Ken W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Behen

Moringa oleifera

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the leaves, bark, nuts and root, which have had numerous uses in traditional medicine.

Flower and Fruit: The inflorescence is a leaf-axillary panicle. The flowers are zygomorphic with their structures in fives and a bowl-shaped receptacle. The sepals are linear-lanceolate, irregular and revolute. The petals are spatulate, veined, irregular and white or yellow. There are 5 stamens, and a superior ovary developing from 3 fused carpels. The fruit is a hanging capsule opening on 3 sides, up to 1.2 m long and triangular with 9 ribs. The seeds are triangular, light brown to black, with 3 thin, whitish wings, approximately the size of a hazelnut.

Leaves, Stem and Root: The leaves of the tree are alternate, 30 to 60 cm long, and incompletely triple-pinnate. The

leaflets are 12 to 20 mm long and elliptical. The branches are slim.

Characteristics: The flowers are extremely fragrant, and the leaves, root and fruit taste like horseradish.

Habitat: The tree is indigenous to India.

Production: Behen root is the fresh or dried root of *Moringa oleifera*. Behen nuts are the ripe unpeeled seeds of *Moringa oleifera*.

Other Names: Ben Nut Tree, Drumstick Tree, Indian Horseradish

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BEHEN ROOT

Glucosinolates: 4-(alpha-L-rhamnosyloxy)benzyl glucosinolate (ca. 1%), yielding 4-(alpha-L-rhamnosyloxy)benzyl isothiocyanate following enzymatic segregation with myrosinase, glucotropaeolin (ca. 0.05%), yielding benzyl isothiocyanate

EFFECTS: BEHEN ROOT

The root is antimicrobial in effect, due to the mustard oils it contains. Applied as a cataplasm, it triggers local hyperemias due to the irritating effect of the isothiocyanates. Dried extracts of the root are abortive and contraceptive in their effect.

COMPOUNDS: BEHEN SEEDS

Glucosinolates (up to 9% in the defatted seeds): 4-(alpha-L-rhamnosyloxy)benzyl glucosinolate, yielding 4-(alpha-L-rhamnosyloxy)benzyl isothiocyanate following enzymatic segregation with myrosinase

Phenol carboxylic acids: 1 -beta-D-glucosyl-2,6-dimethyl benzoate

Fatty oil (20 to 50%): chief fatty acids oleic acid (60 to 70%), palmitic acid (3 to 12%), stearic acid (3 to 12%), including as well behenic acid, eicosanoic acid, lignoceric acid

EFFECTS: BEHEN SEEDS

The seeds are antimicrobial in effect, due to the mustard oils they contain.

INDICATIONS AND USAGE

BEHEN ROOT

Unproven Uses: The root has been used internally in folk medicine for gastrointestinal complaints, epilepsy, paralyses, cardiac and blood pressure disturbances, fever (particularly intermittent), scurvy, dizziness and colds. External indications include gingivitis, worm diseases, snake bites, abscesses, inflammation, rheumatism and poorly healing wounds. Root paste has been used to treat worms, rheumatism and headaches.

Indian Medicine: Indications have included smallpox and rheumatism. Efficacy for rheumatism seems plausible because of the stimulating effect of the isothiocyanates. Efficacy for the other indications has not yet been proven.

BEHEN SEEDS

Unproven Uses: Folk medicine indications for internal use are constipation, warts and worms (Central America); for diarrhea (Chad); for splenomegaly, colic, dyspepsia, fever, inflammation of the skin, edema, diabetes, abdominal tumors, paralyses and lumbago (Saudi Arabia). The seeds are used externally for dandruff in Nigeria.

Indian Medicine: Behen seeds are used for fever and as an aphrodisiac. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

BEHEN ROOT

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The ingestion of larger quantities can lead to nausea, dizziness and vomiting.

BEHEN SEEDS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

The single peroral administration of a dosage of 5 g of the drug/kg body weight to a mouse led to hyperkeratosis in the stomach and to liver cell steatosis. Administration of 22 to 50 mg/kg body weight, parenterally, of the glucosinolate mentioned above proved to be fatal for mice.

CONTRAINDICATIONS

BEHEN ROOT

Behen preparations are contraindicated during pregnancy because of their possible abortive effect.

DOSAGE

BEHEN ROOT

Mode of Administration: Preparations of the whole and powdered root are administered internally and externally.

BEHEN SEEDS

Mode of Administration: Preparations of the seed are used internally and externally.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers . Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Belladonna

Atropa belladonna

DESCRIPTION

^P *Medicinal Parts:* The medicinal parts are the leaves and roots.

Flower and Fruit: The flowers are solitary and hanging. The calyx is fused at the base, has 5 divisions and is spread like a star when the fruit ripens. The violet corolla is a campanulate tube, 2.5 to 3.5 cm long, dirty yellow on the inside with crimson veins. There are 5 stamens and 1 style with a 2-lobed stigma. The ovary is superior. The fruit is a cherry-sized globose berry. The fruit is initially green, then becomes black and glossy with numerous black, ovoid seeds.

Leaves, Stem and Root: *Atropa belladonna* is a perennial, herbaceous plant 1 to 2 m high with a many-headed cylindrical rhizome. The woody stem is erect, branched, bluntly angular and hairy. The leaves are ovately pointed, entire-margined, downy and up to 15 cm long. The lower leaves are alternate. Near the inflorescence the leaves are in
^ pairs of 1 large and 1 small.

Characteristics: Belladonna has a strong narcotic smell, a sharp and bitter taste, and is poisonous.

Habitat: The plant is found throughout western, central and southern Europe, in the Balkans, southeast Asia, Iran, northern Africa, Denmark, Sweden and Ireland. It is cultivated in other countries, particularly England, France and the U.S.

Production: Belladonna leaf consists of the dried leaves, or the dried leaves together with the flowering branch tips, of *Atropa belladonna*. The leaves are collected in the wild from May to July. They are dried at a temperature not exceeding 60°C. Belladonna root consists of the dried roots and rhizomes of *Atropa belladonna*. The roots of 2- to 4-year-old plants are dug up in mid-October to mid-November or shortly before the start of the flowering season. They are cleaned and dried at a maximum temperature of 50°C.

V

Not to be Confused With: Belladonna leaf should not be confused with *Ailanthus altissimus*, *Phytolacca americana* or *Scopolia carniolica*. Belladonna root should not be confused with *Atropa acuminata*. It is sometimes adulterated with *Phytolacca americana* and *Scopolia carniolica*.

Other Names: Deadly Nightshade, Devil's Cherries, Devil's Herb, Divale, Dwale, Dwayberry, Great Morel, Naughty Man's Cherries, Poison Black Cherry

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BELLADONNA LEAF

Tropan alkaloids: chief alkaloid (-)-hyoscyamine, which during drying transforms to some extent into atropine, as well as apoatropine, scopolamine and tropine

Flavonoids

Hydroxycoumarins: including scopoline, scopoletine

Tannins

COMPOUNDS: BELLADONNA ROOT

Tropan alkaloids: chief alkaloid (-)-hyoscyamine, in drying transformed to some extent during dehydration into atropine as well as apoatropine, 3alpha-phenylacetoxypitropine, cuskhygrine, scopolamine, pseudotropine

EFFECTS: BELLADONNA LEAF AND ROOT

The tropane alkaloids in the drug (atropine, scopolamine, tropine etc.) are responsible for the anti-cholinergic-parasympatholytic, spasmolytic, positive, dromotropic and chronotropic effect. *Atropa belladonna* preparations act as a parasympatholytic or anticholinergic via a competitive antagonism of the neuromuscular transmitter acetylcholine. This antagonism concerns mainly the muscarine-like effect of acetylcholine and less the nicotine-like effects on the ganglions and the neuromuscular end plate. *Atropa belladonna* preparations release peripheral effects targeted on the vegetative nervous system and the smooth muscle system, as well as the central nervous system. Because of the parasympatholytic properties, the drug can cause relaxation of organs with smooth muscles and relieve spastic conditions, especially in the gastrointestinal tract and bile ducts. Additionally, Belladonna use may result in muscular tremor or rigidity due to effects on the central nervous system. *Atropa belladonna* preparations have a positive dromotropic as well as a positive chronotropic effect on the heart. The drug has always been important in folk medicine for its hallucinogenic effect.

INDICATIONS AND USAGE

BELLADONNA LEAF

Approved by Commission E:

- Liver and gall bladder complaints

Unproven Uses: Belladonna leaf is used for spasms and colic-like pain in the gastrointestinal tract and bile ducts. External uses include gout and ulcers. In folk medicine, the drug is contained in medicinal plasters and is applied for neuro-vegetative disorders, hyperkinesis, hyperhidrosis and bronchial asthma.

Homeopathic Uses: Homeopathic uses include meningitis as well as inflammations (accompanied by fever) of the tonsils,

respiratory organs, the urogenital tract, the skin, the joints and the gastrointestinal tract.

BELLADONNA ROOT

Approved by Commission E:

- Liver and gall bladder complaints

Unproven Uses: The drug is used for arrhythmia, cardiac insufficiency NYHA I and II, nervous heart complaints, and colic-like pains in the gastrointestinal tract and bile ducts. In folk medicine, a drug from the leaves is preferred for pain in the gastrointestinal area, for asthma, bronchitis and muscular pain. (Also see Belladonna leaf.)

PRECAUTIONS AND ADVERSE REACTIONS

BELLADONNA LEAF AND ROOT

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The following could occur as side effects, particularly with overdoses: erubescence, dryness of the mouth, mydriasis, and tachycardiac arrhythmias. These are early signs of atropine poisoning. Other side effects may include hypocoyses, heat accumulation through reduction of perspiration, micturation difficulties and obstipation. Because of potential ramifications, Belladonna should be used only under the supervision of an expert familiar with the appropriate use of this substance.

Pediatric Use: The fatal dose in children is considerably less than that of adults.

Drug Interactions: Tricyclic antidepressants, amantadine and quinidine will increase the anticholinergic effect.

OVERDOSAGE

BELLADONNA LEAF AND ROOT

High dosages lead to central excitation that may produce restlessness, compulsion to talk, hallucinations, delirium and manic attacks, followed by exhaustion and sleep. The fatal dose depends on the atropine content; asphyxiation can occur with 100 mg atropine, which corresponds to 5 to 50 g of Belladonna. Treatment of poisonings consists of gastric lavage, application of wet cloths to reduce body temperature (avoid antipyretics), oxygen respiration for breathing distress, intubation, parenteral physostigmine salts as an antidote, diazepam for spasm and chlorpromazine for serious excitation. (Also see side effects listed under PRECAUTIONS AND ADVERSE REACTIONS, which may be early signs of poisoning.)

DOSAGE

BELLADONNA LEAF

Mode of Administration: The comminuted drug is used for decoctions and dried extracts, and the powdered drug is used internally for galenic preparations. Due to the toxicity, the drug must be handled with care.

How Supplied: Forms of commercial pharmaceutical preparations include coated and uncoated tablets, drops, tea, juice, syrup, ampules, capsules, suppositories, plaster and ophthalmic drops.

Daily Dosage: When using Belladonna powder (*belladonnae pulvis normatus*-total alkaloid content 0.28% to 0.32% German pharmacopoeia 10), the average single dose is 0.05 to 0.10 g. The maximum single dose is 0.20 g, which is equivalent to 0.60 mg total alkaloids, calculated as hyoscyamine. The maximum daily dosage is 0.60 g, which is equivalent to 1.8 mg total alkaloids, calculated as hyoscyamine.

For Belladonna extract, the average single dose is 0.01 g. The maximum single dose is 0.05 g, which is equivalent to 0.73 mg total alkaloids, calculated as hyoscyamine. The maximum daily dosage is 0.150 g, which is equivalent to 2.2 mg total alkaloids, calculated as hyoscyamine.

Storage: Belladonna leaves and various leaf preparations have specific storage requirements. Store leaves and powders tightly sealed and protected from light. Extracts require protection from moisture and light as well as a temperature of approximately 30°C. Store tinctures tightly sealed without exposure to direct sunlight or extreme heat to attain a shelf life of approximately 3.5 years.

BELLADONNA ROOT

Mode of Administration: As a comminuted drug for infusions and dried extracts and as a powdered drug for other galenic preparations for internal use.

Daily Dosage: The average daily dosage is 0.3 g, which is equivalent to 1.5 mg total alkaloids, calculated as hyoscyamine. Single doses range from 0.05 g to a maximum of 0.1 g.

For Belladonna extract, the total alkaloids range from 1.3% to 1.45% (German pharmacopoeia 10). Single doses of the extract range from 0.01 g to 0.05 g. The maximum daily dosage is 0.15 g, which is equivalent to 2.2 mg total alkaloids, calculated as hyoscyamine.

For Belladonna tincture, a single dose of 0.5 to 2 ml is given 3 times daily.

Homeopathic Dosage: 5 to 10 drops, 1 tablet, 5 to 10 globules, 1 to 3 times daily or 1 ml injection solution twice weekly sc. From D3: one suppository 2 to 3 times daily; ointments 1 to 2 times daily (HAB1).

Storage: Belladonna root should be stored for a maximum of 3 years in well-sealed containers protected from light and insects.

Bellis perennis

See Wild Daisy

Bennet's Root

Geum urbanum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried flowering herb, the dried or fresh underground parts and the roots.

Flower and Fruit: The inflorescence is a loose panicle, umbel-like cyme with a few terminal and erect flowers. The pedicels are short-haired. The sepals are 3 to 8 cm long with long tips, pubescent on the outside and glabrous on the inside, except for a tomentose border. The epicalyx bracts are half as long as the sepals, pubescent on both sides and narrowly lanceolate. The yellow petals are 3 to 7 mm long, slightly stemmed, and drop easily. The style is jointed and the stigma flat. The small fruits have no stems and are pubescent.

Leaves, Stem and Root: The plant is a semi-rosette shrub with a primary root mat dies off early and is replaced by adventitious roots. The rhizome is simple, thick, cylindrical and crooked. The stem is erect, soft-haired, 15 to 70 cm high; it sprouts from the basal rosette. The basal leaves are rosette-like and pinnate. The cauline leaves are trifoliate to tri-pinnate and the stipules are small, fused with the stem in

the lower part, and ovate-lanceolate roughly dentate to pinnatesect.

Characteristics: The plant's root has a clove-like scent.

Habitat: Bennet's Root is found in central and southern Europe, central Asia and North America.

Production: Bennet's Root herb is the aerial part of *Geum urbanum*. Bennet's Root (root) is the root of *Geum urbanum*, which is usually harvested in May and then air-dried or dried artificially at a maximum of 35° C.

Other Names: Avens Root, Colewort, Herb Bennet, City Avens, Wild Rye, Way Bennet, Goldy Star, Geum, European Avens, Blessed Herb, Star of the Earth, Yellow Avens

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BENNET'S ROOT HERB

Tannins: gallo tannins, ellagitannins, including sanguin H-6, casuarictin, pendunculagin, potentillin, tellimagrandin I

EFFECTS: BENNET'S ROOT HERB

The drug has an astringent effect.

COMPOUNDS: BENNET'S ROOT (ROOT)

In the freshly harvested rhizome:

Tannins

Gein (eugenol-vicianose): transformed through drying or size reduction into eugenol

In the dried rhizome and the roots:

Volatile oil (traces): chief components - eugenol, additionally cis- and trans-myrtanal, cis- and trans-myrtanol

EFFECTS: BENNET'S ROOT (ROOT)

The drug has an astringent effect.

INDICATIONS AND USAGE

BENNET'S ROOT HERB

Unproven Uses: Although rarely used today, folk medicine indications have included use of the drug for digestive complaints and diarrhea, febrile illnesses, and for muscle and nerve pain. Use as a bath additive for hemorrhoids seems plausible due the astringent content.

BENNET'S ROOT (ROOT)

Unproven Uses: Internal folk medicine applications include use for digestive problems such as loss of appetite and diarrhea. The root of Bennet's Root has been used externally as a gargle for gum and mucous membrane inflammations and as a bath additive or poultice for frost bite, hemorrhoids and skin diseases. Efficacy appears plausible due to the astringent properties of the tannins.

Homeopathic Uses: Homeopathic applications include use for inflammations of the bladder and urinary tract.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

BENNET'S ROOT HERB

The herb is rarely used medicinally today. It is found in some pharmaceutical preparations.

BENNET'S ROOT (ROOT)

Mode of Administration: Infusions are drunk or applied as an external wash or poultice.

Preparation: To prepare an internal infusion, boil 1/2 to 1 teaspoon coarsely powdered drug in water for 10 minutes and filter. Prepare an external infusion by adding 1 teaspoon coarsely powdered drug to cold water, bringing it briefly to the boil, leaving it to steep for 10 minutes and then straining.

Daily Dosage: Infusion (internal): 1 cup lukewarm several times a day. Infusion (external): Use several times a day for washes or poultices.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

Benzoin

Styrax benzoin

DESCRIPTION

^| *Medicinal Parts:* The medicinal part of the plant is the balsamic resin obtained from the mechanically damaged trunk.

Flower and Fruit: The flowers are in terminal or axillary paniced racemes. The flowers are fused and their structures are in fives. The calyx is campanulate, weakly 5 toothed, densely silky tomentose and red-brown on the inside. The corolla is 6 to 11 mm long with 5 tips, brown-red, silky tomentose on the outside and at the margin. There are 8 to 10 stamens fused below to a tube and a 1-chambered ovary above and 2- to 3-chambered ovary below. The fruit is nut-like, appressed pubescent with a diameter of up to 3 cm. The seeds are light brown with 6 longitudinal stripes and are up to 2 cm long.

Leaves, Stem and Root: *Styrax benzoin* is an evergreen tree, which grows up to 30 m high. The leaves are alternate and the petioles are rust brown-downy pubescent. They are W approximately 1 cm long. The lamina is 8 to 13 cm long, 2.5 to 5 cm wide, ovate or elongate with a rounded base and irregularly curved-dentate margin. The lamina is covered with white and brown star hairs beneath. The bark is wine-red and the wood is white.

Characteristics: The flowers have a strong fragrance.

Habitat: The plant is native to western Java and Sumatra.

Production: Sumatra benzoin (Gum benzoin) is the balsamic resin from the damaged trunk of *Styrax benzoin* and *Styrax paralleloneurum*. The optimal age of trees to be harvested is 7 years. The tree is cut, causing it to exude resin to heal the cuts. The resin is then collected in a vessel and left to melt to a homogenous mass in the sun.

Other Names: Benjamin Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Ester mixture (70 to 80%): composed of coniferyl benzoate and cinnamyl benzoate, as well as cinnamyl cinnamate " (styracin), propyl cinnamate

Phenylacrylic acids: cinnamic acid (10%)

Benzoic acid (to 30%)

Resins

EFFECTS

The expectorant effect with which the drug is credited could not be proven experimentally (it possibly originated in

connection with an "aroma,therapy," due to its vanilla content).

INDICATIONS AND USAGE

Unproven Uses: Benzoin is "used for respiratory catarrh.

Chinese Medicine: In China, benzoin is used for stroke, syncope, post partial syncope due to heavy loss of blood, and for chest and stomach pain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb preparations are for internal use.

Storage: Benzoin should be tightly sealed and stored below 25°C.

Betel Nut

Piper betle

DESCRIPTION

Medicinal Parts: The main medicinal parts are the dried leaves; the roots and the fruit are also used.

Flower and Fruit: The inflorescences are compact, hanging, cylindrical and 3.5 to 5 cm long spikes of yellow-green flowers. There are 2 stamens in the male flowers. The female stamens have an ovary, which is pubescent at the top and has 3 to 5 stigmas. The fruit is globular, fleshy and about 6 mm in diameter. The fruit is yellow and becomes red when ripe. The seeds are also globular.

Leaves, Stem and Root: The plant is a dioecious or monoecious woody climber that can grow to 15 m. It has numerous small and short adventitious roots. The stem is thickened at the nodes, and the younger parts are glabrous. The leaves have a 2.5 to 5 cm long petiole, are broadly cordate, 5 to 18 cm long and half as wide. The leaves are glabrous, light green and glossy on both surfaces with 5 to 7 radiating ribs.

Habitat: Piper betle is found in tropical southern Asia and has been introduced to east Africa, Madagascar and the West Indies.

Production: Betel Nut leaves are the leaves of Piper betle. When the leaves are green, they are gathered, pressed and dried.

Other Names: Betel

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.8-1.8%): chief components- chavibetol (betel phenol), eugenol, additionally allylpyrocatechol (hydroxy-chavicol), allylpyrocatechol-mono and -diacetate, anethole, chavibetolacetate, chavicol, methyl eugenol, safrol

Neolignans: including crotepoxide, piperbetol, piperol, among others

EFFECTS

The essential oils are antimicrobial and immune-modulating. The Betel leaf is centrally sedating.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, Betel Nut is used for coughs, as an expectorant for stomach ailments, diphtheria and inflammation of the middle ear.

Indian Medicine: In India, Betel Nut is used to treat asthma, bronchitis, coughs, dyspepsia, rheumatism, leprosy, severe thirst, alcoholism, syncopes, toothache and impotency.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Today, the drug is obsolete.

Beth Root

Trillium erectum

DESCRIPTION

Medicinal Parts: The medicinal parts are the rhizome and the dried root and the leaves.

Flower and Fruit: The plant has solitary, terminal, hanging flowers. The 3 green, persistent sepals and the 3 large, white to red or yellow, wilting sepals are characteristic.

Leaves, Stem and Root: The plant is a perennial, smooth herb with an erect stem, which grows from 25 to 40 cm high. It bears 3 whorled, terminal leaves under the flower, which are broad, rhomboid and lightly curled. The rhizome is matte brown, subcorneal, more or less compressed, 3 to 5 cm long and 2 to 3 cm in diameter. It is often ringed with oblique lines and with numerous wrinkled root fibres on the upper surface.

Characteristics: The taste is sweetish then acrid and the odor is characteristic.

Habitat: The plant is indigenous to the central and western U.S.

Production: Beth Root Stock is the rhizome of Trillium erectum, Trillium pendulum and other varieties.

Other Names: Birthroot, Indian Shamrock, Lamb's Quarters, Wake-Robin, Indian Balm, Ground Lily, Coughroot, Jew's-Harp Plant, Milk Ipecac, Pariswort, Rattlesnake Root, Snakebite, Three-Leaved, Nightshade

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins: including among others, trillin (disogenin monoglucoside), trillarin (disogenin diglucoside), aglycones including cryptogenic chlorogenin, nologenin

Tannins

EFFECTS

The drug has astringent and expectorant properties. It can severely irritate the area to which it has been applied; the irritation can cause vomiting.

INDICATIONS AND USAGE

Unproven Uses: Internally, Beth Root is used internally for long and heavy menstruation and externally, it is used for varicose veins, ulcers, hematoma, and hemorrhoidal bleeding.

CONTRAINDICATIONS

The drug should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. In higher dosages, the drug is said to be nauseant, and to have the effect of promoting labor and menstruation.

Pregnancy: In high dosages, the drug promotes labor; therefore, it should not be used during pregnancy.

DOSAGE

Mode of Administration: The ground drug and liquid extract are used for infusions and poultices.

Daily Dosage: The usual dose is 2 to 4 gm dissolved in liquid as an infusion.

Bilberry

Vaccinium myrtillus

TRADE NAMES

Bilberry, Bilberry Extract, Bilberry Herb (available from numerous manufacturers,) Time Release Bilberry Power, Standardized Bilberry Extract, Super Bilberry Plus, Bilberry Power, Bilberry Leaf

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the ripe, dried fruit and the ripe fresh fruit.

Flower and Fruit: The flowers are axillary and solitary. They are 4 to 7 mm long, short-pedicled, greenish and tinged with pale pink. The calyx is fused to the ovary, persistent and indistinctly 5-lobed. The corolla is globular-jug-shaped and has 5 tips. There are 8 to 10 stamens, which are enclosed and shorter than the styles. They have glabrous filaments that widen toward the base and 2 horn-like yellow-brown anthers, whose spurred appendage is erect. The fruit is a globular, blue-black, frosted, many-seeded berry with purple pulp.

Leaves, Stem and Root: The plant is a deciduous, dwarf shrub with sharp-edged, green branches 15 to 50 cm high. The leaves are alternate, ovate or oblong-ovate, acuminate and finely serrate.

Habitat: The plant is common to central and northern Europe, Asia and North America.

Production: The leaves and fruit of Bilberry are collected in the wild from July to August and dried in the shade.

Not to be Confused With: Myrtilli folium should not be confused with the fruits of *Vaccinium uliginosum*.

Other Names: Whortleberry, Blueberry, Burren myrtle, Dyeberry, Huckleberry, Hurtleberry, Wineberry, Black Whortles, Hurts, Bleaberry, Airelle, Trackleberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BILBERRY LEAF

Catechin tannins (1 to 7%): including oligomeric proanthocyanidins

Flavonoids: including among others, avicularin, hyperoside, isoquercitrin, quercitrin, meratine, astragaline

Iridoide monoterpenes: asperuloside, monotropein

Caffeic acid derivatives: chlorogenic acid

Phenolic acids: including among others, salicylic acid, gentisic acid

Quinolizidine alkaloids: myrtine, epimyrine (hybrids of *Vaccinium myrtillus* x *V. vitis-idaea* contain arbutin [hydroquinone glucosides]).

EFFECTS: BILBERRY LEAF

The drug is astringent and useful for treating diarrhea due to the catechin tannin content. The drug is antiviral and, in animal experiments, lipid-lowering.

It is thought that the chromium content of the drug is responsible for a possible antidiabetic effect.

COMPOUNDS: BILBERRY FRUIT

Fruit acids: including among others, quinic acid (3-5%), malic acid, citric acid

Tannins (5-12%): chiefly catechin tannins, including oligomeric procyanidins

Anthocyanoides (0.1% -0.5%): chief components delphinidine-3-O-arabinoside, delphinidine-3-O-galactoside, delphinidine-3-O-glucoside, cyanidin, petunidin, peonidin, malvidin

Flavonoids: including among others, hyperoside, isoquercitrin, quercitrin, astragaline

Iridoids: including asperuloside, onotropein (only in the unripe fruits)

Caffeic acid derivatives: chlorogenic acid

Pectins

EFFECTS: BILBERRY FRUIT -

The drug is an astringent and has anti-diarrheal action due to the catechin tannin content which is also responsible for the wound healing effect.

Limited data show that the bilberry anthranocoyoside is anti-exudative, vessel-protective, inhibits platelet aggregation in human blood and has an anti-ulcer effect.

Several animal studies have demonstrated that anthocyanosides have a collagen stabilizing effect, and provide protection against ischemia reperfusion injury (Bertuglia, 1995.)

Increased synthesis of connective tissue is one of the contributing factors that may lead to blindness caused by diabetic retinopathy. Anthocyanides have been shown to slow the synthesis of polymeric collagen in diabetic patients (Boniface, 1996.)

CLINICAL STUDIES

One case study involving 20 patients with diabetic retinopathy that were treated with 400 mg of Bilberry extract twice daily demonstrated increased conjunctival capillary resistance in the subjects that were evaluated. The authors of the study concluded that Bilberry provides protection against hemorrhage of the retina (Sevin, 1996.)

INDICATIONS AND USAGE

BILBERRY LEAF

Unproven Uses: Bilberry has been used in Diabetes Mellitus (for prevention and treatment); complaints of the gastrointestinal tract, kidney and urinary tract, arthritis, gout and dermatitis. External uses include inflammation of the oral mucosa, eye inflammation, burns and skin diseases.

BILBERRY FRUIT

- Diarrhea
- Inflammation of the mouth and pharynx

Internally, Bilberry is used for nonspecific, acute diarrhea (particularly in light cases of enteritis). Externally the berry is used for mild inflammation of the mucous membranes of mouth and throat.

Unproven Uses: Well constructed clinical studies in humans that give conclusive support for use of Bilberry in the treatment of diabetic retinopathy or as a treatment for improving night vision are not available. There is moderate support in animal model trials that support the vasoprotective and anti-edema properties of Bilberry. The literature also demonstrates efficacy in animal models for the treatment of diabetes, hyperlipidemia and gastric ulcers. Folk medicine uses include internal use for vomiting, bleeding and hemorrhoids and external use for poorly healing skin ulcers and wound healing.

PRECAUTIONS AND ADVERSE REACTIONS

BILBERRY LEAF

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Digestive complaints due to the high tannin content are possible.

Drug Interactions: Bilberry has a platelet aggregation inhibiting effect. There is a possibility that the herb can interact with other platelet aggregation inhibitors such as aspirin and anticoagulants like warfarin.

BILBERRY FRUIT

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE**BILBERRY LEAF**

The signs of poisoning observed in animal experiments (including cachexia, anemia, icterus) appeared only in conjunction with the chronic administration of high dosages and are presumably effects of the tannins.

DOSAGE**BILBERRY LEAF**

Preparation: To prepare an infusion, pour boiling water over 1 g finely cut drug (1 teaspoonful = approximately 0.6g) and strain after 10 to 15 minutes. Not to be taken over a long duration.

Daily Dosage: The daily dosage of tea is 1 cup 2 to 3 times daily. For an infusion, a single dose is equal to 1 g per cup.

BILBERRY FRUIT

Mode of Administration: Tablets, capsules, macerated drug for infusions for internal use and local application.

How Supplied:

Most commercially available capsules and tablets are standardized at 25 to 36% anthocyanoside content.

Capsule — 40 mg, 60 mg, 80 mg, 125 mg, 160 mg, 310 mg, 400 mg, 500 mg, 1000 mg

Tablet — 40 mg

Preparation: To prepare an infusion, use 5 to 10 g mashed drug in cold water, bring to a simmer for 10 minutes, then strain (1 teaspoonful = 4 g drug). A 10% decoction is prepared for external use.

Daily Dose: 20 to 60 g of unprocessed fruit for internal use. Externally use a 10% infusion. For commercially available tablets and capsules that are standardized to 36% anthocyanosides, the recommended dose is 60 to 160 mg three times daily.

Birch

Betula species

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark, leaves and buds.

Flower and Fruit: The male flowers of *Betula pendula* are sessile and oblong-cylindrical 6 to 10 cm long. The female catkins are petioled, cylindrical and 2 to 4 cm long by 8 to 10 mm thick when fully grown. They are densely flowered, first yellow-green, later light green. The fruit scales are brownish and pubescent or glabrous. The middle lobes are small, short-triangular and shorter than the broad, always revolute side lobes. The fruit wings are half-oval and 2 to 3 times as broad as the fruit.

The male catkins of *Betula pubescens* are sessile and oblong-cylindrical. They are initially upright, later hanging, 2.5 to 4 cm long and 6 to 10 mm thick, greenish to light brown. The middle lobes of the fruit scales protrude clearly, are usually linguiform-elongated and generally longer than the usually sharp-cornered, clearly evolute side lobes. The fruit scales are about as broad as the fruit.

Leaves, Stem and Root: *Betula pendula* is a tree that grows up to 30 cm high, with a snow white bark that usually peels off in horizontal strips or changes into a black, stony, hard bark. Young branches are glabrous and thickly covered in warty resin glands. The petioled leaves are dark green above,

a lighter gray-green below. They have serrate margins and particularly tightly packed veins. The lamina are about 3 to 7 cm long by 2 to 5 cm wide, rhomboid-triangular, acuminate, glabrous, densely covered in glands, and have a doubly serrate margin. They are dark green and glabrous above and a lighter green below; they are initially downy and later pubescent in the vein axils.

Habitat: *Betula pendula* and *Betula pubescens* are indigenous to Europe from the northern Mediterranean regions to Siberia and to temperate regions of Asia.

Production: Birch leaf consists of the fresh or dried leaf of *Betula pendula* (syn. *Betula verrucosa*), *Betula pubescens*, or of both species. The leaves are collected in the wild during the spring and dried at room temperature in the shade. Birch tar (*Betulae oleum empyreumaticum retificatum*) is a clear, dark brown oil obtained from *Betula pendula* or *Betula pubescens* through a distillation process.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BIRCH LEAF

Triterpene alcohol ester with saponin-like effect: betulatri-terpene saponins

Flavonoids: including hyperoside, quercetin, myricetin digalactosides

Proanthocyanidins

Volatile oil: including sesquiterpene oxide

Monoterpene glucosides: including betula alboside A and B, roseoside

Caffeic acid derivatives: including chlorogenic acid

Ascorbic acid

3,4'-dihydroxy propiophenone-3-beta-D-glucoside

EFFECTS: BIRCH LEAF

Birch leaves have a mild saluretic effect and are antipyretic. In animal tests, they have been shown to increase the amount of urine.

COMPOUNDS: BIRCH TAR

Phenols (6%): including among others guaiacol, cresole, catechol, pyrogallol, 5-propyl-pyrogallol dimethyl ether and 5-methyl-pyrogallol dimethyl ether

EFFECTS: BIRCH TAR

The aliphatic and aromatic hydrocarbons in birch tar are irritating to the skin and have an antiparasitic effect. Its use for diverse skin conditions and for parasitic infestation such as scabies seems plausible.

INDICATIONS AND USAGE**BIRCH LEAVES**

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones
- Rheumatism

Unproven Uses: The leaves are used in flushing-out therapy for bacterial and inflammatory diseases of the urinary tract and for kidney gravel. They are also used in adjunct therapy for rheumatic ailments, for increasing amount of urine. In folk medicine, the leaves are used as a blood purifier, and for gout and rheumatism. Externally, the leaves are used for hair loss and dandruff.

BIRCH TAR

Unproven Uses: External birch tar uses include parasitic infestation of the skin with subsequent hair loss, rheumatism and gout (ointment); dry eczema and dermatoses (liquid preparations), psoriasis and other chronic skin diseases. Birch tar is a constituent of "Unguentum contra scabiem" that is used for the treatment of scabies.

CONTRAINDICATIONS**BIRCH LEAF**

The drug should not be used for edema when there is reduced cardiac or kidney function.

PRECAUTIONS AND ADVERSE REACTIONS**BIRCH LEAF**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

BIRCH TAR

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Birch tar can cause irritations on sensitive skin. Administration of the drug is not advisable, due to the possible presence of cancerogenic hydrocarbons.

DOSAGE**BIRCH LEAF**

Mode of Administration: Comminuted herb or dry extracts are used for teas; other galenic preparations and freshly pressed plant juices can also be used internally.

Preparation: Tea is prepared by pouring 150 ml hot water over 1 to 2 dessertspoons of drug and then straining the leaves out after 15 minutes.

Daily Dosage: The average daily dose is 2 to 3 g drug several times a day with a caution to ensure ample intake of fluid (minimum 2 liters per day). A fresh cup of tea is taken between meals 3 to 4 times a day

Storage: Birch leaf should be stored in sealed containers protected from light and moisture.

BIRCH TAR

Mode of Administration: Birch Tar is used in combination preparations as external ointments and liniments.

Storage: Birch tar should be stored in tightly sealed containers.

Birthwort

Aristolochia clematitis

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial portion (when in blossom) and the root.

Flower and Fruit: The plant has dirty yellow flowers, usually in axillary groups of 7. The perigone forms a straight tube, which is bulbous beneath and has a linguiform, oblong-ovate, obtuse border. There are 6 stamens, the style is upward growing, and the stigma is 6-lobed. The flower briefly traps the insects that pollinate it. The fruit is a globose, pear-shaped capsule.

Leaves, Stem and Root: The plant grows to a height of 30 to 100 cm. The stem is erect, simple, grooved and glabrous. The leaves are alternate, long-petioled, cordate-reniform, yellow-green with prominent ribs.

Characteristics: The plant has a fruit-like fragrance and is poisonous.

Habitat: Indigenous to Mediterranean regions, Asia Minor and the Caucasus, but is also found in numerous other regions.

Production: Birthwort is the aerial part of *Aristolochia clematitis*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Aristolochic acids {10-nitro-phenanthrene-l-acids): in particular aristolochic acids I and II

Isoquinoline alkaloids: including magnoflorin, corytuberin

Volatile oil (0.03 to 0.2%): chief constituents alpha-pinene, alpha-terpineol

EFFECTS

The aristolochic acids have a phagocytosis- and metabolism-activating effect. They are also thought to improve the production of lymphokinins. Activation of phagocytes has been demonstrated in animal tests in rabbits and guinea pigs, along with an increase in serum bactericides and stimulation of pMysine. In addition, in animal tests, immune resistance to Herpes simplex viruses of the eye was proven. In the ring test, stimulation and formation of granulation tissue was demonstrated in rats. In mice, there was a clear increase in the survival rate in cases of general infection. No significant results were recorded in cases where infections had no or only a low leucocytic immune reaction. The drug's pure aristolochic acid acts similarly to colchicine; it is nephrotoxic, carcinogenic and mutagenic.

INDICATIONS AND USAGE

Unproven Uses: Birthwort is used to stimulate the immune system and in the treatment of allergically caused gastrointestinal and gallbladder colic. The plant is used in a wide variety of ways in the folk medicine of nearly all European countries.

Chinese Medicine: Uses in Chinese medicine include joint pain, stomachache, malaria and abscesses.

Homeopathic Uses: Homeopathic indications include gynecological disorders and climacteric symptoms, as well as the treatment of wounds and ulcers. It is also used as a treatment after major surgery and in ear-nose-throat treatments.

CONTRAINDICATIONS

Birthwort is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: Birthwort is highly toxic. The intake of acutely toxic doses leads to vomiting, gastroenteritis, spasms, severe kidney damage and eventually to death by kidney failure. The chronic intake of low dosages among both humans and laboratory animals led to the development of tumors. Because of the genotoxic and carcinogenic effects of the aristolochic acids, the drug is not to be administered even in small dosages.

Pregnancy: Birthwort is not to be used during pregnancy.

DOSAGE

Mode of Administration: Birthwort is used as a tincture in an ethanol solution. No further information is available.

How Supplied: Birthwort is available in homeopathic dilutions of D11.

Bishop's Weed

Ammi Visnaga

DESCRIPTION

Medicinal Parts: The medicinal part is the fruit.

Flower and Fruit: The rays are slender and patent in the flower, becoming erect, thickened and indurate in the fruit. The bracts are 1 to 2-pinnatisect, equaling or exceeding the rays, and the bracteoles are subulate. The pedicles are erect, stout and rigid in the fruit. The fruit is 2 to 2.5 mm long.

Leaves, Stem and Root: Bishop's Weed is a robust annual or biennial that grows up to 100 cm tall. The lower leaves are

pinnate, the others are 2 to 3 pinnate. All of the leaves have narrow linear or filiform lobes.

Habitat: The plant grows in the Mediterranean region, and is cultivated in the U.S., Mexico, Chile and Argentina.

Production: Bishop's Weed fruit consists of the dried, ripe fruits of Ammi Visnaga.

Other Names: Khella, Khella Fruits, Greater Ammi

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Furochromones: particularly khellin, visnagin, khellol and khellol glucoside

Pyranocoumarins: particularly visnadin and samidin

Flavonoids: including quercetin and isohamnetin and their 3-sulfates

Volatile oil

Fatty oil

EFFECTS

The drug intensifies coronary and myocardial circulation, acting as a mild positive inotrope. It has an antispasmodic effect on smooth muscles.

INDICATIONS AND USAGE

Unproven Uses: Bishop's Weed has been used for angina pectoris, cardiac insufficiency, paroxysmal tachycardia, extra systoles, hypertonia, asthma, whooping cough and cramp-like complaints of the abdomen.

PRECAUTIONS AND ADVERSE REACTIONS

Infrequently, a cholestatic jaundice (reversible) is observed following administration of the drug. The drug also possesses a phototoxic effect.

OVERDOSAGE

Long-term use or overdose of the drug can lead to queasiness, dizziness, loss of appetite, headache or sleep disorders. Very high dosages, corresponding to over 100 mg khellin, may cause elevated levels (reversible) of liver enzymes in blood plasma.

DOSAGE

No information is available.

Bistort

Persicaria bistorta

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and the rhizome.

Flower and Fruit: The flowering stem terminates in a compact, cylindrical, false spike of flesh-colored flowers without a terminal bud. The pedicle is winged. The flowers consist of 5 sepals, 8 stamens and an ovary with 2 to 3 styles. The flowers are in pairs, one of which is complete, the other only having a rudimentary ovary. Only the latter ripens. The complete flowers can be cross-pollinated by insects. The fruit is a three-seeded achene. The ripe seeds are small, brown and glossy.

Leaves, Stem and Root: The plant is a perennial, 30 cm to 1 m high herb on a thick, somewhat flattened and twisted S-shaped rhizome. The radical, oval leaves grow out of the rhizome to form basal rosette leaves with cordate bases, which are blue-green above and somewhat undulate.

Habitat: The plant is indigenous to Europe, North America and Asia.

Production: Bistort root and rhizome is the subterranean part of *Persicaria bistorta*. The root-stocks of the older plants are harvested, cleaned and freed from green parts and rootlets. The stronger parts are then cut up, and this material is dried in the sun.

Other Names: Adderwort, Dragonwort, Easter Giant, Easter Mangiant, Oderwort, Osterick, Patience Dock, Red Legs, Snakeweed, Sweet Dock

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (15-36%): chiefly catechin tannins, small quantity of gallo tannins

Starch (in the root 30%)

EFFECTS

The active agents are the galenic tannin substance, starch, catechin and silicic acid. Higher concentrations of the root cause an increase in the formation of mucous. It is also an astringent.

INDICATIONS AND USAGE

Unproven Uses: The herb is used in the treatment of digestive disorders, particularly diarrhea and for internal bleeding. Externally, it is used as a gargle for mouth and throat infections and as an ointment for wounds.

Chinese Medicine: Preparations from the rhizome are used for epilepsy, fever, tetanus, carbuncles, snake and mosquito bites, scrofulous and cramps in the hands and feet.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Internally as a powdered drug for infusion, or externally as an extract or ointment.

Preparation:

Infusion (internal) — Macerate 50 g drug in 1 l water for 6 hours, percolate and sweeten as required (Penso, 1987).

Infusion (external) — Boil 60 g drug with 1 l water for 15 minutes, percolate and cool (Penso, 1987).

Liquid extract — drug 1:1 in 25% ethanol (BHP83).

Tincture — drug 1:5 in 25% ethanol (BHP83).

Daily Dosage:

Internal Dosage

Powder—in the form of 0.25 g gelatine capsules, 2 to 4 capsules every 3 hours.

Decoction—1 to 2 g for each decoction, 3 times a day.

Infusion—200 ml every 3 hours.

Liquid extract—1 to 2 ml 3 times daily.

Tincture—1 to 3 ml 3 times daily.

External Dosage

Decoction—poultice applied every 2 hours.

Bitter Apple

Citrullus colocynthis

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the dried pulp.

Flower and Fruit: The flowers are yellow and appear singly in the leaf axils. The fruit is about the size of an apple. It is yellow, smooth, dry and very bitter. When ripe, the fruit contains white spongy flesh within the coriaceous peel, with numerous ovate, white or brownish seeds. The seeds are 0.75 cm long and 0.5 cm wide, ovate, compressed, without an edge, oily and somewhat shiny.

Leaves, Stem and Root: Bitter Apple is an annual similar to a watermelon plant. The stems are leafy and rough-haired. The leaves are alternate on long petioles. They are triangular, divided, variously indented, obtuse and pubescent. The upper surface is delicate green, the lower surface rough and pale.

Characteristics: Bitter Apple (the drug) is highly poisonous.

Habitat: Bitter Apple is indigenous to Turkey and southern Mediterranean countries. It is also found in Sri Lanka, Egypt, Syria and the Arabian Gulf.

Production: Bitter Apples are the ripe fruits of *Citrullus colocynthis* that have been removed from the harder outer layer.

Other Names: Colocynth Pulp, Bitter Cucumber

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cucurbitacins: including cucurbitacin E-, J-, L-glucosides

Caffeic acid derivatives: chlorogenic acid

Fatty oil (in the seeds)

EFFECTS

Bitter Apple irritates the intestinal mucous membrane, increasing liquid production.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Bitter Apple are used as a drastic purgative in fixed combinations in the treatment of acute and chronic constipation with various causes. It is also used in pregnancy and in the treatment of liver and gallbladder disorders.

Indian Medicine: Acitis and elephantiasis are among the conditions treated with Bitter Apple in Indian medicine.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is severely poisonous. It has a strongly irritating (and painful) effect on mucous membranes due to its cucurbitacin glycoside content, out of which cucurbitacins are released in watery environments.

OVERDOSAGE

Vomiting, bloody diarrhea, colic, and kidney irritation follow the intake of toxic dosages (0.6 to 1 g), and then increased diuresis that progresses to anuria. Lethal dosages (starting at 2 g) lead to convulsions, paralysis and, if untreated, to death through circulatory collapse. The treatment for poisonings should proceed symptomatically following gastric lavage. Administration in allopathic dosages is no longer defensible.

Bitter Candytuft

Iberis amara

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe seeds and the whole flowering plant.

Flower and Fruit: The stemmed flowers are arranged in racemes; there are 4 orbicular, diagonally splayed sepals approximately 2 mm long with white or reddish membranous margins and 4 obovate-elongate white petals, the outer ones approximately 6 mm, the inner ones 3 mm long. The plant has 2 short and 4 long stamens and a superior 4-carpel ovary; the carpels are fused. The fruit is a small pod, 4 to 5 mm long, almost circular with wide-winged fruit sides and a tough margin. Each of the 2 chambers has only 1 seed. The seeds are semi-ovoid, 2.5 to 3 mm long, flat and approximately 1 mm thick. They are usually narrow-winged at the margin, brown and smooth.

Leaves, Stem and Root: The plant is an herb, occasionally biennial, up to 40 cm high. The leaves are elongate-cuneiform and obtuse. The lower leaves are often spatulate and narrow toward the petiole. The upper leaves are sessile, usually with 2 to 4 blunt teeth at wide intervals and a ciliate margin. The stem is upright with splayed branches and downy-haired at the edges.

Habitat: The plant is found in most parts of western, central and southern Europe, in the Caucasus, and also in Algeria.

Production: Bitter Candytuft seeds are the ripe seeds of *Iberis amara*, which are collected in the wild and cultivated. Bitter Candytuft herb is the fresh, whole flowering plant of cultivated *Iberis amara*.

Other Names: Clown's Mustard, White Candytuft

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BITTER CANDYTUFT SEEDS

Cucurbitacins (0.2 to 0.4%): particularly cucurbitacins E and I

Glucosinolates (1%): glucoiberin, glucocheirolin, glucoiberviridine

Fatty oil (12%): chief fatty acids are behenic acid (45%), oleic acid (20%), palmitic acid (10%) and linolenic acid (10%)

EFFECTS: BITTER CANDYTUFT SEEDS

The cucurbitacins contained in the seeds are toxic, cytotoxic and generally irritating to the small and large intestines. Furthermore, the seeds exhibit a mildly antimicrobial and fungistatic effect.

COMPOUNDS: BITTER CANDYTUFT HERB

Cucurbitacins: particularly cucurbitacins E and I

Flavonoids: including kempferol-3-O-arabinosido-7-O-rhamnoside, kempferol-7-O-rhamnoside, quercetin-3-O-glucosido-7-O-rhamnoside (high concentration in the flowers)

EFFECTS: BITTER CANDYTUFT HERB

The chief active ingredients of the fresh plant are cucurbitacins. A significant anti-edematous effect was exhibited in animal experiments. Its nature as a bitter substance makes its administration both as a choleric and for stimulating the secretion of gastric juices appear plausible.

INDICATIONS AND USAGE**BITTER CANDYTUFT SEEDS**

Unproven Uses: Folk medicine uses for the drug have included problems with cardiac arrhythmia and insufficiency.

Homeopathic Uses: Homeopathic uses include cardiac arrhythmia and insufficiency.

BITTER CANDYTUFT HERB

Unproven Uses: Folk medicine usage includes digestion problems.

PRECAUTIONS AND ADVERSE REACTIONS**BITTER CANDYTUFT SEEDS**

The drug is toxic, due to its cucurbitacin content. Symptoms of poisoning could include vomiting, diarrhea, colic and kidney irritation. Cases of poisonings, however, have not been documented.

BITTER CANDYTUFT HERB

No risks are known in connection with the administration of homeopathic dosages of the drug. The drug is mildly toxic due to its (low) level of cucurbitacins. Symptoms of poisoning could include vomiting, diarrhea, colic and kidney irritation. Cases of poisonings have, however, never been documented.

OVERDOSAGE**BITTER CANDYTUFT SEEDS**

In case vomiting has not already occurred, gastric lavage should be induced using burgundy-colored potassium permanganate solution and sodium sulfate.

Following gastrointestinal emptying and installation of activated charcoal, begin therapy for poisoning. Diazepam (i.v.) for muscle spasm may be necessary, along with electrolyte substitution and treatment for possible cases of acidosis with sodium bicarbonate infusions. In the event of shock, plasma volume expanders should be infused. Monitoring of kidney function is imperative. Intubation and oxygen respiration also may be necessary.

DOSAGE**BITTER CANDYTUFT SEEDS**

How Supplied: Commercially prepared pharmaceutical compounds only.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules, every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 ml sc: 3 times daily (acute); 1 ml sc once a day (chronic) (HAB1).

BETTER CANDYTUFT HERB

How Supplied: Only available in commercial pharmaceutical compound preparations.

Bitter Milkwort

Polygala amara

DESCRIPTION

Medicinal Parts: The medicinal part is the flowering plant with root.

Flower and Fruit: The blue or occasionally white or pink flowers are in many-blossomed racemes. Of the 5 sepals, the 2 lateral ones are large, petal-like, patent and 3-veined. The other 3 are smaller; the middle vein is green. The 3 petals are fused together with the stamens. These form 2 clusters in 2 green pockets on the larger, lower petal. The 2 upper petals form a kind of upper lip. The ovary is superior and bilocular with a spoon-like style. The fruit is an obcordate capsule, compressed at the sides and enclosed in the sepals.

Leaves, Stem and Root: The plant grows from 5 to 15 cm high. The stems are branched at the base, decumbent or ascending. The basal leaves form a rosette, while the cauline leaves are alternate, oblong-cuneate or obovate-lanceolate.

Habitat: The plant is indigenous to Europe.

Production: Bitter Milkwort herb, including its roots, is the complete plant of *Polygala amara*.

Other Names: European Bitter Polygala, European Senega Snakeroot, Evergreen Snakeroot, Flowering Wintergreen, Little Pollom

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins (1-2%)

Bitter principles: polygalin (polygamarin)

Phenol glycosides: monotroposide (methyl salicylic acid-primveroside)

Polygalite (acerite, 1.5-anhydrosorbite)

EFFECTS

The drug is mildly expectorant.

INDICATIONS AND USAGE

Unproven Uses: Bitter Milkwort is used for conditions of the respiratory tract, cough and bronchitis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: The drug is contained in tea for the treatment of bronchitis.

Bitter Orange

Citrus aurantiwn

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh and dried fruit peel, the flowers, the seeds and the extracted essential oil.

Flower and Fruit: The flowers are arranged singly or in clusters in the axils, and are very fragrant. The calyx is cup-shaped, and the 5 thick fleshy petals are an intense white and revolute. The fruit is about 7.5 cm in diameter (similar in size to a cherry), subglobose, slightly flattened at both ends, 10- to 12-locular. The peel is thick, rough and orange when ripe. The fruit pulp is acidic. The core is hollow when ripe.

Leaves, Stem and Root: Bitter Orange is an evergreen tree with a rounded crown and smooth grayish-brown bark. The branches are angular when young, becoming terete and glabrous soon after, with a few stout but flexible axillary spines. The alternate leaves are 7.5 to 10 cm, broadly elliptoid, subacute at the apex, cuneate or rounded below. The upper surface is a shiny dark green and the underside paler. Petioles are broadly winged, tapering to a wingless base.

Habitat: The plant is indigenous to tropical Asia but is widely cultivated in other regions today, such as the Mediterranean.

Production: Bitter Orange flower consists of the dried flowers of *Citrus aurantium*. The oil is obtained by steam distillation of the fresh, fully opened flowers. Bitter Orange peel consists of the dried outer peel of ripe fruits of *Citrus aurantium* separated from the white pulp layer.

Other Names: Orange, Neroli, Bigarade Orange

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BITTER ORANGE FLOWER AND FLOWER OIL

Volatile oil: chief constituents linalool, linalyl acetate, alpinenes, limonene, nerol

Methyl anthranilate

Limonoids: (triterpenoide bitter principles)

Flavonoids

EFFECTS: BITTER ORANGE FLOWER AND FLOWER OIL

No substantiated information available. Efficacy of the use of an extraction of the blossoms as a neurostimulant is not confirmed.

COMPOUNDS: BITTER ORANGE PEEL

Volatile oil: chief constituents (+) -limonene, nerol, geraniol, linalool, linalyl-, neryl-, geranyl- and citronellyl acetate, typical constituent methyl anthranilate

Flavonoids: among them the bitter compounds neohesperidin dyhydrochalcone and naringin as well as the lipophilic compounds sinensetin, nobiletin, tangeretin

Furocoumarins

EFFECTS: BITTER ORANGE PEEL

Bitter Orange has a mild spasmolytic effect on the gastrointestinal tract and increases gastric juice secretion.

INDICATIONS AND USAGE

BITTER ORANGE FLOWER AND FLOWER OIL

Unproven Uses: Preparations of Bitter Orange flower and flower oil are used as a preventive measure for gastric and nervous complaints, gout, sore throat, as a sedative, for

nervous tension and sleeplessness. Folk medicine uses include chronic bronchitis.

Chinese Medicine: Uses in Chinese medicine include pain in the epigastrium, vomiting and anorexia.

BITTER ORANGE PEEL

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints

Unproven Uses: Folk medicine uses include loss of appetite and dyspeptic symptoms.

Chinese Medicine: Bitter Orange peel is used for coughs, colds, anorexia, to reduce apathy and for uterine and anal prolapse.

PRECAUTIONS AND ADVERSE REACTIONS

BITTER ORANGE FLOWER AND FLOWER OIL

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

BITTER ORANGE PEEL

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. An elevation of UV-sensitivity is possible with light-skinned individuals due to the phototoxic effect of the furocoumarins. Frequent contact with the drug or with the volatile oil (such as the exposure experienced by workers in the liquor industry) can cause a sensitization that results in erythema, swelling, blisters, pustules, dermatoses leading to scab formation and pigment spots.

DOSAGE

BITTER ORANGE PEEL

Mode of Administration: Cut and coarsely powdered drug for teas, other bitter-tasting galenic preparations for oral application.

How Supplied: Commercial pharmaceutical preparations include drops, tonics and tea mixtures.

Preparation: To prepare a tea, add 1 tsp of drug to **150** ml of hot water, let stand for 10 minutes, then strain.

Daily Dosage:

Drug: 4 to 6 g

Extract: 1 to 2 g

Tea: 1 cup 1 hour before meals

Tincture (according to DAB 7): 2 to 3 g

Bittersweet Nightshade

Solanum dulcamara

DESCRIPTION

Medicinal Parts: The medicinal part is the stem of the plant

Flower and Fruit: The violet flowers are arranged in 10 to 20 blossomed, long-peduncled and hanging, panicle-like forms. The calyx is fused, 5-tipped and does not drop. The corolla has a very short tube and 5 long tips, which become revolute when mature. At the base of each tip, there are 2 green spots surrounded by white. There are 5 stamens with golden yellow anthers, which lean toward each other, and 1 superior ovary. The fruit is an oblong, scarlet and many-seeded berry.

Leaves, Stem and Root: The plant is a subshrub from 30 to 150 cm in height with a creeping, branched rhizome. The stem is twining or creeping, woody below, angular and usually glabrous. The leaves are petiolate, the upper and lower ones are usually cordate and acute. The middle leaves are usually pinnatesect with 1 pair of lateral segments and a large terminal segment.

Habitat: The plant is common in Europe, northern Africa, eastern and western Asia, and North America.

Production: Bittersweet Nightshade consists of the dried, 2- to 3-year-old stems of *Solanum dulcamara* harvested in spring prior to leafing, or late autumn after the leaves have dropped.

Other Names: Bittersweet, Dulcamara, Felonwort, Felonwood, Scarlet Berry, Violet Bloom, Blue Nightshade, Fever Twig, Nightshade, Woody, Staff Vine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid alkaloid glycosides: (0.07 to 0.4%) the alkaloid spectrum varies widely with the variety

Tomatidenol variety—alpha-solamarine, beta-solamarine

Soladulcidine variety—soladulcidinetetraoside

Solasodine variety—solasonine, solamargine

Steroid saponins

Mixed varieties also occur.

EFFECTS

The main active principles are the steroid alkaloid glycosides whose resorption is probably promoted by the saponins. They stimulate phagocytosis, are hemolytic, cytotoxic, antiviral, anticholinergic and have local anaesthetic properties.

Solasodin has a cortisone-like effect. A desensitizing and cardiotoxic effect has been observed in clinical trials with patients suffering from rheumatic polyarthritis.

Its use as an expectorant may be due to the saponin content.

INDICATIONS AND USAGE

Approved by Commission E:

- Eczema
- Furuncles
- Acne
- Warts

Unproven Uses: In folk medicine, Bittersweet Nightshade is used internally for nose bleeds, rheumatic conditions, asthma and bronchitis, and to stimulate the immune system; externally for herpes, eczema, abscesses and contusions.

Homeopathic Uses: *Solanum dulcamara* is used for inflammation of the respiratory and gastrointestinal tracts, the joints and skin, and for febrile infections. Efficacy has not been proven.

CONTRAINDICATIONS

Bittersweet Nightshade is contraindicated in pregnancy and nursing mothers.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Toxic effects should not be seen in dosages under approximately 25 gm due to the low alkaloid content of the stem.

OVERDOSAGE

Poisonings among children are known through the unripe berries. More than 10 berries cause nausea, vomiting, dilated pupils and diarrhea. Lethal dosage is estimated to be 200 berries.

DOSAGE

Mode of Administration: Comminuted herb is used in teas and other galenic preparations for internal use. The drug is also used externally in compresses and rinses.

Preparation: A decoction is prepared by adding 1 to 2 g of drug to 250 ml water.

Daily Dosage: The average daily internal dose is 1 to 3 gm of the drug. Externally, the herb is used as infusions or decoctions that have strengths equivalent to 1 to 2 gm of the drug per 250 ml of water.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml, sc, acute: 3 times daily; chronic: once a day (HAB1)

Black Alder

Alnus glutinosa

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the bark and leaves.

Flower and Fruit: Black Alder is monoecious. Male flowers are arranged in stemmed catkins. Female flowers form ovoid fruit, which turns woody and remains on the tree the whole year.

Leaves, Stem and Root: The plants grow as a shrub or tree extending up to 25 m high. Black Alder has gray branches and orange-colored wood. The obovate leaves have double-serrate margins; the young leaves are very sticky.

Habitat: Black Alder originated in the damp regions of Europe, Asia and North America. The plant now grows in much of the Northern Hemisphere.

Production: Black (English) Alder bark is the bark and branch rind of *Alnus glutinosa*. It is gathered from the shrubs or trees growing wild.

Other Names: Common Alder, Owl, Tag Alder

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins

Flavonoids: in particular hypericin

Steroids: beta-sitosterol

Triterpenes: especially alpha-amyrone, lupenone, taraxerol, glutenone

EFFECTS

The decoction is a tonic and has astringent and hemostatic properties, which may be due to the tannins (20%), flavone glycosides and triterpenes.

INDICATIONS AND USAGE

Unproven Uses: Black Alder is used as a decoction for gargles in the treatment of streptococcal sore throat and pharyngitis, and for intestinal bleeding. The bark is considered to be effective for intermittent fever.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Leaves and bark are prepared as infusions and decoctions for internal and local use. Mention is made of an ophthalmic powder.

Preparations: The bark is prepared as a decoction.

Black Bryony

Tamus communis

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The flowers are small greenish-white and in loose clusters. They consist of 6 petals and are found on various plants in fertile and infertile form. The fertile flowers develop into crimson berries.

Leaves, Stem and Root: *Tamus communis* is a glabrous climber. The stem dies back in winter but the root is perennial. The leaves are cordate, smooth, acute and glossy. The root is almost cylindrical with a diameter of 2 to 3 cm. The root is 6 to 8 cm long and has scattered, thin root fibers. Externally, the root is blackish-brown. Internally, it is whitish and produces a slimy paste when it is peeled.

Characteristics: The taste of the root is acrid and the odor is slightly earthy.

Habitat: The plant is indigenous to parts of Europe.

Production: Black Bryony root is the root of *Tamus communis*. The roots are gathered at the end of the vegetation period. They are dug up and the bark is peeled off and cut into slices or pieces. During this procedure, gloves should be worn to protect the hands, as the fresh roots cause serious reddening of the skin.

Other Names: Blackeye Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Histamine-oxalate: in the form of skin- and mucous membrane-irritating needles

Mucilages (2.5-5%)

Volatile oil (1%)

Phenanthrene derivatives

Steroid saponins, aglycone diosgenin

EFFECTS

Black Bryony stimulates the external nerve ends. A substance similar to histamine increases blood circulation in areas of the skin to which it is applied.

INDICATIONS AND USAGE

Unproven Uses: The plant is used for agitation and redness of the skin, bruises, strains, torn muscles, gout and other rheumatic disorders. Black Bryony is also used for irritation of the intestine mucous membrane and as an emetic. It is also used as a tonic for hair loss, as it improves blood circulation to the scalp.

PRECAUTIONS AND ADVERSE REACTIONS

Skin contact with the fresh plant leads to the formation of rashes, swelling, pustules and wheals, due to the skin- and mucous membrane-irritating oxalate needles and histamine. Internal administration triggers signs of severe irritation in the mouth, pharyngeal space and gastrointestinal tract, combined with vomiting and intense diarrhea. Extracts from the plant are toxicologically harmless. Skin lesions are treated with cortisone foam and sterile coverings; tetanus prophylaxis might be required. If taken by mouth, following gastric lavage with burgundy-colored potassium permanganate solution and administration of activated charcoal, treat spasms with diazepam (i.v.) and colic with atropine. Monitoring of kidney function is essential. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: The ground root is applied externally as a lotion.

Black Catnip

Phyllanthus amarus

DESCRIPTION

^{^jf} *Medicinal Parts:* The whole, dried herb is the medicinal part.

Flower and Fruit: The flowers are axillary. The male flower has 5, 0.5 mm long, acute, pale-green sepals with a white margin. There are 3 stamens with the filaments forming a 0.2 mm high column. The female flowers have an apically thickened pedicel and 5 ovate-elongate, up to 1 mm long, yellowish-green sepals. The ovary is 0.3 mm in diameter and 3-chambered. The fruit is ochre to olive with 3 pressed lobes, 2 mm in diameter and 1 mm long.

Leaves and Stem: Black catnip is a monoecious, occasionally dioecious, upright or ascending herb, which grows up to 60 cm high, or occasionally higher. The bracts and stipules are linear-lanceolate, 1 mm long, cream with a brownish middle rib. The stem is round, greenish or reddish, glabrous and woody at the base.

Habitat: Africa, Asia and America.

#

Production: Black catnip herb is the aerial part of *Phyllanthus amarus*. The harvested herb is dried.

Not to be Confused With: May be confused with *Phyllanthus urinaria*, *P. niruri*, *P. debilis* and *P. fraternus*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins: gallotannins, including amarine, phyllanthusin D, geraniine, corilagin, elaecarpusin

Flavonoids: including rutin, quercetin-3-O-glucoside

Lignans: phyllantin (0.8%, extremely bitter), hypo-phyllanthin

EFFECTS

The drug, which contains tannins and lignans, is antiviral and antimicrobial in effect.

INDICATIONS AND USAGE

^{^fr} *Unproven Uses:* The herb is used for fever (Cuba, Nigeria), for malaria (Cuba, Bahamas), diarrhea, tachycardia and female sterility (Congo), constipation with spasms and colic, as a diuretic (Nigeria) and for diabetes (Dominican Republic).

Indian Medicine: Black catnip is used for stomach conditions, ascites, jaundice, diarrhea, dysentery, intermittent fever, conditions of the urogenital tract, eye disease, scabies, ulcers and wounds.

PRECAUTIONS AND ADVERSE REACTIONS "

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb preparations for internal and external use.

Preparation: Decoction: 10 plants to 1-liter water

Daily Dosage: No exact doses are known.

LITERATURE

Black Cohosh

Cimicifuga racemosa

TRADE NAMES

Black Cohosh (available from a number of manufacturers) and sometimes sold as Black Cohosh Root, Black Cohosh Power, Wild Countryside Black Cohosh, NuVeg Black Cohosh Root, Remifemin

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh and dried root.

Flower and Fruit: The inflorescence is a long-peduncled, drooping raceme, 30 to 90 cm long with white flowers. There are 3 to 8 petals without nectaries, and the sepals enclose the flower bud.

Leaves, Stem and Root: The plant grows 1 to 1.5 m high. It is leafy, with a sturdy, blackish rhizome, which is cylindrical, tough and knotty. The straight, strong, dark brownish roots sprout from the underground rhizome and are roughly quadrangular and grooved. The transverse root section shows wedge-shaped bundles of white wood. The rhizome section shows a large black medulla surrounded by a ring of paler, woodier wedges. The leaves are double-pinnate, smooth and crenate-serrate.

Habitat: Black Cohosh is native to Canada and the U.S.; it is cultivated in Europe.

Production: The medicinally used part of the plant consists of the dried rhizome of *Cimicifuga racemosa* with attached roots.

Other Names: Black Snake Root, Rattleroot, Rattleweed, Squaw Root, Bugbane, Bugwort, *Cimicifuga*, Richweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpenes : triterpene glycoside, including actein, 27-deoxyactein, cimifugoside

Quinolizidine alkaloids: cytosine, methyl cytosine

Phenylpropane derivatives: including isoferulic acid

EFFECTS

The active ingredients in the root are the triterpene glycosides such as cimifugoside, 27-deoxyactein and the actein. The increase in luteinizing hormone (LH) that occurs as estrogen levels decrease is implicated as the cause of menopausal symptoms. Compounds of the rootstock of *Cimicifuga racemosa* bind to the estrogen receptor where it selectively suppresses LH secretion with no effect on FSH. The result is an estrogenic effect, which will decrease climacteric symptoms such as hot flashes, diaphoresis and psychological disturbances (Duker, 1991; Lehmann-Wilenbrock, 1988).

There have been conflicting reports stating *Cimicifuga racemosa* has no estrogen-like action (Einer-Jensen, 1996; Liske, 1998). The herb did not appear to have an effect on levels of LH, FSH, sex hormone-binding globulin (SHBG), prolactin and estradiol in a study that concluded the therapeutic effects seen are not attributable to estrogenic or other endocrine-system effects (Liske, 1998).

The improvement in premenstrual symptoms, dysmenorrhea and menopause may be due to the relaxing of uterine tissue (Tyler, 1997).

CLINICAL TRIALS

A placebo-control, open study was conducted to determine the effects of commercially available *Cimicifuga racemosa* extract (Remifemin) on LH and FSH secretion in 110 menopausal women. After 2 months of therapy with 8 mg daily of the drug, FSH levels in the Remifemin treatment group and placebo group were similar. LH secretion was significantly reduced in the Remifemin treatment group, which points to the estrogenic effect of *Cimicifuga racemosa* preparations (Duker, 1991).

Sixty hysterectomized patients, under 40 years of age, with at least one intact ovary were involved in a study to determine the effect of *Cimicifuga racemosa* extract (Remifemin 8 mg), estriol (1 mg), conjugated estrogens (1.25 mg) and an estrogen-gestagen product on menopausal symptoms. The evaluation of menopausal symptoms was determined by the Kupperman-Index. The study also included evaluation of the trophic disorders of the genitals, including FSH and LH serum concentration measurement. There was a significant decrease in menopausal symptoms determined by the Kupperman-Index in all treatment groups. There was a moderate decline in the serum gonadotropin concentration in each group, with no significant therapeutic difference between the groups. *Cimicifuga racemosa* was as effective as the estrogen products in decreasing menopausal symptoms in young patients who have undergone a hysterectomy (Lehmann-Willenbrock, 1988).

In an open study including 50 patients with menopausal complaints, the effect of *Cimicifuga racemosa* extract

(Remifemen) 40 drops twice daily was determined after a duration of 3 months. The participants had either refused hormone treatment or had conditions where hormone treatment was contraindicated. The efficacy of the herb was measured according to the Kupperman-Index, Profile of Mood States (POMS) scale and the Clinical Global Impressions (CGI) scale. A significant improvement in menopausal complaints for all testing protocols were recorded. (Vorberg, 1984).

Note: Cimicifuga racemosa should not be substituted for hormone replacement therapy with estrogen. There is no information to date that the herb contains cardioprotective effects or protective effects against osteoporosis, as those seen with estrogen therapy.

INDICATIONS AND USAGE

Approved by Commission E:

- Climacteric complaints
- Premenstrual syndrome (PMS)

Unproven Uses: In folk medicine, the plant is used for rheumatism, sore throats and bronchitis. The tincture is also used as a sedative, for choreic states (involuntary, rapid motions), fever, lumbago (pain in the lumbar region) and snakebite. The herb is also available commercially in combination with St. John's Wort for depressive moods associated with premenstrual and menopausal symptoms.

Chinese Medicine: The Chinese have used Black Cohosh for the above indications as well as for measles in the pre-exanthem stage.

CONTRAINDICATIONS

The use of Black Cohosh is contraindicated during pregnancy due to an increased risk of spontaneous abortion.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages, although occasional stomach complaints have been observed.

Drug Interactions: Black Cohosh can potentiate the effect of antihypertensive medications. The concomitant use of these drugs may result in hypotension (Einer-Jensen, 1996; Lehmann-Willenbrock, 1988).

OVERDOSAGE

An intake of very high dosages of the drug (5 g) or an extract (12 g) leads to vomiting, headache, dizziness, limb pains and lowered blood pressure.

DOSAGE

Mode of Administration: Galenic preparations for internal use.

flow Supplied:

Capsules — 60 mg, 80 mg, 450 mg, 540 mg, 545 mg

Drops

Solutions

Tablets — 60 mg, 120 mg.

Daily Dosage: Alcoholic-aqueous extracts (ethanolic-aqueous 40-60% (WV) or isopropanolic-aqueous 40% (V/V)) corresponding to 40 mg drug. The herb is not recommended for treatment longer than 6 months unless advised by a physician.

Black Currant

Ribes nigrum

TRADE NAMES

Bio-EFA Black Currant, Black Currant, Black Currant Oil, Black Currant Seed Oil

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves collected after the flowering season and dried, the fresh ripe fruit with the tops and stems and the fresh leaves collected in summer.

Flower and Fruit: The flowers form richly blossomed racemes. Each is in the axil of a pubescent bract, which is shorter than the petiole. The petiole is pinnate has 2 small bracteoles. The sepals are together with the 5 small stamens

on the campanulate flower axis within which the single-valved ovary and the divided style is sunk. The hanging flowers are self-pollinating. The multi-seeded, black, glandular punctuate berries develop from the ovary.

[^] *Leaves, Stem and Root:* The plant is a sturdy perennial bush up to 2 m high. The branches are pale, hard and initially pubescent. The leaves are alternate, petiolate, becoming quickly glabrous on the upper surface and have numerous yellow resin glands on the undersurface. The 3- to 5-lobed leaf blade has a cordate base and doubly dentate margin.

Habitat: The plant is indigenous to Eurasian forests as far as the Himalayas, Canada and Australia and is cultivated in many regions.

Production: Black currant leaves are the leaves of *Ribes nigrum* collected during or shortly after the flowering season. Leaves are harvested from cultivated crops during or shortly after flowering. They are air-dried in the shade or carefully at a maximum temperature of 60° C.

Black currant fruits are the ripe fruits, with stalks attached, of *Ribes nigrum*. Fruits are harvested when fully ripe, and utilized immediately or deep frozen.

£r

Other Names: Quinsy Berries, Squinancy Berries

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BLACK CURRANT LEAVES

Flavonoids: including astragalín, isoquercitrín, rutin

Oligomeric proanthocyanidins

Ascorbic acid (vitamin C, 0.1 to 0.27% of fresh weight)

Volatile oil (traces)

EFFECTS: BLACK CURRANT LEAVES

A salidiuretic effect is attributed to die drug through a 'diuretic factor' that is not closely defined. In animal experiments, a hypotensive, anti-exudative and prostaglandin-release inhibiting effect has been proven.

COMPOUNDS: BLACK CURRANT FRUITS

Ascorbic acid (vitamin C, 0.1 to 0.3%)

Anthocyanins: chiefly cyanidin-3-O-rutinoside and delphinidin-3-O-rutinoside

^{f*} Phenol carboxylic acid derivatives: caffeoyl-, p-cumaroyl- and feruloyl-quinic acids; p-cumaroyl and feruloyl glucoses

Flavonoids: chief components isoquercitrín, myricetin glucoside, rutin

Fruit acids (3.5%): malic acid, citric acid, isocitric acid

Invert sugar

Pectins

COMPOUNDS: BLACK CURRANT SEEDS

Fatty oil (30%) with high gamma linolenic acid content

Monosaccharides: invert sugar

EFFECTS: BLACK CURRANT FRUIT AND SEEDS

The extract of the drug that contains anthocyanes has a hypotensive and spasmolytic effect in animal experiments. In addition, an antimicrobial and xanthine-oxidase and lipoperoxidase inhibiting effect has been proven.

INDICATIONS AND USAGE

BLACK CURRANT LEAVES

Unproven Uses: Black Currant leaves are used internally to increase micurition. In folk medicine they are used internally for arthritis, gout and rheumatism, diarrhea, colic, jaundice and liver ailments, painful micturition, urinary stones, convulsive coughs and whooping cough. Black Currant is used externally for treatment of wounds and insect bites.

BLACK CURRANT FRUITS

Unproven Uses: In folk medicine Black Currant fruit is used internally to relieve colds, hoarseness and coughs, diarrhea and stomachache. It is also used as a source of vitamin C. Preparations are used on mucous membranes as a gargle for hoarseness, strep throat and other inflammations of the oral cavity.

Black currant dried berries are used for bladder complaints, venous insufficiency, hemorrhoids, bruising and petechiae

CONTRAINDICATIONS

BLACK CURRANT LEAVES

Contraindicated in edema resulting from reduced cardiac and renal activity.

PRECAUTIONS AND ADVERSE REACTIONS

BLACK CURRANT LEAVES AND FRUITS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

BLACK CURRANT LEAVES

Mode of Administration: Black currant leaves are available as whole, crude and powder drug for internal use.

Preparation: To prepare a tea, add 1 to 2 heaped teaspoons (2 to 4 gm) Black currant leaves to boiling water (150 ml), and strain after 10 minutes.

Daily Dosage:

Tea — 1 cup to be drunk several times a day.

Poultice — freshly rubbed Black Currant leaves or leaves soaked in warm water are dried and used as a compress. Place dried drug on wounds and fresh rubbed leaves on insect bites.

Storage: Should be protected from light and moisture

BLACK CURRANT FRUITS

Mode of Administration: Black Currant fruit is available as whole drug for internal use.

Daily Dosage:

Syrup — 5 to 10 ml, by the tablespoon, taken several times daily, or eaten as jelly or sweets.

Gargle — with the juice and equal parts of warm water.

Black Haw

Viburnum prunifolium

DESCRIPTION

Medicinal Parts: The medicinal part is the bark of the trunk and the root.

Flower and Fruit: The flowers of the *Viburnum* species are white and in richly blossomed, flat, apical cymes. The central florets are campanulate and fertile; the lateral ones are much larger, rotate and infertile. The calyx margin is small and 5-tipped. The corolla of the fertile florets is campanulate and 5-petalled. There are 5 stamens, a semi-inferior ovary and 3 sessile stigmas. The fruit of the Black Haw is a shiny, black, juicy berry. The fruit of *Viburnum opulus* is red.

Leaves, Stem and Root: Black Haw is a deciduous tree 5 m tall. It has gray-brown bark and green, grooved branches. The leaves are opposite, petiolate, 3 to 5 lobed, roughly dentate, green on both surfaces and softly pubescent beneath.

Habitat: The plant is indigenous to the eastern and central U.S.

Production: Black Haw bark is the bark of the trunk and branches of *Viburnum prunifolium*.

Other Names: Stagbush, American Sloe, European Cranberry, Cramp Bark, Guelder Rose, Snowball Tree, King's Crown, High Cranberry, Red Elder, Rose Elder, Water Elder, May Rose, Whitsun Rose, Dog Rowan Tree, Whitsun Bosses, Silver Bells, Wild Guelder Rose

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: amentoflavon (a biflavone)

Triterpenes: including among others oleanolic acid, ursolic acid as well as their acetates

Hydroxycoumarins: scopoletin, aesculetin, scoplin

Caffeic acid derivatives: chlorogenic acid, isochlorogenic acid

Phenol carboxylic acids: salicylic acid, salicin

Tannins (2%)

Arbutin (traces)

EFFECTS

The drug has a spasmolytic and, to date, an undefined effect on the uterus.

INDICATIONS AND USAGE

Unproven Uses: Black Haw is used for complaints of dysmenorrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: An extract is used as a constituent of a tea mixture made from Black Haw bark, Camomile flowers, and Peppermint leaves.

Black Hellebore

Helleborus niger

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried rhizome with or without roots and the fresh underground parts.

Flower and Fruit: The flower is white with a greenish margin, reddish on the outside. It is hanging and splayed. There are 5 broadly ovate, campanulate bracts with red-brown borders, which tend toward each other. The petals are altered to nectaries. There are numerous yellow stamens. The fruit is a pod-like, many-seeded follicle with a curved beak and horizontal stripes. The seeds are matte black, ovate and have a long swelling on them.

Leaves, Stem and Root: The plant is a perennial subshrub up to 50 cm high. The stem is erect, glabrous, branched, woody at the base and almost leafless. The basal leaves are long-petioled, thickish, coriaceous, glabrous, dark green above with a lighter underside.

Characteristics: The plant is poisonous; rhizome is black-brown.

Habitat: The plant is indigenous to the forests of southern and central Europe.

Production: Black Hellebore root is the root of *Helleborus niger*.

Not to be Confused With: *Helleborus foetidus*, *Helleborus niger* and *Helleborus viridis* are different plants with different active compounds. They may be confused with the subterranean parts of *Trollius eurpaeus*, *Aconitum napellus*, *Astrantia major*, *Actaea spicata* and *Adonis vernalis*.

Other Names: Christe Herbe, Christmas Rose, Melampode

ACTIONS AND PHARMACOLOGY

COMPOUNDS: HELLEBORUS FOETIDUS

Steroid saponins: mixture known as helleborin

COMPOUNDS: HELLEBORUS NIGER

Steroid saponins: mixture known as helleborin

Cardioactive steroid glycosides (bufadienolide): including hellebrin, deglucohellebrin (only traces)

Alkaloids: celliamine, sprintillamine

COMPOUNDS: HELLEBORUS VIRIDIS

Steroid saponins: mixture known as helleborin

Cardioactive steroid glycosides (bufadienolide): including hellebrin, deglucohellebrin

Alkaloids: celliamine, sprintillamine, sprintillin

EFFECTS: ALL SPECIES

The plant is said to have a typical saponin effect (irritates mucous membranes) and is in general extremely toxic.

Note that other varieties of *Helleborus* also contain hellebrin with a digitalis-like effect.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, Black Hellebore is used as a laxative, for nausea, worm infestation, to regulate menstruation and as an abortifacient, as well as for acute nephritis. Also used in the treatment of head colds.

Homeopathic Uses: Used to treat acute diarrhea, encephalitis, cephalitis, kidney inflammation and states of confusion.

PRECAUTIONS AND ADVERSE REACTIONS

General: The mucous membrane-irritating saponin effect of the drug is the chief focus in cases of poisoning. Symptoms include scratchy feeling in mouth and throat, salivation, nausea, vomiting, diarrhea, dizziness, shortness of breath, possible spasm and asphyxiation. Disorders of cardiac function (cardiac arrhythmias are to be expected with large intakes of the rhizome of *Helleborus viridis*). Poisonings are recorded among the animals that feed on the plant. Following stomach and intestinal emptying (gastric lavage, sodium sulfate) and the administration of activated charcoal, therapy for poisonings consists of diazepam for spasm and electrolyte replenishment and sodium bicarbonate infusions for any acidosis that may arise. Intubation and oxygen respiration may also be necessary.

Pregnancy: In folk medicine, Black Hellebore is used as an abortifacient.

DOSAGE

Mode of Administration: Black Hellebore is obsolete and dangerous as a drug in allopathic doses.

Daily Dosage: The average dose is 0.05 gm; the maximum single dose is 0.2 gm; the largest daily dose is 1.0 gm. A powder with a medium content of 10% is used for head colds.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB34).

Black Horehound

Ballota nigra

DESCRIPTION

Medicinal Parts: The aerial parts of the plant are used medicinally.

Flower and Fruit: The clearly stemmed flowers are 1 to 1.5 cm long. They are arranged in 4 to 10 fairly loose and often short-stemmed cymes in the axils of the cauline leaves. The bracteoles are arrow-shaped and soft. They are half as long as the funnel-shaped calyx, which is downy to silky-shaggy haired. The calyx has 5 awned tips. The corolla is usually

reddish-lilac, occasionally white. It contains a straight tube that grows out of the calyx tube and has a ring of hairs at the base. It has an elliptoid, slightly domed upper lip, which is slightly compressed from the outside. There is an equally long, downward hanging, white-marked lower lip, and an obovate, often edged or weakly dentate middle lip. The stamens are slightly hairy at the base and have small, distinctly spreading pollen sacks. The plant produces a hard fruit. The nuts are ovoid, 12 mm long and quite smooth.

Leaves, Stem and Root: Horehound is a perennial 0.30 to 1 m high shrub with a short creeping rhizome and upright, sturdy, angular, branched stems. The whole plant is pubescent and fresh green. In the autumn, the plant is often tinged brown-violet. The opposite leaves have a 0.5 to 1 cm long petiole. The lower leaves are larger and have an ovate to almost round, 2 cm long by 1.5 to 3.5 cm wide leaf blade. They are weakly cordate, blunt or wedge-shaped at the base and finely crenate to roughly and unevenly serrate. Both sides are pubescent, the upper surface often becoming glabrous and somewhat glossy.

Characteristics: The whole plant has an unpleasant smell of essential oil.

Habitat: The plant is considered to be a weed in western, central and northern Europe, but was intentionally introduced to the U.S.

Production: Black Horehound is the aerial part of *Ballota nigra*, gathered when in bloom. It is collected in the wild or from cultivated plants propagated by sowing seeds or planting cuttings at the end of winter. The harvest is in July and August. There are no special conditions for drying.

Not to be Confused With: The drug can be confused with *Folia melissae*. Adulterations with hybrids of *Marubium vulgare* have been found on the market.

Other Names: Black (Stinking) Horehound

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes, marrubiin: 7-acetoxymarrubiin, ballotinon, ballotenol, ballonigrin (to some extent bitter principles)

Volatile oil (traces, unpleasant smell)

Caffeic and ferulic acid derivatives: including chlorogenic acid

Tannins

EFFECTS

Horehound acts as a stimulant, antiemetic and antispasmodic; however, the mode of action has not been satisfactorily explained. According to older literature, a drop in arterial blood pressure and bradycardia occurred in a dog when it

was injected intravenously with an infusion (2.5g infusion per kg body weight). When a decoction of the fresh plant was administered intravenously, the volume of gall secretions tripled within 30 minutes.

INDICATIONS AND USAGE

Unproven Uses: Internally, Horehound is used as a sedative in cases of hysteria and hypochondria, as a spasmolytic for stomach cramps and complaints, for whooping cough and to increase bile flow. Horehound is also used to treat nervous, upset stomach, nausea and vomiting. In France, it is traditionally used in the symptomatic treatment of nervous disorders in adults and children, especially for mild sleep disorders and for the symptomatic treatment of coughs. Furthermore, Horehound enemas and suppositories are used against worm infestation. Externally, Horehound is used for gout. The drug's efficacy has not been adequately proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally in the form of liquid extracts and tinctures. It is also used externally.

Preparation: Liquid extract: 1:1 in 25% ethanol. Tincture: 1:10 with 45% ethanol. Alcohol tincture from the fresh plant with 90% alcohol.

Daily Dose: Single dose of the drug is 2 to 4 g (as an infusion); Liquid extract: 1 to 3 ml; Tincture: 1 to 2 ml.

Black Mulberry

Morus nigra

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe berries and the root bark.

Flower and Fruit: The plant is monoecious or dioecious. The greenish flowers are in catkin-like inflorescences. The male flowers are ovate to cylindrical; the female flowers ovate or globular. The flowers have a 4-bract involucre, which enlarges and becomes fleshy in the female flowers. The female flowers have 2 stigmas, the male flowers have 4 stamens. All of the fruit from the catkins develops into blackberry-like false berries, which are really a series of fleshy drupes that are edible and pleasant-tasting.

Leaves, Stem and Root: The tree grows from 6 to 12 m high. The bark is gray-brown. The leaves are alternate with flat-grooved, somewhat hairy petioles. They are cordate or ovate, sessile, unevenly lobed, and serrate with short rough hairs on the upper surface.

Habitat: The plant is cultivated worldwide in temperate regions.

Other Names: Purple Mulberry, White Mulberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FRUIT

Fruit acids (1.9%): including malic acid, citric acid

Saccharose (10%)

Pectins

Ascorbic acid (0.17%)

Flavonoids: including, among others rutin

COMPOUNDS: IN THE LEAVES

Flavonoids: including among others rutin (2-6%)

The constituents of the rhizome rind are not known.

EFFECTS

The active agents are sugar, acids, pectin and rutin, but there is no information available regarding their effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as a mild laxative and in the treatment of inflammations of the mucous membranes of the respiratory system.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is used internally as a comminuted drug, juice or syrup.

Daily Dosage: The average daily dose is 2 to 4 ml of syrup.

Black Mustard

Brassica nigra

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds from which oil is extracted.

Flower and Fruit: The inflorescences are terminal or axillary and compressed into a semi-sphere. The flowers have 4 free sepals, 4 free petals, 6 stamens and 1 ovary. The sepals are 3.5 to 4.5 mm long and appear linear because of slits on the edge. They are yellowish-green, usually glabrous, upright and slightly splayed. The yellow petals are twice as long as the calyx, obovate, rounded at the tip and narrowed to a stem at the base. The ovary is on the receptacle. The style is thin and has a semi-globose, cushion-like stigma. The fruit is an erect pod, which is linear and rounded or angular with a thin dividing wall. It is 10 to 25 mm long and pressed onto the stem. The seed is globose, brown, matte and punctate.

Leaves, Stem and Root: Black Mustard is an annual that grows up to 1 m tall and is slim-branched with thin fusiform roots. The stem grows up to 1 m. It is almost round and bristly-haired at the base, with a bluish bloom toward the top. The stem is glabrous with upright branches almost in bushels. The leaves are petiolate, up to 12 cm long and 5 cm wide. The lower leaves are grass-green and covered in 1 mm long bristles. They are pinnatifid and densely dentate, with 2 to 4 obtuse lobes on each side and a large end section. The upper stem and branch leaves are smaller, usually glabrous and blue-green, ovate or lanceolate and slightly dentate.

Habitat: Black Mustard grows in temperate regions worldwide.

Production: Mustard seeds are the seeds of *Brassica nigra*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Glucosinolates: chiefly sinigrin (allylglucosinolates, 1-5%); grinding the seeds into powder and then rubbing with warm water (not with hot water because enzymes would be destroyed), as well as chewing, releases the volatile mustard oil allylisothiocyanate

Fatty oil (30-35%)

Proteins (40%)

Phenyl propane derivatives: including sinapine (choline ester of sinapic acid, 1%)

EFFECTS

The hyperemic effect is the main effect and is employed for various indications where increased blood flow is desired. The drug contains glucosinolates whose main constituent, sinigrin, is converted through enzymatic hydrolysis to allyl mustard oil. This causes a stabbing pain and an intense reddening of the skin. Upon contact with the skin, Allylsen oil causes the severity of the inflammation to increase, potentially to the extent where blisters and necrosis may occur.

INDICATIONS AND USAGE

Unproven Uses: External uses include bronchial pneumonia, sinusitis, pleurisy, lumbago and sciatica for which a mustard poultice is applied, sometimes to achieve an antirheumatic effect (mustard spirit 2%). Foot baths and full baths are used to prompt increased circulation (headaches and mild glaucoma) or to stimulate the cardiopulmonary system (frost bite and vascular disease).

Homeopathic Uses: Uses in homeopathy include irritation of the upper respiratory tract and the gastrointestinal tract.

CONTRAINDICATIONS

Use of Black Mustard is contraindicated in individuals with gastrointestinal ulcers or inflammatory kidney diseases.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Gastrointestinal complaints (and, rarely, kidney irritation) could occur following internal administration, due to the mucus-membrane-irritating effect of the mustard oil. The drug possesses minimal potential for sensitization; contact allergies have been observed. The draining effect associated with the drug's administration makes it inadvisable in the presence of varicosis and venous disorder.

Sneezing, coughing and possible asthmatic attacks can result from breathing the allylisothiocyanate that arises with the

preparation and application of mustard poultices. Eyes should be protected when preparing or using the poultices because the vapors can cause eye irritation. Long-term external application or too-intensive reactions upon the skin can lead to injury such as blister formation, suppurating ulcerations and necroses. Mustard poultices are to be removed after no more than 30 minutes.

W

Drug Interactions: Avoid concomitant use of preparations containing ammonia, because ammonia with mustard oil forms inactive thiosinamine.

Pediatric Use: Black Mustard should not be administered to children under 6 years of age.

OVERDOSAGE

Internal overdosage can lead to vomiting, stomach pain and diarrhea. In severe cases, these can be accompanied by somnolence, cardiac weakness, breathing difficulties and even to death through coma. Following installation of activated charcoal and shock prophylaxis (suitable body position, quiet, warmth), the therapy for poisonings consists of administering mucilaginoso for the protection of mucus membranes and generous amounts of fluids. Possible cases of acidosis should be treated with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Cardiac massage, intubation and oxygen respiration may also be necessary.

A

DOSAGE

Mode of Administration: Used externally as a mustard plaster, foot bath or full bath. On rare occasions, Black Mustard is used as a constituent in antirheumatic preparations and cardiac ointments.

How Supplied: Allyl mustard oil: 1 to 3% solution, ointments, emulsions and other rubs (including a rheumatism liniment) are available from commercial sources.

Preparation: To prepare a mustard poultice, mix approximately 100 g mustard flour with lukewarm water and pack in linen. Use on the chest should not exceed 10 minutes (with a maximum of 3 to 5 minutes for children). Limit use on the face to 3 to 4 minutes and take care to avoid the eye area. When mustard paper is used, it is immersed in warm water and then placed on the painful area of skin.

W To prepare a full mustard bath, mix 100 to 200 g mustard flour with cold water and press through a cloth into the warm bath. A mustard footbath should be prepared in a bucket or other container that allows the warm water to extend up the leg to the desired position. Add 1 to 3 dessertspoons of mustard flour and stir.

Daily Dosage: The poultice is placed on the chest for about 10 minutes (with a maximum of 3 to 5 minutes for children). Foot bath use should be limited to 10 minutes.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc; acute: 3 times daily; chronic once a day (HAB34).

Storage: The stored drug should be protected from light.

Black Nightshade

Solanum nigrum

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried herb collected during the flowering season, the whole fresh plant collected during the flowering season and the whole fresh plant with berries.

Flower and Fruit: The small white flowers are in 6- to 10-blossomed, umbel-like, nodding, axillary inflorescences. The calyx is 5-tipped and does not drop. The corolla is 5-tipped with a short tube. There are 5 stamens with clavate anthers inclining toward each other. The corolla is rotate and has 1 superior ovary. The fruit is a pea-sized black, occasionally green or yellow, berry.

Leaves, Stem and Root: *Solanum nigrum* is an annual plant 10 to 50 cm in height. The stem is erect, leafy and angular with outward-inclined branches. The leaves are fleshy, petiolate, rhomboid or ovate. They narrow to a cuneate base, which is crenate-dentate and glabrous or sparsely pubescent.

Characteristics: The plant has a musk-like odor when wilting and is poisonous.

Habitat: The plant is found worldwide.

Production: Black Nightshade is the herb of *Solanum nigrum* picked in uncultivated regions (the wild) and dried in the open air.

Not to be Confused With: Black Nightshade was often called Petty (a corruption of "petit") Morel, to distinguish it from the Deadly Nightshade, or Great Morel, as it is also poisonous but apparently less so.

Other Names: Garden Nightshade, Petty Morel, Poisonberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid alkaloid glycosides: in the foliage and in unripe fruits (0-2.0%). Ripe fruits are, as a rule, free of alkaloids.

Chief alkaloids: solasonine, solamargine, P-solamargine

Steroid saponins: with tigogenin as an aglycone

EFFECTS

According to folk medicine, the herb should work as an antispasmodic, pain reliever, sedative and narcotic; however, there are no studies available. In animal experiments, the steroid alkaloid glycosides have a local anesthetic effect, increase sleep duration and significantly inhibit the occurrence of acetylsalicylic acid-induced stomach ulcers. The effect is attributed to the inhibition of pepsin and hydrochloric acid secretion.

INDICATIONS AND USAGE

Unproven Uses: Internally, Black Nightshade is used for gastric irritation, cramps and whooping cough. Externally, the herb is used for psoriasis, hemorrhoids, abscesses, eczema and bruising.

Chinese Medicine: Black Nightshade is used for furuncles, carbuncles, abscesses, erysipelas, sprains, strains, contusions, chronic bronchitis and acute hepatitis.

Indian Medicine: Black Nightshade is used for rheumatic pain, coughs, asthma, bronchitis, wounds, swellings, ulcers, flatulence, dyspeptic complaints, vomiting, dysuria, earache, hiccups, eye disease, leprosy and skin diseases.

Homeopathic Uses: Black Nightshade is used for cerebral and meningeal irritation.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Overdoses resulting from the intake of large quantities of fresh foliage with high alkaloid content could lead to gastrointestinal signs of irritation, characterized by queasiness, vomiting, headache and, in rare cases, mydriasis.

DOSAGE

Mode of Administration: The herb is available as a ground drug, tincture and liquid extract for internal and external use.

Preparation: To prepare a rinse or moist compress, add a handful of drug to 1 liter of water and boil for 10 minutes. A tincture is prepared in a ratio of 1:1 with 95% ethanol.

Daily Dosage: Externally, use as a compress or rinse. Internally, the dose is 10 drops of liquid extract 2 to 3 times daily, or 5 to 10 gm of tincture daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc; acute, 3 times daily; chronic: once a day (HAB34)

Black Pepper

Piper nigrum

DESCRIPTION

<£. **Medicinal Parts:** The medicinal parts are the berries, which have been freed from the pericarp, and the dried berry-like fruit, which has been collected before ripening.

Flower and Fruit: The inflorescences are pendulous, axillary spikes 5 to 15 cm long containing over 100 inconspicuous white florets. The florets have 1 large ovary with 3 stigmas, 2 stamens and a reduced perianth. Red berry-like drupes form the 30 to 50 flowers, which are fertilized.

Leaves, Stem and Root: The plant is actually a liane, which in cultivation is trained on posts or wire. It can grow to over 6 m. The stem is strong and woody, and the leaves are cordate, glossy and pale green. The leaves are 5 to 10 cm wide, 8 to 18 cm long and are on 5 cm long petioles.

Habitat: The plant grows wild in southern India and is cultivated in tropical Asia and the Caribbean.

Production: Black Peppers are the dried fruits of *Piper nigrum*, harvested before ripening. The whole ears are plucked and separated from the spindles that have been dried, or the fruit is first brushed from the spindles and then dried. Once the shell has been removed, the green stone-fruit is sun-dried or roasted, after which it blackens.

Not to be Confused With: Foreign fruits of the Piperaceae family. It is most frequently confused with peppershells, pepper spindles or stiles, i.e. by-products of the extraction of white pepper from black pepper.

Other Names: Piper, Pepper Bark

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1.2-2.6%): chief components- sabinene (15-25%), limonene (15-20%), caryophyllene (10-15%), beta-pinene (10-12%), alpha-pinene (8-12%), delta³-carene (5%)

Acid amides (pungent substances): chief components- piperine, additionally including among others piperlylin, piperolein A and B, cumaperine

3,4-dihydroxy phenyl ethanol glycosides (substratum for the enzymatic black colouring of the fresh fruits)

Polysaccharides (45%)

Fatty oil (10%)

EFFECTS

The drug stimulates the thermal receptors and increases secretion of saliva and gastric mucous. It has an antimicro-

bial effect. It influences liver and metabolic functions, and has an insecticidal effect.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include stomach disorders and digestion problems, neuralgia and scabies.

Chinese Medicine: Black Pepper is used for vomiting, diarrhea and gastric symptoms in China.

Indian Medicine: Indian uses include arthritis, asthma, fever, coughs, catarrh, dysentery, dyspepsia, flatulence, hemorrhoids, hiccoughs, urethral discharge and skin damage.

Homeopathic Uses: *Piper nigrum* is used for irritation of the mucous membranes and galactorrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Black Pepper is used internally for stomach disorders and externally as an irritant ointment for neuralgia and scabies.

Daily Dosage: Single doses range from 0.3 to 0.6 gm. The daily dosage is 1.5 gm.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or from D4: 1 ml injection solution sc twice weekly (HAB1).

Black Root

Leptandra virginica

DESCRIPTION

Medicinal Parts: The medicinal part is the dried rhizome with the roots. The roots have a very different action according to whether they are used fresh or dry. The dried root is milder.

Flower and Fruit: The stems end in terminal, 15 to 25 cm long spikes of white flowers.

Leaves, Stem and Root: The plant is a perennial herb, which grows to about 120 cm high. The rhizome is horizontal, cylindrical, branched and dark red to dark purple-brown on the outside. The simple, erect stems grow in intervals of 1.2 to 3.2 cm from the rhizome. They are smooth and finely downy. The leaves are whorled (4 to 7 in one whorl), lanceolate, on short petioles, pointed and finely serrate.

Habitat: Indigenous to the eastern U.S. but grows elsewhere.

Production: Black Root and its rhizome are the complete underground parts of *Leptandra virginica*.

Other Names: Bowman's Root, Physic Root, Hini, Oxadody, Tall Speedwell, Tall Veronica, Whorlywort, Culveris Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: composition unknown

Cinnamic acid derivatives: including among others 4-methoxycinnamic acid, 3,4-dimethoxycinnamic acid and their esters

Tannins

The constituents of the drug have not been fully investigated.

EFFECTS

The drug has diaphoretic, carminative and cathartic effects. It is also a cholagogue and a laxative.

INDICATIONS AND USAGE

Unproven Uses: Black Root is used for chronic constipation and liver and gallbladder disorders. It is also used as an emetic.

Homeopathic Uses: The drug is used for diarrhea and inflammation of the liver and gallbladder.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The emetic and laxative effects of the drug are used therapeutically.

DOSAGE

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1).

Blackberry

Rubus fruticosus

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, roots and berries.

Flower and Fruit: The white or sometimes pale pink flowers are in cymes. The calyx is 5-sepaled, the corolla is 5-petalled. There are numerous stamens and ovaries. The small fruit forms a black or reddish-black aggregate fruit, the blackberry.

Leaves, Stem and Root: The plant is a fast-growing, thorny bush up to 2 m high. The generally blunt stems are densely covered in tough thorns that creep or curve backward. The leaves are usually 5-paired pinnate, glabrous above, and gray to white tomentose beneath.

Habitat: The plant is indigenous to Europe and has naturalized in America and Australia.

Production: Blackberry root consists of the underground parts of *Rubus fruticosus* as well as its preparations. Blackberry leaf consists of the dried, fermented or unfermented leaf, gathered during the flowering period, of *Rubus fruticosus* as well as its preparations.

Other Names: Blackberry, American, Dewberry, Bramble, Goutberry, High Blackberry, Thimbleberry

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BLACKBERRY ROOT

Saponins

Tannins

EFFECTS: BLACKBERRY ROOT

There is no reliable information available.

COMPOUNDS: BLACKBERRY LEAF

Fruit acids: including citric acid, isocitric acid

Flavonoids

Tannins (8 to 14%): gallo tannins, dimeric ellagitannins

EFFECTS: BLACKBERRY LEAF

Blackberry leaf has astringent and antidiarrheal effects due to the high tannin content.

INDICATIONS AND USAGE

BLACKBERRY ROOT

Unproven Uses: Blackberry root is used in folk medicine & r. a prophylaxis for dropsy. It is also used in gastrointestinal conditions.

BLACKBERRY LEAF

Approved by Commission E:

- Diarrhea
- Inflammation of the mouth and pharynx

Blackberry leaf is used for non-specific, acute diarrhea and mild inflammation of the mucosa of the oral cavity and throat.

PRECAUTIONS AND ADVERSE REACTIONS

BLACKBERRY ROOT AND LEAF

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

BLACKBERRY ROOT

No information is available

BLACKBERRY LEAF

Mode of Administration: Blackberry leaf is available as crude drug for infusions and other preparations for internal use, as well as for mouthwashes. The drug is a component of various tea mixtures.

Daily Dosage: 2 to 5 gm drug. To prepare a tea, scald 1.5 gm drug, steep for 10 to 15 minutes, strain (1 teaspoon equivalent to approximately 0.6 gm drug).

Bladderwort

Utricularia vulgaris

DESCRIPTION

Medicinal Parts: The medicinal part is the whole plant.

Flower and Fruit: The vertical peduncle is 10 to 35 cm high and bears 4 to 15 flowers in a loose raceme. The petioles are short and campanulate, 13 to 20 mm long with a bilabiate margin.

Leaves, Stem and Root: *Utricularia vulgaris* is a water plant, which appears at flowering time. The water shoot is 60 cm long with double-rowed leaves facing all directions. The water leaves are 1 to 8 cm long and have 2 to 3 large lobes. Each lobe is pinnatifid and ends in numerous tips. There are 8 to 209 tubes per leaf.

I *Habitat:* Europe

Production: Bladderwort is the whole plant of *Utricularia vulgaris*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoids: including globularin, scutellarioside II

Phenylpropane derivatives: 1-p-cumaroyl-glucoside

EFFECTS

The plant has diuretic, antispasmodic and anti-inflammatory effects.

INDICATIONS AND USAGE

The drug was formerly used internally in the treatment of urinary tract disorders and externally for burns. The active substances in Bladderwort increase gallbladder secretions; consequently, the drug is used to treat skin and mucous membrane inflammation.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is obsolete in many parts of Germany. Bladderwort is used internally and externally in other parts of the world.

Preparation: To prepare a diuretic infusion for internal use, add 2 gm of drug per 100 ml of water. To prepare an anti-inflammatory infusion for external use, add 6 gm of drug per 100 ml of water.

Daily Dosage: Internally, as a diuretic infusion, drink two small cups daily. Externally, the anti-inflammatory infusion is used in mouthwashes, cleansers, cosmetics and face packs.

Bladderwrack

Fucus vesiculosus

TRADE NAMES

Bladderwrack (available from numerous manufacturers and as combination product)

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried thallus and the fresh thallus of Bladderwrack.

Flower and Fruit: Some thallus ends look grainy and it is here that the reproductive organs are found. The fructifications consisting of 3 cm long ovoid receptacles are found in the tips of these thalli. They are either cordate or ovately flattened with grainy bladders.

Leaves, Stem and Root: The plant is often over 1 m long, olive green when fresh and black brown when dry. The stem of the thallus is flat, repeatedly bifurcated and has a midrib along the whole length. Beside this midrib there are often scattered pores and numerous air-filled bladders.

Habitat: The plant is found on the North Sea coast, the western Baltic coast, and on the Atlantic and Pacific coasts.

Production: Bladderwrack consists of the dried thallus of *Fucus vesiculosus*, of *Ascophyllum nodosum*, or of both species, as well as their preparations. The algae are harvested when the tide is out, then washed in fresh water and dried at 60° C.

Other Names: Sea wrack, Kelpware, Black-Tang, Bladder Fucus, Cutweed, Fucus, *Quercus marina*, Kelp-Ware, Rockwrack

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Inorganic iodine salts

Organically-bound iodine: in particular in proteins and lipids, also present as diiodothyrosine

Polysaccharides: including alginic acid, fucane, fucoidine (strongly sulfated)

Polyphenold: Phlorotannins

EFFECTS

The drug is antimicrobial, has a hypoglycemic effect in animal experiments and leads in vitro to hemagglutination of human erythrocytes because of the polyphenolic substances.

Its use in the treatment of thyroid conditions associated with hypothyroidism has merit because of the high iodine content. There is information on its apparent usefulness in weight reduction, which must be strongly criticized for the reasons given above.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Bladderwrack are used internally for diseases of the thyroid, obesity, overweight, arteriosclerosis and digestive disorders and externally for sprains.

Homeopathic Uses: In Homeopathy *Fucus vesiculosus* is used for obesity and goitre.

PRECAUTIONS AND ADVERSE REACTIONS

General: Dosages above 150 gm iodide/day carry with them the danger of induction or worsening of a hyperthyroidism. For that reason, the drug should no longer be administered due to its variable iodide content (0.03 - 1%). Allergic reactions have been known to occur.

Pregnancy: Not to be used during pregnancy.

Drug Interactions: Bladderwrack has a hypoglycemic effect. Theoretically, there may be an interaction with other anti-hyperglycemic medications. Monitor patients carefully if they are concurrently using glucose lowering agents.

DOSAGE

Mode of Administration: Bladderwrack is available as drops and fluid extract for internal use.

How Supplied: Fluid Extract: 1:1

Daily Dosage:

Infusion — single dose: 5 to 10 gm drug 3 times daily.

Extract — single dose: 4 to 8 ml 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34).

Maximum daily intake of iodine is limited to 120 µg.

Storage: Should be protected from light.

Blessed Thistle

Cnicus benedictus

TRADE NAMES

Blessed Thistle is available from a number of manufacturers.

DESCRIPTION

Medicinal Parts: The dried leaves and upper stems, including the inflorescence, and the flowering parts of the plant.

Flower and Fruit: The blossom is a pale yellow composite, its solitary flower sessile on the tips of the twigs. The florets are tubular. The few lateral florets are sterile, have 3-part borders and are smaller than the numerous androgynous florets. The epicalyx is ovate. The inner bracts end in a long, rigid and pinnatifid thorn. The outer bracts terminate in a simple thorn. They are broad, leafy and connected with the cordate-oblong leaflets of the epicalyx by numerous web-like hairs. The fruit has a tuft of hair.

Leaves, Stem and Root: The thistle grows to 30 to 50 cm high. The stems are heavily branched, thistle-like, villous and glutinous pubescent. The leaves are oblong, emarginate to pinnatifid, thorny-dentate, and roughly reticulate.

Characteristics: The plant has a strong and bitter taste.

Habitat: The thistle comes from southern Europe but is cultivated in other regions of the continent.

Production: Blessed Thistle herb consists of the dried leaves and upper stems, including inflorescence, of *Cnicus benedictus*.

Other Names: St. Benedicts Thistle, Cardin, Holy Thistle, Spotted Thistle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpene lactone-bitter principles: chief components cnicin, additionally, salonitenolide, artemisiifolin

Lignans (also bitter): trachelogenin, arctigenin, nor-tracheloside

Volatile oil: components including n-nonane, n-undecane, n-tridecane, dodeca-1,11-dien-3,5,7,9-tetraene (polyene), p-cymene, fenchon, citral, cinnamaldehyde

Triterpenes: alpha-amyrin, multiflorenol

Flavonoides: including apigenin-7-O-glucoside, luteolin, astragalgin

EFFECTS

The main constituent is the amaroid cynicin, which is antimicrobial, cytotoxic and antitumoural. The amaroids stimulate the secretion of saliva and gastric juices. In animal tests an anti-edemic effect was demonstrated.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

Unproven Uses: St. Benedict Thistle is used as a cholagogue. Internal folk medicine applications include loss of appetite, anorexia, fever and colds, and as a diuretic. External application for wounds and ulcers is noted.

CONTRAINDICATIONS

St. Benedict Thistle is not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug exhibits a strong potential for sensitization (cross-reactions with mugwort and cornflower, among others); however, allergic reactions have been seen only rarely.

DOSAGE

Mode of Administration: Comminuted drug and dried extracts for infusions or other bitter-tasting galenic preparations for internal use.

How Supplied:

Capsules — 340 mg, 360 mg

Extract — 1:1

Tablets

Preparation: Infusions are prepared by pouring boiling water over 1.5 to 2 gm of drug, allowing to set, then straining after 10 to 20 minutes.

Daily Dosage: Four to 6 gm of drug. The dosage for the aromatic bitter is 1 cup 1/2 hour before meals. One cup of tea is taken 3 times a day.

Bloodroot

Sanguinaria canadensis

DESCRIPTION

Medicinal Parts: The medicinal parts are roots and the whole plant.

Flower and Fruit: The plant bears a white flower with 8 to 12 petals on a 15 cm long scape. It is wax-like and has golden stamens. The seed is an oblong, narrow capsule approximately 2.5 cm long.

Leaves, Stem and Root: The perennial plant grows to about 15 cm high. The rhizome is thick, round, fleshy and slightly curved at the end. It is 2.5 to 10 cm long and has orange-red rootlets. The 1 basal palmately-lobed leaf appears when the flower dies. The down-covered, grayish green leaf is clasping, 15 to 25 cm long and has 5 to 9 lobes. Protruding ribs are recognizable on the under surface.

Habitat: The plant is indigenous to the northeastern U.S.

Production: Canadian Bloodroot is the root-stock (rhizome) of *Sanguinaria canadensis*.

Other Names: Indian Paint, Tetterwort, Red Root, Paucon, Coon Root, Snakebite, Sweet Slumber, Indian Plant, Pauson, Sanguinaria

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids of the benzophenanthridine type (4-7%): chief alkaloid sanguinarine, further including among others, chelerythrine. *oxysanguinarine:* protoberberine-type: berberine, *coptisine:* protopine-type: protopine. *alpha- and beta-allocryptopine*

Resins

Starch

EFFE.CTS

The alkaloid sanguinarin is antimicrobial and anti-inflammatory. Its use as an antiplaque agent and for gingivitis is plausible and has been documented in diverse studies. The alkaloids initially act as a narcotic, causing severe cramping that is followed by a local paralysis of sensitive nerve endings.

INDICATIONS AND USAGE

The drug was formerly used as an expectorant, as an active antiplaque agent, and as a mouthwash.

CONTRAINDICATIONS

Bloodroot is not to be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

The drug has an emetic effect in dosages above 0.03 g, and was previously used therapeutically. Higher dosages of the drug severely irritate the mucus membranes. Overdoses can cause vomiting, diarrhea, intestinal colic, and possible collapse.

DOSAGE

Mode of Administration: The drug is obsolete in most countries. Bloodroot is still used in homeopathic preparations, as an ingredient in some pharmaceutical preparations, and as a component of toothpaste and mouthwashes.

Blue Cohosh

Caulophyllum thalictroides

TRADE NAMES

Blue Cohosh Root Liquid (available from numerous manufacturers and as a combination product)

DESCRIPTION

Medicinal Parts: Medicinal parts are the dried rhizome and roots and preparations of the fresh roots.

Flower and Fruit: The inflorescence on the terminal leaf is paniced, 3 to 6 cm long and surrounded by a leaf-like bract. The flowers are yellowish-green to purple and are 1 cm in diameter. The 6 sepals are arranged in 2 rows. The 6 petals are markedly reduced, inconspicuous and gland-like. The 6 stamens are as long as the petals. The ovary opens before it is ripe and contains 2 dark blue 5 to 8 mm long, roundish seeds on solid stems. These resemble drupes because of the fleshy seed-shell.

Leaves, Stem and Root: The plant is a leafy, 30 to 70 cm high erect perennial with a brownish-gray, branched rhizome. The leaves are inserted in the middle of the shoot with a large, almost sessile leaf, which is tri-pinnate and resembles 3 foliage leaves. The leaflets are stemmed, obovate, finely divided into 3 lobes, and wedge-shaped at the base.

Characteristics: Taste is sweetish, then bitter; almost odorless.

Habitat: The plant is found in the damp woods of the eastern part of North America.

Production: Blue Cohosh is the dried root and root-stock of *Caulophyllum thalictroides*. It is collected in the wild.

Other Names: Papoose Root, Squawroot, Blueberry Root, Beechdrops, Blue Ginseng, Yellow Ginseng

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Quinolizidine alkaloids: main alkaloids (-)-anagyrines, (-)-N-methyl-cytisines, and (-)-baptifoline

Isoquinoline alkaloids: magnoflorine

Triterpene saponins: caulophyllosaponin

Caulosapogenin

EFFECTS

An unspecified glycoside, which has been localized from the drug and then injected into the ears of rabbits, causes a strong local irritation. Applying a solution into the rabbit's eyes leads to inflammation. Glycoside is supposed to have an oxytoxic effect.

The weak estrogenic, spasmolytic effect is probably caused by, as yet unknown constituents; the ensuing nicotine effect is possibly caused by N-methylcytisine.

INDICATIONS AND USAGE

Unproven Uses: Internally it has been used for amenorrhoea, dysmenorrhoea, threatened miscarriage, contraction-like spasms, rheumatic symptoms, and in particular conditions resulting from uterus atonia.

Indian Medicine: In India, the drug is known as a treatment for gynecological disorders. In English and American medicine, the drug has been used since the beginning of the 20th century for worm infestation, dehydration, menstrual ailments, cramps, and mainly to stimulate contractions and act as an antispasmodic during labor.

Homeopathic Uses: Uses include for problems of menstruation and labor, as well as rheumatism of the fingers and toes.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: The drug should not be taken during the first three months of pregnancy due to its estrogenic effect and possible teratogenic action of the anagyrines.

DOSAGE

Mode of Administration: The drug is used internally as a decoction or a liquid extract.

How Supplied:

Liquid — 1:1

Preparation: Infusion (no specifications); liquid extract 1:1, in ethanol 70% (V/V)

Daily Dosage: The average single dose is 0.3 to 1 gm of drug; 0.5 to 1 ml of liquid extract.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml 3 times a day sc (HAB34).

Bog Bean

Menyanthes trifoliata

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the dried herb.

Flower and Fruit: The flowers are white or reddish-white, medium-sized and have many blossomed racemes on long, leafless peduncles. There are 5 sepals. The corolla is fused with 5 tips and is pubescent inside. There are 5 reddish stamens and 1 superior ovary. The fruit is an ovate capsule.

Leaves, Stem and Root: *Menyanthes trifoliata* is a perennial green, glabrous aquatic plant that grows from 15 to 30 cm high. The herb has a small, finger-thick creeping rhizome. The decumbent stem varies in length according to conditions. Leaf sheaths surround the stem. The leaves are on long, fleshy, grooved petioles. They are trifoliate, 5 cm long and 2.5 cm wide, and have obovate leaflets.

Characteristics: The herb has a strong bitter taste.

Habitat: The plant is indigenous to Europe, Asia and America.

Production: Bog Bean leaf consists of the leaf of *Menyanthes trifoliata*.

Other Names: Buck Bean, Bog Myrtle, Brook Bean, Marsh Clover, Moonflower. Trefoil, Water Shamrock

ACTIONS AND PHARMACOLOGY

COMPOUNDS

fridoide monoterpenes (bitter principles): chief components 7', 8'-dihydrofoliamenthin, additionally including among others sweroside, loganin, menthiafolin, foliomenthin

Monoterpene alkaloids: including gentianin E

Flavonoids: including among others rutin, hyperoside, trifolin

Hydroxycoumarins: scopoletin

Caffeic acid derivatives

Pyridine alkaloids: including gentianine, gentianidine

Triterpene glycosides: lupeol, beta-amyranol, betulin, betulinic acid, alpha-spinasterol, stigmast-7-enol

EFFECTS

The drug stimulates saliva and gastric juice secretion. An antimicrobial effect has been demonstrated in vitro.

INDICATIONS AND USAGE

- Dyspeptic complaints
- Loss of appetite

Because it is a bitter and promotes gastric secretion, the drug is used for loss of appetite and peptic discomfort.

Unproven Uses: Folk medicine uses, particularly in European countries, include diseases of the digestive system and fevers.

Chinese Medicine: Insomnia, weak stomach and intestines, spleen disorders, intermittent fever, headache, breathing difficulties, amenorrhea, ear ache, jaundice, edema, gout, scabies and furuncles are among the applications in Chinese medicine.

CONTRAINDICATIONS

JP* Use of the drug is contraindicated for patients with diarrhea, dysentery or colitis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Symptoms of overdose include vomiting and diarrhea.

DOSAGE

Mode of Administration: Comminuted herb for teas and other bitter-tasting preparations for internal use.

Preparation: Pour boiling water over 0.5 to 1 g of the finely cut drug (1 teaspoonful = 0.9 g) or place the drug in cold water and bring rapidly to a boil. Allow either preparation to steep for 5 to 10 minutes, then strain.

How Supplied: The drug is a component of standardized preparations of various tonics.

Daily Dosage: The average daily dose is 1.5 to 3 g of the drug. The dosage for the infusion is 1/2 cup, unsweetened, before each meal.

Bog Bilberry

Vaccinium uliginosum

DESCRIPTION

Medicinal Parts: The medicinal part is the dried ripe fruit.

Flower and Fruit: The flowers are arranged in axils of small leaves at the end of short lateral branches. They are hanging and white or reddish in color. The pedicle is encircled at the base with a light brown bud husk. The calyx is fused with the ovary. The fruit is a round or pear-shaped, blue-frosted, 7 to 10 cm long, multi-seeded berry. The light brown seeds are sickle-shaped with sharp ends, and have a punctate-reticulate skin.

Leaves, Stem and Root: The plant is an angular shrub up to 80 cm high with round, gray-brown, glabrous branches and a creeping rhizome. The leaves are deciduous, obovate or oblong, entire, tough and short-petioled. The undersurface has a protruding, reticulate vein system and is blue-green. The upper surface of the leaves is light matte-green to almost white.

Habitat: The plant is common throughout the Northern Hemisphere.

Production: Bog Bilberries and leaves are the ripe fruit and leaves of *Vaccinium uliginosum*. The collection or picking occurs in uncultivated regions. The drug is either air-dried in the shade or dried artificially.

Not to be Confused With: The Bog Bilberry has smaller flowers and berries than the common Bilberry (*Vaccinium myrtillus*; see separate entry).

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE LEAVES

Tannins: catechin tannins

Triterpenes: alpha-amyrin, friedelin, ursolic acid

Sterols: beta-sitosterol, beta-sitosterol-3-O-beta-glucoside

Flavonoids: including hyperoside

COMPOUNDS: IN THE FRUITS

Anthocyanins: including chief components: malvidin-3-O-glucoside, delphinidine-3-O-glucoside, delphinidine-3-O-arabinoside

Organic acids: including benzoic acid

Flavonoids: including hyperoside, myricetin, myricetin-5'-methyl ether

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Bog Bilberry is used for gastric and intestinal catarrh, diarrhea and bladder complaints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Signs of poisoning following consumption of large quantities of the fruits have occurred very rarely. Signs include queasiness, vomiting, states of intoxication, feelings of weakness and visual disorders. Presumably, these poisonings can be traced back to the plant being infested with the lower fungus *Sclerotinia megalospora*.

DOSAGE

Mode of Administration: The drug is used internally as a liquid extract (tea).

Preparation: To prepare a tea, pour 250 ml of cold water over 2 heaping teaspoons of drug; steep for 10 to 12 hours and strain.

Daily Dosage: Drink 1 cup of the prepared tea, unsweetened, once or twice a day.

Boldo

Peumus boldo

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves.

Flower and Fruit: The inflorescences are racemes of whitish or pinkish campanulate flowers. The berries are small, yellowish-green and edible.

Leaves, Stem and Root: The plant is a strongly aromatic, heavily branched evergreen shrub 5 to 6 m tall. The leaves are sessile, opposite, oval, about 5 cm long with an entire and slightly revolute margin. They are rather thick and coriaceous with a protruding midrib and a row of small glands on the upper surface. Both surfaces are slightly pubescent.

Characteristics: Boldo has a bitter, aromatic odor and a camphoraceous, lemony taste.

Habitat: The plant is indigenous to Chile and Peru. It is naturalized in mountainous Mediterranean regions and on the western coast of the U.S.

Production: Boldo leaf consists of the dried leaves of *Peumus boldus*.

Other Names: Boldu, Boldus

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids of the aporphine type (0.25-0.5%): main alkaloid boldine (0.1%)

Volatile oil (2-39c): chief components are p-cymene, cineol, ascaridole

Flavonoids: including rhamnetin-3-0-arabinoside-3'-0-rhamnoside (peumoside), isorhamnetin-3-0-glucoside-7-0-rhamnoside (boldoside), isorhamnetin dirhamnoside (fragroside)

EFFECTS

Boldo has been shown to be antispasmodic, choleric and to increase gastric secretions.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints

CONTRAINDICATIONS

Boldo is contraindicated in patients with bile duct obstruction and those with severe liver diseases. Patients who have gallstones should consult a physician before using the drug.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The volatile oil should not be used, because it contains up to 40% of the toxin ascaridole.

OVERDOSAGE

Signs of paralysis are reported to appear following intake of very high dosages. A case is described in the older scientific literature in which depression, color hallucinations, sound hallucinations and partial motor aphasia occurred following the consumption of boldine over a period of months.

DOSAGE

Mode of Administration: Comminuted herb for infusions and other, virtually ascaridol-free preparations for internal application. Because of the ascaridol content, essential oil and distillates of Boldo leaf should not be used.

Daily Dosage: The average daily dosage is 4.5 gm

Boneset

Eupatorium perfoliatum

DESCRIPTION

Medicinal Parts: The medicinal part is the herb after flowering.

Flower and Fruit: There are numerous flower heads in terminal, large and slightly convex cymose-paniculate inflorescences. They consist of 10 to 12 white, inconspicuous florets with bristly pappus whose hairs are arranged in a single row. The fruit is a tufted achene.

Leaves, Stem and Root: *Eupatorium perfoliatum* is a perennial herb with a horizontal hairy rootstock. The stems are rough-haired and grow to about 1.5 m. The leaves are opposite, 10 to 15 cm long, lanceolate, crenate, tapering to narrow point and fused at the base. They have shiny yellow points due to the resin glands, which are visible on the undersurface.

Characteristics: The taste is astringent and persistently bitter.

Habitat: The herb is indigenous to the eastern U.S.

Production: Boneset is the complete aerial part of *Eupatorium perfoliatum*.

Other Names: Agueweed, Crosswort, Feverwort, Indian Sage, Sweating Plant, Teasel, Thoroughwort, Vegetable Antimony

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including eupatorin, astragalin, rutin, hyperoside

Sesquiterpene lactones: including eupafolin, euperfolitin, eufoliatin, eufoliatorin, euperfolide

Immunostimulating polysaccharides (heteroxylans)

EFFECTS

The herb acts as an antiphlogistic, a diaphoretic and a bitter, in addition to stimulating the body's immune system. In a comparative study of the homeopathic preparation *Eupatorium D2* with aspirin in the treatment of feverish catarrh, a similar positive tendency was observed. In vitro, the phagocytic action of granulocytes was increased.

INDICATIONS AND USAGE

Unproven Uses: On rare occasions, Boneset is used in folk medicine.

Homeopathic Uses: Boneset is used as a treatment for flu and febrile diseases.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Sensitization after skin contact with the plant is possible. Older scientific literature (Lewin) calls attention to the fact that the drug can lead to enhanced outbreaks of sweat and diarrhea in therapeutic use.

DOSAGE

Mode of Administration: Boneset is used in homeopathic preparations and dilutions.

Borage

Borago officinalis

TRADE NAMES

Borage Oil capsules are available from numerous manufacturers.

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried Borage flowers and the dried or fresh foliage, stems and leaves.

Flower and Fruit: The flowers are in separate, terminal, erect, leafy racemes. The calyx is divided almost to the base into 5 rough-haired tips. The 1.5 to 2.5 cm wide corolla is usually sky blue (occasionally white) and has a short tube. The scales of the tube are white. The 5 stamens have a broadened filament and a violet, spur-like appendage. The anthers are black-violet. The style is thread-like with a head-like stigma. The ovary is divided into 4 valves. The small nuts elongate-ovate, about 7 to 10 mm long, light brown, keeled, ribbed, warty and rough.

Leaves, Stem and Root: Borage is an annual, succulent, bristly-haired herb, 15 to 60 cm high. The erect, vertically grooved stems are covered in rough, whitish hairs. The leaves are alternate, clasping, solitary, entire-margined and hairy. They are also folded, curved in at the margins, green

on top and whitish on the underside. The leaves are 3 to 10 cm long and elliptoid to ovate.

Characteristics: Borage has a taste similar to cucumber.

Habitat: Borage originated in the Mediterranean region, but is now found all over Europe and the U.S.

Production: Borage oil is the fatty oil of the seeds of *Borago officinalis*. Borage leaves are the dried leaves and inflorescence of *Borago officinalis*. The herb most often grows wild, but is cultivated on a small scale in Yugoslavia, Rumania, Bulgaria and Turkey. Borage is harvested during the flowering period. Due to the plant's very high water content, it should be artificially dried at 40°C.

Not to be Confused With: The herb can be confused with *Echium vulgare*.

Other Names: Burrage, Bugloss, Burage

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BORAGE OIL

Fatty oil: chief fatty acid is gamma-linolenic acid (17-25%), linoleic acid

EFFECTS: BORAGE OIL

^ The drug acts as an astringent and as a sequestering agent.

COMPOUNDS: BORAGE LEAF

Pyrrrolizidine alkaloids: supinin, lycopsamin, 7-acetyl-lycopsamin, intermedin, 7-acetyl-intermedine, amabiline, thesinine

Silicic acid (to some extent water-soluble)

Mucilages

Tannins

EFFECTS: BORAGE LEAF

The tannins in Borage leaves have an astringent effect and the mucins a sequestering effect.

INDICATIONS AND USAGE

BORAGE OIL

Unproven Uses: The oil is used for neurodermatitis and as a food supplement.

BORAGE LEAF

Unproven Uses: In folk medicine, Borage is used as a sequestering and mucilaginous agent for coughs and throat illnesses and as a bronchial treatment. It is also used as an anti-inflammatory agent for kidney and bladder disorders, as an astringent and to treat rheumatism. Preparations using Borage are also used for blood purification and dehydration; the prevention of chest and peritoneal inflammation and rheumatism of the joints; as a pain-relieving, cardiotoxic, sedative, sudorific; as a performance-enhancing agent; and for phlebitis and menopausal complaints.

PRECAUTIONS AND ADVERSE REACTIONS

BORAGE OIL

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

BORAGE LEAF

Even though the hepatotoxic and hepatocarcinogenic pyrrolizidine alkaloid content is small, the drug should not be administered. External use may present less of a potential for problems.

DOSAGE

BORAGE OIL

Mode of Administration: In capsules, sometimes in combination with vitamins.

How Supplied:

Capsules — 500mg, 1000 mg

BORAGE LEAF

Storage: The drug should be protected from light and moisture.

Boxwood

Buxus sempervirens

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried Boxwood tree leaves and the woody aerial parts of the plant.

Flower and Fruit: Clusters of axillary yellow flowers open in early spring. The male flowers are evenly shaped and have 4 tepals, 4 stamens and a small rudimentary ovary. The female flowers have 4 to 8 tepals, 3 fused carpels with 3 free, short, thick styles. The fruit is a capsule with oblong, 5 to 6 mm long seeds.

Leaves, Stem and Root: Boxwood is an evergreen monoecious shrub or tree growing to a height of 6 m with variable forms and leaf shapes. The green branches are initially pubescent, later glabrous, olive green, angular and densely covered with ovate leaves, which are usually opposite. The upper surface of the leaves is smooth, coriaceous, dark green and very glossy. The lower surface is lighter in shade, and the lamina margin is smooth.

Characteristics: The leaves have a nauseous taste.

Habitat: The plant is found mainly in southern and central Europe with a clear division into east and west regions, i.e., northwest Spain and southern France in the west and the Balkans to northern Greece and Asia Minor in the east. It is otherwise extensively cultivated.

Production: Boxwood leaves are the leaves of *Buxus sempervirens*. They are collected from the wild.

Other Names: Dudgeon, Bush Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid alkaloids: including cyclobuxine-D, cyclobuxine-B, cycloprotobuxine-A, cycloprotobu

EFFECTS

The cycloprotobuxine in the drug was shown to have a cytotoxic effect in vitro as well as an inhibitory effect on the growth of *Mycobacterium tuberculosis*.

In animal tests, an inhibition of motility, including tetanus, spinal paralysis and respiratory paralysis, was demonstrated.

A hypotensive effect has been described.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine preparations were used internally for rheumatism and constipation (decoction), as a diaphoretic (aqueous extract), for malaria (tincture) and pneumonia (ethanol extract), and externally for rashes, hair loss, gout and rheumatic complaints (ointment)

Homeopathic Uses: *Buxus sempervirens* is used for greasy scalp with dandruff and for hair loss.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Contact dermatitis, in particular through contact with the freshly harvested plant, is possible.

OVERDOSAGE

The intake of toxic dosages of the drug leads to vomiting, diarrhea, severe clonic spasms, eventually to signs of paralysis and ultimately to fatal asphyxiation. The fatal dosage in dogs is 0.1 gm of the alkaloid mixture/kg body weight (approximately 5 to 10 gm of the drug/kg body weight). The treatment for poisonings proceeds through suppression of the spasms with diazepam or barbiturates (no more than absolutely necessary) followed by gastric lavage and possible oxygen respiration. Phenothiazines and analeptics are not to be administered.

DOSAGE

Mode of Administration: Boxwood is obsolete as a drug.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules, 1 to 3 times daily or 1 ml injection solution sc twice weekly. (HAB34)

Brassica nigra

See *Black Mustard*

Brassica oleracea

See *Cabbage*

* Brassica rapa

See *Wild Turnip*

Brazilian Pepper Tree

Schinus terebinthifolius

DESCRIPTION

Medicinal Parts: Medicinal properties have been attributed to the bark, leaves, fruit and seeds.

Flower and Fruit: The flowers are in panicles up to 15 cm long. The flowers are small, ivory white to greenish, and the structures are in five. The calyx is 5-tipped. There are 5 petals, 10 stamens and a superior ovary developing from a single carpel and a style in 3 sections. The fruit is a bright pink to red, glossy, single-drupe with a diameter of approximately 5 mm, a thin pergament-like exocarp, an oleo-resin-rich mesocarp and a hard endocarp.

4& *Leaves, Stem and Root:* The leaves are alternate, up to 40 cm long, odd pinnate, with 7 to 13 leaflets up to 8 cm long, 1 to 2 cm wide, sessile, elongate, glossy, finely serrate or jagged-edged. The branches do not hang down.

Characteristics: The fruit is aromatic and sweetish.

Habitat: Indigenous to Central America and South America.

Production: Brazilian peppers (Pink peppers) are the ripe unpeeled seeds of *Schinus terebinthifolius* Raddi, which are

harvested in winter (May to August) and then air- or freeze-dried.

Other Names: Christmas-Berry Tree, Florida Holly

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (2.0 to W.0%): chief components including limonene, alpha-phellandrene, beta-phellandrene, alpha-pinene, beta-pinene, including as well p-cymol, sabinene, terpinolene, in some chemical varieties up to 50% delta3-carene

Alkyl phenols (0.1%): cardanols, cardols, 2-methyl cardolenes

Fatty oil (in the seeds 20 to 60%)

Flavonoids: including biflavonoids, for example amentoflavone

Triterpenes: masticadienonic acid, 3-epimasticadienonic acid

EFFECTS

The "antibiotic activity" with which the drug is credited has not yet been proven. Its use on wounds and inflammatory alterations of the skin appears plausible, due to the antimicrobial, astringent and anti-inflammatory characteristics of the gallic acid it contains.

INDICATIONS AND USAGE

Unproven Uses: Internal folk medicine uses have included treatment of tumors and as a diuretic. In Brazil, a liquid extract and tincture are prepared from the bark and used internally as a stimulant, tonic and astringent, and externally for rheumatism, gout and syphilis. The leaf and fruit have been added to baths for wounds and ulcers. (Hager, 1949.) The effect seems plausible due to the gallic acid content but has not yet been sufficiently clinically proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages, although there is some danger of sensitization (alkyl phenols). Sensitizations occur particularly frequently in North America. Stomach upset and vomiting have been observed following the ingestion of a number of the fruits.

CONTRAINDICATIONS

Should not be administered to individuals with a pre-existing sensitivity to alkyl phenols.

DOSAGE

Mode of Administration: Whole drug, tincture and extract for internal and external use.

Daily Dosage: There is no information in the literature.

Storage: Store tightly sealed and protected from light in a cool* dry place.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Haridbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Brewer's Yeast

Saccharomyces cerevisiae

DESCRIPTION

Medicinal Parts: The medicinal part is the mature, debittered, bottom-fermented Brewer's Yeast.

Flower and Fruit: The cells may be single, in pairs, in chains or aggregate. On a suitable solid fertile base the individual cell colonies have smooth margins, are slightly convex to flat and are whitish to cream-yellow. Older individual colonies are slightly raised, smooth or slightly lobed (sometimes in sections), or folded, and are yellowish to light brown. The vegetative reproduction is via multilateral budding. Ascospores are produced from the vegetative cells. There are normally 1 to 4, occasionally more, round, smooth-walled ascospores per ascus.

Characteristics: Brewer's Yeast is found extensively in the wild, and it lives as a saprophytic parasite or symbiotically.

Habitat: Brewer's Yeast is grown worldwide.

Production: Medicinal yeast consists of fresh or dried cells of *Saccharomyces cerevisiae* and/or of *Candida utilis*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Vitamins of the B group (per 100 gm): thiamin 8-15 mg, riboflavin 4-8 mg, nicotinic acid amide 45-90 mg, pantothenic acid 7-25 mg, pyridoxine 4-10 mg, biotin 20 jg, folic acid 1-5 mg, vitamin B-12 20 fig

Polysaccharides: mannans, glucans

Proteins

Amines

Sterols: ergosterol, zymosterol

EFFECTS

The yeast is antibacterial and stimulates phagocytosis.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Eczema, furuncles, acne
- Loss of appetite

Unproven Uses: Brewer's Yeast is used for constipation and itching skin diseases.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The intake of large quantities can cause gas. Allergic intolerance reactions are possible (itching, urticaria, exanthema, Quinck's disease). Migraine headaches can be triggered in susceptible patients.

Drug Interactions: The simultaneous intake of monoamine oxidase inhibitors can cause an increase in blood pressure.

DOSAGE

Mode of Administration: Medicinal yeast and galenic preparations are available for internal use. Pharmaceutical forms include tablets and compound preparations.

Daily Dosage: The average daily dosage is 6 gm.

Storage: Store in air-tight containers protected from light.

British Elecampane (Xuan-Fu-Hua)

Inula britannica

DESCRIPTION

Medicinal Parts: The medicinal part is the flower.

Flower and Fruit: The semi-globose composite flowers are surrounded by bracts; they have a diameter of 2.5 to 5 cm, are single or in umbelliferous racemes with bracts arranged in a number of rows. The lingual florets are yellow and up to 1 mm wide, the tubular florets are 5-tipped, androgenous and numerous. The anther has an appendage tail. The fruit is a cylindrical, long-ribbed, 1.3 mm long achene. The pappus is single-rowed, approximately 5 mm long and consists of fine, rough bristles.

Leaves, Stem and Root: This herbaceous perennial grows up to 60 cm high. The leaves are alternate and simple. The lower leaves narrow into the short petiole, entire or dentate. The upper leaves are sessile and rounded at the base, lanceolate, sparsely pubescent above, and are covered below in dense silky hairs or almost glabrous. The stem is upright, round, weakly ribbed, silky-haired to almost glabrous. The root is creeping.

Habitat: The plant is indigenous to Asia and Europe.

Production: Elecampane flowers are the inflorescences of *Inula britannica* and *Inula japonica*, dried in the sun or shade after harvesting.

Not to be Confused With: Arnicae flos

Other Names: Alant-Okleuveasis

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpenes: sesquiterpene lactones, particularly gaillardin but also including britanin

Flavonoids: including isoquercitrin

Caffeic acid derivatives: including chlorogenic acid

EFFECTS

It has been reported that a watery extract of the sesquiterpene-containing drug inhibits in vitro cAMP-phosphodiesterase up to 60%, and prevents the infection of human embryo muscle cells with the herpes simplex virus II. The drug is also assumed to possess potential for sensitization, due to the sesquiterpene lactones with exocyclic methylene groups it contains. The secretolytic and emetic effect with which the drug is credited has not been documented. The flower of the East Asian species is used as a depurative.

INDICATIONS AND USAGE

Unproven Uses: Indications in folk medicine include feelings of fullness in the chest and diaphragm area, vomiting, coughs and symptoms of the efferent urinary tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole and powdered drug.

Preparation: The drug is roasted with a honey solution until it is no longer sticky. A decoction is prepared by boiling 3 to 9 g drug in a sealed sachet.

Storage: Store in a dry place.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl., Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Iijima K, Kiyohara H, Tanaka M, Matsumoto T, Cyong JC, Yamada H Preventive effect of taraxasteryl acetate from *Inula britannica* subsp. *japonica* on experimental hepatitis in vivo. *Planta Med*, 61:50-3, 1995 Feb.

Broad Bean

Vicia faba

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh flower.

Flower and Fruit: The white or bluish short-pediced flowers have black spots on the standard. They are arranged in groups of 2 to 4 in the upper leaf axils. The calyx tips are uneven, with the upper ones shorter than the lower. The pod is leathery and velvety on the flat surface. The seeds are large, flat, ovate or oblong, and brown.

Leaves, Stem and Root: The plant is 60 to 125 cm high. The stem is erect and has no climbers. The leaves are pinnate and the leaflets elliptical, fleshy, blue-green and terminate acutely. The stipules are ovate and semi-saggitate.

Habitat: The plant is indigenous to the temperate regions of the world.

Production: Broad Beans are the seeds of *Vicia faba*.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Pyrimidine derivatives: vicine (vicioside, 0.4-0.8%), convicine (0.1-0.6%)

Lectins: The isolectins mixture is referred to as favine

L-3,4-dihydroxyphenylalanine (L-DOPA, up to 8%)

Starch

Proteins (26%)

Tannins (2%)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Formerly, Broad Bean flowers were used in the treatment of coughs and kidney and genital complaints. Externally, they are used as a poultice for skin inflammation, warts and burns.

Homeopathic Uses: An essence of the fresh plant after flowering is used in homeopathy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Following division of the glycosides in the intestine resorption and oxidation through dehydration of SH-groups in the erythrocyte membrane, the pyrimidine derivatives can, in high dosages, lead to hemolysis.

OVERDOSAGE

The intake of large quantities of raw or only briefly cooked seeds can lead to queasiness, vomiting, diarrhea and feelings of vertigo. In severe cases, overdosage may lead to acute hemolytic anemia with fever, icterus, hemoglobinuria, oliguria and anuria, particularly among individuals with genetically caused glucose-6-phosphate-dehydrogenase deficiency (inadequate protection of the erythrocytes by glutathione), which is also known as favism. Favism is treated by transfusion of washed erythrocytes and administration of prednisone. Elevations in blood pressure are also possible due to the L-DOPA content of the seeds.

DOSAGE

Mode of Administration: Broad Bean preparations are now obsolete.

Brooklime

Veronica beccabunga

DESCRIPTION

^ *Medicinal Parts:* The medicinal parts are the fresh flowering plant freed from the root, the fresh aerial parts collected during the flowering season and the whole plant.

Flower and Fruit: The flowers are in loose, axillary, diagonal clusters. The accompanying leaves are linear, as long as or shorter than the flowers. The peduncles and pedicels are glabrous. The calyx is dorsiventral and divided into 4. The sepals are lanceolate to spatulate and acuminate; the front ones are larger than the back ones. The corolla is rotate with a very short tube, 4 to 9 mm wide and azure blue. The ovary is green and the stigma capitulum-like. The fruit is a cordate, almost globular, narrow-winged capsule. The seeds are 0.6 mm long and 0.45 mm wide. They are yellow, oval and flatly convex with a fairly smooth back.

Leaves, Stem and Root: The plant is a perennial with a creeping rhizome. The stem is ascending, up to 50 cm high, round and filled with latex. The leaves are petiolate, ovate or "W broad elliptical, obtuse, narrowly serrate, glabrous and glossy.

Habitat: The plant is indigenous to almost all of Europe, western and northern Asia and northern Africa, and is naturalized in eastern North America.

Production: Brooklime is the aerial part of *Veronica beccabunga*. The collection or picking occurs in uncultivated regions in Europe, west and north Asia, North Africa and North America.

Other Names: Beccabunga, Mouth-Smart, Neckweed, Speedwell, Water Purslane, Water Pimpernel

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes: aucubin (0.8%)

Flavonoids: including among others scutellarin glycosides

£ The drug has not been extensively investigated.

EFFECTS

Brooklime has a diuretic effect.

INDICATIONS AND USAGE

Unproven Uses: Brooklime is used to lessen the elimination of urine. It is also used for constipation, liver complaints, dysentery and lung conditions. The drug has also been reported to be effective against bleeding of the gums.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

LITERATURE

Broom Corn

Sorghum vulgare

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds.

Flower and Fruit: The flowers and inflorescences are large spadix-like and solitary. They may also be in pairs and terminal on long, stiff, indistinct panicles. The panicles may be bushy-branched or occasionally tangled-branched. The individual spikelets are usually ovate to round, and the spels are usually broad-lanceolate. The spels become hard, shiny and dentated at the tip. The seeds are small, round and white.

Leaves, Stem and Root: The plant is reed-like and similar to maize but is not as tall.

Habitat: The plant is common in Spain, Italy and southern Europe. It is widely cultivated in the U.S.

Production: Broom Corn seeds are the seeds of *Sorghum vulgare*.

Other Names: Darri, Durri, Guinea Cora, Sorghum

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyanogenic glycosides: dhurrin (in the fruits, in contrast with the foliage [250-700 mg/100 gm] only in very low concentrations: 0.005-5 mg/100 gm)

Starch (70%)

Proteins (10%)

Fatty oil (3%)

Vitamins of the B group: thiamin (B1), riboflavine (B2)

EFFECTS

Broom Corn is a demulcent that is soothing to the alimentary tract.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the seeds' are used for digestive disorders, but it is mainly used as a cereal grain.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Broom Corn can be administered as an infusion, but is mostly used as a cereal grain.

Brown Kelp

Macrocystis pyrifera

DESCRIPTION

Medicinal Parts: The medicinal part is the thallus.

Flower and Fruit: This brown algae grows up to 100 m long. Generations switch between sporophyte and gametophyte. The haploid male or female gametophytes are tiny plantlets. The 50 to 100 m long sporophyte is made up of root-like rhizoids, a rope-like cauloid, and phylloids that are leaf-like, coriaceous-thick sections with a large elongate to pear-shaped air-bladder at the base. The rhizoids form a conical adhesive disc of up to 1 m in diameter. The phylloids grow up to 1 m long, are attached to the cauloid-like leaflets and are covered with sporangia.

Habitat: Found along the west coast of United States (primarily California) and along the coast of Chile.

Production: Brown algae thallus is the dried thallus, usually only the phylloid, of *Macrocystis pyrifera*. (*Macrocystis integrifolia* may be added.) The algae are harvested using vessels called mowing ships.

Other Names: Giant Kelp, Long-Bladder Kelp, Sea Kelp

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Alginic acid (15 to 20%)

Polysaccharides: fucoidan, laminaran

Iodine (0.1 to 0.5%): to some extent organically bound

Proteins

Cyclitols: laminitol (4-C-methyl-meso-inositol)

Sugar alcohols: mannitol

EFFECTS

Brown algae thallus serves chiefly as a source of iodine. The drug has also been demonstrated to have an influence on the immune system, as well as antiviral qualities. In a study with 400 women, the daily intake of 5.5 g of macrocystis powder over a period of 6 to 8 weeks led to an elevation of hemoglobin levels of 86% over normal values. Although licensed as a substance to aid weight loss, no adequate experimental data are available to support that effect.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include weight reduction. The drug is used as a commercial pharmaceutical preparation in the U.S. for anemia in pregnancy. In Japan the drug is used for hypertension.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

CONTRAINDICATIONS

Brown Kelp should not be used by individuals with a familial disposition to thyroid illness or hyperthyroidism.

OVERDOSAGE

Long-term administration of daily dosages that exceed 150 micrograms iodine carry with them the danger of worsening an existing hyperthyroidism. Quantities over 300 micrograms iodine per day can precipitate hyperthyroidism.

DOSAGE

Mode of Administration: Brown Kelp preparations are available for internal use.

Storage: Store in tightly sealed container.

LITERATURE

Brunfelsia hopeana

See Manaca

Bryonia alba

See *White Bryony*

Bryonia cretica

See *Red Bryony*

Buckthorn

Rhamnus catharticus

DESCRIPTION

Medicinal Parts: The medicinal parts are the whole, ripe, dried fruit and the fresh ripe fruit.

Flower and Fruit: The small, dioecious, greenish-yellow flowers are in axillary cymes. The calyx is fused, has 4 segments and droops. The petals are small and are on the edge of the calyx tube, which has short stamens. The ovary is 4-valved with a style that is divided in 4. The fruit is a pea-sized, black berry-like drupe. The seeds are 5 mm long and triangular with a narrow split, which separates slightly at the end and is surrounded by a cartilaginous margin.

Leaves, Stem and Root: The plant occurs in a variety of forms, usually as a bush that is up to 3 m in height, but occasionally as a tree with a bent trunk that grows up to 8 m. The boughs are usually stiffly spread; the branches are more or less clearly opposite, glossy, glabrous or occasionally pubescent and end in a thorn. The leaves are clustered on the older branches, opposite on the younger ones. They are ovate or elliptical, finely serrate with 2 to 3 lateral ribs curved towards the midrib.

Characteristics: The flowers are fragrant, the heartwood is orange-red.

Habitat: The plant is common all over Europe, Western Asia and North Africa.

Production: Buckthorn, consists of the dried ripe berries of *Rhamni catharticus* and its preparations. Buckthorn is harvested in uncultivated regions in autumn and dried.

Not to be Confused With: May be confused with the fruit of *Frangula alnus*.

Other Names: Hartsthorn, Common Buckthorn, Purging Buckthorn, Way thorn, High way thorn, Ramsthorn

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (2 to 7%): anthranoids, chief components glucofrangulin A, diacetylglucofrangulin, frangulin A

Flavonoids (1 to 2%): including catharticin (rhamnocitrin-3-O-rhamnoside), xanthorhamnine (rhamnetin-3-O-rhamnoside)

Tannins (3 to 4%): oligomeric proanthocyanidins

EFFECTS

The drug has a laxative effect because of the anthranoid content. Anthranoids have an anti-absorptive hydrogogic effect resulting in a more liquid stool and an increase in volume of the content of the intestine.

INDICATIONS AND USAGE

Approved by Commission E:

- Constipation

Buckthorn is used internally for constipation and for bowel movement relief in cases of anal fissures and hemorrhoids. It is used after recto-anal surgery and in preparation for diagnostic intervention in the gastrointestinal tract and to achieve softer stool.

Unproven Uses: In folk medicine it is used as a diuretic (in 'blood-purifying' remedies).

Homeopathic Uses: *Rhamnus catharticus* is used for poor digestion.

CONTRAINDICATIONS

Contraindicated in intestinal obstruction, acute inflammatory intestinal diseases, appendicitis and abdominal pain of unknown origin. Use during pregnancy or while nursing only after consulting a physician. The drug is not to be administered to children under 12 years of age.

PRECAUTIONS AND ADVERSE REACTIONS

General: Spasmodic gastrointestinal complaints could occur as a side effect to the drug's purgative effect. Long-term use leads to loss of electrolytes, especially potassium ions. This may lead to hyperaldosteronism, inhibition of intestinal motility and enhancement of the effect of cardioactive steroids, which in rare cases may result in cardiac arrhythmias. Nephropathies, edema and accelerated bone deterioration may be the result of long term use.

Drug-Interactions: Resorption of other medications could be reduced due to the laxative effect. In the case of chronic use/overuse, a potassium deficiency leads to an increase in the effect of cardiac glycosides as well as effecting heartbeat-regulating drugs.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

The intake of large quantities of the fresh berries could lead to European cholera or kidney irritation. The question of the increase in probability of developing colonic carcinomas following long-term administration of anthracene drugs has not yet been fully clarified. Recent studies show no connection between the administration of anthracene drugs and the frequency of carcinoma of the colon.

DOSAGE

Mode of Administration: Buckthorn is available in solid pharmaceutical forms and in commercial compounded preparations for oral intake. It is also available parenterally for homeopathic use.

Preparation: To prepare a tea, pour boiling water over 4 gm cut drug and strain after 10 to 15 minutes or put the drug in cold water, bring to boil, boil for 2 to 3 minutes and strain while still warm. (1 teaspoon corresponds to approximately 3.8 gm drug).

Daily Dosage: 2 to 5 gm drug corresponding to 20 to 30 mg hydroxyanthracene derivative per day calculated as glucofrangulin A

Tea — 1 cup mornings and evenings.

The individual dose is the minimum dose required to produce a soft stool. Administration should be limited to a few days.

Homeopathic Dosage: from D3: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1)

Storage: Buckthorn should be protected from light.

Buckwheat

Fagopyrum esculentum

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh aerial parts, and the leaves and flowers collected during the flowering season and later dried.

Flower and Fruit: Short, compact, long-peduncled thryses form in the leaf axils and at the end of the branches. The involucre is 3 to 4 mm long. It has 5 bracts, is pink or white and usually green at the base. The floret has 8 stamens with golden yellow nectaries at the base. The fruit is a sharply triangular achaene.

Leaves, Stem and Root: Buckwheat is an annual 15 to 60 cm high plant with an erect, usually red stem covered in alternating, sagittate and sessile leaves. The lobes are obtuse or rounded with sweeping borders. The lower leaves are petioled, the upper ones less so. The root is fusiform. Tatar Buckwheat (*Fagopyrum tataricum*), which is used in the pharmaceutical industry, is easily distinguishable from *Fagopyrum esculentum* by its green flowers, usually green stems, and curved, dentated and squat achaenes.

Habitat: The plant is indigenous to central Asia and is cultivated in Europe.

Production: Buckwheat herb consists of the flower and leaves of *Fagopyrum esculentum*, which are⁵ harvested (Q* during flowering season and dried. The harvest takes place 50 to 60 days after sowing and before the fruit forms. There is a slight loss of rutin if it is quickly dried (20 to 40 minutes) at high temperatures (105° to 135° C).

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: rutin (up to 8% in the leaves), quercitrin, hyperoside

Anthracene derivatives (naphthodianthrones, chiefly in the blossoms): fagopyrine (0.01%), protofagopyrine

EFFECTS

Buckwheat increases the venous tone (antiedematic, capillary sealing), which can be attributed to the rutin in the herb.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug is used as a venous and capillary tonic and as a prophylaxis to prevent general hardening of the arteries. The drug alleviates venous stasis and varicose veins.

Homeopathic Uses: Buckwheat is used to treat skin and liver diseases with itching and headache.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

OVERDOSAGE

The intake of large quantities of the Buckwheat plant leads to phototoxicoses in animals due to the photosensitizing effect of the naphthodianthrones. There are no dangers for humans in the application of therapeutic dosages.

DOSAGE

Mode of Administration: Buckwheat is taken orally as tablets and in teas.

Preparation: Follow package instructions for making Buckwheat tea.

I*
w *Homeopathic Dosage:* 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); from D6: parenterally: 1 to 2 ml sc, acute, 3 times daily; chronic: once a day (HAB1).

Bugle

Ajuga reptans

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial parts collected during the flowering season and dried.

Flower and Fruit: The flowers are 1 to 1.5 cm long. The flowers are in spikes. They are located in the axils of undivided bracts at the end of the stem. The 5-tipped, hairy calyx is short-stemmed, erect, labiate and campanulate. The tips are triangular and about as long as the tube. The corolla is bright violet-blue, pink or white. It is downy-haired on the outside with a long straight tube, which has a circle of hairs under the stamen. There are 4 stamens with yellow anthers. The 4 mericarps are 2 mm long and finely reticulate.

Leaves, Stem and Root: Ajuga reptans is a shrub, up to 30 cm high with overground rooting runners sprouting from the rosette-like basal leaves. The flower stem is quadrangular, villous above and glabrous below. The rest of the plant is glabrous. The basal leaves are large, long-petioled, spatulate and dentate. The cauline leaves are crossed opposite, short-petioled, small and oval. The lowest or at least the third-lowest stem is flower-bearing. There are some upper false whorls, which are compressed into a false spike.

Habitat: The plant is found in Europe, Britain, and parts of Asia and northern Africa.

Production: The aerial parts of Ajuga reptans are picked when in bloom and dried. Gathered in uncultivated areas (the wild).

Other Names: Bugula, Middle Comfrey, Middle Confound, Sicklewort, Carpenter's Herb

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoid glycosides and ajugols

Phytoecdysone: ajugalactone

Diterpene bitter principles

Caffeic acid derivatives: including rosemary acid

EFFECTS

There is no information available.

INDICATIONS AND USAGE

Unproven Uses: Internally, Bugle is used as an astringent for inflammation of the mouth and larynx. It is also used for gallbladder and stomach disorders. Externally, the plant is used for the treatment of wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Bugle is used topically, in alcoholic extracts, as a water infusion and in teas.

LITERATURE

Bugleweed

Lycopus virginicus

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh or dried herb collected during the flowering season.

Flower and Fruit: The flowers are small, almost radial in dense axillary whorls. The calyx is campanulate with a glabrous tube and 4 or 5 regular, usually erect, tips. The corolla is whitish with the tube only partly showing and a few uneven lobes. The epicalyx and calyx sepals are shorter than in the European variety. There are only 2 fertile stamens with initially parallel, later spreading pollen sacs. The upper stamens are reduced to staminoids or completely disappear. The fruit is a flattened, rectangular, stunted, and smooth nutlet.

Leaves, Stem and Root: The plant is a herbaceous perennial with runners. The quadrangular, 60 cm high smooth stems grow from the perennial creeping root. The stems bear pairs of opposite, short-petioled leaves. The upper ones are dentate and pointed; the lower ones wedge-shaped to entire-margined. They are glabrous and glandular-punctate on the lower surface.

Habitat: The plant grows in North America. Lycopus europaeus, Gypsywort, is a close European relative.

Production: Bugleweed consists of the fresh or dried, above-ground parts of Lycopus europaeus and/or Lycopus virginicus, as well as preparations collected in the wild and air-dried.

Other Names: Sweet Bugle, Water Bugle, Virginia Water Horehound, Gypsywort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Caffeic acid derivatives: rosmarinic acid, lithospermic acid and their oligomers created through oxidation

Flavonoids: including acacetin-, apigenin-, luteolin glycosides, among them cosmosiin, genkwanin, pilloin, apigenin-, acacetin- and luteolin-7-O-glucuronides.

Diterpenes: tetrahydroxy-delta8(9)-pimaric acid methyl ester

Volatile oil (0.1%)

EFFECTS

Bugle weed has antigonadotropic and antithyrotropic effects. It inhibits the peripheral de-iodination of T4. The phenolic constituents of the drug have an atigonadotropic effect. They cause a lowering of the prolactin level and have a depressant effect on the thyroid as a result of an inhibition of iodine transport and the release of preformed thyroid hormone.

INDICATIONS AND USAGE

Approved by Commission E:

- Nervousness and insomnia
- Premenstrual syndrome (PMS)

Unproven Uses: Bugleweed is used for mild thyroid hyperfunction associated with disturbances of the autonomic nervous system. It is also used for tension and pain in the breast (mastodynia). In folk medicine, it is used for functional and organic cardiac conditions, liver and kidney disease.

Homeopathic Uses: *Lycopus virginicus* is used to treat hyperthyroidism in homeopathic preparations.

CONTRAINDICATIONS

The drug is contraindicated in hypofunction of the thyroid and thyroid gland enlargement without function disturbance. There should not be any simultaneous administration of thyroid hormone preparations.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

Drug Interactions: No simultaneous administration of thyroid preparations. Administration of *Lycopus* preparations disturbs the administration of diagnostic procedures with radioactive isotopes.

OVERDOSAGE

Enlargement of the thyroid gland is possible only through administration of the drug in very high dosage. Sudden discontinuation of *Lycopus* preparation can lead to a rebound phenomenon with increased TSH secretion and prolactin secretion, as well as an increase of the hyperthyroid symptom complex and mastodynia.

DOSAGE

Mode of Administration: Comminuted herb, freshly pressed juice and other galenic preparations for internal use.

Daily Dosage: The average daily dose is 1 to 2 gm of the drug for teas, and water-ethanol extracts containing the equivalent of 20 mg of the drug.

Each patient has his own individual optimal level of thyroid hormone. Only rough estimations of dosage are possible for thyroid disorders, in which age and weight must be considered.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1)

Bulbous Buttercup

Ranunculus bulbosus

DESCRIPTION

Medicinal Parts: The medicinal parts are the latex and the fresh flowering herb with root.

Flower and Fruit: The large golden yellow flowers consist of 5 sepals hanging down, 5 petals on grooved stems and numerous stamens and ovaries. The small fruit has a short curved beak.

Leaves, Stem and Root: The plant grows from 10 to 30 cm high and has a tuber on the underground part of the stem. The basal leaves are long-petioled, trifoliolate with orbicular and pinnasect leaflets. The middle one has a longer petiole and is sheath-like at the base. The stems are branched and tuberously thickened at the base. The plant is appressed pubescent above and patently pubescent below.

Habitat: The plant grows in the northern parts of Europe and in the northeastern U.S.

Production: Bulbous Buttercup is the whole plant in flower of *Ranunculus bulbosus* with root.

Other Names: Crowfoot, Cuckoo Buds, Frogwort, King's Cup, Meadowbloom, Pilewort, St. Anthony's Turnip, Frogfoot, Goldcup

ACTIONS AND PHARMACOLOGY

COMPOUNDS

The glycoside ranunculin: changes enzymatically when the plant is cut into small pieces, and probably also when it is dried, into the pungent, volatile protoanemonine that quickly dimerizes to non-mucous-membrane irritating anemonine. When dried, the plant is not capable of protoanemonine formation.

EFFECTS

The active agents cause signs of toxic irritation; the drug is also said to cause symptoms of drowsiness and tiredness.

INDICATIONS AND USAGE

Homeopathic Uses: The herb is used for skin diseases, rheumatism, gout, neuralgia, influenza and meningitis.

CONTRAINDICATIONS

The administration of the drug during pregnancy is absolutely contraindicated.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug.

Extended skin contact with the freshly harvested, bruised plant can lead to blister formation and cauterizations that are

difficult to heal due to the resulting protoanemonine, which is severely irritating to skin and mucous membranes. If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritation of the urinary drainage passages, are possible. Symptomatic treatment for external contact should consist of mucilage, after irrigation with diluted potassium permanganate solution; in case of internal contact, activated charcoal should follow gastric lavage.

Pregnancy: The administration of the drug during pregnancy is absolutely contraindicated.

OVERDOSAGE

Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments.

DOSAGE

Mode of Administration: The herb is used as an extract in homeopathic dilutions.

Bupleurum chinense

See *Chinese Thoroughwax (Chai-Hu)*

Burdock

Arctium lappa

TRADE NAMES

Burdock Root (available from numerous manufacturers).

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the ripe seed and the fresh or dried roots.

Flower and Fruit: The crimson flowers grow in long-peduncled, loose cymes. The heads are fairly large, globose and almost glabrous. All flowers are funnel-shaped and androgynous. The bracts are green and coriaceous with a barb-shaped inward-curving tip. The fruit is compressed and has a bristly tuft, which falls off easily. The fruits separate from their stems on ripening.

Leaves, Stem and Root: The plant grows to a height of 80 to 150 cm. The stem is erect, rigid, grooved, branched and downy to wooly. The leaves are alternate, petiolate, broad to ovate-cordate. They are blunt and slightly wooly to hairy on the underside. The lowest leaves are very large and have a latex-filled stem.

Habitat: Burdock grows in Europe, northern Asia and North America.

Production: Burdock root consists of the fresh or dried underground parts of *Arctium lappa*, *Arctium minus* and/or *Arctium tomentosum*. Roots are gathered in the autumn of the plant's first year or the early part of the second year.

4p *Other Names:* Bardana, Beggar's Buttons, Burr Seed, Clot-Bur, Cockle Buttons, Cocklebur, Fox's Clote, Great Burr, Happy Major, Hardock, Hareburr, Lappa, Love Leaves, Personata, Philanthropium, Thorny Burr

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (small amounts) of very complex make-up: including, among others, phenylacetaldehyde, benzaldehyde, 2-alkyl-3-methoxy-pyrazines

Lignans: neoarchitin A

Sesquiterpene lactones

Polyynes: chief components are trideca-1, 11-dien-3, 5,7,9-tetraen, as well as sulfur derivatives

Caffeic acid derivatives: including chlorogenic acid, isochlorogenic acid

Polysaccharides: insulin (fructose), mucilage's (xyloglucans, acidic xylans)

ff* *Triterpenes:* including alpha-amyrin, omega-taraxasterol, present to some extent as acetic acid ester

Phytosterols: beta-sitosterol, stigmasterol, campesterol and their esters

Tannins

EFFECTS

In vitro, the drug shows mild antimicrobial activity. No other information is available.

INDICATIONS AND USAGE

Unproven Uses: Preparations of Burdock Root are used for ailments and complaints of the gastrointestinal tract, as a diaphoretic and diuretic, and for blood purifying. Externally, they are used for ichthyosis, psoriasis and seborrhea of the scalp. The claimed efficacies have not been documented.

Chinese Medicine: Burdock is used to treat carbuncles, ulcers and erythema of the skin as well as sore throats. Efficacy has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There is a slight potential for sensitization via skin contact with the drug.

DOSAGE

Mode of Administration: Administered as a drug and, for external use, in the form of burdock oil (extract with fat oil).

How Supplied:

Capsules — 460 mg and 475 mg

Fluid Extract — 1:1

Burning Bush

Dictamnus albus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried and occasionally the fresh leaves, the fresh or dried root, and the fresh or dried root rind.

Flower and Fruit: The flowers are terminal racemes and pink with dark veins. They are large and irregular, with 5 sepals and 5 petals. There are 2 bracteoles that are slightly zygomorphous. The 10 stamens are long, threadlike and bent forward. The ovaries have 5 carpels fused at the base on a short gynophore. The fruit is a capsule that bursts open into mericarps ejecting the seeds.

Leaves, Stem and Root: The plant is a 0.5 to 1.5 m high perennial. Numerous erect, unbranched and sticky-glandular-haired shoots grow from the root. The leaves are alternate, odd, 7 to 11 pinnate and transparently punctuated with oil glands.

Characteristics: The plant has a strong lemon or cinnamon fragrance. The oil is easily inflammable.

Habitat: The plant is indigenous to central Europe and parts of Asia, and is cultivated in the northern U.S.

Not to be Confused With: Burning Bush herb can be confused with that of the herb *Dictamnus creticus*. Previous sources cite a confusion between Burning Bush root and Carophyllaceen root.

Other Names: Fraxinella, Dittany, Gas Plant, Diptam

ACTIONS AND PHARMACOLOGY

COMPOUNDS: BURNING BUSH ROOT

Volatile oil: chief components are the fraxinellone derivatives, thymol methylether, beta-pinene, pregeijerene, geijerene

Furoquinoline alkaloids: including skimmianine, gamma-fagarine, dictamnine

Limonoids: including limonin, obacunone, dictamdiol, limonin diosphenol

EFFECTS: BURNING BUSH ROOT

In vitro, a mutagenic effect on *Salmonella typhimurum* and a phototoxic effect on bacteria and yeasts have been observed.

In animal tests, a contraceptive effect was observed through the inhibition of implantation, as well as a slight increase in hair growth of shaved mice after the application of an alcoholic extract.

COMPOUNDS: BURNING BUSH HERB

Volatile oil: chief components (according to breed) anethole (+) estragole, anethole (+) myrcene, limonene, 1,8-cineol, p-cymene (+) estragole

Furoquinoline alkaloids: including skimmianine, gamma-fagarine, dictamnine

Furocoumarins: including psoralen, xanthotoxin, auraptene, bergaptenE

Limonoids: including limonin, obacunone, obacunone acid

Flavonoids: including rutin, diosmin, isoquercitrin

EFFECTS: BURNING BUSH HERB

See Burning Bush root.

A 40% reduction in egg laying by *Clonorchis sinensis* (Chinese liver fluke) was observed when infected rabbits were given an evaporated extract of the drug.

INDICATIONS AND USAGE

BURNING BUSH ROOT

Unproven Uses: Infusion of the root is used to treat stomach disorders, cramps and worm infestation, and to promote menstruation.

In Greece, it is used as a tonic and a stimulant.

Chinese Medicine: Burning Bush root is used for jaundice, inflammation of the skin, rheumatic ailments, fever, hemorrhage of the womb, thread fungus, as a sedative, tonic and for nervous crying in children. It is also found in decoctions for the external treatment of eczema, impetigo and scabies.

Indian Medicine: Burning Bush root is used for amenorrhea and the regulation of labor.

BURNING BUSH HERB

Unproven Uses: In the Middle Ages, the drug was used as a cure or remedy for wounds, to promote menstruation and to aid the expulsion of afterbirth. It served as a urinary aid and was used in the treatment of epilepsy, in combination with mistletoe and peony.

At the end of the 19th century, the drug was applied as an ointment for rheumatism. The infusion is used as a remedy for worm infestation, to treat stomach disorders and cramps and to promote menstruation. In Greece, it is used as a tonic and stimulant.

PRECAUTIONS AND ADVERSE REACTIONS

BURNING BUSH ROOT AND HERB

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The plant can trigger phototoxicoses through skin contact. The furoquinoline derivatives have a mutagenic effect in the Ames test.

DOSAGE

BURNING BUSH ROOT

Mode of Administration: Mostly obsolete as a drug. It is occasionally used in tea mixtures.

Preparation: To prepare a tea infusion, add 1 teaspoon of drug to 2 glasses of hot water.

Daily Dosage: Drink the tea preparation throughout the day.

BURNING BUSH HERB

Mode of Administration: Mostly obsolete as a drug. The herb is sometimes used internally as an infusion.

Preparation: An infusion is prepared by adding 20 gm 01" dried herb to 1 liter of water; or 1 gm fresh or 2 gm dried herb to 1 cup of water.

Daily Dosage: Drink one cup of the infusion 2 to 3 times daily after meals.

Burr Marigold

^ *Bidens tripartita*

DESCRIPTION

Medicinal Parts: The whole Burr Marigold plant is used medicinally.

Flower and Fruit: The flower heads are solitary, erect or inclined, 15 to 25 mm long and wide, generally with no lingual blossoms. There are two rows of bracts. The inner row is ovate and brownish-yellow; die outer is oblong and

green. The petals are brownish-yellow. The fruit is glabrous, distinctly compressed, brownish-green, with thorny edges and 2 to 4 awns.

Leaves, Stem and Root: *Bidens tripartita* is an erect annual growing 15 to 100 cm high with a fibrous fusiform root. The stem is erect, heavily branched, glabrous or somewhat downy, and often brownish-red. The leaves are dark green, opposite and narrow to a short, winged petiole. The leaves are usually 3 to 5 lobed, ovate-rhomboid to lanceolate with pointed, roughly dentate tips and straight or narrowly curved teeth.

Habitat: The plant is found in damp regions throughout Europe.

Production: Burr Marigold is the aerial part of *Bidens tripartita*.

Other Names: Water Agrimony

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including isookanin-7-O-glucoside and tridecane derivatives such as trideca-1,12-dien-3,5,7,9-tetra-

Hydroxycoumarins: including umbelliferone, scopoletin

Polyynes (tridecane derivatives): including trideca-i,12-dien-3,5,7,9-tetra-

Water-soluble polysaccharides

Bitter principles

Tannins

Volatile oil: including eugenol, ocimene, cosmene

EFFECTS

Astringent, diaphoretic and diuretic effects are attributed to the plant, but remain unproven. In a study that has not been described in detail, a choleric effect caused by the flavones and flavonoids was proven.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include gout, hematuria, loss of hair, scurvy and toothache. The roots were used for scorpion bites. It was used for other indications when a diuretic, diaphoretic or astringent effect was desired.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

No information is available.

Butcher's Broom

Ruscus aculeatus

TRADE NAMES

Butcher's Broom (available from numerous manufactures),
Butcher's Broom Root, Curcu Capsules

DESCRIPTION

Medicinal Parts: The medicinal parts are the herb and the rhizome.

Flower and Fruit: The small greenish white flowers are solitary or in a few clusters and grow from the middle of the leaves. They are dioecious. The corolla is deeply divided into 6 segments. In one variety the stamens are fused at the base. In fertile varieties the style is surrounded by a honey gland. The fertile flowers develop into cherry-sized, scarlet berries, which ripen in September and remain on the tree all winter.

Leaves, Stem and Root: The plant is a perennial evergreen subshrub that grows 20 to 80 cm high. The stems are erect, woody and heavily branched. The leaves are small, brown-membranous, triangular to lanceolate, and scale-like. The phylloclades (short shoots spread like leaves) are oblong, stiff, double-rowed, up to 2.5 cm long and terminate in a sharp tip.

Habitat: The plant is indigenous to almost all of Europe, western Asia and North Africa.

Production: Butcher's Broom consists of the dried rhizome and root of *Ruscus aculeatus*.

Other Names: Kneeholm, Pettigree, Sweet Broom, Knee Holly, Jew's Myrtle

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Steroid saponins (4-6%): chief components, ruscine, ruscoside, aglycones neoruscogenin, ruscogenin

Benzofuranes: euparone, ruscodibenzofurane

EFFECTS

In animal tests, there was an increase in venous tone and an electrolyte-like reaction on the cell wall of capillaries. Butcher's Broom is antiphlogistic and diuretic.

INDICATIONS AND USAGE

Approved by Commission E:

- Hemorrhoids
- Venous conditions

The herb is used as supportive therapy for discomfort of chronic venous insufficiency, such as pain and heaviness, as well as cramps in the legs, itching, and swelling. Butcher's Broom also is used as therapy for hemorrhoid complaints, such as itching and burning.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Stomach complaints and queasiness can occur in rare cases.

DOSAGE

Mode of Administration: Extracts and their preparations for internal use.

OVERDOSAGE

Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments.

DOSAGE

Mode of Administration: Buttercup is available as a ground dried herb and as an extract.

Butternut

Juglans cinerea

TRADE NAMES

Black Walnut (*Juglans nigra*), Black Walnut Hulls, Alcohol Free Black Walnut Green Hulls

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark of the tree and root.

Flower and Fruit: The tree has male catkins and female flowers. The male catkins are 5 to 8 cm long. The fruit is 4 to 6.5 cm and ovoid-oblong. The fruit is pubescent, viscid and strong smelling. The hard nut is ovoid-oblong with 4 prominent and 4 less prominent sharp ridges and many broken grooves between them.

Leaves, Stem and Root: Butternut tree grows up to 30 m tall. The bark is gray and deeply fissured. The leaf scars have a prominent pubescent band on their upper edge. The 6 to 12 cm long leaflets are oblong-lanceolate, acuminate and appressed-serrate. They are finely pubescent above, glandular and pubescent beneath.

Habitat: Butternut is indigenous to the forests of the U.S.

Production: Butternut bark is the inner rind of *Juglans cinerea*.

Other Names: White Walnut, Oil Nut, Lemon Walnut, and Black Walnut

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil

Tannins

Juglone

Juglandis folium

EFFECTS

Vermifuge, laxative, tonic.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the bark are used for disorders of the gallbladder, for hemorrhoids and in the treatment of skin diseases. Juglone has antimicrobial, anti-neoplastic and antiparasitic properties as well as being a gentle laxative.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Available preparations include liquid and dry extracts that are used internally and externally.

How Supplied:

Capsules — 95 mg, 500 mg, 3.5 gm

Fluid Extract -1:1

Buttercup

Ranunculus acris

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The golden-yellow, medium-sized flowers are on long, round pedicles. The 5 sepals and 5 petals are close. There are numerous stamens and ovaries. The broad obovate petals are very glossy and have a broad scale on the surface. The small fruit is in an almost globular capitulum.

Leaves, Stem and Root: The leafy plant grows from 30 to 80 cm. The erect stem has few branches. The petioles and

pedicles are appressed and downy. The basal leaves are long-petioled and palmate with rhomboid tips, which are divided into 2 or 3. The similar cauline leaves are shorter-petioled.

Characteristics: The fresh herb is spicy and poisonous; once dried, it is no longer poisonous.

Habitat: The plant is indigenous to northern Europe.

Production: Buttercup is the fresh herb *Ranunculus acris*.

Other Names: Acrid Crowfoot, Batchelor's Buttons, Blisterweed, Burrwort, Globe Amaranth, Gold Cup, Meadow-bloom, Yellows, Yellowweed

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Glycoside ranunculin: as protoanemonine-forming agent in the freshly harvested plant (0.36-2.66% of the fresh weight) that changes enzymatically when the plant is cut into small pieces, and probably also while it is drying, into the pungent, volatile protoanemonine that quickly dimerizes to non-mucous-membrane-irritating anemonine. Once dried, the plant may not be capable of protoanemonine formation.

*Saponins***EFFECTS**

The active agents are ranunculin, protoanemonin and anemonin. On contact with the skin, the juice of the plant causes redness, swelling and blisters. If taken internally, it can lead to burning in the mouth, vomiting, stomachache and pains in the liver.

INDICATIONS AND USAGE

Unproven Uses: Buttercup is used for blisters, bronchitis, chronic skin complaints, neuralgia and rheumatism.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug. Extended skin contact with the freshly harvested, bruised plant can lead to blister formation and cauterizations that are difficult to heal due to the resulting protoanemonine, which is severely irritating to skin and mucous membranes. If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritation of the urinary drainage passages, may occur.

Symptomatic treatment for external contact should consist of mucilaginous, after irrigation with diluted potassium permanganate solution. In case of internal contact, administration of activated charcoal should follow gastric lavage.

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the fresh cabbage head and juice derived from the fresh leaves.

Flower and Fruit: The inflorescences have long-pediced flowers. The flowers are large and have 4 erect, narrowly elliptoid sepals 6 to 12 mm long. The 4 petals are about twice as long as the calyx and are sulphur yellow. The margin broadens at the tip and narrows at the base to an equally long wedge-shaped funicle stem. The stamens are erect and close to the ovary. The central honey gland is almost erect. The fruit is oblong, pod-like, almost cylindrical and has a domed lid. The dividing wall of the fruit is thin as well as pitted and folded between the dark brown seeds, which have a diameter of 1.5 to 4 mm.

Leaves, Stem and Root: The plant can be annual, biennial or perennial. It is about 2 m high and has thin roots. The stem is woody from the first year and is covered in leaf nodes. It has a bluish bloom and is branched toward the top. The leaves are fleshy, blue-green and glabrous. The lower leaves are petiolate, lyre-shaped, pinnatifid or simple. The upper leaves are oblong to linear-oblong, usually entire-margined and narrowed to rounded at the base and sessile.

Habitat: Wild Cabbage was originally found in the Mediterranean region. Today it grows wild as far north as southern England and Helgoland, and cultivated varieties are found in temperate and damp climates worldwide.

Production: White cabbage juice is the juice of *Brassica oleracea*.

Other Names: Colewort

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Mustard oils (breakdown products of the glucosinolates accompanying cell destruction): allyl mustard oil, methyl sulfinyl alkyl isothiocyanates, methyl sulfonyl alkyl isothiocyanates

3-hydroxy-methyl-indole

5-vinyl-oxazolidine-2-thion (goitrin)

Rhodanides

Alkyl nitriles

Amino acids: including S-methyl cysteine sulphoxide, S-methyl methionine sulphoxide and, when extracted from red cabbage, also anthocyanins, including cyanidine-5-O-glucoside-3-O-sophoroside

EFFECTS

Cabbage protects the mucous membrane of the stomach from gastric hydrochloric acid. The gastroprotective effect of the

juice is attributed to the regenerative ability of the mucous membrane that is caused by an anti-ulcer factor (vitamin U).

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include drinking the juice for Roemheld syndrome, gastritis, gastric and duodenal ulcers, gastralgia and subacidity.

Homeopathic Uses: Preparations of the flowering herb are used for hypothyroidism.

Indian Medicine: Cabbage leaves are used for disorders of the thyroid, gastrointestinal tract, itching and cough, as well as for asthma, gout and hemorrhoids.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is available as a standard preparation or prepared from chopped and pressed Cabbage for internal use. Also available in homeopathic preparations.

How Supplied:

Tablet — 500 mg

Preparation: White cabbage (*Brassica Oleracea* Var. *Capitata*) extract is prepared by processing leaves by mashing or using a centrifuge. The resulting mass is pressed through a linen cloth.

Daily Dosage: To augment a bland diet take 1 liter of juice daily for at least 3 weeks but not more than 6 weeks as a dietary additive.

For gastralgia and subacidity, the dose is 1 teaspoonful to be taken before meals, 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc; acute: 3 times daily; chronic: once a day (HAB34).

Storage: The fresh juice will keep for approximately 24 hours if kept cool.

Gaesalpinia bonducella

See *Divi-Divi*

Cajuput

Melaleuca leucadendra

DESCRIPTION

Medicinal Parts: The medicinal part is the oil distilled from the fresh leaves and twigs.

Flower and Fruit: The tree has racemes of small, sessile, creamy white flowers on long terminal spikes up to 15 cm long, which themselves terminate in a tuft of leaves. The flowers have numerous stamens extending to 15 mm.

Leaves, Stem and Root: *Melaleuca leucadendra* is a large tree up to 40 m tall with a flexible trunk and irregular pendulous branches. The tree is covered in a pale, lamellate bark, which is soft and spongy and occasionally peels off its layers. The leaves are alternate, entire-margined, oblong-lanceolate, tapering, ash-colored and on short petioles.

Characteristic: It has an odor reminiscent of camphor and eucalyptus.

Habitat: The plant is indigenous to Southeast Asia and the tropical regions of Australia. It is cultivated elsewhere.

Production: Cajuput oil consists of the essential oil of *Melaleuca leucadendra*. It is extracted from the fresh leaves and twig tips of a number of varieties collected from the wild or from cultivation, followed by air-drying and aqueous steam distillation.

Other Names: White Tea Tree, Swamp Tea Tree, Paperbark Tree, White Wood

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Chief constituents: cineol, (+)-alpha-terpineol, (-)-alpha-terpineol, (+)-alpha-terpineol valerate, (-)-alpha-terpineol valerate, furthermore alpha-pinenes and bicyclic sesquiterpenes, non-rectified oils also contain 3,5-dimethyl-4, 6-di-O-methyl-phloroacetophenone

EFFECTS

In vitro, the drug has an antimicrobial and a rubefacient effect.

INDICATIONS AND USAGE

Approved by Commission E:

- Rheumatism
- Neurogenic pain
- Temporary relief of muscular pain
- Tendency to infection
- Wounds and burns

Unproven Uses: The drug is used for painful muscles and joints in rheumatic disorders, sciatica, lumbago, slipped disk and low back pain. Cajuput is also used for muscular tension and pain following sports injuries such as sprains, bruising, and pulled muscles or ligaments.

CONTRAINDICATIONS

No internal administration of the drug should take place in the presence of inflammatory illnesses of the gastrointestinal area or of the biliary ducts, nor in the presence of severe liver diseases. Preparations containing the oil should not be applied to the faces of infants or small children (glottal spasm or bronchial spasm or even asthma-like attacks or respiratory failure might occur).

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages; however, contact dermatitis is possible.

Pediatric Use: The drug should not be applied to the facial area, in particular not around the nose, of infants and small children (glottal spasms could occur).

OVERDOSAGE

Overdoses of cajuput oil (more than 10 gm) could lead to life-threatening poisonings, due to the high cineole content. Symptoms include including loss of blood pressure, circulatory disorders, collapse and respiratory failure. Vomiting is not to be induced in the case of poisoning, because of the danger of aspiration. Following administration of activated charcoal, the therapy for poisonings consists of treating spasms with diazepam (i.v.), treating colic with atropine, electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. Intubation and oxygen respiration may also be necessary.

DOSAGE

Mode of Administration: Cajuput oil is used only for external purposes.

Calabar Bean

Physostigma venenosum

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds.

Flower and Fruit: The inflorescences are pendulous racemes of bean-like flowers. The fruit is a dark brown pod up to 15 cm long containing two or three dark brown or blackish kidney-shaped seeds that are about 2.5 cm long. They are rounded at the ends, uneven and somewhat polished with the hilum extending along the whole convex side. The cotyledons are whitish.

Leaves, Stem and Root: The plant is a large, perennial, twining, woody climber with large, pinnate, trifoliate leaves.

Habitat: The plant is indigenous to western Africa and is cultivated in India and parts of South America.

Production: The Calabar Bean is the seed of *Physostigma venenosum*.

Other Names: Chop Nut, Ordeal Bean

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (0.3 - 0.5%): main alkaloid physostigmine, secondary alkaloids include physovenine, geneserine, eseramine

mStarch (up to 50%)

Proteic substances

Fatty oil

EFFECTS

The main alkaloid, physostigmine, is miotic, spasmogenic, negatively chronotropic and curare-antagonistic. It causes an increase in tone in the parasympathetic system and the striated muscles. In particular, it causes the pupils to

contract, thus reducing intraocular pressure. It is a glandular stimulant and increases peristalsis of the gastrointestinal tract. It reduces heart rate and is a curare antidote.

INDICATIONS AND USAGE

Unproven Uses: The drug is frequently used in the treatment of glaucoma. It is also a poison antidote. Its use in the treatment of Alzheimer's disease to reduce memory loss and confusion is being investigated.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is only used in the extraction of physostigmine. Symptoms of poisoning include: diarrhea, dizziness, nausea, salivation, stupor, sweats and vomiting.

OVERDOSAGE

Lethal doses can cause muscle twitching, spasms, tachycardia and cyanosis through asphyxiation. Following gastric lavage, poisonings are treated with atropine; in the case of spasms, diazepam is also used. Forced diuresis can be useful. The lethal dose for an adult is 6 to 10 mg of physostigmine (corresponding to approximately 2 to 3 Calabar Beans). Poisonings are possible through inappropriate administration of physostigmine eye drops, due to drainage into the mouth or nose.

DOSAGE

Mode of Administration: As an eye medication, in drops and ointments. It is used as an antidote in the form of an injection solution. For gastrointestinal use, it has been replaced by synthetic prostigmine.

Daily Dosage: Apply 1 to 2 eye drops 3 times daily to the conjunctival sac.

Calamint

Calamintha nepeta

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried foliage, stems, leaves and flowers.

Flower and Fruit: The medium-sized to large flowers are 5 to 20 blossomed cymes. The pedicle is 0 to 22 mm long and the tubular calyx is 3 to 7 mm by 1 to 1.5 mm in size and slightly downy to very downy on the inside. The upper tips are 0.5 to 1.5 mm and the lower ones are 1 to 2 mm, downy. They occasionally have long, ciliate hairs. The corolla is white to lilac and purple.

Leaves, Stem and Root: Calamint is a perennial, 30 to 80 cm high, slightly to densely downy shrub. The leaves are oval, obtuse, almost entire-margined or lightly to deeply crenate-serrate, with 9 teeth on each side.

Habitat: Britain, Europe, northern Africa

Production: Calamint is the above-ground part of *Calamintha nepeta*. It is collected in the wild.

Other Names: Basil Thyme, Mountain Mint, Mountain Balm, Mill Mountain

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.35%): including pulegone, menthone, menthol and its ester, P-bisobolen, cineol, thymol

Triterpenes: including calaminthadiol, ursolic acid

EFFECTS

The drug is a diaphoretic and expectorant.

INDICATIONS AND USAGE

Unproven Uses: Calamint has been used for febrile colds and respiratory diseases. The drug is also used in folk medicine for hiccups, tinnitus, as a diuretic and for stomach complaints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

No information is available.

Calamintha nepeta

See Calamint

Calamus

Acorus calamus

DESCRIPTION

Medicinal Parts: The medicinal part is the rhizome after the removal of all other material.

Flower and Fruit: Green flowers, like small dice, form a tightly packed, slim, conical spadix. The plant is non-fruit-bearing and propagates from the rhizome.

Leaves, Stem and Root: The plant grows from 60 to 100 cm tall. The stem is triangular and sprouts from a horizontal, round root-stock, which has the thickness of a thumb. The upper shoot forms a grooved flower sheath. The leaves are oblong, sword-shaped and arranged in two rows. The leaves have no stems.

Characteristics: The rhizome has an intensely aromatic fragrance and a tangy, pungent and bitter taste. The leaves often undulate on the margins.

Habitat: Today Calamus is found all over the world. It probably originated in India and North America.

Production: Calamus root-stock is the dried, coarsely ground and mostly peeled, root-stock of *Acorus calamus*. Calamus oil is extracted from the same plant.

Other Names: Sweet Flag, Sweet Sedge, Grass Myrtle, Myrtle Flag, Sweet Grass, Sweet Myrtle, Sweet Rush, Sweet Root, Sweet Cane, Gladdon, Myrtle Sedge, Cinnamon Sedge

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief constituents are heavily dependent upon the chemical strain (divtri-, tetraploid); beta-asarone (cis-isoasarone), alpha- and gamma-asarone, beta-gurjuns, acorone (bitter), ZZ-Deca-4,7-dienal (odor-determining)

EFFECTS

Calamus is an aromatic, bitter stomachic, which stimulates appetite and digestion. It has spasmolytic, carminative and sedative effects, in addition to being externally hyperemic.

INDICATIONS AND USAGE

Unproven Uses: The drug is used in the form of teas, for dyspeptic disorders, gastritis and ulcers. It is used externally for rheumatism, gum disease and tonsillitis.

£ *Indian Medicine:* Calamus is used for dyspeptic complaints, worms, pain syndrome and toothache.

Chinese Medicine: Acorus calamus stimulates peptic juices for disorders of the gastrointestinal tract. It is used externally for fungal infections.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Long-term use of this drug should be avoided. Malignant tumors appeared in rats that received Indian Calamus oils over an extended period (tetraploid strain, over 80% β -asarone in volatile oil).

DOSAGE

Mode of Administration: Calamus preparations are for internal and external use. Preparations are used as a bitter, stomachic, carminative, digestant, sedative, rubefacient, balneotherapeutic and corrigent. Calamus is available in tea mixtures, as an oil or extract and as a bath oil.

Preparation: Steep with hot water to make a tea. For use in a bath, add 250 to 500 gm of the drug to the bath water.

Storage: Store for a maximum of 18 months. If in powder form, however, do not keep for more than 24 hours.

Calendula officinalis

See Marigold

California Peppertree

Schinus molle

DESCRIPTION

Medicinal Parts: Medicinal properties have been attributed to the plant's leaves, bark, fruit and gum resin.

Flower and Fruit: The flowers are in apical, heavily branched, hanging, 5 to 30 cm long panicles. The flowers are small, yellowish-white, and their structures are in fives. The calyx is 5-tipped. The flower has 5 petals, 10 stamens and a superior ovary that develops from a carpel. The style is divided into 3. The fruit is a coral red, single-seeded drupe with a diameter of approximately 7 mm, a thin pergament-like exocarp, an oleo-resin-rich mesocarp and a hard endocarp.

Leaves, Stem and Root: The tree is an evergreen, up to 15 m high. The leaves are alternate, up to 25 cm long and odd pinnate. There are 17 to 35 leaflets, 1.6 to 6 cm long, 2 to 8 mm wide, sessile, linear-lanceolate, punctate with oil glands and dentate. The branches hang down.

Characteristics: The leaves give off a pepper-like smell when rubbed; the fruit is aromatic and somewhat sweet.

Habitat: The tree is indigenous to Central America and South America.

Production: California Peppertree (or Peruvian Peppertree) leaves are the leaflets of *Schinus molle*. California Peppertree fruits are ripe unpeeled drupes of *Schinus molle*, which are air- or freeze-dried.

Not to be Confused With: Other *Schinus* species.

Other Names: Australian Pepper Tree, Brazilian Pepper Tree, False Pepper, Peruvian Mastix Tree, Peruvian Peppertree, Weeping Pepper Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS: CALIFORNIA PEPPERTREE LEAVES

Volatile oil (0.2 to 1.0%): chief components including alpha-phellandrene, beta-phellandrene, limonene, including as well T-cadinol, elemol, germacrene D, gamma-eudesmol

Flavonoids: including kaempferol, myricetin, quercetin

Resins

Mucilages

EFFECTS: CALIFORNIA PEPPERTREE LEAVES

The leaves contain unknown bitter substances and tannins, which make administration for inflammatory alterations of the skin and oral mucous membranes plausible.

COMPOUNDS: CALIFORNIA PEPPERTREE FRUIT

Volatile oil (2.0 to 5.0%): chief components including alpha-phellandrene, beta-phellandrene, limonene, alpha-pinene, beta-pinene, including as well camphene, carvacrol, p-cymol, 4-ethyl phenol

Triterpenes: including 3-epiisomasticadienolalic acid, 3-epimasticadienolic acid, isomasticadienonic acid, masticadienonic acid

Fatty oil (in the seeds 6 to 14%)

Resins (with long-chained fatty acids, C22 to C28)

EFFECTS: CALIFORNIA PEPPERTREE FRUIT

The fruit resin is purgative in effect. The essential oil is fungicidal and is said to be excreted primarily through the lungs and the kidneys. No experimental data are available for the traditional areas of administration.

INDICATIONS AND USAGE

CALIFORNIA PEPPERTREE LEAVES

Unproven Uses: Internal uses in folk medicine include infections of the pharynx, respiratory tract conditions, rheumatism (decoction), for leucorrhoea, suppuration of the mucous membranes and hypertension (infusion), for swell-

ings, loss of teeth, conjunctivitis (leaf juice), and as a diuretic. External indications are considered to include uterus prolapse, eye inflammations, joint pains, colds (used as healing baths), as a vulnerary and for rheumatism.

CALIFORNIA PEPPERTREE FRUIT

Unproven Uses: Used internally as a stomachic, tonic, for nausea, vomiting, anuria, gastric complaints, loss of appetite, conditions of the respiratory tract, blennorrhagia, for muscular pain and as a diuretic. Preparations from the fruit are used externally for rheumatism.

PRECAUTIONS AND ADVERSE REACTIONS

CALIFORNIA PEPPERTREE LEAVES AND FRUIT

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

CALIFORNIA PEPPERTREE LEAVES

Preparation: To prepare an infusion, use 30 g drug to 500 ml water.

Daily Dosage: For inflammation of the mucous membranes, gargle with infusion 3 times daily. For wound cleansing, wash wounds with infusion.

CALIFORNIA PEPPERTREE FRUIT

Mode of Administration: Whole and cut drug are used in preparations for internal and external use.

Daily Dosage: No information is given in the literature.

Storage: Tightly sealed, cool, dry and protected from light.

LITERATURE

California Poppy

Eschscholtzia californica

DESCRIPTION

Medicinal Parts: The medicinal parts of *Eschscholtzia californica* are the aerial parts collected during the flowering season and dried.

Flower and Fruit: The bright yellow-to-orange flowers are solitary, axillary and long-pedicled. They are 2.5 to 4 cm in diameter with a cup-shaped receptacle. The sepals are fused. Four crenate petals, orange-red at the base, form an open dish. The stigma is thread-like. There are numerous yellow JP*stamens. The fruit is an oblong, 4 to 6 cm pod-like exploding capsule, which spreads small globular seeds.

Leaves, Stem and Root: *Eschscholtzia californica* is a bluish-green annual or perennial that grows 30 to 60 cm high. The leaves are sparse. The strongly pinnatifid leaves have linear sections and taper to a thin tip.

Habitat: The plant grows in California and is cultivated in central Europe and southern France.

Production: The Californian Poppy herb consists of the aerial parts of *Eschscholtzia californica*. It is collected in uncultivated regions.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids: The main alkaloid is californidine. Included are others, such as eschscholzine (escholzine), α (r)protopine, α -allocryptopine, β -allocryptopine.

Cyanogenic glycosides (in the freshly-harvested plant)

EFFECTS

The main active principle californidine has sleep-inducing, sedative, anxiolytic and spasmolytic effects. In mice, a hot water extract had a significant sleep-inducing effect. In other animal experiments an anxiolytic and spasmolytic effect was proven.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the drug are used for insomnia, aches, nervous agitation, enuresis nocturna in children, diseases of the bladder and liver, reactive agitative and masked depressions, melancholia, neurasthenia, neuropathy, organic neuroses, vegetative-dystonic disorders, mood swings, weather sensitivity, vasomotor dysfunctions, vegetative-endocrine syndrome, constitutional weakness of the nervous system and vasomotor cephalgia. The tea is used as a sedative.

m

Homeopathic Uses: *Eschscholtzia californica* is used to treat insomnia.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: The drug is rarely prescribed, yet is a component of some standardized preparations in combination with plant sedatives. Medical or clinical documentation and other experimental material about phytotherapeutic application of the Californian Poppy herb are unavailable. As the efficacy of the claimed uses has not been documented, a therapeutic application cannot be justified.

Preparation: The tea is prepared using 2 gm herb per 150 ml water. The liquid extract (*Extractum Eschscholziae*) should be prepared according to the German Pharmacopoeia (DAB) 10.

Daily Dosage: The tea is taken as a drink. The average single dose for the liquid extract is 1 to 2 ml.

Homeopathic Dosage: from D2: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); from D4: parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (PF X).

Calotropis

Calotropis procera

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried root and root bark. The bark with its outer cork layer removed is known as Mudar, and is used medicinally.

Flower and Fruit: The fragrant flowers are 2.5 cm in diameter and form umbel-like flower clusters. The erect petals are whitish and have purple spots on the upper half. The bracts of the corolla are smooth or downy with a divided tip. The ovate follicles are 7.5 to 10 cm long by 5 to 7.5 cm wide. The seeds have a tuft of silky hair.

Leaves, Stem and Root: This upright herbaceous perennial normally grows to a height of 1.8 to 2.4 m. The leaves are short-petioled, 6 to 15 cm long by 4.5 to 8 cm wide, oblong-elliptoid to broadly ovate. The bark appears in irregular short pieces, slightly quilled or curved and about 0.3 - 0.5 cm thick. The external portion is grayish-yellow, soft and spongy. The internal portion is yellowish-white. The fracture is short.

Characteristics: The taste is acrid and bitter.

Habitat: Indigenous to parts of Asia, India, Africa, Pakistan and on the Sunda Islands

Production: Calotropis bark is the dried root bark of *Calotropis procera*.

Other Names: Mudar Bark, Mudar Yercum

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroids (cardenolids): including calotropin, calactin, uscharidin

EFFECTS

The cardenolid glycosides calotropine shows an anti-tumor effect in vitro on human epidermoid carcinoma cells of the rhinopharynx. It is also works as an expectorant and a diuretic.

INDICATIONS AND USAGE

Unproven Uses: The powdered root bark is used to treat dysentery. It has a similar effect to that of the ipecacuanha root. In Indian and African folk medicine, the bark is used to treat epilepsy, hysteria, cramps, cancer, warts, leprosy, elephantitis, worms, fever, gout and snake bites. In particular, the milky juice is used against boils, ulcers, swellings and rheumatism. In Africa, it is used to treat toothache, syphilis, digestive disorders and diarrhea.

Indian Medicine: The smoke (fumes) from the bark is used for coughs and asthma and as a sudorific.

Homeopathic Uses: *Calotropis procera* is used for obesity.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

The drug is highly toxic. Higher dosages cause vomiting, diarrhea, bradycardia and convulsions. Very high dosages may cause death. Following gastric lavage, treatment for poisonings should proceed symptomatically (for further measures, see *Digitalis*).

DOSAGE

Mode of Administration: *Calotropis* is used in a ground form, as a powder, as smoke (fume) and also topically.

Daily Dosage: As an expectorant and diaphoretic 200 mg to 600 mg; as an emetic 2 gm to 4 gm.

Homeopathic Dosage: from D4: 5 to 10 drops, 1 tablet, 5 to 10 globules 1 to 3 times daily; from D6: 1 ml injection solution sc twice weekly (HAB1).

Camphor Tree

Cinnamomum camphora

DESCRIPTION

Medicinal Parts: The medicinal part is camphor oil extracted from the tree.

Flower and Fruit: The flowers are small, white and sessile on 1 to 1.5 mm long pedicels. The petals are pubescent on the inside. The flowers are caespitose, on long axillary petioles. The 1.5 mm stamens form 3 circles and are pubescent with broad, sessile-cordate glands. The fruit is a purple-black, 1-seeded, 10 to 12 mm oval drupe.

Leaves, Stem and Root: The plant is an evergreen tree growing up to 50 m tall and 5 m in diameter. The trunk is erect at the lower part and knottily branched above. The leaves are alternate on long petioles, oval-lanceolate, acuminate, grooved and glossy. They are light yellowish-green above and paler beneath; they grow to 5 to 11 cm long by 5 cm across.

Habitat: Camphor trees are indigenous to Vietnam and an *Mpzz* extending from southern China to southern Japan.

Production: Purified camphor is obtained from the chipped wood of the *Cinnamomum camphora* tree using steam distillation followed by sublimation to yield the oil.

Other Names: Gum Camphor, Laurel Camphor, Cemphire

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Camphora is a single substance: D(+) -camphor ((1R,4R)-1,7,7-trimethyl-bicyclo[2.2.1]heptan-2-on), extracted from the volatile oil of the trunk of the camphor tree, *Cinnamomum camphora*. L(-)-camphor also occurs in nature. Synthetic camphor is DL-camphor.

EFFECTS

Used externally, camphor acts as a bronchial secretolytic and hyperemia Internally, the effect is that of a respiratory analeptic and bronchospasmolytic. It should be noted that the effect only sets in at dosages considered toxic. An antibacterial effect has been noted in vitro, with cineol the main active principle.

INDICATIONS AND USAGE

Approved by Commission E:

- Arrhythmia
- Cough/bronchitis
- Hypotension
- Nervous heart complaints
- Rheumatism

Unproven Uses: External uses in folk medicine include muscular rheumatism and cardiac symptoms. Among internal uses are hypotonic circulatory regulation disorders and digestive complaints. Inflammation of respiratory-tract mucous membranes is treated with both internal and external applications.

Indian Medicine: Uses include muscle pain, cardiac insufficiency and asthma.

CONTRAINDICATIONS

Camphor should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: Local administration can lead to skin irritation, as well as to resorbent and/or airborne poisonings. Contact eczema occasionally appears following the application of oily salves containing camphor. The drug is sometimes used as a hashish substitute because 6 to 10 g leads to intoxication.

Pediatric Use: Camphor salves should not be administered to infants.

OVERDOSAGE

Symptoms of poisonings that have been seen, particularly in children, include intoxicated states, delirium, spasms and respiratory control disturbances. Treatment proceeds symptomatically. Less than 1 g can be a lethal dosage for young children. For adults, the lethal dosage is considered to be approximately 20 g. However, toxicity in adults has been noted after use of as little as 2 g.

DOSAGE

Mode of Administration: As a liquid (camphor spirit) for topical application or inhalation, and also semi-solid ointments and liniments. Internally, in liquid or solid preparations.

How Supplied: Commercial pharmaceutical preparations include creams, ointments, balms and gels.

Daily Dosage: Internal average daily dosage: 2 to 4 g drug; 0.05 to 0.2 g essential oil. For external use, camphor spirit (DAB 10) 9.5 to 10.5% camphor to be rubbed in several times a day: Depending on prescribed application, concentrations generally are not higher than 25% for adults and no higher than 5% for small children.

Storage: Camphor should be stored in containers filled so there is no empty air space left and also should be protected from light.

Canadian Fleabane

Erigeron canadensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts of the plant and the fresh aerial parts of the flowering plant.

Flower and Fruit: Canadian Fleabane has very small yellowish-white composite flowers in long, terminal, branched panicle-like inflorescences. The involucre is in a number of rows. The composite head has numerous florets. The ray florets are linguiform, female, white or reddish. The disc florets are tubular and androgynous. The stamens are fused. The fruit is an achene, 1.2 to 1.5 mm long, brownish and has short appressed hair.

Leaves, Stem and Root: *Erigeron canadensis* is an annual or biennial 30 to 100 cm high. The root is thin and fusiform, the stem erect, roundish, slightly ribbed, greenish with paler ribs and is covered in scattered patent hairs. It is branched from the peduncle. The leaves are alternate, pointed, ciliate, narrowly lanceolate and up to 10 cm wide and tapering to the petiole.

Habitat: The plant is indigenous to America but is found globally today.

Production: Canadian Fleabane is the flowering plant and seeds (without the root) of *Erigeron canadensis*. The plant is collected in the wild in high summer, then hung in bundles to dry.

Other Names: Coltstail, Flea Wort, Horseweed, Prideweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: including (++)-limonene, alpha-cis-bergamots, beta-trans-famesene, beta-pinenes, myrcene, cis, cis-matriciamethyl ester (polyne)

Tannins

EFFECTS

The drug is reported to have anti-edema and antiphlogistic effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for diarrhea, dysentery, as an antihelminthic, a mild hemostyptic, for uterine bleeding, gout, rheumatic symptoms, dropsy, tumors, and bronchitis. In African folk medicine, it is used in the treatment of granuloma annulare, sore throats, urinary tract infections and for medicinal baths.

Homeopathic Uses: *Erigeron canadensis* is used for bleeding of the bladder, hemorrhoids, menorrhagia and metrorrhagia, gastritis, hepatitis and cholecystitis

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: The drug is used topically and in alcoholic extracts.

Daily Dosage: Tea: 3 cups daily after meals; Liquid extract: approximately 2 teaspoons.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml 3 times daily sc (HAB1).

Canadian Golden Rod

Solidago canadensis

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts collected during the flowering season, the fresh inflorescences and the flowering twigs.

Flower and Fruit: The yellow composite flowers are in erect racemes facing all directions and are simple or compound. They are medium-sized. The involucre bracts are imbricate and arranged in numerous rows. The ray florets are narrow, lingual and female. The disc florets are funnel-shaped, 5-tipped and androgynous. The fruit is an achene, which is cylindrical with numerous ribs. It is brown, sparsely pubescent and 3.5 to 4.5 mm long with a tuft of hair.

Leaves, Stem and Root: The plant is a perennial that ranges in size from a few centimeters to over 1 m. The rhizome is cylindrical, noded, diagonally ascending and short. The stem is erect, cane-like, angularly grooved above, usually red-tinged beneath, and glabrous to loosely appressed pubescent higher up. The basal leaves are long-petioled, elliptical, acuminate and narrowing to the winged stem. The lower ones are serrate and the upper ones entire-margined.

Habitat: The plant is indigenous to Europe, Asia and North America.

Production: Golden Rod is the aerial part of *Solidago virgaurea*. It occurs in the wild in Hungary, former Yugoslavia, Bulgaria and Poland. Golden Rod herb consists of the above-ground parts of *Solidago serotina* (synonym *S. gigantea*). *Solidago canadensis* and its hybrids are gathered during the flowering season and carefully dried.

Not to be Confused With: Despite qualitative and quantitative differences in their effects, drugs containing *Solidago gigantea* or *Solidago canadensis* are exchanged with *Solidago virgaurea* on the market; confusions with *Senecio* species are also conceivable.

Other Names: Aaron's Rod, Woundwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS: CANADIAN GOLDEN ROD

Triterpene saponins: bisdesmosides of the bayogenin, bearing acylglycosidically-bound arabino residue

Polysaccharides (water-soluble): beta-1,2-fructans, acidic polysaccharides

Volatile oil (0.6%): chief components curlone, germacrene D, alpha-pinene, beta-sesquiphellandrene, limonene

Diterpenes of the trans-clerodane and ladanum types

Carotenoids (as blossom pigments)

Flavonoids (2.4%): rutin (1.4%), including as well hyperoside, quercitrin, astragalgin

Caffeic acid derivatives: including chlorogenic acid

COMPOUNDS: CANADIAN GOLDEN ROD (GIGANTEA VARIETY)

Triterpene saponins (9%): bisdesmoside of the bayogenins: GS1-GS4

Volatile oil (0.5%): chief components gamma-cadinene-diterpenes of the cis-clerodane-type, including among others 6-deoxysolidagolactone IV-18,19-olide

Carotenoids (as blossom pigments)

Flavonoids (3.8%): quercitrin (1.3%), further including among others hyperoside, rutin, isoquercitrin

Caffeic acid derivatives: including among others chlorogenic acid

EFFECTS: CANADIAN GOLDEN ROD

Canadian Golden Rod is diuretic, weakly spasmolytic and, because of the saponin component, antiphlogistic.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Unproven Uses: The herb is used as a flushing-out therapy for inflammatory diseases of the lower urinary tract.

CONTRAINDICATIONS

Irrigation therapy is contraindicated in cases of edema resulting from reduced cardiac and/or kidney function.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a weak potential for sensitization. Care must¹ be taken in patients with chronic renal diseases, and the drug should be used in this patient population only under the supervision of a doctor.

DOSAGE

SOLIDAGINIS VIRGAUREAE HERBA

Mode of Administration: As chopped drug by itself or in combination preparations.

Daily Dosage: The daily dosage is 6 to 12 gm of comminuted drug prepared as an infusion. Fluid intake of at least 2 liters daily is recommended.

Storage: The drug must be protected from light and moisture.

See *Chinese Olive*

Cane-Reed

Costus speciosus

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the rhizome.

Flower and Fruit: The inflorescence is ovoid, apical and 4 to 7 cm long. The zygomorphic flowers are each supported by one narrow, ovate, acuminate, coriaceous, thickly haired, red to red-brown bract. There is a bracteole, which is approximately 2 cm long, violet to brown-red and sparsely pubescent. The calyx is approximately 2.5 cm long, green to red-brown and tubular. The 3 petals are approximately 6 cm long, white to pale pink and silky haired. The corolla tube is approximately 1.5 cm long. The lobes are elliptical to ovate and 6 to 7 cm long. The lobes are white to pale pink, with a yellow lip in the center made up of 5 stamens. When spread out, the lobe is broad obovate and crenate. There is 1 fertile stamen, which is white to yellowish and up to 5 cm long. The style is thread-like and the ovary 3-chambered and inferior. The fruit is a light red, loculicidal capsule. The seeds are black, 2 to 4 mm wide, with a narrow, fleshy aril.

Leaves, Stem and Root: *Costus speciosus* is a herbaceous perennial, upright, up to 3 m high. The leaves have tubular sheaths, which are 0.7 to 1.2 cm in diameter and a pubescent to glabrous. The ligula is 1 to 2 mm long; the leaves are 12 to 25 cm long, 3 to 6 cm wide, narrow elliptical, thorny-tipped, glabrous above and downy-haired beneath. The stem is upright. The rhizome is up to 50-cm long, 3 cm thick and rich in starch.

Habitat: India

Production: Kust or costus root is the dried rhizome of *Costus speciosus*.

Not to be Confused With: Confusion may occur with *Saussurea lappa* and *Canella winterana*. The drug itself is used to adulterate *Gloriosa superba*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins (1 to 4%): chief components dioscin and gracillin, aglycones diosgenin, tigogenin

Steroids: sterols, including beta-sitosterol, beta-sitosterol glucoside

Curcuminoids (3 %): including curcumin

EFFECTS

The saponin fraction of the drug exhibits estrogenic, **antiexudative**, spasmolytic, choleric and anesthesia-pro-

I **longing effects.**

INDICATIONS AND USAGE

Indian Medicine: for febrile conditions, coughs, skin conditions, retention of the placenta, post-partum bleeding, threatening abortion, insufficient uterine contractility and snake bites.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. It is conceivable that gastric complaints and nausea might be experienced, as well as kidney irritation, due to the high level of saponin content.

OVERDOSAGE

Overdose could lead to European cholera, increased diuresis and shock.

DOSAGE

Mode of Administration: Whole herb preparations, cut and powdered drug for internal use.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed) Hagers Handbuch der Pharmazeutischen Praxis. 5. Aufl., Bde 4 - 6 ^Drogen), Springer Verlag Berlin, Heidelberg. New York, 1992-1994

Canella

Canella winterana

DESCRIPTION

Medicinal Parts: The medicinal part is the bark of the tree.

Flower and Fruit: The flowers are small and seldom open. They are violet and fused in clusters to the tips of the branches. The involucre is sometimes fused at the base. The stamens are fused to form a pollen tube. The fruit is an elongate berry with 4 reniform seeds. The fruit changes color from green to blue and then to a shiny black.

Leaves, Stem and Root: Canella winterana is a tree that grows up to 15 m and is only branched at the top. The bark is whitish-yellowish on the outside and chalk-like on the inside. Jjjpie leaves are alternate, oblong, thick, and are a dark, intense laurel-green shade.

Habitat: The tree is indigenous to the Caribbean and Florida.

Not to be Confused With: It is often sold as the rarer Cortex winteranus.

Other Names: Canella alba, White Cinnamon, White Wood, Wild Cinnamon

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (1%): chief components eugenol, cineol, pinene, caryophyllene, myristicin

Resins (8%)

Sesquiterpenes: including muzigadial, warburganal (pungent-tasting dialdehydes)

Mannitol (6-8%)

Starch (12%)

EFFECTS

Canella has a stimulant and tonic effect. The sesquiterpenes contained in the bark have antimycotic and molluscicidal effects.

INDICATIONS AND USAGE

Unproven Uses: In Central and South America, Canella is used internally to treat upset stomach, fever and conditions of the mouth and throat; it is used externally for rheumatism. In the West Indies, it is used to treat scurvy and as a spice.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Canella is available in whole, cut and powdered forms.

Garambola

Averrhoa carambola

DESCRIPTION

Medicinal Parts: The medicinal part is the fruit.

Flower and Fruit: Cymose inflorescences grow from the trunk. The flowers are radial, and their structures are arranged in fives. The petals are free; there are 10 stamens and a 5-chambered ovary. The fruit is a berry, approximately 10 cm long. The berry is acuminate, 5-sided and star-shaped in cross-section. It is translucently amber-yellow.

Leaves, Stem and Root: *Averrhoa carambola* is a tree, that grows up to 5 m high. The leaves are alternate, odd pinnate and 10 to 12 cm long.

Habitat: India

Production: The fruit of the Carambola tree is the ripe fruit of *Averrhoa carambola*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Oxalic acid (0.3% of fresh weight)

Vitamin C (0.05% of fresh weight)

Monosaccharides/polysaccharides

Carotinoids

EFFECTS

No definitive data available.

INDICATIONS AND USAGE

Indian Medicine: Carambola is used for diarrhea, vomiting, severe thirst, hemorrhoids, intermittent fever, scabies and liver pain.

PRECAUTIONS AND ADVERSE REACTIONS

There is no evidence of any health risks connected with limited consumption of the fruit or the preserves made from them. Nevertheless, due to the high oxalate content, which corresponds approximately to that of rhubarb stalks, the ingestion of large amounts over extended periods should be avoided.

DOSAGE

No information is available.

Caraway

Carum carvi

DESCRIPTION

Medicinal Parts: The medicinal part is the fruit and the oil obtained from the squashed fruit when ripe.

Flower and Fruit: The main trunk and the side branches each terminate in a compound flowering umbel of 8 to 16 umbel rays. The epicalyx and calyx are almost non-existent. The florets are white or reddish and very small. The fruit is a schizocarp that is glabrous, oblong and ellipsoid. It consists of 2 mericarps that are 3 to 6 mm long, sickle-shaped, brownish with 5 lighter, angular main ribs (caraway seeds).

Leaves, Stem and Root: *Carum carvi* is usually a biennial, 30 to 100 cm high plant with a fleshy, fusiform tap root. The stem is erect, angular, grooved, filled with latex, glabrous and branched from the ground up. The rosette leaves and the cauline leaves are glabrous and in part tri-pinnate. The lower pinna are typically crossed.

Characteristics: The plant has a caraway taste and an aromatic smell.

Habitat: Caraway is found in Europe, Siberia, the Caucasus, the Near East, the Himalayas, Mongolia and Morocco. Found wild in North America after being introduced.

Production: Caraway oil consists of the essential oil extracted from the ripe fruits of *Carum carvi*. Caraway is harvested when completely ripe and threshed 3 weeks later. The oil is recovered from the crushed seeds by a process of aqueous steam distillation.

Not to be Confused With: Carvon is occasionally added in synthetic form.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

In the berries: volatile oil, fatty oil, polysaccharides, proteins, furocoumarins (traces)

In volatile oil: in particular D-(+)-carvone and D-(+)-limonene

EFFECTS

In animal tests the drug had a spasmolytic effect. The antimicrobial effect has been demonstrated against *bacillus*, *pseudomonas*, and *Candida*; *dermatomyces* are also inhibited. The choleric effect has been described in a study which is not accessible.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints

Unproven Uses: Caraway is used for gastrointestinal cramps, flatulence and feelings of fullness, as well as nervous cardiac-gastric complaints.

In folk medicine, Caraway is used to improve lactation in nursing mothers, as an emmenagogue and to settle the stomach. The essential oil is used as constituent in mouth-washes and bath additives.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

An intake of larger dosages of the volatile oil (see for example in caraway liquor) for extended periods can lead to kidney and liver damage.

DOSAGE

Mode of Administration: Preparations from the essential oil are for internal use. The comminuted fresh drug is used for infusions and other galenic preparations.

How Supplied: Powder, capsules, film tablets, coated tablets, drops and tea.

Preparation: An infusion is prepared by pressing 1 to 2 teaspoonfuls of seeds before using and pouring 150 ml of hot water over it, draining after 10 to 15 minutes.

Daily Dosage: The average single dose of oil is 2 to 3 drops on sugar; caraway, 1 to 5 gm. The average daily dose of oil is 3 to 6 drops; caraway, 1.5 to 6 gm.

Storage: Protect from light and moisture in glass or metal containers.

Cardamom

Elettaria cardamomum

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the seeds and fruit plus seeds harvested shortly after ripening.

Flower and Fruit: The flowering shoots grow on the stem very close to the ground. The panicle branches can grow up to 8 cm. The flowers are alternate and covered by sheath-like bracts before opening. The calyx is slightly wider above, finely striped, obtusely 3-tipped and does not droop. The corolla is greenish white. The lobes are rounded, somewhat curly, white with a yellowish border with blue veins and lines in the center. The only fertile stamen is set into the edge of the petals. The sterile stamens are arranged beside the styles on the receptacle. The pollen is globular and prickly. The ovary is inferior, oblong, obovate with 3 valves, each with 12 horizontal ovules. The fruit is 6 to 18 mm long, 6 to 10 mm thick, short-stemmed, ovate or elliptical to oblong. The seeds are light brown, gray or dark red brownish. They are very roughly wrinkled, 4 to 5 mm long, irregular edged and the whole seed is surrounded by an almost colorless seed coat. Mysore and Malabar cardamoms are usually blanched pale and have a smooth surface. They are sold commercially less often than the Green Aleppy or Ceylon varieties.

Leaves, Stem and Root: *Elettaria cardamomum* is a perennial with a thick, tuberous rhizome and numerous long roots. There are up to 30 erect, glabrous, green stems that are 2 to 3 m high. The leaves are in 2 rows with a leaf membrane at the end of a soft-haired sheath. The leaf surface is lanceolate, clearly acuminate and up to 60 cm long. The leaves are entire-margined, downy above, silky-haired beneath and

punctuated by numerous small oil cells. The seeds are about 4 mm diameter and dark-reddish-brown.

Characteristics: Cardamom has an aromatic and pleasant odor. The taste is aromatic and pungent.

Habitat: The plant is indigenous in southern India and Sri Lanka and is cultivated in tropical regions in southeast Asia and Guatamala.

Production: Cardamom consists of the dried, almost ripe, greenish to yellow-gray fruit of *Elettaria cardamomum*. Medicinal use is limited to the seed, which is removed from its fruit capsule. The main harvest is in October and November of the third year after planting. The fruit is then dried either in the sun or in so-called 'curing houses' and then sorted according to size, form, color etc.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: composition varies according to the specific strain, chief components cineol, alpha-terpinyl acetate, linalyl acetate

Fatty oil

Starch

EFFECTS

The drug is a cholagogue and has virustatic properties. The essential oil (monoterpene) of the drug is antibacterial and antimycotic. In animal experiments the essential oil caused an increase in the secretion of bile and a reduction of gastric juice production.

INDICATIONS AND USAGE

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds
- Inflammation of the mouth and pharynx
- Liver and gallbladder complaints
- Loss of appetite
- Tendency to infection

Unproven Uses: Cardamom is also used for dyspepsia. In folk medicine it is used for digestive complaints, vomiting and diarrhea, morning sickness and loss of appetite as well as Roemheld syndrome.

Chinese Medicine: Cardamom is used for stomachache, nausea, vomiting and flatulence.

Indian Medicine: In Indian medicine, Cardamom is used for disorders of the efferent urinary tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug can trigger gallstone colic, due to its motility-enhancing effect.

DOSAGE

Mode of Administration: Ground seeds, as well as galenic preparations for internal use.

Daily Dosage: The average daily dosage is 1.5 gm of drug. When using a tincture, the dosage range is 1 to 2 gm.

Storage: Cardamom should be stored in a cool, dry place protected from light in tightly sealed containers. The powder can be stored for a maximum of 24 hours. Loose seeds without the testa cannot be stored.

See Carlina Thistle

Carline Thistle

Carlina acaulis

DESCRIPTION

£ *Medicinal Parts:* The medicinal part is the root.

Flower and Fruit: The flowers are made up of individual heads that are 7 to 13 cm in diameter. The disc florets are androgynous, pink to violet, and have a 5-tipped radial corolla. The outer bracts are thorny. The middle bracts consist of glossy white, acuminate, 3 to 4 cm long leaves. The stamens have bristly-tipped appendages. The styles are cylindrical with short stigma lobes. The fruit is 5 mm long, obclavate to cylindrical, and bluntly angular with bifurcated hairs at the tip.

Leaves, Stem and Root: *Carlina acaulis* is a 30 cm high thistle-like, leafy plant with milky latex. The stem is compressed and under 5 cm long. The whorled to alternate leaves are flat or slightly frilled and a little tough, 10 to 20 cm long, pinnatifid to pinnatisect with broad, thorny tips. The rhizome is finger thick and has 1 or more heads.

9> *Habitat:* The plant extends from Spain, Italy and the Balkans across central Europe to central Russia.

Production: Carline Thistle (Dwarf Thistle) is the root of *Carlina acaulis* collected in autumn and dried. It is collected in the wild.

Not to be Confused With: Sometimes Carline Thistle is adulterated by addition of other *Carlina* species.

Other Names: Stemless *Carlina* Root, Dwarf Carline, Ground Thistle, Southernwood Root

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components carlina oxide

Inulin (18 to 20%) (fructosan)

Tannins

EFFECTS

If There is no valid data on the mode of action. The essential oil hinders the growth of *Staphylococcus aureus* up to a dilution of 1:2 X 10⁵. Carline Thistle has mild diuretic, spasmolytic and diaphoretic effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for cholecystopathy, digestive insufficiency and for spasms in the alimentary canal. In Spain, it is used to treat colds and illnesses accompanied by fever.

Externally, it is used as a wash for dermatosis, and to rinse wounds and ulcers; as a mouthwash to alleviate symptoms associated with cancer of the tongue.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Carline Thistle is used both internally and externally.

Daily Dosage: Common preparations and doses are:

Decoction: Boil 3 gm of drug in 150 ml of water for 5 minutes, drink 3 cups daily.

Infusion: 2 teaspoons of the drug to be boiled in 1 cup of water for 10 minutes, leave to draw for half an hour, take 3 to 4 cups daily between mealtimes.

Tincture: 20 gm of chopped drug, left to draw for 10 days in 80 gm of ethanol 60%, use 40 to 50 drops, 4 to 5 times daily.

Wine: Add 50 gm of the drug to 1 L of white wine, leave to draw for a minimum of 12 days, then strain; drink one full small glass before mealtimes.

Externally it is used as a decoction; 30 gm of the drug added to 1 L of water.

Storage: Should be stored in tightly sealed containers.

LITERATURE

Carob

Ceratonia siliqua

DESCRIPTION

Medicinal Parts: The medicinal parts are the fruit and the bark.

Flower and Fruit: The inflorescence is erect and lateral in old wood. It is often bushy, clustered or catkin-like, and unisexual with erect receptacles. There is no corolla. The male flowers have 5 long filaments with long slits and opening pollen tubes. The female flowers have short-

stemmed ovaries. The pods are 10 to 20 cm by 2 cm, tough leathery, brown-violet, flat and often rounded to a horn shape. There are numerous, lumpy and glossy brown seeds.

Leaves, Stem and Root: This walnut-like tree is usually under 6 m high, broad-crowned, sparsely branched and with cracked gray-brown bark. There are 2 to 4 paired pinnate leaves. The leaflets are obovate, 4 to 5 cm long, curved, glabrous, glossy dark green above and red-brown beneath.

Habitat: Indigenous to southeastern Europe and west Asia, otherwise cultivated.

Production: Carob seed flour is the ground endosperm of the seeds of *Ceratonia siliqua*.

Not to be Confused With: Carob Tree, *Jacaranda procera* or *Jacaranda caroba*.

Other Names: St. John's Bread, Locust Bean, Locust Pods, Sugar Pods

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilages: chiefly made up of galactomannanes

Proteic substances

Flavonoids: including isoschaftoside, neoschaftoside, schaftoside

EFFECTS

In various test series and studies, the effect of carob gum on the serum glucose level, the secretion and activity of digestive enzymes, the secretion of gastrointestinal hormones as well as on the serum lipid level was proven. The hypoglycaemic and hypolipidaemic effect is attributed to an increase in viscosity of the gastrointestinal content.

Effects on nitrogen balance, efficacy in infantile diarrhea, as well as an anti-exudative, anticoagulant and antiviral effects have been demonstrated.

INDICATIONS AND USAGE

Unproven Uses: Carob is used in dietary agents for acute nutritional disorders, diarrheal disorders, dyspepsia, enterocolitis, celiac disease and sprue. It is also used for habitual vomiting in babies, acetonemic vomiting, rumination, retching cough and vomiting.

Carob seed flour is used in the production of gluten-free starch bread, which is used for vomiting during pregnancy, celiac disease and obesity.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: It is obsolete as a drug but is included in thickening powders and as a baking aid for gluten-free starch bread.

Preparation: As a baking aid or thickening agent, dissolve in cold liquid, boil for 1 to 2 minutes, cool and mix into the prepared baby food.

Daily Dosage: For a 3 to 10% arabon preparation, add 20 to 30 mg of drug to water, tea or milk, to be drunk during the course of the day. As a baking agent in gluten-free bread for babies, add 1/4 to 1/2 gm of drug (max. 2 gm) to 100 ml liquid; adults 1% to 3% additive to low-calorie starters and desserts.

Carrageen

Chondrus crispus

DESCRIPTION

Medicinal Parts: The medicinal part of carrageen, the Irish seaweed, is the thallus that has been freed from the adhesive disc then dried and bleached in the sun.

Flower and Fruit: Gametangia: The spermatangia are colorless and are at the end of the younger thaljus lobes. The spermatia are 7.5 to 10 µm long and 4 to 5 µm wide; the carposporangia are 20 to 20 µm long and 14 to 25 µm wide and have no outer threads. The tetrasporangia, along with the cruciform arranged tatra spores, are in the medulla of the short side branches.

Thallus: *Chondrus crispus* is a perennial red algae that grows in waters up to 25 m deep. The thallus is usually yellow-green to purplish-brown when fresh, white to yellow and translucent after drying. Thallus fronds, are 10 to 30 cm long on an adhesive disc, arising from a subcylindrical stem. They

then become flattened, curled and sometimes bifid. The segments are linear and usually 3 to 8 mm wide. The margin is linguiform, later repeatedly dividing into bifid thallus lobes. The thallus is cartilaginous and double-layered. The internal tissue is made up of reticulately linked cells. The bark layer is at right angles to the thallus. The bifurcated cell strings are like strings of pearls that are spread radially.

Habitat: Carrageen is found from the coast of Iceland to the Baltic, from northern Russia to the south of Spain, Morocco and the Cape Verde Islands, and also in parts of North America and some Japanese coastal regions.

Production: Carrageen is the dried and bleached thalli of *Chondrus crispus* as well as other varieties of *Gigartina* species. After being cleaned, the algae are left to bleach in the sun, then dried.

Not to be Confused With: Confusion can arise with related species of *Gigartina stellata* and *Gigartina pistillata*.

Other Names: Irish Moss, Chondrus, Carrahan, Carrageennan

ACTIONS AND PHARMACOLOGY COMPOUNDS

Carrageenans: (carrageenine): in particular kappa-, iota- and lambda-carrageenan (muciform galactane sulphates)

Proteins

Mineral salts: including iodides and bromides

EFFECTS

The drug contains hydrocolloids of the carrageenan type. Carrageen is considered a mucilage because it hinders the effect of peptides in digestive enzymes. It also acts as an expectorant and secretory agent. In animal experiments the drug was not absorbed. There are no studies available on absorption in humans. The drug's purported demulcent and antitussive effects have not been confirmed.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine internal uses of Carrageen include as roughage for constipation and as a mucilage for diarrhea, as well as for peptic ulcers. Sometimes a decoction is used for coughs, bronchitis and tuberculosis.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Intracutaneous injections of solutions, however, can trigger local inflammations.

DOSAGE

Mode of Administration: Seldom used as a drug, but is included in compound preparations as syrup and granules.

Preparation: Irish moss extract is prepared using a diluted, almost boiling alkali solution. Filtration and vacuum inspissation follow prior to extensive dehydration. A decoction is prepared by combining 1.5 g drug with 1 cup water.

Storage: The drug should be stored in tightly sealed containers.

Cascara Sagrada

Rhamnus purshiana

TRADE NAMES

Cascara Sagrada (available from numerous manufacturers), Cascara Sagrada Bark Mild Stimulant Laxative, Cascara Sagrada Natural Laxative, Cascara Sagrada Bark

DESCRIPTION

Medicinal Parts: The medicinal part is the dried bark.

Flower and Fruit: The flowers are in axillary richly blossomed racemes. The receptacles are green and the sepals are larger than the petals. Both receptacles and sepals are white. The ovary is longer than the style and is trilobular. The fruit is dark purple and top-shaped. The seeds are ovate, black, glossy, domed on the outside and have a distinct line on the inside.

Leaves, Stem and Root: The plant is either a bush or a 6 to 18 m tall tree with branches which are gray tomentose when young. The leaves are oblong-ovate, rounded at the base or sometimes narrowing at the petiole. On the longer shoots they are up to 17 cm long and 7.5 cm wide with an 8 to 18 mm long petiole. The margins are finely dentate and the young leaves are tomentose, later becoming dark-green but not coriaceous even in autumn.

Habitat: The plant is indigenous to the western part of North America and is cultivated on the Pacific coast of the U.S., Canada and in eastern Africa.

Production: Cascara Sagrada bark consists of the dried bark of *Rhamnus purshiana*.

Not to be Confused With: The bark of other *Rhamnus* species.

Other Names: Purshiana Bark, Sagrada Bark, Sacred Bark, Bitter Bark, Yellow Bark, Dogwood Bark, California Buckthorn, Chittam Bark, Cascara Buckthorn

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (8-10%): anthranoids, chief components cascariosides A and B (stereoisomeric aloin-8-glucosides), C and D (stereoisomeric 11-deoxy-aloin-8-glucosides), E and F (C-glucosyl-emodin-anthron-8-glucosides), further including aloin, 11-deoxyaloin

EFFECTS

Laxative Effects

The anthranoid compounds of Cascara are carried unabsorbed to the large intestine where the active aglycon is released by bacterial hydrolysis of the sugar. The intestinal bacterial flora reduces anthraquinone aglycons to the active components of 1,8-dihydroxy-anthracene derivatives, which have the laxative effect (de Witte & Lemli, 1990).

The anthranoids are anti-absorptive, hydrogogic and inhibit the absorption of electrolytes and water from the colon. The laxative effect is caused by an increase in the volume of the intestinal contents with the resulting increase in pressure and stimulation of intestinal peristalsis. In addition, stimulation of the active chloride secretion into the intestine by nitric-oxide-donating compounds or nitric oxide itself increases water and electrolyte content (Izzo, 1998). Aloin and other anthranoid derivatives stimulate prostaglandin production in isolated segments of intestinal tissue, thus contributing to the cathartic action (Cohen, 1982; Capasso, 1983).

CLINICAL TRIALS

Bowel Preparation

The effectiveness and acceptability of three bowel-cleansing regimens was determined in 271 patients for colonoscopy. Senna laxative (X-prep), combined with a saline enema, a polyethylene glycol electrolyte lavage solution (Golytely 4 liters) or combined regimen of Cascara-Salax laxative (PicoSalax) and 1.5l Golytely was administered. No clinically important differences were found between the three bowel preparation regimens (Borkje, 1991).

A prospective, randomized clinical trial was conducted to determine the side effects, patient acceptance, residual liquid and stool during colonoscopy and also quality of examination of three colon cleansing methods. Three hundred ambulatory patients were randomly assigned to one of the following three groups for colon preparation: Group 1, (4 liters of Golytely), group 2, (2 liters of Golytely combined with Cascara-Salax), and group 3, (X-Prep (a Senna preparation) combined with an enema). X-Prep caused significantly more abdominal cramps than Group 1 or Group 2. Vomiting was most frequent with Group 1, and the patients preferred X-Prep to 4 liters of Golytely. The cleanest colon was obtained with 4 liters of Golytely; 2 liters of Golytely with Cascara-Salax was least effective. The quality of the examination was equal in groups 1 and 3, which were both significantly better than group 2 (Hangartner, 1989).

INDICATIONS AND USAGE

Approved by Commission E:

- Constipation

Cascara Sagrada is used for constipation, relief of defecation with anal fissures, hemorrhoids, and as a recto-anal postoperative treatment. The herb is also used in preparation of diagnostic procedures of the gastrointestinal tract and to obtain a soft stool.

Unproven Uses: In Folk medicine, Cascara is used as a tonic and for cleaning wounds.

Homeopathic Uses: The herb is used for rheumatism and as a digestive aid.

CONTRAINDICATIONS

The drug is contraindicated in intestinal obstruction, acute inflammatory intestinal disease (colitis, Crohn's disease, irritable bowel), appendicitis and abdominal pain of unknown origin. Cascara drug is not to be administered to children under 12 years of age.

PRECAUTIONS AND ADVERSE REACTIONS

General: Spasmodic gastrointestinal complaints can occur as a side effect to the drug's purgative effect. In rare cases, prolonged use may lead to heart arrhythmias, nephropathies,

edema and accelerated bone deterioration. Intake of the fresh rind could lead to European cholera, intestinal colic, bloody diarrhea and kidney irritation.

£T *Electrolyte Abnormalities:* Long-term use leads to loss of electrolytes, in particular potassium ions. Hyperaldosteronism, albuminuria, hematuria, inhibition of intestinal motility, and muscle weakness may occur. Enhancement of cardioactive steroids and antiarrhythmics may also occur as a consequence of hypokalemia.

Carcinogenesis: The probability of carcinomas in the colon following long-term administration of anthracene drugs has not yet been fully clarified. Cascara glycoside may act as weak promoters in colon carcinogenesis in animal models (Mereto, 1996). One study determined aloe-enriched diets did not promote incidence and growth of adenomas, carcinomas or significant hepatotoxicity after 20 weeks (Siegers, 1993a). Anthranoid laxative abuse is a relative risk factor for colorectal cancer (Siegers, 1993b).

Drug Interactions:

ftk — Thiiazide Diuretics/Corticoadrenal Steroids/Liquorice Root — These drugs may potentiate potassium deficiency when used concomitantly with Cascara.

Antiarrhythmics — Loss of potassium associated with prolonged use of Cascara may potentiate arrhythmias when given concomitantly with antiarrhythmic medications.

Digitalis Glycosides — With prolonged use or abuse of Cascara, loss of potassium may potentiate digitalis toxicity.

Indomethacin (NSAIDS) — Indomethacin given concomitantly with anthracene derivatives had a decrease in therapeutic effect due to the inhibition of prostaglandin E2 (SEE EFFECTS) (Cohen, 1982; Capasso, 1983).

Pregnancy: Use during pregnancy or while nursing only after consulting a physician.

Nursing Mothers: Cascara has been identified by the American Academy of Pediatrics as compatible with breastfeeding. (Hagemann, 1998).

•* *Pediatric Use:* The drug is not to be administered to children under 12 years of age.

DOSAGE

Mode of Administration: Liquid or solid forms of medication are exclusively for oral use. The drug is used as comminuted drug, powder or dry extracts for infusions, decoction, and as a cold maceration or elixir.

How Supplied:

Capsule — 425 mg, 440 mg, 450 mg, 850 mg

Preparation: To prepare an infusion, add 2 gm finely cut drug to boiling water and strain after 10 minutes. (1 teaspoonful = 2.5 gm drug)

Daily Dosage: Administer 20 to 30 mg hydroxyanthracene derivatives daily, calculated as cascaroside A.

Tea: Take 1 fresh cup mornings and evenings.

Homeopathic Dosage: from D3: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34)

Note: The individually correct dosage is the smallest dosage necessary to maintain a soft stool. Stimulating laxatives must not be used over a period of more than 1 to 2 weeks without medical advice.

Cascarilla

Croton eluteria

DESCRIPTION

Medicinal Parts: The medicinal part is the dried bark.

Flower and Fruit: The flowers are small, with white petals and a pleasant fragrance.

Leaves, Stem and Root: The plant is a small tree that rarely grows to more than 6 m. It has small, opposite, ovate-lanceolate leaves about 5 cm long. Scales beneath densely cover the leaves, giving them a silver-bronze appearance. Above, the scales are scattered and white. The bark occurs in short quilled pieces, usually with a chalky, more or less cracked, white surface, with black dots due to the fruit of lichens. The transverse fracture is reddish-brown.

Characteristics: The taste is aromatic and bitter.

Habitat: Indigenous to the West Indies, also grown in tropical areas of America.

Production: Cascarilla bark is the bark of *Croton eluteria*.

Other Names: Sweet Wood Bark, Sweet Bark, Bahama Cascarilla

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1.5 to 3%): chief components are p-cymene, limonene, alpha-thujone, pinenes, linalool, myrcene, terpenol-4

Diterpene bitter principles: including Cascarillin A (15%)

Resins (25%)

EFFECTS

Cascarilla is a stimulant and a tonic.

INDICATIONS AND USAGE

Unproven Uses: Cascarilla is used for digestive disorders, diarrhea and vomiting.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Available as a powder, liquid extract or tincture.

Cashew

Anacardium occidentale

DESCRIPTION

«P» *Medicinal Parts:* The medicinal parts are the finely chopped bark, the cashew nut, the fresh leaves and extracted cashew oil.

Flower and Fruit: Flowers are in terminal, cyme-like, 10 to 20 cm long panicles and are polygamous. The pedicles are 2 to 3 mm long. The calyx is deeply divided into five sepals, which are lanceolate, erect, imbricate, glabrous inside and covered on the outside with short, thick, gray hairs. The corolla is 5-petaled. The petals are lineal-lanceolate, 7 to 8 mm long by 1 mm wide, acute, soft and gray-haired on the outside. The petals are glabrous and yellow with a red stripe on the inside that curls outward in the later stages. Seven to 10 stamens are fused at the base, but only one 8 to 9 mm long stamen is fertile; the sterile ones are shorter. Anthers are yellowish-white, oblong-ovate and burst open along a vertical slit. The gynoecium is obovate, 2 mm long, one-valved and elongates to a 4 mm long wedge-shaped style with a spot-like stigma. The flowers are followed by a fleshy, edible receptacle, which partly encloses the fruit. The fruit is reniform, with a smooth, pale grayish-brown drupe, about 2 to 3 cm long and 1 cm thick.

Leaves, Stem and Root: The Cashew is a broad evergreen tree from 6 to 10 m high with smooth glabrous branches, densely leafed toward the tops. It has short-petioled leaves that are alternate, coriaceous and entire-margined. The leaf blade is obovate, 12 to 14 cm by 6 to 8 cm with a prominent midrib and 10 to 14 veins that are almost parallel.

Habitat: The plant grows in the Caribbean and Central and South America; it is cultivated everywhere in the tropics especially in Africa and India.

Production: Fruit of the Cashew tree is harvested with the stem removed.

Other Names: East Indian Almond

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE SEED CASE

* Alky I phenoles

Anacardic acid

Cardol

Methyl cardol

COMPOUNDS: IN THE SEEDS

Fatty oil

Chief fatty acids: oleic acid and linolenic acid

Proteins

Starch

EFFECTS

It has been demonstrated in vitro that the dried extract prepared with ethanol is effective against the gram-positive bacteria *Bacillus subtilis* and *Staphylococcus aureus*. It also acts as an astringent and cauterizing agent due to the phenolic skin stimulant (anacardic acid) found mostly in the skin of the fruit, but also in the fruit itself.

INDICATIONS AND USAGE

Unproven Uses: Cashew is used for gastrointestinal ailments in Brazil and Nigeria. Cashew shell oil and cashew fruit are used as skin stimulants and cauterizing agents for ulcers, warts and corns. In Brazil and Nigeria, the bark is used to make an astringent decoction to treat toothache and inflammation of the gums. External uses in Haiti include amenorrhea, and internally cashew is used for dysentery. Young leaves are used in the Philippines in the treatment of diarrhea, dysentery and hemorrhoids; older leaves are used as hot poultices for burns and skin disorders. Efficacy for these indications has not been documented.

Indian Medicine: Cashew bark is used for fevers, as a laxative and anthelmintic, and to treat diabetes insipidus. One particular form is used to treat snake bites. Cashew shell oil is used as a runefacient and skin stimulant in the treatment of leprosy, elephantitis, psoriasis and ring worm, in addition to warts and corns.

Homeopathic Uses: Cashew is used to treat severely itching rashes with blistering and also facial erysipelas.

PRECAUTIONS AND ADVERSE REACTIONS

The alkyl phenoles contained in the seed case of the nut are strong skin irritants. Contact between the seed case and skin can lead to erythemas with nodule and blister formation. Frequent contact can lead to rimose exanthemas. The roasted seeds eaten as cashew nuts are free of alkyl phenoles, as is the plant stalk.

DOSAGE

Mode of Administration: Available preparations include acajou oil, cashew oil, oleum anacardiae and fatty oil extracted from the seeds.

Preparation: Preparations are often compounds, particularly in homeopathy.

Homeopathic Dosage: Daily dosage is 5 drops, 1 tablet, 10 globules, every 30 to 60 minutes for acute conditions; or one of those options 1 to 3 times daily for chronic conditions. Parenterally: 1 to 2 ml 3 times daily; Ointments, rinses and poultices: 1 dessertspoon : 1/4L water 1 to 2 times daily (HAB34).

Castor Oil Plant

Ricinus communis

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the seeds, the fat extracted from the oil, the ripe seeds and the dried seeds.

Flower and Fruit: The inflorescences are terminal and almost paniced and 15 to 50 cm long. The pedicled female flowers are in the upper section and the male flowers are clustered in the lower section of the inflorescence. The male ones have a 3 to 5 part perianth with numerous, heavily branched stamens which bear up to 1,000 separate bursting anthers. The female perianth is divided in 5. The ovary is trilobular. The style has 3 red, doubly split stigma branches.

The fruit capsule is soft prickly or smooth and grooved, 1 to 2.5 cm in diameter. The capsule bursts open when ripe flinging out the large brightly speckled seeds.

Leaves, Stem and Root: *Ricinus communis* is an annual plant in Central Europe, a bi- or -triennial shrub in Southern Europe and a perennial tree in the tropics. There is a taproot and lateral roots near the surface. The stem is erect and hollow. As it grows older, the stem becomes green or brownish-red. The leaves are petioled, greenish or reddish, often frosted blue, and arranged in a spiral. The leaf blade is peltate, 10 to 60 cm long and wide. The blade is usually divided into palmate, ovate-oblong or lanceolate lobes. The ribs are palmate and the margins are irregularly serrate.

Habitat: The plant is cultivated widely today in the tropics and subtropics and in temperate latitudes where maize thrives.

Production: Castor Oil is fatty oil obtained from the seeds of *Ricinus communis*. It is obtained by mechanical harvesting followed by sorting. Fruits that open by bursting when ripen, must be harvested before ripening and then threshed.

Not to be Confused With: May be confused with the poisonous seeds of other Euphorbiaceae.

Other Names: Castor Bean, Mexico Seed, Castor Oil Plant, Castor Oil Bush, Palma Christi

ACTIONS AND PHARMACOLOGY

COMPOUNDS

CASTOR OIL SEEDS

Fatty oil (42 to 55%, see below for constituents)

Proteic substances (20 to 25%)

Lectins (0.1 to 0.7%): including ricin D (RCA-60, severely toxic), RCA-120 (less toxic)

Pyridine alkaloids: ricinine (up to 0.3%)

Triglycerides: chief fatty acids ricinoleic acid (12-hydroxy-oleic acid, 85 to 90%)

Tocopherols (vitamin E)

EFFECTS

The laxative principle of Castor Oil is the ricinolic acid. Ricinolic acid is anti-absorptive and secretogic. In animal

experiments, stimulation of PgE2 synthesis in the small intestine was proven. The possible reason for effectiveness of ricini semen is the antimicrobial activity of the seeds (ricin is highly toxic).

INDICATIONS AND USAGE

Unproven Uses: Castor Oil is used internally in folk medicine for acute constipation, intestinal inflammation, for removal of worms, and as a form of birth control. The oil is used externally for inflammatory skin disorders, furuncles, carbuncles, abscesses, inflammation of the middle ear and headaches (poultice.)

Chinese Medicine: In China, Castor Oil is used to treat sore throat, facial paralysis, dry stool, furuncles, ulcers and festering inflammation of the skin.

Indian Medicine: In India, the drug is used for dyspeptic complaints and joint pains.

Homeopathic Uses: *Ricinus communis* is used to treat diarrhea.

CONTRAINDICATIONS

Castor Oil is contraindicated in intestinal obstruction, acute inflammatory intestinal diseases, appendicitis, abdominal pain of unknown origin, during pregnancy and while nursing. The drug is not to be administered to children under 12 years of age.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of Castor Oil. Allergic skin rashes have been observed in rare cases.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Overdosage can lead to gastric irritation with nausea, vomiting, colic and severe diarrhea. Long-term use leads to loss of electrolytes, especially potassium ions. This effect may lead to hyperaldosteronism, inhibition of intestinal motility and enhancement of the effect of cardioactive steroids.

Castor beans are severely poisonous due to the toxic lectin content. The ricinus lectins disturb the function of ribosomes and thereby prevent protein synthesis. 12 castor beans are believed to be fatal for an adult. Symptoms include severe gastroenteritis with bloody vomiting and bloody diarrhea, kidney inflammation, loss of fluid and electrolytes and ultimately circulatory collapse. Death is usually the result of hypovolemic shock.

Following gastrointestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate) and installation of

medicinal charcoal, the therapy for castor bean poisoning includes treating spasms with diazepam (i.v.), generous supplies of fluids, electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. In case of shock, plasma volume expanders should be infused. Monitoring of kidney function and blood coagulation is essential. Papain activated with H₂S has been attempted as an antidote.

DOSAGE

Mode of Administration: Castor Oil is available as whole drug, in solid, semi-solid and in compounded pharmaceutical preparations for internal and external use.

Preparation: Industrial production using specific procedures.

Daily Dosage:

Internally — for acute constipation or as a laxative against worms, at least 5 (x2 g) or 10 (x1 g) capsules must be taken; Castor Oil is also available in compound preparations.

Externally — a paste made of ground seeds is applied to the affected skin areas twice daily. A course of treatment takes up to 15 days.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34)

Cat's Claw

Uncaria tomentosa

TRADE NAMES

Cat's Claw (available from numerous manufacturers), Cat's Claw Power, Cat's Claw Inner Bark, Cat's Claw Bark

DESCRIPTION

Medicinal Parts: The medicinal part is the root bark

Flower and Fruit: The flowers are bisexual and sessile. The calyx is tubular 1 to 2 mm in length and 1 mm in diameter. The corolla is 7-12 mm long, 4 mm in diameter and contains 5 roundish lobes. The stamens are in fives and fused. The anthers are 1 mm in length; the stigma elliptical. The ovary is inferior. The fruits are elliptical, 6-8 mm in length and 4-6 mm wide.

Leaves, Stem and Root: *Uncaria tomentosa* is a large woody vine that sometimes reaches heights of 100 feet. The bark has longitudinal fissures and range from yellow to yellow-green in color. The leaves are simple, opposite, elliptic or ovate. They range in size from 7 to 18 cm in length and from 4 to 13 cm wide. The margins of the leaf are entire, with a roundish base. The spines are woody and occur in pairs. They are curved like a cat's and thorn-like.

Characteristics: The sap of *Uncaria tomentosa* is watery and has an astringent taste.

Habitat: Cat's Claw is indigenous to the rainforest areas of Central and South America

Production: Cat's Claw is harvested in the wild.

Not to be Confused With: There are several plants with the common name of Una de Gato. Confusion can occur with *Anadenanthera flava*, *Bauhinia aculeata*, *Berberis goudotii*, *Celtis uguaanae*, *Doxantha unguis catti*, *Mimosa albida*, *Pisonia aculeata*, *Rubus urticaefolius*, the various *Smilax* species and *Zanthoxylum panamensis* (Obregon, 1995).

Other Names: Una de Gato, Paraguaya, Garbato, Tamborhausca, Toron

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alkaloids: including 5-alpha-carboxystrictosidine, isopteropodine, mitraphylline, isomitraphyllin, isorynchophylline, rynchophyllin

Triterpenes

Organic acids: oleanolic acid, ursolic acid

Glycosides: quinovic acid glycosides

Procyanidins: (-)-epicatechin, cinchonain 1 a, cinchonain 1b

Sterols: beta-sitosterol (60%), stigmasterol, campesterol

EFFECTS

Anti-inflammatory/Immunostimulating Effects — The sterol components of Cat's Claw have been found to have anti-inflammatory activity (Scnatore, 1989). Carrageenan-induced rat paw edema was shown to respond to per oral doses of various extracts of Cat's Claw dried root bark (Aquino, 1991). The beta-sitosterol fraction, which accounts for 60% of the total steroid content in the herb is thought to be responsible for most of the anti-inflammatory effect (Senatore, 1989). Uncaria tomentosa extract has been found to stimulate interleukin-1 and interleukin-6 production by alveolar macrophages (Lemaire, 1999).

Effects on Platelet Aggregation — Rhynchophylline, an alkaloid present in Cat's Claw, has been found to inhibit venous and cerebral thrombosis in rabbits. It has also demonstrated platelet aggregation inhibition (Chen, 1992).

Effects on Serotonin and Dopamine — In one study, rhynchophylline increased the serotonin levels in the hypothalamus and cortex of rat brain and reduced the dopamine levels in the cortex, amygdala, and spinal cord. Rhynchophylline increased the release of endogenous dopamine from 4 brain regions. The release of serotonin was increased in 2 brain regions (Shi, 1993).

Hirsutine, an alkaloid present in Uncaria tomentosa has a potent ganglion blocking effect. Hirsutine was found to block nicotine induced dopamine release in rat pheochromocytoma cells. Hirsutine was found to be equipotent to hexamethonium in blocking the inward current activated by nicotine (Nakazawa, 1991).

Antihypertensive Effects — Hirsutine has antihypertensive effects. This effect can partly be explained by the ability of hirsutine to reduce intracellular calcium levels by inhibiting calcium release from the calcium store and increasing calcium uptake into the calcium store. Hirsutine was also found to exhibit calcium channel blocking activity by

inhibiting the calcium influx through voltage dependent calcium channels in the rat aorta (Horie, 1992).

Contraceptive Effect — There is only anecdotal evidence of the use of Cat's Claw in the prevention of pregnancy. In Peru, it has been used for this purpose for years in some rainforest tribes, but the amount of drug used would be considered very high. A decoction prepared from 11 to 13 pounds of the root is reduced to about 1 cup and taken at the time of menstruation. It is claimed that sterility can be maintained for 3 to 4 years after one dose (Cabieses, 1994).

Effects on Cancer — Aqueous extracts of Uncaria tomentosa suppressed cell growth through induction of apoptosis in two different human leukemic cell lines. Apoptosis was demonstrated by the fact that both DNA single and double strand breaks increased within 24 hours of treatment with the Uncaria tomentosa extract (Sheng, 1998).

INDICATIONS AND USAGE

Unproven Uses: The effects that have some scientific evidence of efficacy include antiviral, immunostimulating, and anti-inflammatory properties.

Cat's Claw has been used in folk medicine for rheumatic complaints, diarrhea, gastritis, treatment of wounds, as an adjunct to cancer treatment, asthma, menstrual irregularity and as a contraceptive.

CONTRAINDICATIONS

Cat's Claw is contraindicated in pregnancy and in nursing mothers.

PRECAUTIONS AND ADVERSE REACTIONS

General: Serum estradiol and progesterone levels may be reduced after long-term Cat's Claw use. In one study, long term use (8 weeks) of Uncaria tomentosa resulted in a precipitous drop in both estradiol and progesterone serum levels (Rodriguez, 1998).

Uncaria tomentosa prevented estrogen from binding to estrogen receptors on breast cancer cells (Salazar & Jayme, 1988).

There is one report of acute renal failure associated with Cat's Claw ingestion in a patient with systemic lupus erythematosus. Though the patient was taking several other medications at the time, Cat's Claw was the only agent that was discontinued. Urinalysis results gradually returned to baseline following discontinuation of the herb (Hilepo, 1997).

DOSAGE

Mode of Administration: Cat's Claw is available in a powder form, capsules and liquid for internal administration.

Preparation: To prepare a decoction, add 30 g of powder to 800 ml water; allow to simmer on the stove for 45 minutes or

until there is about 500 ml liquid remaining. Allow to cool, then strain and refrigerate (Schauss, 1998).

How Supplied:

Capsule — 250 mg, 350 mg, 400 mg, 440 mg, 500 mg, 505 mg, 540 mg

Liquid — 4:1

Daily Dosage: The daily dosage is 250 to 1000 mg daily. The total alkaloid equivalent should be 10 to 30 mg. Decoction dosage is 60 ml once daily in the morning on an empty stomach (Schauss, 1998).

Storage: Cat's Claw should be stored at room temperature away from heat, moisture and direct light.

Cat's Foot

Antennaria dioica

DESCRIPTION

Medicinal Parts: The medicinal part is the flower.

Flower and Fruit: The plant has bright red and white, dioecious composite flowers. They are very small and are in terminal cymes. The female flowers are bright red with thread-like, cylindrical corolla. The male flowers are white with a funnel-shaped corolla. The bracts of the male are white, the female, pink. The fruit has a tuft of hair.

Leaves, Stem and Root: The plant is 7 to 20 cm tall, with leafy rooting runners. The stem is erect with basal leaves that are spatulate, green above, gray beneath, cauline, linear and erect.

Habitat: Cat's Foot is found in Europe, Asia and America as far north as the Arctic.

Production: Cat's Foot flower consists of the fresh or dried flowers of *Antennaria dioica*.

Not to be Confused With: Occasional confusion occurs with the flower heads of *Helichrysum stoechas* or *Helichrysum angustifolium*.

Other Names: Mountain Everlasting, Life Everlasting, Cudweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives

Flavonoids: including luteolin and its glucosides

Bitter substances

Mucilages

Saponins

Tannins

EFFECTS

In animal tests, a mild spasmolytic and choleric effect has been reported.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, preparations of Cat's Foot flower are used as a diuretic, for diarrhea, and to treat respiratory and intestinal diseases.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Since the efficacy for the claimed uses is not documented, a therapeutic application cannot be recommended.

Preparation: To prepare an infusion, pour boiling water over 1 gm finely cut drug, then strain after 5 to 10 minutes.

Catechu

Acacia catechu

DESCRIPTION

Medicinal Parts: Black catechu is extracted from the heartwood in a process of distillation and is used in a variety of preparations.

Flower and Fruit: The flowers grow in closely sitting spikes from the leaf axils. The calyx is about 1 to 2 mm and covered in gray hairs. The corolla is yellow. The pod is about 10 to 15 cm long, dark brown and veined with 6 to 8 seeds.

Leaves, Stem and Root: *Acacia catechu* is a medium-sized tree with brown bark and downy-haired branches. The leaf stems of the double-pinnate leaves are about 15 cm long and have glands at the base and between the upper 5 to 7 cm long fronds. The leaflets are sessile, close, pale green and smaller than 1 cm. There are a few short thorns in pairs.

Habitat: The plant is indigenous to India and Burma.

Production: The heartwood is ground and boiled in water for 12 hours. The wood residue is removed and the extract steamed to the consistency of a syrup. The syrup is stirred and cooled in molds. The dried mass is broken up into irregular pieces.

Not to be Confused With: *Haematoxylon campechium* and the seeds of *Areca catechu*, tar products and admixtures of earth, alumen, iron carbonate and sand.

Other Names: Cutch

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Catechins (2-12%): (+)- and (-)-catechin, (+)- and (-)-epicatechin

Catechin tannins (20-60%)

EFFECTS

Catechu is an astringent and antiseptic.

INDICATIONS AND USAGE

Unproven Uses: Internally, Catechu is used for chronic catarrh of the mucous membranes, dysentery and bleeding. Externally, Catechu is a constituent of tooth tinctures, mouth washes and gargles. It is used externally in hemostatic powders, dressing solutions and injection solutions. It is also used for colitis mucosa, gingivitis, stomatitis and pharyngitis.

Indian Medicine: Catechu is a constituent of preparations for mouth ulcers, throat infections and toothache.

Chinese Medicine: The drug is used for poorly healing ulcers, weeping skin diseases, oral ulcers with bleeding and traumatic injuries.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Catechu tincture can be painted on mucous membranes or used for mouth washes.

Preparation: Catechu tincture.

Daily Dosage: The average daily dose of the drug is 0.3 to 2 gm to be taken orally, 3 times daily; single dose is 0.5 gm.

Twenty drops of Catechu tincture is added to a glass of lukewarm water for use as a mouthwash, or the tincture may be applied with a brush in undiluted form to affected mucous membranes.

Catha edulis

See Khat

Catnip

Nepeta cataria

TRADE NAMES

Catnip is available from numerous manufacturers, sometimes as Catnip Leaf, Catnip Herb or Catnip Herb Liquid.

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial parts of the plant.

Flower and Fruit: The inflorescence is spike-like and the lower verticillasters distant from each other. The small individual flowers are on short pedicels. The bracts are 1.5 to 3 mm and linear-awl-shaped. The sepals are 5 to 6.5 mm long and ovate. The tips are 1.5 to 2.5 mm long, linear-lanceolate and patent. The corolla is 7 to 10 mm long, slightly longer than the calyx and white with small purple spots.

Leaves, Stem and Root: The root of the plant is perennial. The stems are up to 1 m high, angular, erect and branched. They are leafy and gray-pubescent to tomentose, which gives the entire plant a whitish-gray appearance. The leaves are 2 to 8 cm, ovate, cordate at the base, crenate or serrate and gray-tomentose beneath. The petiole is 0.5 to 4 cm in length.

Characteristics: The plant has a characteristic aromatic scent, reminiscent of Mint and Pennyroyal.

Habitat: Catnip is indigenous to Europe and naturalized in the U.S.

Production: Catnip is the aerial part of *Nepeta cataria*. The harvesting of uncultivated plants takes place during the flowering season. The drug is manually cut during dry and sunny weather. The woodless parts of the plant are sorted out and the usable material is then left to dry in the shade.

Other Names: Catnep, Catnip, Catmint, Catswort, Field Balm

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.2-0.7%): chief components are nepetalactone (share 80-95%), additionally including among others epi-

nepetalactone, caryophyllene, camphor, thymol, carvacrol, pulegone

EFFECTS

Active agents are bitter and tannin substances, as well as essential oil. Catnip is considered to have antipyretic, refrigerant, antispasmodic, sedative and diaphoretic effects. The tea has a diuretic effect and increases gallbladder activity.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include treatment of colds, colic and fevers. It is also used for nervous disorders and migraine, since preparations from the mint have a calming effect. It is also used in the treatment of gynecological disorders. *Nepeta cataria* has a long tradition in England and France as a kitchen and medicinal herb and was used occasionally as a stimulating drink until the introduction of black tea.

CONTRAINDICATIONS

Catnip is not to be taken during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Orally in ground and dried forms. Flowers are usually ingested in tea form, because the important constituent elements are to some extent volatile.

How Supplied:

Capsules — 380 mg

Fluid extract — 1:1

Liquid — 1:01

Preparation: To prepare an infusion (tea), add 10 dessert-spoonfuls per liter of water, leave this to steep for 10 minutes, then strain.'

Daily Dosage: 2 to 3 cups of the tea daily.

Cayenne

Capsicum species

TRADE NAMES

Cayenne (available from numerous manufacturers), Cayenne Herbal, Cayenne Peppers, Cayenne 30,000 Heat Units, Premium Cayenne, Cayenne Power Herb, Cayenne 40,000 BTU, Natural Herbal Cayenne, Zostrix

DESCRIPTION

Medicinal Parts: The fresh or dried fruits of different *Capsicum* species are used medicinally.

Flower and Fruit: The flowers are usually solitary, but may occasionally be in pairs or in threes. They are hanging and long-pedicled. The calyx is semi-globose to campanulate and

has 5 to 7 tips. The corolla is wheel-shaped with a short tube, varying in color from white to yellow, occasionally from purple to violet with whitish-green or violet markings. There are 5 to 6 stamens with violet anthers and 5 small papillous staminoids. The ovary is superior. The dividing walls are partially underdeveloped. The seed carriers at the top are attached to the walls and fused to a column below. The berry is 1.5 to 5 cm long and up to 9 cm thick; it varies in form. The calyx remains. The wall of the fruit is tough and leathery and may be red, yellow-green or brownish. The seeds are numerous, light, yellowish-white, flat, disc, circular or kidney-shaped and thickened at the margins. The surface is pitted.

Leaves, Stem and Root: *Capsicum annum* is an annual (perennial in the tropics) 20 to 100 cm high plant with an erect stem, which is somewhat woody and angular. It is sparsely branched higher up. The leaves are usually solitary, long-petioled, oval, lanceolate to ovate, obtusely acuminate, wedge-shaped at the base, entire-margined or slightly curved and glabrous.

Habitat: The herb is indigenous to Mexico and Central America and is cultivated today in warmer regions of the globe.

Production: Paprika consists of the dried ripe fruit of *Capsicum annum* or *Capsicum frutescens*. The fruit is harvested when completely ripe and dried at a maximum temperature of 35° C.

Not to be Confused With: Other varieties of *Capsicum annum*.

Other Names: *Capsicum*, Grains of Paradise, African Pepper, Bird Pepper, Chili Pepper, Sweet Pepper, Hungarian Pepper, Red Pepper, Goat's Pod, Zanzibar Pepper, Paprika, Tabasco Pepper, chilies, Chili

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Capsaicinoids (amides of the vanillyl amine with C8 - C13 fatty acids): chief components capsaicin (32-38%), dihydrocapsaicin (18-52%)

Carotenoids (0.3-0.8%): in particular capsanthin (dark red), alpha-carotin, violaxanthine, free or as fatty acid esters

Flavonoids: including apiin, luteolin-7-O-glucoside

Steroid saponins: mixture referred to as capsicidine, in the seeds

Volatile oil (0.1%): 2-methoxy-3-isobutyl pyrazine and N-(13-methyl tetradecyl)acetamide (capsiamide)

EFFECTS

Pain Modulation

The most important active ingredient in the herb is the capsaicin, which exerts hyperemic effects. Cutaneous nociceptors are also known as peripheral sensory neurons of primary sensory neurons activated by noxious stimuli (Biro, 1997; Nakamura, 1999). Peripheral fibers produce a local response consisting of edema, redness and vasodilation, while afferent fibers relay nociceptive information to the central nervous system resulting in the perception of pain and burning. Long-term desensitization of the fibers occurs after repeated exposure to capsaicin, and results in a subsequent loss of pain sensation (Appendino, 1997).

Capsaicin binds to the C-type vanilloid receptor (VR1) and opens a cationic channel allowing the influx of calcium. The calcium influx is an excitatory response, which initiates release of neuropeptides (substance P). The neuropeptides are responsible for chemogenic pain, thermoregulation and neurogenic inflammation. By blocking the calcium channel, there will be a depletion of substance P in the sensory nerves and loss of pain (Appendino, 1997; Biro, 1997; Jung, 1999).

Antimicrobial

Capsaicin and dihydrocapsaicin have antimicrobial effects against *Bacillus cereus*, *Bacillus subtilis*, *Clostridium sporogenes*, *Clostridium tetani*, and *Streptococcus pyogenes* (Cichewicz, 1996). Capsaicin has shown bactericidal activity against *H. pylori* and therefore, could have a protective effect against *H. pylori*-associated gastroduodenal disease (Jones, 1997). A recent study using capsaicin from jalapeno peppers did not support the role for jalapenos in the treatment of *H. pylori* infection (Graham, 1999).

Antineoplastic

Capsaicin, once thought to be carcinogenic, has been shown to not cause any significant increase in papilloma formation, abnormal hyperplasia or inflammatory lesions. The drug does not induce the epidermal ornithine decarboxylase activity, suggesting that it lacks tumor-promotional activity (Park, 1997; Park, 1998). Chemoprotective effects of capsaicin and dihydrocapsaicin include the inhibition of microsomal monooxygenases involved in carcinogen activation (Surh, 1995).

Detoxification/Gastroprotective/Thrombolytic Effects

Capsaicin and dihydrocapsaicin have detoxification activity with pharmacologically active substances by interacting irreversibly with hepatic drug metabolizing enzymes (Surh, 1995). Capsaicin has a gastroprotective effect against gastric mucosal injury caused by aspirin (Yeoh, 1995). Capsicum has been found to induce increased fibrinolytic activity and simultaneously cause hypocoagulability of blood (Visudhiphan, 1982).

Many documented trials are based on observations of various extracts of the drug. The initial local effect is pain, then warmth, then hypersensitivity; reversible or irreversible peripheral nerve damage is possible.

CLINICAL TRIALS

Pain Modulation

The efficacy of topical capsaicin was determined in 22 patients with chronic severe painful diabetic neuropathy over an 8-week study period. The randomized, placebo-controlled study demonstrated a significant improvement with capsaicin 0.75% applied 4 times daily for the overall clinical improvement of pain status, as measured by physician's global evaluation and by a categorical pain severity scale. The capsaicin treatment group had a 16% decrease in mean pain intensity by a visual analogue scale (VAS) versus 4.1% decrease with the placebo group. The capsaicin treatment group had a 44.6% decrease in mean pain relief on VAS versus 23.2% decrease with the placebo group. Approximately 50% of subjects reported improved pain control or were cured in a follow-up, open-label study, and 25% were unchanged or worse (Tandan, 1992).

Gastroprotective Effects

The efficacy of capsaicin as a gastroprotective agent was determined in 18 healthy volunteers with normal index endoscopies. The volunteers underwent two studies four weeks apart to evaluate the effect of capsaicin against aspirin-induced gastric mucosal injury. Each volunteer took 20 g chili orally with 200 ml water in one study and 200 ml water in another study. After 30 minutes, each case was followed with 600 mg aspirin with 200 ml water. Endoscopy was repeated 6 hours later, and the gastroduodenal mucosal damage was assessed by a previously validated scoring system. The median gastric injury score in the chili group was significantly less, demonstrating a gastroprotective effect of chili in human subjects (Yeoh, 1995).

INDICATIONS AND USAGE

Approved by Commission E:

- Muscular tensions
- Rheumatism

Unproven Uses: Cayenne is used for painful muscle spasms in areas of shoulder, arm and spine. In folk medicine the herb is used for frostbite, chronic lumbago and as a gargle for hoarseness, sore throats and infected throats. The drug is also used internally for gastrointestinal disorders, seasickness and as prophylactic therapy for arteriosclerosis, stroke and heart disease.

The herb is used in cream form for circulation and as a female orgasm stimulant. Use should be limited to 2 days,

and should only be used again after 2 weeks. Longer usage can cause festering dermatitis, blistering and ulceration (See PRECAUTIONS).

Indian Medicine: Cayenne is used for gout, arthritis, sciatica, coughs and hoarseness. It has been used for lowering the temperature in malaria, yellow fever, scarlet fever and typhus. It is used for cholera, edema and anorexia nervosa. It is used in compound preparations for loss of appetite, dyspepsia and diarrhea (tablets 1:1:1; Cayenne pepper, rhubarb and ginger root) and for alcoholism as an infusion (Cayenne pepper with sugar and cinnamon) to reduce the desire for alcohol.

Homeopathic Uses: The herb is used for inflammation of the efferent urinary tract, the alimentary canal, the mouth and throat, and middle ear infection.

PRECAUTIONS AND ADVERSE REACTIONS

General: There has not yet been a final determination of possible health hazards or side effects in conjunction with the proper administration of designated therapeutic dosages. Internal administration may increase gastrointestinal peristalsis resulting in diarrhea, intestinal and gallstone colics. Besides the intended stimulating effect, external applications can lead to blister and ulcer formation. Investigations into mutagenicity, teratogenicity and carcinogenicity yielded contradictory results. Warning: Use should be limited to 2 days and should only be used again after 2 weeks. Keep away from the eyes!

Hematologic Effects: Capsicum has been found to induce increased fibrinolytic activity and simultaneously cause hypocoagulability of blood (Visudhiphan, 1982).

Hypersensitivity: Anaphylaxis and rhinoconjunctivitis symptoms have been associated with the herb due to its antigenic components (Jensen-Jarolim, 1998; Vega de la Osada, 1998). Contact dermatitis has been reported from the direct handling of chili peppers containing capsaicin (Williams, 1995). A hypersensitivity reaction known as plasma cell gingivitis may occur with the herb, and may cause severe gingival inflammation, discomfort and bleeding (Serio, 1991). One study suggest the allergy is rarely an autonomous sensitization, but rather a consequence of pollen allergy on the basis of immunologic cross-reactivity (Ebner, 1998).

•^ *Respiratory Effects:* Alveobronchiolitis and fibrotic changes have occurred as a result of a respirable paprika dust preparation used after a single intratracheal dose (Tatrai, 1992). Chronic exposure to chili peppers has been associated with an increase in cough (Blanc, 1991).

Drug Interactions: Aspirin and salicylic acid compounds—The bioavailabilities of aspirin (acetylsalicylic acid) and of salicylic acid were reduced when given concomitantly with

Capsicum annum extract, containing 100 mg of capsaicin per gram as a result of the gastrointestinal effects of capsaicin (Cruz, 1999).

OVERDOSAGE

Toxic dosages lead to life-threatening hypothermias by affecting the thermoreceptors. High doses of the drug (or the herb) administered over extended periods can cause chronic gastritis, kidney damage, liver damage and neurotoxic effects. The treatment for poisonings proceeds symptomatically.

DOSAGE

Mode of Administration: Preparations of Cayenne are exclusively for external indications in antirheumatic ointments and plasters.

How Supplied:

Capsules—400 mg, 445 mg, 450 mg, 455 mg, 500 mg

Cream—0.25% capsaicin, 0.75% capsaicin

Preparation: A liquid extract is prepared by percolating 100 gm drug with 60 gm ethanol. Other formulations include: Capsicum-oleoresin with 90% ethanol and a tincture with 90% ethanol.

Daily Dosage: External daily dose: 10 gm drug; Tincture: (1:10); Semi-solid preparations: maximum 50 mg capsaicin in 100 gm neutral base. The cream is applied to the affected area not more than 3 or 4 times daily (Zostrix Package Insert, 1998).

Internal application: Decoction: 1/2 liter water with 5 gm powdered drug, 3 gm powdered Cascarella bark and 5 gm powdered rhubarb root; 2 cups per day.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); ointment: once or twice daily (HAB1)

Storage: Should be well sealed and protected from light.

Cedar

Cedrus libani

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves, the wood and the oil.

Flower and Fruit: The male cones are 3 to 5 cm; the female cones are 7 to 12 cm and almost cylindrical-truncate or umbilicate at the apex.

Leaves, Stem and Root: The cedar is a majestic tree that grows up to 40 m in height with a rigid leading shoot and a flat crown. The young branches are glabrous. The needle-like leaves are dark green and 20 to 30 mm long.

Habitat: The Lebanon Cedar is indigenous to the Lebanese mountains and the southwest of Turkey, Cyprus, the Atlas Mountains and the Himalayas. The tree is also found in Asia and Africa.

Production: Cedar oil is the essential oil extracted from the leaves and wood of *Cedrus libani*.

^ ^ ACTIONS AND PHARMACOLOGY

** COMPOUNDS

When extracted from Cedrus libani (true cedarwood oil): borneol

When extracted from Cedrus atlantica (atlas cedarwood oil): cadinene, alpha- and gamma-atlantone

When extracted from Cedrus deodora (Himalayan cedarwood oil): alpha- and gamma-atlantone, p-methyl-delta-3-tetrahydroacetophenone, (+)-longiborneol, himachalol, all-ohimachalol

EFFECTS

Cedar has an expectorant effect.

INDICATIONS AND USAGE

Unproven Uses: Cedar wood oil is used for catarrhal conditions of the respiratory tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

4p

DOSAGE

Mode of Administration: Externally, the drug is used as a rub (Bormelin balm). It is also used internally as an inhalation.

Celandine

Chelidonium majus

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial parts that have been collected during the flowering season and dried. The root, which has been collected in late autumn and dried, and the fresh rhizome are also used medicinally.

Flower and Fruit: The plant has yellow flowers arranged in umbels. There are 2 sepals, 4 petals, numerous yellow stamens and 1 ovary. The fruit is pod-like and many-seeded. The seeds are black-brown and glossy.

Leaves, Stem and Root: Celandine is a 30 to 120 cm high plant with an erect stem. The stem has irregularly bifurcated, thickened nodes. The leaves are alternate and indent-pinnatifid. The upper leaves are pinnatisect, dull green above, sea-green beneath. The plant contains a dark-yellow latex.

Characteristics: Celandine has a hot and bitter taste. The latex has a narcotic fragrance.

Habitat: Celandine is found throughout Europe and the temperate and subarctic regions of Asia.

Production: Celandine herb consists of the dried, above ground parts of *Chelidonium majus* gathered during flowering season. The herb is collected in the wild during the flowering season and dried at high temperatures.

Greater Celandine root is the root, harvested between August and October, of *Chelidonium majus*. The herb is gathered in uncultivated regions and harvested commercially.

Other Names: Tetterwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS: CELANDINE HERB

Isoquinoline alkaloids of the protoberberine type: including coptisine (main alkaloid), berberine

Isoquinoline alkaloids of the benzophenanthridine type: including chelidonine, sanguinarine, chelerythrine

Isoquinoline alkaloids of the protopine type: including protopin, cryptopine

Caffeic acid derivatives: including 2-(-)-coffeoyl-D-glyceric acid, coffeoyl-L-malic acid

EFFECTS: CELANDINE HERB

Celandine has mild analgesic, cholagogic, antimicrobial, oncostatic and central-sedative effects. It also acts as a spasmolytic on smooth muscles. In animal tests, Celandine is a cytostatic. It also has a nonspecific immune-stimulating effect.

Note: The blood pressure-lowering effects and the therapeutic efficacy for mild forms of hypertonia (borderline hypertonia) need further investigation.

COMPOUNDS: CELANDINE ROOT

Isoquinoline alkaloids of the protoberberine type: including coptisine (main alkaloid), berberine

Isoquinoline alkaloids of the benzophenanthridine type: including chelidonine, sanguinarine, chelerythrin

Isoquinoline alkaloids of the protopine-type: including protopin, cryptopine

Caffeic acid derivatives: including 2-(-)-caffeoyl-D-glyceric acid, caffeoyl-L-malic acid

EFFECTS: CELANDINE ROOT

Only clinical studies and experiments on the fresh plants are available. However, previous studies have shown that the extract, with an alkaloid content of 80%, should have similar effects to those of the fresh leaves. These effects include immobilization in mice, when it was applied subcutaneously and orally. On rabbit intestines it caused limpness; and in higher doses, tone reduction. When applied to the rabbit uterus, it caused contraction of the smooth muscle. Positive inotropic effects were observed in isolated cat and frog hearts; in a canine heart-lung preparation it stimulated the heart, raised blood pressure and widened the arteries.

Experimental data are unavailable, therefore the results must be considered unofficial.

An oncostatic effect was observed through the cytotoxic results of Eagle's 9 KB carcinoma of the naso-pharynx in cell cultures.

INDICATIONS AND USAGE

CELANDINE HERB

Approved by Commission E:

- Liver and gallbladder complaints

Unproven Uses: Celandine is used for spasmodic pain of the bile ducts and the gastrointestinal tract. In folk medicine, it was used for skin conditions such as blister rashes, scabies and warts. It is said to be effective in the treatment of cholecystitis, chloelithiasis, catarrhal jaundice, gastroenteritis, and diffuse latent liver and gall bladder complaints. It has also been used for intestinal polyps and breast lumps. Other uses include angina pectoris, cramps, asthma, arteriosclero-

sis, high blood pressure, stomach cancer, gout, edema and hepatitis.

Chinese Medicine: Celandine is used for inflammation of the rim of the eyelid, febrile and ulcerating dermatitis, warts, edema, ascites, jaundice and stomach carcinomas

CELANDINE ROOT

Unproven Uses: In folk medicine, the fresh roots are chewed to alleviate toothache, and a powder derived from the roots is applied to ease tooth extraction.

Chinese Medicine: Preparations are used for irregular menstruation.

Homeopathic Uses: Chelidonium majus is used for inflammation, stones and chronic disorders of the hepatobiliary system, rheumatism and inflammation of the lungs and pleura.

PRECAUTIONS AND ADVERSE REACTIONS

CELANDINE HERB

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Older scientific literature credits the plant with toxicity (burning in the mouth, nausea, vomiting, bloody diarrhea, hematuria, stupor), but recent studies offer no clear proof of this; animal experiments yielded no results.

No symptoms of inflammation were observed in the eyes of rabbits following introduction of the chyle. Nevertheless, contact between it and the eyes should be avoided.

Pregnancy: Not to be used during pregnancy.

CELANDINE ROOT

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Older scientific literature credits the plant with toxicity (burning in the mouth, nausea, vomiting, bloody diarrhea, hematuria, stupor), but recent studies offer no clear proof of this. Animal experiments yielded no examples of toxicity.

DOSAGE

CELANDINE HERB

Mode of Administration: Comminuted and powdered drug for infusions and decoctions; dried extracts for liquid and solid medicinal forms for internal use.

Preparations:

Fluid extract — 1:1 in 25% ethanol.

Tincture — 1:10 in 45% ethanol (BHP83).

Tea — allow 1/2 dessertspoonfuls to draw in boiling water for 10 minutes.

Infusion — 15 gm dried herb to 1 liter of water, leave to draw for 15 minutes.

Daily Dosage: The average daily dose is 2 to 4 gm of drug in liquid or solid extracts, equivalent to 12 to 30 mg total alkaloids calculated as chelidonine; fluid extract, 1 to 2 ml three times daily; decoction, 3 cups daily; infusion, 3 cups between meals.

Storage: Celandine herb should be protected carefully from light.

CELANDINE ROOT

Mode of Administration: Most standardized and compound preparations contain the extract of Celandine herb; various homeopathic preparations also contain dilutions of the fresh herb Greater Celandine.

Daily Dosage: The standard dose is 0.5 gm of drug.

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once daily (HAB1).

Storage: Preparations must be stored carefully.

See American Bittersweet

Celery

Apium graveolens

TRADE NAMES

Celery Seed, Celery Seed-Power, Celery Liquid

DESCRIPTION

Medicinal Parts: The medicinal parts are the root, above-ground foliage and stems, the fruit (seeds) of the plant and the oil extracted from the seeds.

Flower and Fruit: The umbels are greenish-white, small, 6 to 12 rayed, star-shaped and splayed. Some umbels are top-heavy, short petioled or sessile, and some are terminal and more or less long-petioled with no involucre. Petals are usually 0.5 mm, white or greenish to yellowish, cordate at the base and have indented tips. The fruit is almost spherical and somewhat compressed at the side. The 5 mm mericarps are rounded in section. They are 5-cornered with 5 equal, weakly protruding, bow-shaped main ribs. The edge of the ribs form the edge of the mericarps. The fruit axis is bristly and slightly crenate at the tip.

Leaves, Stem and Root: The glabrous plant is a biennial and reaches a height of 30 to 100 cm. The root of the wild variety is fusiform, about 5 to 7 mm thick, branched and becomes woody in the second year. The root of the cultivated variety is fleshy, roundly tuberous and reaches a diameter of over 15 cm. The stem is erect, with edged grooves, often hollow and branched. The leaves are glossy and rich green. The basal and lower cauline leaves are more or less long-petioled and pinnatifid. The upper cauline leaves are sometimes opposite. They are on short white-membrane-edged sheaths and are almost sessile and tri-pinnate. The lower leaves are roundish, almost blunt at the base with broad, lozenge-shaped, indented-serrate, blunt and short-thorned tips. The upper

cauline leaves are wedge-shaped and acuminate, also 3-lobed or pinnate or lanceolate and entire-margined.

Characteristics: The plant has a strong odor.

Habitat: Celery is found in Europe from England and Lapland to southern Russia. The plant also grows in western Asia as far as eastern India; in northern and southern Africa and South America; and is cultivated and grows wild in North America, Mexico and Argentina.

Production: Celery seed consists of the fruit of *Apium graveolens*; celery herb consists of the fresh or dried above-ground parts of the plant; and celery root is the plant's fresh or dried underground parts.

Other Names: Smallage

ACTIONS AND PHARMACOLOGY

COMPOUNDS: CELERY SEED (FRUIT)

Volatile oil: chief constituents (:) - limonene, beta-selinene, phthalides among them 3-butyliden phthalide, 3-butyl phthalide, 3-isovaleryliden-3a, 4-dihydrophthalid, 3-isobutyliden phthalide, sedanoid, neocnidilid)

Flavonoids: graveobioside A and B, apiin, isoquercitrin

Furocoumarins: including bergapten, isoimperatorin, isopimpinellin

Fatty oil

EFFECTS: CELERY FRUIT

In animal tests, a sedative and anticonvulsive effect was demonstrated, a diuretic effect could not be proven. The essential oil contained in the drug had a mildly inhibiting effect on bacteria and fungi.

COMPOUNDS: CELERY HERB

Volatile oil: including (+)-limonene, myrcene, beta-selinene, alpha-terpineol, carveol, dihydrocarvone, geranyl acetate, phthalides (including 3-butyliden phthalid, 3-butyl phthalid, 3-isobutyliden dihydrophthalid)

Flavonoids: including apiin, luteolin-7-O-apiosyl glucoside, chrysoeriol glucoside

Furocoumarins: including bergaptene, xanthotoxin, isopimpinellin

Caffeic acid derivatives: including chlorogenic acid

EFFECTS: CELERY HERB

In animal tests, a sedative and anticonvulsive effect was demonstrated, a diuretic effect could not be proven. The essential oil contained in the drug had a mildly inhibiting effect on bacteria and fungi.

COMPOUNDS: CELERY ROOT

Volatile oil: chief constituents (+)-limonene, beta-pinene, p-cymene, cis-, 3-methyl-4-ethyl-hexane), phthalides (including 3-butyriden phthalid, 3-butyl phthalid, ligustilid, neocnidilid)

Flavonoids: including apiin, luteolin-7-O-apiosyl glucoside

Furocoumarins: including bergaptene

Polyynes: including falcarinol, falcarindiol

EFFECTS: CELERY ROOT

In animal tests, a sedative and anticonvulsive effect was demonstrated; a diuretic effect could not be proven. The essential oil contained in the drug had a mildly inhibiting effect on bacteria and fungi.

INDICATIONS AND USAGE

CELERY FRUIT, HERB AND ROOT

Unproven Uses: Folk medicine use of celery and preparations of celery are used as a diuretic, for regulating the bowels, for glandular stimulation, rheumatic complaints, gout, gall and kidney stones. Other traditional uses include as a prophylactic for nervous agitation, for loss of appetite and exhaustion. Celery is also used as a cough treatment and as a helminthic.

Homeopathic Uses: Celery preparations are used in homeopathy for ailments of the ovaries and rheumatism.

CONTRAINDICATIONS

CELERY SEED (FRUIT)

The drug should not be used during pregnancy. Also, because of the kidney-irritating effect of the volatile oil, the drug should not be administered to individuals with kidney infections.

PRECAUTIONS AND ADVERSE REACTIONS

CELERY FRUIT, HERB AND ROOT:

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Nevertheless, because of the kidney-irritating effect of the volatile oil, the drug should not be administered in the presence of kidney infections. Latent yeast infections of the plant could cause the furanocoumarin content of the fresh root to rise to 200 times its original level under storage conditions. For this reason, the relatively large amounts of furanocoumarins frequently to be found in stored celeriac bulbs, or in incorrectly dehydrated drug samples, could lead to phototoxicoses.

DOSAGE

CELERY SEED (FRUIT)

Mode of Administration: Whole and powdered drug, liquid extract, and as a component in a variety of tea mixtures.

How Supplied:

Capsules — 450 and 505 mg

Fluid Extract — 1:1

Preparation: To prepare a liquid extract, percolate 1 kg of seed in a specula process to 1 liter of fluid extract. The essential oil is removed after filtration with paper soaked in alcohol.

For an infusion, pour boiling water on 1 g of the squeezed drug and strain after 5 to 10 minutes.

Decoctions are prepared in a 1:5 ratio.

Daily Dosage: The daily dosage of the seeds is 1.2 to 4 g and as an infusion, 1 g drug.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution twice weekly sc (HAB34).

Storage: Celery seed should be kept tightly sealed, away from light and moisture.

CELERY HERB

Mode of Administration: Whole and cut drug as well as a variety of tea mixtures.

Preparation: Celery is contained in a variety of tea mixtures (kidney and bladder teas).

Daily Dosage: Pressed juice of the fresh plant: 23 g (15 ml) 3 times daily.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution twice weekly sc (HAB34).

Storage: The herb should be kept sealed, away from light and moisture.

CELERY ROOT

Mode of Administration: The drug is available in a few combination preparations for internal use.

Preparation: A cough mixture is prepared by boiling the root juice with sugar.

Dosage: Pressed juice of the fresh plant: 23 g (15 ml) 3 times daily.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times daily or 1 ml injection solution twice weekly sc (HAB1).

Storage: Celery root should be kept sealed, away from light and moisture.

Centaurea cyanus

See *Cornflower*

Centaureum erythraea

See *Centaury*

Centaury

Centaureum erythraea

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried, aerial parts of the flowering plant.

Flower and Fruit: The different-sized flowers form a dense or loose cyme. They are purple to pink-red, seldom white. The calyx tube is pentangular with awl-shaped tips. There are 5 petals fused into a tube, 5 stamens mostly fused to the corolla and 1 superior, narrowly linear ovary. The stigma is 2-lobed. The fruit is a large, yellow, many-seeded capsule.

Leaves, Stem and Root: The plant is an annual that grows to between 5 and 30 cm high. The stem is erect, quadrangular and unbranched. The cauline leaves are crossed opposite, fleshy, oblong-ovate to lanceolate, and sessile. The basal leaves are rosette-like, obovate and narrowed to a petiole.

Characteristics: Centaury has a very bitter taste.

Habitat: The plant is found in the Mediterranean region and as far as Britain and Scandinavia. It is cultivated in the U.S.

Production: Centaury consists of the dried aerial parts, in flower, of *Centaureum erythraea*. The plant is harvested during the flowering season and dried quickly to retain the flower color.

Not to be Confused With: Other *Centaureum* varieties.

Other Names: Feverwort, Centaury Gentian, Filwort, Centory, Christ's Ladder, Bitter Herb, Bitterbloom, Bitter Clover, Eyebright, Rose Pink, Wild Succory, Canchalagua

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide bitter principles (monoterpenes): in particular swertiamarin, including among others gentiopicrin, sweroside

Pyridine alkaloids: gentianine, gentianidine

Xanthones: including methyl bellidifoline

EFFECTS

Centaury increases gastric secretion and salivation because of the typical bitter reaction, also antiphlogistic and antipyretic effects have been studied in various animal experiments. The effect for loss of appetite, stomach complaints and dyspepsia can also be attributed to the amaroids.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

** *Unproven Uses:* The drug is used for loss of appetite, dyspepsia and poor gastric secretion. In folk medicine, it is used for fever, worm infestation and as a hypotensive. It is also used for diabetes in Mallorca, and for expelling kidney stones in Egypt. Externally, it is used in the treatment of wounds.

CONTRAINDICATIONS

Because of its secretion-activating effect, the drug should not be administered in the presence of stomach or intestinal ulcers.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Comminuted herb for infusions and other bitter-tasting preparations for internal use.

Preparation: Tea: Brew 2 to 3 gm drug with 150 ml boiling water and strain after 15 minutes; Centaurium Extract: extract of 1 part drug to 10 parts water and 1 part 98% ethanol steamed till thickened (EB6).

Liquid extract: 1:1 25% ethanol (V/V) (BHP83).

Daily Dosage: The average daily dose is 6 gm of drug or 1 to 2 gm of extract; single dose is 1 gm.

The powdered drug is taken 3 times daily on a wafer with honey; the infusion is taken 1/2 hour before meals.

The daily dose of extractum Centaurii fluidum is 2 to 5 ml.

Storage: Keep protected from light and moisture in sealed containers.

Chaste Tree

Vitex agnus-castus

TRADE NAMES

Chasteberry Power, Vitex, Alcohol-Free Chaste Tree Bern'

DESCRIPTION

Medicinal Parts: The medicinal parts are the ripe dried fruit and the dried leaves.

Flower and Fruit: The 8 to 10 cm, blue, occasionally pink flowers form terminal, branched, spike-like inflorescences. The calyx and epicalyx of the bilabiate corolla are pubescent. The fruit is a globular to oblong, 3 to 4 mm, reddish black, 4-seeded drupe. It is surrounded up to two-thirds in cup-like fashion by the calyx. The exocarp has short-stemmed, glandular hairs.

Leaves, Stem and Root: The plant is a 1 to 6 m high bush or tree with quadrangular, gray, tomentose, young branches. The leaves are deciduous, crossed-opposite, long-petioled and palmate. They have 5 to 7 entire-margined, up to 10 cm long, lanceolate leaflets. The under surface of the leaf is white and tomentose.

Habitat: The plant is indigenous to the Mediterranean region as far as western Asia.

Production: Chaste Tree fruits consist of the ripe, dried fruits of *Vitex agnus-castus*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoid glycosides: agnoside, aucubin

Flavonoids: including casticin, 3,6,7,4'-tetramethylether, 6-hydroxy-kempferol-3,6,7,4'-tetramethylether, 6-hydroxy-kempferol-3,6,7-trimethylether (penduletin), quercetagenin-3,6,7-trimethylether (chryso-splenol D)

Volatile oil (0.8-1.6%): including among others, 1,8-cineole, lime, alpha-pinene, beta-pinene, as well as bornyl acetate, camphor, p-cymol, sabinene

Fatty oils

EFFECTS

The drug is dopaminergic and FSH-suppressive; it also inhibits lactation (main active principles aucubin and agnoside). In addition, the drug represses the release of prolactin and improves the symptoms of PMS.

In older animal experiments, the drug was tested on the ovaries and resulted in a reduction of cystic and bleeding follicles. In other animal experiments, an inhibition of lactation and a normalization of stress-induced hyperprolactin anemia was observed. In clinical studies, the positive effect on symptoms resulting from hyperprolactin anemia was proven.

A dopaminergic effect via bonding on D2-receptors was also shown.

INDICATIONS AND USAGE

Approved by Commission E:

- Premenstrual syndrome (PMS)
- Menopausal complaints

Unproven Uses: Chaste Tree preparations are used to treat irregularities of the menstrual cycle, premenstrual complaints, menstrual disturbances caused by corpus luteum insufficiency, insufficient milk production and mastodynia. It is also used to control libido, increase milk flow, reduce flatulence, suppress appetite, and induce sleep. Additional uses include the treatment of impotency, spermatorrhea, prostatitis, swelling of the testes, sexual neurasthenia, sterility, amenorrhea, uterine pain, and swelling of the ovaries. Chaste Tree is also used to induce menstruation.

Homeopathic Uses: Chaste Tree is used for male sexual disturbances, disturbances of milk flow, and nervous depression.

CONTRAINDICATIONS

The drug is contraindicated in pregnancy and in nursing mothers.

PRECAUTIONS AND ADVERSE REACTIONS

General: Occasionally, the administration of the drug leads to the formation of rashes.

Drug Interactions: Because of the dopaminergic effect of the drug, a reciprocal weakening of the effect can occur in case of ingestion of dopamine-receptor antagonists.

Pregnancy: The drug should not be administered during pregnancy

Nursing Mothers: The drug should not be used by breast-feeding mothers.

DOSAGE

Mode of Administration: Whole and powdered drug available as capsules, drops, film tablets, and compound preparations.

How Supplied:

Capsules — 40 mg, 100 mg

Liquid Extract — 1:1

Preparation: For the dried extract, preparations of 100 gm contain 0.2 gm dried extract in a ratio of 1:5, in either ethanol or water.

Daily Dosage: The daily dosage of aqueous-alcoholic extracts is 30 to 40 mg of the drug.

m

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules, 1 to 3 times a day; parenterally: 1 ml injection solution sc twice weekly (HAB1).

Chaulmoogra

Hydnocarpus species

DESCRIPTION

Medicinal Parts: Chaulmoogra is found in all of the named species. The expressed oil is known as Gynocardia oil in Britain and Oleum Chaulmoograe in the U.S.

Flower and Fruit: The grayish seeds are about 2 to 3 cm long and 1.5 cm in diameter. They are irregularly angular with rounded ends. The kernel is oily and encloses two thin, heart-shaped, three-veined cotyledons and a straight radical.

Characteristics: The taste is acrid and the odor disagreeable.

Habitat: Malaysia, Indian subcontinent.

Production: Chaulmoogra seeds are the seeds of various Hydnocarpus varieties. Chaulmoogra oil is the fatty oil extracted from the seeds.

Other Names: Hydnocarpus

ACTIONS AND PHARMACOLOGY

COMPOUNDS: CHAULMOOGRA SEEDS

Fatty oil (30-40%, bitter-type consistency)

Proteins (25%)

Cyanogenic glycosides

Flavolignans

EFFECTS: CHAULMOOGRA SEEDS

The chaulmoogric acid in the drug is antimicrobial. The drug has sedative, febrifuge and dermatic effects. The flavonol lignans hydnocarpin, hydnowightin and neohydnocarpin isolated from the seeds are lipid lowering, anti-inflammatory and antitumoral in animal experiments.

COMPOUNDS: CHAULMOOGRA OIL

Triglycerides: chief fatty acids D-hydnocarpic acid, D-chaulmoogric acid, D-gorli acid (cyclopentene fatty acids)

EFFECTS: CHAULMOOGRA OIL

The chaulmoogric acid in the drug is antimicrobial.

INDICATIONS AND USAGE

Unproven Uses: Externally, preparations of Hydnocarpus are used in the treatment of various skin conditions such as psoriasis and eczema. It is also used as an injection in the treatment of leprosy.

Chinese Medicine: In China, Chaulmoogra is used for leprosy, scabies and furuncles.

Indian Medicine: Uses include leprosy, skin diseases, itching, leocodermia, eczema, flatulence and diabetes.

PRECAUTIONS AND ADVERSE REACTIONS

Coughing, dyspnea, laryngospasms, kidney damage, visual disorders, head and muscle pain, and central paralyses are side effects following intake of the oil. It is severely irritating in local application.

OVERDOSAGE

Following stomach and intestinal emptying (inducement of vomiting, gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate), the treatment for poisonings consists of the instillation of activated charcoal and shock prophylaxis (quiet, warmth), and of electrolyte substitution and the countering of any acidosis imbalance that may appear through sodium bicarbonate infusions. In the event of shock, plasma volume expanders should be infused. Monitoring of kidney function is necessary. Intubation and oxygen respiration may also be required.

The seeds are severely poisonous due to their cyanogenic glycoside content. Injections of solutions of Dicobalt-EDTA or of thiosulfates, or administration of methemoglobin-forming agents, such as amyl nitrite, are recommended as antidotes. The triggering of vomiting and gastric lavage should be carried out in a parallel fashion. Circulatory support measures and artificial respiration may be required.

DOSAGE

Mode of Administration: The seeds and oil in various preparations, as powder, oil, emulsion and ointments.

Cheiranthus cheiri

See Wallflower

Gheken

Eugenia chequen

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves.

Flower and Fruit: The flowers are usually solitary, occasionally in threes. The receptacle is top-shaped and pubescent. There are 4 pubescent or ciliate sepals. The petals are white, oval and 5 to 8 mm long. The stamens are numerous but small. The ovary is glabrous. The fruit is a red or black-violet, glabrous, globular berry, 6 to 8 mm in diameter. It has 2 to 3 seeds which are dark, lentil-shaped and are about 4 mm in diameter.

Leaves, Stem and Root: The plant is an evergreen tree, which grows up to 15 m high and sometimes looks like a shrub. The leaves are coriaceous, ovate, about 1 to 1.5 cm long, 0.5 to 1 cm wide, entire-margined, very shortly petioled with numerous minute, round, translucent oil-cells.

Characteristics: The leaves have a bitter taste that is astringent and aromatic, reminiscent of bay leaves. The odor is slight and they contain an essential oil.

Habitat: Eugenia chequen grows in Chile.

*^ *Production:* Cheken leaves are the leaves of Eugenia chequen.

Other Names: Arryan, Myrtus Chekan

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Bitter substances

Volatile oil: including alpha-pinene, 1,8-cineol

EFFECTS

The ethanol extract inhibits xanthinoxidase. The essential oil has a similar effect on germinating salad seeds such as auxin. An antibacterial and antimycotic effect has also been demonstrated. In the agar diffusion test, the leaf oil was effective against *Pseudomonas aeruginosa*, *Trichophyton mentagrophytes* and *Aspergillus niger*. It also affects fat metabolism: the oil is used against hyperlipoproteinemia. It is used as a tonic, a diuretic and an expectorant.

INDICATIONS AND USAGE

Unproven Uses: In South American folk medicine, a decoction of the leaves is used in the treatment of diarrhea, fever, gout, as a tonic, diuretic, an antihypertensive, and as a digestive aid.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: As a decoction and as a liquid extract.

Cherry Laurel

Prunus laurocerasus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves.

Flower and Fruit: The flowers are erect and in slender racemes 10 to 12 cm long with 3 mm pedicels. The petals are obovate, 3 mm long and white. The fruit is black and globular-ovoid. The smooth kernel within the fruit is ovoid and acute, with a long black weal.

Leaves, Stem and Root: The plant is an evergreen shrub or tree, completely glabrous, and grows up to 6 m high. The bud scales drop early. The petioles are 1 cm long and glandless. The leaf blades are obovate-lanceolate and 8 to 15 cm long. They are curved, entire or with a finely serrate margin, coriaceous and bright green. The upper surface of the leaves is glossy. The lower surface has 1 to 4 protruding nectaries in the axils of the ribs.

Characteristics: Poisonous. The fruit is similar to black cherries, and smells of hydrocyanic acid.

Habitat: The plant is indigenous to parts of Asia and is cultivated in many temperate areas.

Production: Cherry Laurel leaves are the leaves of *Prunus laurocerasus*.

Not to be Confused With: Other forms of *Prunus* species.

Other Names: Cherry-Bay

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyanogenic glycosides: prunasin (corresponding to 0.5-2.5%, 50-210 mg HCN/100 gm)

EFFECTS

The drug acts as a tonic for the stomach, an anti-irritant and a sedative.

INDICATIONS AND USAGE

Unproven Uses: Cherry Laurel is used to treat coughs and the common cold.

Homeopathic Uses: Cherry Laurel is used for dry coughs, whooping cough, cyanosis and spasms.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Overdoses of Cherry Laurel water prepared from the drug can lead to fatal poisonings. Ingestion of the leathery leaves and the seeds is improbable; the fruit pulp is low in cyanogenic glycosides (yielding 5-20 mg HCN/100 gm). The recommended antidotes include the injection of solutions of Dicobalt-EDTA or thiosulfates, or the administration of methemoglobin-forming agents, e.g., amyl nitrite, 4-dimethyl aminophenol. The inducement of vomiting or gastric lavage should be done in parallel fashion. Circulatory support and artificial respiration may also be required.

DOSAGE

Mode of Administration: The drug is available as a watery extract, an aromatic, a breathing stimulant and an antispasmodic.

Chickweed

Stellaria media

TRADE NAMES

Chickweed Herbs, Wild Countryside Chickweed

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh flowering or dried herb.

Flower and Fruit: The solitary white flowers are located in the leaf or branch axils. They open at 9 am and, in good weather, remain open for 12 hours. The 5 double petals are shorter than the oblong-lanceolate sepals. There are 2 to 5 stamens and 3 stigma. The fruit is globular or ovate and covered in teeth. It opens when ripe and the seeds are shaken out through the movement of the plant.

Leaves, Stem and Root: The plant is 5 to 30 cm high. The stem is decumbent and weak, heavily branched and often grows to an impressive length. It creeps along the ground, is fleshy, pale green, and slightly thickened at the nodes. The leaves are opposite and orbicular-ovate. The lower ones are long-petioled and the upper ones are sessile. They are 1.25 cm long and 0.70 cm wide and sit in pairs on the stem.

Characteristics: The stem is pubescent on one side.

Habitat: The plant is found worldwide as a weed.

Production: Chickweed is the fresh herb in flower of *Stellaria media*.

Other Names: Adder's Mouth, Passerina, Satin Flower, Starweed, Starwort, Stitchwort, Tongue-Grass, Winterweed

**ACTIONS AND PHARMACOLOGY
COMPOUNDS**

Flavonoids: including, among others, rutin

Ascorbic acid (vitamin C, 0.1-0.15%)

Alkaloids**INDICATIONS AND USAGE**

Unproven Uses: Internally. Chickweed is used for rheumatism, gout, stiffness of the joints, tuberculosis, and diseases of the blood. Externally, it is used for poorly healing wounds, hemorrhoids, inflammation of the eyes, eczema and other diverse skin diseases.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The herb is used as a tea or in the form of juice for poultices, and in baths for medicinal purposes.

Chicory

Cichorium intybus

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the dried leaves and roots, which are collected in autumn; the whole plant collected and dried in the flowering season; and the fresh plant and root.

Flower and Fruit: Size: The numerous flower heads are 3 to 4 cm in diameter and are terminal or axillary, solitary or in groups, sessile or short-pedicled. The epicalyx bracts are bristly ciliate, often glandular-haired. The inner bracts are oblong-lanceolate and erect, the outer ones ovate, splayed and half as long as the inner ones. The androgynous lingual florets are usually light blue, but occasionally white or pink. The fruit is an achene 2 to 3 mm in length. It has no hair tuft and is ovate and straw yellow to blackish.

Leaves, Stem and Root: The plant can grow to a height of 2 m and has a hardy, 10 to 30 cm long, thick root. The stem is rigidly erect, sparsely branched above and often bristly. The leaves are 10 to 30 cm long and 1 to 5 cm wide. They are obovate, oblong, shaped like a cross-cut saw or slit, with numerous stiff hairs beneath. The lowest leaves in a basal rosette are petiolate. The upper ones as well as those near the inflorescences are alternate, oblong to lanceolate, crenate-dentate and sessile.

Characteristics: Chicory has a bitter taste.

Habitat: The plant is found in Europe, the Middle East as far as Iran, north and south Africa, all of America, Australia and New Zealand.

Production: Chicory consists of the dried leaves and underground parts of *Cichorium intybus*, which are collected in autumn in the wild and air-dried.

Other Names: Succory, Hendibeh

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpenes: sesquiterpene lactones, especially lactucin, lactucopicrin, 8-desoxy lactucin, guaianolid glycosides, including chicoroisides B and C, sonchuside C

Caffeic acid derivatives: chiroic acid, chlorogenic acid, isochlorogenic acid, dicaffeoyl tartaric acid

Hydroxycoumarins: including umbelliferone

Flavonoids: including hyperoside

Polyynes

EFFECTS

An anti-exudative, choleric, negatively chronotropic and negatively inotropic effect has been described due to the plant's sesquiterpene lactones, cinnamic acid derivatives and flavonoids. Animal studies have noted a distinct reduction of pulse rate and contractility; a mildly cholagogic effect; and lowered cholesterol level in rats' livers and plasma. Application for dyspeptic complaints seems plausible because of the amaroid (guaianolide) content.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints

Unproven Uses: In Folk medicine, the herb is used externally for liver complaints and as a gargle. Among internal uses are sore throat, hemorrhoids, tuberculosis, abdominal cramps, melancholy, deafness and rashes. The juice of the chicory plant is also used as a laxative for children.

Indian Medicine: Medicinal uses include headaches, dyspeptic symptoms, skin allergies, vomiting and diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There is a slight potential for sensitization via skin contact with the drug.

DOSAGE

Mode of Administration: Comminuted drug for infusions as well as other bitter-tasting preparations for internal use.

How Supplied: Commercial pharmaceutical preparations include drops and compound preparations.

Preparation: Prepare an infusion by scalding 2 to 4 g drug with boiling water, allowing it to stand for 10 minutes, then straining. A tea is prepared by brewing 2 to 4 g of the whole herb with 150 to 250 ml boiling water and then straining it after 10 minutes.

Daily Dosage: 3 to 5 g comminuted drug. Single dose: 2 to 4 g whole herb for an infusion.

Chinese Cinnamon

Cinnamomum aromaticum

DESCRIPTION

Medicinal Parts: The medicinal parts are the flowers collected and dried after they have finished blossoming, and the whole or partly peeled, dried bark of thin and young branches, as well the oil extracted from them.

Flower and Fruit: The flowers are small on short, slender, silky pedicles. They are arranged in threes in cymous panicles in the leaf axils and in larger panicles at the end of the branches. The perianth is slightly silky, about 3 mm long, with oblong-lanceolate petals. The fruit is a juicy, pea-sized, ellipsoid, smooth drupe.

Leaves, Stem and Root: This evergreen tree grows up to 7 m tall with aromatic bark and angular branches. The bark is brown, in quilled pieces, sometimes with the remains of the outer layer present. The 7.5 to 10 cm long leaves are oblanceolate and pubescent on 6 to 8 cm long petioles, more or less tapered toward the base. They are coriaceous, alternate and brown underneath.

Habitat: Indigenous and cultivated in southern China, Vietnam, Laos and Burma.

Production: Chinese Cinnamon consists of the completely or partly peeled, dried stem bark from the aboveground or thin-branched axis of *Cinnamomum aromaticum*. The drug, from branches 2 to 3 cm thick, is peeled with horn knives, freed from cork and outer rind, and dried in the sun for 24 hours.

Not to be Confused With: Chinese Cinnamon should not be confused with waste products from the production process or other barks and materials, nor with the skins of horse chestnut seeds.

Other Names: Cassia, False Cinnamon, Bastard Cinnamon, Cassia Lignea, Cassia Bark, Cassia aromaticum, Canton Cassia

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components are cinnamaldehyde, weiterhin cinnamylacetate, cinnamyl alcohol, o-methoxycinnamaldehyde, cinnamic acid, coumarin

Diterpenes: cinnzeylanoles, cinncassioles A to E

Tannins: catechin tannins

Oligomere proanthocyanidins

Mucilages

EFFECTS

The essential oil and its main constituent cinnamaldehyde are antibacterial, fungistatic, improve immune resistance in animal tests (inhibiting allergic reactions Type I and II), promote motility, inhibit ulcers and act on the digestive tract (tannin content).

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints

Unproven Uses: Folk medicine uses include symptomatic treatment of gastrointestinal disorders (mild, colicky upsets of the gastrointestinal tract, bloating, flatulence and diarrhea), as well as for temporary states of exhaustion and to increase weight. Efficacy has been sufficiently proven for

gastric complaints and it is plausible for diarrhea, but the evidence is not sufficient for the other indications.

Chinese Medicine: Among uses in Chinese medicine are impotence, diarrhea, enuresis, rheumatic conditions, testicle hernia, menopause syndrome, amenorrhea, abortion and to stabilize immunity.

Indian Medicine: Digestive complaints, vomiting and diarrhea are the most common uses in Indian medicine.

CONTRAINDICATIONS

Use of medicinal preparations of Chinese Cinnamon is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a medium potential for sensitization, primarily due to the cinnamaldehyde.

Pregnancy: The drug is not to be administered in time of pregnancy.

DOSAGE

Mode of Administration: Comminuted bark for infusions, essential oil, as well as other galenic preparations for internal use.

Preparation: To prepare a tincture of Chinese Cinnamon, moisten 200 parts cinnamon bark evenly with ethanol and percolate to produce 1000 parts tincture.

Daily Dosage: 2 to 4 g drug; 0.05 to 0.2 g essential oil. The average single dose is 1 g.

Storage: Chinese Cinnamon should be stored in a cool, dry environment in tightly sealed containers.

Chinese Motherwort

Leonurus japonicus

DESCRIPTION

Medicinal Parts: The fruit is said to have medicinal properties.

Flower and Fruit: The inflorescence is long with whorls of a few flowers at some distance from each other. The bracts are short and usually have a thorn-like awn. The flowers are sessile and dorsiventral. The calyx is narrow clavate. approximately 8 mm long, short-haired. The calyx teeth are upright, the lower 2 are longer than the 3 upper ones. The corolla is bilabiate, made up of 5 fused petals, approximately 10 mm long, lilac to pink. The upper lip has a purple middle lobe and the lower lip is divided into 3. There are 2 long and 2 short stamens. The ovary is superior, 2-carpel and 4-chambered. The fruit breaks up into 4 black, 3-edged approximately 2 mm long, 1-seeded mericarps.

Leaves, Stem and Root: This herbaceous perennial grows to a height of up to 1 m. The leaves are petiolate, 5 to 10 cm long, ovate to cordate, narrowing cuneiformly at the base. The lower leaves are palmately divided to the middle: the sections are pinnatifid with linear-acuminate lobes. The upper leaves are decussate opposite, simple, lanceolate. entire and pubescent on both surfaces. The stem is gray-green, upright, branched and square; the surface is grooved, and the ribs are pubescent.

Habitat: *Leonurus japonicus* is found in China, North and South Korea, and Japan.

Production: Chinese Motherwort fruit is the dried fruit of *Leonurus japonicus*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: including leonurine

Fatty oil: chief fatty acids oleic acid and linolenic acid

EFFECTS

When taken internally, the alkaloid-containing drug (chief active ingredient leonurine) is said to have a contracting effect upon the uterus and to have generally anti-inflammatory effects upon various organ systems.

Topical application is said to reduce edema connected with injuries.

Watery drug extracts reduce blood pressure in animal experiments.

INDICATIONS AND USAGE

Chinese Medicine: Chinese Motherwort is used internally for inflammation of the kidney, the throat and the retina; for disturbances of menstruation, and in obstetrics for lochias-tase. Externally, the fruit is used for swelling of the tissue after trauma.

Homeopathic Uses: The drug is used as a cardiac tonic, for nervous cardiac disturbances, anxiety states and nervous breathlessness.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Feelings of weakness, outbreaks of sweating, enhanced sensitivity to pain and feelings of closeness in the chest can all follow intake of higher dosages of the drug (starting at 30 g).

CONTRAINDICATIONS

Not to be used during pregnancy.

DOSAGE

Mode of Administration: Whole and powdered drug. Preparations are administered internally and externally

Preparation: Infusion: 4 to 10 g drug

Daily Dosage: Not specified in the literature

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed), Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl, Bde 4 - 6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Chinese Olive

Canarium species

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the resin.

Flower and Fruit: The flowers are arranged in helicoid or scorpioid cymes; the structures are in threes. The 3 petals are thick and often coriaceous; the 3 sepals are usually fused into a cup- or jug-shaped calyx. There are 6 stamens, and the ovary is 3-chambered with an ovule in each chamber; the stigma is 3-lobed. The fruit is an ovoid drupe with a thin, resin-rich mesocarp.

Leaves, Stem and Root: The tree is monoclinal or diclinal, reaching heights up to 15 m. The leaves are odd pinnate. The leaflets are short-petiolate and very irregular. The stipules are round or slit.

Habitat: The tree is indigenous to the Spice Islands, Philippines, China, Melanesia, and Moluccas.

Production: Elemi is the oleoresin (soft) exuding from fresh cuts made in *Canarium luzonicum* and the residual resin (hard) left to dry on the tree. The soft elemi is obtained by cutting split secretion channels and, after knocking off the hard elemi, collecting the resin which dries on that tree.

Other Names: Elemi

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Triterpenes (70 to 80%): particularly alpha- and beta-amyrin, including alpha-, beta-, gamma-, delta-elemic acid, brein, maniladiol

Volatile oil (20 to 30%): chief component limonene (25%), also including alpha-phellandrene, elemol, eudesmol, carvacrol, methyl eugenol

EFFECTS

The resin is credited with promoting the healing of wounds. An immunostimulating effect was demonstrated in animal experiments. Topical administration causes skin irritation.

INDICATIONS AND USAGE

Unproven Uses: The resin is used in folk medicine as an expectorant for coughs as well as for gastric complaints, ulcers and rheumatism (plaster).

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. According to older sources, stomach complaints, kidney irritation and hemorrhagic erosions have been observed following administration of the essential oil. Topical application causes skin irritation.

DOSAGE

Mode of Administration: Preparations of the resin are used topically.

Preparation: Elemi resin is prepared by melting the resin at low heat and putting it through a filter. This cleaning process

results in a somewhat darker elemi. Plasters are prepared using 25% drug in ointment.

Storage: Store in well-sealed tins protected from light.

Chinese Rhubarb (Da-Huang)

Rheum palmatum

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried underground parts, and most of the root bark in the dried form.

Flower and Fruit: The inflorescence is an erect panicle foliated to the tip. The flowers have narrow, red, pink or whitish yellow tepals. The tepals are curved and located far back in the mature flowers to facilitate wind pollination. The fruit is red-brown to brown, and oval. The fruit is angular, about 10.2 mm to 7.8 mm wide and usually has scarios wings. The nutlet is 6 to 10 mm long and 7 mm in diameter.

Leaves, Stem and Root: The plant is a large, sturdy herbaceous perennial. The stem grows to over 1.5 m high. The leaves are orbicular-cordate, palmate lobed, somewhat rough on the upper surface and 3 to 5 ribbed. The lobes are oblong-ovate to lanceolate, dentate or pinnatisect. The root system consists of a tuber, which after a number of years measures 10 to 15 cm in diameter and has arm-thick lateral roots.

Habitat: The plant is indigenous to the western and north-western provinces of China and is cultivated in many regions around the world. The main producers are China and Russia.

Production: Chinese Rhubarb consists of the dried underground parts of *Rheum palmatum*, *Rheum officinale* or of both species. Stem parts, roots and most of the bark are removed from the rhizomes.

Not to be Confused With: Other *Rheum* species such as *Rheum rhaponticum* or *Rheum rhabarbarum*. Garden Rhubarb is *Rheum ponticum*.

Other Names: Rhubarb

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthracene derivatives (3-12%): chief components 1- or 8-O-f-glucosides of the aglycones rheumemodin, aloe-emodin,

rhein, chrysophanol, physcion (together 60-80%), 8,8'-diglucosides of dianthrones (10-25%), including among others, sennosides A and B

Tannins: gallo tannins, including among others galloyl glucose, galloyl saccharose, lindleyine, isolindleyine

Flavonoids (2-3%)

Naphthohydroquinone glycosides

EFFECTS

Main active principles: hydroxyanthracene derivatives, tannins and a small proportion of flavonoids

The laxative effect is due to the hydrogogic and anti-absorptive properties of the anthranoids. This effect causes an increase in the volume of the intestinal contents resulting in pressure and stimulation of intestinal peristalsis.

INDICATIONS AND USAGE

Approved by Commission E:

- Constipation

Unproven Uses: Rhubarb is used as an appetite stimulant and for digestion problems, gastrointestinal catarrh and painful teething (children). External uses include burn treatment and skin conditions.

Chinese Medicine: In China, Rhubarb is used for delirium, tenesmus, edema, amenorrhea and abdominal pain. Efficacy for digestion problems is plausible because of the tannin content but not without risk because of the anthranoids (toxicity); efficacy for the other indications has not been proven.

Homeopathic Uses: Homeopathic uses include diarrhea and teething.

CONTRAINDICATIONS

Chinese Rhubarb is contraindicated in cases of intestinal obstruction, acute inflammatory intestinal disease, appendicitis and abdominal pain of unknown origin.

PRECAUTIONS AND ADVERSE REACTIONS

General: Spasmodic gastrointestinal complaints can occur as a side effect to the drug's purgative effect. Long-term use leads to losses of electrolytes, in particular potassium ions. The loss of electrolytes may lead to hyperaldosteronism, inhibition of intestinal motility and enhancement of the effect of cardioactive steroids. Long term use may lead to heart arrhythmias, nephropathies, edema and accelerated bone deterioration.

The increased incidence of carcinoma of the colon following long-term administration of anthracene drugs has not yet been fully clarified. Recent studies show no association

between the administration of anthracene drugs and the frequency of carcinoma of the colon.

Stimulating laxatives must not be used over an extended period (1 to 2 weeks)^without medical advice.

Drug Interactions: Potassium deficiency can cause an increase in the effect of cardiac glycosides.

Pregnancy: Use during pregnancy or while nursing only after consulting a physician.

Pediatric Use: The drug is not to be administered to children under 12 years of age.

DOSAGE

Mode of Administration: Liquid or solid forms of medication are exclusively for oral use. The drug is available as comminuted drug, powder or dry extracts for teas, decoctions, cold macerations or elixirs. Extracts of the drug are often constituents of laxatives, cholagogics and gastrointestinal remedies, and are found in "slimming cures," "spring-time tonics" and "blood purifying" teas.

Preparation: To prepare an infusion to be used as a laxative, use 1.0-2.0 gm coarse powdered drug; for a stomachic, 0.1 to 0.2 gm powdered drug stirred with sufficient liquid (may be flavored with cinnamon, ginger, or peppermint oil) or scald and strain after 5 minutes. (1 teaspoonful = approximately 2.5 gm drug)

Daily Dosage: As a laxative, the dose is 1.0 to 2.0 gm of drug prepared according to instructions above. As an astringent and stomachic, the dose is 0.1-0.2 gm.

1.2 to 4.8 gm drug corresponds to 30 to 120 mg hydroxyanthracene derivatives/day, calculated as rhein.

Tea — 1 cup mornings and/or evenings

Extract — Single dose: 0.3 to 1 gm

Laxatives should be used for the shortest possible time (maximum 1 to 2 weeks)

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB1).

Chinese Thoroughwax (Chai-Hu)

Bupleurum chinense

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root.

Flower and Fruit: The inflorescence is a compound umbel. The flower structures are arranged in fives. The flowers are radial and small; the petals are yellowish, almost orbicular; the calyx teeth are insignificant. The ovary is inferior and 2-chambered. The fruit is a double achaene.

Leaves, Stem and Root: Thoroughwax is an upright herbaceous perennial, which grows about 30 to 70 cm high. The leaves are alternate, arranged in spirals, simple and entire. The stem is hollow, gnarled and branched.

Habitat: China, Japan and central Europe

Production: Bupleuri roots are the dried roots of *Bupleurum chinense*. They are collected in the wild.

Not to be Confused With: May be confused with *Bupleurum longiradiatum*.

Other Names: Chai Hu

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins (saikosides.1.2 to 4.9%, content declining with the diameter of the root): saikosaponins a, b1, b2, c and d, aglycones are the so-called saikogenins

Steroids: sterols, including alpha-spinasterol, stigmasterol

Polyynes: saikodiine A, B and C

EFFECTS

The drug is not usually used alone, but rather used in various drug mixtures.

The saiko saponins or saikogenins that the drug contains have exhibited antipyretic, edema-protective and anti-inflammatory effects in animal experiments. At the same time, an inducement of the depletion of corticosterone and a liver-protective effect could be demonstrated, as could a sedative and an analgesic effect. The drug is also credited with antitussive, anti-ulcerogenic and blood-pressure lowering characteristics.

INDICATIONS AND USAGE

Unproven Uses: Chinese Thoroughwax is used for inflammatory conditions (oriental regions).

Chinese Medicine: Preparations are used for shivering and fever, jaundice, chest pain, bitter taste in the mouth, nausea, vomiting, malaria and deafness.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

Pregnancy: The drug is not to be administered during pregnancy.

OVERDOSAGE

The ingestion of larger dosages of the drug may lead to gastroenteritis, intestinal colic and diarrhea, due to the saponin content.

DOSAGE

Mode of Administration: Whole drug and cut drug preparations for internal and external use.

Preparation: The drug is usually only used in Chinese and Japanese medicine in compounded preparations.

Storage: Should be well sealed (to protect against insects), and air dried.

LITERATURE

Chionanthus virginicus

See *Fringetree*

Chiretta

Swertia chirata

DESCRIPTION

Medicinal Parts: The medicinal part is the herb, which is cut and dried when the seed is ripe.

Flower and Fruit: The numerous flowers are small and form a yellow panicle. The fruit is a single-valved capsule, which tastes very bitter and is odorless.

Leaves, Stem and Root: The plant is an annual and grows up to 90 cm high. The branching stem is brown or purplish. 2 to

4 mm thick, cylindrical below and becoming quadrangular toward the top. The leaves are smooth, opposite, lanceolate or ovate and entire-margined with 3 to 7 longitudinal ribs.

Habitat: The plant is indigenous to northern India and Nepal.

Production: Chiretta is the aerial part of *Swertia chirata*.

Other Names: Chirata, Chirayta, Indian Balmony, Indian Gentian

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpinos as bitter substances (1.3%): chief components swertiamarin (0.4%), sweroside (0.2%), including as well gentiopicrin, amarogentin, amaroswerin

Xanthone derivatives: including mangiferin (0.12%), swerchirin (methyl bellidifoline), swertianin, 7-O-methyl swertianin, chiratol, swertiapunicoside, chiratanin

EFFECTS

Chiretta stimulates the secretion of gastric juices. In animal experiments, an anticholinergic (due to swertiamarin), antiphlogistic, hypoglycemic (due to xanthone derivatives), and centrally suppressing effect has been described.

INDICATIONS AND USAGE

Unproven Uses: Chiretta is used for dyspeptic disorders, loss of appetite, problems with the production of gastric juices and disorders of the digestive system.

CONTRAINDICATIONS

The drug should not be used in patients who have gastric or duodenal ulcers due to the drug's stimulation of gastric juice secretion.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is a constituent part of various preparations, especially drops.

Daily Dosage: The daily dosage is 15 to 20 drops, 3 times daily before meals. For nervous disorders, 10 to 15 drops are taken daily between meals.

Chives

Allium schoenoprasum

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried aerial parts of the plant.

Flower and Fruit: The cyme has numerous florets. The sheath of the inflorescence has 2 or 3 flaps. The flap is broad-ovate and shorter than the inflorescence; it is white or reddish. The florets are dense and globose with no bulbils. The petals of the perianth are lanceolate-ovate and acute or pointed. They are 7 to 11 mm long, bluish or white to yellowish, and have a dark middle stripe. The stamens are shorter than the perianth. They are awl-shaped and fused with each other and the perianth petals at the base. The perianth surrounds the capsule like a balloon.

Leaves, Stem and Root: *Allium schoenoprasum* is a perennial, 15 to 30 cm high plant. The base is branched with numerous erect, closely packed leaves. Thin sheaths form incomplete, oblong bulbs. The bulb skin is thin, white and splitting when mature. The stem is round, usually smooth and leafy from the lower third. The compact leaves are completely hollow, round, somewhat elastic, and gray or gray-green.

Habitat: Chives grow wild in the temperate regions of Europe and North America and are cultivated in Europe, Turkistan, North America and from Siberia to Japan.

Production: Chives are the complete aerial parts of *Allium schoenoprasum*, which are harvested before flowering.

Other Names: Cive Garlic, Civet, Chive

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Alliins (alkyl cysteine sulfoxides): in particular, methyl alliin (S-methyl-L-(+)-cysteine sulfoxide) and pentyl alliin (S-pentyl-L-(+)-cysteine sulfoxide), as well as their gamma-glutamyl conjugates; in the course of cutting up the fresh foliage, the alliins undergo a transformation (which is triggered by fermentation) into the so-called alliaceous oils, e.g., dimethyl-disulfide-mono-S-oxide

EFFECTS

The volatile and non-volatile sulphur bonds are said to be anthelmintic. However, efficacy has not been documented in scientific studies.

INDICATIONS AND USAGE

Unproven Uses: The drug is used to expel worms and intestinal parasites.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The intake of large quantities can lead to stomach irritation.

DOSAGE

Mode of Administration: Chives are used fresh or dried, as a cut drug.

Chocolate Vine (Mu-Tong)

Akebia quinata

DESCRIPTION

Medicinal Parts: The dried stems and fruits of the *Akebia quinata* are frequently used in medicine.

Flower and Fruit: The inflorescence is racemose, hanging, 5 to 9 cm long, with 1 to 3 female flowers. The pedicle is 3 to 5 cm long. There are 3 to 4 violet to pink-violet sepals up to 1.5 cm long and 5 to 7 apocarpic, blue-violet carpels. There are 4 to 15 male flowers with 3 violet to lilac sepals and 6 to 7 violet to black stamens. The fruit is an elongate pome, 6 to 9 cm long, dark violet when ripe with white spots and a coriaceous cupule. The seeds are numerous, red-brown to

black, ovoid, approximately 6 mm long and embedded in jelly-like tissue.

Leaves, Stem and Root: *Akebia quinata* is a climbing shrub that grows up to 10 m high. The shrub is deciduous, diclinous and monoecious. The leaves are alternate and arranged in fives. The petiole and the stems of the leaflets are approximately 2 cm long. The leaflets are up to 2.5 cm long, rounded at the base and entire. The trunk is silvery or gray, with cork warts.

Characteristics: The fruit is edible.

Habitat: Japan, China, Korea

Production: Chocolate vine is the dried stem of *Akebia quinata*.

Other Names: Five-Leaflet *Akebia*, Mu Tong

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins: akebosides, aglycones oleanolic acid and hederagenin

Steroids: sterols, including beta-sitosterol, beta-sitosterol glucoside, betulin

Monosaccharides/oligosaccharides: saccharose

Cyclitols: meso-inositol

EFFECTS

Animal experiments have demonstrated an anti-edemic effect attributed to the saponin mixture contained in the drug. In addition, diuretic, uricosuric, centrally depressant, antipyretic, mild analgesic and motility-inhibiting (intestinal) effects have been reported, although no results of controlled clinical studies have as yet been published.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the plant have been used for acute urinary tract infections and ascites.

Chinese Medicine: Mu Tong is used for laryngitis and dry coughs, urinary stones, disturbances of bladder function, galacturia, convulsions, anemia and hematuria.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The ingestion of larger dosages of the drug may lead to gastroenteritis, intestinal colic and diarrhea, due to the saponin content. The drug is not to be administered during pregnancy.

DOSAGE

Mode of Administration: Liquid preparations for internal use.

Daily Dosage: 3 to 9 gm in the form of a decoction.

Cinnamon

Cinnamomum verum

TRADE NAMES

Cinnamon bark liquid extract is available from several manufacturers.

DESCRIPTION

Medicinal Parts: The medicinal parts are the cinnamon oil extracted from the bark, the cinnamon bark of younger branches and the cinnamon leaf oil.

Flower and Fruit: The flowers are whitish-green, inconspicuous and have an unpleasant smell. They are about 0.5 cm long; arranged in loose, axillary or terminal panicles; and covered in silky hairs. The fruit is berry-like, ovoid-oblong, short-thorned and half-enclosed by the attached epicalyx.

Leaves, Stem and Root: The plant is a heavily foliated evergreen tree 6.5 to 12 m tall with a pale brown bark in thin quills, several rolled inside one another. The branches are cylindrical with a gray-brown bark. The tough leaves, which are opposite and splayed horizontally to leaning, are initially red then turn green. They are about 12 cm by 5 cm, roundish-ovate or ovate-lanceolate to oblong, more or less acuminate and entire-margined. The leaves smell like cloves.

Habitat: Cinnamon is indigenous to Sri Lanka and southwest India.

Production: Cinnamon consists of the dried tree bark, "separated from the cork and outer rind, of young shoots
 ••K growing on the branches of *Cinnamomum verum*. The tree is widely cultivated, and the harvested bark is dried in the shade.

Not to be Confused With: Confusion can arise with other powdered cinnamon varieties.

Other Names: Ceylon Cinnamon

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components - cinnamaldehyde, weiterhin eugenol, cinnamylacetate, cinnamyl alcohol, o-methoxycinnamaldehyde, cinnamic acid

Diterpenes: cinnzeylanol, cinnzeylanin

Oligomeric proanthocyanidins

Mucilages

4f» EFFECTS

The cinnamaldehyde in the cinnamon bark's essential oil is antibacterial, fungistatic and promotes motility. It has a mildly positive estrogen effect on the genital system of animals in tests, although the constituent responsible is unidentified. Cinnamon increases gastric secretions slightly and is an insecticide due to the diterpenes cinnzeylanin and cinnzeylanol.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Dyspeptic complaints

Unproven Uses: In addition, folk medicine internal uses include infantile diarrhea, chills, influenza and worm infestation. Cinnamon is used externally for cleaning wounds.

Indian Medicine: Uses in Indian medicine include toothache, nausea and vomiting, and halitosis.

^ CONTRAINDICATIONS

- * Use of the drug is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a medium potential for sensitization because of the cinnamaldehyde content.

Pregnancy: The drug is not to be administered to pregnant women.

DOSAGE

Mode of Administration: Comminuted drug for infusions; essential oil, as well as other galenic preparations for internal use. Bath additives, drops and compound preparations for external use.

How Supplied:

Extract — 1:1

Preparation: To prepare a tea, pour hot water over 0.5 to 1 g cinnamon bark and strain after 10 minutes. A tincture is made from a maceration of 20 parts cinnamon bark + 100 parts 70% ethanol V/V (OAB90).

Daily Dosage: 2 to 4 g drug; 0.05 to 0.2 g essential oil. One cup of tea/infusion is taken 2 to 3 times daily at mealtimes. Liquid extract is taken 3 times in 1.5 to 1 ml doses. Two to 4 ml of tincture are taken 3 times daily. The standard single dose is 0.5 to 1 g of the drug.

Storage: Protect from light and moisture in non-synthetic containers.

Ginquefoil

Potentilla erecta

DESCRIPTION

Medicinal Parts: The medicinal parts are the rhizome freed from the roots, the fresh underground parts collected in the spring, the dried rhizome and the rhizome gathered in the spring.

Flower and Fruit: The small, yellow, long-pediced flowers grow opposite the leaves or at branching points on the stem. The 4 sepals have a 4-bract epicalyx. There are 4 free petals, which are obcordate and somewhat darker at the base. There are usually 16 stamens and numerous ovaries with thread-like styles. The receptacle is domed. The fruit is nut-like, hard, 1 seeded, ovate, grooved and occasionally smooth.

Leaves, Stem and Root: The plant is about 30 cm high and a rhizomatus herbacious perennial. The rhizome is 1 to 3 cm thick, irregular, gnarled to cylindrical, woody, dark-brown outside and blood red inside. The stem is erect or decumbent, never rooting, branching. The trifoliate rosette-like basal leaves wilt early and are gone before flowering. The cauline leaves are sessile, trifoliate and appear to be in fives because of 2 stipules

Characteristics: The plant is odorless and has an astringent taste.

Habitat: The plant is found as far north as Northern Scandinavia and as far south as Northwest Africa, Italy, Central Spain and the Balkans.

Production: Cinquefoil rhizome consists of the dried rhizome, freed from the roots, of *Potentilla erecta* (syn: *Potentilla tormentilla* N.) and its preparations. After harvesting the rhizome is air-dried.

Not to be Confused With: May be confused with *Radix bistortae* and the rhizomes of *Geum* species.

Other Names: Cinquefoil, Septfoil, Thormantle, Biscuits, Bloodroot, Earthbank, Ewe Daisy, Flesh and Blood, Shepherd's Knapperty, Shepherd's Knot, English Sarsaparilla

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Catechins: including (-)-gallocatechin gallate, (-)-epigallocatechin gallate, dimers and trimers of the catechin derivatives

Catechin tannins (15 to 20%), transformed under storage conditions into non-water soluble tannin's (phlobaphenes)

Flavonoids: including kaempferol

Gallo tannins (3.5%), including agrimonine, pedunculagin, levigatines B and F proanthocyanidins

Tannins (17 to 22%)

Triterpenes: including tormentoside, ursolic acid, e-epi-pomolic acid

EFFECTS

The drug is astringent, antimicrobial and molluscidal because of the tannin complex (gallic tannins and ellagic tannins). In animal experiments an antihypertensive, anti-allergic, immune-stimulating, antiviral and interferon-inducing effect has been demonstrated.

INDICATIONS AND USAGE

Approved by Commission E:

- Diarrhea
- Inflammation of the mouth and pharynx

Tormentil is used internally to treat non-specific acute diarrhea. The drug is used externally for gingivitis, stomatitis and pressure caused by prosthetic devices.

Unproven Uses: In folk medicine, the drug is used internally for acute and subacute gastroenteritis and diarrhea and externally for poorly healing wounds, frostbite, burns and hemorrhoids.

PRECAUTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. There are reports in the literature of gastric complaints or vomiting following intake of the drug or its extracts.

DOSAGE

Mode of Administration: Tormentil is available in solid, liquid and compounded preparations for internal and external use.

Preparation: To prepare a tea, 2 to 3 gm finely cut or coarsely powdered drug is added to cold water, and rapidly brought to a boil, steep for some time and then strain. A cold water decoction may be used to avoid loss of tannin strength that occurs during the boiling process (1 teaspoon is equivalent to approximately 4 gm drug).

To prepare a tincture, 1 part cut rhizome is percolated with 5 parts 70% ethanol (V/V) (DAB 10)

Daily Dosage: 4 to 6 gm drug

Tincture (1:10): 10 to 20 drops to one glass of water as a rinse several times a day

Tea: 1 cup to be taken 3 to 4 times a day (acts as an anti-diarrheal agent.)

Wine decoction: For diarrhea soak 2 to 4 gm powdered drug with red wine)

Storage: The herb should be protected from light.

Cleavers

Galium aparine

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial parts collected during the flowering season and dried, as well as the fresh, flowering herb and the fresh or dried whole plant.

Flower and Fruit: There are a few small white or greenish flowers in axillary, peduncled cymes. The corolla is about • 1.5 to 1.7 mm long and has a pointed tip. The pedicels do not turn back before the fruit ripens. The 4 to 7 mm long mericarps are covered in barbed bristles.

Leaves, Stem and Root: The plant is 60 to 150 cm high. The stem is decumbent or climbing, sharply quadrangular even to the point of being winged and branched. There are long cauline leaves. The margins and midrib of the leaves are thorny. The foliage leaves are arranged in false whorls of 6 or 8. They are lanceolate from a wedge-shaped base, 30 to 60 mm long and 3 to 8 mm wide, obtuse and thorny tipped.

Habitat: A common wild plant throughout Europe, in Asia from Siberia to the Himalayas, and in North and South America.

Production: Cleavers is the flowering herb of the aerial part of *Galium aparine*, which is garnered and then dried.

Other Names: Clivers, Goosegrass, Barweed, Hedgeheriff, Hayriffe, Eriffe, Grip Grass, Hayruff, Catchweed, Scratweed, Mutton Chops, Robin-Run-in-the-Grass, Love-Man, Goosebill, Everlasting Friendship, Bedstraw, Coachweed,

Cleaverwort, Goose Grass, Gosling Weed, Hedge-Burs, Stick-a-Back, Sweethearts

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes: asperuloside

Benzyl isoquinoline alkaloids: including protopine

Beta-carbolin alkaloids: harmine

Quinazoline alkaloids: 1-hydroxydesoxyepiganin, 8-hydroxy-2,3-dehydrodesoxyepiganin

Flavonoids

EFFECTS

No information is available.

INDICATIONS AND USAGE

The drug is used internally as well as externally for ulcers, festering glands, lumps in the breast and skin rashes. It is also used for lithuresis and calculosis and as a diuretic for dropsy, bladder catarrh and retention of urine (ischuria).

Efficacy has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Used topically in alcoholic extracts. Internally as a tea and juice.

Daily Dosage: As a tea, add 4 teaspoonfuls (3.3 to 4.4 gm) of the drug to 2 glasses of hot water. Drink in sips during the course of the day.

Clematis

Clematis recta

DESCRIPTION

Medicinal Parts: The medicinal part is the fresh, flowering plant.

Flower and Fruit: The flowers are in many blossomed terminal cymes. The individual blossoms are white and similar to *Clematis vitalba*, except that the bracts are only downy on the edges. The nutlet is glabrous, with a thickened edge and a long tail.

Leaves, Stem and Root: The plant grows to about 50 to 125 cm high. The stem is non-climbing, erect, leafy and glabrous. The leaves are pinnatifid. The leaflets are smaller than those of *Clematis vitalba*.

Characteristics: The plant is poisonous.

Habitat: The plant grows in Europe.

Production: *Clematis* herb is the whole fresh flowering plant of *Clematis recta*. The herb is gathered when the plant is in full flower. It is turned regularly while being dried in the shade.

Other Names: Upright Virgin's Bower

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Protoanemonine-forming agents in the freshly harvested plant: presumably, the glycoside ranunculin changes enzymatically when the plant is cut into small pieces (and probably also when it is dried) into the pungent, volatile protoanemonine that quickly dimerises to anemonine. Once dried, the plant may not be capable of protoanemonine formation.

Saponins

EFFECTS

The fresh plant induces blistering on the skin and mucous membranes and is a fungicide. Sun plants are more effective than shade plants.

INDICATIONS AND USAGE

Unproven Uses: *Clematis* was formerly used as a remedy for venereal diseases (syphilis), chronic skin conditions, gout, rheumatism and bone disorders, as well as a diuretic. In the pharmaceutical industry, it is used for rheumatic pains, headaches and varicose veins. In folk medicine, it is used for blisters and as a poultice for festering wounds and ulcers.

Homeopathic Uses: *Clematis* is used in homeopathic dilutions for ulcers and poor wound healing.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages of the dehydrated drug. Extended skin contact with the freshly harvested, bruised plant can lead to blister formation and cauterizations that heal poorly, due to the released protoanemonine, which is severely irritating to the skin and mucous membranes. If taken internally, severe irritation to the gastrointestinal tract, combined with colic and diarrhea, as well as irritation of the urinary drainage passages, are possible.

Symptomatic treatment for external contact consists of mucilaginous, after irrigation with diluted potassium permanganate solution. In case of internal contact, administration of activated charcoal should follow gastric lavage.

OVERDOSAGE

Death by asphyxiation following the intake of large quantities of protoanemonine-forming plants has been observed in animal experiments. The risk associated with use of this plant is less than that of many other Ranunculaceae (e.g., *Anemones nemorosae*) due to the relatively low levels of protoanemonine-forming agents.

DOSAGE

Mode of Administration: The drug is seldom used today. It is available in the form of decoctions, which are used for poultices, as well as extracts and drops.

Homeopathic Dosage: *Clematis* is used in homeopathic dilutions D3 and D4.

Storage: The herb should be stored in tightly sealed containers.

Clove

Syzygium aromaticum

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the whole or macerated flower buds, the pedicles and leaves, the dried flower buds and the not quite ripe fruit.

Flower and Fruit: The flowers are in triply-triple-branched cymes. They are short-pedicled, whitish-pink, approximately 6 mm wide and have 2 scale-like bracteoles. The calyx tube is 1 to 1.5 cm long and cylindrical. The 4 sepals are fleshy and there are 4 petals. The fruit is 2 to 2.5 cm long, 1.3 to 1.5 cm wide and is crowned by 4 curved sepals. The fruit is 1-seeded.

Leaves, Stem and Root: The plant is a 20 m high, pyramid-shaped evergreen tree. The diameter of the trunk is 40 cm. The branches are almost round. The leaves are 9 to 12 cm long and 3.5 cm wide. They are coriaceous, elliptical to lanceolate, short, obtusely tipped and narrowing in a cuneate form to the petiole, which is 2.5 cm long. There is 1 main rib and more than 20 lateral ones.

Characteristics: The taste and odor are characteristic.

Habitat: The plant is indigenous to the Molucca Islands and is cultivated there and in Tanzania, Madagascar, Brazil and other tropical regions.

Production: Cloves consist of the hand-picked and dried flower buds of *Syzygium aromaticum* (syn. *Jambosa caryophyllus*, *Eugenia caryophyllata*).

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (15-21%): chief components eugenol (70-90%), eugenyl acetate (aceteugenol, up to 17%), beta-caryophyllene (5-12%)

Flavonoids: including astragalin, isoquercitrin, hyperoside, quercetin-3,4'-di-O-glycoside

Tannins (10%): ellagitannins, including eugenin

Triterpenes: oleanolic acid (1%), crataegolic acid (maslic acid, 0.15%)

Steroids: sterols, including beta-sitosterol

EFFECTS

Clove is antiseptic, antibacterial, antifungal, antiviral, spasmolytic and a local anaesthetic.

INDICATIONS AND USAGE

Approved by Commission E:

- Dental analgesic
- Inflammation of the mouth and pharynx

Unproven Uses: Clove oil is used internally for stomach ulcers and externally for colds and headaches. It is also used externally as a local analgesic and dental antiseptic.

Indian Medicine: The drug is used for halitosis, toothache, eye disease, flatulence, colic, gastropathy, and anorexia.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Allergic reactions to eugenol occur rarely. In concentrated form, oil of clove may be irritating to mucosa.

DOSAGE

Mode of Administration: As a powdered, ground, or whole herb for the recovery of the essential oil, and other galenic preparations for topical use.

Daily Dosage: Aqueous solutions corresponding to 1 to 5% essential oil are used externally for mouthwashes. In dentistry, the undiluted essential oil is used.

Storage: Do not store the drug in plastic containers, and protect it from light.

Club Moss

Lycopodium clavatum

DESCRIPTION

Medicinal Parts: The medicinal parts are the spores and the fresh plant.

Flower and Fruit: Sulfur yellow, minute spores, carried in large numbers in 2 to 3 cylindrical yellow-green cones, develop in August at the ends of leafy, 15 cm high stalks extending from aerial branches.

Leaves, Stem and Root: The plant has a 1 m long, procumbent stem with only a few roots. It is covered with yellowish-green leaves, densely arranged in spirals, which are entire-margined, linear, smooth and end in a long, white, upwardly bent hair tip. There are numerous erect, circular, 5 cm high branches on the mainstem.

Habitat: The plant is found worldwide, but it originated in China and Eastern Europe.

Production: Club Moss is the aerial part *Lycopodium clavatum*. It is collected in the uncultivated regions and air-dried or dried artificially at a maximum of 40° C.

Other Names: Stags Horn, Witch Meal, Wolfs Claw, Vegetable Sulfur

ACTIONS AND PHARMACOLOGY

COMPOUNDS

^£ *Alkaloids (0.2%):* including among others those of the lycopodine- and lycodan-types (derived from piperidine alkaloids), chief alkaloids lycopodine and dihydrolycopodine, in traces also nicotine.

Triterpenes: including alpha-onocerin, lycoclavatul, lycoclananol, serratendiol (demonstrated in plants of Japanese origin)

Steroids: including beta-sitosterol, campesterol and stigmasterol

Flavonoids: including among others chrysoeriol, luteolin

EFFECTS

Club Moss has a diuretic effect.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, it is used internally for bladder and kidney complaints, also for pharyngeal catarrh and tonsillitis, menstruation complaints, rheumatism and impotence; externally for wounds, itching and suppurating eczema of the skin.

Homeopathic Uses: Herb and spores are used in liver and gallbladder complaints, general blood poisoning, inflammation of the respiratory tract, disorders of the intestinal tract, varicose veins, metabolic diseases, chronic and acute skin conditions, inflammation of the female genital organs and menstruation complaints, as well as behavioral and mood disturbances.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Irritations should be expected with extended use of the drug.

OVERDOSAGE

Despite the toxicity of the alkaloids, no poisonings have been recorded.

g, DOSAGE

*• *Mode of Administration:* In folk medicine, chopped drug is used in teas.

Daily Dosage: Single dose: 15 gm drug. Tea: 1 cup to be taken 2 to 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally; 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1)

Cnicus benedictus

See Blessed Thistle

Coca

Erythroxylum coca

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves of the coca bush.

Flower and Fruit: The flowers are small and greenish white. They are in axillary clusters. The fruit is a red almost 1 cm long drupe with 1 seed.

Leaves, Stem and Root: *Erythroxylum coca* is a small shrub-like tree up to 5 m tall. The leaves are brownish-green, oval, thin but tough, up to 5 cm long and 2.5 cm wide with two lines on the surface parallel to the midrib. The margins are entire, the apex rounded. There are 2 faint projecting lines on the upper surface parallel to the midrib which stiffen the leaf. There are small stipules in the leaf axils, which later become brown and hard.

Habitat: The plant is indigenous to the Andes region of South America; it is cultivated in Indonesia, India and Sri Lanka.

Production: Coca leaves are the dried leaves of *Erythroxylum coca*.

Other Names: Bolivian Coca, Cocaine, Cuca, Peruvian Coca

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tropane alkaloids: main alkaloid (-)-cocaine, including, among others, cis-cinnamoyl cocaine, trans-cinnamoyl cocaine, also including alpha-truxillin, beta-truxillin, benzoylecgonin

EFFECTS

The leaves act as a local anesthetic and stimulate the central nervous system. In high doses, the drug causes paralysis of motor neuron fibers.

INDICATIONS AND USAGE

Unproven Uses: The plant is used in the manufacture of the local anesthetic cocaine hydrochloride. It is a model for synthetic local anesthetics. Cocaine is still occasionally used in ophthalmology.

PRECAUTIONS AND ADVERSE REACTIONS

General: Chewing an excessively large quantity of the leaves can cause psychic disturbances and hallucinations. Chronic use can lead to poor nutritional states and disinterest in work, due to the suppression of feelings of hunger and the resulting reduction in food intake. The enhanced vulnerability to illness and the reduced life expectancy are also conditioned by the immunosuppressive effect of the drug. Beyond that, the drug is probably carcinogenic in effect, embryotoxic and sensitizing. The observed dependence on the drug (cocoaism) is mainly psychically conditioned, although withdrawal symptoms are also known (need for sleep, bulimia, anxiety, irritability, tremor). For the toxicology of cocaine, consult publications (Lewin, Teuscher).

Pregnancy: Cocaine passes into the embryo or fetus and is embryotoxic.

Nursing Mothers: Cocaine passes into the mother's milk.

DOSAGE

Mode of Administration: Use of *Erythroxylum coca* is obsolete except for use in 2% eyedrops.

Cochlospermum gossypium

See Cotton Tree

Cocillana Tree

Guraea rusbyi

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the bark.

Flower and Fruit: The flowers are radial, and their structures are in fives. They are white to yellowish and inconspicuous. The ovary is superior.

Leaves, Stem and Root: The plant grows as a tree, rising up to 5 m high. The leaves are large and pinnatifid.

Habitat: *Guraea rusbyi* is indigenous to Cuba, Brazil and Bolivia.

Production: Cocillana bark is the bark of the trunk of *Guarea rusbyi*, which is collected in the wild.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Steroids: sterols, including beta-sitosterol

*Tannin**Alkaloids*

EFFECTS

The drug is said to be expectorate, emetic and laxative in effect. In higher dosages, it is said to be menstruation-inducing. The emetic effect is credited to the alkaloid fraction, which has not been more precisely defined. Experimental data have not been made available. The bark of the tree induces vomiting and can frequently bring on a feeling of weakness and nausea. But it can also provide a stimulatory expectorant and has been used successfully in the treatment of bronchitis and respiratory illnesses.

INDICATIONS AND USAGE

Unproven Uses: Uses in folk medicine have included treatment of chronic bronchitis and coughs and also as an emetic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The drug is said to induce vomiting and diarrhea in high dosages.

CONTRAINDICATION

Because it is said to induce menstruation, it should not be administered to anyone who is pregnant.

DOSAGE

Mode of Administration: Whole, cut and powdered drug preparations for internal use.

Preparation: Tinctures are prepared using drug 1:10 60% ethanol (V/V) (BHP83). Liquid extracts contain drug 1:60% ethanol (V/V) (BHP83).

Daily Dosage:

Decoction — from 0.5 to 1 g drug, 3 times daily

Liquid extract — 0.5 to 1 ml, 3 times daily

Tincture — 5 to 10 ml, 3 times daily

Syrup — 2 to 4 ml, 3 times daily

Dose for children — 1/4 to 1/3 of the above doses.

Cocoa

Theobroma cacao

DESCRIPTION

Medicinal Parts: The medicinal parts are the seed skins that remain after making cocoa and cocoa butter: the seeds which have been partly freed from their skins and lightly roasted: and the raw, dried, unroasted seeds.

Flower and Fruit: The inflorescences are on the main trunk and thicker branches on a so-called "flower cup." The cyme-like branchlets are short, noded and persistent. There are 5 sepals, which are narrow. The petals are cap-shaped and stemmed with flag-like laminas. The stamen tube, with 5 fertile stamens and 5 awl-shaped staminoids, is short. The fruit is a 15 to 25 cm long and 10 cm thick, large berry. It is oblong or obovate, thick-skinned, yellow or reddish, grooved and sometimes bumpy and cucumber-like. The 20 to 50 seeds are arranged in rows and embedded in a pink, fruity, sweetish-sour pulp. They are pressed flat, almond-shaped, reddish-brown and without endosperm.

Leaves, Stem and Root: The plant is a 4 to 6 m, occasionally up to 13 m, tall tree with an irregular knotty trunk and a broad crown. The young branches are rounded. The leaves are coriaceous or paper-like, alternate and in 2 rows on the branches. The petiole is downy, cushioned, and 1.5 to 2 cm long. The lamina is oval or elliptical, slightly asymmetrical, rounded at the base with a conspicuous tip. The upper surface is green and pale when dry. The lower surface is paler green, glabrous or has a few, tiny, simple, branched and scattered hairs.

Habitat: The plant is cultivated globally in tropical regions.

Production: Cocoa seeds consist of the seeds of *Theobroma cacao*, which have been removed from their shells, fermented and lightly roasted. Cocoa consists of the testae of *Theobroma cacao*. Cocoa butter is the hard fat obtained from the ripe cocoa seeds of *Theobroma cacao*. After removal of the germ-roots and the shell from the seeds, the seeds are removed from the shell and crushed. The cocoa fat is squeezed out at a temperature of 70° C to 80° C and allowed to cool.

Other Names: Cacao, Chocolate Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS: COCOA SEED

Purine alkaloids (3 to 4%): main alkaloid theobromine (2.8 to 3.5%), with a lesser amount of caffeine (0.1 to 0.4%)

Fat (50%): chief fatty acids oleic acid (33 to 39%), stearic acid (30 to 37%), palmitic acid (24 to 31%)

Proteic substances (10 to 16%)

Starch (5 to 9%)

Monosaccharides/oligosaccharides (2 to 4%): saccharose, glucose, fructose

Biogenic amines: including phenyl ethyl amine, tyramine, tryptamine, serotonin

Isoquinoline alkaloids: salsolinol

Catechin tannins (10%): including oligomeric proanthocyanidins (8%)

Oxalates (0.6 to 1%)

EFFECTS: COCOA SEED

Cocoa seeds can cause constipation because of the tannin content. The drug contains methylxanthines, mainly theobromine, which have a diuretic, broncholytic, and vasodilatory effect. They also stimulate cardiac muscle performance and act as a muscle relaxant.

COMPOUNDS: COCOA SEED COAT

Purine alkaloids: main alkaloid theobromine (0.4-1.2%) with less caffeine (0.02%)

Fat (5%)

Biogenic amine: including phenyl ethyl amine, tyramine, tryptamine, serotonin

Catechin tannins: among them, proanthocyanidins

EFFECTS: COCOA SEED COAT

Cocoa can cause constipation. Cocoa contains methylxanthines, which have a diuretic, broncholytic, and vasodilatory effect. They also improve cardiac muscle performance and act as a muscle relaxant.

COMPOUNDS: COCOA BUTTER

Triglycerides (melting temperature 31 to 35°C): chief fatty acids oleic acid (33 to 39%), stearic acid (30 to 37%), palmitic acid (24 to 31%)

Free fatty acids

Steroids: sterols, including beta-sitosterol

Purine alkaloids (0.001 to 0.1%)

EFFECTS: COCOA BUTTER

The main constituents are triglycerides. High doses of cocoa butter, in contrast to similar saturated fatty acids, do not cause an increase of serum cholesterol and the LDL fraction.

INDICATIONS AND USAGE

COCOA SEED

Unproven Uses: In folk medicine, Cocoa seeds are used for infectious intestinal disease, diarrhea and as a secretolytic. It is also used to regulate the thyroid and as a mild stimulant (in compound drinks containing caffeine.)

COCOA SEED COAT

Preparations of cocoa seed coat are used for liver, bladder, and kidney ailments, diabetes, as a tonic and general remedy and as an astringent for diarrhea.

COCOA BUTTER

Cocoa Butter is used by the pharmaceutical and cosmetic industries as an inactive ingredient in dermatologic preparations.

PRECAUTIONS AND ADVERSE REACTIONS

COCOA SEED

General: No health hazards or side effects are known in conjunction with either the proper administration of designated therapeutic dosages or the consumption of normal amounts of chocolate products. Large dosages lead to constipation due to the tannin content. Cocoa and cocoa products can cause allergic reactions. The amines can trigger migraine attacks.

Pediatric Use: Large quantities of chocolate products can lead to overexcitability, racing pulse and sleep disorders in children because of the caffeine content, which can be as high as 0.2% in milk chocolate and 0.4% in bitter chocolate.

COCOA SEED COAT

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Cocoa and cocoa products can cause allergic reactions. Large dosages lead to constipation due to the tannin content. The amines can trigger migraine attacks.

COCOA BUTTER

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

COCOA BUTTER

Mode of Administration: Cocoa Butter is used as a pharmaceutical base for suppositories and vaginal globules. It is an additive for ointments and cosmetic preparations, such as skin creams and lip balms.

Storage: Store in a cool, dark place.

Coconut Palm

Cocos nucifera

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the fruit.

Flower and Fruit: The flowers are arranged in up to 1.5 m long, spindle-shaped, branching axillary inflorescences, which are surrounded by a woody spathe. On each of the 20 to 40 lateral branches of the inflorescence there is only one, 3 to 3.5 cm large, yellowish-green-white female flower. There are 200 to 300 male flowers at the apex of the single *ff* branches with their structures arranged in threes. The flowers are up to 1.5 cm wide and yellowish; the ovary is 3-carpeled and fused. The drupe is up to 30 cm long and weighs 1.5 to 2.5 kg. The exocarp is smooth and impervious to water. The mesocarp is fibrous (certain floating ability, coconut fiber) and the endocarp woody and hard. The stone kernel is incorrectly called a nut. The inconspicuous embryo is embedded in the fat rich endosperm (copra). Inside the unripe fruit there is approximately 500 ml of clear, sweet-tasting liquid (coconut milk), which reduces when the fruit ripens. At the side stem insert there are 3 shoot holes, only one of which is covered with a membrane. These allow the embryo to penetrate the surrounding fiber layer.

Leaves, Stem and Root: Coconut Palm is diclinous and monoecious. The tree grows up to 30 to 35 m high. The frond is up to 5 m long, 1 to 1.7 m wide (up to 15 kg in weight) and clasps the trunk with a wide petiole. The bark is thick and the surface is shaggy with remains of the leaf bases of fallen leaves. The trunk is divided into nodes and internodes. Adventitious roots arise from the base of the **HT** trunk.

Characteristics: One palm tree produces up to 70 ripe fruit per year.

Habitat: The native country of this species is disputed, but is believed to be the Pacific regions.

Production: Coconut oil is the fat extracted from the dried solid part of the endosperm of *Cocos nucifera* through cold pressing. Completely ripe fruit is harvested, followed by

manual or mechanical opening of the kernel and then followed by the extraction of the endosperm (known as copra). It is dried in the sun, over a fire or in special drying houses. The pressed oil is refined and cleaned.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil: chief fatty acids lauric acid (45 to 50%), myristic acid (13 to 20%), palmitic acid (7 to 10%), caprylic acid (5 to 10%), including as well stearic acid, linoleic acid, caproic acid.

Free fatty acids (3 to 5%)

Delta-lactones of 5-hydroxy-fatty acids: particularly delta-octalactone (as aroma compounds)

EFFECTS

Coconut oil is characterized by having a large quantity of short-chained fatty acids and a rather small amount of unsaturated fatty acids. It is chiefly used as a dietetic. An immunomodulating effect was observed in animal experiments, as was an inhibiting effect upon the growth of carcinoma cells of the colon in vitro.

INDICATIONS AND USAGE

Unproven Uses: The oil of Coconut Palm has been used for poorly healing wounds and skin infections (Africa). Internally it is used for colds and inflammation of the throat (with salt; Central America) and for tooth decay (southeast Asia).

Indian Medicine: Coconut Palm oil is used for dysuria, coughs, bronchitis and to stop hair from turning gray.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the use of the drug as a food or as a pharmaceutical vehicle or raw substance (including its use in the extraction of short- and medium-chained fatty acids and in the manufacture of soaps and solubilizing agents).

DOSAGE

Mode of Administration: Preparations are intended for internal and external use.

Storage: Protect from light in tightly sealed containers at a maximum temperature of 25° C.

Cocos nucifera

See *Coconut Palm*

Coffea arabica

See *Coffee*

Coffee

Coffea arabica

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the seed in various forms and stages.

Flower and Fruit: The inflorescences are axillary dense clusters with 10 to 20 flowers. The sessile or very short pedicled partial inflorescences bear dense, overlapping apical leaves. The calyx is 2.5 to 3 mm long with a blunt 5-tipped border. The corolla is white and fragrant. The stamens come from the mouth of the tube and are exerted. The ripe fruit is ellipsoid, 12 to 18 mm long by 12 to 15 mm wide with a 3 to 6 mm long stem. It is initially green, later yellow and dark red when ripe. The exocarp is tough and the mesocarp fleshy and slightly sweet. The endocarp is hard. The seeds are flat-convex with a groove on the flat adaxial side. They are 8 to 12 mm long, 5 to 8 mm wide and 3 to 5 mm thick. When fresh, the seeds are gray-green. They turn brown after roasting.

Leaves, Stem and Root: *Coffea arabica* is an evergreen shrub or small tree up to 8 m high with many basal branches. The young branches are glabrous and flattened, and the nodes produce many shoots. The bark of the fruiting branches is

ashy-white. The leaves are 6 to 20 cm long, 2.5 to 6 cm wide and live for 2 to 3 years. They are glabrous, slightly coriaceous, dark green, glossy and elliptoid-lanceolate, with a distinct leaf tip. The border is occasionally extensively ribbed.

Habitat: Coffee's area of origin is disputed, but it is now cultivated in many tropical regions of the world, including Brazil, Mexico, Columbia and Ethiopia.

Production: Coffee charcoal is produced by roasting the outer seed parts of the green, dried fruit of *Coffea arabica* (and other *Coffea* species) until almost black, then grinding the carbonized product.

Coffee beans are the seeds of *Coffea arabica*, which are ripe for harvest nine months after flowering. Thereafter, they are processed using one of two methods. In the dry method, the beans are dried for 3 to 4 weeks in the sun, or mechanically with air-stream dryers. In the wet method, the beans are placed in a water-filled tank, where only the ripe ones sink to the bottom. The ripe fruit is then mechanically crushed and subsequently fermented. Fermentation lasts for approximately 48 hours (for arabica varieties). Afterward, the coffee is dried mechanically or in the sun.

Not to be Confused With: Coffee beans are not easily confused with other drugs. However, ground and roasted coffee may contain coffee substitutes such as chicory, dandelion root, figs, sugar beet root, lupin seeds, rye kernels and barleycorn.

Other Names: Arabica Coffee, Arabian Coffee, Caffea

ACTIONS AND PHARMACOLOGY

COMPOUNDS: COFFEE CHARCOAL

Purine alkaloids: main alkaloid caffeine

Trigonelline

Carbonization products of hemicelluloses

EFFECTS: COFFEE CHARCOAL

Coffee charcoal contains purine alkaloids, with caffeine as the main constituent, and is absorbent and astringent.

COMPOUNDS: COFFEE BEANS (SEEDS)

Purine alkaloids: main alkaloid caffeine (0.6 - 2.2%), with it theobromine, theophylline

Caffeic and ferulic acid ester of quinic acid: in particular chlorogenic acid

Trigonelline

Norditerpene glycoside ester: atractylosides

Diterpenes: including the diterpene alcohol fatty acid esters kahweol and cafestol

In roasted coffee beans: numerous aromatic substances yielded from carbohydrates, proteins, fats and aromatic acids through pyrolysis

EFFECTS: COFFEE BEAN'S

- ^ Most of the indicated effects of coffee are due to the presence of caffeine. The primary effects of caffeine can be summarized as follows: Caffeine has a positive inotropic effect. In higher concentrations, it has a positive chronotropic effect on the heart and CNS. It causes a relaxation of the smooth muscles of blood vessels (except for cerebral blood vessels) and the bronchial tubes. Moreover, caffeine works as a short-lived diuretic and produces an increase of gastric secretions and the release of catecholamines.

Caffeine works competitively to block adenosinal receptors that lie on cell surfaces in the brain, fat tissue, liver, kidneys, heart and erythrocytes.

Heart, circulation, vessels: People who normally do not drink coffee react 1 hour after an intake of 250 gm, with an increase of 10 mm Hg in their systolic blood pressure. Habitual coffee drinkers are tolerant in this regard.

- W* *Blood:* After 9 weeks of an average daily intake of 5.6 cups of coffee (steeped for 10 min.), the overall and LDL cholesterol increases significantly. The use of coffee filters can reduce this by up to 80%.

Digestive tract: Oral intake of 200 mg of chlorogene acid doubles gastric secretion, as does caffeine alone.

Miscellaneous: In animal studies, a diet consisting of 20% green coffee impedes the growth of DMBA-induced tumors in hamsters by 90%.

Outcome of the stimulating effects of caffeine commence a few minutes subsequent to taking the drug. The maximum plasma concentration of caffeine is reached between 15 and 45 minutes later. The plasma half-life amounts to 4 to 6 hours.

- £t Coffee extracts made from roasted and unroasted seeds are used analogously with other drugs containing caffeine for physical and mental fatigue. The drink can also be used therapeutically in cases of hypotonia, as an analeptic agent, in the treatment of influenza (flu) and migraine and as an additive to analgesia.

INDICATIONS AND USAGE

COFFEE CHARCOAL

Approved by Commission E:

- Diarrhea
- Inflammation of the mouth and pharynx

Unproven Uses: Coffee is used for nonspecific, acute diarrhea, and local therapy of mild inflammation of the oral

and pharyngeal mucosa. In folk medicine coffee is also used for festering wounds.

COFFEE BEANS (SEEDS)

Unproven Uses: Coffee is used to treat hypotonia and as a constituent of analgesics. In folk medicine coffee is also used to increase performance capability as well as for anemia, hepatitis and edema.

Homeopathic Uses: Uses in homeopathy include insomnia and neuralgias.

Indian Medicine: Unripe seeds are used in Indian medicine for migraine and fever; ripe seeds for diarrhea; and strong coffee to treat opium and alcohol intoxication.

PRECAUTIONS AND ADVERSE REACTIONS

COFFEE CHARCOAL

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

Drug Interactions: The drug can hinder the resorption of other medicines.

COFFEE BEANS

General: Health risks following the proper administration of designated therapeutic dosages are not recorded. Quantities corresponding to as much as 500 mg caffeine daily (5 cups of coffee) spread out over the day are toxicologically harmless for healthy adults accustomed to drinking coffee. Caution is advised for persons with sensitive cardiovascular systems, kidney diseases, hyperfunction of the thyroid gland, higher disposition to convulsions and certain psychic disorders (for example, panic anxiety states). Side effects of coffee intake, mainly caused by its chlorogenic acid content, can include hyperacidity, stomach irritation, diarrhea and reduced appetite. Non-specific symptoms such as restlessness, irritability, sleeplessness, palpitations, dizziness, vomiting, diarrhea, loss of appetite and headache appear with the long-term intake of dosages exceeding 1.5 g caffeine per day. Caffeine can lead to psychic as well as physical dependency (caffeinism). Symptoms of withdrawal can include headache and sleeping disorders.

Pregnancy: Pregnant women should avoid caffeine, under no circumstances exceeding a dosage of 300 mg per day (3 cups of coffee spread out over the day).

Nursing Mothers: Infants nursing from mothers who take drinks containing caffeine may suffer from sleeping disorders.

OVERDOSAGE

Dosages exceeding 1.5 g caffeine per day can lead to stiffness, arrhythmic spasms of different muscle groups, opisthotonus and arrhythmic tachycardia. Fatal poisonings

with the drug are not conceivable: The lethal dosage (LD50) for an adult is approximately 150 to 200 mg caffeine per kg body weight (for which 50 kg body weight = 7.5 g = 75 cups of coffee), although there are cases of survival also with 106 g caffeine. The death of a child following the intake of 5.3 g of caffeine has been reported. The first signs of poisonings are vomiting and abdominal spasms. The therapy for caffeine poisoning should begin with the inducement of vomiting or gastric lavage. Afterward, activated charcoal and sorbitol should be given to retard resorption. Spasms are to be treated with diazepam.

DOSAGE

COFFEE CHARCOAL

Mode of Administration: Powdered coffee charcoal and its preparations intended for internal consumption or local application.

Daily Dosage: The average daily dose for internal use is 9 g of ground drug. The average single dose is 3 g of powder.

Storage: Coffee charcoal should be stored in well-sealed containers.

COFFEE BEANS

Mode of Administration: The ground beans are used in different types of infusion, i.e. cooked coffee (filter, espresso etc.). Caffeine is used in various combinations and preparations for numerous therapeutic uses. Commercial pharmaceutical preparations include tablets, coated tablets, compresses and diverse compound preparations.

Preparation: The dried seeds are roasted until they procure a deep brown color and a characteristic aroma. This process is usually carried out in the country of consumption. During roasting, the beans float for 1.5 to 3 minutes in hot gas at 220°C to 270°C.

Daily Dosage: 15 g drug

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) and 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a **day (HAB1)**

Storage: The beans should be stored in sealed containers away from light and moisture.

Cola

Cola acuminata

DESCRIPTION

Medicinal Parts: The seeds are the medicinal parts of the plant.

Flower and Fruit: The male flowers with a diameter of 1.5 cm or the androgynous flowers with a diameter of 2.5 cm are axillary or on branches in cymes of few flowers. The 5 part chalice-shaped perigone is white to yellow and marked with red on the inside. The star-shaped fruits have 5 coriaceous, thick, dark brown, unkeeled follicles arranged at right angles to the stem. The fruits grow up to 20 cm long and 5 cm wide. There are up to 14 ovate or square seeds of about 2.5 cm diameter in 2 rows with a white fleshy seed shell. The seed kernel is usually reddish or red, occasionally white.

Leaves, Stem and Root: The plant is an evergreen tree 15 to 20 m tall. The trunk is branched down as far as the base. The bark is dark green, rough and breaks off in pieces as it ages. Branches have leaves only at their ends. The tough coriaceous leaves are 15 to 18 cm long and 10 cm wide, elliptoid to ovate, and end in a curled and spiraled tip. Both sides are dark green and glossy.

Habitat: The plant is indigenous to Togo, Sierra Leone and Angola. It is found today in all tropical regions and cultivated widely.

Production: The ripe fruit is harvested and the seeds are removed and dried. Cola nut is the endosperm freed from the testa of various Cola species, particularly Cola nitida.

ft; Not to be Confused With: Other varieties of Cola, such as Male kola which contains no caffeine.

Other Names: Kola Tree, Guru Nut, Cola Nut, Cola Seeds, Bissy Nut

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Purine alkaloids: main alkaloid caffeine (0.6 - 3.7%), additionally theobromine, theophylline

(+)-catechin, (-)-epicatechin

Catechin tannins

Oligomeric proanthocyanidins

Starch

EFFECTS

Cola's purine (caffeine) content makes it a strong CNS stimulant. In humans it acts as a respiratory analeptic, lipolytic, mildly positively chronotropic and mild diuretic. In addition, it stimulates gastric acid and increases motility of the gastrointestinal tract. In animal tests. Cola is also analeptic, lipolytic, stimulates production of gastric acid and increases gastric motility.

INDICATIONS AND USAGE

Approved by Commission E:

- Lack of stamina

Unproven Uses: Cola is used internally to decrease mental and physical fatigue. In folk medicine it is chewed to treat diarrhea, suppress hunger, thirst, morning sickness and migraine. It is also used to promote digestion. It is ground and made into poultices for wounds and inflammations. Cola is also an indigenous cult drug.

CONTRAINDICATIONS

Use of Cola is contraindicated during pregnancy. The drug should not be administered in the presence of stomach or duodenal ulcers, due to the drug's stimulation of gastric juice secretion.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks following the proper administration of designated therapeutic dosages have not been recorded. Side effects that may occur include difficulty falling asleep, hyperexcitability, nervous states of restlessness and stomach complaints. Signs of poisoning following the intake of Cola drinks (20 to 60 mg caffeine per glass) or medications or stimulants containing Cola extracts are not expected. Small children should avoid the intake of large quantities of Cola drinks.

DOSAGE

Mode of Administration: Powdered drug and other galenic preparations for internal use.

How Supplied: Capsules, tablets, tonics.

Preparation: Dry extract: from the percolation 1:1 with 45% ethanol; fluid extract: percolation with 70% ethanol (V/V); Cola tincture: 1:5 with 70% ethanol; Cola wine: 50 parts fluid Cola extract with 850 parts Xeres wine and 100 parts sugar syrup.

Daily Dosage: 2 to 6 g of Cola nut drug, usually taken 1 to 3 g, 3 times daily; 0.25 to 0.75 g of Cola extract; 2.5 to 7.5 g of Cola liquid extract; 10 to 30 g of Cola tincture; 60 to 180 g of Cola wine.

Storage: Cola should be protected from light in sealed containers.

Cola acuminata

See Cola

Colchicum

Colchicum autumnale

DESCRIPTION

Medicinal Parts: The fresh flowers and the dried ripe seeds, collected in early summer and then sliced, as well as the tubers (fresh and dried) are the medicinal parts of the plant.

Flower and Fruit: The 5 to 20 cm flowers usually bloom in autumn. They are a bright lilac-pink, and solitary or in pairs from the corm. The 6 bracts of the involucre are fused into a long, narrow tube. The flower has 6 stamens and 3 thread-like styles. The ovaries are on the side of the corm. The 3-valved capsule is initially green, later becoming brown and wrinkled, and contains black seeds with sticky appendages.

Leaves, Stem and Root: Colchicum can grow to 40 cm in height. The 3 to 4 broadly lanceolate leaves are tulip-like;

leaves appear together with the fruit in spring. They are 8 to 25 cm long, 2 to 4 cm wide and overlap at the base to form a tube.

Characteristics: All parts of the plant are very poisonous and have a disgustingly bitter and scratchy taste.

Not to be Confused With: The tubers are sometimes confused with cooking onions.

Habitat: Colchicum autumnale is primarily a central European plant found in northern Ireland, England, northern Germany, southern Poland, the Ukraine, Bulgaria, Turkey, Albania and northern Spain. It also grows in central Asia.

Production: Colchicum seeds are the dried seeds of Colchicum autumnale harvested in the wild in June or July and air-dried. Colchicum bulbs are the cut and dried tubers of the plant harvested in early summer. After the surrounding leaves have been removed, the tubers are cut into slices and dried at temperatures of 60°C or lower. Colchicum flowers are collected from the wild in late summer and autumn and then air-dried.

Other Names: Meadow Saffron, Meadow Saffran, Autumn Crocus, Naked Ladies, Upstart

ACTIONS AND PHARMACOLOGY

COMPOUNDS: COLCHICUM BULB

Tropolone alkaloids: colchicine, colchicoside and N-deacetyl-N-formyl-colchicine; companion alkaloids include demecolcine

Starch

COMPOUNDS: COLCHICUM SEEDS

Tropolone alkaloids: colchicine and colchicoside

Fatty oil

COMPOUNDS: COLCHICUM FLOWERS

Tropolone alkaloids: colchicine and N-deacetyl-N-formyl-colchicine, additional alkaloids including demecolcine

EFFECTS: COLCHICUM BULBS, SEEDS AND FLOWERS

Colchicum inhibits mitosis through the inhibition of motility, particularly of the phagocytosing lymphocytes. This is of therapeutic use for blocking the immigration and the autolysis of phagocytes in inflammatory processes and thereby producing an antiphlogistic effect.

INDICATIONS AND USAGE

COLCHICUM BULBS, SEEDS AND FLOWERS

Approved by Commission E:

- Gout
- Mediterranean fever

Unproven Uses: Due to the plant's toxicity, internal application is seldom used with the exception of acute attacks of

gout and familial Mediterranean fever. Efficacy for these uses appears plausible. The drug was previously used for skin tumors, condyloma, psoriasis, necrotic vasculitis, tendovaginitis, inflammation of the gastrointestinal tract, morbus

^ Behect, liver cirrhosis, acute and chronic leukemia; also for lice, asthma, dropsy and rheumatism.

Homeopathic Uses: In addition to acute and chronic gout, Colchici is also used for inflammation of the kidney and gastrointestinal tract, bodily secretions, tendovaginitis and acute joint rheumatism. Efficacy has not been proven.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drugs are severely poisonous. Signs of poisoning, including stomachaches, diarrhea, nausea, vomiting and, less frequently, stomach and intestinal hemorrhages, can occur even with the administration of therapeutic dosages.

Kidney and liver damage, hair loss, peripheral nerve inflammation, myopathia and bone marrow damage with their resulting symptoms (leukopenia, thrombocytopenia, megaloblastic anemia, and, more rarely, aplastic anemia) have been observed following long-term administration.

4

Pregnancy: Colchicum is not to be used during pregnancy because of possible teratogenic damage. This also has been noted following intake of the drug by the father before conception.

OVERDOSAGE

Three to 6 hours following intake of acutely toxic dosages, burning of the mouth, difficulty swallowing and thirst appear. After 12 to 14 hours, the following appear: nausea, severe stomach pains, vomiting, diarrhea, bladder spasms, hematuria, falling blood pressure and spasms, and later, progressive paralysis. Death follows through exhaustion, asphyxiation or circulatory collapse. The fatal dosage for an adult is 5 g of the seeds, 1 to 1.5 g for a child. The fatal dosage of an intake of colchicine lies between 7 mg and 200 mg.

The treatment for poisonings, following gastric lavage and the administration of a saline purgative (such as sodium sulfate), proceeds symptomatically (diazepam for convulsion, atropine for intestinal spasm) and includes possible

^ intubation and oxygen respiration.

DOSAGE

COLCHICUM BULBS, SEEDS AND FLOWERS

Mode of Administration: Comminuted drug, freshly pressed juice and other galenic preparations taken orally.

How Supplied: Ampules, tablets.

Daily Dosage: For an acute attack of gout, an initial oral dose corresponding to 1 mg colchicine, followed by 0.5 to

1.5 mg every 1 to 2 hours until pain subsides. Total daily dosage must not exceed 8 mg of colchicine. For prophylactic and therapeutic purposes, the dosage should correspond to 0.5 to 1.5 mg of colchicine.

Storage: All forms of the drug should be stored in containers that protect them from light and dampness. In addition, the seeds should be stored over lime.

See *Colchicum*

Collinsonia canadensis

See *Stone Root*

Colombo

Jateorhiza palmata

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the roots cut in slices when fresh and then dried.

Flower and Fruit: The plant is dioecious. The male inflorescences are 40 cm long and have green sepals, which are 2.7 to 3.2 mm long and 1.2 to 1.6 mm wide. The stamens are free and are fused at the base with the involuted margins of the petals. The female inflorescence is 8 to 10 cm long and has a 1 to 1.5 mm rust-red, pubescent ovary. The fruit is a 2 to 2.5 cm long and 1.5 to 2 cm wide globose drupe containing a moon-shaped stone.

Leaves, Stem and Root: The plant is a woody, branched liane, which can climb to tree height. The liane is initially downy, then bristly to villous. The leaves are opposite and have an 18 to 25 cm long petiole. The leaf blades are 15 to 35 cm long and 18 to 40 cm wide. They are bristly haired on both surfaces, broadly rounded, deeply cordate at the base and usually have 5 broad-ovate lobes. The root has a diameter of 3 to 8 cm. It is greenish-black. The root has a floury consistency, an indented center and a thick bark. The transverse section is yellowish, with vascular bundles in radiating lines.

Characteristics: The taste is mucilaginous and very bitter, the odor is slight.

Habitat: Indigenous to Mozambique, east Africa and Madagascar. It is cultivated elsewhere.

Production: Colombo root is the root of *Jateorhiza palmata*, which has been sliced horizontally and dried. The tuber roots, stemming from the rhizome, are dug up in March, washed and thinly sliced, and then dried quickly in the shade to avoid decomposition.

Other Names: Calumba

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids: main alkaloid palmatine, additionally jatrorrhizines (jateorhizine), columbamine, and bisjatrorrhizines

Diterpene bitter principles: including palmarin, chasmanthin and their glucosides (palmatoside A and B), columbin, jateorin and their glucosides (palmatoside D and E)

EFFECTS

The drug is no longer used as a bitter (amarum). The alkaloids have a narcotic effect. They act similarly to morphine, increasing resting muscle tone in the smooth muscle of the intestinal tract. Colombo alkaloids are said to act as a CNS paralyzing agent in frogs, and palmatin has the same effect on mammals. No further information is available.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine it is used for digestive disorders accompanied by diarrhea, dyspeptic disorders, chronic diarrhea in patients with lung disease, subacidic gastritis and chronic enterocolitis.

The drug is used in some European countries as an antidiarrheal agent because of its morphine-like side effects.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Higher dosages of the drug may trigger vomiting and pains in the epigastrium.

OVERDOSAGE

According to older sources, very high dosages can also lead to signs of paralysis and unconsciousness (Lewin).

DOSAGE

Mode of Administration: Due to its morphine-type action, its use as an antidiarrheal agent is limited. Otherwise, the chopped root is used (no preparations known).

Preparation: Colombo liquid extract is prepared with diluted ethanol, according to the German pharmacopoeia. Colombo wine is prepared using 100 parts coarsely powdered drug and 1000 parts xeres wine. The extract is pressed out after 8 days and filtered.

Daily Dosage: The dose of the decoction is 1 dessertspoonful every 2 hours. The liquid extract standard single dose is 20 drops. Tincture of Colombo standard single dose is 2.5 gm. Colombo wine standard single dose is 5 gm.

Storage: Colombo must be kept dry at all times.

Colt's Foot

Tussilago farfara

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried inflorescences, the dried leaves and the fresh leaves.

Flower and Fruit: The yellow compound flowers are in small, solitary capitula at the end of the scapes. The lateral florets are lingual, narrow and female. The disc florets are tubular-campanulate, 5-petalled and male. The involucre bracts are almost as long, linear-lanceolate and have a scarious margin. The fruit is 3 to 11 mm long, cylindrical, brown, glabrous and stemmed. The pappus is in a number of rows and consists of long, glossy white hairs, which are much longer than the fruit.

*

Leaves, Stem and Root: The plant is a perennial, 10 to 30 cm high. It has a broadly branched, underground shoot and root system with a thin round, scaly base. There is also an up to 1.8 m long, far-reaching, creeping shoot. The flower stem is a scaly, round, tomentose scape covered with lanceolate, reddish scales, which is 30 cm long when the fruit ripens. The leaves, which appear after flowering, are basal, coriaceous, cordate-round, angular, irregularly dentate, long-petioled and tomentose beneath. The leaves can reach a diameter of up to 30 cm.

Characteristics: The taste and texture is slimy-sweet and the leaves have a honey-like smell when they are rubbed.

Habitat: The plant grows wild in most of Europe, central, western and northern Asia. It has spread to the mountains of northern Africa and has been introduced into North America.

Production: Colt's Foot flower consists of the fresh or dried flowers of *Tussilago farfara*. Colt's Foot herb consists of the fresh or dried, above-ground parts of *Tussilago farfara*.

* Colt's Foot root consists of the fresh or dried, below-ground parts of *Tussilago farfara*.

Not to be Confused With: The leaves of various Petasites species, but petasine and flavonoids can be identified using thin layer chromatography.

Other Names: British Tobacco, Bullsfoot, Butterbur, Coughwort, Rower Velure, Foal's-Foot, Horse-Foot, Horsehoof, Hallfoot, Ass's Foot, Foalswort, Fieldhove, Donnhove

ACTIONS AND PHARMACOLOGY

COMPOUNDS: COLT'S FOOT FLOWER

Mucilages (7%): acidic polysaccharides

Tannins

Triterpenes: including beta-amyrin, arnidiol, faradiol

Steroids: including beta-sitosterol

Pyrrrolizidine alkaloids (traces, not in plants from all places of origin): tussilagine, isotussilagine, senkirkine, senecionine

Flavonoids

COMPOUNDS: COLT'S FOOT HERB

Mucilages (8%): acidic polysaccharides

Tannins (5%)

Triterpenes: including alpha-amyrin, beta-amyrin

Steroids: including beta-sitosterol, campesterol

Pyrrrolizidine alkaloids (not in plants from all places of origin): senkirkine (0.01%), senecionine, tussilagine, isotussilagine

Flavonoids

COMPOUNDS: COLTS FOOT ROOT

The roots have not been fully investigated. Only the presence of triterpenes and sterols has been established.

EFFECTS: COLT'S FOOT FLOWER, HERB, AND ROOT

The mucin contained in the drug has a sequestering effect and envelopes the mucous membrane with a layer that protects the throat from chemical and physical irritation and thereby reduces cough irritation. The pyrrrolizidine alkaloids are antibacterial, carcinogenic, and hepatotoxic.

COMPOUNDS: COLT'S FOOT LEAF

Mucilages (8%): acidic polysaccharides

Tannins (5%)

Pyrrrolizidine alkaloids (traces, not from all sources): tussilagine, isotussilagine, senkirkine 0.01%, senecionin

Steroids: including beta-sitosterol, campesterol

Triterpenes: including alpha- and beta-amyrin

Flavonoids

EFFECTS: COLT'S FOOT LEAF

The pyrrrolizidine alkaloids are antibacterial, carcinogenic, and hepatotoxic. The mucin polysaccharides cause a demulcent, sequestering, and anti-inflammatory effect. In animal experiments there was evidence of a stimulating effect on the ciliated epithelium.

INDICATIONS AND USAGE

COLT'S FOOT FLOWER. HERB, AND ROOT

Unproven Uses: When added to Colt's Foot leaf, the flower, herb, and root are used to treat rheumatism.

COLT'S FOOT LEAF'

Approved by Commission E:

- Cough
- Bronchitis
- Inflammation of the mouth and pharynx

Unproven Uses: Colt's Foot leaf is used for inflammation of the oral and pharyngeal mucosa. In addition, cigarettes made of the leaves are used to help cure smoking addiction.

CONTRAINDICATIONS

COLT'S FOOT FLOWER. HERB, ROOT, AND LEAF

Administration during pregnancy and while nursing is contraindicated.

PRECAUTIONS AND ADVERSE REACTIONS

COLT'S FOOT FLOWER, HERB, AND ROOT

Because of the possible hepatotoxic and carcinogenic pyrrolizidine alkaloid content, the administration of the blossoms should be avoided.

COLT'S FOOT LEAF

Colt's Foot leaves may no longer be brought into circulation in Austria. In Germany, dosages cannot exceed an intake of 10 mg pyrrolizidine alkaloids with 1,2-unsaturated necic parent substances in the form of tea mixtures, and an intake of 1 mg in the form of extracts.

Because even traces of the alkaloids present some danger, one should forgo any administration of the drug.

DOSAGE

COLT'S FOOT FLOWER, HERB, AND ROOT

Mode of Administration: The drug is used internally through the use of tea and standardized remedies.

Preparation: To prepare a tea, add 1.5 to 2.5 gm cut drug to boiling water, then strain after 5 to 10 minutes.

Storage: Protect the drug from light and store it tightly sealed.

COLT'S FOOT LEAF

Mode of Administration: Whole, cut, and powdered drug used in teas, infusions, extracts, and tinctures.

Preparation: To make an infusion, pour hot water over 1.5 to 2.5 gm of drug and allow to draw for 10 minutes. Other preparations are made as follows: liquid extract: 1:1 with 20% ethanol; extract: 1:1 with 25% ethanol; tincture: 1:5 with 45% ethanol.

Daily Dosage: The total daily dose is 4.5 to 6 gm of drug. The maximum daily dosage must not be more than 1 mg of total pyrrolizidine alkaloids with 1.2 unsaturated necine structure.

The tea is given several times a day. The dosage for the extract is 2 ml 3 times daily; for the tincture, it is 8 ml 3 times daily.

Storage: Protect the drug from light and store it tightly sealed.

Columbine

Aquilegia vulgaris

DESCRIPTION

Medicinal Parts: The medicinal parts are the stems and leaves, the aerial parts gathered and dried in flowering season, and the seeds and preparations of the whole plant also gathered in flowering season.

Flower and Fruit: The long-stemmed flowers are terminal, hanging, and either dark blue, dark violet, pink or white. The 5 sepals spread like petals. They are broadly ovate, and end in a blunt, green tip. The 5 petals are hood-shaped with long, inwardly hooked spurs. There are numerous stamens and usually 5 ovaries. The follicle is oblong, erect and glandular-downy. The seeds are glossy black, oval, 2.2 to 2.5 cm long by 1.5 cm wide. They are thick, blunt-tipped and anatropous. The raphe forms a distinct line on the side of the plant.

Leaves, Stem and Root: The 30- to 60-cm high plant has a many-headed, light brown and branched rhizome. The stems are erect and usually branched. They are glabrous or soft-haired. The basal leaves are long-petioled and trifoliate. The leaflets are wedge-shaped to ovoid, blunt, irregularly crenate to serrate, and bluntly lobed. The underside of the leaves are usually light green and pubescent. The cauline leaves are smaller than the basal leaves and simpler. The highest leaves are usually made up of a few elongate-ovate, entire-margined lobes.

Habitat: Columbine is indigenous to central and southern Europe and is also found in the eastern U.S. and Asia.

Production: Columbine herb is the complete aerial part of *Aquilegia vulgaris* harvested while in flower and dried.

Other Names: Culverwort, Capon's Feather, Culver Key

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cyanogenic glycosides: trigloquinine, dhurrin (presumably only traces)

EFFECTS

It is not known which constituents are responsible for the herb's effects. The cyanogenic glycoside trigloquinine could possibly be of toxicological interest but is probably only present in traces.

INDICATIONS AND USAGE

Unproven Uses: Columbine is used internally for scurvy and jaundice; the herb is also used to treat states of agitation due to its supposedly tranquilizing effect.

Homeopathic Uses: The herb is used to treat menopausal vomiting and dysmenorrhea in young women. It is also used to treat the sensation of a lump in the throat (globus hystericus) and nervous shaking.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Poisonings from the leaves because of the cyanogenic glycoside content have not been observed. The amount of hydrocyanic acid that is released from the leaves is apparently too small to cause toxicity.

DOSAGE

Mode of Administration: Columbine is available in tablets and capsules for internal use.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or 1 ml injection solution sc twice a week (HAB1).

Combretum micranthum

See Opium Antidote

Comfrey

Symphytum officinale

TRADE NAMES

Comfrey (available from numerous manufacturers)

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh root and the leaves.

Flower and Fruit: The flowers are dull purple or violet. They are arranged in crowded, apical, 2-fayed hanging cymes. The calyx is fused and has 5 tips. The corolla is also fused and is cylindrical-campanulate with a pentangular tube and 5-tipped border. The tips are revolute and there are 5 awl-shaped scales in the mouth of the tube. The scales close together in a clavate form and have a glandular tipped margin. There are 5 stamens and 1 style. The ovary is 4-valved. The fruit consists of 4 smooth, glossy nutlets.

Leaves, Stem and Root: The plant grows from 30 to 120 cm in height. The root is fusiform, branched, black on the outside and white on the inside. The stem is erect and stiff-haired. The leaves are wrinkly and roughly pubescent; the lower ones and the basal ones are ovate-lanceolate and pulled together in the petiole; the upper ones are lanceolate and broad.

Characteristics: The root is slimy and horn-like when dried.

Habitat: The plant is indigenous to Europe and temperate Asia and is naturalized in the U.S.

Production: Comfrey herb consists of the fresh or dried above-ground parts of *Symphytum officinale*. Comfrey leaf consists of the fresh or dried leaf of *Symphytum officinale*. Comfrey root consists of the fresh or dried root section of *Symphytum officinale*.

Other Names: Ass Ear, Black Root, Blackwort, Boneset, Bruisewort, Consound, Gum Plant, Healing Herb, Knitback, Knitbone, Salsify, Slippery Root, Wallwort, Consolida, Boneset

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Allantoin

Mucilages (Fructans)

Triterpene saponins: including symphytoxide A

Tannins

Silicic acid: to some extent water-soluble

Pyrrrolizidine alkaloids (0.03% in the leaves): including echinatine, lycopsamine, 7-acetyl lycopsamine, echimidine, lasiocarpine, symphytine, intermedine, symveridine.

EFFECTS

Anti-inflammatory Effect—Comfrey suppresses leukocyte infiltration during the inflammation process (Shipochliev, 1981).

Demulant Effect—The mucilages act as demulants for a soothing and irritation reduction effect.

Hypotensive Effect—Symphytoxide A, a triterpene saponin, exhibited hypotensive activity in anesthetized rats (Ahmad, 1993).

Tissue/Nerve Stimulation—Allantoin, a component in Comfrey, stimulates tissue repair and wound healing through cell proliferation (Rieth, 1968). Allantoin has also had significant effect on cellular multiplication in degenerating and regenerating peripheral nerves (Loots, 1979).

CLINICAL TRIALS

The anti-inflammatory effects of Comfrey were studied in musculoskeletal disorders. Forty-one patients with musculoskeletal rheumatism were treated with either a pyrrolizidine alkaloid-free ointment or placebo for 4 weeks. The patient illnesses consisted of epicondylitis, tendovaginitis, and peri-arthritis. Efficacy was determined by evaluation of different pain parameters (tenderness on pressure, pain at rest, pain on exercise). There was significant improvement with the ointment compared to placebo at weeks 1, 2, and 4 in patients with epicondylitis. There was improvement with tendovaginitis at week 1 and 2, but not at week 4 with the ointment compared to placebo. There was no improvement in the peri-arthritis patients in either of the two treatment groups (Petersen, 1993).

INDICATIONS AND USAGE

Approved by Commission E:

- Blunt injuries

Externally, Comfrey is used for bruises, sprains and promotion of bone healing.

Unproven Uses: The root has been used externally as a mouthwash and gargle for gum disease, pharyngitis, and strep throat. Internally, the root has been used for gastritis and gastrointestinal ulcers. In Folk medicine, the root of the plant has been used for rheumatism, pleuritis, and as an anti-diarrheal agent.

CONTRAINDICATIONS

Comfrey is contraindicated in pregnancy and in nursing mothers.

PRECAUTIONS AND ADVERSE REACTIONS

Hepatotoxicity: Internal administration of the drug, due to the presence of pyrrolizidine alkaloids, has resulted in hepatocyte membrane injury with hemorrhagic necrosis and loss of microvilli (Yeong, 1993). Hepatic veno-occlusive disease and severe portal hypertension has been associated with Comfrey ingestion, and in one case report, death resulted by liver failure (Ridker, 1989; Yeong, 1990).

Carcinogenic/Mutagenic Effects: Mutagenic effects are associated with aqueous extracts of the alkaloid fractions (Furmanowa, 1983). Hepatocellular adenomas have been reported in animal models receiving diets containing Comfrey roots and leaves (Hirono, 1978). Comfrey also has chromosome-damaging effects in human lymphocytes (Behninger, 1989).

Gastrointestinal/Kidney/Pancreas Effects: Comfrey, through the pyrrolizidine alkaloids, has been shown to produce lesions in the gastrointestinal tract, pancreas, and renal glomeruli in animal models (Winship, 1991).

Respiratory Effects: Pulmonary endothelial hyperplasia from the pyrrolizidine alkaloids has been seen in animal models (Miskely, 1992).

Use in Pregnancy: The drug is contraindicated during pregnancy.

Use in Nursing Mothers: Use of the drug while nursing is contraindicated.

DOSAGE

Mode of Administration: The crushed root, extracts, and pressed juice of the fresh plant are used as semi-solid preparations and poultices for external use. The drug is a component of standardized preparations of analgesics, anti-rheumatic agents, antiphlogistics, antitussives, and expectorants.

How Supplied:

Cream—1.25 oz., 2 oz.

Preparation: To make an infusion, pour boiling water over 5 to 10 gm comminuted or powdered drug, steep 10 to 15 minutes, then strain (1 teaspoonful = 4 gm drug). For external application, a decoction of 1:10 is used, or the fresh roots are mashed.

Daily Dosage:

External Use—The daily dosage should not exceed 1 meg of pyrrolizidine alkaloids for external preparations calculated with 5 to 7% drug, maximum 1 ppm/gm for commercial pharmaceutical preparations. The drug should be used for a maximum of 4 weeks.

Tea—When using the infusion, take 1 cup 2 to 3 times daily, but not for a long duration (SEE PRECAUTIONS).

Commiphora molmol

See Myrrh

Common Kidney Vetch

Anthyllis vulneraria

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the flower.

Flower and Fruit: The many-floreted capitula are in the upper bract axils. The papilionaceous flowers are almost sessile and have an upright corolla up to 20 mm long. The calyx is membranous and up to 17 mm long. It is tubular-bottle-shaped and shaggy to felt-haired. The color is yellow ^{4B} to white at the bottom, turning violet toward the top. The petals are whitish-yellow to yellow or occasionally crimson. They have a free standard, slightly shorter wings, and an acute, often red, carina. Ten stamens are fused into a tube. The ovaries are stemmed with a thickened style and rounded stigma. The pod-fruit is enclosed in the dried calyx. It is ovate, reticulate, dark brown, single-seeded, and does not spring open. The seed is ovate, smooth, shiny and checkered yellow-green.

Leaves, Stem and Root: Anthyllis vulneraria is a 15 to 30 cm high half-rosette shrub with a sturdy tap-root and a short, entire or often branched rhizome. The stem is upright, unbranched or branched, and tomentose. The leaves are variously pinnate, depending on where they are on the stem. All leaves are entire-margined, glabrous or slightly pubescent above, and thickly tomentose beneath. The stipules are small and generally connected to a clasping sheath.

[^] *Characteristics:* Kidney Vetch has a weak aromatic odor and dry taste.

Habitat: The plant is found all across Europe to the Caucasus and the Middle East. It is found in the south to the Sahara and Ethiopia.

Production: Kidney Vetch are the flowers of Anthyllis vulneraria without their stems. Woundwort is collected in the wild and then dried quickly in the shade.

Other Names: Ladies' Fingers, Lamb's Toes, Kidney Vetch, Stauchwort, Woundwort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins

Saponins

Flavonoids .

^{4f} *Isoflavonoids*

Lectins

EFFECTS

Antiviral activity was demonstrated with an ethanol extract of the plant. The flavonols quercetin and rhamnetin have a mutagenic effect. The herb's use in the treatment of ulcers and wounds may be due to the tannins (probably of the catechin type).

INDICATIONS AND USAGE

Unproven Uses: Kidney Vetch tea is used in the treatment of ulcers and wounds both internally and externally. The drug is also used in a tea for coughs that also contains ribwort, as an ingredient of blood-purifying teas, and for exposure and vomiting. It is used internally for diseases of the mouth and throat.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Preparations are available for internal uses, often as teas, and external uses including poultices, washes and rinses.

Preparation: To prepare tea, use 1 dessertspoonful of the flowers per 250 ml of water.

LITERATURE

Czczot H, Tudek B, Kusztelak J, Szymczyk T, Dobrowolska B, Glinkowska G, Malinowski J, Strzelecka H, Isolation and studies of the mutagenic activity in the Ames test of flavonoids naturally occurring in medical herbs. *Mutat Res.* 240:209-16, 1990 Mar.

Common Stonecrop

Sedum acre

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh or dried aerial parts collected during the flowering season.

Flower and Fruit: The flowers are leafy, twining cymes on short pedicles. There are 5 ovate sepals and 5 golden yellow petals that are 7 to 9 mm long, lanceolate and twice as long as the calyx. The fruit is a follicle, which splits after flowering to form a 5-rayed star, which is 3 to 5 mm long and has numerous seeds.

Leaves, Stem and Root: The perennial plant grows 2 to 15 cm high. It has many heavily branched shoots, which often creep underground and form grass. The leaves are thick, fleshy, almost round, acute, appressed and knobby-domed.

They are rounded at the base and have no spur-like appendage.

Characteristics: The texture is slimy and the taste hot and pepper-like.

Habitat: Common Stonecrop is common to all of Europe, western Siberia, the Caucasus region and North America.

Production: The flowering parts of *Sedum acre* are picked while in bloom and then dried, either in the sun or, preferably, with the use of artificial heat.

Other Names: Wallpepper, Golden Moss, Wall Ginger, Bird Bread, Prick Madam, Gold Chain, Creeping Tom, Mousetail, Jach-of-the-Buttery

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Piperidine alkaloids (0.39c): chief alkaloids are sedinine, sedinon

Flavonoids: including among others, glycosides of isorhamnetin, quercetin, limnocitrin

Tannins (10%)

Hydroquinone glycosides: Arbutin

Mucilages (30%)

EFFECTS

In animal experiments, the drug displayed both motility-inhibiting and motility-stimulating effects. The alkaloids and tannins may make use of the drug in the treatment of wounds plausible, but no reliable documentation is available.

INDICATIONS AND USAGE

Unproven Uses: The drug is used internally for coughs (Spain) and high blood pressure (central Europe), edema and febrile conditions. Externally, it is used for wounds and ulcers resulting from burns, hemorrhoids, warts, eczema, and oral ulcers.

Homeopathic Uses: In homeopathy, Common Stonecrop is used for hemorrhoidal pain and anal fissures.

CONTRAINDICATIONS

The drug should not be administered in the presence of inflammatory diseases of the gastrointestinal tract or of the urinary drainage passages.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

Dosages consisting of over 10 g of the juice or 1 to 3.5 g of the dried foliage of the fresh plant result in queasiness,

vomiting and diarrhea. However, cases of poisoning have not been recorded in recent times.

DOSAGE

Mode of Administration: Decoctions or syrups for internal use; poultice of fresh leaves for external use.

Preparation: A decoction is prepared using 1 teaspoonful of the drug in 1 cup of water. Prepare a syrup by mixing 100 g of plant juice with 180 g of sugar.

Daily Dosage: The average daily dose of the drug as a decoction is 3 g (approximately 2 teaspoonfuls). Average syrup dosage is 1 dessertspoonful every 3 hours. In external application as a poultice, the fresh plants are crushed and placed on the wart or skin area exhibiting eczema.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34).

Condurango

Marsdenia condurango

DESCRIPTION

Medicinal Parts: The medicinal part is the dried bark of the branches and trunks.

Flower and Fruit: The flowers are in umbel-like inflorescence. The calyx and the campanulate to funnel-shaped corolla have 5 sepals and petals. Pollination is only possible by insects. The fruit is a follicle containing the seeds, with a tuft of hair.

Leaves, Stem and Root: The plant is a climbing shrub with pubescent shoots. The trunk can have a diameter of 10 cm. The transverse section shows granular, yellowish-white, scattered, fine and silky fibers. The outer surface is brownish-gray, often warty, with patches of lichen. The tough, ovate, 8 to 11 cm long and 5 to 8 cm wide leaves are very pubescent. They are crossed opposite.

Characteristics: The taste is bitter and acrid. The odor is faintly aromatic.

Habitat: The plant grows on the western slopes of the Andes in Ecuador, Peru and Columbia.

Production: Condurango bark consists of the dried bark of branches and trunk of *Marsdenia condurango*.

Not to be Confused With: *Asclepias umbellata* or *Elcomarhiza amylacea*

Other Names: Eagle Vine

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pregnane- and pregn-5-ene glycosides (mixture known as condurangin): including condurango glycosides A, A0, A1, BO, C, CI, DO, E0, E2

Caffeic acid derivatives: including chlorogenic acid, neo-chlorogenic acid

Flavonoids: including trifoliin, hyperoside, quercitrin, rutin, and saponarin

EFFECTS

The drug contains bitter condurango glycosides (condurangin). As with other amaroid drugs, a reflexive increase of saliva and gastric juice secretion is to be expected. The drug stimulates the secretion of saliva and gastric juices. It has an antitumoral effect in animals.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

Unproven Uses: Condurango is used for loss of appetite. In folk medicine, it is used for atonia of the stomach, painful nutritional disorders, for stomach cancer to alleviate nausea, as an appetite stimulant and to increase tolerance of food.

Homeopathic Uses: Condurango is used for cracked skin, constriction of the alimentary canal, and for ulceration of the lips and anus.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Comminuted drug for infusions and other bitter-tasting preparations for internal use.

Preparation: An infusion is prepared by adding 1.5 gm comminuted drug to cold water and bringing to a boil; strain when cold. The drug is also added to wine; 50 to 100 gm of the drug per liter.

Daily Dosage: The average daily dose of aqueous extract is 0.2 to 0.5 gm; tincture, 2 to 5 gm; liquid extract, 2 to 4 gm; bark, 2 to 4 gm; Infusion and wine: 1 cup or 1 liquor glass 30 minutes before meals.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day. Apply ointment 1 to 2 times a day (acute and chronic) (HAB1).

Storage: Condurango should be kept tightly sealed and protected from light.

Congorosa

Maytenus ilicifolia

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the dried leaf.

Flower and Fruit: The flowers are in clusters in the leaf axils; the bracts have a reddish border. The flowers are radial; their structures are in fives. The calyx is reddish and 5-tipped. The petals are free, oval to elliptical and yellow. The male flowers have 5 stamens approximately 2 mm long with their ovary covered by a disc. The female flowers have 1 mm long stamens and a 2-carpeled, fused ovary on a thick fleshy disc. The fruit is a reddish, 2-chambered capsule. The seeds are reddish with a thin aril.

Leaves, Stem and Root: Congorosa grows as a dioecious evergreen shrub or tree, reaching up to 5 m high. The leaves are alternate, 2 to 15 cm long and 1 to 7 cm wide. They are elliptical to lanceolate, coriaceous and covered on both sides with 4 to 7 prickly teeth. Sometimes the leaves are completely entire, with very narrow, dropping stipules.

Habitat: The plant is indigenous to South America.

Production: Congorosa leaves (Argentinean name) are the dried leaves of *Maytenus ilicifolia*.

Not to be Confused With: Congorosa is sometimes confused with (and adulterated with) *Verba Mate*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Macrocyclic alkaloids (0.00005%): maytansinoides, including maytansine, maytanprine, maytanbutine

EFFECTS

The quinoid triterpene maytenin contained in the drug exhibits antimicrobial and tumor-inhibiting properties, particularly in topical administration for the treatment of basal cell carcinomas. Maytansine exhibits significant cytotoxic and antitumoral efficacy (similar to that of vinca alkaloids). Additionally, an ulcer-preventing effect has been demonstrated in both animal and human studies.

INDICATIONS AND USAGE

Unproven Uses: Congorosa is used mainly in South American folk medicine. In Brazil, external uses focus primarily on skin conditions such as eczema and skin ulcers. Internal uses include skin cancer, gastrointestinal complaints, gastrointestinal ulcers, hyperacidity, flatulence, gastralgia, dyspepsia, pain, states of exhaustion and anemia.

In Argentina, Congorosa is used for asthma, alcoholism and as a vulnerary. Other varieties are also used for inflammatory swelling and eye conditions.

PRECAUTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Animal experiments revealed embryotoxic and teratogenic effects of maytansines (no detailed description of dosage or experimental procedure available). Should not be used during pregnancy.

CONTRAINDICATIONS

Congorosa preparations are contraindicated during pregnancy.

DOSAGE

Mode of Administration: Preparations are available for internal and external use.

How Supplied: Capsules

Daily Dosage:

Infusion/decoction (2 to 5%) — 100 to 400 ml internally. Externally as required.

Powder — 5 to 20 g

Liquid extract — 5 to 20 ml

Extract — 1 to 4 g

Tincture — 25 to 100 ml

Elixir/wine/syrup — 50 to 100 ml

Contrainerva

Dorstenia contrayerva

DESCRIPTION

Medicinal Parts: The medicinal parts are the roots of a number of species.

Flower and Fruit: The plant has long-pedicled, greenish flowers.

Leaves, Stem and Root: The plant is a perennial, growing to a height of up to 30 cm. It is stemless with palmate leaves. The rhizome is about 2 to 4 cm long and 1 cm thick. It is reddish-brown on the outside, paler on the inside and rough with leaf scars. The rhizome is nearly cylindrical and tapers suddenly at the end into a tail-like root with numerous curled, wiry rootlets.

Characteristics: The taste is slightly aromatic, then acrid.

Habitat: Contrayerva is found in Mexico, Peru and the West Indies.

Production: Contrayerva root is the rhizome of *Dorstenia contrayerva* and related varieties.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroids (cardenolides): syriogenin

Furocoumarins

Volatile oil

EFFECTS

Diaphoretic and stimulant.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the root are used as a stimulant and to treat low stamina. It has also been used as an antidote for snakebite (uncertain mechanism).

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The plant can trigger phototoxicoses through skin contact.

DOSAGE

Mode of Administration: Ground root as an infusion.

Coolwort

Tiarella cordifolia

DESCRIPTION

Medicinal Parts: The medicinal part is the herb.

Flower and Fruit: The plant has inconspicuous white flowers in racemes. The buds are pink-tinged. The few seeds are somewhat clavate. They have a light acrid taste and are odorless.

Leaves, Stem and Root: The plant is a 15 to 20 cm high herbaceous perennial, which produces runners. The simple leaves are usually slightly 5-lobed and cordate. The basal leaves are often deep red-orange. The cauline leaves have deep red spots and veins, although the latter are often lacking.

Habitat: The plant is indigenous to North America from Virginia to Canada.

Production: Coolwort is the aerial part of *Tiarella cordifolia*.

Other Names: Foam Flower, Mitrewort

ACTIONS AND PHARMACOLOGY

COMPOUNDS

The effective agents of the plant are unknown.

EFFECTS

The herb is a diuretic and a tonic.

INDICATIONS AND USAGE

Unproven Uses: Coolwort is used for conditions of the urinary tract and digestive disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The drug is ground for infusions.

LITERATURE

No literature is available.

Copaiba Balsam

Copaifera langsdorffi

DESCRIPTION

Medicinal Parts: The medicinal parts are the resin- oil (containing resin and essential oil) tapped from drillings in the trunk.

Flower and Fruit: The flowers are small and yellow.

Leaves, Stem and Root: *Copaifera langsdorffi* is an evergreen tree up to 18 m high with compound leaves.

Characteristics: The resin oil consists of resin and essential oil. The resin oil (oleoresin) ranges in viscosity from very liquid to a resin-like substance, and in color from a pale yellow to a red or fluorescent tint. The taste is unpleasant and there is a characteristic smell. A single tree can yield up to 40 liters.

Habitat: Copaiba Balsam is indigenous to tropical regions of South America and South Africa.

Production: Copaiba Balsam is extracted from *Copaifera reticulata* and other varieties from cavities drilled into the tree trunk.

Other Names: Copaiva

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief constituent alpha- and beta-caryophyllene, beta-bisabolene, L-cadinene, ~)-alpha-copaene

Resins: in particular, diterpenoid oleoresins including eperu-8(20)-en-15,18-dicarboxylic acid, (-)-16beta-kaurane-19-carboxylic acid, copaiferic acid, (+)-hardwickiic acid, copalic acid

EFFECTS

Possible bacteriostatic effect on the urinary tract. The sesquiterpenes give the drug an antimicrobial effect.

INDICATIONS AND USAGE

Unproven Uses: The obsolete drug is still used in some homeopathic preparations. Folk medicine employed Copaiba Balsam as a stimulant, laxative and diuretic for conditions such as infections of the urinary tract, chronic inflammation of the mucous membranes of the lungs, kidney stones and gonorrhoea.

PRECAUTIONS AND ADVERSE REACTIONS

The drug is irritating to the mucous membranes and toxic in large amounts. Stomach pains appear after the intake of 5 g of the drug. Repeated doses bring about summer cholera, shivers, tremor, pains in the groin and insomnia. Skin contact can lead to contact dermatitis such as erythema, papular or

vesicular rash, urticaria and petechias. Occasionally, the rashes leave brown spots after healing.

Coral Root

Corallorhiza odontorhiza

DESCRIPTION

Medicinal Parts: The medicinal parts are the roots of the parasite.

Flower and Fruit: The plant has 10 to 20 flowers in terminal panicles. The flower heads are hood-like, reddish or purplish on the outside, paler and flecked with purple lines on the inside. One petal forms a lip with purple spots and a purple rim. The fruit is a large, bent-back, ribbed, long capsule.

Leaves, Stem and Root: Coral Root is a perennial found growing around the roots of trees in woodlands. The rhizome is small, brown, coral-like, about 2 to 3 cm long and 2 mm in

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include gastritis, coughs, skin impurities, edema and worm purging.

Homeopathic Uses: Dilutions are used for gastritis.

^ PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated homeopathic dosages of the drug.

OVERDOSAGE

2 to 3 gm of the seeds are considered harmless to humans; poisonous levels are reached between 3 and 5 gm, due to the toxic triterpene saponin content. Dosages over 5 gm are considered lethal. Signs of poisoning include local irritation of mucous membranes (sneezing, lacrimation, conjunctivitis, salivation, nausea, vomiting, colic, diarrhea). The ingestion of toxic levels leads to headache, dizziness, restlessness, circulatory disorders, deliria and possible spasms. Death occurs through asphyxiation. Long-term ingestion of acute non-toxic dosages can cause chronic signs of poisoning. The toxins are not affected by baking or cooking.

^ Following gastrointestinal emptying (inducement of vomiting, gastric lavage, sodium sulfate) and the instillation of activated charcoal, the treatment for poisoning includes diazepam or barbitol (i.v.) for spasms. In the event of shock, plasma volume expanders should be infused. Monitoring of kidney function is necessary. Intubation and oxygen respiration may also be required.

DOSAGE

Mode of Administration: Whole herb preparations for internal, external and parenteral uses.

Homeopathic Dosage: Parenterally: Can be given 1 ml sc, 3 times daily for acute use; and once a day for chronic use but only from D2 (HAB34). Orally: 5 drops, 1 tablet, 10 globules, every 30 to 60 minutes for acute use; and 1 to 3 times daily for chronic use.

Corn Poppy

Papaver rhoeas

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the flowers and seeds.

Flower and Fruit: The flowers are solitary, terminal or axillary, and have a diameter of 10 cm. The pedicels are bristly, irregularly curved and usually axillary. The two sepals are green, bristly and fall off. The 4 petals are orbicular, usually scarlet or crimson (though occasionally white or violet) with a round, shiny, often white-bordered deep-black mark at the base. The fruit capsule is broad-elliptical, dark brown and reticulate-pitted.

Leaves, Stem and Root: Poppy is an annual, occasionally biennial, multiple-stemmed plant 25 to 90 cm high. The stems are erect to semi-erect, simple or branched with stiff, protruding hairs. They have basal rosette lanceolate leaves and deeply indented cauline leaves. The foliage leaves are oblong-lanceolate, pinnatifid to pinnatisect and very bristly.

Habitat: The plant is indigenous to Europe, northern Africa and temperate regions in Asia, and has been introduced in North and South America.

Production: Corn Poppy flower consists of the dried petals of *Papaver rhoeas* as well as its preparations.

Not to be Confused With: Confusion can occur with *Papaver dibium* and *Papaver argemone*.

Other Names: Copperose, Corn Rose, Cup-Puppy, Headache, Headwark, Red Poppy

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Isoquinoline alkaloids (0.1%): chief alkaloids rhoeadine, isorhoeadine, rhoeagine, coptisine, isocorydine, stylophine

Anthocyanins: including among others mecocyanin (cyanidin-3-isosophrorose), cyanin

Mucilages

EFFECTS

No information is available other than that the drug, which contains alkaloids (not opium alkaloids), is said to be convulsive.

INDICATIONS AND USAGE

Unproven Uses: Corn Poppy flower is used for diseases and disorders of the respiratory tract, for disturbed sleep, as a sedative and for the relief of pain. In folk medicine, it is used to make a cough syrup for children, as a tea for insomnia, for pain relief and as a sedative.

Homeopathic Uses: Homeopathy uses Corn Poppy flower for states of agitation and excitation and also for spasms of the hollow organs.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug itself is non-toxic due to the low level of alkaloid content, but reports exist in the scientific literature of children being poisoned by intake of the fresh foliage (with blossoms). Poisoning symptoms include vomiting and stomach pain.

DOSAGE

Mode of Administration: As a component of "metabolic" teas.

Preparation: To prepare a tea, use 1 g of the flowers to 1 cup hot water. To make an infusion, scald 2 teaspoonfuls drug, steep for 10 minutes and strain (1 teaspoonful is equal to approximately 8 g drug). A poultice is prepared using 1 to 2 teaspoonfuls of tincture to 250 ml of water. (Prepare tincture in accordance with HAB1 guidelines.)

Daily Dosage: As an expectorant for inflammation of the bronchial mucous membranes, drink 1 cup infusion 2 to 3 times a day. The infusion may be sweetened with honey.

Homeopathic Dosage: Full bath: 2/3 dessertspoon tincture in a bath (correspondingly less for partial baths).

Storage: Corn Poppy flower should be thoroughly dried before storing in a tightly sealed container that protects it from light.

Corn Silk

Zea mays

DESCRIPTION

Medicinal Parts: The medicinal part is the seed.

Flower and Fruit: The plant is monoecious. The male flowers form terminal racemes of spikes with 2-flowered husks. The female flowers are axillary. The spikes are at varying distances from the ground and are enclosed in a number of thin leaves, the sheath-like maize husk. The spikes consist of a cylindrical substance, the cob, on which the seeds are arranged in 8 rows of 40 or more. Single whitish-green threads of a silky appearance grow from the eyes of the seeds and hang outside the husk, where they catch the pollen. The Maize seeds are usually yellow but can be darker to almost black.

Leaves, Stem and Root: The plant is 1 to 3 m high and sturdy with a solid stem covered in alternate, over 4 cm wide, linear leaves.

Habitat: The plant is indigenous to America and is cultivated all over the world as green fodder or as a cereal crop.

Production: Corn Silk flowers are the styles and stigmas of *Zea mays*. The styles of the female flowers, as they begin to grow out of the pillow-lace, are gathered for medicinal or therapeutic purposes. They are removed by hand and dried in the shade.

Other Names: Indian Corn, Maize, Stigmata maydis

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (0.2%): including among others carvacrol, alpha-terpineol, menthol, thymol

Flavonoids: including among others may sin, maysin-3'-etiyl ether

thickness, with minute warts and transverse scars. The fracture is short and horny.

Characteristics: The taste is sweetish, then bitter. The odor is strong and peculiar when fresh.

W-- *Habitat:* The parasite is indigenous to the U.S.

Production: Coral Root is the rhizome of *Corallorhiza odontorhiza*.

Other Names: Crawley Root. Scaly Dragon's Claw, Chicken Toe, Crawley, Fever Root, Turkey Claw

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Unknown

EFFECTS

Coral Root has diaphoretic, febrifuge and sedative effects.

INDICATIONS AND USAGE

Unproven Uses: Coral Root is used for colds. It is very efficient at inducing perspiration. Its scarcity prevents its wider use.

PRECAUTIONS AND ADVERSE REACTIONS

A- Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Internally as a liquid extract.

LITERATURE

No references are available

Corallorhiza odontorhiza

See Coral Root

Coriander

Coriandrum sativum

DESCRIPTION

Medicinal Parts: The medicinal parts are the coriander oil and dried ripe fruit.

Flower and Fruit: The flowers are white, compact, 3 to 5 blossomed umbels with no involucre. The floret has a 3-bract epicalyx. The border of the calyx has 5 tips. The corolla of the androgynous lateral florets is splayed. The fruit is globular and has a diameter of 3 cm, is straw yellow to brownish, and drops without dividing.

Leaves, Stem and Root: *Coriandrum sativum* is a 20 to 70 cm high plant with a bug-like smell. The root is thinly fusiform.

The stem is erect, round, glabrous and branched above. The leaves are light green, entire below and double-pinnate above.

Characteristics: The fresh herb and unripe fruit have a bug-like smell. Ripe fruit has a pleasant, tangy smell and taste.

Habitat: The herb is found in the Mediterranean region, central and eastern Europe, eastern Asia, and North and South America.

Production: Coriander consists of the ripe, dried, spherical fruit of *Coriandrum sativum* and its varieties *vulgare* A. and *microcarpum*. The fruit is threshed when it is rust red and is dried in lofts.

Not to be Confused With: Grains and legumes.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.4 to 1.7%): chief components D-(+)-linalool (*coriandrol*, share 60 to 75%), including in addition borneol, p-cymene, camphor, geraniol, limonene, alpha-pinene: me unusual, bug-like smell is caused by the trans-tridec-2-enale content

Fatty oil (13 to 21%): chief fatty acids petroselic acid, oleic acid, linolenic acid

Hydroxycoumarins: including umbelliferone, scopoletin

EFFECTS

The essential oil of coriander stimulates the secretion of gastric juices and is a carminative and spasmolytic; in vitro it has antibacterial and antifungal effects.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite

Unproven Uses: Coriander is used for dyspeptic complaints, loss of appetite and complaints of the upper abdomen.

In folk medicine, Coriander is also used for digestive and gastric complaints; in other cultures for coughs, chest pains, bladder complaints, leprosy rash, fever, dysentery, externally for headaches, oral and pharyngeal disorders, halitosis, post-partum complications; the folk indications have not been proven.

Chinese Medicine: Coriander is used in China for loss of appetite, the pre-emptive phase of chickenpox and measles, hemorrhoids and rectal prolapse.

Indian Medicine: In India, Coriander is used to treat nose bleeds, coughs, hemorrhoids, scrofulous, painful micturation, edema, bladder complaints, vomiting, amoebic dysentery and dizziness.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug possesses a weak potential for sensitization.

DOSAGE

Mode of Administration: Crushed and powdered drug, as well as other galenic preparations for internal indication.

Preparations: Coriander extract 1:2 is prepared by percolating 1 weight part of the drug with 45% ethanol so that 2 weights tincture is produced. The infusion is prepared by pouring 150 ml of boiling water over 2 tsp. of crushed drug and straining after 15 minutes.

Daily Dosage: The average daily dose is 3.0 gm of drug. The single dose is 1 gm.

Infusion — 1 fresh cup between meals.

Tincture — 10 to 20 drops after meals.

Storage: The non-comminuted drug is stored at a maximum temperature of 25°C, protected from light in well-sealed containers.

Corn Cockle

Agrostemma githago

DESCRIPTION

Medicinal Parts: The medicinal part of the herb is the seed.

Flower and Fruit: The flowers are apical or arranged in twos or threes like a curled cyme; the 5 sepals of the calyx have 2 to 4 cm long tips that project above the corolla; the flower tube is 14 to 18 mm. The 5 petals are 30 to 35 mm long, dark purple and occasionally whitish. There are 5 styles and 10 stamens. The ovary is superior, undivided and has a central placenta. The fruit capsule is 15 to 18 mm long with numerous 2.5 to 3.5 mm long, warty seeds.

Leaves, Stem and Root: *Agrostemma githago* is an annual herb that grows upright, up to 100 cm high. The leaves are opposite, linear-lanceolate, acuminate and up to 10 mm wide. The stem is upright, usually unbranched, shaggy-gray-pubescent. The primary root is spindle-shaped and heavily branched.

Habitat: Europe and Asia

Production: Corn cockle seed is the dried seed of *Agrostemma githago*.

Other Names: Cockle

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Triterpene saponins: chief component is githagoside (0.04%, gypsogenine tetraglycoside), additional components are gypsogenin and quillaic acid glycosides

Fatty oil: 6%

Steroids: sterols, including alpha-spinasterol

Unusual amino acids: orcyll alanine (0.4%)

EFFECTS

The drug exhibits an antimycotic effect. Cornflower seeds are toxic in higher dosages.

Bitter substances

Saponins (2-3%)

Tannins: the main one is probably proanthocyanidins

Mt Sterols: including among others beta-sitosterol, ergosterol

Alkaloids (0.05%)

6-methoxybenzoxazolinone

Fatty oil (2%)

EFFECTS

The active agents are saponin, essential oil and tannin. Maize stimulates the cardiac muscles, increases blood pressure, acts as a diuretic and sedates the digestive tract.

INDICATIONS AND USAGE

Unproven Uses: Maize is used for disorders of the urinary tract.

Chinese Medicine: Maize is used in the treatment of liver disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Liquid extract, in medicinal preparations and combinations.

Preparation: Prepare an infusion using 2 teaspoons of drug per cup of water. A tincture is prepared by adding 20 gm of drug to 100 ml of 20% alcohol (leave to stand for 5 days).

Daily Dosage: Drink 1 cup of infusion every other day. Take 2 to 3 teaspoons of tincture per day.

Cornflower

Centaurea cyanus

DESCRIPTION

Medicinal Parts: The medicinal parts are the fast-growing ray flowers and the dried ray florets, which have been separated from the receptacle and epicalyx, and to a lesser extent the tubular florets, which have usually been separated from the ovaries.

Flower and Fruit: The 3 cm wide flowers are solitary and terminal. The tubular flowers are blue, the cultivated ones are usually all purple-violet, pale pink or white. The lateral florets are larger, in rays and funnel-shaped. The oblong gray fruit is an achene with the remains of a tuft of hair.

Leaves, Stem and Root: Growing 20 to 70 cm high, the annual or biennial plant contains fusiform, pale tap roots. It has a rosette of basal leaves and an erect, branched, spider-web-pubescent angular stem, covered in alternate, faintly linear-lanceolate leaves. The basal leaves are lyre-shaped, pinnatifid and long-petioled. The upper leaves are non-compound.

Habitat: The plant is probably indigenous to the Middle East, but is cultivated worldwide because of grain production.

Production: Cornflower consists of the quickly dried flowers of *Centaurea cyanus*. The plant is harvested during the flowering season from June to August.

Other Names: *Centaurea*, Bachelor's Buttons, Bluebonnet, Bluebottle, Blue Centaury, Cyani, Bluebow, Hurtsickle, Blue Cap, Cyani-flowers

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Anthocyanins: chief components succinylcyanin (centaurocyanin, cyanidine-3-O-(6-O-succinyl-beta-D-glucosyl)-5-O-beta-D-glucoside)

Flavonoids

Bitter principles (structure unknown)

EFFECTS

The drug has an antibacterial effect in vitro (centaurocyanin), but only for the aerial parts of the plant without the flowers.

INDICATIONS AND USAGE

Unproven Uses: Cornflowers and their preparations are used internally for fever, constipation, leucorrhea, menstrual disorders and vaginal *Candida*, and as a laxative, tonic and bitter. The flowers are also used as a diuretic and an expectorant, or as a stimulant for liver and gall bladder function. Externally, Cornflowers are used in preparation of

eye washes for eye inflammation and conjunctivitis, and for eczema of the scalp.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug possesses a weak sensitization potential.

DOSAGE

Mode of Administration: Cornflower is rarely used today. Occasionally, it is used as an inactive ingredient in tea mixtures.

Preparation: The infusion is prepared by adding 1 gm of drug per cup.

Dosage: The tea should be drunk several times daily.

Storage: Store carefully and protect from light.

Corydalis cava

See *Corydalis (Yan-Hu-Suo)*

Corydalis (Yan-Hu-Suo)

Corydalis cava

DESCRIPTION

Medicinal Parts: The medicinal parts are the tubers collected and dried when the plant is dormant. The fresh tuber collected just before flowering is also used.

Flower and Fruit: Flowers first appear in the fourth or fifth year. There are 4 to 5 racemes of 6 to 12 blooms, which are symmetrically 2-sided. There are 2 entire-margined bracts under the racemes. The flowers are dull red or yellowish-white, seldom lilac, brown-red or dark blue. The sepals are very small. The upper petal is drawn out into a downward curved spur; the front end is curved upward like a lip. The inner petals form a hood-like protective cover for the 6 stamens fused into 2 bundles. There is one ovary. The fruit is a pale green pod 20 to 25 cm long. The seeds are 3 mm wide, black, round, smooth and glossy.

Leaves, Stem and Root: The plant is perennial and grows to about 15 to 30 cm. A number of erect stems grows from the tuberous rhizome, which quickly becomes hollow. The stems bear the racemes and the 2 leaves. The 2 leaves under the racemes are long-petioled, double trifoliate, sea green above, and whitish green beneath.

Characteristics: The flowers have a slight fragrance of resin.

Habitat: The plant is indigenous to southern and central Europe.

Production: Corydalis tubers are the rhizomes of *Corydalis cava*. The tubers are dug up in autumn or in spring, once the ground has thawed. They are thoroughly cleaned, the roots and greenery are removed, and the remainder is sliced. The material is dried in a well-aired place, turned regularly and kept in temperatures not exceeding 40°C.

Other Names: Early Fumitory, Turkey Corn, Squirrel Corn, Yan-Hu-Suo

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Isoquinoline alkaloids: very complex, breed-specific mixture of approximately 40 alkaloids, including (+-)-bulbocapnine and (+)-corytuberin (aporphine-type) as well as (-)-corydaline (berberine-type)

EFFECTS

The full extract has a mildly sedative, sleep-inducing, spasmolytic, tranquilizing and hallucinogenic effect. It suppresses the CNS, reduces blood pressure and impedes movement of the small intestine.

INDICATIONS AND USAGE

Unproven Uses: Formerly, *Corydalis* was used for hyperkinetic conditions. Today, it is occasionally used for treatment of melancholia, pathological neuroses and mild forms of depression, as well as for severe nerve damage, trembling limbs and emotional disturbances.

Folk medicine: *Corydalis* was used in the past for worm infestation, menstruation disorders, Menier's disease and

Parkinson's. Externally, the plant was used for poorly healing wounds and ulcers.

Homeopathic Uses: Used for inflammations of the respiratory tract and the eyes, rheumatism, hyperorexia, diarrhea and furunculosis.

*£

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Poisonings among humans have not yet been observed.

OVERDOSAGE

Clonic spasms with musculature tremor occur with overdoses.

DOSAGE

Mode of Administration: The drug is available as a full extract in ready-made preparations.

Daily Dosage: Externally: as a compress, 3 to 5 gm of drug to 1/8 Liter of water.

Homeopathic Dosage: Oral: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day; eye drops 1 to 3 times daily; liquid dilutions D2 to D6: 20 to 60 drops; D12 to D30: 15 to 45 drops (HAB1).

Corynanthe pachyceras

See Hwema Bark

Costus

Saussurea costus

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the root.

Flower and Fruit: The flowers are in tough, orbicular, axillary or apical capitula with a diameter of 2.5 to 3.8 cm surrounded by an involucre. The epicalyx sepals are in a number of rows, ovate to lanceolate, acuminate, stiff and revolute. The tubular florets are dark blue to black-violet. The fruit is an achene up to 8 mm long with a brownish, feather-like pappus that is up to 1.7 cm long.

Leaves, Stem and Root: *Saussurea costus* is a herbaceous upright perennial growing to a height of up to 2 m. The leaves are alternate, the lamina simple, irregular dentate, basal, 0.5 to 1.2 m long and triangular. The petiole is lobed-winged. The cauline leaves are smaller, petiolate or sessile with 2 clasping lobes at the base. The plant has a strong, hard root up to 6 cm thick.

Habitat: The plant is indigenous to India and China.

Production: Indian *Costus* roots are the dried roots of *Saussurea costus*, which are harvested in September and October when the concentration of essential oils is highest.

Not to be Confused With: Because of the similarity in name, confusion sometimes occurs with *Costus speciosus*. The plant is also confused with *Inula racemosa*. In the past, confusion existed with many plants such as *Byronia* or *Galanga*, which went under the name of *Kostus*. However, differentiation has been established.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1 to 6%): chief components dehydrocostus lactone (35%) and costunolid (15%), including as well alpha-, beta- and gamma-costol, elemol, cyclocostunolide; aroma bearers include acetic acid, 4-ethyl octanoic acid, heptanoic acid, 3-methyl butyric acid, 7-octenoic acid, isopropyliden pentanoic acid

Resins (6%)

Polysaccharides: inulin (18%)

Lignans: including olivil-4"-0-beta-D-glucoside

Sesquiterpenes: saussureamines A to E

Steroids: sterols, including beta-sitosterol, stigmasterol

EFFECTS

The drug contains large quantities of essential oil with the sesquiterpene lactones, costunolid and dehydrocostus lactone. Various drug extracts exhibit antimicrobial and fungistatic efficacy, and have an influence over liver metabolism and liver sugar levels. The saussure amines it contains inhibit the formation of stress-related stomach ulcers. A bronchospasmodic effect has also been described. A dry extract of the drug administered in 500 mg dosages p.o. 3 times daily over a 3-month period led to a statistically significant reduction of angina pectoris attacks among patients with coronary heart disease.

INDICATIONS AND USAGE

Indian Medicine: The root has been used in India since ancient times as a universal antidote and as a contraceptive (Tschirch manual). It was also used medicinally as an aromatic and stimulant (according to Hoppe's work on drugs - 1958).

Chinese Medicine: Internal uses include gastric complaints, flatulence, coughs, cholera, loss of appetite and asthma. Externally, it has been used for poorly healing wounds and skin conditions. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. It is conceivable that the plant could cause allergic reactions due to its sesquiterpene lactone content, but no cases of this have as yet been documented.

DOSAGE

Mode of Administration: Whole and powdered drug preparations for internal and external use.

LITERATURE

Cheminat A, Stampf JL, Benezra C, Farrall MJ, Frchet JM, Allergic contact dermatitis to cosrus: removal of haptens with polymers. *Acta Derm Venereol*, 61:525-9, 1981.

Costus speciosus

See Cane-Reed

Cotton

Gossypium hirsutum

DESCRIPTION

Medicinal Parts: The medicinal parts are the seeds.

Flower and Fruit: Single axillary, radial flowers are structured in fives. The calyx is approximately 4.5 cm long, fused, divided into 5 and surrounded by 3 large, deeply dentate, epicalyx sepals. The 5 petals are 5 to 7 cm long, free, white to cream-yellow. The stamens are numerous, and the filaments are fused into a tube. The ovary is superior, and the carpels are fused. There is 1 style, with 3 to 5 stigmas that project through the stamen tube. The fruit is a walnut-sized capsule that opens on 3 to 5 sides and has 8 to 10 reniform, 3 to 5 mm thick, black seeds. These are covered in single-celled hair up to 46 mm long.

Leaves, Stem and Root: This evergreen shrub grows up to 2 m high and is typically cultivated as an annual. The leaves are alternate, long-petiolate, 3- to 7-lobed, with serrate margins, a rounded base and stipules that drop.

Habitat: The plant is indigenous to the U.S., China, Commonwealth of Independent States, India, Pakistan and Egypt.

Production: Cotton seeds are the ripe seeds of *Gossypium hirsutum*, *Gossypium oleum* and *Gossypium herbaceum*, as well as other cultivated *Gossypium* species. Cotton seed oil is the refined, fatty oil from the seeds. The oil is extracted using solvents or pressing followed by refinement with a yield of approximately 19%. *Gossypium* semen is derived from the industrial extraction of cottonseed oil.

Not to be Confused With: Mistaken identity can occur with sesame and kapok oil, which are sometimes used to adulterate Cotton oil preparations.

Other Names: American Cotton Plant, Cotton Seed

ACTIONS AND PHARMACOLOGY

COMPOUNDS: COTTON OIL

Fatty oil: chief fatty- acids include linoleic acid (55%), palmitic acid (22%), oleic acid (15%), myristic acid (5%), as well as stearic acid, eicosanoic acid, di- cyclopropene-fatty acids malvalic acid and sterculiac acid

Lignans: gossypol (traces)

Steroids: sterols, particularly beta-sitosterol, as well as campesterol, stigmasterol, delta7-stigmasterol, 24-methyl cycloartenol

Tocopherols (vitamin E): including 0.04% alpha-tocopherol, 0.04% gamma-tocopherol

EFFECTS: COTTON OIL

The oil contains large amounts of unsaturated fatty acids and is chiefly used as a dietetic.

COMPOUNDS: COTTON SEED

[^] *Fatty oil (20 to 30%)*: chief fatty acids include linoleic acid (55%), palmitic acid (22%), oleic acid (15%), myristic acid (5%), as well as stearic acid, eicosanoic acid, the cyclopropene-fatty acids malvalic acid and sterculic acid

Protein (20 to 25%)

Lignans: (+)-gossypol and (-)-gossypol (0.1 to 6.0%, yellow to red in color); there are also cultivated forms that are low in gossypol (gossypol content < 0.01%)

Flavonoids

Monosaccharides/oligosaccharides (7%): saccharose, raffinose, stachyose, glucose, fructose

EFFECTS: COTTON SEED

The pigment substance gossypol contained in the seeds inhibits enzymes of the energy metabolism, decouples the respiratory chain from the oxidative phosphorylation, reduces the cellular ATP concentration, lessens membrane potentials and inhibits the acrosomal sperm proteinase acrosine (anti-fertility effect). A cytostatic effect has been demonstrated.

INDICATIONS AND USAGE

COTTON OIL

Unproven Uses: Folk medicine indications for Gossypii oleum have included hypercholesteremia and vitamin E deficiency. It is also used when a non-nitrogenous or parenteral nourishment is required.

INDICATIONS AND USAGE

COTTON SEED

Indian Medicine: Among indications in Indian medicine are headache, coughs, dysentery, constipation, gonorrhoea, chronic cystitis, fever, poor lactation, epilepsy and snake bites. Reference is also made to use as an abortifacient and aphrodisiac. Efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

COTTON OIL

^{4p}^No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Animal experiments over a period of several weeks involving the administration of cyclopropene-fatty acids led to elevated cholesterol and triglyceride blood levels in rabbits and to a delayed sexual development in young female rats.

COTTON SEED

The drug is toxic, due to its gossypol content. Chronic ingestion of Cotton seed will lead to fertility disorders in I

men. After feeding sheep and cattle a total of 2 to 3 kg of Cotton seed press cakes over a period of 3 to 4 weeks, gastroenteritis, kidney damage with hematuria and icterus were observed. Death occurred 24 to 48 hours after first appearance of symptoms. Eye damage (Cotton seed blindness) was also noted.

DOSAGE

COTTON OIL

Preparation: Emulsion 10 to 15%: sterilization is carried out at 150° C for 1 hour.

Daily Dosage: Emulsion 40%: 60 ml p.o. in a single dose.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Ed.). Hagers Handbuch der Pharmazeutischen Praxis, 5. Aufl.. Bde 4-6 (Drogen), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

Cotton Tree

Cochlospermum gossypium

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant is the root, which yields a laxative, and the hard exudate of the aromatic bark.

Flower and Fruit: The flowers are in apical, sparsely flowered panicles. Flowers are 11 to 15 cm in diameter with 4 to 5 free silky-haired sepals, 4 to 5 gold-yellow petals and numerous stamens. The superior ovary has 5 carpels with many ovules attached to the walls. The fruit is an oval, dark-brown, hanging capsule 5 to 10 cm long, 4 cm thick and loculicidal. The seeds are reniform, approximately 7 mm long, 5 mm wide and villous.

Leaves, Stem and Root: *Cochlospermum gossypium* grows as a tree, rising up to 10 m high. The leaves are 10 to 20 cm wide and palmate-lobed. The 3 to 5 lobes are acuminate, or digitate; the petioles are 6 to 17 cm long. The young branches are velvet-haired and tinged reddish, the older ones are glabrous and ash gray.

Habitat: The tree is indigenous to India, Southeast Asia, Kenya and Mauritius.

Production: Cotton Tree gum is made up of the irregularly formed, leathery clumps of the exudate from the bark of *Cochlospermum gossypium*.

Other Names: Cotton Shell

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Water-soluble polysaccharides: partially-acetylated, acidic heteroglycans

EFFECTS

The drug (acetylated acid polysaccharide) is laxative in effect.

INDICATIONS AND USAGE

Unproven Uses: The drug is used in folk medicine for constipation and sluggishness of the bowels.

Indian Medicine: Uses include coughs, diarrhea, dysentery, pharyngitis and venereal disease.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages, nor with the drug's use as a pharmaceutical vehicle.

DOSAGE

Preparation: There is no information in the literature.

Daily Dose: A single dose of 3 g drug with plenty of liquid

LITERATURE

Blaschek W, Hansel R, Keller K, Reichling J, Rimpler G, Schneider G (Eds), Hagers Handbuch der Pharmazeutischen Praxis. Folgebnde 1 und 2. Drogen A-Z. Springer. Berlin, Heidelberg 1998.

Gowhage

Mucuna pruriens

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the hairs on the pod and the seeds.

Flower and Fruit: The flowers grow in racemes in twos and threes. They are large and white, with a bluish-purple papilionaceous corolla. The pod is pubescent, thick and leathery and averages about 10 cm in length. Pods have the shape of the sound opening in a violin. They are dark brown, covered with 0.25 cm long stiff hairs and contain 4 to 6 seeds. The seeds are made up of conical, sharply acuminate cells less than 1 mm in diameter and barbed at the apex. They are extremely irritating to the skin and must be handled with caution.

Leaves, Stem and Root: The plant is a climbing legume with long, thin branches and opposite, lanceolate leaves 15 to 30 cm in length. The petioles are pubescent.

Habitat: The plant is indigenous to tropical regions, especially India and the West Indies.

Production: Cowhage bean pods are the bean pods of *Mucuna pruriens*. The drug is derived from the hair of the pods.

Other Names: Cowitch, Couhage, Kiwach

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Serotonin: 5-methyl-N,N-dimethyl-tryptamine

EFFECTS

Externally, Cowhage is a cutaneous stimulant and rubefacient. Internally, the drug has an anthelmintic effect. Carminative, hypotensive, hypoglycemic and cholesterol-reducing effects have also been described.

Experiments carried out on frogs demonstrated that prurienin slowed down the heart rate, lowered blood pressure and stimulated intestinal peristalsis. The reduction in blood pressure was caused by the release of histamines; the spasmolysis of smooth muscle by indole bases.

INDICATIONS AND USAGE

Unproven Uses: The drug is used externally for rheumatic disorders and muscular pain, and internally for the treatment of worm infestation.

Indian Medicine: Uses in Indian medicine include gonorrhoea, sterility and general debility.

PRECAUTIONS AND ADVERSE REACTIONS

Once in contact with the skin, the stinging hairs lead to extremely aggressive itching and burning, accompanied by long-lasting inflammation, caused by the injection-like introduction of serotonin and proteins (mucunain, proteolytic enzyme). The intake of the hairs for the purpose of fighting intestinal worms should be avoided. Internal administration of the drug in the form of extracts may be harmless due to the difficulty involved in resorbing the active ingredients.

DOSAGE

Mode of Administration: The drug is used internally in extract form and powder form.

Cowslip

Primula veris

DESCRIPTION

Medicinal Parts: The medicinal parts are the roots and flowers.

Flower and Fruit: The flowers are in richly blossomed umbels with a short peduncle. The flowers are turned to one side and grow in clusters (up to 25) from the center of the leaf rosette. The calyx is cylindrical and appressed with a green margin. The remaining part of the calyx is yellow and it is 12 to 15 cm long. The corolla is odorless, usually sulfur yellow and has a tube with 5 triangular, orange spots. The fruit is an oval capsule with 1.5 to 2.5 mm-long brown, warty seeds.

Leaves, Stem and Root: This 10 cm high plant is a herbaceous perennial with a short sturdy rhizome. The green plant parts are covered in 2 mm long segmented hairs. The 4£ leaves are revolute in the bud. They are wrinkled, ovate or ovate-oblong and are rounded at the base. They narrow quickly to the winged stems. During the flowering season they are irregularly dentate with blunt teeth. They are 3 to 6 cm long during the flowering season, but grow larger later. The upper side of the leaf is glabrous.

Habitat: The plant is indigenous to all of Central Europe as far as the Southern European mountains. There are many subspecies.

Production: Cowslip flower consists of the dried, whole flowers with calyx of *Primula veris* and/or *Primula elatior* as well as their preparations. Cowslip root consists of the dried rhizome with roots of *Primula veris* and/or *Primula elatior* as well as their preparations. Cowslip root is harvested at best in the third year of growth.

Other Names: Oxlip, True Cowslip, Peagles, English Cowslip, Butter Rose, Herb Peter Paigle, Key Flower, Key of Heaven, Fairy Caps, Petty Mulleins, Buckles, Crewel, Palsywort, Plumrocks, Mayflower, Password, Primrose, Arthritica, Our Lady's Keys

ACTIONS AND PHARMACOLOGY

COMPOUNDS: COWSLIP FLOWER

Flavonoids (3%): including rutin, kaempferol-3-O-rutinoside, isorhamnetin-3-O-glucoside; isorhamnetin rhamnosyl robinoside, isorhamnetin robinoside, isorhamnetin rutinoside, kaempferol robinoside, limocitrin-3-O-glucoside. quercetin gentiobioside, quercetin-3-O-glucoside, quercetin robinoside

Primine

Triterpene saponins

EFFECTS: COWSLIP FLOWER

The drug has an expectorant effect, which is due to the flavonoid and saponin content. An increase of the volume of bronchial secretion has been demonstrated in animal experiments.

COMPOUNDS: COWSLIP ROOT

Phenol glycosides (0.2 to 2.3%, high values in the Spring): primulaverin (3%, 2-hydroxy-5-methoxy-benzoic acid methyl ester-O-xyloglucoside) changing over during dehydration into the characteristic-smelling 5-methoxy-methyl salicylate

Triterpene saponins (5 to 10%): chief components primulic acid A (chief aglycone protoprimulagenin)

EFFECTS: COWSLIP ROOT

The saponin content gives the drug expectorant and diuretic effects. Recent studies on these effects are not available. The mode of action is postulated to be due to vagal stimulation.

INDICATIONS AND USAGE

COWSLIP FLOWER

Approved by Commission E:

- Cough/Bronchitis

Unproven Uses: Cowslip flower is used internally for catarrh of the respiratory tract. In folk medicine it is used for insomnia, anxiety states, as a cardiac tonic for feelings of dizziness and cardiac insufficiency. It is also used as a nerve tonic for shaking limbs, headaches and neuralgia.

Homeopathic Uses: Primula veris is used to treat headaches and skin rashes

COWSLIP ROOT

Approved by Commission E:

- Cough/Bronchitis

Unproven Uses: Cowslip root is used internally for catarrh of the respiratory tract. In folk medicine it is used internally for whooping cough, asthma, gout, rheumatic arthritis, bladder and kidney disease, migraine, dizziness, stomach cramps, scurvy and neuralgia. Externally it is used for headaches and skin impurities.

CONTRAINDICATIONS

COWSLIP FLOWER

Contraindicated in known allergies to Cowslip.

PRECAUTIONS AND ADVERSE REACTIONS

COWSLIP FLOWER

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The epigeal organs of the Primula species possess a very high potential for sensitization due to the primine content. In the cases of Primula veris and P. elatior, the primine content is quite low, but sensitizations are nevertheless possible.

COWSLIP ROOT

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

OVERDOSAGE

COWSLIP FLOWER

Overdose could lead to gastric complaints and nausea.

COWSLIP ROOT

Overdose could lead to queasiness, nausea, gastric complaints and diarrhea.

DOSAGE

COWSLIP FLOWER

Mode of Administration: Cowslip preparations are available as solid and liquid pharmaceutical forms for oral intake and also available parenterally for homeopathic use.

Preparations: Tea: boiling water is poured over 2 to 4 gm drug and strained after 10 minutes (1 teaspoon corresponds to approximately 1.3 gm drug).

Liquid extract — drug 1:1 with 25% ethanol (V/V) (BHP83)

Daily Dosage: The average daily dose is 3 gm of drug. The single dose is 1 gm of drug.

Tea — 1 cup several times a day. As a bronchial tea, several cups a day, possibly sweetened with honey

Liquid extract — 1 to 2 ml 3 times a day

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: i to 2 ml sc acute: 3 times daily; chronic: once a day (HAB34); different doses for children.

Storage: Should be protected from light and moisture.

COWSLIP ROOT

Preparations: Tea: 0.2 to 0.5 gm finely cut drug are added to cold water and brought to the boil, left to draw for 5 minutes and strained (1 teaspoon corresponds to approximately 3.5 gm drug).

Extract: Percolation with 50 parts water and 50 parts ethanol, then filtration and vacuum drying. The residue is dissolved in 60 parts ethanol and 40 parts water and neutralized with ammonia. It is then cooled for 24 hours and filtered again. It is finally dehydrated to produce a dry extract under low pressure. (OAB90)

Liquid extract: the Primula extract is dissolved in a mixture of ethanol (30 parts), glycerol 85% (20 parts) and water (20 parts) and filtered when cool. (OAB90)

Tincture: 20 parts root and 100 parts diluted ethanol are processed to a tincture in accordance with the OAB VII maceration procedure.

Syrup: 15 parts Cowslip are dissolved in 20 parts water while being heated. It is then mixed with 10 parts 85% glycerol and 68.5 parts simple syrup. (OAB90)

Daily Dosage: The average daily dose is 1 gm of drug. The single dose is 0.5 gm of drug.

Tincture: The daily dose is 7.5 gm.

Extract: The single dose is 0.1 to 0.2 gm.

Liquid extract: The single dose is 0.5 gm.

Tea: as an expectorant, 1 cup every 2 to 3 hours, sweetened with honey

Storage: Cowslip should be protected from light.

Cranesbill

Geranium maculatum

DESCRIPTION

Medicinal Parts: The medicinal parts are the plant's dried rhizome and the leaves.

Flower and Fruit: The inflorescence is a terminal, cymose umbel. The flowers are radial with the structures arranged in fives with a 2.5 to 4 cm diameter. There are 5 free, pubescent sepals, 5 free purple petals and 10 stamens. The ovary is formed from 5 carpels, which are fused to the sides of the central column with their long awns. The fruit is a schizocarp, which breaks up into 5 mericarps with beak-like extensions and 1 seed each.

Leaves, Stem and Root: The herbaceous perennial grows upright, rising to 60 cm high. The leaves are opposite, in fives with cuneiform lobes and whitish-green spots when older. Leaves growing from the rhizome are large with long, pubescent petioles: those growing from the trunk have short petioles; stipules are present. The stem is upright, green, pubescent and dichotomously branched. The rhizome is thick, cylindrical and branched.

Habitat: The plant is found throughout Europe, but also in North America from Newfoundland to Manitoba and as far south as Georgia and Missouri. It grows in shady and moist ground in mixed and deciduous forests.

Production: American Cranesbill herb is the dried aerial herb of *Geranium maculatum* harvested during the flowering season. American Cranesbill root is the dried rhizome of *Geranium maculatum*, which is collected in late summer and autumn.

Other Names: Alumroot, Crowfoot, Geranium, Spotted Cranesbill, Spotted Geranium, Storksbill, Wild Cranesbill

ACTIONS AND PHARMACOLOGY

COMPOUNDS: CRANESBILL HERB

Tannins (30%): gallotannins

COMPOUNDS: CRANESBILL ROOT

Tannins (10 to 28%): gallotannins

EFFECTS

The tannins give the drug astringent, hemostyptic and tonic properties.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine indications have included hemorrhoids, duodenal ulcers, diarrhea, metrorrhagia, heavy menstruation and dysmenorrhea. Efficacy for these internal use indications has not yet been proven.

Homeopathic Uses: The drug is used for stomach ulcers and bleeding of the mucous membranes, but efficacy for these indications has not yet been proven.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Because of its high tannin content, the intake of preparations of the drug could lead to digestive disorders. Individuals with sensitive stomachs could experience nausea and vomiting.

DOSAGE

CRANESBILL HERB

Daily Dosage: Powder/Infusion: 1 to 2 g, 3 times daily.

Homeopathic Dosage: Literature notes the drug's importance as a homeopathic medicine, but does not state dosage.

CRANESBILL ROOT

Preparation: Liquid extract - drug 1:1 45% ethanol (V/V) percolated (BHP83).

Daily Dosage:

Decoction — 1 to 2 g drug, 3 times daily

Liquid extract — 1 to 2 ml, 3 times daily

Tincture — 2 to 4 ml, 3 times daily.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules, 1 to 3 times daily, or 1 ml injection solution sc twice weekly (HAB34).

Croton Seeds

Croton tiglium

DESCRIPTION

Medicinal Parts: The seeds are the medicinal parts. The oil is extracted from the seeds and is toxic; 1 ml can be fatal.

Flower and Fruit: Croton tiglium is a shrub or tree that grows up to 6 m. The leaves are alternate, smooth, ovate or acuminate. They are dark green above and paler beneath, with an unpleasant smell. There are inconspicuous flowers in terminal racemes. The seeds have a brown, mottled appearance. The outer layer of the seed is easily removed, leaving a hard, black coat.

Characteristics: Croton Seed oil is yellowish or reddish-brown and rather viscid, with an unpleasant odor. It is toxic and should be handled with extreme care.

Habitat: The tree is found throughout Asia and China.

Production: Croton oil is extracted from the seeds of Croton tiglium.

Other Names: Tiglium, Tiglium Seeds

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: phorbol ester, including 12-O-tridecane olyphorbol-13-acetate (TPA, myristoylphorbolacetate, MPA)

Fatty oil

EFFECTS

Croton Seed oil is a laxative, skin-irritant, co-carcinogenic, nephrotoxic. It is a drastic irritant. TPA is a carcinogen, affecting prostaglandin metabolism.

INDICATIONS AND USAGE

Unproven Uses: At present, it is used only in Chinese medicine and in very small doses as a remedy for gall bladder colic, obstruction of the bowels and malaria. The drug is obsolete in Europe.

Chinese Medicine: In China, Croton Seed oil is used for edema, furuncles, constipation, chest and stomach pain, worm infestation and sore throat.

Indian Medicine: Indian uses include constipation, abdominal disorders, worm infestation, convulsions and attacks of dizziness.

PRECAUTIONS AND ADVERSE REACTIONS

The phorbol esters of the oils are severe co-carcinogenics. Therapeutic uses as well as skin or mucous membrane contacts with the drug are to be strictly³ avoided. The drug possesses acute toxicity. When applied to the skin, it brings about itching, burning and after a time, blisters. If taken internally, it leads to burning in the mouth, vomiting, dizziness, stupor, painful bowel movements and ultimately to collapse.

OVERDOSAGE

One to 2 drops are already acutely toxic; the lethal dosage is put at 20 drops. After stomach and intestinal emptying, treatment of poisonings can only proceed symptomatically.

DOSAGE

Mode of Administration: Croton Seed oil is obsolete as drug

Croton tiglium

See Croton Seeds

Cubeb

Piper cubeba

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried, not fully ripe fruit.

Flower and Fruit: The male flowering spikes are about 4 cm long and have 2 or 3 stamens. The female spikes are made up of about 50 individual flowers, which mostly consist of the oblong ovary of 4 fused carpels with 4 sessile stigmas. The infructescence is 4 to 5 cm long. When ripe, the base of the ovary grows into a stem-like, cylindrical lower part. The upper portion of the fruit is globular and holds the seed, which contains a tiny embryo in a small cavity at the apex.

Leaves, Stem and Root: The plant is a 5 to 15 m high dioecious climbing shrub. The branches are initially pubescent, later glabrous. The leaves are glabrous, entire-margined, coriaceous, ovate to oblong-elliptical and up to 15 cm long and 6 cm wide.

Characteristics: The odor is warm and reminiscent of turpentine.

Habitat: The plant is indigenous to Indonesia and is cultivated in Sri Lanka, India and Malaysia.

Production: Cubebs are the fruit of *Piper cubeba*. The fruit is harvested when still green and dried in the sun.

Other Names: Java Pepper, Tailed Cubebs, Tailed Pepper

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (10 to 20%): chief constituents alpha- and beta-cubebenenes (11%), copaene (10%), cubebol (10%), delta-cadinene (9%), humulenes

Lignans: chief components (-)-cubebin, additionally (-)-cubebinin, dihydroclusin, (-)-dihydrocubebin, hinokinin

Resins

Fatty oil (12%)

EFFECTS

The sesquiterpene-rich essential oil is said to be expectorant in chronic bronchitis. The resinous acids in the drug are said to have an antiseptic and astringent effect on the urinary tract. There is no information on the mode of action.

INDICATIONS AND USAGE

Unproven Uses: Folk medicine uses include treatment for urinary tract diseases, flatulence and stomach complaints, headaches (dizziness), chronic bronchitis, to increase libido and for poor memory.

Homeopathic Uses: Piper cubeba is used for inflammation of the mucous membrane of the urogenital tract.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

OVERDOSAGE

High dosages (over 8 gm) cause irritation of the urinary passages, kidney and bladder pains, albuminuria and urination problems. Beyond this, vomiting, diarrhea, cardiac pain and skin rashes can occur. After stomach and intestinal emptying, treatment of poisonings should proceed symptomatically.

DOSAGE

Mode of Administration: Cubeb is contained in medicinal preparations, such as bath additives.

Daily Dosage:

Powder — 2 to 4 g daily for internal administration

Extract (1:1) — daily dose: 2 to 4 ml

Tincture (1:5) — daily dose: 2 to 4 ml

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or 1 ml injection solution sc twice weekly (HAB1); children's dosage does not equal adult dose.

Cudweed

Gnaphalium uliginosum

DESCRIPTION

Medicinal Parts: The aerial parts are the medicinal parts of the plant.

Flower and Fruit: The composite flower heads are 3 to 4 mm by 5 mm, sessile and in terminal racemes of 3 to 10. They are shorter than the leaves growing from the leaf axil. The involucre bracts are oblong to linear and brownish. There are 50 to 150 female florets, 5 to 8 hermaphrodite florets. The achene is 0.5 mm oblong-cylindrical. The pappus is 1.5 mm.

Leaves, Stem and Root: The stems are 5 to 20 cm high and branched. The leaves are 10 to 50 mm by 2 to 5 mm, linear-lanceolate to oblong-obovate. They are downy and greenish above; whitish and even more downy beneath.

Habitat: The plant is native to many parts of Europe, the Caucasus and west Asia. It has been introduced into America.

Production: Cudweed is the aerial part of *Gnaphalium uliginosum*.

Other Names: Cotton Weed, Dysentery Weed, Everlasting, Mouse Ear, Wartwort, Cotton Dawes

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil

Tannins

The constituents of the drug have not been extensively investigated.

EFFECTS

Cudweed is an astringent and a stomachic. According to unconfirmed sources, the drug also has antidepressive, aphrodisiac and hypotensive effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used as a gargle and rinse in the treatment of diseases of the mouth and throat.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Liquid extract used as a gargle and rinse.

LITERATURE

Kern W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde. 1-8, Springer Verlag Berlin, Heidelberg, New York. 1969.

Cumin

Cuminum cyminum

DESCRIPTION

Medicinal Parts: The medicinal parts are the Cumin oil extracted from the ripe fruit and the ripe, dried fruit.

Flower and Fruit: The flowers are in umbels radiating in groups of 3 to 5. The petals are white or red, oblong and deeply bordered with a long indented tip. The involucre bracts are long and simple. The style is short and turned outward at the end. The ovary is inferior and 3-locular. The fruit is a schizocarp, about 6 mm long and 1.5 mm wide and crowned with awl-shaped calyx tips. The mericarp is almost round in transverse section, with 5 thread-like, bristly main ribs and bristly secondary ribs.

Leaves, Stem and Root: The plant is a delicate, glabrous annual 10 to 50 cm high. The stem is bifurcated at the base and glabrous. The leaves are glabrous and finely pinnatifid with oblong-linear tips, of which the lower are mostly doubly trifoliate.

Habitat: The plant is indigenous to Turkestan (Hager) or northern Egypt (Grieve), but is cultivated today in the whole of the Mediterranean region as well as in Iran, Pakistan, India, China, the U.S. and South America.

Production: Cumin is the dried ripe fruit of *Cuminum cyminum*.

Not to be Confused With: Certain Indian products, such as *Carum carvi* and the fruit of the earth chestnut, *Bunium bulbocastanum* can be mistaken for or confused with Cumin. Synthetic coloring is frequently added to Turkish products.

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (2 to 5%): chief components cuminaldehyde, gamma-terpenes, beta-pinenes, p-cymene, 1,3-p-menthadiol

Fatty oil (10 to 15%): chief fatty acids petroselic acid, palmitic acid

Proteic substances (15 to 20%)

EFFECTS

Antimicrobial: The drug contains fatty oil (mainly petroselic acid and oil acid) and has an antimicrobial effect. A powder suspension of the drug has diverse inhibitory effects; it stunts mycelium growth, toxin production or aflatoxin production in *Aspergillus ochraceus*, *C. versicolor*, and *C. flavus*.

Influence on blood-clotting: A dried Cumin ether extract inhibits (in vitro) arachidon acid-induced plate aggregation in platelet-rich human plasma.

Mutagenic effect: In comparison to *Salmonella typhimurium* TA 100, a mutagenic effect of the polar fractions of chloroform extract and methanol extract of Cumin did appear.

Influence of pharmacological metabolism: An injection of a dried ether extract prolonged the phenobarbiturate hypnosis of female albino mice, up to 120%; a higher dose shortened it to 83%.

Estrogenic effect: An acetone extract of cumin, administered to female albino rats (ovariectomised, ovaries have been removed) led, depending on the dosage, to an increase in the weight of the uterus, an increase in the amount of protein in the endometrium and an increase of alkali phosphates.

Other effects (for which there are no experimental results) include the following: obstructive influence on fertility, galactogen, antispasmodic, diuretic and aphrodisiac.

Cumin also has carminative, stimulant and analgesic effects.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, Cumin is used as a carminative for stomach disorders, diarrhea and colic, particularly in veterinary medicine.

In America, Africa and India the drug is used as an abortive and as an emmenagogue.

In Indonesia, Cumin is used in cases of bloody diarrhea and headache (paste is applied to the forehead). It is also taken orally for rheumatic ailments.

Indian Medicine: In India, Cumin is used as an abortifacient, for kidney and bladder stones, chronic diarrhea, leprosy and eye disease.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Cumin is used both internally and externally in ground form and as a pressed oil.

Daily Dosage: The average single dose is 300 to 600 mg of drug (equivalent to 5 - 10 fruits).

LITERATURE

Cuminum cyminum

See *Cumin*

Gup Plant

Silphium perfoliatum

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The flowers are 5 to 8 cm wide, long-pedicled and clustered. The sepals are overlapping, and the petals are egg-yolk yellow. The disc-like flowers are androgynous with long thread-like styles. The lateral flowers are female and lingual. The double-winged fruit is compressed and has a pappus of lateral awns.

Leaves, Stem and Root: The perennial plant is a 1.25 to 2.5 m high plant with a branched rhizome. The erect, angular, smooth stem is branched higher up and foliated up to the tip. The leaves are opposite, rough, ovate, acuminate, crenate, dark green above and blue-green beneath. The lower leaves are up to 30 cm long, and the upper ones are oblong-ovate, sessile and fused at the base to a cup form.

Habitat: The plant is indigenous to the western U.S., Oregon and Texas.

Other Names: Ragged Cup, Indian Gum, Prairie Dock, Pilot Plant, Polar Plant, Rosinweed, Turpentine Weed

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Triterpene saponins

Sesquiterpenes: including among others silphinene, silphiperfolen, 8-hydroxy-presilphiperfolane

EFFECTS

The drug is a tonic and has a diaphoretic effect.

INDICATIONS AND USAGE

Unproven Uses: Cup Plant has been used for digestive disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Cup Root is not used in modern medicine.

LITERATURE

Davidyants ES et al. (1984) Khim Priir Soedin. 5:666.

Cupmoss

Cladonia pyxidata

DESCRIPTION

Medicinal Parts: The wineglass-shaped scyphi of *Cladonia pyxidata* are used medicinally.

Flower and Fruit: Cupmoss is a lichen, not a moss as the name suggests. The scyphi are grayish-white, about 2.5 cm long, wineglass-shaped, with hollow stems and terminal cups.

Characteristics: The taste is mucilaginous and slightly sweet. There is no odor.

Habitat: The plant is indigenous to North America and is also common in other areas including Great Britain.

Other Names: Chin Cups

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Lichen acids: including fumaroprotocetraric acid, barbatic acid, psoromic acid

Mucilages

EFFECTS

Cupmoss has the effect of an expectorant and antitussive.

INDICATIONS AND USAGE

Unproven Uses: Cupmoss is used for coughs, bronchitis, and also in the treatment of whooping cough.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Cupmoss is used internally as an infusion with honey.

LITERATURE

Cupressus sempervirens

See Cypress

Curcuma

Curcuma xanthorrhiza

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried, tuberous rhizomes cut into slices.

Flower and Fruit: The inflorescence is large; it is purple or crimson. The corolla has a red margin. Otherwise it is very similar to *Curcuma domestica*.

Leaves, Stem and Root: The plant is a perennial, 1.75 m high and leafy. The leaves are in long thin sheaths on the rhizome. The leaf blades are broadly lanceolate or oblong and have a narrow, purple mark on the midrib. The main rhizome is thickened like a tuber, ovate, the size of a fist with numerous roots and thin lateral rhizomes. The roots terminate partially in ovate tubers.

Habitat: Curcuma is indigenous to the forests of Indonesia and the Malaysian peninsula. It is cultivated mainly on Java, in Malaysia, Thailand and the Philippines.

Production: Japanese turmeric consists of the sliced, dried, tuberous rhizomes of *Curcuma xanthorrhiza*. Curcuma is cultivated and harvested in the second year of growth. After the rhizome has been washed, the main thick root is isolated, cut and dried at a temperature of 50°C.

Not to be Confused With: The rhizome of *Curcuma domestica*.

Other Names: Tewon Lawa, Temu Lawak

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Volatile oil (3 to 12%): chief components ar-curcumene (alpha-curcumene), xanthorrhizol, beta-curcumene, germa-crene, furanodien, furanodienone

Curcuminoids (0.8 to 2%): including curcumin, demethoxycurcumin

Non-phenolic diarylheptanoids: alnustone

Starch (30-40%)

EFFECTS

Curcuma acts in a manner similar to turmeric root but is mainly choleric and antitumoral (animal testing).

INDICATIONS AND USAGE

Approved by Commission E:

- Liver and gallbladder complaints
- Loss of appetite

Unproven Uses: Curcuma is used for dyspepsia, particularly feelings of fullness after meals and meteorism.

In Indonesia it has long been used for liver and gallbladder complaints.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Stomach complaints can occur following extended use or in the case of overdose. Because of the stimulating effect of the drug on the biliary tract, it should not be administered if there is a bile duct blockage. Colic can occur when the patient suffers from gallstones.

DOSAGE

Mode of Administration: Comminuted drug for infusions and other galenic forms for internal use.

Preparation: The infusion is prepared by pouring 1 cup of boiling water over 1/2 tsp. of drug and straining after 10 minutes.

Daily Dosage: The average daily dose is 2 gm of drug; infusion: 2 to 3 times daily between meals.

Storage: It should be protected from light.

Cyclamen

Cyclamen europaeum

DESCRIPTION

Medicinal Parts: The medicinal part is the dried rhizome with the roots.

Flower and Fruit: The flowers are pinkish-red, solitary and nodding on erect stems. The 5 sepals are ovate, pointed and dentate. The corolla is a short campanulate tube with 5 revolute tips; it is darker at the base. There are 5 stamens and 1 ovary. The fruit is a capsule, which opens on 5 sides.

Leaves, Stem and Root: The plant grows from about 5 to 10 cm. The rhizome is a disc-like tuber. The leaves are long-petioled, orbicular or cordate, crenate, glabrous, with a white edge above and red beneath. The petioles and pedicles are roughly glandular.

Characteristics: The flowers are fragrant and poisonous.

Habitat: The plant is found in the Alps and the alpine regions of southern Europe.

Other Names: Groundbread, Sowbread, Swinebread, Ivy-Leafed Cyclamen

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins: including cyclamine, deglucocyclamine I, deglucocyclamine II

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: The drug is used to treat menstrual complaints, emotional disorders/nervous states and digestive problems.

Homeopathic Uses: Cyclamen is used for migraine and its accompanying autonomic symptoms, and for the treatment of premenstrual syndrome.

PRECAUTIONS AND ADVERSE REACTIONS

The intake of even small dosages (0.3 gm) can lead to nausea, vomiting, diarrhea and stomach pain.

OVERDOSAGE

High dosages can cause spasm and asphyxiation. Following gastric lavage and the administration of activated charcoal, the treatment for poisoning should proceed symptomatically (e.g., treatment of convulsions with diazepam, treatment of colic with atropine).

DOSAGE

Mode of Administration: Cyclamen is used in homeopathic treatments. It is also used topically and in alcoholic extracts.

LITERATURE

Cypress

Cupressus sempervirens

DESCRIPTION

Medicinal Parts: The medicinal parts are the cones, branches and oil.

Leaves, Stem and Root: *Cupressus sempervirens* is a tree that grows up to 30 m tall. The leaves are 0.5 to 1 mm, dark green and obtuse. The male cones are 4 to 8 mm, the female are 25 to 40 mm. They are elliptical-oblong (rarely globose), green when young and shining yellowish-gray when ripe, with 8 to 14 short and obtusely spiked scales. There are 8 to 20 seeds on each scale,

Habitat: The plant is indigenous to Turkey and is cultivated throughout the Mediterranean region.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Chief components: alpha-pinene, D-camphene, D-silvestrene, p-cymene, L-cadinene, cedrol, terpinenol-4, terpineol, acetyl- and isovalerianyl esters of monoterpene alcohols

EFFECTS

Cypress acts as an expectorant.

INDICATIONS AND USAGE

Unproven Uses: The drug is used externally for head colds, coughs and bronchitis.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Kidney irritation is likely with intake of larger dosages.

DOSAGE

Mode of Administration: Occasionally, Cypress is used externally as an ointment.

LITERATURE

Kem W, List PH, Horhammer L (Hrsg.), Hagers Handbuch der Pharmazeutischen Praxis, 4. Aufl., Bde 1-8, Springer Verlag Berlin, Heidelberg, New York, 1969.

Cypress Spurge

Euphorbia cyparissias

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is the flowering plant with the root.

Flower and Fruit: The flowers are in terminal cymes. They are yellow-green but usually red after flowering. What appear to be flowers are in fact inflorescences. In the jug-shaped involucre there is 1 hanging pistil with a 3 valved ovary and 3 styles each with 2 stigmas and numerous stamens. Four half-moon-shaped nectaries are at the edge. The fruit is covered in small papilla.

Leaves, Stem and Root: The plant is about 15 to 30 cm high. The stem is erect, unbranched, and glabrous. The leaves are alternate, sessile, linear, entire-margined and very narrow on the non-flowering branches.

Characteristics: The entire plant contains white latex, which is poisonous.

Habitat: Indigenous to Europe and Mediterranean.

Production: Cypress Spurge herb and root is the whole plant in flower and root of *Euphorbia cyparissias*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Diterpenes: ingenan-di- and triester, for example 13-hydroxy-ingenol-3-(2,3-dimethylbutyryl)-13-dodecanoate, 13-hydroxy-ingenol-5-(2,3-dimethylbutyryl)-13-dodecanoate, 13-hydroxy-ingenol-3-(2,3-dimethylbutyryl)-13-decanoate

Triterpenes

EFFECTS

The diterpene esters in the drug are severely toxic, a strong irritant, drastically purgative and encourage growth of tumors.

In animal tests and in vitro there are indications of a cytotoxic, non-specific immune-stimulating, antiphlogistic and strongly laxative effect.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine Cypress Spurge is used internally for constipation, toothache and as a diuretic (macerate). It is used externally for warts and corns (ointment).

Homeopathic Uses: *Euphorbia cyparissias* is used for diseases of the respiratory organs, diarrhea, and skin diseases.

PRECAUTIONS AND ADVERSE REACTIONS

The Ingenan esters are severely inflammatory in their effect and cocarcinogenic. Administration of the drug should be avoided because of the cocarcinogenic effect.

A particular danger exists with the chyle of the freshly harvested plant, but the ingenan ester retains its efficacy even after drying, which means that the drug also is acutely toxic. If it gets on the skin, the chyle causes reddening, itching, burning and blisters.

In the eye, the chyle leads to swelling of the lids, conjunctival inflammation and corneal defects. If taken internally, the chyle in the drug causes burning in the mouth and vomiting. Very high dosages cause pupil enlargement, dizziness, stupor, painful bowel movements, cardiac rhythm disorders and ultimately collapse. Skin contact with the chyle requires thorough cleaning. Contact with the eye requires thorough rinsing with water. Following stomach and intestinal emptying, the treatment of poisonings is carried out symptomatically.

DOSAGE

Mode of Administration: Cypress Spurge is used only in homeopathic dilutions.

Daily Dosage: Macerate/decoction: 0.5 to 1 gm daily

Homeopathic Dosage: from D4: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); From D6 parenterally: 1 to 2 ml sc acute: 3 times daily; chronic: once a day. Children should be given a weaker dose (HAB1)

Daffodil

Narcissus pseudonarcissus

DESCRIPTION

W Medicinal Parts: The medicinal parts are the bulb, die leaves and the flowers, or the whole flowering plant without the roots.

Flower and Fruit: The flowers are solitary and bending on compressed 2-edged pedicles. They are pale yellow. At the base of the flower there is a dry, membranous sheath that is split higher at the side. The perigone is 6-tipped and splayed like a plate. The secondary corolla is egg-yolk yellow and cylindrical, with an undulating, folded, unevenly crenate

margin. The stamens are fused to the tube. The ovary is inferior, the style is thread-like and the stigma obtuse.

Leaves, Stem and Root: The plant grows from 15 to 30 cm high. The leaves are basal, sprouting from an ovate, brown bulb. They are erect, linear, flatly grooved, and have 2 grooves rather than a keel.

Characteristics: Daffodil has a weak unpleasant odor and is poisonous.

Habitat: The plant is found all over Europe and is cultivated elsewhere.

Production: Daffodil is the flowering plant *Narcissus pseudonarcissus* without the root.

Other Names: Lent Lily

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Amaryllidaceae alkaloids (0.08-0.15% in the bulb, with considerably less in the foliage): including, among others, hemanthamine, galanthine, galanthamine, pluviine, masonine, homolycorine

Chelidonic acid

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Daffodil is used for irritation of the mucous membranes, such as bronchial catarrh, whooping cough, colds and asthma.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The plant possesses a weak potential for sensitization, a condition called "daffodil itch."

OVERDOSAGE

Overdosage or accidental intake of the bulbs (e.g., confusing them with cooking onions) can lead to poisoning. Symptoms include vomiting, salivation, diarrhea and central nervous disorders following resorption.

DOSAGE

Mode of Administration: Daffodil is available ground and as an extract. It is also found in homeopathic remedies.

Damiana

Turnera diffusa

TRADE NAMES

Damiana Leaves (from various manufacturers), Wild Countryside Damiana Leaves

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves harvested during the flowering season.

Flower and Fruit: The flowers are yellow, solitary and axillary. The fruit is a small, globular, many-seeded capsule, which breaks up into 3 parts. It is aromatic and resinous.

Leaves, Stem and Root: The plant is a small shrub that grows up to 60 cm high. The leaves are 1 to 2.5 cm long and up to 6 mm wide. They are smooth and pale green on the upper surface and glabrous with a few scattered hairs on the ribs underneath. The leaves are ovate-lanceolate, short-petioled and have 2 glands at the base. They have a few serrate teeth and recurved margins.

Habitat: The plant is found mainly in the region of the Gulf of Mexico, the Caribbean and southern Africa.

Production: Damiana leaf consists of the leaf of *Turnera diffusa* and its variations. Damiana herb consists of the herb of *Turnera diffusa* and its variations.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (0.5-0.9%): chief components 1,8-cineole, alpha- and beta-pinene, p-cymene, as well as thymol, alpha-copene, gamma-cadinene, calamene

Tannins (4%)

Resins (7%)

Hydroquinone glycosides: arbutin (0.2-0.7%)

Cyanogenic glycosides: tetraphylline B (barterin)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Damiana preparations are used as an aphrodisiac and for prophylaxis and treatment of sexual disorders.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

How Supplied:

Capsules — 380 mg, 384 mg, 395 mg, 450 mg

Fluid Extract — 1:1

Dandelion

Taraxacum officinale

TRADE NAMES

^k Dandelion Root (available from various manufacturers)
Alcohol-Free Dandelion, Wild Countryside Dandelion Root

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves harvested before the flowering season, the dried root collected in autumn, the dried aerial parts with the rhizome harvested before the flowering season and the whole fresh plant.

Flower and Fruit: The flower is a golden yellow composite flower. The composite head is solitary and has a diameter of 3 to 5 cm. All the florets are lingual and androgynous. The epicalyx is oblong-campanulate. The tepals are arranged in 3 imbricate rows, 2 of which are turned back. The inner one is long acuminate with a white margin and erect. The receptacle has no bracts. The fruit is small, long-beaked, light gray-brown, ribbed and has a parachute-like tuft of hair.

Leaves, Stem and Root: The plant is perennial, hardy and is found in a number of forms. It grows to about 30 cm tall and has a short rhizome. The rhizome turns into a many-headed, 20 to 50 cm long and 2 cm thick taproot. The hollow stem is erect or ascending. The basal leaves are glabrous or villous, usually deeply notched, lanceolate and lobed like a saw. They narrow to a red-violet tinged petiole and end in a large deltoid tip.

Characteristics: The flower opens in the morning and closes in the evening remaining closed all night and in dull weather. The plant parts contain bitter latex.

Habitat: Dandelion grows in most temperate regions of Europe and Asia.

Production: Dandelion root with herb consists of the entire *Taraxacum officinale* plant gathered while flowering. It is air dried.

Not to be Confused With: *Cichorium intybus* and the leaves of various *Leontodon* species.

Other Names: Blowball, Cankerwort, Lion's Tooth, Priest's Crown, Swine Snout, Wild Endive

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Sesquiterpene lactones (bitter substances): including, among others, taraxinacetyl 1 - 1' - O - glucosides, 11,13-dihydrotaraxinacetyl 1 - 1' - O - glucosides, taraxacolide - 1' - O - glucosides, 4 α , 15,11 beta, 13 - tetrahydroridentin B

Triterpenes and sterols: beta-sitosterol, beta-sitosterol-glucosides, taraxasterol, psi-taraxasterol, taraxerol, taraxol

Flavonoids: including among others, apigenin-7-O-glucosides, luteolin-7-O-glucosides

Mucilages

Inulin (2-40%, high values in autumn)

EFFECTS

The amaroids in Dandelion are cholagogic and secretolytic in the upper intestinal tract. The saluretic effect demonstrated in animal experiments requires further investigation.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Infections of the urinary tract
- Liver and gallbladder complaints
- Loss of appetite

Unproven Uses: Dandelion is used internally for disturbances in bile flow, inflammatory conditions of the efferent urinary tract, and dyspepsia. It is also used for liver and gallbladder disorders, hemorrhoids, congestion in the portal system, gout, rheumatic disorders, eczema, and other skin disorders. The drug has a diuretic effect and is used for kidney and bladder complaints and kidney stone formation. A diabetic infusion is made from the roots and leaves.

Chinese Medicine: The drug is used for acute mastitis, urinary disorders, and agalactia.

Indian Medicine: The drug is used for chronic ulcers, tuberculosis, flatulence, colic, kidney disease, gout, jaundice, and biliary stones.

CONTRAINDICATIONS

Contraindications include closure of the biliary ducts, gallbladder empyema, and ileus. Consultation with a doctor is necessary in the presence of biliary ailments.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Superacid – gastric complaints are possible due to the drug's secretion-stimulating effect. The drug possesses weak potential for sensitization reactions.

DOSAGE

Mode of Administration: Whole, cut, and powdered drug is available in the form of drops, tinctures, juice, and in compound preparations.

How Supplied:

Capsules—425 mg, 475 mg, 515 mg, 520 mg,

Liquid—1:1

Preparation: To make a tea, use 1 to 2 teaspoonfuls finely cut drug with 150 ml rapidly boiled water; strain after 15 minutes and drink warm.

To make a decoction, use 3 to 4 gm cut and powdered drug per cup of water. To make an infusion, use 3 to 4 gm cut drug per 1 cup of water.

For an extract, mix 1 part coarsely powdered Dandelion root with 8 parts of water and 1 part spirit of wine.

Daily Dosage: When using a tincture, the recommended dosage is 10 to 15 drops 3 times daily. A cup of the freshly made tea can be taken mornings and evenings.

Storage: The drug should be protected from light and moisture.

Date Palm

Phoenix dactylifera

DESCRIPTION

Medicinal Parts: The medicinal part is the fruit.

Flower and Fruit: The flowers are androgynous and are in branched, cob-like inflorescences. The 3 carpels form 1 ovary. The fruit is a 1-seeded berry about 5 cm long (the date with the characteristic seed).

Leaves, Stem and Root: The Date Palm is a woody plant growing primarily in girth. The leaves form a large long-petioled tuft at the top of the trunk. The lamina are frond-like pinnatifid.

Habitat: Date Palm is found from India to northern Africa.

Production: Dates are the fruits of *Phoenix dactylifera*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS: IN THE FRUIT PULP

Sugar (50%): saccharose, inverted sugar

Leucoanthocyanidine

Piperidine derivatives: pipercolic acid, 5-hydroxy-pipercolic acid, baikiaine

COMPOUNDS: IN THE SEEDS

Fatty oil (10%)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Indian Medicine: Date Palm is used for bronchitis, clouding of the cornea, headaches, inflamed wounds, kidney disease and gastric complaints.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Preparation: Honey made from dates is produced in Algeria using juice-rich dates, which are dried in the sun; the leftover liquid results in date honey. Date honey is used to treat chest complaints.

Devil's Claw

Harpagophytum procumbens

TRADE NAMES

Devil's Claw (available from a number of manufacturers), Devil's Claw Secondary Root, Devil's Claw Root Tuber

DESCRIPTION

* *Medicinal Parts:* The medicinal parts are the dried tubular secondary roots and the thick lateral tubers.

Flower and Fruit: The flowers grow on short pedicles in the leaf axils and are solitary, large and foxglove-like. The petals are pale-pink to crimson. The seed capsules are bivalvular, compressed at the sides and ovate. The capsules are 7 to 20 cm long, 6 cm in diameter, and very woody with longitudinally striped rind. They have a double row of elastic, arm-like, branched appendages with an anchor-like hook. The

capsules contain about 50 dark oblong seeds with a rough surface.

Leaves, Stem and Root: The plant is perennial and leafy. It has a branched root system and branched, prostrate shoots 1 to 1.5 m long. The leaves are petiolate and lobed, and may be opposite or alternate. The aerial parts of the plant die back in the dry season. The tuber (storage) roots are formed from the main and lateral roots. The main roots have obtuse, quadrangular, upright collar-like sections, 10 to 20 cm long and 30 to 60 cm thick, which are covered in a fissured cork layer. The nodes of the lateral roots are up to 60 mm thick and 20 cm long, and are light-brown to red-brown on the outside. The roots extend out to an area of about 150 cm around the plant and grow down to a depth of 30 to 60 cm.

Characteristics: The dried, pulverized secondary tubers and roots are yellowish-gray to bright pink and horn-like in their hardness. They have a bitter taste.

Habitat: The plant originated in South Africa and Namibia, and has spread throughout the Savannas and the Kalahari.

Production: Devil's Claw root consists of the dried lateral roots and secondary tubers of *Harpagophytum procumbens*. The lateral roots are cut into slices or pieces, or pulverized immediately after digging because they harden and become very difficult to cut once dry.

Other Names: Grapple Plant, Wood Spider

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Liridoide monoterpenes: including harpagoside (extremely bitter), harpagide, procumbide

Phenylethanol derivatives: including acteoside (verbasco-side); isoacteoside

Oligosaccharides: stachyose

Harpagoquinones (traces)

EFFECTS

Devil's Claw stimulates gastric juice secretion and is choleric. Anti-inflammatory, analgesic (and tius anti-ar-thritic) effect has been shown in animal experiments.

INDICATIONS AND USAGE

Approved by Commission E:

- Dyspeptic complaints
- Loss of appetite
- Rheumatism

Unproven Uses: In folk medicine, Devil's Claw is used as an ointment for skin injuries and disorders. The dried root is used for pain relief; pregnancy discomforts; arthritis; allergies; metabolic disorders; and kidney, bladder, liver and

gallbladder disorders. In South Africa it is used for fevers and digestive disorders. Devil's Claw is also used for supportive therapy of degenerative disorders of the CNS system.

Homeopathic Uses: Chronic rheumatism is the primary use for Devil's Claw in homeopathy.

CONTRAINDICATIONS

The drug should not be used in the presence of stomach or duodenal ulcers, due to the drug's stimulation of gastric juice secretion.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug has a sensitizing effect.

DOSAGE

Mode of Administration: As comminuted drug for infusions and other preparations for internal use, as an ointment for external use.

How Supplied:

Capsules — 405 mg, 480 mg, 510 mg, 520 mg

Tablets

Preparation: To make an infusion, use 1 teaspoonful (equivalent to 4.5 g) comminuted drug with 300 ml boiling water. Steep for 8 hours and strain.

Daily Dosage: For loss of appetite, the recommended dosage is 1.5 g of drug; otherwise 4.5 g of drug is used. The infusion can be taken 3 times a day.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day, or from D3 1 ml injection solution sc twice weekly (HAB1). The ointment is applied 1 to 3 times a day. For external use, 1 dessertspoon of the tincture should be diluted with 250 ml and used for washes or poultices.

Storage: Store Devil's Claw in a container that protects it from light and moisture.

Digitalis

Digitalis purpurea

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves (in powder form), the ripe dried seeds, the fresh leaves of the 1-year-old plant or the leaves of the 2-year-old plant collected at the beginning of flowering. In the past, the drug of *Digitalis purpurea* was the raw material employed in

isolating the cardiac glycosides. Today, *Digitalis lantana* is used.

Flower and Fruit: The flowers are carmine red with white-edged spots on the inside. The flowers appear in long > hanging racemes. They have 5 free, short-tipped sepals. The corolla is about 4 cm long, campanulate, bilabiate with an obtuse upper lip and an ovate tip on the lower lip. The flower is glabrous on the outside and has a white awn on the inside. There are 2 long and 2 short stamens, and 1 superior ovary. The fruit is a 2-valved, ovate, glandular, villous capsule.

Leaves, Stem and Root: The plant is a biennial with a branched tap root. In the first year it develops a leaf rosette. In the second it produces a 2 m high, erect, unbranched, gray, tomentose stem. The leaves are alternate, ovate, tapering upward and petiolate. Almost all leaves are crenate; only the highest ones are entire-margined.

Characteristics: The plant is very poisonous; it tastes hot-bitter with a slightly unpleasant odor.

Habitat: *Digitalis* is indigenous to Europe. It was introduced to the east and the American continent.

Production: *Digitalis* leaves are the leaves of *Digitalis purpurea* or of *Digitalis lanata*. *Digitalis lanata* corresponds to *Digitalis purpurea* but has a milder effect. The rose leaves are harvested during the first period of vegetation in early autumn. The drying period is decisive for the content of cardenolide glycosides. The temperature for drying is 30° C to 50° C.

Not to be Confused With: Confusion seldom occurs due to cultivation under controlled conditions.

Other Names: Foxglove, Dead Men's Bells, Dog's Finger, Fairy Fingers, Fairy Gloves, Finger Rower, Folks' Glove, Lion's Mouth, Ladies' Glove, Witches' Gloves, Gloves of Our Lady, Fairy Caps, Fairy Thimbles, Virgin's Glove

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolides 0.5 to 1.5%): including ones of the -

- *A-sequence (aglycone digitoxigenin):* purpurea glycoside A (primary glycoside), digitoxin (secondary glycoside)

- *B-sequence (aglycone gitoxigenin):* purpurea glycoside B (primary glycoside), gitoxin (secondary glycoside), *Digitalinum verum*

- *E-sequence (aglycone gitaloxigenin):* glucoverodoxin, glucogitaloxin, gitaloxin

Pregnane glycosides: including digipurpurin, diginin, digitalonin

Steroid saponin: including desgalactotigonin, digitonine, purpureagitoside

Anthracene derivatives: anthraquinones

EFFECTS

The drug contains cardioactive cardenolide glycosides that are positively inotropic, negatively chronotropic and improve the contraction power of cardiac muscle.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the drug's use originated in Ireland, then came to Scotland and England and finally to central Europe. It was used to treat ulcers in the lower abdomen, boils, headaches, abscesses and paralysis. Externally, the drug was used for the granulation of poorly healing wounds and to cure ulcers. Furthermore, the drug was used for cardiac insufficiency, especially high blood pressure.

Use of the raw product has become obsolete because the effect is not reproducible. The use of pure glycosides is recommended instead. Digitoxin is available in mono preparations (extract) and is used as an isolated pure substance.

Homeopathic Uses: *Digitalis purpurea* is used for cardiac insufficiency and migraine.

PRECAUTIONS AND ADVERSE REACTIONS

General: Because of the narrow therapeutic range of digitalis glycosides, a certain percentage of patients may experience side effects immediately upon administration of therapeutic dosages: hypertonia in gastrointestinal area, loss of appetite, vomiting, diarrhea and headache.

Drug Interactions: The simultaneous administration of arrhythmogenic substances (sympathomimetics, methylxanthines, phosphodiesterase inhibitors, quinidine) increases the risks of cardiac arrhythmias.

OVERDOSAGE

With overdosage, in addition to the already-mentioned symptoms, the following can also occur:

Heart: cardiac rhythm disorders, all the way up to life-threatening ventricular tachycardia, atrial tachycardia with atrioventricular block

Central nervous system: stupor, visual disorders, depression, confused states, hallucinations, psychoses

Lethal dosages lead to heart failure or asphyxiation. Administration over extended periods leads in rare cases to gynecomastia. Because of the difficulties in standardizing the drug, the administration of pure glycosides is to be preferred (digitoxin).

The first measures to be taken in case of poisoning are gastric lavage and activated charcoal instillation. All other

measures proceed according to the symptoms. For loss of potassium, careful replenishment is necessary. For ectopic irritation build-up in the ventricle, administration of phenytoin as an antiarrhythmic is recommended. Lidocaine should be used in cases of ventricular extrasystole, and for partial atrioventricular block, atropine is recommended. The prophylactic installation of a pacemaker is often necessary. For elimination of the glycosides hemoperfusion is possible, the administration of cholestyramine for interrupting the enterohepatic circulation and/or the application of digitoxin antibodies (antigen-binding fragments, digitalis antidote {Boehringer Mannheim}, is very likely only fully effective with digitoxin poisoning).

The drugs and pure glycosides should be administered in the following situations (among others): atrioventricular block of the 2nd and 3rd degree, hypercalcaemia, hypocalcaemia, hypertrophic cardiomyopathy, carotid sinus syndrome, ventricular tachycardia, thoracic aortic aneurysm, WPW-syndrome.

DOSAGE

Mode of Administration: Today, the drug is obsolete. Due to the lack of reproductivity of content, the use of appropriate pure glycosides is advisable. Digitoxin is contained in mono preparations (extract) and used as an isolated pure substance.

Preparation: Tincture: shaken for 1 day in 25% ethanol at a ratio of 1:10.

The manufacture of the digoxin and digitoxin is a complicated process that involves fermentation, extraction and evaporation.

Storage: Store carefully away from sources of light.

Digitalis Lanata

Digitalis lanata

DESCRIPTION

Medicinal Parts: The leaves are the medicinal part of the plant.

Flower and Fruit: The inflorescence is long and densely flowered, with racemes facing all directions. The bracts are glandular-haired with ciliate edges. The flower structures are in fives. The sepals are fused, the calyx tubular. The petals are fused to a campanulate corolla, which is glandular-haired on, the outside, white with yellow-brown spots, 18 to 25 mm long and unevenly bilabiate. The upper lip has 4 points, and is flat and hem-like. The lower lip is almost as long as the corolla tube and is turned away from it. There are 4 stamens, often stretching out of the corolla tube. The ovaries are superior, 2-chambered, clavate, glandular-haired, gradually merging into the stigmas. The fruit is a 10 mm long septical, brittle capsule. The seeds are approximately 1.5 mm long and red-brown.

Leaves, Stem and Root: *Digitalis lanata* is a herbaceous biennial or perennial, upright, up to 1.2 m high. The leaves are sessile, simple, narrow-lanceolate, 15 to 35 cm long, entire and ciliate in the upper area of the shoot axis. The stem is upright, usually green, grooved-edged, usually glabrous below and long woolly-haired in the upper half. The plant has a primary root with no shoot-bearing roots.

Habitat: The plant's habitat extends from Greece and the Balkans across the northern coast of the Black Sea to the Caucasus and the Caspian Sea.

Production: Woolly foxglove leaves are the dried leaves of *Digitalis lanata*. Annual cultivation begins with sowing in April; harvesting is between September and November. The roughly cut leaves are dried for 10 to 12 hours at 50° C.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Cardioactive steroid glycosides (cardenolides) (0.5 to 1.5%) of the following series, including:

A-series (aglycone digitoxigenin): including lanatoside A (0.05 to 0.25%) glucodigifucoside (0.01 to 0.15%), glucoevatromonoside (0.02 to 0.05%), digitoxin, alpha- and beta-acetyldigoxin

B-series (aglycone gitoxigenin): lanatoside B (0.01 to 0.15%), glucogitoroside (0.02 to 0.12%), Digitalinum verum (0.02 to 0.12%), gitoxin, alpha- and beta-acetylgitoxin

C-series (aglycone digoxigenin): lanatoside C (0.08 to 0.24%), desacetyl lanatoside C, digoxin

D-series (aglycone diginatin): lanatoside D, diginatin, diginatin gitaloside

E-series (aglycone gitaloxigenin): lanatoside E, glucoverodoxin (0.01 to 0.14%), glucoverodoxin (0.02 to 0.12%), gitaloxin

Pregnane derivatives: including digifolein, glucodigifolein, diginin, digipronin, lanafolien, gitonine

Steroid saponins: including lanagitosides I and II, tigonin, desglucolanatigonin, aglycones including tigogenin, digalogenin, digitogenin, gitonin

EFFECTS

The cardioactive cardenolide glycosides contained in the drug are positively inotropic and negatively chronotropic. *Digitalis lanata* is known to be highly resorbent when administered orally. It produces rapid results and wide-ranging effects; has strong diuretic properties; is quickly abating; and demonstrates good tolerability. *Digitalis lanata* has three times the physiological effect of *Digitalis purpurea* and is preferred for its fast-acting effect. Despite these

qualities, the drug is now obsolete and has been replaced by pure cardenolide glycosides.

INDICATIONS AND USAGE

Because of the unsatisfactory reproducibility during production, this drug is obsolete today; the pure cardenolide glycosides are used. The simultaneous administration of arrhythmogenic substances (sympathomimetics, methyl xanthines, phosphodiesterase inhibitors, quinidine) increases the risk of cardiac arrhythmias.

PRECAUTIONS AND ADVERSE REACTIONS

General: Because of the difficulties involved in standardizing the drug, the administration of pure glycosides is to be preferred (digitoxin, digoxin, alpha-acetyldigoxin, beta-acetyldigoxin, lanatoside C, deslanoside). Patients receiving no more than therapeutic dosages might experience the following side effects: hypertonia in gastrointestinal area, loss of appetite, vomiting, diarrhea and headache.

Drug Interactions: Neither the drug nor pure glycosides should be administered in the presence of first- and second-degree AV-Block, hypercalcemia, hypokaliemia, hypertrophic cardiomyopathy, carotid sinus syndrome, ventricle tachycardia, thoracic aortic aneurysm or WPW syndrome.

OVERDOSAGE

With overdosage, in addition to the symptoms above, the following can also occur:

Heart: Cardiac rhythm disorders as serious as life-threatening ventricular tachycardias and atrial tachycardias with atrioventricular block.

Central nervous system: Dizziness, vision disorders, depressions, states of confusion, hallucinations, psychoses.

Lethal dosages (for humans, 2 to 3 g of the drug) initially lead to signs of nausea, vomiting and diarrhea caused by irritation of the gastrointestinal tract. Slowed pulse, extrasystoles and conduction disturbances result from resorption. These are followed by ventricular fibrillation and later death from cardiac arrest.

The first-aid measures to be taken with poisonings are gastric lavage and instillation of medicinal charcoal. All other measures proceed according to the symptoms: careful potassium substitution for potassium; phenytoin as an antiarrhythmic for ectopic stimulation formation in the ventricle; lidocaine for ventricular extrasystole; atropine for partial atrioventricular block.

The prophylactic insertion of a cardiac pacemaker is recommended. Hemoperfusion for the elimination of the glycosides and cholestyramine administration for the interruption of the enterohepatic circulation are possible.

DOSAGE

Mode of Administration: The drug is not used today. The following preparation and supply information is for historical reference.

How Supplied: Whole and powdered drug.

Preparation: Tincture; powder: ethanol 25%; 1:10; succussed for 24 hours.

Storage: Store securely and protect from light.

Dill

Anethum graveolens

DESCRIPTION

Medicinal Parts: The medicinal part is the seed, the fresh or dried leaves and the upper stem.

Flower and Fruit: The yellow flowers are in large, 20 to 50 rayed umbels. There is no involucre or calyx. The petals have an inward-curving point, which is not indented. The fruit is flattened and oval with a rib on the back, which is sharp-edged. Ribs that appear on the edge have a winged edge.

Leaves, Stem and Root: The plant is 40 to 120 cm tall. The stem is erect, round, smooth, dark-green and white-striped.

The stem is branched above, with a bluish bloom. The leaves are double and more pinnate, feathery, white-tipped leaflets with a deep groove on the upper surface. The leaf sheath is oblong with a thick-skinned edge.

Characteristics: Dill has an aromatic scent.

Habitat: The plant is indigenous to the Mediterranean region, southern Russia, and cultivated throughout Europe as well as North and South America.

Production: Dill herb consists of the fresh or dried leaf and upper stem of *Anethum graveolens*. Dill seed consists of the dried fruit of *Anethum graveolens*.

Other Names: Dilly

ACTIONS AND PHARMACOLOGY

COMPOUNDS: DILL HERB

Volatile oil (0.5 to 1.5%): chief constituents are carvone, dill apiole, (+) limonene

Phthalides

EFFECTS: DILL HERB

No information is available.

COMPOUNDS: DILL FRUIT

Volatile oil (2.5 to 4.0%): chief constituents are carvone (approximately 50%), dill apiole, (+) — limonene

Phthalides

Fatty oil

Furanocoumarins: including bergaptene

Hydroxycoumarins: including umbelliferone

EFFECTS: DILL FRUIT

The fruit of the Dill plant has an antispasmodic effect on the smooth muscles of the gastrointestinal tract, and a bacteriostatic effect.

INDICATIONS AND USAGE

DILL HERB

Unproven Uses: Dill herb is used for prevention and treatment of diseases and disorders of the gastrointestinal tract, kidney and urinary tract, for sleep disorders and for spasms.

DILL FRUIT

Approved by Commission E:

- Dyspeptic Complaints

Indian Medicine: Dill is used for halitosis, worm infestation, complaints of the respiratory tract and syphilis.

PRECAUTIONS AND ADVERSE REACTIONS

DILL HERB

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DILL FRUIT

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. Photodermatitis is possible after contact with the juice of the freshly harvested plant.

DOSAGE

DILL FRUIT

Mode of Administration: Whole seeds and crushed fruits are used to make teas and other galenic preparations for internal application.

Daily Dosage: The average daily dosage of the seeds is 3 gm; essential oil daily dose is 0.1 to 0.3 gm.

Divi-Divi

Caesalpinia bonducella

DESCRIPTION

Medicinal Parts: The medicinal part of the plant is seed.

Flower and Fruit: The flowers are dorsiventrally zygomorphous and arranged in dense clusters. The sepals are free or fused at their base, or fused to the base of the petals and stamens to form the corolla. The petals are separate from each other but have an ascending bud covering. There are twice as many stamens as petals, usually 10. The ovary always has only 1 carpel. The fruit is indehiscent or a legume with yellow nuts.

Leaves, Stem and Root: Divi-Divi is a tree or shrub that grows to a height of 9 m, with alternate entire-margined or double-pinnate thorny leaves.

Habitat: Sri Lanka, Brazil, South America

Production: Nikkar nuts are the seeds of *Caesalpinia bonducella*.

- *Other Names:* Nikkar Nuts, Nichol Seeds, Gray Nicker

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil (20 to 25%, bonduc nut oil): chief fatty acids are linoleic acid, oleic acid, palmitic acid, stearic acid

Proteins

Starch

Diterpenes: including, among others, alpha-, beta-, gamma-, eta-caesalpine

Saponins

EFFECTS

Divi-Divi is a febrifuge and tonic.

INDICATIONS AND USAGE

Indian Medicine: The roasted seeds are used in febrile illnesses and in the treatment of diabetes.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Seeds are ground and roasted for internal use.

Dodder

Cuscuta epithymum

DESCRIPTION

Medicinal Parts: The medicinal parts are the aerial parts of the plant.

Flower and Fruit: The flowers are reddish, wax or flesh-colored. They are arranged in small clusters. The calyx is divided into 5 and the corolla is fused to a 4 to 5 tipped tube with fringed scales inside. There are 5 stamens and 1 ovary.

Leaves, Stem and Root: The plant is a leafless parasite up to 150 cm high. The stem is yellow or reddish, thread-like, branched, with sucking roots, and climbing.

Habitat: The plant grows in Europe, Asia and South Africa.

Production: Dodder is the whole plant of *Cuscuta epithymum*.

Other Names: Lesser Dodder, Dodder of Thyme, Devil's Guts, Beggarweed, Hellweed, Strangle Tare, Scaldweed

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Saponins

Tannins

A purgative principle

The drug has been subjected to very little investigation.

EFFECTS

Dodder has hepatic and laxative effects.

INDICATIONS AND USAGE

Unproven Uses: Dodder is used for disorders of the urinary tract, spleen and liver.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. It is conceivable that the drug triggers intestinal colic in cases of overdosage.

Dog Rose

Rosa canina

DESCRIPTION

Medicinal Parts: The medicinal parts are the petals, the Rose hips with and without seeds and the seeds.

Flower and Fruit: The pink flowers are usually solitary or in clusters of 2 or 3. The receptacle deepens to form a cup whose upper edge the 5 pinnatifid sepals and 5 petals and numerous stamens sit. There are long white silky hairs in the receptacles and numerous ovaries. The ovaries grow into stiff-haired nuts surrounded by the receptacle and become the scarlet 'rosehip'.

Leaves, Stem and Root: The plant is an approximately 1 to 3 m high shrub with hanging branches and erect root shoots that are covered in tough, sickle-shaped prickles that are appressed below. The leaves are pinnatifid with 5 to 7 ft, leaflets. They are markedly petiolate, obovate, smooth-margined, glabrous, glossy and dark green above, lighter and simple-serrate beneath.

Characteristics: The sepals revolute at the end of the flowering period and drop when the fruit ripens.

Habitat: *Rosa canina* grows in Europe and North Africa and is extensively cultivated.

Production: Dog Rose fruit consist of the ripe, dried fruit (nutlet) of various species of the genus *Rosa* particularly *Rosa moschata*. The fruits are secondary products of Dog Rose shells. Dog Rose shells consist of the ripe, fresh or dried, opened seed receptacle, whole or cut and freed from hairs, of *Rosa canina*, *Rosa pendulina*, *Rosa rugosa*, *Rosa moschata* and other *Rosa* species. The ripe receptacles are harvested by hand and dried in the air, sun or in drying plants at a maximum temperature of 80° C. The dry Dog Roses are broken up and the fruit and skins are separated by sieving.

Other Names: Brier Hip, Hip, Rose Hip, Sweet Briar, Brier Rose, Eglantine Gall, Hogseed, Dog-Berry, Sweet Brier, Wild Brier, Witches' Brier

ACTIONS AND PHARMACOLOGY

COMPOUNDS: DOG ROSE FRUITS

Fatty oil (8 to 10%)

Tocopherol (vitamin E)

Volatile oil (0.3%)

Proteic substances

EFFECTS: DOG ROSE FRUITS

The pectin and fruit acid content are responsible for the diuretic and laxative effect.

COMPOUNDS: DOG ROSE SHELLS

Carotinoids

Flavonoids

Fruit acids: malic acid, citric acid

Monosaccharides/oligosaccharides (12 to 15%): invert sugar, saccharose

Pectins

Tannins

Vitamins: ascorbic acid (vitamin C, 0.2 to 2.4%)

EFFECTS: DOG ROSE SHELLS

The drug is a vitamin C supplement

INDICATIONS AND USAGE

DOG ROSE FRUITS

Unproven Uses: Dog Rose fruits are used in folk medicine for disorders of the efferent urinary tract and the kidneys. kidney stones, rheumatic conditions such as rheumatism, and gout, colds, scurvy and febrile conditions.

DOG ROSE SHELLS

Unproven Uses: Dog Rose shells are used in folk medicine for colds and 'flu,¹ intestinal conditions, digestive complaints, vitamin C deficiency, gallstones, subacidic-stomach. infectious diseases, conditions of the efferent urinary tract. edema, rheumatism and gout, bleeding and leucorrhea.

PRECAUTIONS AND ADVERSE REACTIONS

DOG ROSE FRUITS AND SHELLS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

DOG ROSE FRUITS

Mode of Administration: Dog Rose fruits are available as whole and powdered drug.

Daily Dosage: The single dose is 2 gm drug.

Storage: Dog Rose should be stored in a dry and dark place.

DOG ROSE SHELLS

Mode of Administration: Dog Rose shells are available as whole, crude and powdered drug.

Daily Dosage: Tea: 2 to 5 gm drug added to 1 cup and steeped for 10 to 15 minutes

Storage: Should be stored in dark place.

Dogwood

Comus florida

DESCRIPTION

Medicinal Parts: The medicinal part is the dried bark. Fresh bark is also used occasionally.

Flower and Fruit: The flowers are sessile, small, greenish, and in clusters of 12 to 20 at the splayed end of a tough, 3 cm long stem. The bracts are white or pale reddish, ovate to long and are longer than the inflorescence. The petals are about 4 mm long. The fruit is a scarlet berry.

Leaves, Stem and Root: The plant is a deciduous shrub or a 4 to 9 m high tree, which is heavily branched and has a dark gray, thick and rough bark. The branches are smooth and covered in leaf scars. The leaves are 7 to 10 cm long, opposite, petiolate, entire, ovate acuminate at both ends, and somewhat rough. The upper surface is dark green. In autumn the upper surface is bright red to violet. The underside is always whitish-green. The leaves are slightly pubescent when young.

Habitat: *Cornus florida* is indigenous to eastern and southern North America; other varieties are found in Europe.

Production: American Boxwood bark and root-bark are the dried and occasionally fresh bark and root-bark of *Cornus florida*. It is collected in the wild.

Other Names: Dog-Tree, Box Tree, Boxwood, Budwood, False Box, Cornelian Tree, Cornel, Bitter Redberry, Green Ozier, Swamp Dogwood, Silky Cornel, Osier, Rose Willow

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins: including sarsapogenin-O-beta-D-galactoside, sarsapogenin-0-beta-D-xylosyl-(1(2)-beta-D-galactoside

Iridoide monoterpenes: cornin (verbenalin)

Tannins

EFFECTS

Effect on mollusks: The drug destroys the biomphalaria glabratus snails (carrier of bilharziose).

Cardiac effect: Heart activity, at different levels up to the cessation of heartbeat, is examined depending on the concentration of the methanol extract.

Antiplasmodic effect: Induced malaria on chicks and Peking ducks was treated for 5 days with a water-insoluble fraction. As a result, antiplasmodic activity toward *P. cathemerium* could be observed, similar to that deployed by quinine and sulfadiazine. To date, the results cannot be sufficiently assessed.

The bark works as a tonic, an astringent and a stimulant.

INDICATIONS AND USAGE

Unproven Uses: In North America, the dried bark was used in folk medicine for strength, to stimulate appetite, for fever and for chronic diarrhea. It is used externally as an astringent for wounds and boils. Formerly, it was in use as a replacement for quinine. It is still used for headaches and fatigue.

Homeopathic Uses: Uses include for poor digestion and chronic attacks of fever.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Formerly the drug was used internally as a tincture as an alternative to quinine and externally as a liquid extract.

Homeopathic Dosage: Oral: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB34).

Preparation: Decoction or infusion (no specifications).

Dragon's Blood (Xue-Jie)

Daemonorops draco

DESCRIPTION

Medicinal Parts: The medicinal part is the red resin from the fruit, which is extracted from both *Daemonorops draco* and *Daemonorops propinquis*.

Flower and Fruit: The flowers are arranged along the branch. The fruit is a cherry-sized berry ending in a point. When the fruit are ripe, they are covered in a reddish, resinous substance, which is separated in various ways.

Leaves, Stem and Root: Dragon's Blood is a tree with long, thin, flexible stems, which are inclined to climb when they are older. The leaves have thorny petioles, which grow into long appendages. The bark is covered in hundreds of flattened thorns.

Habitat: Malaysia, Indonesia.

Production: Dragon's Blood resin is the resin of *Daemonorops draco*.

Other Names: Dracorubin, Sanguis Draconis, Draconis Resina, Xue-Jie

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Ester resins (dracoresin): benzoyl ester of dracoresinotannol

Dracoresen

Flavane quinones: including dracorubin (dracocarmin), dracorhodin, both colored an intense red

EFFECTS

Dragon's Blood has an astringent effect.

INDICATIONS AND USAGE

Unproven Uses: The resin is used for diarrhea, digestive disorders and as a coloring agent.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: The resin is used in a powder form.

Duckweed

Lemna minor

DESCRIPTION

Medicinal Parts: The medicinal part is the whole fresh plant.

Flower and Fruit: The plant flowers infrequently. The tiny inconspicuous flowers have 2 unevenly sized stamens and 1 pistil. A delicate membranous bract surrounds 3 flowers, which are located on the edge of the stem. The fruit is tubular with 1 ovule. The seeds have longitudinal ribs.

Leaves, Stem and Root: *Lemna minor* is a water plant with leaf-like organs that are 2 to 6 mm long. They are flat, have 3 to 5 ribs, and are sometimes pigmented with red. Two to six leaf-like shoots stick together, and each bears a root with a rounded root cover.

Characteristics: The plant has leaf-like shoots with 1 root per leaf.

Habitat: The plant is found worldwide in cooler, oceanic climates. The plant is not found in east Asia and South Africa.

Production: Duckweed is the fresh plant *Lemna minor*.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: in particular C-glucosyl-flavone, including among others orientin, isoorientin, vitexin, isovitexin, luto-narin, vicenin-1; also O-glycosides, including among others apigenin-7-O-glucoside, luteolin-7-O-glycoside

Cyclopentane fatty acids, with structure resembling prostaglandin

Polysaccharides: apiogalacturonans

Cardiac steroids (cardenolides)

EFFECTS

No information is available.

INDICATIONS AND USAGE

Unproven Uses: Duckweed is used internally for inflammation of the upper respiratory tract and externally for gout and rheumatism.

Chinese Medicine: Duckweed is used for measles, edema, joint pain, dysuria, acne, erysipelas and epilepsy.

Homeopathic Uses: Duckweed is used for chronic colds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The plant is available as fresh or ground herb and as an extract.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml s.c, acute: 3 times daily; chronic: once a day (HAB1).

LITERATURE

Dusty Miller

Senecio bicolor

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh plant harvested before flowering, the herb of the flowering plant, and the whole fresh, flowering plant.

Flower and Fruit: The plant has numerous yellow capitula, 12 to 15 cm in diameter, on short peduncles. The calyx only has a few sepals. There are 10 to 12 lingual florets. The fruit is striped.

Leaves, Stem and Root: *Senecio cineraria* is a semi-shrub that grows up to 80 cm high. The stem is erect, heavily branched at the base, and sometimes snow-white tomentose. The leaves are densely pubescent beneath and more or less cobwebbed on the upper surface. They may have sparse greenish hairs. The lower leaves are oval to lanceolate, pinnatifid, and the outer lobes are usually longer than they are wide.

Habitat: The plant is indigenous to the Mediterranean region, naturalized in North America and cultivated as an ornamental plant in many countries.

Production: *Cineraria* juice is the juice of the whole *Senecio cineraria* plant.

Other Names: *Cineraria Maritima*

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Pyrrrolizidine alkaloids (0.9% in the blossoming foliage): including, among others, jaconine, jacobine, otosenine, retrorsine, senecionine, seneciphylline

Polyynes

EFFECTS

The active agents are the alkaloids jacobin, senecionin, and otosenin. These pyrrolizidine alkaloids are hepatotoxic and carcinogenic.

INDICATIONS AND USAGE

Unproven Uses: Though no longer recommended, the plant previously was administered for ailments of the eye, as an emmenagogic, and in cataplasms and oral rinses.

Homeopathic Uses: In homeopathy, the juice is used to treat eye-sight problems (for the treatment of spots before the eyes), migraine, and as an emmenagogue.

PRECAUTIONS AND ADVERSE REACTIONS

Dusty Miller should not be taken internally (except in homeopathic dosages) because of the potential hepatotoxicity and carcinogenicity of the pyrrolizidine alkaloids and the 1,2-unsaturated necic parent substances.

DOSAGE

Mode of Administration: The use of the sterilized juice is no longer recommended for internal use, nor is any other preparation of Dusty Miller.

Dwarf Elder

Sambucus ebulus

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the ripe, dried or fresh fruit and the dried roots.

Flowers and Fruit: The reddish-white flowers are in a terminal, umbrella-like, richly blossomed, paniculate cyme with 3 main branches. The calyx margin is 5-tipped. The corolla has fused petals and is rotate with 5 acuminate tips. The 5, stamens have dark red anthers and an inferior, 3-valved ovary with 3 stigmas. The fruit is a black, globular, berry-like drupe with at least 3 to 4 ovate seeds. When ripe, the fruit stems are erect and violet or crimson.

Leaves, Stem and Root: Dwarf Elder is a perennial, herb-like plant 0.5 to 2 m high with a sturdy, finger-thick, branched rhizome that creeps deeply and horizontally. The stems are leafy, erect, sturdy and branched above. They die off in autumn. The leaves are crossed opposite, odd-pinnate with 3 to 4 pairs of ovate-lanceolate leaflets and 2 large, ovate-lanceolate, and serrate stipules.

Characteristics: The fragrance is similar to that of sunflowers or almond.

Habitat: The plant is found from southern Sweden throughout central and southern Europe, in northern Africa, in western Asia as far as Iran, and in North America.

Production: Dwarf Elder root is the root of *Sambucus ebulus*, which is collected in the spring or late autumn and then air-dried.

Other Names: Dane wort, Wale wort, Blood Elder, Blood Hilder

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoides: ebuloside, 6'-0-apiosyl-ebuloside, 7,7-0-dihydroebuloside, secoebuloside, isosweroside

Nauseant, purgative resins with unresolved structure

EFFECTS

The drug is said to be a mild diuretic.

INDICATIONS AND USAGE

Unproven Uses: Dwarf Elder is used in folk medicine as an ingredient in different teas prepared to assist in weight reduction and alleviate rheumatism. The drug also is used for constipation and as an emetic and to treat edema and kidney disease.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

OVERDOSAGE

According to older scientific reports, large quantities of all parts of the plant, (in particular the raw berries) leads to vomiting, bloody diarrhea, cyanosis, dizziness, headache, and unconsciousness. Cases of death are also mentioned.

DOSAGE

Mode of Administration: Dwarf Elder is obsolete as a drug in most countries. It is found in some tea mixtures, but is not used in medicinal preparations.

Dyer's Broom

Genista tinctoria

DESCRIPTION

Medicinal Parts: The entire plant has medicinal applications.

Flower and Fruit: The flowers are in short, terminal racemes. They are golden yellow and bean-shaped, 1.5 to 2 cm long and are on pedicles, which are shorter than the calyx. The petal stems of the 4 lower petals are initially straight, but in moments of tension, when for instance, they are touched by an insect, they curl down suddenly and the flower opens. The fruit is a smooth pod 2.5 to 3.5 cm long. It is brown, compressed at the sides, and contains 5 to 10 seeds.

Leaves, Stem and Root: The plant is a 30 to 60 cm high, always thornless subshrub with a creeping, woody rhizome. The florescent green stems are smooth and produce fairly rigid, smooth or pubescent forked branches, which sprout lanceolate leaves. The leaves are alternate, glabrous, entire-margined, 1.25 to 2.5 cm long, nearly sessile, and with a ciliate margin. The stipules are linear-awl-shaped.

Habitat: Dyer's Broom is indigenous to the Mediterranean region, the Canary Islands, Europe and western Asia, and cultivated elsewhere, including the eastern U.S.

Production: Dyer's Broom leaves are the green leaves of *Genista tinctoria*.

Other Names: Dyer's Weed, Dyer's Greenwood, Dyer's Whin, Furze, Green Broom, Greenweed, Wood Waxen

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Quinolizidine alkaloids: main alkaloids — cytisine, methylcytisine, anagyryne, as well as isosparteine, lupanine, tinctoin

Flavonoids: in particular luteolin glycosides

Isoflavonoids: genistein, genistin

Lectins**EFFECTS**

The drug acts as a purifier, cathartic, diuretic, purgative and emetic. It increases heart rate, strengthens the walls of blood vessels, stimulates kidney blood circulation and affects metabolism.

INDICATIONS AND USAGE

Unproven Uses: Formerly, the drug was used as a purgative and to remove bladder stones, as well as for digestive disorders and gout. Once an infusion has been taken, breathing deepens and pain in the lumbar and pelvic region is alleviated.

PRECAUTIONS AND ADVERSE REACTIONS

General: Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. Overdosage can lead to diarrhea and to symptoms of a cystine poisoning. Anagyryne has exhibited teratogenic effect in animal experiments.

Pregnancy: Not to be used during pregnancy.

DOSAGE

Mode of Administration: The drug is used internally as an infusion.

Preparations: To prepare an infusion, use 1 teaspoonful of the ground drug per cup of water.

Daily Dosage: Drink 1 to 2 cups of infusion daily.

Echinacea

Echinaceae species

TRADE NAMES

Echinacea (available from numerous manufacturers), Echinacea Root, Echinacea Standardized, Echinacea Root Herbal, Echinacea angustifolia Herb, Echinacea purpurea Root

DESCRIPTION

Medicinal Parts: The medicinal parts are, depending on varieties, the roots, leaves or the whole plant in various stages of development.

Flower and Fruit: The flower-heads are large and solitary on terminal peduncles with spreading ray florets. The bracts are in a number of rows. The bracts are leafy, rigid, thorny tipped, and longer than the conical erect disc florets. The reddish or occasionally white florets are conspicuous. The Hgual florets are usually sterile and 3 cm long. The pappus is small or absent.

Leaves, Stem and Root: Echinacea is usually a perennial herb and grows up to 45 cm. in height. The leaves are large, solitary, opposite or alternate and are smooth-margined. They are 7 to 20 cm long and have a rough surface. The leaves are entire-margined and are on slender petioles. A transverse section of the rhizome shows a thin bark and a yellowish, porous wood, which is flecked with black.

Characteristics: The taste is slightly sweet then bitter leaving a tingling sensation on the tongue. The odor is faintly aromatic.

Habitat: Echinacea purpurea and Echinaceae pallida grow in the middle or eastern U.S. and is cultivated in Europe.

Production: Echinacea purpurea herb consists of the fresh, above-ground parts, harvested at flowering time. The root consists of the fresh or dried underground part, gathered in autumn. Echinacea pallida herb consists of the fresh or dried above-ground parts, collected at the time of flowering. Echinacea angustifolia herb and root consist of the fresh or dried roots, or above-ground parts collected at the time of flowering.

Not to be Confused With: The herbs and roots of Echinacea purpurea, Echinacea angustifolia and Echinacea pallida have different medicinal properties. Some Echinacea species may be confused with or adulterated with Parthenium integrifolium.

Other Names: Black Sampson, Niggerhead, Rudbeckia, Sampson Root, Purple Coneflower, Hedgehog, Red Sunflower

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ECHINACEA PURPUREA HERB

Water-soluble immunostimulating polysaccharides (4-O-methylglucuronylarabinoxylans, acidic arabinorhamno-galactans)

Volatile oil (under 0.08-0.32%): components including germacrene alcohol, borneol, bornylacetate, pentadeca-8-en-2-on, germacrene D, caryophyllene, caryophyllene epoxide

Flavonoids: ferulic acid derivatives including cichoriic acid, cichoriic acid methyl ester, 2-O-caffeoyl-3-O-feruloyl-tartaric acid, 2,3-O-diferuloyl tartaric acid 2-O-caffeoyl tartaric acid

Alkamides: including undeca-2E,4Z-dien-8,10-diin acid- and dodeca-2E,4E-8Z,10E/Z- tetraen acid isobutylamide

Polyenes: trideca-1,11-dien-3,5,7,9,-tetraene, trideca-1-en-3,5,7,9,11-pentaine, trideca-8,10,12-trien-2,4,6-triene, pontica epoxide

COMPOUNDS: ECHINACEA PURPUREA ROOT

Water-soluble immunostimulating polysaccharides

Water-soluble immunostimulating glycoproteins

Volatile oil (0.2%): components including caryophyllene, humules, caryophyllene epoxide, dodeca-2,4-dien-1-yl-isovalerate, germacrene D, palmitic acid, linolenic acid

Caffeic and ferulic acid derivatives (0.6-2.1%): including cichoriic acid, cichoriic acid methyl ester, 2-O-caffeoyl tartaric acid

Alkamides (0.01-0.04%): including undeca-2E,4Z-dien-8,10-diinacetyl- and dodeca-2E,4E-8Z,10E/Z-tetracetyliso-butylamide

Polyynes (0.01 mg/%): including trideca-1-en-3,5,7,9,11-pentain, trideca-1,1 l-dien-3,5,7,9,-tetraene, trideca-8,10,12-trien-2,4,6-triene, pontica epoxide

Effective pyrrolizidine alkaloids: tussilagine, isotussilagine

COMPOUNDS: ECHINACEA PALLIDA HERB

Volatile oil (0.1%)- including 1,8-pentadecadien

Flavonoids: in particular rutin

Caffeic acid derivatives: Cichoriic acid, chlorogenic acid, isochlorogenic acid, verbascoside

Alkamides: including dodeca-2E,4E-8Z,10E-tetracetyliso-butylamide

COMPOUNDS: ECHINACEA PALLIDA ROOT

Water-soluble immunstimulating polysaccharides (arabino-rhamnolactans)

Volatile oil (0.2 - 2%): chief components include pentadeca-8Z-en-2-on, pentadeca-1,8Z-dien, 1 -pentadecan

Caffeic acid derivatives: echinacoside

Alkamides: including isomeric dodeca-2E,4E-8Z,10E/Z-tetraenic acid-isobutylamide

Polyynes: including trideca-1-en-3,5,7,9,11-pentain, pontica epoxide

COMPOUNDS: ECHINACEA ANGUSTIFOLIA HERB

Volatile oil (under 0.1%): typical components consist of epishyobunol, beta-farnesene, alpha- and beta-pinenes, myrcene, carvomenthene, caryophyllene

Flavonoids

Caffeic acid derivatives: cichoriic acid, chlorogenic acid, isochlorogenic acid, verbascoside, echinacoside

Alkamides: including dodeca-2E,4E-8Z,10E-tetracetyl-isobutylamide

Polyynes: including trideca-1-en-3,5,7,9,11-pentaine, pontica epoxide

COMPOUNDS: ECHINACEA ANGUSTIFOLIA ROOT

Volatile oil (under 1%): components include dodeca-2,4-dien-1-ylisovalerate, as well as palmitic acid, linolenic acid

Flavonoids

Caffeic acid derivatives (0.3 to 1.3%): echinacoside, cynarin

Alkamides (0.01%): including dodeca-2E,4E-8Z,10E/Z-tetracetyl isobutylamide

Polyynes: including trideca-1-en-3,5,7,9,11-pentaine, pontica epoxide, in dehydrated roots only traces

EFFECTS: ALL VARIETIES

General

Echinacea activity is directed towards the nonspecific cellular immune system. The herb exerts anti-inflammatory, immunostimulating, bactericidal, and wound healing actions, depending on the type of plant species. The main active principles of the immunostimulating, antibacterial and virostatic drug are the alkamides, glycoproteins, caffeic acid derivatives (cichoriic acid and echinosides) and polysaccharides.

Immunostimulating

Ethanollic root extracts of the Echinacea purpurea, Echinacea pallida and Echinacea angustifolia were shown to cause a 23% increase of the phagocytosis rate in granulocyte smears *in vitro* (Jurcic, 1989; Melchart 1995). Confirmed by the carbon clearance test and granulocyte tests, the ethanollic root extracts significantly enhance phagocytosis (Bauer, 1988). The ethanollic extracts of aerial parts of Echinacea angustifolia and Echinacea purpurea exert immunostimulatory effects also through metabolic and bactericidal activities of peritoneal macrophages. The ethanollic extracts of both Echinacea plants also increase the total weight of the spleen (Bukovsky, 1993).

Anti-Inflammatory

Polyunsaturated alkamides in Echinacea angustifolia exert anti-inflammatory effects through inhibition of cyclooxygenase and 5-lipoxygenase (Muller-Jakic, 1994). The polysaccharide fraction of Echinacea angustifolia exerts anti-inflammatory effects (Tubaro, 1987), and the polysaccharide from Echinacea purpurea induces an acute phase reaction. The acute phase reaction occurs with enhancing the spontaneous motility of PMN and increasing the ability of these cells to kill bacteria such as staphylococci. (Roesler, 1991).

Cytokine Stimulation

Arabinogalactan, a highly purified polysaccharide from plant cell cultures of Echinacea purpurea, is effective in activating macrophage cytotoxicity actions against tumor cells and microorganisms (Leishmania enriettii). This polysaccharide induces macrophages to produce tumor necrosis factor (TNF-alpha), interleukin-1 (IL-1), interleukin-6 (IL-6), interleukin-10 (IL-10) and interferon-beta. The component also induces a slight increase in T-cell proliferation (Burger, 1997; Luettig, 1989; Roesler, 1991). Extracts of Echinacea purpurea stimulate cell-mediated immunity through the

production of lymphokines by lymphocytes (Coeugriet, 1987). Echinacea purpurea herb has shown some short-term viral resistance against influenza, herpes, and vesicular stomatitis viruses, which has been credited to an interferon-like effect (Wacker, 1978).

Collagen Protectant

The caffeic acid derivatives exert a protective effect on the free-radical-induced degradation of Type HI collagen. Collagen degradation was inhibited the greatest by echinacoside and chicoric acid, then cynarine and chlorogenic acid. The collagen protection from free radical damage is through a scavenging effect on reactive oxygen species and/or C-, N-, S-centered secondary radicals. These activities may be useful for the treatment/protection of photodamage of the skin by UVA/UVB radiation, in which oxidative stress plays a critical role (Facino, 1995).

CLINICAL TRIALS

A randomized, placebo-controlled, double-blind trial evaluated the effect of a fluid extract of Echinacea purpurea on the incidence and severity of colds and respiratory infections. There were 109 patients with a history of more than 3 colds or respiratory infections in the previous year included in the study. The fluid extract, given 4 mL twice daily for 8 weeks, did not significantly decrease the incidence, duration or severity of colds and respiratory infections compared to placebo (Grimm, 1999).

The efficacy and safety of Echinaforce® (Echinacea purpurea preparation from 95% herb and 5% root), Echinacea concentrate (same preparation at 7 times higher concentration), and special Echinacea purpurea root preparation were evaluated in the treatment of the common cold. There were 559 volunteers with a common cold included in the study. The participants received 2 tablets 3 times daily. The primary endpoint was the relative reduction of the complaint index, which is a group of 12 symptoms that occur during common cold. Echinaforce® and its concentrated preparation were significantly more effective than the special extract or placebo treatment group. All treatments were well tolerated with the frequency of adverse events not significantly higher than in the placebo group (Brinkeborn, 1999).

m The safety and efficacy of Echinacea angustifolia and Echinacea purpurea ethanolic root extracts for the prevention of upper respiratory tract infections (URTI) was determined in a double-blind, placebo-controlled study. The time until the first URTI (time and event) and adverse effects were evaluated in 302 patients. The root extract dosages were 50 drops twice daily for 12 weeks from Monday to Friday. The time until occurrence of a URTI was 66 days in the Echinacea angustifolia group, 69 days in the Echinacea purpurea group and 65 days in the placebo group. Though the

results do not prove efficacy of prophylaxis, the authors conclude that Echinacea may reduce the risk of developing a URTI by 10 to 20% (Melchart, 1998).

A randomized, placebo-controlled, double-blind study was conducted to determine the effect of an extract of Echinacea pallida root with influenza infections of the upper respiratory tract. A dose of 900 mg daily was evaluated for the relief of symptoms, including shortening of the illness period and curing cough and hoarseness. The length of the illness period was reduced significantly with the extract from 13 to 9 days compared with placebo. The strongest effects on the clinical symptoms were achieved after 8-10 days (Brauning, 1993).

INDICATIONS AND USAGE

ECHINACEA PURPUREA HERB

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds
- Infections of the urinary tract
- Inflammation of the mouth and pharynx
- Tendency to infection
- Wounds and burns

Echinacea purpurea herb is used internally as supportive therapy for colds and chronic infections of the respiratory tract and lower urinary tract. It can also be applied locally to poorly healing superficial wounds.

ECHINACEA PURPUREA ROOT

Unproven Uses: Echinacea purpurea root is used for acute and chronic respiratory tract infections (of viral and bacterial origin); increased susceptibility to infection due to temporarily lowered resistance, treatment of leukopenia following radio and cytostatic therapy and in support of anti-infectious chemotherapy.

ECHINACEA PALLIDA ROOT

Approved by Commission E:

- Fevers and colds

Echinacea pallida root is used as a supportive therapy for influenza-like infections.

ECHINACEA ANGUSTIFOLIA HERB AND ROOT

Unproven Uses: In folk medicine, native Americans use the drug externally for burns, swelling of the lymph nodes, and insect bites. The drug is used internally for pain associated with headaches and stomach aches, measles, coughs and gonorrhea. The drug has also been used for rattlesnake bites. Today the drug is used for prophylaxis and treatment of 'flu' infections, sepsis, and mild to moderate cold infections. Externally, the drug is used for treatment of poorly healing

wounds and inflammatory conditions such as abscesses and leg ulcers.

CONTRAINDICATIONS

ALL VARIETIES AND FORMS

Because of a possible activation of autoimmune aggressions and other overreactive immune responses, the drug should not be administered in the presence of multiple sclerosis, leukosis, collagen disease, AIDS or tuberculosis. Parenteral administration should not be used in patients with tendencies to allergies, especially allergies to members of the composite family (Asteraceae). Echinacea should not be used during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

ALL VARIETIES AND FORMS

General: When used parenterally, dose-dependent short-term fever reactions, nausea and vomiting can occur. Caution should be exercised if the drug is administered parenterally to people with diabetes. Hypersensitivity reactions with anaphylaxis have been reported (Mullins, 1998). Rashes, itching, occasional swelling of the face, breathing difficulties, dizziness and a drop in blood pressure have been observed after administration of preparations containing Echinacea.

Fertility: High concentrations of Echinacea had adverse effects on oocytes in animal models (Ondrizek, 1999).

Pregnancy: Parenteral administration should be avoided during pregnancy.

Drug Interactions: The immune-stimulating effect of echinacea may interfere with drugs that have immunosuppressant effects. Interaction may occur when using cyclosporine or other anti-rejection drugs. Echinacea may also interfere with the cancer chemotherapeutic effect of corticosteroids.

DOSAGE

ECHINACEA PURPUREA HERB

Mode of Administration: Pressed juice and galenic preparations for internal and external use.

Preparation: The pressed juice is prepared in a concentration of 2.5:1 and is stabilized with 22% alcohol. Other complicated methods of preparation are known.

Daily Dosage: When used internally, the recommended dosage is 6 to 9 ml of the expressed juice. The recommended dosage for parenteral administration should be individualized, depending on the seriousness of the condition as well as the specific nature of the respective preparation. Parenteral application requires a gradation of dosage, especially for children. The manufacturer is required to show this information for the respective preparation. When used externally, semi-solid preparations containing at least 15% pressed juice are used for a maximum of 8 weeks.

ECHINACEA PURPUREA ROOT

Mode of Administration: Comminuted drug for decoctions and galenic preparations.

Daily Dosage: When using the tincture, 30 to 60 drops should be taken three times a day.

Storage: Echinacea should be protected from light sources, and, if possible be uncomminuted.

ECHINACEA PALLIDA HERB AND ROOT

Mode of Administration: As a liquid preparation for oral use.

Preparation: A 1:5 tincture is made using 50% (V/V) ethanol and native dried extract (50% ethanol in a 7 to 11:1 proportion)

Daily Dosage: The daily dose is 900 mg of drug. The drug should be used for a maximum of 8 weeks.

Storage: Protect from light sources. If possible, store uncomminuted.

ECHINACEA ANGUSTIFOLIA HERB AND ROOT

Mode of Administration: Since the efficacy in the claimed areas of application has not been documented, therapeutic application cannot be recommended. Because of the risks, the use of parenteral preparations is not justified.

How Supplied:

Capsule — 100mg, 125mg, 250mg, 380mg 390mg, 400mg, 430mg, 450mg, 500mg

Liquid — 120mg/5mL

Preparation: The root tea is prepared using 1/2 teaspoonful of comminuted drug with boiling water. Strain after 10 minutes.

Daily Dosage: For colds, drink 1 cup freshly made tea several times daily.

Storage: Protect from light sources. If possible, store uncomminuted.

Echinaceae species

See *Echinacea*

Elecampane

Inula helenium

DESCRIPTION

Medicinal Parts: The medicinal part is the dried or fresh rhizome.

Flower and Fruit: The inflorescences are yellow composite flowers in loose, terminal, paniced cymes. They are 7 to 8 cm in diameter. The involucre is imbricate and cup-shaped. The inner bracts are dry at the tip and splayed, the outer ones are like leaves and ovate. The female lateral florets are narrowly linguiform. The androgynous disc florets are tubular. The receptacle is flat, slightly pitted and glabrous. The flowers are a bright yellow. The achenes are cylindrical, 4 to 5 mm long, brown, glabrous and have 4 tips. The pappus is 8 to 10 mm long and consists of brownish, fine, rough, brittle bristles.

Leaves, Stem and Root: The plant is perennial and 80 to 180 cm high. The rhizome is short with compact branches. It is tuberous and has sturdy, 1 cm thick and 50 cm long roots. The stem is erect, branched above and villous. The leaves are large, tomentose beneath and irregularly dentate. The cauline leaves are cordate-acute. The basal leaves are oblong and petiolate.

Characteristics: The rhizome has a strong odor, the taste is pungent, bitter and tangy.

Habitat: Indigenous to Europe and temperate Asia, introduced to the U.S. and China.

Production: Elecampane root is the root of *Inula helenium*. It is harvested in autumn. The roots are then cut and hung up to dry or dried artificially at 50° C.

Other Names: Alant, Elfdock, Elfwort, Horse-Elder, Horse-heal, Scabwort, Wild Sunflower, Yellow Starwort, Velvet Dock

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components alantolactone, isoalantolactone, 11,13- dihydroisoalantolactone, 11,13- dihydroalantolactone (the mixture of alantolactone derivatives is also known as helenalin or elecampane camphor)

Polyynes

Polysaccharides: above all inulin (fructosan)

EFFECTS

The main active principles are alantolacton, isoalantolacton and other sesquiterpenlactones. Compounds of this kind have an antiphlogostic and antibiotic effect. Antifungal activity has also been demonstrated.

The antimicrobial and anthelmintic effect results from the sesquiterpene lactones. Alantolactone and isoalantolactone are antitumoral, and helenin shortens clotting time. Alantolactone and heler.in lead to complete paralysis of the spontaneous contraction of the intestine in animal studies.

The plant has mild antiseptic and expectorant effect due to the essential oil, which contains sesquiterpene.

INDICATIONS AND USAGE

Unproven Uses: Preparations of the rhizome are used to treat bronchitis, whooping cough and bronchial catarrh. In folk medicine, Elecampane is used as a stomachic, diuretic, carminative and cholagogue, as well as for menstrual complaints.

Homeopathic Uses: *Inula helenium* preparations are used for stomach ulcers and chronic cough.

PRECAUTIONS AND ADVERSE REACTIONS

General: The drug is severely irritating to mucous membranes and strongly sensitizing.

Pregnancy: Not to be used during pregnancy.

OVERDOSAGE

Larger administrations of the drug lead to vomiting, diarrhea, spasms and signs of paralysis. Following gastric lavage, intestinal emptying (sodium sulfate) and the administration of activated charcoal powder, poisoning is treated with the antitmetic trifluopromazine.

DOSAGE

Mode of Administration: The comminuted drug is used in tea mixtures. The extract is used as a constituent in numerous pharmaceutical preparations, including gastrointestinal remedies, alterants, gout remedies, diuretics and in numerous expectorants.

Preparation: To prepare an infusion, boiling water is poured over 1 gm of ground drug and left to draw for 10 to 15 minutes, after which time it is strained through a tea strainer (1 teaspoonful corresponds to about 4 gm drug).

Daily Dosage: Average single dose 1 gm.

Tea—1 cup is drunk 3 to 4 times daily as an expectorant; may be sweetened with honey.

Helenium Extract—The single dose is 0.5 gm.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic once a day (HAB34).

Storage: Store in a cool place, protected from light, not in plastic containers.

Elephant-Ears

Bergenia crassifolia

DESCRIPTION

Medicinal Parts: Whole plant has medicinal properties.

Flower and Fruit: The flowers are arranged in curled cymes. Their structures are arranged in fives and they are radial with the 2 to 3 ovaries joined only at the base. The petals are red or pink-violet and up to 1.5 cm long. The ovary is superior, and the fruit has numerous seeds. The seeds are brown to brown-black, edged, up to 2 mm long and 0.5 mm thick.

Leaves, Stem and Root: *Bergenia crassifolia* is a herbaceous perennial that grows up to 50 cm high. The leaves are basal, oval, up to 20 cm long, over 10 cm wide, orbicular, fleshy, glabrous, with indented glands and slightly dentate. The rhizome is up to 3 cm thick, above ground and covered with the sheaths of the previous year's leaves.

Habitat: Russia, Mongolia

Production: *Bergenia* rhizoma are the dried rhizomes of *Bergenia crassifolia*. They are collected in the wild and air-dried for 2 weeks.

Other Names: Learner *Bergenia*, Siberian Tea

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Hydroquinone glycosides: arbutin (1.8 to 2.3%)

Phenol carboxylic acids: bergenin (6.7 to 10.1%, lactones)

Tannins (28%)

EFFECTS

The watery extracts of the drug have astringent, bacteriostatic, local hemostyptic and antiphlogistic effects, due to the tannin content and that of other phenolic constituents. The arbutin they contain exhibits urine-disinfecting effect (comparable to *Uva ursi*). A shortening of blood coagulation time could be demonstrated in animal experiments.

INDICATIONS AND USAGE

Unproven Uses: Elephant-Ears have been used for fever, tuberculosis, pneumonia, diarrhea, intestinal disease and rheumatism. The drug is also used for skin leishmaniosis and as a hemostyptic.

CONTRAINDICATIONS

Preparations are contraindicated in pregnancy, breast-feeding and children under 12 years of age.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Because of its high tannin content, the intake of preparations of the drug could lead to digestive disorders; individuals with sensitive stomachs may experience nausea and vomiting.

OVERDOSAGE

Overdose could lead to inflammatory irritation of the mucous membranes of the bladder and urinary tract, accompanied by urgency and blood in the urine. Long-term administration of the drug could lead to liver damage, due to the possible hepatotoxicity of the hydroquinone released, particularly among children.

DOSAGE

Mode of Administration: Whole drug preparations for internal and external use.

Elm Bark

Ulmus minor

DESCRIPTION

Medicinal Parts: The medicinal part is the inner bark of the young branches.

Flower and Fruit: The reddish brown flowers appear before the leaves. They are androgynous, short-pedicled and in globular clusters. The perigone is campanulate-top-shaped and greenish with a purple margin. There are 3 to 4 stamens with dark violet anthers. The tree is wind pollinated. The fruit is a broad-winged, almost circular, oval or elliptical and glabrous achene. The reddish nutlet reaches to the front margin of the notch.

Leaves, Stem and Root: *Ulmus minor* is a 40 m high tree with black-brown, finely fissured bark. The branches, which develop long grooves, have alternate, petiolate, 6 to 10 cm **long leaves with 8 to 12 lateral ribs**. The leaves are ovate. **The lamina is irregular and the margin double-serrate**. The petioles are 8 to 15 mm longer than the buds, which develop in spring on short branches and form into clusters before flowering.

Habitat: **The plant is indigenous to Europe as far as the Mediterranean.**

Production: Smooth-leaved Elm bark is the bark of *Ulmus minor*. **The bark is gathered for therapeutic or medicinal purposes. It is manually cut in circles and the bark is removed from the young (new) twigs (the diameter of the twig should not be more than 1 cm). The long grain and the upper layer of the bark must be removed, then the bark is dried.**

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Mucilage: yielding mainly D-galactose, L-rhamnose, D-galacturonic acid after hydrolysis

Tannins (3%)

Caffeic acid derivatives: chlorogenic acid

Sterols: including, among others, beta-sitosterol, stigmasterol

EFFECTS

The drug has diuretic and astringent properties.

INDICATIONS AND USAGE

Unproven Uses: Internally, the drug is used for digestive disorders and severe cases of diarrhea. Externally, it is used to treat open wounds.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Elm bark is used both internally and externally in various preparations.

Preparation: The ground bark is used for infusions. A decoction from the bark can be prepared using 2 teaspoons of the drug per cup of water. Externally, a 20% decoction is used, which is diluted 1:1 with water, for the treatment of festering and open wounds.

Daily Dose: The dosage of the decoction prepared from die bark is 1 cup 2 to 3 times daily. In powder form, a dose of 2 to 5 gm may be taken daily.

English Adder's Tongue

Ophioglossum vulgatum

DESCRIPTION

Medicinal Parts: The medicinal parts of the plant are the root and leaves.

Flower and Fruit: The plant's 12 to 40 ripe yellow sporangia on either side of the middle panicle form an acuminate spike. The tip contains no sporangia.

Leaves, Stem and Root: This fern grows from 8 to 25 cm high. The stems, covered in the remains of leaves, grow **singly from the underground roots**. The stems consist of a few sturdy, yellow fibers and are round, hollow and

succulent. Each bears a smooth, oblong-oval, acuminate, entire frond.

Characteristics: Though a member of the Fern family, the appearance of English Adder's Tongue is not at all typically fern-like.

Habitat: The plant is indigenous to Britain.

Production: English Adder's Tongue is the aerial part of *Ophioglossum vulgatum*.

Not To Be Confused With: English Adder's Tongue is not related to American Adder's Tongue (*Erythronium americanum*).

Other Names: Serpent's Tongue, Christ's Spear

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids: including among others quercetin-3-methyl ether-7-diglucoside-4' glucoside

The constituents of the drug have not been thoroughly investigated.

EFFECTS

See *Erythronium americanum*.

INDICATIONS AND USAGE

See *Erythronium americanum*.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: See *Erythronium americanum*.

English Chamomile

Chamaemelum nobile

"DESCRIPTION

Medicinal Parts: The medicinal parts are the English Chamomile oil extracted from the fresh or dried filled or unfilled flower heads and the dried aerial plant parts; the dried flower heads of the cultivated, filled varieties; and the fresh aerial parts of the flowering plant.

Flower and Fruit: The stems end in 12 to 18 fruit-bearing, white florets, which are about 2 to 2.5 cm wide. The epicalyx is semi-globose. The bracts are in a number of rows and are lanceolate to spatulate with a broad membranous border. The

receptacle is clavate, filled with latex, and covered at the edge with slit bracts. The linguiform florets are female and silver-white. The tubular florets are androgynous and yellow. The corolla of every floret has a short appendage at the base, which surrounds the tip of the fruit. The achenes are 2 mm long, light brown and almost triangular with vertical ribs. The achenes are smooth and have no pappus.

Leaves, Stem and Root: The 15 to 30 cm high plant has a deeply buried rhizome. The rhizome sprouts numerous, ascending, occasionally upright, simple or branched, rounded, vertically grooved, pubescent stems. The stems are covered in alternating, heavily segmented, gray-green to rich-green leaves that are 2 to 4 cm long.

Habitat: The plant is indigenous to southern and western Europe and northern Africa, and is cultivated all over Europe. The main exporters are Belgium, France, Great Britain and Italy, as well as Poland, the Czech and Slovakian Republics, North America and Argentina.

Production: English Chamomile consists of the dried flowers of the cultivated double flowered variety of *Chamaemelum nobile*. The plant is harvested in June and July, then dried at temperatures of 35°C.

Other Names: Ground Apple, Whig Plant, Roman Chamomile

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components include ester of angelic- or tiglic acid with isobutanol, isoamyl alcohol or 3-methylpentan-1-ol, to some extent present as hydroperoxides

Sesquiterpene lactones: in particular nobilin, besides 3-epinobilin, 1,10-epoxynobilin, 3-dehydronobilin that is present to some extent as hydroperoxides, including 1-beta-hydroperoxy-isonobilin and 4-alpha-hydroperoxy-manolide

Flavonoids: including anthemoside, cosmosioside, luteolin-7-O-glucoside

Caffeic and ferulic acid ester

Polynes: Including cis- and trans-dehydromatricaria ester

EFFECTS

In contrast to true chamomile, few studies are available. The essential oil is active against gram-positive bacteria and dermatomyces. The drug is also cytostatic and acts on the CNS, causing a reduction of aggressive behavior in animal tests. Efficacy in dyspepsia (including flatulence) may be due to the amaroids.

INDICATIONS AND USAGE

Unproven Uses: In folk medicine, the French use English Chamomile mainly for feelings of fullness, bloating and mild

spasmodic gastrointestinal disturbances and sluggishness of the bowels. It is also used for menstrual complaints, nervousness, hysteria and general debility. It is used topically for inflammation of the mouth and throat, rhinitis, toothache, earache, headache and influenza. The oil is used in mouthwashes.

Homeopathic Uses: The drug is used in homeopathy to treat nervous gastrointestinal disorders, but efficacy has not been proven.

CONTRAINDICATIONS

Use of the drug is contraindicated during pregnancy.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a small potential for sensitization.

Pregnancy: The drug is not to be used during pregnancy.

DOSAGE

Mode of Administration: Since the efficacy for the claimed uses is not documented and there is a certain risk involved, a therapeutic application cannot be recommended. English Chamomile is used in folk medicine as a fluid extract, tincture, elixir, wine, syrup, ointment and powder.

Preparation: To prepare a decoction, add 3 g drug to 100 ml water. An infusion is prepared using 7 to 8 capitula per cup. A liquid rub is prepared using 1 dsp diluted in 250 ml water.

Daily Dosage: The average single dose of the drug is 1.5 g at the main meals. The average daily dose of an infusion is 50 ml to 200 ml. When used as a bath additive, add 50 g to 10 liters of water. Liquid rubs are applied as poultices or washes 2 to 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes for acute conditions. For chronic conditions: 1 to 3 times daily; Parenterally: 1 to 2 ml sc acute 3 times daily; Chronic: once a day (HAB1)

Storage: Store in well-sealed glass or metal containers protected from moisture.

English Hawthorn

Crataegus laevigata

TRADE NAMES

Hawthorn, Hawthorn Extract (available from numerous manufacturers and as a combination product), Hawthorne Berries, Hawthorn Flowers, Leaves & Berries, Standardized Hawthorn Extract, Hawthorn Extract, Hawthorn Power, Time Release Hawthorn Power, HeartCare

DESCRIPTION

Medicinal Parts: The medicinal parts are generally white thorn flowers, leaves, fruit, and various mixtures of different plant parts.

Flowers and Fruit: The white flowers are in richly-blossomed cymes. The sepals are usually short, more or less triangular, entire-margined or, particularly the American variety, fairly long with glandular tips. The petals are usually separate, orbicular, crenate, white or occasionally red. There are 10 to 20 stamens and 1 to 5 carpels, which are more or less fused to the receptacle. There are 2 ovules, the upper one is sterile and covers the lower fertile one like a cap. There is 1 seed in each chamber. The false fruit is ovoid or globose and crowned by the remains of the sepals. It is red, black, or yellow and mealy.

Leaves, Stem and Root: Hawthorn is a bulky shrub or small tree, 1.5 to 4 m high with hard wood and usually thorny branches. The leaves have many forms. They are shallow, 3 to 5 lobed, with the lobes pointed forward. The leaves are unevenly serrate, obovate, yellowish-green, and glossy.

Characteristics: The flowers have an unpleasant smell and a slightly bitter taste; the fruit has a sour taste.

≠ *Habitat*: The plant is indigenous to northern temperate zones of Europe, Asia, and North America.

Production: Hawthorn consists of the leaves and flowers of *Crataegus laevigata* and occasionally other species. The medicinal parts of the Hawthorn plant are collected in the wild and dried at room temperature.

Not to be Confused With: Hawthorn is sometimes mistaken for the flowers, leaves, and fruit of *Robinia pseudoacacia*, *Sorbus aucuparia* or *Prunus spinosa*.

Other Names: Haw, May, Whitethorn, Hawthorn

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoides (1.8%): O-glycosides, including hyperoside (0.28%), rutin (0.17%)

6-C- and 8-C-glycosyl compounds, including vitexin (0.02%), vicenin-1, orientin

6-C- and 8-C-glycosyl compounds, linked O-glycosidically as well as with other monosaccharides, including vitexin-2"-O-alpha-L-rhamnoside (0.53%), vitexin-2"-O-alpha-L-rhamnoside-4"-acetate

Oligomeric proanthocyanidins (2.4%)

Biogenic amines, including tyramine

Triterpenes (0.6%): including oleanolic acid, ursolic acid, 2-alpha-hydroxy oleanolic acid (crataegolic acid)

EFFECTS

The active principles are procyanidins and flavonoids. They cause an increase in coronary blood flow due to dilatatory effects resulting in an improvement of myocardial blood flow. The drug is positively inotropic and positively chronotropic. The cardiotropic effect of *Crataegus* is said to be caused by the increased membrane permeability for calcium as well as the inhibition of phosphodiesterase with an increase of intracellular cAMP concentrations. Increased coronary and myocardial circulatory perfusion and reduction in peripheral vascular resistance were observed. High doses may cause sedation. This effect has been attributed to the oligomeric procyanidins (Anonym, 1994).

Crataegus extract has been found to prolong the refractory period and increase the action potential duration in guinea pig papillary muscle. One study demonstrated that a *Crataegus* extract blocked the repolarizing potassium currents in ventricular myocytes of guinea pigs. This effect is similar to that of class III antiarrhythmic drugs and may explain the antiarrhythmic effect of Hawthorn (Muller, 1999).

INDICATIONS AND USAGE

Approved by Commission E:

- Decrease in cardiac output (Stage II NYHA)

Hawthorn is used for senile heart, chronic cor pulmonale, and mild forms of bradycardia! arrhythmias.

Unproven Uses: In folk medicine, Hawthorn is also used as a cardiotoxic, for hypertension, ischemia of the heart, arrhythmia and as a sedative. Hawthorn has a high flavonoid content and is used to prevent collagen destruction in joints and decrease inflammation and decrease the fragility of capillaries. Hawthorn has shown some effectiveness in lowering cholesterol levels in at least one study. Several extracts from different components of the plant have demonstrated antioxidant effects.

Chinese Medicine: In China, Hawthorn is used to reduce food stagnancy and blood stasis (Chen, 1995).

Homeopathic Uses: Therapeutic dilutions are used for cardiac insufficiency, senile cardiac insufficiency, dysrhythmia, and angina pectoris.

CLINICAL STUDIES

Cardiac Effects

Several studies that have used animal models demonstrate the cardiac effects of Hawthorn. The influence of the main flavonoids from Hawthorn on coronary flow, heart rate, left ventricular pressure and the velocity of contraction and relaxation was investigated on isolated guinea pig hearts maintained at a constant perfusion pressure was the focus of one study. The study recorded an increase in coronary flow of 186% for one of the main glycosides, luteolin-7-glucoside; 66% for the hyperoside component and 66% for the rutin flavonoid. Coronary relaxation velocity increased by 104% in the luteolin-7-glucoside arm, 62% for hyperoside and 73% for rutin. Positive inotropic and chronotropic effects were noted for all of the above extracts as well. The beta adrenergic effects of the flavonoids were prevented by the addition of propranolol. The authors postulate that the mechanism of action for the cardiac effects of Hawthorne is due to the inhibition of the 3', 5'-cyclic adenosine monophosphate phosphodiesterase enzyme (Schussler, 1995). It should be noted that in a more recent study, the positive inotropic effect of Hawthorn was not attributed to phosphodiesterase inhibition or to a beta-sympathomimetic effect (Muller, 1999).

Another small, placebo controlled, randomized double-blind study was performed to test the efficacy of a special extract (WS 1442) of Hawthorn in a group of 30 patients with stage II NYHA cardiac insufficiency. Treatment duration was 8 weeks. Primary parameters were alteration in the pressure-x-

rate product (PRP) under standardized loading on a bicycle ergometer, and the score of a subjective questionnaire on improvement of complaints. Secondary target parameters included exercise tolerance and the change in heart rate and arterial blood pressure. A statistically significant improvement in both primary and secondary parameters were noted in the WS 1442 group over that of the placebo group (Leuchtgens, 1993).

CONTRAINDICATIONS

Hawthorn is contraindicated in children under 12 years of age. Use of Hawthorn during the first trimester of pregnancy is contraindicated.

PRECAUTIONS AND ADVERSE REACTIONS

General: It is recommended that Hawthorn supplements be prescribed and monitored by a physician. During treatment with Hawthorn, the clinician should monitor heart rate and blood pressure on a regular basis.

Higher doses can produce hypotension, cardiac arrhythmia, and sedation. Less serious adverse effects include dizziness and tremor.

Accidental corneal scratches caused by thorns of hawthorn bushes have resulted in blindness in 88 out of 132 reported cases in Ireland (Duke, 1985).

Drug Interactions Hawthorn may potentiate the effects of cardiac glycosides. If Hawthorn therapy is initiated in patients taking digoxin, digitoxin or g-strophanthin, the dosage of standard cardiac glycosides should be adjusted downward.

Hawthorn may cause a hypertensive effect when used in combination with beta-blockers (Murray & Pizzorno, 1996).

Because Hawthorn has an action similar to Class III antiarrhythmics, use with other antiarrhythmics should be discouraged.

Hawthorn has been found to inhibit the inward flow of potassium channels resulting in an increased action potential in cardiac ventricular cells. Drugs that act in a similar manner such as cisapride are likely to interact with Hawthorn and should therefore not be taken in conjunction with Hawthorn.

Pregnancy: Hawthorn is contraindicated during the first trimester of pregnancy.

Nursing Mothers: There are no warnings in the literature regarding use of Hawthorn in nursing mothers.

Pediatrics: Hawthorn is not recommended for children under the age of 12 years.

OVERDOSAGE

The LD50 via intraperitoneal injection in the mouse model has been reported at a single dose of 1,170 mg/kg and 750 mg/kg in the rat. In both species, signs of overdose included sedation, dyspnea, tremor and piloerection (Schlegelilch & Hey wood, 1994). The same authors reported that an oral dose of 3,000 mg/kg in mice and rats was well tolerated with no negative clinical signs or death reported in the animal models.

DOSAGE

Mode of Administration: The dried and comminuted drug for decoctions as well as liquid or dry extracts for oral intake.

How Supplied:

Capsules — 80 mg, 100 mg, 300 mg, 450 mg, 455 mg, 480 mg, 500 mg, 510 mg, 565 mg

Liquid — 250 mg/ml

Tablets — 80 mg

Daily Dosage: The average daily dose is 5 gm of drug or 160 to 900 mg extract administered in divided doses, 3 times daily, (ethanol 45% V/V or methanol 70% V/V) standardized on procyanidin or flavonoids; single dose: 1 gm of drug several times daily. The duration of treatment is minimum 6 weeks.

Homeopathic Dosage: 5 to 10 drops, 1 tablet or 5 to 10 globules 1 to 3 times a day or 1 ml injection solution sc twice a week; ointment 1 to 2 times a day (HAB1)

Storage: Hawthorn should be protected from light and moisture in well-sealed containers at temperatures below 25° C.

English Horsemint

Mentha longifolia

DESCRIPTION

£k *Medicinal Parts:* The medicinal part is the dried herb.

Flower and Fruit: The flowers are sometimes interrupted lower down by 1 cm thick, gray to white, downy, paniced, false spikes. The false spikes are arranged with linear, villous bracts, which are longer than the flowers. The calyx is fluffy and woolly pubescent with awl-shaped tips. The corolla is lilac to flesh-colored. The fruit is a finely speckled nutlet

Leaves, Stem and Root: The plant is a perennial. It has a sturdy rhizome with underground runners. The shoots are

densely covered in 1- or more-celled tomentose hairs with few glands and a mild odor. The stem is erect, simple or branched, up to 1 m high, tough and obtusely angular. The leaves are sessile, oblong-ovate to lanceolate, usually acuminate, with 6 to 12 pairs of curved pinnate veins. The underside of the leaves are gray to white tomentose.

Production: English Horsemint is the aerial part of *Mentha longifolia*, the dried herb.

Habitat: The plant is common in all of Europe to southern Sweden.

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: chief components piperitone (share 60-80%), furthermore beta-caryophyllene (5-15%), germacren D (5-15%), 1,8-cineole (2-7%), limonene (1-8%), with other chemotypes chief components D-carvone, piperitone, isomenthone & plus; menthofurane, menthone, piperitol, menthol or linalool

Flavonoids: including among others diosmin, hesperidin, quercitrin, thymonin, apigenine-7-glucuronide

EFFECTS

English Horsemint has carminative and stimulant effects.

INDICATIONS AND USAGE

Unproven Uses: The drug is used for digestive disorders, particularly for flatulence. Historically, it has been used for all kinds of pain, headaches in particular.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: The ground drug is used internally as an infusion; it is used externally as a bath additive.

LITERATURE

Hansel R, Keller K, Rimpler H, Schneider G (Hrsg.), *Hagers Handbuch der Pharmazeutischen Praxis*, 5. Aufl., Bde 4-6 (Drogdh), Springer Verlag Berlin, Heidelberg, New York, 1992-1994.

English Ivy

Hedera helix

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and berries.

Flower and Fruit: The inflorescences are greenish-yellow umbels, which form dense, semi-globular clusters. The calyx tips are short, almost triangular, tomentose and drooping. The 5 petals are oblong and slightly involute. There are 5 stamens and 1 inferior ovary with 5 valves. The style is fused into a column. The fruit is a globular, usually 5-valved berry, which becomes black and ripens in spring. It contains 3 to 5 reniform, triangular, acute seeds, which are reddish-violet when young, later dark brown, and finally black.

Leaves, Stem and Root: The plant is an evergreen perennial, which creeps or, by means of adventitious roots, climbs to a length of 3 to 15 m. The stem is branched, the leaves are alternate, petioled, glabrous, glossy, coriaceous. Younger leaves are 5-lobed; the leaves of older flowering plants are ovate-rhomboid.

Characteristics: The berries and leaves have a bitter taste.

Habitat: English Ivy is indigenous to the temperate regions of Europe, and also north and central Asia. It is cultivated in the U.S.

Production: English Ivy leaf consists of the dried leaves of *Hedera helix*.

Other Names: Gum Ivy, True Ivy, Woodbind

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins: aglycone hederagenin, oleanolic acid, bayogenin, chief components hederosaponin C (hederacoside C, slightly transforming into alpha-hederin, aglycone hederagenin), additionally hederosaponin B (hederacoside B)

Volatile oils: including some with methylethylketone, methylisobutylketone

Polyynes: including falcarinol, 11,12-didehydrofalcarinol

Steroids: sterols, including beta-sitosterol, campesterol

Flavonoids: including rutin

EFFECTS

English Ivy is an expectorant and antispasmodic. In animal experiments, the drug is anti-exudative and cytotoxic. *Hedera* saponin C exhibits an antiviral, antibacterial, antimycotic, anthelmintic and molluscicidal, as well as an antinflamellate, effect. The fresh leaves are an irritant to the skin and mucosa and can have an allergenic effect.

INDICATIONS AND USAGE

Approved by Commission E:

m Cough

- Bronchitis

English Ivy is a respiratory catarrh used for the symptomatic treatment of chronic inflammatory bronchial conditions.

Unproven Uses: In folk medicine, English Ivy is used internally for liver, spleen and gallbladder disorders and for gout, rheumatism and scrofulosis. Externally, it is used for burn wounds, calluses, cellulitis, inflammations, neuralgia, parasitic disorders, ulcers, rheumatic complaints and phlebitis.

Homeopathic Uses: English Ivy is administered in homeopathy for rachitic states.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded. The drug has a medium potential for sensitization through skin contact.

DOSAGE

Mode of Administration: English Ivy is available as comminuted drug and other galenic preparations for internal external use.

How Supplied: Forms of commercial pharmaceutical preparations include drops, suppositories and tablets.

Preparation: Prepare a tea by adding 1 heaped teaspoonful of drug to 1/4 liter of hot water and steeping the mixture for 10 minutes. A poultice is prepared by mixing fresh Ivy leaves 1:3 with linseed meal. To make an infusion, add 1 heaping teaspoonful of drug to one-quarter cup boiling water and steep for 10 minutes.

Daily Dosage: Tea and other infusions can be taken internally 3 times daily. The average daily dose is 0.3 to 0.8 g of drug. Fresh leaves may be laid upon festering wounds and burns; a decoction of fresh leaves (200 gm/liter water) may be used externally for rheumatism. The daily dose of a tincture is 40 to 50 drops; single dose: 5 to 10 drops.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute, 3 times daily; chronic: once a day (HAB1).

English Lavender

Lavandula angustifolia

DESCRIPTION

Medicinal Parts: The medicinal parts are the essential oil extracted from the fresh flowers and/or the inflorescences, the flowers collected just before opening and dried, the fresh flowers and the dried flowers.

Flower and Fruit: The flowers are in false whorls of 6 to 10 blossoms forming interrupted terminal spikes. The pedicels are 10 to 15 cm long downy stems. The bracts are 5 mm long, ovate to broadly triangular, often brown and brown-violet or violet-tinged. The tubular calyx has 5 uneven tips, it

is amethyst-colored, tomentose and after flowering it is closed by a lidlike appendage of its upper tip. The corolla is longer with a cylindrically fused base, the lips are flat, and the upper lip is larger with 2 lobes. The lower lip is 3-lobed with even* tips. The stamens are enclosed in the tube. The ovary consists of 4 carpels and has a nectary below it. The fruit is a glossy brown nutlet.

Leaves, Stem and Root: English Lavender is a 60 cm high subshrub and is heavily branched with leafy, erect, rod-like, gray-green, young branches. The leaves are sessile, oblong-lanceolate, entire-margined, involute, gray, later green with glandular spots beneath.

Characteristics: The flowers have a fresh aromatic fragrance.

Habitat: The plant is indigenous to the Mediterranean region but is common in most of southern Europe and is cultivated extensively.

Production: English Lavender flower consists of the dried flower of *Lavandula angustifolia*, gathered shortly before fully unfolding, as well as its preparations. Flowering shoots are harvested when the middle section of the spike is flowering; it is cut 10 cm beneath the insertion of the spike. The most valuable part is the receptacle.

Not to be Confused With: Other varieties of lavender such as *Lavandula intermedia* (Lavendin) and *Lavandula latifolia*. The varieties are often mixed commercially. When the drug material has a high proportion of stem and leaf material, it is considered less valuable.

Other Names: French Lavender, Garden Lavender, Lavender

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil (1-3%): chief components (-)-linalool (making up 20-50%) and linalyl acetate (30-40%), furthermore, including among others, cis-ocimene, terpinene-4-ol, beta-caryophyllene, lavandulyl acetate

Hydroxycoumarins: including among others, umbelliferone, herniarin

Tannins (13%)

Caffeic acid derivatives: including among others, rosmarinic acid

EFFECTS

The drug contains essential oil. The main active constituents are linalyl acetate and linalool.

In a 1936 study, a choleric and cholagogic effect was described. In addition, an antimicrobial effect has been demonstrated in vitro. In animal experiments a neurodepressive effect was demonstrated (shortening of the falling-

asleep period and lengthening of sleep duration) and a reduction of motor activity.

In humans, after inhalation of the drug, an effect on the limbic cortex (similar to nitrazepam) was demonstrated.

INDICATIONS AND USAGE

Approved by Commission E:

- Loss of appetite
- Nervousness and insomnia
- Circulatory disorders
- Dyspeptic complaints

Internally, English Lavender is used for mood disturbances such as restlessness or insomnia, functional abdominal complaints (nervous stomach irritations, Roehmheld syndrome, meteorism, nervous intestinal discomfort).

Externally, English Lavender is used in balneotherapy for treatment of functional circulatory disorders.

Unproven Uses: In folk medicine, English Lavender is used for migraine, cramps and bronchial asthma. Externally, it is used for rheumatic conditions (the drug as an extract in liniments), as a sedative in cases of tension, exhaustion; also for poorly healing wounds (lavender baths) and for sleep as aroma therapy (herb pillow).

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The volatile oil possesses a weak potential for sensitization.

DOSAGE

Mode of Administration: The whole drug is used for infusions, as an extract and as a bath additive. Combinations with other sedative and/or carminative herbs may be beneficial.

Preparation: An infusion is prepared by adding 5 to 10 ml of drug per cup of hot water (150 ml), draw for 10 minutes, and strain. For external use as bath additive, 100 g of drug is scalded or boiled with 2 liters of water and added to the bath.

Daily Dosage: A tea prepared as indicated above can be administered 1 cup three times daily. One to 4 drops of Lavender oil may be placed on a sugar cube.

English Plantain

Plantago lanceolata

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, the dried herb and the fresh plant.

Flower and Fruit: The globular or shortly cylindrical spikes are on erect or ascending, 5-grooved, appressed pubescent

peduncles. The flowers are small, almost colorless behind scarious, narrow-acuminate bracts. The scarious calyx is deeply divided into 4 parts and has a cylindrical tube and a margin with 4 ovate tips. There are 4 long stamens with yellowish-white filaments and anthers and 1 superior ovary. The fruit is a bivalvular, 3 to 4 mm long capsule. The seeds are oblong, 2 mm long and blackish.

Leaves, Stem and Root: The plant is perennial and grows from 5 to 50 cm high. It has a very fibrous root. All the leaves are in basal rosettes and are lanceolate or linear-lanceolate, deeply 3 to 5 ribbed, entire-margined or short-dentate.

Habitat: The plant is widespread in the cool temperate regions of the world.

Production: English Plantain herb consists of the fresh or dried above-ground parts of *Plantago lanceolata*, harvested at flowering season (May to September) and dried quickly at 40 to 50° C.

Not to be Confused With: the similar *Digitalis-lanata* leaves.

Other Names: Buckhorn, Chimney-Sweeps, Headsman, Narrow-Leaved Plantain, Ribgrass, Ribwort, Ripplegrass, Soldier's Herb

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoide monoterpenes (2-3%): chief components are aucubin (rhinantin) and catalpol as well as asperuloside

Mucilages (2-6%): glucomannans, arabinogalactane, rhamnogalacturonane

Flavonoids: including among other chief components apigenine-6,8-diglucoside, luteolin-7-glucuronide

Caffeic acid esters: chlorogenic acid, neochlorogenic acid, acteoside (verbascoside)

Tannins

Hydroxycoumarins: aesculetin

Saponins (traces)

Silicic acid

EFFECTS

Liquid extract and the pressed juice of fresh Plantain herb have a proven bactericidal effect. The aucubigenin (hydrolysed aucubin) and an antimicrobial saponin are believed to be responsible for the antibacterial effect. In addition, acceleration of blood clotting has been demonstrated and a possible epithelization effect has been mentioned.

INDICATIONS AND USAGE

Approved by Commission E:

- Common cold
- Cough/bronchitis
- Fevers and colds
- Inflammation of the mouth and pharynx
- Inflammation of the skin

Unproven Uses: In folk medicine, the pressed juice of English Plantain is used internally for conditions of the respiratory tract, cystitis, enuresis, liver disease, stomach cramps, diarrhea and as a diuretic.

Externally the plant is used for wounds, furuncles, conjunctivitis and as a hemostyptic.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: As a comminuted herb and other galenic preparations for internal and external use. It is available as macerations, liquid extracts, lozenges, syrup and pressed juice of the fresh plant. The drug is available in many standardized preparations of antitussives and expectorants.

Preparation: To make an infusion, pour boiling water over 2 to 4 gm cut drug (or put in cold water brought to a boil) and strain after 10 minutes (1 teaspoonful = approximately 0.7 gm drug).

Daily Dosage: The average daily dose is 3 to 6 gm of herb.

Tea—1 cup of freshly made tea to be drunk several times a day.

Ergot

Claviceps purpurea

DESCRIPTION

Medicinal Parts: The medicinal part of the fungus is the sclerotium, which grows on rye plants and is later dried.

Flower and Fruit: Ergot is a permanent form of a fungus that is a parasite on ripening rye, wheat and other grasses. It is black, hard and much larger than the grains of rye. The cycle

of the fungus begins with the infection of the ovary by an ascospore. The spore, usually deposited by a visiting insect, germinates on the stigma, and the hyphae grows down into the ovary where it appropriates food destined for the grain. When the ovary has been completely destroyed, the mycelium grows. Horizontal walls are formed and fat vacuoles become visible. The hyphae of the skin layer store purple pigment 3 weeks after the infection a long, curved, black sclerotium develops. It reaches a length of up to 8 cm and bears minute conidia, which are made up of the remains of the ovary and the style embedded into the loose mycelium. The sclerotium usually falls to the ground before harvest and survives the winter. In the spring, 1 to 3 cm long red-stemmed, capitula-like, pink fruiting bodies grow out of it, which in turn produce 50 to 70 µm long thread-like ascospores.

Habitat: *Claviceps purpurea* grows as a parasite on rye (occasionally on other grasses), and is found in all areas of the world where rye is cultivated.

Production: Ergot consists of the sclerotium of *Claviceps purpurea*, a parasitic fungus harvested after it has grown on cultivated rye.

Other Names: Cockspur Rye, Hornseed, Mother of Rye, Smut Rye, Spurred Rye

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Indole alkaloids (ergot alkaloids, varying by variety of ergot)

Chief alkaloid of the lysergic acid amide type: ergometrine (ergobasine)

Chief alkaloid of the lysergic acid ergopeptine type: ergotamine, ergovaline, ergosine, ergocristine, ergocornine, alpha- and beta-ergocryptine, further alkaloids of the clavine type: including among others agroclavine, elymoelavine, festuclavine

Peptide alkaloids (ergopeptine group): especially ergotamine, as well as ergovaline, ergosine, ergocristine, ergocornine, alpha- and beta-ergocryptine

Xanthone derivatives (ergochromes): including, among others, secalononic acid A to C, ergoflavin

Anthracene derivatives: including, among others, clavorbine, endocrocine

Amines: including, among others, trimethylamine, methylamine

Fatty oil

EFFECTS

The drug contains ergoline alkaloids of which only ergometrin and ergopeptine have a therapeutic and toxic effect. The

*fE

*

«*

action of ergot is traceable to its stimulation of the smooth musculature. However, therapeutic use cannot be recommended because of the risks involved.

INDICATIONS AND USAGE

^| *Unproven Uses:* Although the risk involved is too high to recommend therapeutic use, ergot and ergot preparations were previously used in gynecology and obstetrics. Uses included hemorrhages, climacteric hemorrhages, menorrhagia and metrorrhagia, before and after miscarriage, for removal of the placenta and shortening of the afterbirth period, for atonia of the uterus and also for migraine.

Homeopathic Uses: Uses in homeopathy include uterine and muscle spasm, convulsions, paralysis, circulatory problems accompanying arterial disease and a tendency to bleed. Efficacy has not been proven.

CONTRAINDICATIONS

£- Ergot is now contraindicated for all therapeutic use, but especially in the presence of peripheral blood flow disorders such as Raynaud's disease. Thrombangitis obliterans, severe arteriosclerotic vascular changes, liver function disorders, severe coronary insufficiency, kidney damage, pregnancy, nursing, infectious diseases, sepsis, hypertonia and severe hypotonia.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages, but therapeutic use is not recommended because of the many side effects. Among side effects that may occur are queasiness, vomiting, feeling of weakness in the legs, muscle pain, numbness in the fingers, angina complaints, tachycardia or bradycardia, localized edema and itching.

OVERDOSAGE

Overdosage or long-term administration can lead to thrombosis, damage to the vessels of the retina (combined with optic atrophy) gangrene of the extremities, hemiplegia and convulsions.

fc Symptoms of acute poisonings include queasiness, vomiting, diarrhea, thirst, skin coolness, itching of the skin, rapid and weak pulse, paresthesia, numbness of the extremities, confusion or unconsciousness.

Chronic poisonings appear as:

Ergotismus gangrenosus: characterized by painful arterial blood flow disorders of the extremities with dry gangrene, angina complaints, field of vision losses, aphasias.

Ergotismus convulsivus: characterized by muscle twitching, later clonic spasm and ultimately tonic spasms, hemiplegia, loss of consciousness and death.

Drug overdose is managed by¹ gastrointestinal emptying through inducement of vomiting and gastric lavage with burgundy-colored potassium permanganate solution, sodium sulfate. That is followed by installation of activated charcoal and shock prophylaxis (quiet and warmth). The therapy for poisonings consists of treating angiospasm with Nitrolingual-spray and vascular massage, sedatives for spasm (diazepam or chloral hydrate), administration of blocking agents, electrolyte substitution and treating possible cases of acidosis with sodium bicarbonate infusions. Intubation and oxygen respiration may also be necessary.

DOSAGE

Homeopathic Dosage: 5 drops, 1 tablet, 10 globules every 30 to 60 minutes (acute) or 1 to 3 times a day (chronic); parenterally: 1 to 2 ml sc: acute: 3 times daily; chronic: once a day (HAB1).

Storage: Ergot must be stored in tightly sealed containers and kept in a cool place, protected from light. The powdered form should not be stored.

Eriodictyon californicum

See *Yerba Santa*

Eryngium campestre

See *Eryngo*

Eryngo

Eryngium campestre

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried leaves, dried flowers and dried roots.

Flower and Fruit: The plant bears small terminal cymes on oval to globular capitula on sweeping inflorescences. The linear-lanceolate to awl-shaped bracts terminate in sharp thorns. The sepals are lanceolate, terminate in thorny tips and are twice as long as the white or gray-green petals. The fruit is compressed obovate with lanceolate, pointed scales.

Leaves, Stem and Root: The plant is 15 to 60 cm high, perennial, with a whitish or yellow-green color. The bifurcated stem is erect, thick, grooved and sparse. The stem forms a round bush with the branches. The leaves are tough, short-petioled or sessile. The upper leaves are clasping, double pinnatesect and thorny dentate. The root is cylindrical, thick, brown and woody.

Characteristics: The root is spicy.

Habitat: The plant grows in most parts of Europe and northern Africa and has been introduced into North America.

Production: Eryngo root is the root of *Eryngium campestre*, which is gathered and dried in the spring and autumn. It is gathered in uncultivated regions. The roots are halved and air-dried. Eryngo herb is the dried leaves and blossoms of *Eryngium campestre*.

Other Names: Eringo, Sea Holly, Sea Holme, Sea Hulver

ACTIONS AND PHARMACOLOGY

COMPOUNDS: ERYNGO ROOT

Triterpene saponins

Furanocoumarins

Pyranocoumarins: including egelinol and its angeloyl-, senecionyl- or benzyl-esters agasyllin, grandivetin and egelinol benzoate

Monoterpene glycosides of the cyclohexenol type: including 3-(beta-D-glucosyloxymethyl)-2,4,4-trimethyl-2,5-cyclohexadien-1-one

Caffeic acid ester: chlorogenic acid, rosmarinic acid

Oligosaccharides: 1-kestose

EFFECTS: ERYNGO ROOT

The root is said to be mildly expectorant and spasmolytic; however, there is no scientific evidence to support this.

COMPOUNDS: ERYNGO **HERB**

^TTriterpene saponins

Caffeic acid ester: chlorogenic acid, rosmarinic acid

Flavonoids

EFFECTS: ERYNGO HERB

The herb is said to be a mild diuretic and an expectorant; however, there is no scientific evidence to support this.

INDICATIONS AND USAGE

ERYNGO ROOT

Unproven Uses: The root is used in the treatment of bladder and kidney stones, renal colic, kidney and urinary tract inflammation, urinary retention and edema. It is also used for coughs, bronchitis, skin disorders and respiratory disorders.

ERYNGO HERB

- *Unproven Uses*: The herb is used in the treatment of urinary tract infections and as an adjuvant to treat inflammation of the efferent urinary tract, prostatitis and bronchial catarrh.

PRECAUTIONS AND ADVERSE REACTIONS

ERYNGO ROOT AND HERB

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

ERYNGO ROOT

Mode of Administration: The comminuted root is contained in tea mixtures, extracts, decoctions, liquids and tinctures.

Preparation: To make a tea, use 1 level teaspoonful of the ground root per cup of boiling water (30 to 40 gm per liter boiling water). Allow to draw until cold. To make a decoction, boil 4 teaspoonfuls of the ground root in 1 liter of water for 10 minutes and allow to draw for 15 minutes. The tincture is prepared by soaking 20 gm ground drug in 80 gm of 60% alcohol for 10 days.

Daily Dosage: The daily dosage is 3 to 4 cups of the tea; 2 to 3 cups of the decoction; 50 to 60 drops of the tincture in 3 or divided doses; or 2 to 3 gm of the liquid extract.

ERYNGO HERB

Mode of Administration: The herb is administered as an extract and in homeopathic dilutions (from *E. yuccifolium*).

Eucalyptus

Eucalyptus globulus

DESCRIPTION

Medicinal Parts: The medicinal parts are the oil extracted from the fresh leaves and branch tips as well as the dried leaves.

Flower and Fndt: The flowers are solitary on short pedicles. They have a somewhat pointed, but low operculum stretching over the surface of the stamens. There are no sepals but there are numerous long stamens turned inward, which open along the whole length in 2 splits. The fruit is 10 to 15 by 15

to 30 mm and is a depressed-globose, somewhat tapering toward the base, with 4 main ribs.

Leaves, Stem and Root: Eucalyptus is a deciduous tree up to 40 m tall with silver-gray bark, which has scattered warts. The trunk is twisted. The juvenile leaves are 7 to 16 by 4 to 9 cm, ovate to broadly lanceolate, cordate, very glaucous. The mature leaves are 10 to 13 by 3 to 4 cm, lanceolate to falcate-lanceolate, acuminate, asymmetrical rounded and glossy green.

Habitat: Eucalyptus is indigenous to Australia and Tasmania. It is cultivated today in some subtropical regions of southern Europe, Africa, Asia and America.

Production: Eucalyptus oil consists of the volatile oil from various cineol-rich species of Eucalyptus, such as Eucalyptus globulus, Eucalyptus fructicetorum (syn. Eucalyptus polybractea) and/or Eucalyptus smithii. The oil is obtained by steam distillation, followed by rectification of the fresh leaves and branch tops. Eucalyptus leaf consists of the dried, mature leaves from older trees of Eucalyptus globulus. To harvest eucalyptus, the trees are cut down; drying takes place in the shade.

Not To Be Confused With: Camphor oil and by-products of turpentine manufacture: the oil is also blended with other expensive oils, such as rosemary and thyme. The properties of Eucalyptus leaves vary from species to species.

Other Names: Blue Gum, Fever Tree, Gum Tree, Red Gum, Stringy Bark Tree

ACTIONS AND PHARMACOLOGY

COMPOUNDS: EUCALYPTUS OIL

Chief constituent of the rectified volatile oil: 1,8-cineol (over 80%), furthermore p-cymene, alpha-pinenes, limonene, geraniol, camphene

EFFECTS: EUCALYPTUS OIL

Some of the subsequent properties mentioned refer to isolated cineole. As the standardized commodity, the drug contains 80 to 90% cineole.

In vitro, eucalyptus oil has an antibacterial and fungicidal effect. The drug inhibits prostaglandin biosynthesis and has a mild hyperemic, expectorant and secretolytic motor effect when used topically. In animal experiments eucalyptus was demonstrably cough relieving and displayed a surfactant effect. In vitro, the oil was enzyme inducing and improved pulmonary compliance. It is secretolytic, expectorant, mildly antispasmodic, and a mild local hyperemic.

COMPOUNDS: EUCALYPTUS LEAF

Volatile oil: chief constituent 1,8-cineol (45-75%), in addition myrtenol, alpha-pinenes, beta-pinenes, pinocarvon,

gamma-terpenes, aliphatic aldehydes (butyr-, capron-, valerenaldehyde)

Euglobale: macrocarpale (with acylphloroglucinol-monoterpene or else sesquiterpene- parent substances)

Flavonoids: rutin, hyperoside, quercitrin

EFFECTS: EUCALYPTUS LEAF

The drug has been shown to be secretolytic, expectorant, weakly antispasmodic, deodorizing, cooling and diuretic. In animal experiments the blood-sugar level of uninfluenced plasma insulin was reduced. The euglobulin is said to have an anti-inflammatory and antiproliferative effect in animal experiments and inhibits in vitro TPA-induced EBV-EA activity.

INDICATIONS AND USAGE

EUCALYPTUS OIL

Approved by Commission E:

- Cough/bronchitis
- Rheumatism

Eucalyptus oil is used internally and externally for catarrh of the respiratory tract and externally for rheumatic complaints.

Unproven Uses: In folk medicine, the oil is used for asthma, coughs, diseases of the frontal sinuses, fever, flu, gastric complaints, hoarseness, incipient scarlet fever and measles, worm infestation and as an intestinal antiseptic.

EUCALYPTUS LEAF

Approved by Commission E:

- Cough/bronchitis

Eucalyptus leaf is used internally as a catarrh of the respiratory tract.

Unproven Uses: In folk medicine, it is used internally for the treatment of bladder diseases, asthma, fever, flu, whooping cough, liver and gallbladder complaints, loss of appetite and diabetes. It is used externally for wounds, acne, poorly healing ulcers, stomatitis, bleeding gums, pain and rheumatism, neuralgia, gonorrhea and as a gastrointestinal remedy.

PRECAUTIONS AND ADVERSE REACTIONS

EUCALYPTUS OIL

General: The administration of the drug leads in rare cases to nausea, vomiting and diarrhea. It should not be taken internally with inflammation of the gastrointestinal area and the biliary ducts or with severe illnesses of the liver.

Pediatric Use: Infants and small children should not have preparations containing the oil applied to their faces as this practice can lead to glottal or bronchial spasms, asthma-like attacks or even death by asphyxiation.

EUCALYPTUS LEAF

General: The administration of the drug leads in rare cases to nausea, vomiting and diarrhea. It should not be taken internally with inflammation of the gastrointestinal area and the biliary ducts or with severe illnesses of the liver. Poisonings occur with the volatile oil but are not likely with administration of the leaf drug.

Pediatric Use: Infants and small children should not have preparations containing the oil applied to their faces as this practice can lead to glottal or bronchial spasms, asthma-like attacks or even death by asphyxiation.

OVERDOSAGE

EUCALYPTUS OIL

Overdoses can lead to life-threatening poisonings. Severe poisonings are possible for children after a few drops; poisonings have been known in adults with 4 to 5 ml. Symptoms include drop in blood pressure, circulatory disorders, collapse and asphyxiation. Because of the danger of aspiration, vomiting should not be induced. Following the administration of activated charcoal, therapy consists of diazepam for spasms, atropine for colic, electrolyte replenishment and sodium bicarbonate infusions for any acidosis that may arise. Intubation and oxygen respiration may also be necessary.

DOSAGE

EUCALYPTUS OIL

Mode of Administration: Essential oil and other galenic preparations are available for internal and external application.

Preparation: 1,8-cineole is recovered through a renewed fractional distillation of the oil.

Daily Dosage: For internal use, the average daily dose is 0.3 to 0.6 gm eucalyptus oil.

Inhalation: 2 to 3 drops in boiling water, inhale the steam (single dose: 0.2 gm corresponding to 10 drops). Oil: 3 to 6 drops added in 150 ml water, to be taken several times a day.

When used externally, the concentration is 5 to 20% essential oil, in oil and semi-solid preparations and 5 to 10% essential oil, in aqueous-alcoholic preparations. If the essential oil is used, several drops may be nibbed into the skin.

Storage: Eucalyptus must be kept in appropriate, tightly sealed containers protected from light; different consignments must be stored separately.

EUCALYPTUS LEAF

Mode of Administration: Eucalyptus leaf is administered as the comminuted leaf for infusions and other galenic prepara-

tions for internal and external application. The drug may also be administered by inhalation.

Preparations:

Eucalyptus tincture — 1:5 70% ethanol (V/V)

Eucalyptus liquid extract — 60% 1:1

Eucalyptus syrup — pour 1500 ml on 100 gm cut drug and leave to draw for 6 hours and strain. 180 gm sugar is added to 100 ml infusion, brought to a simmer and filtered.

Tea — pour boiling water over 1.5 to 2 gm of the finely cut drug, cover and leave to draw for 5 to 10 minutes, strain.

Daily Dosage: The average daily dose is 4 to 6 gm of drug, divided up every 3 to 4 hours. Single dose: 1.5 gm several times a day

The average dose for the tincture is 3 to 4 gm.

Eucalyptus tea — 1 cup up to 3 times a day.

Eucalyptus syrup — 2 to 5 dessertspoons daily.

Eucalyptus powder — daily dose 4 to 16 gm; divided over 3 to 4 hours.

Storage: Eucalyptus must be kept in appropriate, tightly-sealed, non-synthetic containers; different consignments must be stored separately.

European Elder

Sambucus nigra

DESCRIPTION

Medicinal Parts: The medicinal parts are the bark peeled from the branches in spring and freed from the cork, the air-dried flowers, the fresh and dried leaves, the fresh and dried ripe fruit, the dried roots, and the fresh leaves and inflorescences in equal parts.

Flower and Fruit: The strongly perfumed, yellowish-white flowers are in large, flat, apical, richly and densely blossomed erect cymes with 5 main branches. The edge of the calyx is small and 5-tipped. The corolla is rotate, deep, and has 5 petals. There are 5 stamens and 1 inferior ovary. The fruit is a black-violet, berry-like drupe with blood-red juice. The seeds are brownish, ovate, and domed on the outside.

Leaves, Stem and Root: The plant is a shallow-rooted, up to 7 m high tree or bush with spreading branches containing dry white latex. The bark of the trunk is light brown to gray, and fissured. The bark on the young branches is green and covered with gray lenticles. The leaves are odd 3 to 7 pinnate. They are matte green above and light blue-green beneath. The leaflets are ovate or oblong acuminate, and densely serrate.

Characteristics: The flowers have a strong, somewhat numbing perfume.

Habitat: European Elder is indigenous to almost all of Europe.

Production: Elder flowers consist of the inflorescence of *Sambucus nigra*, which are collected in the wild, sifted and dried.

Not to be Confused With: Confusion sometimes arises with the flowers of *Sambucus ebulus*.

Other Names: Black Elder, Black-Berried Alder, Boor Tree, Elder, Bountry, Ellanwood, Ellhorn

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Flavonoids (up to 3%): chief components are rutin, isoquercitrin, quercitrin, hyperoside, astragalin, nicotiflorin

Volatile oil (0.03-0.14%): higher share (65%) of free fatty acids, including among others palmitic acid (share 38%)

Caffeic acid derivatives (3%): chlorogenic acids

EFFECTS

Animal tests have shown that Alder increases bronchial secretion. A diaphoretic effect is apparent, but the mechanism is unknown.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis
- Fevers and colds

The drug is used for colds and coughs. It is a sweat-producing remedy for the treatment of feverish colds.

Unproven Uses: In folk medicine, Elder flowers are used internally as a sudorific tea and for colds and other feverish conditions. Elder is also used as an infusion, as a gargle/

mouthwash and for respiratory disorders such as coughs, head colds, laryngitis, flu, and shortness of breath. Elder is used occasionally by nursing mothers to increase lactation. Externally, herbal pillows are used for swelling and inflammation.

Homeopathic Uses: Among uses in homeopathy is inflammation of the respiratory tract.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

Mode of Administration: Whole herb and other galenic preparations for infusions.

Preparation: To prepare an infusion, brew 2 teaspoonfuls (3 to 4 g) of elder flowers in 150 ml of boiling water and strain after 5 minutes.

Daily Dosage: The average daily dose of the drug is 10 to 15 gm. The infusion (tea) should be freshly prepared and drunk in doses of 1 to 2 cups several times—especially in the afternoon and evening.

Homeopathic Dosage: For adults, 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc acute: 3 times daily; chronic once a day (HAB1). Adjust dosages for children.

Storage: Elder should be stored where it is protected from light and moisture.

European Five-Finger Grass

Potentilla reptans

^ DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh flowering plant and the roots.

Flower and Fruit: The flowers are solitary or in pairs on long thin pedicels opposite the leaves. The calyx has 5 segments and is 10 to 25 mm across. The golden yellow petals are obcordate and up to twice as long as the calyx. A ring-like swelling at the base of the stamens exudes a kind of honey. The small fruit is oblong-ovate and wrinkled.

Leaves, Stem and Root: The plant is a herbaceous perennial with a thin, divided rhizome and rosettes of basal leaves. The basal leaves produce 30 cm to 100 cm-long flowering stems from their axils, which are rooted at the nodes. The stems are pubescent or almost glabrous, have no glands and are often tinged red. The cauline leaves are long-petioled and 5 to 7 digitate. The basal stipules are fused to the petiole. The leaflets are obovate, 10 to 70 mm long, dentate to serrate and pubescent or almost glabrous.

Habitat: Europe. The plant is common in Europe, Western Asia, North America, Ethiopia and the Near East. *Potentilla canadensis* is indigenous to Canada and the U.S. and is very similar.

Production: European Five-Finger Grass and root is the complete plant of *Potentilla reptans*.

The drug is a mixture of green and brown in color and has no particular smell or taste. The roots are dug up in September/October and then dried in a sunny, airy place.

Other Names: Cinquefoil, Five Fingers, Five-Finger Blossom, Sunkfield, Synkfoyle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Tannins (6 to 12%)

Flavonoids: including quercetin-3,7-diglucuronide

EFFECTS

The drug is astringent and has wound healing effect due to the tannin content.

INDICATIONS AND USAGE

Unproven Uses: European Five-Finger Grass is used internally for diarrhea and fever; externally for inflammation of the mucous membranes of mouth and gums, toothache, and heartburn.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. There have been complaints of gastrointestinal upset in conjunction with the drug use reported in the literature.

DOSAGE

Mode of Administration: Available as crude drug and as an infusion for internal and external use.

Preparation: A decoction for internal use is prepared by adding 3 gm of drug per 100 ml of water. A decoction using 6 gm of drug per 100 ml of water is used for external application and mouth rinses.

Daily Dosage: Internally, 2 to 3 cups of a decoction prepared according to the formula above are administered daily. Externally, a decoction using the formula above is administered as a gargle, mouthwash or rinse. Moist compresses may be applied to affected areas of the skin.

LITERATURE

European Golden Rod

Solidago virgaurea

DESCRIPTION

Medicinal Parts: The medicinal parts are the dried aerial parts **collected during the flowering** season, the fresh inflorescences and the flowering twigs.

Flower and Fruit: The yellow composite flowers are in erect racemes facing all directions and are simple or compound. They are medium-sized. The involucre bracts are imbricate and arranged in numerous rows. The ray florets are narrow, lingual and female. The disc florets are funnel-shaped, 5-tipped and androgynous. The fruit is a cylindrical achene with numerous ribs. It is brown, sparsely pubescent and 3.5 to 4.5 mm long with a tuft of hair.

Leaves, Stem and Root: The plant is a perennial that ranges in size from a few centimeters to over 1 m. The rhizome is cylindrical, noded, diagonally ascending and short. The stem is erect, cane-like, angularly grooved above, usually reddened beneath, and glabrous to loosely appressed pubescent higher up. The basal leaves are long-petioled, elliptical, acuminate and narrowing to the winged stem. The lower ones are serrate and the upper ones entire-margined.

Habitat: The plant is indigenous to Europe, Asia and North America.

Production: Golden Rod is the aerial part of *Solidago virgaurea*. It occurs in the wild in Hungary, former Yugoslavia, Bulgaria and Poland

Not to be Confused With: Despite qualitative and quantitative differences in their effects, drugs containing *Solidago gigantea* or *Solidago canadensis* are exchanged with *Solidago virgaurea* on the market; confusions with *Senecio* species are also conceivable.

Other Names: Aaron's Rod, Woundwort, Goldenrod

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins (0.2 to 0.3%):

In the European form—3,28-bisdemosidic ester saponins, including acyl-*virgaurea* saponins 1, 2 and 3; the acid components are acetic acid and beta-hydroxy butyric acid; aglycone is polygalic acid.

In the Asian form—bi- or tridemosidic *solidago* saponins I to XXIX, acyl-*virgaurea* saponin 1, acyl-*virgaurea* saponin 2, bellis saponin BA2

Volatile oil (0.4 to 0.5%, in the stored drug less than 0.2%): chief components

In the European form—alpha-pinene, beta-pinene, limonene, delta-elemene, gamma-cadinene, beta-phellandrene, myrcene

In the Asian form—limonene, germacrene-D, germacrene-B and beta-caryophyllene

Polysaccharides (water-soluble, 6 to 8%)

Diterpenes: cis-clerodane-derivatives, presumably only in the Asian variety

Carotenoids (as blossom pigments)

Flavonoids (1.1 to 2%): chief component rutin (0.8 %), including as well hyperoside, isoquercitrin, avicularin, quercetin-3-O-beta-D-robinoside, astragaln, nicotiflorin, kaempferol-3-O-beta-D-galactoside, kaempferol-3-O-alpha-arabinoside, kaempferol-3-O-beta-D-robinobioside, isorhamnetin-3-O-beta-D-galactoside, isorhamnetin-3-O-beta-D-glucoside, isorhamnetin-3-O-beta-D-rutinoside, rhamnetin-3-O-glucorhamnoside

Phenol glucosides (hydroxy benzylbenzoate diglucosides, 0.2 to 1.0%): leicarposide (0.2 to 1%), virgaureoside A (0.01 to 0.14%), benzyl-2,6-dimethoxy-benzoate

Caffeic acid derivatives (0.2 to 0.4%): including chlorogenic acid, neochlorogenic acid, 3,5-dicaffeoyl quinic acid

Phenol carboxylic acids: salicylic acid (0.1%), as well as vanillic acid, protocatechuic acid, ferulic acid, caffeic acid, sinapinic acid—free, esterified or glycosylated

Polyynes (in the roots): 2,8-cis-trans-matricaria ester, 2,8-cis-cis-matricaria ester, cis-lachnophyllum ester, matricaric acid lactone, lachnophyllum lactone

EFFECTS

The drug has a diuretic effect due to the leicarposide and the phenol glucosides. Golden Rod also inhibits the formation of urinary calculi. Leicarposide displays an analgesic effect. The saponin is antimicrobial, weakly spasmolytic and anti-exudative.

INDICATIONS AND USAGE

Approved by Commission E:

- Infections of the urinary tract
- Kidney and bladder stones

Unproven Uses: In folk medicine, Golden Rod is used internally for rheumatism, gout, diabetes, hemorrhoids, prostatic hypertrophy, nervous bronchial asthma, internal bleeding, enlargement of the liver, acute exacerbation of pulmonary tuberculosis; externally for inflammations of the mouth and throat as well as festering wounds

Homeopathic Uses: *Solidago virgaurea* is used for renal insufficiency and liver disorders.

CONTRAINDICATIONS

Irrigation therapy is contraindicated in cases of edema resulting from reduced cardiac and/or kidney function.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The drug possesses a weak potential for sensitization. Care must be taken in patients with chronic renal

diseases, and the drug should be used in this patient population only under physician supervision.

DOSAGE

Mode of Administration: As chopped drug by itself or in combination preparations.

Preparation: To make an infusion, 1 to 2 teaspoonfuls (3 to 5 gm) of drug is scalded with simmering water (150 ml) and strained after 15 minutes.

Daily Dosage: The daily dosage is 6 to 12 gm of comminuted drug prepared as an infusion. The infusion dosage is one cupful, 2 to 4 times daily between meals. The recommended dosage for the liquid extract is 0.5 to 2 ml liquid extract (1:1) in 25% ethanol 2 to 3 times daily. A dosage of 0.5 to 1 ml tincture (1:5) in 45% ethanol, 2 to 3 times daily is commonly used. Ample fluid intake should be ensured. In folk medicine, 0.5 to 2 gm drug as an infusion is taken 3 times daily.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic); parenterally: 1 to 2 ml sc, acute: 3 times daily; chronic: once a day (HAB1)

Storage: The drug must be protected from light and moisture.

European Mistletoe

Viscum album

DESCRIPTION

Medicinal Parts: The medicinal parts are the leaves and twigs collected before the berries form, the fresh herbs of certain host plants, the fresh leafy twigs with fruit collected in the autumn, the whole fresh plant collected from apple trees, the leaves and the berries.

Flower and Fruit: The flower is yellowish-green, dioecious and appears in insignificant, small, 3 to 5 flowered clusters. The perigone of the male flower is 4 tipped. The stamens are fused with the tips. The female flower is smaller and has 4 tepals with a thick stigma sitting on the short style. The fruit is a glossy, white, globular, pea-sized berry with thick sticky flesh. When ripe, it is white to yellowish or orange and has 1 to 2 oval or angular seeds.

Leaves, Stem and Root: The plant is a semi-parasitic, almost round bush growing on deciduous trees, which are 30 to 80 cm in diameter. The round branches are repeatedly bifurcated and thickened to knots at the joints and are the same yellowish-green as the leaves. The leaves are alternate, sessile, lanceolate or lanceolate-spatulate, coriaceous and evergreen.

Habitat: European Mistletoe is found mostly in Europe and as far as Iran. It is not found in America or Australia. It is cultivated in central Europe and China.

Production: European Mistletoe berries are the fresh or dried fruit of *Viscum album*. Mistletoe stem is the fresh or dried stem of *Viscum album*. Mistletoe herb consists of fresh or dried younger branches with flowers and fruits of *Viscum album*. The drug is collected in the wild during the spring and is air-dried or put in driers at a maximum temperature of 40° C.

Other Names: Mistletoe, Mystyldene, All-Heal, Birdlime, Devil's Fuge

ACTIONS AND PHARMACOLOGY

COMPOUNDS: EUROPEAN MISTLETOE FRUIT

Mucilage (2%, referred to as Viscin): The mock berries of the Mistletoe have not been fully investigated. Presumably, they lack the toxic lectins and viscotoxins.

EFFECTS: EUROPEAN MISTLETOE FRUIT

No information is available.

COMPOUNDS: EUROPEAN MISTLETOE STEM

The Mistletoe stems contain the same constituents as the Mistletoe foliage (*Visci alhi herba*), but because of the high percentage of support elements lacking any effective ingredients, these constituents exist only in very low concentrations.

EFFECTS: EUROPEAN MISTLETOE STEM

No information is available.

COMPOUNDS: EUROPEAN MISTLETOE HERB

Lectins (glycoproteins with 11% carbohydrate): Mistletoe lectin I (ML I, VAA 1, viscumin), mistletoe lectin II (ML II), mistletoe lectin III (ML III, VAA II), the lectin fractions named are isolectin mixtures

Polypeptides (built up out of 46 amino acids, 0.05-0.1%): viscotoxins A2, A3, B, Ps 1-

Mucilages (known as viscin, 4-5%): including among others galacturonans, arabino galactans

Sugar alcohols: including among others mannitol, quebrachitol, pinitol, viscumitol

Flavonoids: including glycosides of quercetin, quercetin methyl ethers, isorhamnetin, sakuranetin and homoeriodictyol; in the subspecies *V. album* ssp. *platyspermum*: homoeriodictyol-7-O-glucoside, isorhamnetin-3-O-rutinoside, isorhamnetin-3-[apiosyl (1->6)]-glucosyl-7-O-rhamnoside, 5,7-dimethoxyflavanone-4'-O-glucoside, 3',5,7-trimethoxyflavanone-4'-O-glucoside

Phenyl alyl alcohols: including among others syringin (syrigenin-4'-O-glucosides), coniferyl-4'-[apiosyl (1-2')] glucoside

Lignans: including among others syringaresinol and its glycosides

Triterpenes: including among others alpha-amyrin (alpha-viscol), beta-amyrin acetate, betulinic acid, oleanolic acid, ursolic acid *

EFFECTS: EUROPEAN MISTLETOE HERB

The Mistletoe lectins in the drug are hypotensive, cytotoxic and immune-stimulating. It causes significant improvement of the symptoms of chronic joint conditions, and a significant lengthening of survival times of cancer patients as well an improvement of quality of life.

INDICATIONS AND USAGE

EUROPEAN MISTLETOE FRUIT

Unproven Uses: The fruit acts on circulation by regulating blood pressure. It is also an expectorant and a tonic. In addition, the fruit is used to treat internal bleeding, epilepsy, arteriosclerosis, cramps, gout, hysteria and major blood loss.

EUROPEAN MISTLETOE STEM

Unproven Uses: The stem of European Mistletoe is used for its calming effect; in the treatment of mental and physical exhaustion; and as a tranquilizer against nervous conditions such as agitation, anxiety and increased excitability.

EUROPEAN MISTLETOE HERB

Approved by Commission E:

- Rheumatism
- Tumor therapy (adjuvant)

Unproven Uses: For treating degenerative inflammation of the joints and as palliative therapy for malignant tumors through nonspecific stimulation. Other uses include long-term therapy for cases of mild high blood pressure and as an arteriosclerosis prophylactic.

European Mistletoe tea may be used for high blood pressure, epilepsy, whooping cough, asthma, vertiginous attack, amenorrhea, diarrhea, chorea, nervous tachycardia, hysteria and nervousness.

Chinese Medicine: The drug is used for joint pain, tendon and muscle pain, lumbago, back pain, vaginal bleeding during pregnancy and agalactia.

Homeopathic Uses: The drug is used for dizziness, high and low blood pressure, cardiac arrhythmia and joint degeneration.

CONTRAINDICATIONS

EUROPEAN MISTLETOE HERB

Contraindications for parenteral administration of the herb include protein oversensitivity, chronic-progressive infections, e.g., tuberculosis, and conditions of high fever.

PRECAUTIONS AND ADVERSE REACTIONS**EUROPEAN MISTLETOE FRUIT**

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The berries are said to have emetic and evacuant effects and to have caused the death of children. However, unambiguous proof for these effects does not exist.

EUROPEAN MISTLETOE STEM

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

EUROPEAN MISTLETOE HERB

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. The drug is non-toxic with peroral administration. Local reactions can occur with parenteral administration of European Mistletoe extracts such as wheal formation, possibly also necrosis, chills, fever, headache, anginal complaints, orthostatic circulatory disorders and allergic reactions.

The wheal formation and the elevation of body temperature are considered signs of immune system stimulation and therefore as positive therapeutic effects.

DOSAGE**EUROPEAN MISTLETOE HERB**

Mode of Administration: Whole, cut and powdered herb are available in the forms of juice, coated tablets, drops, oil preparations, ampules and compound preparations.

Preparation: A medicinal tea is prepared using 2.5 gm (1 teaspoonful) finely cut drug with 1 cup cold water, steeped for 12 hours at room temperature, then strained. European Mistletoe wine is prepared by adding 40 gm drug to 1 liter wine; the preparation is ready for use after 3 days.

A liquid extract is made in the ratio of 1:1 with diluted ethanol; a tincture is made in the ratio of 1:5 with 45% ethanol.

Daily Dosage: The recommended daily dose is 10 gm drug. The dosage of medicinal tea is 1 to 2 cups daily. European Mistletoe wine dosage is 3 to 4 glasses daily, liquid extract dosage is 1 to 3 ml 3 times daily, and the tincture dosage is 0.5 ml 3 times daily.

The dosage for the treatment of hypertonia and as an arteriosclerotic prophylactic is 2 to 6 gm of European Mistletoe powder 3 times daily by mouth.

Storage: European Mistletoe must be stored away from the light over an appropriate drying agent.

European Peony

Paeonia officinalis

DESCRIPTION

- A *Medicinal Parts:* The medicinal parts are the dried ripe seeds, the fresh underground parts harvested in spring and the fresh root.

Flower and Fruit: The large flowers are solitary at the ends of the stems. The calyx consists of 5 green, partly corolla-like sepals. The wild species has 5 to 8 ovate, red petals that are 4 to 5 cm long; the cultivated forms have many more. The stamens are light-red with long yellow anthers. The 2 or 3 ovaries have red stigmas and develop into tomentose follicles containing numerous, dark, glossy, pea-sized seeds.

Leaves, Stem and Root: In its winter state, the plant has a turnip-like rhizome and close, gnarled root fibers that are brown on the outside and white inside. The stem is leafy, erect, lightly branched and glabrous, with a stalk about 50 cm high. The leaves are alternate, more or less petiolate with a dark green glossy upper surface and a light green finely pubescent undersurface.

m

Habitat: The plant is indigenous to the mountains of southern Europe from Portugal to Albania and Hungary, as far as Asia Minor. It is widely cultivated as a garden plant.

Production: European Peony flower consists of the petals of *Paeonia officinalis* and/or *Paeonia mascula*. European Peony root consists of the dried secondary roots of *Paeonia officinalis* and/or *Paeonia mascula*. The cultivated Peony roots are dug up in spring, cleaned and dried in the sun or artificially. The flowers are harvested in dry weather shortly after the end of flowering and dried quickly in the shade or in moderate sunshine.

Other Names: Peony, Piney

ACTIONS AND PHARMACOLOGY

COMPOUNDS: EUROPEAN PEONY FLOWERS

Anthocyanins: in particular paeonin (paeonidin-3,5-diglucoside)

Tannins (pentagalloyl glucose)

- £ *Flavonoids:* in particular kaempferol glycosides

EFFECTS: EUROPEAN PEONY FLOWERS

The plant contains anthocyanin glycosides and tannins (main active principle: paeonidin-3, 5-diglucoside). Animal tests have demonstrated strong uterine contraction, tone reduction in the gastrointestinal tract and a drop in blood pressure. Anticonvulsive and analgesic effects could not be demonstrated, although hypertonia has been reported in animal tests.

COMPOUNDS: EUROPEAN PEONY ROOT

Monoterpenes: monoterpene ester glucosides of the pinane-type: chief component paeoniflorine (1.5 to 3.5%)

EFFECTS* EUROPEAN PEONY ROOT

The plant contains anthocyanin glycosides and tannins (main active principle: paeonidin-3, 5-diglucoside*). Animal tests have demonstrated strong uterine contraction, tone reduction in the gastrointestinal tract and a drop in blood pressure. Anticonvulsive and analgesic effects could not be demonstrated.

INDICATIONS AND USAGE

EUROPEAN PEONY ROOT

Unproven Uses: In folk medicine. European Peony root is used for neurasthenia and neurasthenia syndrome, neuralgia, migraines and allergic disorders such as excitability, epilepsy and whooping cough.

Homeopathic Uses: Among uses in homeopathy are hemorrhoids and other anal conditions.

EUROPEAN PEONY FLOWERS

Unproven Uses: The flowers were formerly used as a folk medicine remedy for epilepsy, as an emetic, emmenagogue and abortifacient, for diseases of the skin and mucous membranes, fissures, anal fissures associated with hemorrhoids, gout, rheumatoid arthritis and ailments of the respiratory tract.

Homeopathic Uses: Homeopathic uses include hemorrhoids and other anal conditions.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages. Side effects that may occur, particularly in cases of overdosages, include gastroenteritis with vomiting, colic and diarrhea. Because efficacy has not been documented, therapeutic use cannot be recommended.

DOSAGE

EUROPEAN PEONY FLOWERS

Mode of Administration: Therapeutic use cannot be recommended because efficacy has not been proven.

How Supplied: Forms of commercial pharmaceutical preparations include drops and compound preparations.

Preparation: To make an infusion, use 1 g Tree Peony flowers per cup water.

Daily Dosage: Drink one cup of infusion per day.

Homeopathic Dosage: 5 drops. 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (chronic). Parenterally: 1 to 2 ml sc acute. 3 times daily: chronic: once a day (HAB1).

Storage: Store protected from light and moisture for no longer than 1 year.

EUROPEAN PEONY ROOT

Mode of Administration: European Peony root is administered as a tincture. European Peony flowers are used as an inactive ingredient in cough and fumigant teas and as a coloring agent in cough syrup.

How Supplied: Forms of commercial pharmaceutical preparations include drops and compound preparations.

Daily Dosage: Tincture: 30 to 50 drops daily.

Storage: Store protected from light and moisture for no longer than 1 year.

European Sanicle

Sanicula europaea

DESCRIPTION

Medicinal Parts: The medicinal parts are the fresh flowering herb and the basal leaves collected during the flowering season and dried.

Flower and Fruit: The white or reddish inflorescences form a cyme with small head-like umbels with 4 to 6 linear bracts. The calyx is 5-tipped and there are 5 petals. The androgynous florets are in the center of the small umbel surrounded by 10 to 20 male florets. The ribless fruit is densely covered with barbed thorns and almost globular, with long styles that curve downwards. The mericarps are distinctly domed and almost flat at the narrow groove. There are numerous oil lines.

Leaves, Stem and Root: The perennial, plant grows 20 to 40 cm high. The short rhizome is solid, horizontal, multi-segmented, broken off and covered in thick fibers. It has scales formed by leaf stalk remnants at the neck and has a number of segments. The stem is usually undivided, erect, grooved, and has only 1 to 2 sessile leaves. The leaves are basal, long-petioled, and palmate with 5 lobes. The tips are 3-lobed. The lateral tips are divided in 2 and especially glossy underneath.

Characteristics: The taste is slightly salty, bitter and dry.

Habitat: The plant is indigenous to Europe, Asia Minor, the Caucasus, western Siberia, northern Africa, and in the mountains of tropical Africa.

Production: European Sanicle consists of the dried, above-ground parts of *Sanicula europaea*, which is collected in the wild.

Not to be Confused With: Commercially, the herb may be mixed with leaves of *Cardamine enneaphylos*. In some areas, *Astrantia major* is labeled as sanicle and used accordingly in folk medicine.

Other Names: Poolroot, Self-Heal, Sanicle

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Triterpene saponins (up to 13%): including among others, acyl-saniculosides A-D, aglycones including A1-barrigenol, R1-barrigenol, barringtogenol

Caffeic acid derivatives: rosmarinic acid, chlorogenic acid

Flavonoids: chief components rutin, isoquercitrin, astragalin

EFFECTS

The drug has a mild astringent and expectorant effect. It also reduces edema in animal experiments. The saponin complex has been shown to be antimicrobial and antifungal.

INDICATIONS AND USAGE

Approved by Commission E:

- Cough/bronchitis

European Sanicle is used for mild inflammation of the mucous membranes of the respiratory tract.

Unproven Uses: Past external uses in folk medicine have included wounds and contusions, and European Sanicle has been used internally for stomach inflammations and bloody vomiting, among other applications.

Homeopathic Uses: The primary application of European Sanicle in homeopathy is for diarrhea.

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages.

DOSAGE

w* *Mode of Administration:* Comminuted drug for decoctions and other preparations for oral application.

How Supplied: Commercial pharmaceutical preparations include juices, tablets and compound preparations.

Preparation: No information is available.

Daily Dosage: The average daily dose is 4 to 6 g of the herb.

Homeopathic Dosage: 5 drops, 1 tablet or 10 globules every 30 to 60 minutes (acute) or 1 to 3 times daily (Chronic); parenterally: 1 to 2 ml sc acute: 3 times daily: chronic once a day (HAB34).

Storage: The drug must be kept in sealed containers, protected from light.

European Water Hemlock

Cicuta virosa

DESCRIPTION

Medicinal Parts: The medicinal part is the rhizome with roots.

Flower and Fruit: The flower is a white umbelliferous blossom with distinct calyx tips. The petals have indented tips. The style cushion is flat. The fruit is brown-yellow, 2.5 mm by 3 mm, and has dark-brown stripes.

Leaves, Stem and Root: The plant grows to a height of 30 to 120 cm. The leaves are 2- to 3-pinnate. The leaflets are lanceolate and sharply serrate. The whole plant is glabrous. The rhizome is tuberous, fleshy and hollow. The stem is erect, round, hollow, glabrous, branched above, and forms adventitious roots at the nodes.

Characteristics: The rhizome has a bad odor and is extremely poisonous.

Habitat: The plant is indigenous to Europe and Asia.

Other Names: Cowbane

ACTIONS AND PHARMACOLOGY**COMPOUNDS**

Polyynes: including cicutoxin (0.07-0.2% in the fresh rhizome tuber), isocicutoxin, cicutol, cicudiol, faltarindiol

Furanocoumarins

Alky I phthalides

EFFECTS

No information is available.

INDICATIONS AND USAGE

Homeopathic Uses: The drug is used in homeopathic dilutions for migraine, painful menstruation, worm infestation and inflammation of the skin.

PRECAUTIONS AND ADVERSE REACTIONS

The freshly harvested root stock is extremely poisonous due to its cicutoxin content. The plant itself is weakly poisonous.

OVERDOSAGE

Two to 3 gm of the root stock are said to be fatal for an adult. The toxicity of the drug declines through dehydration and storage. Symptoms of poisoning, following the initial stupor and nausea, include severe tonic-clonic spasms, unconsciousness, cyanosis and extremely widened pupils. Death occurs through asphyxiation at the peak of a convulsive attack or through heart failure.

Forced diuresis, hemodialysis and hemoperfusion are initiated as treatment for poisonings. Gastric lavage should only be carried out under anesthetic because of the danger of convulsion. Benzodiazepine or barbiturates are used to lessen the effects of the spasms.

DOSAGE

Mode of Administration: The drug is used topically and internally as a dilution of the mother tincture.

Evening Primrose

Oenothera biennis

TRADE NAMES

Evening Primrose Oil Capsules (available from numerous manufacturers), Mega Primrose Oil, Oil of Evening Primrose, Original Primrose for Women, Royal Brittany Evening Primrose Oil

DESCRIPTION

Medicinal Parts: The medicinal parts are the fatty oil extracted from the ripe seeds and the fresh plant gathered at the beginning of the flowering season.

Flower and Fruit: The fragrant flowers are 2 to 3 cm long and are solitary in the leaf axils. The open ones are lower than the buds. The sepals are lanceolate, acuminate, turned down, thin, more or less pale green and smooth on the outside with a few scattered hairs. The petals are obovate. The ovary is inferior. The style has a 4-sectioned stigma. The fruit is a linear-oblong, quadrangular, downy-villous capsule that's up to 3 cm long. The seeds are 1.5 mm long, dark gray to black with irregular sharp edges.

Leaves, Stem and Root: This biennial grows up to 1 m and has a spindle-shaped, fleshy, turnip-like root, which produces leaf rosettes in the first year. The stem is erect, unbranched or branched higher up and angular. The ovary is a capsule covered in short glandular hairs, with simple, light hairs on the purple papilla. The cauline leaves are short-petioled or sessile, often hanging, oblong-lanceolate, pointed, irregular and finely dentate.

Characteristics: The flowers are fragrant and open in the evening.

Habitat: Originally indigenous to North America, it is now naturalized throughout most of Europe and parts of Asia.

Production: Evening Primrose oil is the fatty seed oil of *Oenothera biennis*. The oil is extracted by means of a cold-extraction process, which involves hexane in steel or glass-lined tanks. The extract is washed and the solvent removed using low pressure.

Other Names: Fever Plant, King's Cureall, Night Willow-herb, Scabish, Sun Drop

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Fatty oil: chief fatty acids linoleic acid (65-80%), gamma-linolenic acid (8-14%), oleic acid (6-11%), palmitic acid (7-10%)

EFFECTS

Gamma-linolenic acid (a component in Evening Primrose oil) is converted to dihomo-gamma-linolenic acid and then to prostaglandin E1 (PGE1) in-vivo by the enzyme delta-6-desaturase. PGE1 has anti-inflammatory and cell membrane stabilizer activity in the body. Evening Primrose oil supplements provide increased levels of dihomo-gamma-linolenic acid in the blood of people with a deficiency of the enzyme delta-6-desaturase. Gamma-linolenic acid is also a component in breast milk, but is not added to infant formulas. It has been postulated that gamma-linolenic acid may be beneficial to neural development in breast-fed infants (Newall, 1996).

A review of the literature involving human trials shows that EPO has not been effective in the treatment of atopic asthma, weight loss, atopic dermatitis, arthritis, attention deficit disorder, diabetes or premenstrual syndrome. Animal studies have demonstrated benefits in treating hypertension, thrombosis, hypercholesterolemia and platelet aggregation.

CLINICAL TRIALS

Mastalgia

A retrospective study covering seven years involving 566 women with cyclical breast pain (mastalgia) was performed. Most women were first treated with Vitamin B-6 (pyridoxine HCL) 100 mg daily for a 3-month period. Those that did not

respond were given 3 g of Evening Primrose Oil (EPO) daily for a one-month period followed by 2 g daily for an additional two months. Other women were given the Evening Primrose oil regimen as first-line treatment. 58% of the pyridoxine/EPO treatment group reported pain relief and 59% of the EPO first-line group reported relief. The author concluded that good responses can be obtained from products devoid of significant side effects, such as EPO and Vitamin B-6 as a first line treatment (McFayden, 1992). Tamoxifen and danazol should be reserved for those patients who do not respond to EPO or pyridoxine.

Premenstrual Syndrome

A meta-analysis of 7 placebo-controlled trials involving the use of EPO for the treatment of premenstrual syndrome (PMS) was carried out in 1996. The authors note that two well-constructed studies in the group failed to show any statistically relevant beneficial effects with EPO in treating PMS symptoms. The scoring in the remaining studies was not consistent and therefore the authors were not able to pool the results for statistical analysis (Budeiri, 1996).

INDICATIONS AND USAGE

Unproven Uses: Evening Primrose oil is used for neurodermatitis, premenstrual syndrome and as a dietary aid. The drug is also used to treat hyperactivity in children, high cholesterol levels, menopausal hot flashes and mastalgia.

Capsules containing 500 mg of Evening Primrose oil have been approved for use in Germany, in the treatment of and to relieve the symptoms of atopic eczema.

PRECAUTIONS AND ADVERSE REACTIONS

There are case reports of seizures in schizophrenic patients that were being treated with Evening Primrose oil along with phenothiazine medications. Practitioners should be aware that Evening Primrose oil has a potential to lower the seizure threshold in patients with seizure disorders or those being treated with drugs that lower the seizure threshold.

DOSAGE

Mode of Administration: Evening Primrose oil is available in capsules for oral administration.

How Supplied:

Capsules—500 mg, 1300 mg.

Most commercial products (capsules) are standardized for gamma linolenic acid content of 9%.

Daily Dosage: Treatment with Evening Primrose oil may require up to 3 months duration before positive results are attained for all indications listed below (Newall, 1996).

Atopic eczema

Adult—6 to 8 grams daily in divided doses

Pediatric—2 to 4 grams daily in divided doses

Mastalgia (breast pain)

3 to 4 grams daily in divided doses

Storage: Evening Primrose oil is rinsed in nitrogen and stored in cooled tanks lined with polyethylene. Commercial products should be stored at room temperature in an area that is dry and not in direct sunlight.

Eyebright

Euphrasia officinalis

TRADE NAMES

Eyebright (Available from numerous manufacturers) Eye--bright Herb, Herbal Eyebright, NuVeg Eyebright

DESCRIPTION

Medicinal Parts: The medicinal part is the flowering plant.

Flower and Fruit: White, bluish or reddish-violet flowers are in spike-like inflorescence in the axils of the upper leaves. The calyx has 4 tips and is glabrous to short bristly. The corolla is bilabiate and is 8 to 12 mm long. The upper lip is domed, helmet-like and revolute at the tips. The lower lip has 9 dark violet long stripes. There are 4 stamens and 1 superior ovary. The fruit is a narrow, oblong capsule with a ciliate edge. The seeds are numerous and grooved.

Leaves, Stem and Root: The plant is about 30 cm high. It is annual. The stem is rigid, erect, lightly branched below. The leaves are opposite, sessile and grass-green. They are ovate or oblong-ovate and twice as long as wide. The involucre bracts have 4 to 7 teeth.

Characteristics: Eyebright is odorless and has a bitter and salty taste. It is semi-parasitic.

Habitat: Europe.

Production: Eyebright consists of the whole plant of *Euphrasia officinalis* gathered during flowering season. Eyebright herb consists of the fresh or dried, above-ground parts of *Euphrasia officinalis*.

Other Names: Euphrasia

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Iridoid monoterpenes: aucubin, catalpol, euphroside, ixoroside, veronicoside, verproside, mussaenoside, ladroside

Lignans: dehydrodiconiferyl-4-beta-D-glucoside

Flavonoids: including apigenin-, chrysoeriol- and luteolin-7-O-galactosides and -rhamnogalactosides

Tannins

EFFECTS

No documentation available.

INDICATIONS AND USAGE

Unproven Uses: Eyebright preparations are used externally as lotions, poultices, and eye-baths, for eye complaints associated with disorders and inflammation of the blood vessels, inflammation of the eyelids and conjunctiva, as a preventive measure against mucus and catarrh of the eyes.

In folk medicine, Eyebright is used for blepharitis, conjunctivitis, styes, eye fatigue symptoms, functional eye disorders of muscular and nervous origin, coughs and hoarseness.

The efficacy of the herb for its^ claimed uses is not documented.

PRECAUTIONS AND ADVERSE REACTIONS

Health risks or side effects following the proper administration of designated therapeutic dosages are not recorded.

DOSAGE

Mode of Administration: Since the efficacy of the claimed uses is undocumented, and external eye application is not absolutely hygienic, therapeutic use cannot be recommended.

Preparation: To prepare a tea, add 2 to 3 gm of finely cut drug to boiling water; strain after 5 to 10 minutes.

Decoction — 2%.

Daily Dosage: A decoction is used 3 to 4 times daily for eye rinses.

Fagopyrum esculentum

See *Buckwheat*

False Schisandra

Kadsura japonica

DESCRIPTION

[^]pt *Medicinal Parts:* The fruit of the plant is considered to have medicinal value, but efficacy has not been documented.

Flower and Fruit: Single axillary flowers on up to 4 cm long, purple stems; there are 9 to 15 white, reddish or yellow tepals. Male flowers have numerous stamens; female flowers have numerous carpels and a superior ovary. The fruit is a berry-like, globose aggregate fruit.

Leaves, Stem and Root: This dioecious climbing shrub has leaves that are 6 to 11 cm long, elliptical to lanceolate, simple, pergament-like with a slightly crenate margin.

Habitat: Indigenous to Japan.

Production: False Schisandra fruit are the dried fruits of *Kadsura japonica*. They are collected in the wild.

Not to be Confused With: *Schisandra chinensis*

Other Names: *Kadsura* fruit

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Volatile oil: including germacrene C

Lignans: dibenzo[a,c]cyclooctene lignans, including binan-kadsurin-A-ester

EFFECTS

Although clinically unsubstantiated, False Schisandra fruit is credited in classical Chinese-Tibetan medicine with an efficacy analogous to that of *Schisandra* fruit. That drug exhibits liver-protective, inflammation- and tumor-inhibiting, neuroleptic and anti-convulsive effects, as well as a non-specific enhancement of physical performance ability. Experimental documentation regarding analogous efficacy of *kadsura* fruit has not been forthcoming, however.

INDICATIONS AND USAGE

Unproven Uses: The fruit is used for chronic coughs and asthma, chronic diarrhea, enuresis, spermatorrhoea, night sweats and insomnia.

H Chinese Medicine: The fruit is used as an analgesic for pains in the bones, ligaments, stomach and during menstruation, as well as for spontaneous, painful local swellings.

DOSAGE

Preparation: Before being dried and cut, the fruits are simmered in vinegar.

Daily Dosage: 1.5 to 6 g

Chinese Dosage: 9 to 15 g drug daily

PRECAUTIONS AND ADVERSE REACTIONS

No health hazards are known in conjunction with the proper administration of designated therapeutic dosages.

False Unicorn Root

Veratrum luteum

DESCRIPTION

Medicinal Parts: The medicinal part is the root.

Flower and Fruit: The flowers are numerous, greenish-white, without covering leaves. They are dioecious and arranged in terminal racemes of 15 cm with nod-like feathery. The petals are narrow and shorter than the stamens, while the filaments taper to a point. The anthers are terminal and 2-lobed. The petals of the female flowers are linear, the stamens short, and the ovary ovate, deltoid and grooved. The stigmas are oblong, have 3 grooves and open upward. The fruit is numerous and capsule-like, compressed and acute.

Leaves, Stem and Root: The plant is a perennial with a strong leafy stem 30 to 90 cm high. The stem is undivided, smooth and angular. The foliage leaves are alternate; the lower ones spatulate and the upper ones lanceolate. The basal leaves are 20 cm long, 1.25 cm wide, narrow and whorled at the base. The rhizome is tuberous and stunted. It is approximately 1.25 cm long.

Characteristics: False Unicorn Root has a bitter taste.

Habitat: The plant grows in the Mississippi Delta region.

Production: False Unicorn Root is the rhizome of *Veratrum luteum*.

Other Names: Starwort, Helonias Root, Blazing Star, Fairy-Wand

ACTIONS AND PHARMACOLOGY

COMPOUNDS

Steroid saponins: (mixture is referred to as chamaelirin, ca. 10%), aglycone diosgenin

EFFECTS

Oxytocic, diuretic, anthelmintic

INDICATIONS AND USAGE

Unproven Uses: False Unicorn Root is used for menstrual disturbances, dysmenorrhea and pregnancy complaints.

PRECAUTIONS AND ADVERSE REACTIONS

General: No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages. The appearance of gastric complaints is conceivable with the drug, due to the high saponin content, particularly in cases of overdosage.

Pregnancy: Not to be used during pregnancy.

Fennel

Foeniculum vulgare

DESCRIPTION

Medicinal Parts: The medicinal parts are the Fennel oil extracted from the ripe fruit and the dried ripe fruit and Fennel seeds of *Foeniculum vulgare*.

Flower and Fruit: The inflorescence is fairly large umbels almost 15 cm across on very irregular rays. The flowers are fairly small and usually androgynous. The petals are a rich yellow, broadly ovate and have an involute lobe at the tip. The style is very short and almost wart-like. The fruit is glabrous, brownish or greenish-gray. They are 6 to 10 mm long, somewhat cylindrical with blunt ribs and strongly domed.

Leaves, Stem and Fruit: The plant is biennial to perennial, about 80 to 150 cm high, glabrous, sea-green to glaucous and has a strong spicy smell. The stem is erect, round, glabrous, smooth and filled with latex. The lower leaves are petiolate and have long sheaths.

Characteristics: Fennel has a spicy aroma.

Habitat: Fennel is indigenous to the Mediterranean region, has spread to England, Germany, South Tyrol and Argentina. Fennel is also found today in Iran, India and China.

Production: Fennel oil is the essential oil obtained from the dried, ripe fruits of *Foeniculum vulgare* by steam distillation.

Fennel seed consists of the dried, ripe fruits of *Foeniculum vulgare*.

Other Names: Large Fennel, Sweet Fennel, Wild Fennel, Fenkel, Bitter Fennel

ACTIONS AND PHARMACOLOGY

COMPOUNDS: FENNEL OIL

When extracted from bitter fennel the chief components are:

Trans-anethols (50-75%)

Fenchone (12-33%)

Estragole (2-5%?)

Additional components are - alpha-pinenes, camphene, p-cymene, myrcene, limonene, alpha- and beta-phellandrene, gamma-terpenes, terpinols, cis-ocimene

When extracted from sweet fennel the chief components are:

Trans-anethole (80-90%)

Fenchone (1-10%?)

Estragole (3-10%*c*)

Additional components are - alpha-pinenes, camphene, p-cymene, myrcene, limonene, alpha- and beta-phellandrene, gamma-terpenes, terpinols, gamma-fenchen

EFFECTS: FENNEL OIL

Stimulation of gastrointestinal motility; in higher concentrations, antispasmodic; experimentally, anethole and fenchone have shown a secretolytic action on the respiratory tract. In vitro, it is antimicrobial.

COMPOUNDS: FENNEL SEED

Volatile oil

With bitter fennel the chief components are:

Trans-anethole (50-75%)

Fenchon (12-33%)

Estragole (2-5%)

Additional components - alpha-pinenes, camphene, p-cymene, myrcene, limonene, alpha- and beta-phellandrene, gamma-terpenes, terpinols cis-ocimene

With sweet fennel the chief components are:

Trans-anethole (80-90%)

Fenchon (1-10%)

Estragole (3-10%)

Additional components - alpha-pinenes, camphene, p-cymene, myrcene, limonene, alpha- and beta-phellandrene, gamma-terpenes, terpinols, gamma-fenchen

Hydroxycoumarins (traces): umbelliferone, scopoletine, osthenol, scoparin, Furocoumarins traces) including bergapten, columbianetin, psoralen, xanthotoxin

Pyranocoumarins

Flavonoids

Fatty oil

EFFECTS: FENNEL SEED

The seed promotes gastrointestinal motility. In higher concentrations, Fennel has an antispasmodic effect. Experimentally, anethole and fenchone have been shown to have a secretolytic effect in the respiratory tract of frogs. Aqueous Fennel extracts raised the mucociliary activity of the ciliary epithelium.

INDICATIONS AND USAGE

FENNEL OIL

Approved by Commission E:

- Cough
