Violating routines	Omitting or incorrectly performing a step in an established routine to encourage the child to comment.	When offering cookies, forget to provide a napkin. Child: Us need napkin. Adult: <i>We</i> do! You're right! <i>We</i> do need napkins.
Withholding objects and turns	Used to encourage requests.	Clinician skips a client's turn in a board game. Child: My turn! Adult: It <i>is</i> ! Is it your turn? I guess it <i>is</i> !
Violating object function	Used to encourage use of negative forms.	Adult uses demitasse spoon to stir large bowl of pudding mix. Child: No that one! Adult: No? You <i>don't</i> want me to use this spoon? You <i>don't</i> ? We <i>don't</i> use this spoon to stir?
"Syntax stories"	Clinicians and parents create stories, similar to "Dad's Bad Joke," (see Box 9-3) that give multiple exemplars of target forms.	Excerpt from "Dad's Bad Joke": Dad had a big grin on his face. Warren and Neil started to play. They were having lots of fun. Then something happened. The light went out. We're in the dark! said Neil. We sure <i>are</i> , said Warren. Are you afraid? Are you afraid of the dark? No, I'm not, said Neil. I <i>am</i> not afraid. Are you?

Adapted from Cleave, P., & Fey, M. (1997). Two approaches to the facilitation of grammar in children with language impairments: Rationale and description. *American Journal of Speech-Language Pathology*, 6, 23-32.

Script Therapy

Remember that Olswang and Bain (1991) described script therapy as a way to reduce the cognitive load of language training by embedding it in the context of a familiar routine. One way to use scripts is to develop some verbal routines with the child in the intervention context. We might, for example, have some stock phrases related to the client's targets that we say at the beginning

of each session. To a client working on use of *I* and copula verbs, we could say, "I *am* glad to see you. I *am* happy you came today. I *am* ready for you. How about you?" We also talked in Chapter 3 about establishing the script and then violating it, encouraging the client to comment on or correct the violation. In addition, we discussed "playing" with the script, getting clients to ring changes on it as a way to broaden their use of the forms in the routine.

Event Structures

Script therapy also can be used in conjunction with event structures that are familiar to the client. Carrow-Woolfolk (1988) described event structures as holistic, goal-directed, sequentially organized sets of activities that have prototypic features but some internal variation. Ordering food in a restaurant would be one example; going grocery shopping is another. We can choose event structures from the “real world” that are well-known to our clients and use these as contexts for developing verbal routines. The clients and clinician can then use props to act out the event structure, with the clinician first modeling the entire verbal script. Later, cloze procedures can be used to elicit increasingly large parts of the verbal script from the clients. Eventually the clients can act out and recite the entire event structure. The clients can repeat the enactment of the event structure numerous times, trading roles so that each gets a chance to produce all the parts of the verbal script. A client who is the shopper one day may be the clerk the next. After a while, variations on the event structure and its verbal script can be imposed. Children who used a script for going grocery shopping might be asked to pretend they are shopping for pet food in a pet store. Finally, the clinician can play a role in the event structure and violate the expected events or verbal formulae that are familiar to the clients.

These scripts can serve as frames for developing vocabulary, morphosyntax, and pragmatics. An event script for vocabulary development might involve shopping in a clothing store. The clinician can model using a sentence frame to request items whose names the child needs to learn (“I need socks, I need a *blouse*, I need a *vest*.”). Morphosyntactic targets can also be addressed (“I need socks, my baby needs socks”). Pragmatic practice in taking turns and maintaining topics, and adding new information to established topics can also be included.

Using event structures in a script-based intervention program differs somewhat from using event scripts in more child-centered play. Child-centered play, as we discussed earlier, is more open-ended. The clinician can provide guidance and scaffolding but generally follows the child’s lead; the focus of the activity is the play. In script therapy using event structures, the play provides a background, but the focus is using the target language forms and functions. The clinician takes a stronger leadership role in the activity, modeling what the child is to say and requesting that the child say the target forms. We might use the same play scripts for each of these two types of approaches. We might, for example, use a scripted, hybrid version of “shopping” to work on specific linguistic goals, such as food vocabulary and sentences of the form, “I need X.” We might use the same shopping context another time for more child-centered play, focusing on developing turn-taking skills and increasing the range of communicative intentions expressed. This time, instead of letting the child simply ask for a series of products (“I need apples, I need grapes”), as we did in the hybrid form of the activity, we could introduce some problems (“We’re out of grapes”) and provide opportunities and scaffolding for the child to use language to overcome these obstacles in the play.

We would want to select event structures that are familiar to our clients but that also lend themselves to the goals being targeted. If spatial prepositions are intervention goals, for example, the restaurant might not be the best structure to choose. Going to a birthday party could be better (for example, “Put your gift *beside* the table; pin the tail *on* the donkey; put the candle *in* the cake; your treat bag is *under* your hat.”). Script-based activities have been shown to be effective in teaching semantic relations (Kim, Yang, & Hwang,

2001) and improving social uses of language (Neeley, Neeley, Justen, & Tipton-Sumner, 2001) in preschoolers with disabilities.

Literature-Based Scripts

Bedrosian (1997), Cole, Maddox, and Lim (2006), Snow and Goldfield (1983), as well as Wasik and Bond (2001) have discussed the advantages of joint book reading as an ideal context for language learning. Picture books are of interest to children and are a natural, familiar format for adult-child interaction. They use repetitive language closely tied to the nonlinguistic, pictured context. In addition, Kirchner (1991) pointed out that joint book reading provides an excellent opportunity for adults to scaffold the child’s contribution to the interaction. With the stable, repetitive form of the text of the book, adults can encourage the child to operate in the zone of proximal development, asking the child to make a contribution to the reading that is slightly above what he or she is able to do in spontaneous speech. As the child acquires the script, the adult can “up the ante,” requiring a higher level of contribution later. Ratner, Parker, and Gardner (1993) suggested further that joint book reading is an ideal context for establishing the joint attention so necessary for effective discourse and for providing a framework for semantic contingency, as the book anchors the child’s and adult’s remarks to a reliable, meaningful, and engaging base. Carrow-Woolfolk (1988) pointed out that both book reading and recitation of story passages provide ideal opportunities for practicing and stabilizing specific language skills. In short, much language learning normally goes on in the context of the pleasant and familiar activity of joint book reading. Research has demonstrated that shared book reading can promote vocabulary acquisition (e.g., Arnold, Lonigan, Whitehurst, & Epstein, 1994; Kotaman, 2008; Wasik & Bond, 2001), grammatical development (Bradshaw et al., 1998; Whitehurst et al., 1988; Yoder et al., 1995), social communication (Crain-Thoreson & Dale, 1999; Stanton-Chapman, Kaiser, & Wolery, 2006), and preliteracy (Justice, McGinty, Piasta, Kaderavek, & Fan, 2010; Munro & Lee, 2008). In fact, Justice et al. (2009) and Lovelace and Stewart (2007) showed that having teachers simply add some explicit references to print during story reading resulted in significant gains in print knowledge for preschoolers who were at risk as well as for those with language impairments. We can make use of this ideal context in language intervention as well. Cole, Maddox, and Lim (2006) add that the practice appears culturally appropriate for families from a range of backgrounds.

Clinicians can choose books for literature-based intervention that provide frequent examples of intervention targets.

Of course, just reading books to children with language impairments does not constitute intervention. If all they needed were to be read to, most would have learned language by now and would not be in an intervention program. We need to structure the joint book reading experience in the following three important ways:

- By the use of carefully planned, scaffolded language input. For example, if spatial terms are a vocabulary category to be targeted, we would choose books that provide many examples of these terms, such as *Inside, Outside, Upside Down* (Berenstain & Berenstain, 1968), reading the book repeatedly, using emphatic stress on the spatial terms, and asking the child to comment or answer questions after hearing each page ("Where is the bear now? He's . . ."). Eventually, cloze techniques can be used to "up the ante" on the child's contribution.
- By the selection of books that provide opportunities for the child to practice forms and meanings being targeted in the intervention. For example, if we are working on auxiliary verbs, we can select a book such as *Green Eggs and Ham* (Suess, 1956) and after several rereadings, ask the child to play the role of Sam-I-Am.
- By using these carefully selected books as an opportunity for language production practice. Using spatial vocabulary as our example again, we can, after several readings using questions and cloze techniques, ask the child to "read" *Inside, Outside,*

Upside Down to the clinician and to several puppets, so the child must show each page to each "listener" and read the page over again to each.

McGee and Schickedanz (2007) also suggest that multiple readings of the same book can be useful opportunities to focus children's attention on different aspects of the book, some relating to print awareness (Justice et al., 2009; 2010), others to vocabulary and language structure, and still others to literal and inferential comprehension (van Kleeck, Vander Woude, & Hammett, 2006). Skarakis-Doyle and Dempsey (2008) suggest additional techniques for challenging children to enhance their interaction with stories. Some examples of techniques that can be used in rereading activities appear in Box 9-5.

In addition to carefully structuring these activities, though, we need to be aware, as Kaderavek and Justice (2002) caution us, that some children just don't like listening to books; in fact, unwillingness to listen to books is associated with language disorder. To use book reading as an intervention context, it is crucial that we make sure children are engaged and interested in the activity and that targets addressed in book reading are also practiced and generalized in other contexts. Kaderavek and Justice advocate using strategies like allowing children to choose a book from several that contain target forms, asking children to describe their feelings about the book being used, allowing the child to hold and control

BOX 9-5 Activities for Enhancing Interactions with Preschool Storybooks

Questions: After reading a story, ask questions about the literal events, as well as about inferences that can be drawn (Ex.: What did Goldilocks do first when she went into the Bears' house? How did the bears feel when they came home and saw what Goldilocks had done?)

Joint Story Retell: After reading a story, use cloze questions to help the child recall and reconstruct the story (e.g., When Goldilocks saw the Bears' house was empty, she went inside and sat down at the _____. She saw three _____. First she tasted _____. . .)

Expectancy Violation Detection: Retell the story, making errors. Pause after each, allowing the child to detect and correct them. If he or she does not detect them, call attention to them and ask, "Is that right?" (e.g., Goldilocks tasted the Papa Bear's porridge and said, "This porridge is just right!")

Picture Walk: Before reading the book, hand it to the child, and ask him or her to look through it and tell about what he or she sees in the pictures, and what the story may be about.

Print Referencing Activities: Call attention to print during reading by focusing on:

Print Organization

Page Order: "I'm going to read this page first, then I'll read that page next to it."

Author: the author of this book, Bill Martin, Jr., wrote all the words I'm going to read in it.

Page Organization: "I'm going to start reading here at the top of this page."

Title: "Let's look at this book; here's the title. That's the name of the book. It's called . . ."

Print Direction: "I'm going to start reading here and read across the page this way."

Print Meaning

Print Function: This writing here on the page says, "Brown Bear, Brown Bear . . ."

Environmental Print: "Oh, look at this new truck we got. It says "Ambulance" on it!

Concepts of Print: "These words written here will tell us what the bear said."

Letters

Upper and Lower Case: You can see 2 letters on this page of the alphabet book. The big one is the capital S, the little one is a small s.

Letter Names: There's a letter on this page that you see a lot, at the beginning of *bear* and *brown*. Which letter is it?

Concept of Letters: Can you find a letter on this page that is at the beginning of Malik's name?

Words

Word Identification: This word here is the word see. It's on almost every page of this book. Let's see if we can find it on each page, before I read the page.

Short versus Long Words: This word is *yellow*. It looks longer than the word *red*. Let's count the letters in *yellow* and *red* to be sure.

Letters versus Words: Can you find a B on this page? B is at the beginning of two different words on this page, *brown* and *bear*.

Concept of Word: Let's count how many words are written on this page. Can you help me?

the book (by turning pages, etc.), incorporating activity and movement (such as acting out characters' antics) in the book reading, and responding to the child's interests and attentional shifts during reading. When encouraging parents and teachers to use book reading for language enrichment and literacy development, it is equally important to alert them to these issues.

We looked at one approach to scaffolding language input in joint book reading in Chapter 7: that of Whitehurst et al. (1991). Kirchner (1991) provided another approach that is more naturalistic in its discourse structure and is suited to children in both the emerging language and DL stages. She advocated using children's books as the routine, predictable language base from which the child can learn to segment longer and more complex utterances into their constituent parts. Because children with language impairments appear to rely on using unanalyzed language forms learned through imitation, rather than generating novel utterances, more than normally developing children do (Wetherby, Schuler, & Prizant, 1997), the joint book reading situation provides an opportunity to exploit this tendency and use it to scaffold the child to higher levels of production. The fixed text of the storybook provides an ideal substrate for the child's emerging linguistic analysis. Kirchner (1991) provided a sequence of activities to be used with individuals or groups in conjunction with joint book reading. These are summarized in Box 9-6. Books for language intervention are chosen on the basis of the forms used within their text. Not just any good children's book will do, but you may be surprised at how many classics of children's literature use repetitive semantic and syntactic forms that are commonly the targets of intervention in the DL period. Ratner, Parker, and Gardner (1993) and Owens (2009) assembled a list of classic children's books that contain repetitive use of grammatical patterns commonly targeted in language intervention. Their lists form the basis for the suggestions for books to use in literature-based script therapy that can be found in Appendix 9-2. Additional resources for using children's literature in language intervention include Gebers (1990), Kaderavek and Justice (2002), Lockhart (1992), and Owens and Robinson (1997).

In addition to classic children's books, other forms of children's literature also are very useful adjuncts to script therapy. Songs and nursery rhymes can be used in exactly the same way as books to highlight semantic and syntactic forms in reliable, repetitive formats, following Kirchner's (1991) procedures. Zoller (1991)

presented some suggestions along these lines. Finger plays or songs and rhymes that lend themselves to acting out are especially helpful, as they engage clients in multimodal experience with the text. What's more, they give clients a way to participate in the activity as the clinician sings or recites, until the text has been internalized enough for them to participate through the verbal medium. Box 9-7 provides some well-known songs and nursery rhymes that contain repetitive use of forms often targeted in intervention at the DL phase. Once we have script therapy applications for children's literature in mind, it will be easy to add to these lists by visiting a children's library or bookstore to examine additional children's books and compilations of songs, rhymes, and finger plays. A clinician interested in script therapy can soon assemble an impressive array of texts to be used for any language form that a client might need to improve. Many such lists are already commercially available. Beall and Nip (2005), Gebers (2003), Prelutsky (1986), Sillberg, Schiller, Berry, & Oshiver, (2006), and Sterling-Orth (2005) are some examples. There are also a range of free sources of rhymes, songs, and fingerplays on the internet, including preschoolrainbow.org, songsforteaching.com, and preschoolexpress.com, to name just a few.

An additional plus for literature-based script therapy is that it provides an ideal "homework" activity for families interested in following up on intervention activities. Having parents read children books used in intervention is a simple and accessible activity that most parents will find enjoyable rather than taxing. Parents can be encouraged to ask the children to fill in words or phrases they leave out as they read. If songs and nursery rhymes are used, parents can ask the child to "teach" them the actions that go along with the rhymes and sing or recite them together as the parent "learns" the routine. In this way children can be made to feel that they are making an important contribution to the interaction. When encouraging parents to use literature-based scripts, whether from books or other oral texts, it will be important to be sensitive to the cultural aspects of these kinds of interactions and help parents find ways to engage their children actively and playfully around these scripts. Parents from low income or non-European backgrounds may not use the kinds of interactive strategies that clinicians expect. Family and cultural practices that are appropriate for script-based language activities should be explored with these families.

BOX 9-6 Suggestions for Using Joint Book Reading in Language Intervention

Step 1: Read the book to the client several times over the course of a few sessions. Use prosodic cues to segment and highlight target semantic and syntactic patterns.

Step 2: After adequate exposure to the text, pause at points containing the target forms, creating a cloze condition. Let the client produce the next word, phrase, or line (in choral fashion for groups of clients). Insert pauses in linguistically specific ways to mark and select the portion of the text the client will produce. This facilitates the client's segmentation of the linguistic material for analysis.

Step 3: Read the book often enough that the client memorizes it. At each reading, segment the text in variable but explicit ways to facilitate linguistic analysis.

Step 4: Segment the text so that the client must produce increasingly long portions, until eventually the client can recite the whole book.

Step 5: Once clients have memorized the text, have them take turns "reading" it and having the clinician or other clients fill in parts left out by the "reader."

Step 6: Make up a new book using a similar linguistic pattern to encourage the child to use the learned forms in new ways. Write down each client's version, and let the clients illustrate their "books" to take home to read to family members.

BOX 9-7 Examples of Songs, Rhymes, and Finger Play Routines for Targeting Language Forms

Subject-Verb-Object Sentences

One, Two, Buckle My Shoe
All Around the Mulberry Bush
Old McDonald

Prepositions

In and Out the Window
Hickory, Dickory, Dock
Skidamarink-a-Dink-a-Dink
Over the River and Through the Woods

Copula

Where is Thumbkin?
Little Boy Blue

(Be)(Verb)ing

She'll Be Coming Round the Mountain

Modal Auxiliary

Mother, May I?
Jack Sprat

Third-Person Singular

The Farmer in the Dell
One He Loves, Two He Loves, Three He Loves, They Say

Past Tense

Jack and Jill
There Was an Old Woman Who Lived in a Shoe
Eensy Weensy Spider
This Little Piggy

Questions

Where is Thumbkin?
Way Down Yonder in the Pawpaw Patch

Have Auxiliary

Little Bo Peep
I've Been Working on the Railroad
He's Got the Whole World in His Hands

Relative Clauses

The House that Jack Built
There Was an Old Lady Who Swallowed a Fly

Conjunctions

Old Mother Hubbard
If You're Happy and You Know It

Like auditory bombardment, literature-based script therapy will probably make up a relatively small portion of the intervention session, perhaps 5 to 10 minutes. Other activities will, no doubt, use the bulk of the intervention time, but the benefits of those few minutes can be disproportionate. Not only will they contribute to the children's ability to use sophisticated language forms, they also will add to the clients' "cultural literacy," or familiarity with the classic texts of mainstream Western children's literature. Many children with language impairments have a weaker base of general information and cultural reference than normally developing children because they have limited access as a result of their language deficits. Literature-based script therapy can help fill this gap. In addition, literature-based script therapy provides excellent focused opportunities for "literacy socialization," the development of a familiarity with books and literary language style that will give the client a solid foundation for learning to read. As we use these approaches, though, we need to recall the cautions raised by Kaderavak and Justice (2002) to ensure we are maximizing children's attention and engagement with books and other literature

Literature-based script intervention develops cultural literacy in children with language disorders.

scripts. And we must remember to provide opportunities for children to practice the forms learned within the script in a wider variety of linguistic contexts. For example, if children have learned several spatial terms from *Inside, Outside, Upside Down*, these terms should be used in other activities. The child and clinician might, for example, take turns "hiding" a raisin and giving clues that contain spatial terms so the other can "find" it ("it's *inside* the drawer; it's *outside* the doll house").

Structured Play

Shriberg and Kwiatkowski (1982a) also discussed using play organized by the clinician as a hybrid approach to phonological intervention. They suggested, for example, having cards with pictures representing the client's target words to be sent as letters. Each picture is named by the client as it is placed in an envelope, "stamped," and "addressed" to someone the client thinks would like to get that picture. The "letters" are then mailed in a toy mailbox. The clinician does not correct the child's pronunciation but can offer production cues if the child is receptive to them. The focus of the activity is on the fun of sending the letters, rather than on responding to the clinician's prompts to say the words. Still, the naming of the words on the cards provides opportunities for client practice and clinician feedback.

Using Conversation and Narrative in Hybrid Intervention

We talked before about the fact that we do not generally want to add pragmatic targets to our list of intervention goals. Instead, we try to set up pragmatic contexts in which clients can use the semantic, syntactic, and phonological skills being developed. As we saw in Table 9-1, the pragmatic skills that we expect to show the greatest degree of growth during the DL stage are conversational skills and the emergence of the ability to tell and understand stories or use narrative discourse. Let's look briefly at how we might incorporate conversational and narrative contexts into hybrid intervention activities.

Conversation. Brinton and Fujiki (1994, 1995) have presented example programs for using conversation as a context for intervention. The clinician ensures that guided conversation supports the skills being targeted. Brinton and Fujiki (1994) focused on two types of conversational behaviors identified by Fey (1986)—*assertive* and *responsive* skills—and suggested techniques for developing each set of skills in clients with language impairment.

Children with poor *assertive* skills are quiet in conversation. They take their conversational turns reluctantly or not at all and rarely initiate topics. For clients with this difficulty, Brinton and Fujiki suggested first engaging the children in entertaining interactive activities in which they must do something to sustain the interaction, although at first a child's contribution can be minimal. For example, a simple game such as "Go Fish" can be used. Here a client working on question forms might use the form "Do you have (X)?" in the game format. The game requires the client to initiate the question. If the client does not ask spontaneously, the clinician can simply wait, providing a cue only after a relatively long (10- to 15-second) pause in which the client does not initiate. As the game progresses, the clinician can use more and more truncated cues, going from "Say, 'Do you have (X)?'" to "Ask me," to simply an expectant look. Later the demands of the game can be "upped" so that more is expected of the client. For example, the rules of the game can be changed so that the client must ask a more elaborate question ("Do you have a green fish with white fins?") or a more polite form of the question ("May I please have an (X)?").

Brinton and Fujiki emphasized that the format should soon become less structured. They advocated manipulating the context so that clients are highly motivated to initiate. If questions were the structural target, again, a clinician might set up a situation in which a puppet told the clinician a "secret." Clients who wanted to hear the secret would have to *ask* to be told. When initiations such as these, using forms targeted in the intervention program, become frequent in conversations guided by the clinician, Brinton and Fujiki suggested having the client participate in peer conversations. Here the clinician would be present as a conversational "coach," offering advice, cues, and prompts as the client engages in conversation with first one peer, then with several. The clinician can encourage the client to be persistent about getting a turn, give hints about appropriate topic-maintaining comments the client can make, supply cues as to when it is appropriate for the client to take a turn, and help the client handle interruptions. In the context of these peer conversations, the clinician also can remind the client to use the forms learned in the intervention program to accomplish the conversational goals. Using questions as the example target again, the clinician can, for instance, remind the client to use a target form to initiate role negotiation in pretend play with peers. The clinician can coach the client to use question forms to ask who wants to play the mommy in a game of "house," who wants to be the baby, and so on.

Fujiki and Brinton (1991) showed that children who have trouble with *responsiveness* in conversation are less likely to find conversational partners responsive to them. Both peers and adults find conversations with such children difficult and unrewarding. In using conversational contexts for language intervention with unresponsive children, Brinton and Fujiki (1994) suggested some interactive games that help the child become sensitive to signals in conversation that a turn is available. They advocated setting up turn exchanges in fairly structured situations so that turn exchange points are, at first, explicitly marked. Using walkie-talkies or pretend radios or cell phones, for example, the client and clinician can talk to each other and signal that their turn has ended by saying "over." The turns themselves can consist of structured talk in which forms targeted in the interaction program are used. If, for example, *[be]-[verb]-ing* sentences are intervention targets, the client and clinician can talk over their radios about what they are doing as they roam the hallway (Clinician: "I am going around the corner. Over." Client: "I am walking past our room. Over.>").

Brinton and Fujiki advocated moving from these activities to more collaborative games in which the client needs to obtain and attend to information provided by the partner. They suggested that children (or puppets, if additional children are not involved in the session) can each be given different pieces of a puzzle or toy that needs to be assembled and told to hide their piece. The client can then approach each one and ask what each had and where to find it. The client would need to listen to each response before assembling the whole. The client also might "take orders" from a catalogue or fast-food menu and be required to "check back" with the customer to be sure the order was taken correctly before filling it. These games can go on at first between the client and clinician. Later, additional peers can be added, with the clinician serving again as coach, reminding clients to signal that others can take a turn and to pay attention and respond to the talk of other participants. Brinton and Fujiki (1995) also advocate training parents, teachers, and peers to use conversational contexts to address semantic and syntactic targets, such as referring to events outside the immediate context and increasing the production of complex sentence forms. Brinton and Fujiki (2006) also point out that children with DLD need repeated support, scaffolding, and practice opportunities to acquire the social and language knowledge required to engage in successful conversational exchanges. They advocate focusing on social communication early in the intervention program, and maintaining this focus throughout the child's treatment.

Research is emerging that suggests that peers are especially effective agents of intervention for social and conversational skills (Paul, 2003a). We'll talk later about how to involve preschool peers in mediating social interactions for children with disabilities, in order to take advantage of the special salience that conversations with peers have for young children. DeKroon, Kyte, and Johnson (2002) showed that social pretend play, in which children played with peers using toys or objects around pretend or fantasy themes, elicited the highest levels of conversational behavior in dyads containing a child with language impairment and a typical peer. These play settings, then, would be ideal ones for the clinician to orchestrate when coaching clients in conversational contexts. Beilinson and Olswang (2003) showed that coaching preschoolers to use interesting props in order to gain entry into peer group play activities was especially helpful in increasing the opportunities for social interactions for young children with communication difficulties. Part of our conversational coaching agenda, then, could be to arm children with interesting objects in order to smooth their way into peer interactions.

Narrative. When we talk about language in the school-age period, we'll see in more detail that narrative skills—which begin to emerge during the DL period and reach their full flower during the school years—are closely related to academic success. Fey, Catts, Proctor-Williams, Tomblin, and Zhang (2004) and Paul and Smith (1993) showed that children with language disorders in the DL period were less skilled than typical peers at producing narratives. We talked just a while ago about how work on metaphonology develops emerging literacy skills and provides preventive intervention for averting later problems in learning to read. Targeting narrative skills during the DL phase can also build toward emerging literacy and effect preventive intervention. That's because narrative, too, is highly correlated with success in literacy (Bishop & Edmundson, 1987; Gillam, McFadden, & van Kleeck, 1995). Petersen, Gillam, Spencer, & Gillan (2010), for example, showed that narrative intervention, in which preschoolers at risk

were read stories, then asked to retell them with picture and verbal scaffolding, was useful for improving children's functional use of narrative macrostructure and microstructure, and their production of literate language forms.

In addition, narrative contexts provide fertile ground for addressing a variety of other aspects of communication, including vocabulary, syntax, morphology, and verbal memory, in addition to narrative structure (Spencer & Slocum, 2010; Swanson, Fey, Mills, & Hood, 2005). Culatta (1994) presented some suggestions for integrating narrative contexts into language intervention at this level, using story re-enactments. These involve, first, having clients listen to simple stories. The stories can be read from classic children's books, such as those used in literature-based script activities. Familiar folktales or fairy tales also can be told orally. Before the clients listen to the story for the first time, the clinician can provide a preparatory set to focus their attention on the basic elements of the story. These include its setting, its central character, its basic problem, the characters' plans and goals, and the consequences of the characters' actions. If the story chosen is a familiar tale, clients can be asked to recall the setting, characters, and so on before it is told. If it is a new story, they can be told to listen for these elements so they can answer questions about them later. After hearing the story the first time, clients can be asked to focus on these elements by answering questions about where the story happens, who is in the story, what the character's problem is in the story, how the character tries to solve it, and what happens when the character acts on the plan. If clients hear and enact several different stories over the course of an intervention period, we can ask the same questions about each one. In this way clients can begin to internalize the story grammar structure (see Box 10-3) that these questions imply.

Clients can then assume roles to act out the story, using simple props and costumes. The language of the story can be chosen specifically to emphasize forms being targeted in the intervention. If clients are working on auxiliary *will*, for example, the "Three Little Pigs" story might be used. The client can play the wolf, who says, "I *will* huff, and I *will* puff, and I *will* blow your house in." The clinician can act as "narrator," again pointing out the critical elements in the story. The next time, the client can act as both narrator and actor, using the target language and embedding it in the narrative frame. The clinician can "coach" the client in the retelling, encouraging both the use of correct forms and attention to critical story grammar elements in the narration. Later re-enactments can use paper cutouts instead of live actors, which the client can manipulate as the story is narrated. The story also can be retold with slightly different characters or by changing the language slightly to broaden the target language forms used (after using the uncontracted, "I *will* huff . . .," for example, the dialogue can be changed to the contracted, "I'll huff . . ."). Swanson, Fey, Mills, and Hood (2005) provide additional suggestions for using narratives in language intervention at the DL stage.

Intervention Contexts for Children with Developing Language

When deciding about the contexts for intervention for children in the DL phase, we need to answer two primary questions:

1. Who should deliver the intervention?
2. What service delivery model will be used?

Let's look at some of the options available for answering these questions in the DL period.

Agents of Intervention for Children with Developing Language

Three types of intervention agents, apart from certified SLPs, are typically considered for children in the DL period: paraprofessionals, parents, and peers.

Paraprofessionals

Paraprofessionals are individuals who deliver services to children and their families but serve under the supervision of a professional who is ultimately responsible for the intervention program. Generally, paraprofessionals provide one-to-one instruction, using methods and procedures developed by the supervising clinician. Coufal, Steckelberg, and Vasa (1991) reported that paraprofessionals are effective in modifying both articulatory and language behavior in children. ASHA (2004e) has provided guidelines for the training and supervision of paraprofessionals in speech-language pathology; an explication of these guidelines is provided by Paul-Brown and Goldberg (2001). These documents tell us that there are several roles for paraprofessionals to assume with children in the DL period. They can be trained to use the same kind of indirect language stimulation we might teach parents to provide, for the purpose of practice and generalization, following procedures outlined in research such as Girolametto, Weitzman, and Greenberg (2003). For children in classroom-based intervention settings, the paraprofessional can supply intensive one-to-one language stimulation. This can include modeling appropriate uses of communication that the client can use to interact with peers and engage in developmentally appropriate play, and "coaching" the client within these interactions.

They can also provide structured CD or hybrid intervention to individuals or small groups, as directed by the clinician. Here the clinician designs a lesson plan in detail, including the linguistic stimuli, materials, and activities to be used; the responses to be targeted; and the reinforcement or corrective feedback to be given. Alternatively, the clinician might provide a commercially available lesson plan to address a goal that is part of the child's program. In either case, the paraprofessional follows the clinician's instructions, records the client's responses, and presents the data to the clinician for evaluation and subsequent treatment planning. Use of paraprofessionals can provide helpful expansion of the amount of intervention time available to clients with language disorders. We need to remember, though, that in working with these assistants, the design and evaluation of the program remains our job, not theirs. We can make best use of paraprofessionals by training them in a small set of tasks and providing clear and explicit instruction as to what they are to do with the client, while maintaining responsibility ourselves for the bulk of the decision making and accountability in the intervention program.

There's one more issue in working with paraprofessionals. In the case of children with severe disabilities, a paraprofessional is sometimes assigned full-time to one child in order to allow him or her to function within the classroom. But training is especially important for paraprofessionals in this role, since without it they may serve to isolate rather than integrate the child (Causton-Theoharis & Malmgren, 2005; Ghese, York-Barr, & Sommerness, 2002). SLPs should work closely with these paraprofessionals to help them develop strategies for mediating social interactions and communication between the child and peers. Methods such as those used by Causton-Theoharis and Malmgren (2005); Ghese et al. (2002); Girolametto, Weitzman, and Greenberg (2003); Leblanc, Ricciardi, & Luiselli, 2005; and Odom et al. (1999) can be used to develop this kind of training.

Parents

We've talked before about the considerations that ought to go into a decision to use parents as agents of intervention. We've heard the argument that parents make better intervention agents because they are with the child all the time and can, theoretically, do nonstop intervention. We know, too, that it may not be to the child's advantage to be in intervention all the time and that children may need the acceptance and uncritical approval that parents can offer. In the DL period, the goal of intervention moves from simply eliciting language to eliciting and elaborating specific forms. This kind of elaboration can include corrective forms of feedback that, at times, may conflict with the normal communicative patterns between parents and children, in which errors of form are accepted and only errors of meaning corrected (Brown & Hanlon, 1970).

Tannock and Girolametto (1992) and Fey, Cleave, Long, and Hughes (1993) presented evidence questioning the efficacy of intervention approaches that rely solely on parents as agents of intervention. Fey et al. showed that the effects of clinician-delivered intervention were larger, more consistent, and more likely to continue over time than were the effects of intervention delivered by parents. Tannock and Girolametto argued that parent-delivered intervention, using techniques such as ILS, is good for giving children opportunities to practice or to generalize recently learned skills but is less effective in imparting the new skills themselves. Still Law, Garret, and Nye (2004) found in a meta-analysis that parent-delivered intervention was equal in efficacy to clinician-delivered programs for preschoolers, and some studies (e.g., Kashinath, Woods, & Goldstein; 2006; McConachie et al., 2005) have shown positive child outcomes subsequent to parent training. Although parents may be effective agents of intervention, many will prefer to have a professional involved, whenever cost does not prohibit it. Fey et al. (2006), for example, showed that training parents to provide responsive interactions in addition to clinician-delivered prelinguistic milieu training (PMT) resulted in increases in child communicative acts (although no comparison of PMT without parent training was provided).

Peers

A third alternative for intervention agent for children in the DL period is a normally speaking peer. For example, Weiss and Nakamura (1992) reported on the use of typical peers as communication models for children with language impairments in a preschool classroom setting. The idea behind this approach is that normally speaking peers provide models that are slightly above the language of the client but not too far above, because of the typical peer's own still-developing stage. Presumably, conversation with a peer will be more natural and engaging to a developmentally young child than will interaction with an adult, since topics of conversation and activities of interest are more likely to be shared between two speakers of similar developmental level. Moreover, the typically developing (TD) peer is likely to provide models of appropriate behavior and speech that can be imitated by the child with language impairment.

Weiss and Nakamura emphasized that, if normally speaking peers are introduced into an intervention setting such as a special education, reverse-mainstream classroom, or small group therapy setting, children who act as models need to be carefully selected. Not all preschoolers are equally willing or able to interact with disabled peers. Weiss and Nakamura suggested selecting peers as models who not only demonstrate normal language competence but also show interest in peers with disorders, willingness to engage in play with them for extended periods, and responsiveness

to their conversational bids. This selection could be accomplished by inviting several TD peers to visit the language classroom or group and providing some especially engaging activities, such as water or sand play, to serve as an incentive for their participation. The visitors can be observed and models chosen from those who appear most responsive to the children with language disorders. These special visitors can be invited to return on a regular basis.

Still, simply putting a child with a disorder in a playroom with a typical peer does not constitute intervention. Peers must be supported and encouraged to provide appropriate models and opportunities for the client. Hadley and Schuele (1998) showed that adults can support the development of talk between children with communication impairments and their typically speaking peers by demonstrating how to prolong interactions, respond to unclear messages, give time for the client to produce a conversational turn, and so on. Venn et al. (1993) showed that TD preschoolers could be trained to provide very specific linguistic stimuli, using the mand-model procedure discussed in Chapter 3. Their study showed that TD preschoolers could, with some practice as well as online modeling by the teacher, use scripted language models to elicit appropriate requests from peers with language disorders. Peers who model appropriate language usage, then, can be useful adjuncts to the intervention program (Mashburn et al., 2009). Like parents, though, peer language models will probably be most useful for providing opportunities for practice and generalization, rather than for eliciting new communicative behaviors.

One additional role for peer-mediated intervention is in the area of play and social skills. For preschoolers with communication deficits that include pragmatic and social disabilities, peers are an especially effective source of intervention (Paul, 2003a). Peer-mediated interventions involve teaching peers to use strategies to facilitate interaction with children with developmental disabilities (Goldstein, Schneider, & Thiemann, 2007). Research has shown that training peers to engage with children with disabilities has positive effects on their social skills that generalize beyond the training period and include higher rates of initiation by typical peers and higher rates of responding by clients (Timler, Vogler-Elias, and McGill, 2007).

Peer training usually involves a series of phases. First, peers are introduced to the idea of playing with new friends and given strategies to use, each introduced one at a time. Peers rehearse the strategies by saying what they are expected to do. Then, they practice using the strategies with an adult whose responses become increasingly like a child with a disability (Goldstein et al., 2007).

Several approaches to peer-mediated social communication training have appeared in the literature. One approach (Odom et al., 1999) uses "play organizers" in which typical peers are taught to cue the target child during play sessions to share, help, give affection, and praise others. Results of programs like this indicate positive changes in social behavior, but they do require that adults spend some time in training, modeling, and role-playing for the peer partners. English, Goldstein, Shafer, and Kaczmarek (1997) developed a peer-mediated social skills program for preschool classrooms that involves less prior training for peers and has been shown to lead to improvements in the frequency of social communication between target children and typical peers. Each child in the class is assigned a "buddy" for a specified period of time, and each day includes a "buddy time" session of 20 minutes in length, often during the "free play" period of the preschool day. All children in the class participate, so some pairs include two typical

children; others have a typical child and one with a disability. The rules for buddy time are taught to the group:

- Week 1: STAY with your buddy; maintain physical proximity to assigned partner.
- Week 2: PLAY with your buddy; maintain proximity while continuing to play with your partner (partners are offered a choice of one activity each from a visual “choice board” then instructed to play with each partner’s choice for half the buddy period session, usually 10 to 20 minutes).
- Week 3: TALK with your buddy; say your partner’s name to establish joint attention, make suggestions for playing together, talk about the play, respond to what your partner says by repeating, saying more about it, or asking a question.

Pairs who comply with the rules for a buddy session each receive a prize. This reward gives the typical child an incentive to help the child with a disability maintain contact. These kinds of peer-mediated interventions can help to integrate students with disabilities more effectively in mainstream settings. They also increase their opportunities for exposure to relevant peer models, and for using their communication skills in an authentic context.

Goldstein et al. (2007) also support the use of sociodramatic script training, in which adults develop scripts for peer pretend play around familiar activities. Several scripts may be developed, such as shopping in a grocery store, going to the doctor, and visiting the post office. This method is usually conducted with groups of three preschoolers, at least one of whom has a communication disorder. Each child is assigned to a role within the script by the adult, and given gestural/motor (for preverbal children) and/or verbal responses to use in the script. The children are taught the script and prompted to stay in their roles during free play. An adult is available to “coach” during play time, reminding children of their roles and prompting them to continue playing together.

Timler et al. (2007) suggest an additional way to employ peers in social communicative intervention: as a context for generalizing clinician-delivered intervention. After teaching social communication skills in a clinician-mediated program, the SLP can set up “practice” sessions designed to provide naturalistic opportunities to use newly learned skills in authentic contexts, like pretend play. Again the clinician can remain at the edge of the play, providing prompts and coaching clients to use the skills learned in the intervention session as they engage with their peers.

Service Delivery Models for Children with Developing Language

Our discussion of agents of intervention answers the “Who?” aspect of intervention contexts. The following discussion of service delivery models will answer the questions “Where?” and “When?” We talked in Chapter 3 about the range of service-delivery models available to us. These include the pull-out, or clinical, model; the language-based classroom; the consultant model; and the collaborative model. We’ve seen that a variety of agents of intervention can be involved in any of these service delivery models. Let’s look at how each service delivery model might function for a child in the DL period.

Clinical Model

Many children in the DL phase are seen for one-to-one or small-group intervention in schools, clinics, and private-practice settings using this model. If you did your training in a program that had a campus clinic affiliated with it, you probably earned some of your clinical practicum hours seeing preschool children there, using this service delivery option. Despite the many onslaughts on

its primacy, it is still a common service delivery model used with children in the DL period. And there’s nothing wrong with it. Roberts, Prizant, and McWilliam (1995) showed that few differences existed in interactive styles of either clients or clinicians when in-class and pull-out methods of intervention were compared. Just as we want to have a repertoire of clinical procedures available to us to match to the needs of the client, it is helpful to have a range of service delivery models we can use. The clinical model is very useful for children with attentional problems, for whom a classroom or other rich environment might be too distracting. It provides a helpfully quiet environment for children with hearing impairments or others who have difficulty screening out background noise. It can provide a safe and comforting place for children with behavioral or emotional problems who need the nurturing qualities of a one-to-one attachment to an adult.

The major shortcoming of the clinical model, aside from its high cost and labor intensity, is that it may be less effective at achieving generalization to the natural communicative environment. For this reason, it is wise to be especially careful to build in some of the generalization activities discussed in Chapter 3 when this model is used. Similarly, we need to be sure to build in some social interactive opportunities that will facilitate peer interactions for our clients. To achieve this end, the clinician must be sure to incorporate a mix of activities across the continuum of naturalness from structured CD to more naturalistic CC approaches, using multiple exemplars, involving multiple communication partners, carrying on the intervention in different places, using naturalistic reinforcers, using distracter items and intermittent reinforcement, providing coaching in peer interactions, and encouraging self-monitoring.

Language-Based Classroom

A classroom specially designed to provide intensive language stimulation and training in the context of a mainstream, reverse mainstream (typical peers invited to join a special education preschool), or special education program is a model that is used with increasing frequency to address the needs of children in the DL phase. For SLPs with little background in early education, following such a service delivery model can seem daunting. The need to address the individual needs of all the students within a common set of activities may seem difficult at first. But the advantages of the model are many. Language-based classrooms usually provide extended periods of intervention time, more than the usual 45 minutes

Classroom-based intervention is often used at the preschool level.

two or three times a week. These settings also provide opportunities to work as a team to improve language and pre-literacy skills for children with disabilities and those at risk (Hadley, Simmerman, Long, & Luna, 2000; Justice et al., 2008).

Bricker and Pretti-Frontczak's (2004) activity-based intervention program, Bunce's (2008) language-focused curriculum, and Morrow's (2008) Literacy-Rich Preschool are examples of language-based classroom models. These classrooms typically involve theme-based units that incorporate traditional preschool activities such as crafts, story reading, pretend play, and small-group interactions. Some may include pull-out or clinical service to some or all of the students for a portion of the day, but the bulk of the intervention is done in the context of the classroom activities, which are chosen not only for their theme and content, but for the specific purpose of fostering communicative development. SLPs often serve as lead teachers in these classrooms, or function collaboratively on a team with a special educator, and have responsibility for planning the overall classroom program so that it addresses the communicative needs of all the students. Table 9-9 presents some of the strategies suggested by Pretti-Frontczak and Bricker (2004) for enhancing communicative development in these settings. The procedures can, of course, be used in a variety of other intervention settings as well. You'll probably notice that many are similar to Wetherby and Prizant's (1989) communication temptations and are not all that different from Cleave and Fey's (1997) focused stimulation. Classroom-based preschool language intervention combines a variety of approaches we've been discussing, such as milieu teaching, indirect language stimulation, script therapy, and theme-related structure. As such, it exemplifies what we mean by hybrid intervention.

Routine activities are one context for language modeling and practice in these settings. Each client's language goals can be integrated in the language used in the routines. If Rachel, for example, were involved in this type of intervention program, a goal such as producing subjective pronouns might be addressed during snack each day. She might be asked by the teacher, "Who wants a cracker? If you want a cracker, raise your hand and say, 'I do!' Who wants a cracker?" Children with different goals would be provided with models of their own target forms during the same activity.

Theme-based units are another feature of language-based classrooms. If the theme for the week were "planting and growing," then stories, songs, and rhymes around the unit might be presented

during group time. The group might play "Ring Around the Rosie" and read *The Carrot Seed* (Kraus & Johnson, 1945). Activities the children could choose from during Free Choice time might include making a plant collage with pre-cut paper shapes in the Art Center; listening to a prerecorded story with a planting theme in the Listening Center; pretending to plant a garden with appropriate props in the Dramatic Play area; and building walls, flower boxes, and a plant sale stand in the Block Center.

Again, individual goals would be addressed in theme-based activities. Using Rachel as our example, again, she might be asked to sing the line "We all fall down" when it comes up in the song. During story reading she might be asked to repeat certain parts of the story that include the pronoun *he* in response to the teacher's question. For outdoor time, the group might take a nature walk to look for things that grow. Rachel might be asked to name some of the growing things she sees as she walks along, beginning each sentence with, "I see . . ." At snack time, sunflower and pumpkin seeds might be served. Rachel could be asked to select which she wants by saying, "I want . . ." At the Art Center, Rachel could be asked to answer questions such as, "Who put a leaf on the collage?" with "I did!" A concept lesson might include planting seeds to grow in the classroom. The teacher might describe each step in the planting, and then ask students to reiterate the sequence of actions after they were finished. Rachel, for her turn, could be asked to answer questions such as, "Who put a seed in the dirt?" with "I did!" Again, children with other goals would also be presented with opportunities for modeling or practice of these forms within the same activities.

Child-initiated contexts also are used for intervention purposes in these programs, as they are in the incidental teaching approach. Any initiation by the child would receive a response that highlighted or capitalized on the child's identified intervention goals. If Rachel, for example, said, "Me cold!" to the teacher on the playground, the teacher could respond, "Are you? I'm cold, too. I am. I am very, very cold today. And you are too! I need a warmer coat. I need a hat. I need mittens. How about you?"

Another advantage is that classroom-based intervention provides ample opportunity for development not only of communicative skill but of emergent literacy. Prelock, Cataland, Honchell, and Cordonnier (1993) suggested the importance of including "literacy centers" within the preschool environment for children with language disorders. These centers would include theme-based

TABLE 9-9 Strategies for Activity-Based Language Intervention

Strategy	Example
Forgetfulness	Forget to give out brushes during painting; children must do something to request needed supplies.
Novelty	Introduce slightly new elements into known routine (e.g., play "Farmer in the Dell" wearing a big straw hat. Let children who comment on the hat have a turn to wear it).
In sight but out of reach	Put attractive or necessary objects where children can see them, but cannot get them without help. Encourage them to communicate a request.
Violate expectations	Omit or change a step in a routine (e.g., give a child a dish of ice cream but no spoon).
Piece by piece	Give items needed for an activity one at a time, so the clients need to communicate something to get each one. At snack time, give out one raisin at a time, or color by giving out one crayon at a time.
Assistance	Put the child's snack in a clear glass jar that he or she cannot open without help, so the child needs to communicate a request to obtain an object or activity.
Sabotage	Unplug the music player, then ask child to turn it on; hide children's coats when it is time to go outside. This forces the client to do something communicative to try to correct the situation.
Delay	Pause in the midst of an activity to get the child to communicate the need to continue (e.g., pause while zipping a coat before going outdoors).

opportunities for seeing print in labels and captions for pictures; playing with literacy artifacts such as menus, newspapers, grocery lists, and product labels drawn from classroom themes. Justice (2007) reminds us to include opportunities for children to write and pretend to write in these activities. Writing their own names is a particularly important skill for preschoolers to learn and practice in meaningful settings, such as writing and signing notes, letters, and invitations within dramatic play contexts. Justice suggests using *mediated writing*, in which adults encourage children to use invented spelling and scaffold their translation of sounds within words to print in a range of emergent writing activities, throughout the preschool day, including “writing” stories, labeling drawings to follow up storybook experiences; and dictating class “experience stories” to record events of importance to the group. Kaderavek and Justice (2004); Morrow (2008); and Enz, Prior, Gerard, and Han (2008) provide additional activities, and Watson, Layton,

Pierce, and Abraham (1994) outlined additional ways to incorporate literacy events in the preschool classroom. Table 9-10 gives some examples of their suggestions.

Consultant Model

It's very likely that some part of the service delivery for children in the DL period will involve the SLP in a consulting role. One reason is that the U.S. Department of Education (2007) reports that 40% of preschool children with disabilities spend the bulk of their time in community programs, such as child care centers, nursery schools, and Head Start classrooms, rather than in dedicated special education classes. Many SLPs providing services to these “mainstreamed” preschoolers will visit each site only once a week, or less, in order to get to all the preschoolers on their caseload. What is the best service delivery model for this situation? Dinnebeil, Prett-Frontczak, & McInerney (2009) argue that, rather than attempting to provide direct service for the small amount of time

TABLE 9-10 Facilitating Emergent Literacy in Preschool Classroom Activities

	Print Awareness	Book Awareness	Story Sense	Phonological Awareness	Matching Speech and Print	Practicing Prereading and Prewriting
Circle time	Look for name tag	Make “book” with words of daily song; children follow along as they sing, teacher points out words in book			Match printed words in song “book” to the words they sing	“Read” job list with students’ names and pictures of each classroom job
Story time	Show book during reading	Point out when pages are turned	Use well-structured stories; ask questions about story after reading	Point out rhymes, alliteration in reading; ask students to remember words that rhymed or started with the same sound from the story	Have children “read” parts of the book chorally	Have children “read” parts of the book chorally
Center time	Provide magnetic, felt, tactile letters at play centers	Provide blank paper “books” for children to write and draw in	Relate art activities to stories read; carry over story theme	Encourage invented spelling in art and play activities	Label favorite play equipment; post classroom rules for children to “read”	Label drawings, encourage children to invent spellings to label their own drawings
Snack time	Label snack supplies; have snack helpers “read” labels		Follow recipes from stories, such as “Stone Soup”	Talk about sounds in words for snacks eaten; make up rhymes for daily snack item	Encourage children to “read” labels on foods used at snack	Encourage children to “read” labels on foods used at snack
Outdoor time	Use signs, such as a “STOP” sign, in games such as “red light, green light”		Act out favorite stories in outside play		Use cards with pictures and words in addition to verbal instructions in games such as “Simon Says”	Use cards with pictures and words in addition to verbal instructions in games such as “Simon Says”

that can be devoted to each client, a consultative model, in which the SLP and regular classroom personnel jointly identify ways to provide IEP-based instruction that is embedded in everyday classroom routines, is the best practice. Fixsen, Naoom, Blase, Friedman, and Wallace (2005) identify a coaching model of consultation, in which instruction, demonstration, and feedback is provided to classroom personnel, as the only evidence-based form of consultation currently available. So, just as we coach our clients in social interactive skills by providing them with a somewhat scripted set of interactive behaviors that we model for them, then encourage them to try as we provide hints, tips, and reminders, we can use the same approach to help early childhood classroom teachers to use ILS, or incidental teaching, or whatever methods we prescribe to target a client's communication development. In this way, the client gets the benefit of these interventions for a much larger portion of the day than could be provided by direct clinical service. **Box 9-8** gives an example of the kind of specific consultation suggestions and data forms that might be given to a classroom teacher in a consultative coaching model to help include a client's phonological targets within the classroom setting.

Consultative coaching can also involve helping teachers understand and manage challenging behaviors. We talked earlier

about the fact that children with disabilities sometimes turn to maladaptive behaviors, such as aggression, because they do not have more conventional means available for expressing themselves. Nungesser and Watkins (2005) report that the presence of challenging behaviors can limit a child's opportunities to participate in mainstream settings, because teachers are unwilling or feel unable to manage these difficult episodes. They also found teachers are often unaware of the communicative function of these behaviors. As consultants, SLPs can help teachers to understand how communication disorders can lead to these behaviors, how communication intervention can impact them, and how to select appropriate language-based prevention and intervention approaches. This process is often called functional communication training (FCT; Bopp, Brown, & Mirenda, 2004). Positive behavior support is another approach widely advocated for use with preschoolers with challenging behaviors (Benedict, Horner, & Squires, 2007; Hemmeter, Fox, Jack, & Broyles, 2007). In working with teachers as consultants on managing challenging behaviors, Nungesser and Watkins (2005) and Bopp, Brown, and Mirenda (2004) made the following suggestions for SLP consultations:

- Help the teacher to understand that these behaviors may be used to serve a communicative function.

BOX 9-8 Consultation Suggestions for Including Phonological Targets within a Classroom Setting

Classroom Theme:

Winter

Center:

Water play

Phonological Targets:

/s/, /z/, and /s/ blends

Activity:

Cookie sheets filled with ice are placed floating in the water at the water table. Small toy people figures are placed there, too. A sign is placed over the water table that reads, "Skate, slip, and slide," which is read to the class when the activity is introduced.

Suggestions for Teacher:

As you circulate among students at the table, model talking about the figures as they skate, slip, and slide. Talk with the children about safety on ice, the process of freezing and melting, how the ice feels and looks, and their own experiences with ice and skating. Introduce target vocabulary in this talk. As the ice begins to melt, give the children toothpicks and small pieces of paper to make signs that say, "Keep off ice" or "Stay off." Use target vocabulary to ask open-ended questions and comment on the changes in feel, look, and safety of the ice as it melts.

Target Vocabulary:

Ice, icy, frozen, freeze, freezing, slide, slip, slippery, skate, across, start, sign, safe, safety, smooth, slick, soft, melts, cracks, slush, sink, sinking

Evaluation:

Allow the student to play at the water area for several days, providing models of target vocabulary, and encouraging peers to provide additional models. After 3 days, track the client's productions at the center for 7 minutes, using the data sheet below. Put a hash mark under "Attempts" each time the client attempts a word with a target sound and a check under "Correct Productions" each time the target sound is produced correctly. Discuss with the team at weekly meetings to decide if new target sounds and words should be added.

- Establish the function of the maladaptive behavior through functional behavior analysis.
- Use visual schedules to aid comprehension and predict events.
- Model dealing with the behavior within the classroom. Work with the child in a situation likely to trigger the behavior, and model how to prevent it, by providing an appropriate communication strategy to the child when aggressive behavior seems imminent.
- Suggest that the teacher model using language for emotions within classroom activities; show students how to talk (or communicate) about how they feel; and encourage peers to do the same.
- Help teachers involve families in carrying over strategies to the home setting.

An additional role we have as consultants is to do ongoing assessment and evaluation of the client's program. We need to decide when to move on to a new goal, modify the program, or terminate intervention. This monitoring function can be fulfilled by giving the parent or teacher evaluation procedures (that is, data sheets such as the one in Box 9-8) to be filled out at specified time intervals. Alternatively, we can collect the data ourselves by spending some time directly assessing the client periodically. This approach has the advantage of keeping us in touch with the client in a more immediate way than simply reviewing written records. We can get a better "feel" not only for what but also for *how* the client is learning. It also increases our credibility with our consultees. If we are known to be willing to get down on the floor and "get our hands dirty" with the client in the DL period, we are less likely to engender resentment on the part of the people who see themselves as "really doing all the work" of delivering intervention. Such resentments are lethal to the success of a consultative form of intervention. A little direct involvement with the client can go a long way toward avoiding this dangerous pitfall.

Collaborative Model

Roth and Troia (2006) discuss two forms of collaborative intervention aimed at enhancing language and pre-literacy skills in preschool classrooms: *demonstration teaching* and *team teaching*. Both allow the SLP to support these developments not only for children with identified special needs, but for those at risk for literacy difficulties who may not qualify for special educational services.

In the first approach, the SLP acts as a "guest teacher," providing targeted intervention activities for clients placed in a mainstream classroom setting. Dialogic storybook reading, in which the SLP reads a story and asks a series of questions throughout the reading aimed at focusing children's attention on vocabulary, story structure, recall, and inferencing, is an excellent vehicle for such demonstration lessons. Roth and Troia suggest using *CROWD* questions as a basis for discussion and modeling with teachers:

C = Completion questions that focus on the linguistic structure
(The cat was wearing a red and white _____. [hat] Are there any words that you heard that rhyme with *hat*?)

R = Recall questions that focus on story content. (Where did the children's mother go?)

O = Open-ended questions that focus on increasing amount of talk about the book. (Why do you think the fish was upset with the cat's ideas?)

W = Wh- questions that focus on teaching new vocabulary.
(Can anyone find the *rake* in this picture? What do you use a *rake* for?)

D = Distancing questions that focus on linking book events with one child's own experiences. (How would you feel if you made a mess in your house while your mother was not around?)

Roth and Troia identify team teaching is a second form of collaborative intervention. Here the SLP spends her time not demonstrating a lesson, but participating in a lesson designed in collaboration with the teacher. The SLP may work with a small group that includes both students with IEPs as well as those identified as at risk, or needing extra assistance. The SLP may provide additional activities and guided practice in areas such as curricular vocabulary, phonological awareness skills, or narrative structure and recall.

This form of collaboration is very similar to that used in a responsiveness to intervention (RTI) model. Although RTI has primarily been implemented in primary grade classrooms, these approaches have been advocated for preschool classrooms, as well (Bayat, Mindes, & Covitt, 2010; Coleman, West, & Roth, 2009; Fuchs, Buysse, & Coleman, 2007; Jackson et al., 2009; Justice, 2006), particularly for those in which a large number of children are at risk for difficulties in learning to read due to limited English proficiency, low socio-economic status, or a high incidence of students with language delays. When applying RTI in preschool settings, the same basic principles defined for school-aged implementation apply. According to Coleman, West and Roth (2009), these include:

- A tiered framework of instruction, comprising
 - Tier I: Provision of evidence-based instruction for all students
 - Tier II: More intensive instruction for children for whom progress monitoring indicates a need for additional support
 - Tier III: Additional support that is more intense and individualized

- Continuous progress monitoring

- Collaborative problem solving

Cabell and McGinty (2008) argue that the SLP's unique knowledge of the connections between oral language, phonological awareness, and literacy are key to making us valuable contributors to the design of the highest quality Tier I instruction. Our consultation on the development of this instruction will focus on the range of important pre-literacy domains to be included—phonological awareness, print and alphabet knowledge, and literate language—and on the need for both

- *embedded strategies* seen in classrooms with literacy-rich environments (e.g., available books and writing materials, display of literacy artifacts, encouragement of interaction with books and print), as well as
- *explicit, direct instruction* that highlights aspects of print during storybook reading, introduces new vocabulary in conjunction with classroom themes, and provides guided practice in letter and sound identification as well as phonological awareness.

SLPs will also be key players in monitoring children's progress in the acquisition of these pre-literacy skills, and using this progress monitoring to identify children who need additional support through Tier II or III intervention. SLPs may either design or deliver this more intensive instruction. As in all RTI models, team planning is as essential for success in preschool classrooms as in primary grades.

Collaborative intervention, whether in an RTI or other format, requires intensive planning, coordination, and cooperation among team members. Giangreco (2000) identified five themes that reflect successful collaborative efforts involving SLPs:

- *Be ready to learn from others.* It is not necessary for the SLP to present himself or herself as the "expert." Instead, listen to

the contributions of others and consider them from your perspective as a language specialist.

- *Take responsibility for the student as a team.* Each member of the team should feel ownership in the student's program. Rather than saying the student "belongs" to the special education or classroom teacher, the team should share their individual viewpoints on the student's needs, find points of agreement, and cooperatively assume responsibility for his or her progress.
- *Have a system in place for making decisions.* Build time for discussion and comparing points of view into the team process. Have established means of resolving conflicts and dealing with conflicting views.
- *Clarify the roles of team members.* Decide who will do what when. Not all members need to be involved in all aspects of a student's program. Make explicit joint decisions.
- *Support families and regular education teachers.* Include family and teachers in meetings; include family and teacher perceptions in planning. Be aware that the child will spend more time in the home and classroom than in the therapy setting, so these are the contexts in which it is most important for the child's progress to be seen.

INTERVENTION FOR OLDER CLIENTS WITH SEVERE IMPAIRMENT AND ASD AT THE DEVELOPING LANGUAGE LEVEL

Students with Severe Disabilities

Some clients whose language is in the DL phase may be quite a bit older than preschool age. Students with severe disabilities and developmental delays who have been in language intervention programs for a number of years may be operating within Brown's stages II to V in terms of their use of language forms and meanings. Is the goal for these clients to achieve fully adult grammar and semantics? Should we attempt to teach them all the rules and vocabulary we would choose as targets for a younger, less severely involved child? Part of this decision, of course, involves the family. Their desires and perceptions of the client's needs will play an

Intervention for older clients with developing language uses functional material.

important role in determining intervention targets. Nelson (2010) provided several principles that we should keep in mind when designing intervention programs for older students at the DL level. These are summarized in [Box 9-9](#).

FCT can be used with students who have some speech, or those whose primary mode of communication is augmentative or alternative communication (AAC). Task analysis, breaking the client's communicative needs down into very small "slices," also can help in planning the intervention. For example, suppose the ecological inventory (see Chapter 8) identified the need to take the city bus to school each day as an important context in which communication is needed. The clinician might ride the bus with the client one day and note the communication that is required. It might be noticed that the client needs to find the correct place to wait for the bus by "reading" the sign or at least identifying the sign that says "Bus Stop" and finding the stop with the correct bus number. Then the client might need to check the number on the bus that stops; get on the right one; show the driver a bus pass; and say, "Please tell me when we get to Washington School." The client might need to sit near the front of the bus to hear the driver announce the stop. The client would need to listen for the announcement, get up when it is heard, and say, "Thank you" to the driver before getting off the bus.

BOX 9-9 Principles of Intervention for Older, Severely Impaired Clients at Developing Language Levels

1. Focus intervention on helping students develop functional abilities for participating with as much independence as possible in mainstream settings.
2. Goals for older individuals in this phase of language development should be functional, rather than based on the normal developmental sequence. Instead of attempting to teach all the grammatical morphemes, choose specific language forms that are useful for particular situations selected by means of an ecological inventory.
3. Provide specific communication services for clients who:
 - Have trouble understanding instructions in their daily living activities
 - Cannot produce enough communication to function independently in a variety of mainstream settings (such as travel, school, work, shopping, leisure)
 - Violate rules of politeness and appropriateness in social interactions
 - Lack functional abilities to read important environmental signs and use functional written communication
 - Have difficulty making their speech understood, speaking fluently, or using audible voice
4. Use activities and materials in intervention that are appropriate and functional.
5. Develop early literacy skills, using specific behavioral techniques, even if cognitive levels usually associated with reading have not been achieved.
6. Develop opportunities for students to participate as independently as possible in important social contexts (athletics, church, clubs, leisure activities, etc.).

The clinician could record each of these steps and, using behavioral techniques, modeling, and role-playing in script therapy, teach each piece of the process, one at a time. As each is acquired, it can be “chained” (McCormick & Goldman, 1984) onto the sequence being learned, so that the sequence gets longer as each new piece is added, until the client can perform the entire sequence independently in the educational setting. Then the clinician may want to accompany the client again in the real situation to provide monitoring and feedback as the new chain of skills is used in the functional setting.

Note that, in using script therapy or behavioral techniques, a long, complex sentence such as, “Please tell me when we get to Washington School,” could be taught, even though such structures might be developmentally more advanced than the client’s spontaneous speech would suggest is possible. Functional intervention means teaching a few powerful scripts or behaviors that might not be acquired as generalizable rules. Similarly, “reading” might be considered developmentally too advanced a skill for certain clients. But careful training could enable such clients to “read” several important signs and symbols that have functional significance. These might include the “Bus Stop” sign and the ability to match the numbers on the sign, the bus, and the bus pass. When working with severely impaired older clients, we don’t want to impede their progress toward autonomy by requiring them to go through all the stages of normal development before attempting to teach skills that can foster independence.

Another focus for students at this level will be FCT (Bopp, Brown, & Mirenda, 2004; Mancil & Boman, 2010). As we discussed when talking about our consultative role, this training is used to replace troublesome behaviors that serve a communicative function with more adaptive responses. FCT can take place either in speech or using AAC systems. Bopp, Brown, and Mirenda (2004) argue that SLPs are equipped to provide FCT, in either direct or consultative roles, because of our familiarity with AAC strategies and our depth of knowledge about communication. They provide detailed instructions for implementing an FCT program. These are summarized briefly in Table 9-11. Research summarized

by Bopp et al. (2004), Mancil (2006), and Prelock et al. (2011) also supports the use of FCT to prevent and replace maladaptive behaviors for clients with severe disabilities. Parents need to be involved in replacing maladaptive behavior with more functional communication strategies at this level, using approaches similar to the ones we discussed earlier. Tait, Sigafos, Woodyatt, O’Reilly, and Lancioni (2004) showed that parents could be successful in helping their children replace challenging behaviors with communication and that these gains were maintained over time.

Halle, Brady, and Drasgow (2004) emphasize the importance of helping children with severe disabilities repair communication breakdowns. These, too, are a source of frustration for low-functioning students, as they may be attempting to communicate in a way that is not easily understood by their audience, and these breakdowns can lead to maladaptive behaviors. They emphasize the importance of developing a larger repertoire of socially acceptable signals, so if one fails they have alternatives, and of making sure communication partners (parents, teachers, and peers) are cued in to the child’s new signals and encouraged to respond to them.

One additional strategy is relevant here. Visual schedules have also been shown to be helpful as a part of FCT (Bopp et al., 2004). These help students predict what will come next and can avoid maladaptive behaviors due to the frustration of not understanding the rapid flow of events in a classroom. Visual schedules can be made from a variety of materials, using a range of levels of symbols. An example of a visual schedule appears in Figure 9-1. Hodgdon (1995) provides additional examples of visual schedules. Electronic visual schedules, such as the iPrompt application, provide a more normative, less stigmatizing platform for developing these assistive devices.

Preschoolers with ASD

Young children with ASD tend to be delayed in their language development, although most will have developed some level of spoken language by the end of the preschool period. For these

TABLE 9-11 Elements of Functional Communication Training

Element	Example
Functional Behavior Analysis: Identify functions of maladaptive behavior	Child bites peers; observe when child bites and identify antecedent, such as inability to gain access to toy peer has
Identify a form of communicative response available to the client	A word or sentence, sign or gesture, picture book or board, AAC device such as a voice output communication aid (VOCA)
Match an adaptive response to the communicative function of the maladaptive behavior	Teach child to use sign for “want” when he wishes to gain access to a peer’s toy
Establish response mastery: make sure new communication achieves desired outcome	Teach “want” sign to peers and encourage them to respond when child requests in this way, or to call a teacher if they cannot respond
Establish appropriate schedule of reinforcement	Ensure that at the first desired response is achieved quickly (less than 20 sec). Gradually time delay can increase. Teach child to use “want” sign with clinician and adults first to guarantee quick response; later bring in peers.
Provide an alternative form if first is unsuccessful	Teach child if “want” sign does not achieve goal to use “please” sign
Use mild punishment when problem behaviors occur; quickly redirect to new communication behavior	If child bites or begins to bite, use brief facial screening (hands over eyes), then hand-over-hand guidance to produce “want” sign

FIGURE 9-1 Example of a visual schedule.

children, whose syndrome results in significant delays in both language and other forms of communication, the preschool intervention program will generally need to target the development of both language forms and functions. Chapters 6 and 7 provide guidelines for working with children with ASD at preverbal and single-word levels. Here we will address the needs of those who have developed some spoken language, but are still acquiring the basic forms and functions of linguistic communication.

Echolalia

Prelock (2006), Prizant & Duchan (1981), Prizant and Rydell (1984), Stribling et al. (2006), and Tager-Flusberg & Caronna (2007) discuss the role of echolalia in the language of children with ASD. Children with ASD are often seen to echo what others say during early stages of language development. But it's important to know that echolalia is neither universal nor unique to this syndrome. Some typically developing children have transient immediate echolalia, and it sometimes is observed in children who are language delayed or blind. For about 40% of children with ASD, echolalia is a first step toward language acquisition, and it generally decreases as spontaneous language grows (Tager-Flusberg & Calkins, 1990).

Echolalia can be immediate or delayed. Immediate echolalia can consist of the last word(s) of another person's sentence, or the whole of the previous utterance. Often it shows the characteristic pronoun reversal sometimes seen in, although not unique to, autism (e.g., a child says, "You want juice?" after being asked if he wants juice). Delayed echolalia occurs when a child with little or no spontaneous language repeats commercials or large chunks of dialogue from movies or conversations heard earlier. Echolalic phrases may be complex but do not necessarily reflect the child's

level of spontaneous language. Although echolalia in children who have ASD can seem to be a self-stimulatory behavior, it sometimes is functional, allowing children to make requests, soothe themselves, participate in a social routine, or gain time to process language (Prizant & Duchan, 1981).

Behavioral interventions are often used to help children decrease their use of echolalia. Ahearn, Clark and MacDonald (2007), for example, used *response interruption and redirection* (RIRD), an approach that involved a teacher issuing a series of vocal demands the child readily complied with at other times (such as "Say, Hi!") when echolalia occurred. The adult continued to present these demands until the child complied correctly with three consecutively. This treatment was found to significantly reduce the frequency of echolalia in the three children studied, and to increase in appropriate communication, as well.

Another approach to reducing echolalia is more naturalistic (Laski, Charlop & Schreibman, 1988), involving prompting changes in the child's echoed production, to elicit *mitigated echolalia*. The clinician can echo the child's echo, then ring a slight change and invite imitation of the change. For example, if the child says, "yellow balloon," the clinician can say "Yellow balloon! I like blue! Here's a blue balloon!" Materials that correspond to the modified model can be offered and withheld until the mitigated form is produced. Once this can be done in short phrases, longer utterances can be used. The same kinds of activities can take place around the social routines being learned. After learning to sing "Five Little Monkeys," for example, the routine can be changed to "Five Little Doggies," etc. It is important to accompany work on reducing echolalia with efforts aimed at increasing language comprehension and production, since advances in language are usually accompanied with spontaneous decreases in the use of echolalia, as we said earlier.

Language Form

Tager-Flusberg, Paul, & Lord (2005) reported that, when children with ASD learn to speak, most aspects of language form, such as phonology, morphology and syntax, are more or less on par with cognitive level. This would imply that once children start using spoken language, these aspects would naturally evolve. Unfortunately, this is not always the case, for two reasons: first, language development is greatly delayed in children with ASD, so that even though a child with ASD may achieve more or less developmental-level appropriate language at school age, they can take much longer than other children do to get there, and experience very limited spoken communication abilities throughout the preschool period. Second, a substantial proportion of speakers with ASD show patterns of language acquisition that are similar to those seen in children with DLD (Tager-Flusberg & Joseph, 2003). These children show *both* autistic communication difficulties *and* the problems in acquiring language form, including delayed speech sound development, difficulty with learning grammatical morphemes, auxiliary verbs and closed-class morphemes, as well as higher rates of syntactic errors and ungrammatical sentences, for longer periods of time. These findings suggest that many preschoolers with ASD will need intervention in the same areas as other children with DLD, in addition to intervention to address the communicative symptoms of autism.

Children with ASD sometimes develop speech with clear articulation, adequate prosody and fluency. But it is not unusual, either, for speech in preschoolers with ASD to be delayed or difficult to understand. Some preschoolers with ASD may need help developing their speech skills, just as other preschoolers do.

Many of the same techniques we've talked about already to address these delays in the development of speech and language form are appropriate for children with ASD as well as those with DLD. However, because of their difficulties with imitation and joint attention, many children with ASD have difficulty responding to the kinds of child-centered and hybrid techniques that work well with other preschool clients. For this reason, many language form programs for young children with ASD make use of clinician-directed, behavioral approaches, like discrete trial training. In fact, these approaches, so far, have the strongest evidence base for this population (Foxy, 2008; Mandell, Levy, & Schultz, 2010; Rogers & Vismara, 2008). Some examples of behavioral programs developed specifically for teaching language form to children with ASD appear in Table 9-12.

Language Content

Although research suggests that children with ASD may learn words in an atypical way (e.g., Norbury, Griffiths, & Nation, 2010), their use of the words they know has been found to be very similar to that of other children (Tager-Flusberg et al., 2005). The main differences in semantic development in children with ASD are seen in difficulties with certain classes of words. They use few words that refer to mental states, like *think*, *remember*, and *know*, and they have trouble with deictic uses of words, those like *I/you*, *here/there*, *come/go*, and *give/take*, that shift meaning depending on the point of view of the speaker. These kinds of words may need special attention in an intervention program for a client with ASD.

Language Use

Pragmatics are, of course, the area in which all children with ASD will require assistance, even the highest functioning, most verbally precocious individuals. For children still learning basic lan-

guage forms, we would argue that using pragmatic contexts as generalization opportunities for practicing forms learned in more structured contexts makes sense for children with ASD, as it does for other preschoolers. Timler, Vogler-Elias, and McGill (2007) suggest using a *system of least prompts* to work on generalizing language forms to new pragmatic contexts. They argue this method is useful to avoid allowing children to become dependent on adult support. The system involves first identifying levels of prompts that can be offered to a child to use a new form in a pragmatic setting; such as:

- Level 1: Visual cue; for example, pointing to a picture on a visual schedule showing the steps to entering a play interaction
- Level 2: Nonspecific verbal cue; for example, "Would you like to say something to your friend?"
- Level 3: Nonspecific verbal prompt; for example, "Say something to your friend."
- Level 4: Cloze prompt; for example, telling the child, "Say, 'Can I . . . ?'"
- Level 5: Imitation prompt; for example, telling the child, "Say, 'Can I play with you?'"

When the child needs help to use the forms learned to engage in a generalization activity, such as a peer interaction, the clinician offers the lowest level prompt first. Higher level prompts are only offered if needed.

For preschoolers with ASD who show strengths in language form, intervention will still be needed to help them use their language to engage effectively with others, particularly with peers. Timler et al. (2007) and Goldstein et al. (2007) suggest the following strategies:

- Self-monitoring: Children are given concrete guidelines, such as a visual schedule or social story describing a particular pragmatic interaction, like asking a friend to share a toy. The adult practices each step outlined in the schedule or story with the child, then has the child re-enact the sequence without adult cues, relying only on the visual or graphic support. The adult then asks the child to go through the schedule or story and check whether he or she remembered all the steps. If any were left out, the sequence is practiced again. Figure 9-2 provides an example visual schedule for use in self-monitoring.
- Peer mediation: Typical peers are especially powerful agents of social skills intervention (Goldstein et al., 2007). Goldstein et al. report that teaching preschool peers a set of

- Walk over to your friend.

- Watch your friend.

- Get a toy like the one your friend is using.

- Do the same thing as your friend.

- Tell an idea.

FIGURE 9-2 Visual schedule for peer play entry. (Adapted from Beilinson, J., & Olswang, L. [2003]. Facilitating peer-group entry in kindergartners with impairments in social communication. *Language, Speech, and Hearing Services in Schools*, 34, 154-166.)

simple strategies, and providing daily “buddy time”—in which dyads of typical and autistic preschoolers were required to remain together for 20 to 30 minutes several times per week—was effective in increasing interactions for preschoolers with ASD. Strategies were taught as “buddy skills.” Each strategy was taught separately, so that at first pairs of children learned simply to stay together; then to stay and play; and finally to stay, play, and talk. [Box 9-10](#) provides an outline of this training.

- Socio-dramatic script training: Small groups of children are taught a “script” or expected set of events for a pretend play scenario, like those we discussed as “event structures,” as a “lesson.” Each child is assigned a role within the script, such as doctor, patient, or patient’s mother. The children are then provided with props in the dramatic play area and encouraged to enact the script. An adult is available to remind children to stay within their roles, and use the scripted language they had been taught; however adult prompts are kept to a minimum, in order to encourage interaction among the children. Once the children have played one script several times, a new script, such as shopping at a pet store, may be taught. [Box 9-11](#) provides a sample socio-dramatic play script.

BOX 9-10 “Buddy Skills” for Peer-Mediated Pragmatic Skills Training

Typical peers were given several 15-minute periods of training throughout the program. Buddies were taught three sets of strategies for engaging with peers with ASD. They were provided with rewards for maintaining each level of interaction for the entire “buddy time” period.

Stay:

Typical peer buddies are taught that it is their job to stay with their assigned buddy throughout a designated 20-minute period. Their only job is to stay close to the buddy. If the buddy moves away, the typical peer is taught to follow him.

Play:

Typical peer buddies are taught to not only stay near their buddy but to play together, using the same materials. Specifically, they were taught to get the peer with ASD to look at materials together with the typical peer, and the peer is taught to initiate play actions (“Let’s race these cars”).

Talk:

When buddy pairs could stay and play together, typical peer buddies were taught to add talking to their strategies. They were taught to tap the child with ASD on the shoulder to get his attention, call his name, describe what they were doing together and respond to any attempt by the child with ASD to communicate.

BOX 9-11 Example Socio-dramatic Play Script**Event Structure:**

Shopping at a pet store

Roles:

Storekeeper (S), child shopper (C), child shopper's dad (D)

S: Hi, welcome to the pet store! Can I help you?

C: Puppy! I want a puppy!

D: How much does a puppy cost?

S: It depends. Which puppy do you want?

C: This one! I like this one.

S: That one costs a lot.

D: I don't have a lot of money. Is there one that costs less?

S: Yes, this puppy is only \$10.

C: Can I pet him?

D: He won't bite us, will he?

S: No, just be careful and pet his back gently.

C: I like him, daddy. Can I have him?

(different endings can be improvised: Dad says no, dad says yes, puppy bites, etc.)

CONCLUSIONS

Intervention for clients with DL requires a great deal of thought and planning, as we've clearly seen. Like intervention for any level of language development, intervention at this stage can make use of a broad range of techniques, agents, and settings. Our job as clinicians is to match this repertoire to the needs of our clients. The goals of intervention for clients in the DL period are to increase the elaboration, maturity, and efficiency of communication and to help the clients use that communication in life's important contexts, including play, problem solving, and real social interaction. Let's go back to Rachel and see how we might address some of her needs in an intervention program. Remember that this is just one possible solution. You might like to try to devise a different program just to explore some of the many ways of attaining the same goals.

Ms. Snyder prepared the following IEP to address Rachel's needs:

PRESENT LEVEL OF PERFORMANCE

Rachel's parents understand her speech for the most part, but it is difficult for those outside the family. Articulation testing on 12/18/11 revealed frequent deletions of sounds in final position, and substitution errors on /s/, /z/, /f/, /g/, /k/, /l/, /r/, /j/, /θ/, /ʒ/, and /tʃ/. Phonological process analysis from a spontaneous speech sample showed frequent final consonant deletion, stopping of fricatives, fronting of palatals and velars, and gliding of liquids. Both standardized testing and speech-sample analysis revealed that Rachel is functioning significantly below age level in terms of productive syntax, with most forms at or below a 3-year level of development. Receptive skills appear about 1 year below general developmental level. These developmental delays often make it difficult for her to communicate her intentions in school and social settings, resulting in frustration and isolation for her.

SPECIAL EDUCATIONAL NEEDS

Rachel's speech skills cause her significant problems in interacting with peers and teachers, and she occasionally has cried in frustration at being unable to make herself understood. Rachel needs structured intervention to improve her speech production, increase the number of consonants produced correctly, and reduce the use of phonological processes that interfere with intelligibility. She also would benefit from intervention to increase her productive language skills, so that they come nearer to her receptive level. Rachel also will also receive individualized services from the reading specialist to help her make progress toward learning letter sounds and names, along with the rest of the kindergarten class.

ANNUAL GOALS (AND ACTIVITIES)

Goal	Activity
1. Increase intelligibility and phonological production skill	Use Prezas and Hodson (2010) approach in individual pull-out sessions to address phonological errors identified in assessment.
2. Increase vocabulary	Use collaborative lessons to focus on vocabulary items taken from classroom themes. Have the group produce vocabulary items targeted, draw pictures of scenes containing the item, do sorting activities in teams around groups of words being targeted, and similar tasks.
3. Increase syntactic skills in conversational contexts	Teach ILS techniques to the classroom teacher; have the teacher spend several minutes during Free Choice activity each day with Rachel, providing expansion, extension, recasts, and buildups/ breakdowns, focusing especially on forms of be verbs.

Short-Term Instructional Objectives for Goal Number 1

1. By February break, Rachel will produce words containing a final /s/ sound, given a list of 10 consonant-vowel (CV)/s/ words drawn from classroom stories and curricular themes, with 80% accuracy.
2. By spring break, Rachel will produce CV/s/ words in spontaneous conversation with teachers and peers with 75% accuracy.
3. By February break, Rachel will produce words containing velar sounds, given a list of 10 CVC words drawn from classroom stories and curricular themes containing /k/ and /g/ sounds with 80% accuracy.
4. By spring break, Rachel will produce CVC words containing velars in spontaneous conversation with 75% accuracy.
5. By May 1, Rachel will produce words containing /z/, /tʃ/, and /j/, given a list of 10 CVC words drawn from classroom stories and curricular themes, with 80% accuracy.
6. By the end of the school year, Rachel will demonstrate spontaneous speech that is 75% intelligible by peers and

teachers in a small group activity, as indicated by three consecutive observations in which there is no more than one request for repetition or similar signal of misunderstanding.

Alternative Benchmarks

1. Rachel will produce CVC words accurately enough to be adequately understood by peers and the classroom teacher during group discussions around stories read at group time.
2. Rachel will demonstrate adequate intelligibility in spontaneous speech with peers so that teacher observations reveal no more than occasional requests for repetition or clarification in dramatic play interactions.

Adaptations

Rachel will have an adult education aide present for 25% of her time in the regular classroom. The aide will be available to work with Rachel to help her accomplish fine motor tasks that she has difficulty doing on her own (cutting, writing, etc.).

SPECIAL EDUCATION AND RELATED SERVICES

Rachel will receive 20 minutes of direct speech-language intervention three times a week in a quiet area of the classroom. In addition, the SLP will provide consultation on Rachel's

program to the classroom teacher. This consultation will consist of 30 minutes per week in which the SLP updates the teacher on Rachel's progress and makes suggestions for language activities the teacher can do in the classroom to foster Rachel's linguistic development.

Periodic Review

Date: April 4, 2011

Rachel has achieved all goals listed in Annual Goals

#1. "Rachel will improve her phonological production so that she can participate fully in the academic and social curriculum of the kindergarten class by contributing to group discussions during story time and interacting successfully with peers during dramatic play time."

Although Rachel still makes articulation errors, her intelligibility has improved so that 80% of her speech is understandable by teachers and peers in the classroom. SLP services should now focus on language goals within the classroom setting, rather than continuing to work on pronunciation in individual therapy. Language services will be delivered on a collaborative basis. Individual phonological intervention will be discontinued.

PRESENT LEVELS OF DEVELOPMENT

Physical development

Vision: Within normal limitsHearing: Within normal limitsHealth status: Within normal limits

Communication: Rachel's parents understand her speech for the most part, but it is difficult for those outside the family. Articulation testing on 9/10/10 with the GPTA-2 revealed performance at the 7th percentile. Errors included frequent deletions of sounds in final position, and substitution errors on /s/, /z/, /t/, /g/, /k/, /l/, /r/, /l/, /t/, and /z/ in all positions. Phonological process analysis from a spontaneous speech sample showed frequent final consonant deletion, stopping of fricatives, fronting of palatals and velars, and gliding of liquids. Both standardized testing and speech-sample analysis revealed that Rachel is functioning significantly below age level in terms of productive syntax, with most forms at or below a 3-year level of development. Receptive skills appear about one year below general developmental level. These developmental delays often make it difficult for her to communicate her intentions in school and social settings, resulting in frustration and isolation for her.

INDIVIDUALIZED EDUCATION PROGRAM MEASURABLE ANNUAL GOAL AND SHORT TERM OBJECTIVES

☐ Academic/Cognitive ☐ Social/Behavioral ☒ Communication ☐ Gross/Fine Motor ☐ Health ☐ Self Help ☐ Other: (specify) _____						
Measurable Annual Goal #1 Rachel will improve her phonological production so that she can participate fully in the academic and social curriculum of the kindergarten class by contributing to group discussions during story time and interacting successfully with peers during dramatic play time: Use Hodson and Paden (1991) approach in individual pull-out sessions to address phonological errors identified in assessment.	Method of Evaluation	Performance Criteria	Report of Progress*			
			Nov.	Jan.	April	June
	1: Monthly artic, probes; 6: Classroom observation	C: 80% correct in probes; J: No more than 1 misunderstanding/observation				
Short Term Objectives/Benchmarks						
Obj#						
1. By Feb. break, Rachel will produce words containing final /s/ sounds, given a list of 10 familiar CV/s/ words with 80% accuracy.						
2. By spring break, Rachel will produce CV/s/ words in spontaneous conversation with teachers and peers with 75% accuracy.						
3. By Feb. break, Rachel will produce words containing velar sounds, given a list of 10 familiar CVC words containing /k/ and /g/ sounds, with 80% accuracy.						
4. By spring break Rachel will produce words containing CVC words containing velars in spontaneous speech with 75% accuracy.						
5. By May 1, Rachel will produce /z/, /l/, and /t/ sounds, given a list of 10 familiar CVC words containing these sounds, with 80% accuracy.						
6. By the end of the school year, Rachel will demonstrate spontaneous speech that is 75% intelligible by peers and teachers in a small group activity, as indicated by three consecutive observations in which there is no more than one request for repetition or similar signs of misunderstanding.						
Alternative Bench Marks #						
1. Rachel will produce CVC words accurately enough to be adequately understood by peers and the classroom teacher during group discussions around stories read at group time.						
2. Rachel will demonstrate adequate intelligibility in spontaneous speech with peers so that teacher observations reveal no more than occasional requests for repetition or clarification in dramatic play interactions.						

Measurable Annual Goal #2 Rachel will use new vocabulary words drawn from classroom literature in mediated retelling activities and in spontaneous speech: Use collaborative lessons to focus on vocabulary items taken from classroom themes. Have the group produce vocabulary items targeted, draw pictures of scenes containing the item, do sorting activities in teams around groups of words being targeted, and similar tasks.	Method of Evaluation	Performance Criteria	Report of Progress*			
			Nov.	Jan.	April	June
Short Term Objectives/Benchmarks						
Obj#1: Rachel will retell a story heard during story time to her aide, using 6 vocabulary words pretaught from the story during language therapy session, with moderate prompting from the aide.	7: Data taken by aide	B: 90%				
Obj#2: Rachel will retell a story heard during story time to her aide, using 6 vocabulary words pretaught from the story during language therapy session, with minimal prompting from the aide.						
Obj#3: Rachel will dictate an original story to her aide that contains the words learned in Obj. #2 with minimal prompting.						
Obj#:						
Obj#:						

Measurable Annual Goal #3 Increase syntactic skills in conversational contexts: ILS techniques will be taught to classroom teacher and aide; each will spend several minutes during Free Choice activity each day with Rachel, providing expansion, extension, recasts, build-ups/break-downs, focusing especially on forms of be verbs.	Method of Evaluation	Performance Criteria	Report of Progress*			
			Nov.	Jan.	April	June
Short Term Objectives/Benchmarks						
Obj#1: By the end of the marking period, Rachel will imitate adult's expansions of her utterances, in Free Choice ILS activities, 70% of the time.	6: SLP will take monthly speech samples to monitor responses, MLU, and syntactic errors.					
Obj#2: By the end of the second marking period, Rachel will increase her MLU by 1-2 morphemes.						

Evaluation Procedures	Performance Criteria	Report of Progress Key*
1= Criterion-referenced/curriculum based assessment 2= Pre and post standardized assessment 3= Pre and post base line data 4= Quizzes/tests 5= Student self-assessment/rubic 6= Observation 7= Work samples/project/experiment/portfolio 8= Job performance or products 9= Behavior/performance rating scale 10= Standardized test 11= Achievement of objectives (Note: Use with goal only) 12= Other: (specify) _____	A= 100% B= 90% C= 80% D= 70% E= Standard score increase: _____ F= Months growth increase: _____ G= Passing grades/score: _____ H= Frequency/trials: (e.g., 9/10) _____ I= Duration: (e.g., 15 min, 1 per) _____ J= Successful completion of task/activity _____ K= Other: (specify) _____	M= Mastered S= Satisfactory progress (likely to achieve) U= Unsatisfactory progress (unlikely to achieve) NP 1= No progress (will Not achieve) lack of prerequisite skills NP 2= No progress (will Not achieve) need more time NP 3= No progress (will Not achieve) inadequate assessment NP 4= No progress (will Not achieve) excessive absences/tardiness NI= Not introduced O= Other: (specify) * Indicating extent to which progress is sufficient to achieve goal by the end of the year.

Special Education and Related Services:

1. Rachel will have an adult educational aide present for 25% of her time in the regular classroom. The aide will be available to work with Rachel to help her accomplish fine-motor tasks that she has difficulty doing on her own (e.g., cutting, writing). In addition, the aide will monitor Rachel's interactions with peers and will prompt her to use strategies for intelligibility provided by the SLP.
2. Rachel will receive 20 minutes of direct speech-language intervention three times/week in a quiet area of the classroom. In addition, the SLP will provide consultation on Rachel's program to the classroom teacher. This consultation will consist of 30 min. per week in which the SLP updates the teacher and aide on Rachel's progress, makes suggestions for language activities the teacher can do in the classroom to foster Rachel's linguistic development, and shares strategies for improving her intelligibility.

Classroom Modifications:

Rachel will be given a visual schedule to assist her in making transitions throughout the school day.

Periodic Review:

As of the end spring break, Rachel has achieved all goals listed in Annual Goal #1: "Rachel will improve her phonological production so that she can participate fully in the academic and social curriculum of the kindergarten class by contributing to group discussions during story time and interacting successfully with peers during dramatic play time." Although Rachel still makes articulation errors, her intelligibility has improved so that 80% of her speech is understandable by teachers and peers in the classroom. SLP services will now focus on language goals within the classroom setting, rather than continuing to work on pronunciation in individual therapy.

STUDY GUIDE

- I. Intervention Policy Issues at the Developing Language Level
 - A. What is IDEA? What kinds of service planning does it mandate for children at the preschool level?
 - B. What does family-centered intervention mean for a child at the developing language level?
 - C. How is the family to be involved in the development of the IEP?
- II. Intervention for Developing Language: Products, Procedures, and Context
 - A. Discuss some of the considerations that go into choosing intervention goals at the developing language phase.
 - B. Under what conditions should a child receive speech sound intervention during the developing language phase?
 - C. How does the principle of "one new thing at a time" apply to semantic and syntactic intervention in the developing language period?
 - D. What are some of the typical patterns of grammatical difficulty seen in children in the developing language phase?
 - E. Discuss the use of comprehension versus production goals in intervention at the developing language phase.
 - F. Discuss the role of pragmatics, play, and problem solving in intervention at the developing language period.
 - G. Discuss several clinician-directed methods of phonological intervention for children with developing language. For what kinds of clients or goals would these be appropriate?
 - H. How can CD intervention methods be modified to increase naturalness?
 - I. Discuss the two child-centered approaches to intervention at the developing language period.
 - J. How can ILS be modified for children in the developing language phase?
 - K. How can modeling of higher levels of play be integrated into ILS?
 - L. Outline several extensions of script therapy for children in the developing language period.
 - M. Describe hybrid intervention for children with developing language. What three types of activities can provide opportunities for teaching in this approach?
 - N. Describe three ways to integrate emerging literacy into preschool classroom activities.
 - O. Describe a hybrid approach to phonological intervention.
 - P. Discuss the role of paraprofessionals in intervention for children with developing language.
 - Q. What considerations go into using parents as agents of intervention? What activities are most appropriate for parents?
 - R. How can peers be used in language intervention for children with developing language?
 - S. What kinds of children and targets are best served with clinical models of intervention?
 - T. What skills are needed by the SLP for a language-based classroom in the developing language period?
 - U. What are the advantages of classroom-based and collaborative models of service delivery?
 - V. Discuss ways of improving the effectiveness of a consultative model of intervention in the developing language period.
 - W. Describe how an RTI model would be used at the pre-school level.
- III. Intervention with Older Clients with Severe Impairment and Children with ASD at the Developing Language Level
 - A. How can an ecological inventory be used to set goals for the older, severely impaired client at the developing language stage?
 - B. Describe six principles that can be used to guide intervention for older, severely impaired clients with developing language. Provide an example of applying each of these principles.
 - C. Describe task analysis as it applies to the older, severely impaired client at the developing language stage.
 - D. Discuss the issue of using the developmental sequence to guide intervention planning for the older, severely impaired client at the developing language stage.
 - E. Name several strategies for addressing pragmatic skills in preschoolers with ASD.
 - F. What role can peers play in intervention for preschoolers with ASD?

Working with Language Learning Disabilities

CHAPTER

10

Language, Reading, and Learning in School: What the Speech-Language Pathologist Needs to Know

CHAPTER OBJECTIVES

Readers of this chapter will be able to do the following:

1. Name roles and responsibilities of school-based speech-language pathologist (SLP) practice.
2. Describe the major acts of legislation that govern practice in schools; and describe their implications for practice.
3. Recognize documents critical to school-based SLP practice.
4. Discuss the role played by SLPs in early intervening and responsiveness to intervention models of instruction.
5. List the characteristics of school-aged children with language and learning deficits.
6. Describe connections among oral language, learning, and literacy.
7. List similarities and differences in oral and written language.
8. Identify effective strategies for promoting literacy through oral language support and instruction.

Nick's mother reported she'd had a drug problem before he was born. She'd used a variety of street drugs, and Nick had been born small and showed signs of drug effects at birth. His mother enrolled in a rehabilitation program while he was an infant, overcame her addiction, and worked hard to make a good home for Nick. Nick received a variety of services during his preschool

years, when he'd been somewhat overly active and slow in learning to talk. By the time he entered kindergarten, he had improved greatly and passed a kindergarten screening. He was placed in a mainstream class, and direct services were discontinued. But his third-grade teacher, Mrs. Johnson, noticed early in the year that Nick was having difficulty keeping up with the class. He seemed to be progressing adequately in first and second grade and seemed to enjoy reading the patterned picture books his teachers used for reading materials. His primary-grade teachers did note, though, that his speech was somewhat simpler than that of his classmates and he seemed to have trouble paying attention and following directions in class. Mrs. Johnson was concerned, now that more reading was required from classroom textbooks and more independent work in subject areas became part of the curriculum. Nick seemed to be falling behind. He didn't seem able to read the class texts on his own. He couldn't remember the directions she gave for completing assignments. He seemed unable to "get with" the classroom routines she'd established, such as filling out a card each day to indicate whether he was having a school hot lunch or box lunch from home. He wasn't able to learn the spelling list she assigned each week or write the simple book reports she required. He also was beginning to become disruptive, interrupting other students when they were doing their work, fidgeting and annoying others when she read to the class from the children's novels that were part of her program, and making "wisecracks" instead of contributing productively to class discussions. Mrs. Johnson felt that Nick was a child who could benefit from assessment for special educational services.

Nick is a child whose oral language sounds normal to the “naked ear.” He does not make many obvious errors in phonology or syntax, although he did when he was younger. Now his problems with communication are subtler and harder to define, but they seem to have a significant impact on his ability to acquire the skills needed for success in school. There are many children like Nick in our school classrooms, and they often come to the attention of the speech-language pathologist (SLP) through “early intervening” and responsiveness to intervention (RTI) procedures. Some, like Nick, have histories that suggest a possible root of their problem. Others have no such history, but simply have difficulty meeting the demands of the school curriculum for no apparent reason. Some may have started speaking late, have shown delays in acquiring words, combining words into sentences, or pronouncing the sounds of speech. Others have had unremarkable preschool language histories but seem to “hit a wall” when it comes to making the transition from oral to written language. Regardless of their language history, these children are beyond Brown’s stage V in terms of their vocabulary and sentence structures. They may be classified as learning disabled, reading disabled, or dyslexic, or they may have no diagnosis but have been identified in RTI (see Chapter 3) programs or been recommended for “early intervening services” in areas of language and literacy to prevent school failure.

Over 80% of children with disabilities in schools are diagnosed with the following four categories of disorder: learning disabilities (LDs) (46%), speech/language impairments (20%), intellectual disability (9%), and emotional disturbance (8%) (U.S. Department of Education, 2005). These statistics make up the bulk of children who receive services under the Individuals with Disabilities Education Act (IDEA); the remainder includes children with disorders such as autism, cerebral palsy, traumatic brain injury, vision and hearing impairments, and so on. These figures suggest that over two-thirds of the children on the caseloads of school SLPs will have language and/or learning disorders. And increasingly, due to recent laws requiring schools to be accountable for students’ progress, SLPs are being recruited to address not only the speech and oral language difficulties faced by these students, but to serve on literacy teams, to identify struggling readers, and to develop RTI plans for children with identified special needs, as well as to prevent students from failing to achieve classroom literacy goals.

Here in Section III, we focus primarily on children who, despite otherwise apparently typical development, struggle to succeed in the acquisition of literacy. Many of these children fall under the broad rubric of language-learning disability (LLD). This term implies that students have difficulty with various aspects of communication that interfere with their ability to succeed in school. Other children the SLP will encounter may not have an identified disability, but will fail to make adequate progress in the regular curriculum and will need some support to prevent them from falling so far behind peers as to eventually be diagnosed with a learning disability. Both these types of children, though, will have mastered the basic vocabulary, sentence structures, and functions of their language but have trouble progressing beyond these basic skills to higher levels of language performance in both oral and written modalities. In Chapters 11 and 12, we will talk about the role of the SLP in promoting both language and literacy development for such students during their elementary school years, from kindergarten through fifth or sixth grade, when normally developing children are between 5 and 12 years of age. In Chapters 13 and 14, we will look at adolescents with LLDs in secondary school settings.

There are, of course, children in schools whose communicative skills are still in the developing, emerging, or prelinguistic levels. Some of these students will be placed in resource rooms or special education classes, and others in inclusive settings. SLPs who work in school settings will find these children, too, included in their caseload. In fact, one of the exciting things about working in schools is the wide variety of issues and levels of functioning the SLP encounters. Thanks to legislation that mandates free, appropriate public education (FAPE) to all children, those with every type and severity of communication disorder will go to public schools along with their peers. Although specific methods for use with the broad range of disabilities seen in school settings are not addressed in this chapter, principles for addressing the needs of school children at earlier stages of communication can be found in Chapters 6 through 9. However, because SLP practice in schools involves work with individuals at all points on the spectrum of communicative function, as well as knowledge of the legal and professional issues specific to school-based practice, we will preface our more focused discussion on language/literacy issues for this stage of development by examining some of the issues that affect practice with all our students in school settings.

SCHOOL-BASED PRACTICE IN SPEECH-LANGUAGE PATHOLOGY

SLPs, as part of the educational team that delivers comprehensive services to students with disabilities, provide a wide array of supports to their clients in schools. The American Speech-Language-Hearing Association (ASHA, 2010) has recently redefined our roles and responsibilities to reflect the broad range of activities appropriate for SLPs who practice in school settings. These appear in [Box 10-1](#).

Laws Applying to School-Based Services

SLPs who work in schools are guided by federal laws that regulate special education. The Individuals with Disabilities Education Act (IDEA) of 1997 (reauthorized in 2004) is the major piece of legislation that applies to this work. Part B of IDEA specifies how services are to be provided for children aged 3 to 21. The specific diagnostic categories recognized as requiring special education appear in [Box 10-2](#). Where earlier special education laws had been concerned with ensuring access to FAPE in the least restrictive environment (LRE) and providing Individualized Educational Plans (IEPs) for all children, the 1997 act and 2004 reauthorizations shifted to emphasize accountability for meaningful educational results by:

- Increasing parental participation
- Identifying student strengths and parental concerns
- Raising expectations for children with disabilities by relating student progress to the general education curriculum
- Ensuring that all children have scientifically-based, appropriate instruction in reading
- Including regular education teachers in the special educational team
- Including children with disabilities in district-wide assessments and reports
- Supporting high standards for professionals involved in service provision

In addition, the No Child Left Behind Act of 2001 (NCLB) also focuses on increasing accountability. It is designed to hold schools accountable for making sure that all children, including those with

BOX 10-1 Roles and Responsibilities of School-Based SLPs**CRITICAL ROLES**

- **Working Across All Levels**—providing appropriate speech-language services in Pre-K, elementary, middle, junior high, and high schools with no school level underserved. (Note: In some states infants and toddlers would be included in school services.)
 - **Serving a Range of Disorders**—working with students exhibiting the full range of communication disorders, including those involving language, articulation (speech sound disorders), fluency, voice/resonance, and swallowing.
 - **Ensuring Educational Relevance**—SLPs address personal, social/emotional, academic, and vocational needs that have an impact on attainment of educational goals.
 - **Providing Unique Contributions to Curriculum**—SLPs offer supports in addressing the linguistic and metalinguistic foundations of curriculum learning for students with disabilities, as well as other learners who are at risk for school failure, or those who struggle in school settings.
 - **Highlighting Language/Literacy**—SLPs contribute significantly to the literacy achievement of students with communication disorders, as well as other learners who are at risk for school failure, or those who struggle in school settings.
 - **Providing Culturally Competent Services**—SLPs make important contributions to ensure that all students receive quality, culturally competent services. SLPs have the expertise to distinguish between language disorders and cultural and linguistic differences, socioeconomic disadvantage, lack of adequate prior instruction, and the process of acquiring the dialect of English used in the schools. SLPs can also address the impact of language differences and second language acquisition on student learning and provide assistance to teachers in promoting educational growth.
- Range of Responsibilities**—SLPs help students meet the performance standards of a particular school district and state.
- **Prevention**—SLPs are integrally involved in the efforts of schools to prevent academic failure.
 - **Assessment**—SLPs conduct assessments in collaboration with others that help to identify students with communication disorders as well as to inform instruction and intervention.
 - **Intervention**—SLPs provide intervention that is appropriate to the age and learning needs of each individual student and is selected through an evidence-based decision-making process. Although service delivery models are typically more diverse in the school setting than in other settings, the therapy techniques are clinical in nature when dealing with students with disabilities.
 - **Program Design**—SLPs employ a continuum of service delivery models in the least restrictive environment for students with disabilities, and they provide services to other students as appropriate.
 - **Data Collection and Analysis**—SLPs use data-based decision making, including gathering and interpreting data with individual students, as well as overall program evaluation.
 - **Compliance**—SLPs are responsible for meeting federal and state mandates as well as local policies in performance of their duties. Activities may include Individualized Education Program (IEP) development, Medicaid billing, report writing, and treatment plan/therapy log development.
- Collaboration**—SLPs work in partnership with others to meet students' needs.
- **With Other School Professionals**—SLPs provide services to support the instructional program at a school and complement and augment those made by other professionals.
 - **With Universities**—SLPs form relationships with universities to share knowledge and perspectives and can serve as resources for university personnel and the university students whom they teach.
 - **Within the Community**—SLPs work with a variety of individuals and agencies involved in teaching or providing services to children and youth.
 - **With Families**—For students of all ages it is essential that SLPs engage families in planning, decision-making, and program implementation.
 - **With Students**—SLPs actively engage students in goal planning, intervention implementation, monitoring of progress, and self-advocacy appropriate to age and ability level.
- Leadership**—SLPs provide direction in defining their roles and responsibilities and in ensuring delivery of appropriate services to students.
- **Advocacy**—SLPs advocate for appropriate programs and services for their clients, including reasonable workloads, professional development opportunities, and other program supports. SLPs articulate their roles and responsibilities to others in their professional setting, and work to influence the development and interpretation of laws, regulations, and policies to promote best practice.
 - **Supervision and Mentorship**—SLPs supervise student SLPs, clinical fellows, and paraprofessionals. They mentor new SLPs.
 - **Professional Development**—SLPs are valuable resources in designing and conducting professional development. Given their expertise in communication and language, SLPs have much to offer other educators, including administrators, teachers, other educational specialists, and paraprofessionals in the collaborative effort to enhance the performance of students in schools.
 - **Parent Training**—SLPs are in a position to provide training to parents of students of all ages with regard to communication development and disorders. They may be especially helpful to families in creating a language- and literacy-rich environment.
 - **Research**—Federal law requires the use of scientific, research-based practices. It is important for SLPs in the schools to participate in research to generate and support the use of evidence-based assessment and intervention practices.

Adapted from ASHA (2010). Roles and responsibilities of speech-language pathologists in schools [Professional Issues Statement] www.asha.org.

disabilities and those from impoverished backgrounds, achieve success in school. The law includes:

- The requirement that schools show adequate yearly progress (AYP) on tests and graduation rates
- Permission for school to spend up to 15% of special education funds to support students in the general curriculum

- Standards for reading instruction
- Consequences for schools that fail to demonstrate AYP

One impetus behind NCLB is the notion that too many children, particularly poor children, are identified as having special educational needs, perhaps because they have limited readiness for school and inadequate preschool experience (including limited

BOX 10-2 Diagnostic Categories Recognized by IDEA 2004

- Autism
- Blindness/Visual Impairment
- Deafness/Hearing Impairment
- Deaf-blindness
- Emotional Disturbance
- Intellectual Disability
- Orthopedic Impairment
- Specific Learning Disability
- Speech/language Impairment
- Traumatic Brain Injury
- Multiple Impairments
- Other Health Impaired

language development as a result of restricted models) to prepare them to succeed in the general curriculum. An implication of this notion is that more should be done in the general curriculum to prevent academic failure. RTI is a recent innovation in instruction that attempts to provide more intensive help to students who are struggling without having to identify them as having special educational needs. We'll talk more about how this approach works later on in this chapter.

Another law that pertains to practice in schools is Section 504 of the Rehabilitation Act of 1973. It guarantees equal protection for individuals with physical or mental disabilities. Although it does not provide funding for services, it does require accommodations to allow students to participate in general education, such as physical access to school buildings for students in wheelchairs, assistive listening devices, and extra time to complete tests and assignments. Children with 504 plans do not receive an IEP; and generally such plans are used to support children who do not qualify for one of the twelve diagnoses listed in Box 10-2. Often, for example, children with attention deficit hyperactivity disorder who do not have other disabilities will be accommodated by means of 504 plans.

Recent laws affecting special education have resulted in SLPs' increasing involvement in classroom activities and collaborative approaches to helping children with a variety of challenges succeed in the school curriculum. Although as recently as 10 years ago, SLPs often worked on goal sequences and themes they developed themselves to address IEP objectives, current practice in schools requires us to support clients to succeed in the general curriculum, deriving communication goals from classroom topics and embedding activities within classroom settings. Recent emphasis on RTI has also moved the role of the SLP away from providing "speech therapy" in a segregated space, and toward applying the SLP's knowledge and skills in the connections between language and literacy to all tiers of RTI instruction, as well as in more traditional individualized therapy.

Preassessment and Referral Under RTI

Many school systems today use the RTI (see Chapter 3 for definition and further discussion) model, particularly in the primary grades, to attempt to resolve learning problems within the regular education setting, by providing classroom modifications and accommodations that can prevent the need for special education or

for labeling a student as having a special educational need. RTI approaches are most often seen in the area of literacy instruction in the primary grades (Fuchs & Fuchs, 2009), although their use in other curricular areas and age levels is expanding (see, for example, Ehren & Whitmire, 2009; Justice, McGinty, Guo, & Moore, 2009; Montgomery, 2008). As we saw in Chapter 3, RTI uses a three-tiered structure (National Joint Committee on Learning Disabilities, 2009):

Tier I: High quality, scientifically research-based classroom instruction for all students in general education, with ongoing, curriculum-based assessment and continuous progress monitoring.

Tier II: Students who lag behind peers receive small group, more specialized instruction to prevent failure within general education.

Tier III: For students who continue to struggle after provision of intensified, small group instruction in Tier II, individualized instruction may be provided; if adequate progress is not made, comprehensive evaluation is conducted by a multidisciplinary team to determine eligibility for special education and related services.

RTI, then, is aimed at *prevention* of reading disability.

Children who are found, through the monitoring process, to have difficulty with regular classroom instruction in this model, may be provided first with accommodations within the regular program, such as sitting closer to the teacher, or using an assistive listening device; alternatively, they may receive RTI Tier II (small group, intensified) instruction for a specified period of time. If ongoing assessment finds these strategies are adequate, students may return to Tier I instruction with ongoing follow-up consultation to the classroom teacher. If however, the accommodations fail to lead to adequate progress, students may be either placed in a Tier III (individualized, intensive) instructional setting, where progress will continue to be assessed, or referred directly for special educational evaluation. If Tier III support is provided without special education referral, progress will continue to be monitored and a formal referral for special educational assessment is made only if this high level of support fails to yield adequate progress after a specified period of time. By the time a child is referred for an evaluation for special education, though, the SLP may have already had a chance to get to know him or her through participation in RTI.

Implementation of RTI provides a number of important roles for SLPs. Ehren, Montgomery, Rudebusch, & Whitmire (2009) suggest that SLPs in RTI settings can make unique contributions by (1) participating, through their knowledge of the connections between oral language and literacy, in the design of Tier I instruction by planning and conducting professional development on the language basis of literacy, helping to select scientifically based literacy instruction programs, and choosing appropriate screening and progress-monitoring approaches; (2) collaborating with general education teachers in presenting Tier I instruction, assisting with ongoing progress monitoring, and helping teachers develop accommodations within Tier I for struggling students; and (3) serving students by providing small group and individual instruction at Tiers II and III, and using a range of assessments from tests to observational methods to identify struggling students and monitor progress. While RTI involves changes from the way SLPs have traditionally operated in school settings, it provides opportunities, as well: opportunities to use more pragmatic, authentic assessment procedures to identify children having difficulty, to work more closely with general education teachers on ways to enhance

language and literacy skills not only for children with special educational needs, but for students for whom school failure can be prevented with just a little extra “boost” early in their school careers, and to allocate time for indirect services such as supporting classroom teachers and others who work with children before referrals for special education happen. All these opportunities give SLPs the chance to be a more highly visible, integrated member of the school success team.

Still, SLPs will continue to be responsible for the communication skills of all children in public schools, such as those with intellectual disability, autism spectrum disorder, hearing impairment, and severe speech impairments. As Ukrainetz (2006) pointed out, SLPs may find their services needed *both* by students with recognized special needs *and* by students needing support within an RTI model, as a preventive measure. SLPs in work in settings that demand these dual roles may need to make adjustments in the organization of their delivery of services. We’ll talk about some of these options in Chapter 12.

Determining Eligibility

One responsibility of the school SLP is to decide whether a student referred for speech-language services meets district eligibility criteria. Eligibility criteria, though, vary not only from state to state but in some cases from school district to school district. Just as we learned in Chapter 1 that there is no universally accepted definition of language disorder, there is no universally accepted criterion of eligibility for communication services in schools. Some states require a test score that is two or more standard deviations below the mean; others require two test scores that are 1.5 standard deviations below the mean, some a combination of test performance and severity rating, and so on (Moore-Brown & Montgomery, 2001). In districts that employ RTI, a student may be required to be tried at all three RTI levels before a referral for special education can be made.

Moreover, IDEA requires that whatever impairment the child has must adversely affect academic performance if services are to be provided. This requirement is interpreted rather broadly, though. Whitmire and Dublinske (2003) show that, because many state standards for academic proficiency include speaking and listening skills, children who have language problems may qualify for special educational services, even if their academic achievement is not significantly depressed by their communicative disorder. For example, even though residual speech errors on late-developing sounds such as /s/, /r/, and /l/ do not to carry great risk for literacy problems (Bishop & Clarkson, 2003), the presence of “speech/language impairment” as one category of disability eligible for special education services suggests that SLPs may include children with residual errors on caseloads, particularly if the errors affect social opportunities and acceptance. SLPs need to become familiar with the eligibility requirements and local proficiency standards of the school districts in which they are employed and learn to use these standards to find ways to provide services for all children with communicative needs.

Documenting Present Level of Educational Performance

When a student is deemed eligible for special educational services, the IEP includes a summary of the assessment information gathered on the child. A variety of areas are assessed by the educational

team; these include intellectual functioning; readiness or academic skills; communicative status; motor ability; sensory status; health and physical status; emotional, social, and behavioral development; and self-help skills. Not every area needs to be assessed for every student, however. If deficits are restricted to speech and language, for example, present level of performance may be given in communicative areas alone. The law requires that multiple instruments be used, so that children are not identified as having a disability on the basis of only one test. Informal, observational, parent or teacher interview, and language sampling measures, as well as standardized instruments, can be part of this assessment, and information from previous assessments can also be used. The assessment of performance must also include information on how the child’s disability affects participation and progress in academic and social environments. For schools that employ RTI models, much of this information may be gathered through the course of the child’s participation in the various levels of RTI, thus economizing the new information that needs to be collected at the time of referral.

Writing Individualized Educational Plans

Once a child has been identified as having a special need in the area of communication, the next step is to establish goals and objectives to meet these needs, as identified in the assessment. These goals and objectives are incorporated into the IEP, which contains the components listed in Table 10-1.

Annual Goals

IDEA requires that annual goals be designed to help the child participate and make progress in the general curriculum. The annual goals are directly related to assessment data in the Present Level of Performance section. IDEA 2004 requires that present levels of performance and annual goals be linked to the general curriculum. The goals must be measurable and be achievable within 1 calendar year. Each goal should have five components (Bateman, 2006):

1. The direction of the intended change (increase/decrease/maintain)
2. The area of deficit (e.g., reading comprehension) or excess (e.g., articulation errors)
3. The present level of performance (e.g., at fifth percentile for grade on word reading)
4. The expected annual ending level of performance (e.g., performs at 20th percentile for grade on word reading)
5. The resources needed to accomplish the expected level of performance (e.g., one-to-one instruction; consultation with classroom teacher)

Goals are targeted for each of the areas assessed in which the child has a special educational need. Each area targeted is usually given a separate page on the IEP, and each annual goal in that area is given a section on the page. Beneath each annual goal, the short-term instructional objectives required to reach that goal may be listed. These objectives form the basis for monitoring the student’s progress.

Short-Term Objectives and Benchmarks

Short-term objectives (STOs) are the discrete steps toward the annual goal. They comprise the task analysis for each annual goal, and are listed sequentially in the IEP. Objectives should conform to the “SMART” acronym (PACER Center, 1990): Specific, Measurable,

TABLE 10-1 Required Components of the Individualized Educational Plans

Component	Description
Strengths & concerns	Parent concerns and priorities, as well as child's areas of relative strength are listed.
Evaluation results	Assessment results are reported and interpreted.
Present level of educational performance	The effect of the student's disability on participation and progress in the curriculum is reported.
Annual goals	Long-term goals related to meeting general educational curriculum or other educational needs that result from the disability are listed in each area of disability.
Short-term objective and benchmarks	Measurable, sequenced steps toward annual goals are detailed.
Amount of special education or related services	Projected beginning date, frequency and types of service, and an estimate of duration are given.
Supplementary aids and services	Describes how the regular educational program will be modified so that the child can participate, how services will contribute toward this participation in the general education curriculum, as well as in extracurricular activities. Also contains information about the types of related services needed (SLP, occupational therapy, etc.). These services may be direct, as in one-to-one therapy, or indirect, as in consultation to the classroom teacher by the SLP. Any assistive equipment the student might need to participate in the curriculum (such as a hearing aid or an AAC device) is also listed.
Participation in regular education environments (least restrictive environment; LRE)	The extent of the student's participation with students without disabilities in both educational and extracurricular settings is given. Accommodations might be included, such as support staff to help the child succeed in the setting, modifications in transportation and equipment, and behavioral interventions to manage problem behaviors in the classroom.
Test modifications	Modifications needed to participate in district-wide assessments of student achievement are given.
Transition services	Interagency responsibilities and community links to help student move toward adult placement are listed.
Notification of transfer rights	Documentation that the student has been informed of his or her rights when maturity is reached.
Evaluation procedures and measurement methods	How and when student progress will be measured (progress must be reported as often as it is for general education students). Progress must be evaluated at least once every 3 years, although it can be done more often. Assessment may be relatively short and may use existing data or observational records. Parents also must be informed of how the child's progress toward goals will be measured, and they must receive progress reports as least as often as children in regular education receive report cards. The reevaluation can have three possible outcomes: (1) continuation—if the student is moving toward goals as expected, the plan can be continued without changes; (2) modification—if small changes in the IEP are needed to maximize student progress but the changes are not significant enough to warrant another IEP meeting; or (3) revision—if the IEP must be rewritten with significant changes because of lack of or greater-than-expected progress that warrants the targeting of new goals or a reduction in services needed. Parents' consent must be obtained for the program to be changed.
IEP team members	Signatures of all IEP members, including parents, general education teachers, special educators, and administrators are needed.

Adapted from Moore-Brown, B., Montgomery, J., Bielinski, H., & Shubin, J. (2005). Responsiveness to intervention: Teaching before testing helps avoid labeling. *Topics in Language Disorders, 25*(2), 148-167.

Attainable, Relevant, and Teachable. Each short-term objective has four components:

1. **Conditions:** the circumstances under which the behavior will be performed ("after identifying its story elements with the SLP;" "given a list of ten words and a list of meanings selected from science units")
2. **Description of specific behavior** ("Nick will complete a book report on a book chosen in collaboration between the teacher and the SLP;" "James will match the word to its meaning")
3. **Criterion** for measuring success or attainment of the goal ("that includes at least four of the five elements required for the class assignment;" "with 90% accuracy")
4. **Evaluation** procedure: the way the goal will be measured ("as measured by improvement in grades on book report assignments;" "as measured on end of unit tests")

Benchmarks describe the amount of progress a student is expected to make during each segment of the school year. They translate grade level standards into concrete things the student

should be able to do and understand and mark progress toward the achievement of curricular standards. Each benchmark may contain several indicators, which describe what students will be able to do without teacher assistance on the way toward accomplishing the goal. Both STOs and benchmarks are used to specify the sequence of specific measurable behaviors that will be observed as a student makes progress from the current level of performance to the annual goal (O'Donnell, 1999).

Specifying Services, Modifications, and Accommodations

The IEP must state the amount and type of educational services the student will receive. However, it is important for SLPs to know that the law does *not* require that a specific number of hours of service per week be stated. Clinicians can be flexible in specifying the amount of service by, for example, planning for *daily* service over the course of a specified time period (for example, 1 month or 1 marking period), planning for consultation with general education teachers, co-teaching,

or specifying a number of hours of service over the course of a longer time period (say, 35 hours over the course of a semester), so that more and less intensive periods of intervention and monitoring can take place. For children over 14 years of age, transition planning to post-secondary settings must also be part of the IEP. In addition, other supports such as assistive devices, modification of transportation, test requirements, etc. should also be stated in the IEP.

Evaluation

Planning for evaluation of progress is also an important element. Most children on IEPs will be required to participate in district-wide testing, but other forms of evaluation of progress may also be used.

DELIVERING SERVICES WITHIN THE CURRICULUM

Under IDEA regulations, SLPs no longer work separately on a set of language goals and activities they develop on their own. Whether they work in individual “therapy” sessions, with a small group of students within a classroom activity, or alongside the classroom teacher in a collaborative model, language activities are drawn from the general education curriculum, and goals address helping the student progress through it, to whatever extent possible.

INCLUSION

The 2004 regulations place a greater burden on local education agencies (LEAs) to justify any placement that is not full-time in a mainstream classroom. However, this does not mean that every child must be placed in the general classroom all the time. The law requires that there be a continuum of services to meet the needs of children who are not placed in the mainstream full time. Moreover, the only alternative to full inclusion need *not* be a completely segregated program. Instead, there can be levels of involvement between these two extremes. SLPs will be involved in determining the nature and extent of inclusion for their students, and in finding ways to provide appropriate services within the mainstream setting.

These issues will be addressed again at each of the developmental levels we will discuss for the school-aged student. But for now, let’s get back to Nick. How can we define and characterize the language needs of children like him? What is the SLP’s role in ameliorating their problems? We’ll take these questions one at a time.

STUDENTS WITH LANGUAGE LEARNING DISABILITIES

Definitions and Characteristics

Before we start talking about what children with LLD are like, let’s make sure we understand the terms often used to discuss them. Learning disability (LD) is perhaps the most general. IDEA 2004 defines learning disability as

“... a disorder in one or more of the basic psychological processes involved in understanding or in using language, spoken or written, that may manifest itself in an imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations, including conditions such as perceptual disabilities, brain injury, minimal brain dysfunction, *dyslexia*, and developmental *aphasia*.”

However, learning disabilities do not include, “. . . learning problems that are primarily the result of visual, hearing, or motor disabilities, of mental retardation, of emotional disturbance, or of environmental, cultural, or economic disadvantage” [34 Code of Federal Regulations §300.7(c)(10)].

A more colloquial definition would be that LDs involve an unexpected difficulty, relative to age and other abilities, in learning in school. *Unexpected* is usually taken to mean that there is no obvious explanation for the child’s difficulty. So, as the IDEA definition states, the child may or may not have a hearing impairment, intellectual disability, emotional disturbance, autistic disorder, motor deficit, or lack of opportunity or experience, but even if these are present, they would not be sufficient to explain the learning problem. Many definitions of LD have traditionally included a discrepancy criterion. That means that eligibility for the label involved a significant discrepancy (and we saw in Chapter 1 how hard that is to agree upon!) between potential (usually meaning IQ) and achievement (usually measured by a standardized test of school performance) or between areas of development, such as between verbal and nonverbal IQ. The discrepancy criterion has now fallen out of favor, for many of the reasons we talked about in Chapter 1. In fact, in the 2004 reauthorization of IDEA, the law specifically states that a discrepancy between test scores does *not* have to be the criterion for eligibility for LD. LEAs may, under the new law, choose a different criterion, such as lack of response to scientifically-based instruction. This provision of IDEA has opened the door for the use of RTI as a method both of preventing academic failure and as a means of identifying children with learning disabilities.

Not all LDs are language-based. A student could have a specific learning problem in, say, mathematics or graphomotor skills that might not be based on a language weakness. But the U.S. Department of Education estimated in 2002 that 80% of children with LD have their primary difficulties in the language-based skills of reading and writing/spelling. For most children with LD, then, if other academic areas are affected, it is because of the underlying deficit in literacy. These LDs that affect primarily reading, writing, and spelling are the ones we will call *language-learning disorders*. We use this term to emphasize the fact that reading, writing, and spelling are language-based skills that draw on a foundation of oral language abilities. Students with LLDs have underlying weaknesses in their oral language base, even when speech might sound OK to the “naked ear,” and they often have histories of delayed speech and/or language development. We can think of LLDs, then, as one type—probably the most common type—of LD.

Another term in common use for the disorders we are calling LLD is *reading disorder*, or RD. Catts and Kamhi (2005b) use this term to refer to a heterogeneous group of poor readers whose weak language skills play a causal role in their reading difficulty. The “simple view” of reading (Kahmi, 2009), the view most prevalent among reading researchers today, holds that these reading disorders can be divided into two basic classes, as depicted in Figure 10-1. There we can see that children are given the label *dyslexia* when they have a deficit that primarily affects their ability to decode, or to translate letters into their corresponding sounds and synthesize the sounds to form words. The National Institute of Child Health and Development adopted this definition of *dyslexia* (Lyon, Shaywitz, & Shaywitz, 2003):

Dyslexia is a specific RD that is neurobiological in origin. It is characterized by difficulties with accurate and/or fluent word recognition and by poor spelling and decoding abilities. These difficulties

		Word Recognition	
		Poor	Good
Language Comprehension	Good	Dyslexia	Typical reading
	Poor	Mixed decoding/comprehension deficit	Specific comprehension deficit

FIGURE 10-1 Classification of RD based on the Simple View of Reading (Adapted from Catts, Adlof, & Weismer, [2006]. Language deficits in poor comprehenders: A case for the simple view of reading. *Journal of Speech, Language, and Hearing Research*, 49, 278-293.)

typically result from a deficit in the phonological component of language that is often unexpected in relation to other cognitive abilities and the provision of effective classroom instruction. Secondary consequences may include problems in reading comprehension and reduced reading experience that can impede growth of vocabulary and background knowledge.

Contemporary summaries of the current state of research on dyslexia (Pennington & Bishop, 2009; Pennington & Lefly, 2001; for reviews, see Catts & Kamhi, 2005b; Goswami, 2009; Pennington & Bishop, 2008; Pugh & McCardle, 2009; Ramus & Szenkovits, 2009; Scarborough, 2003; Shaywitz & Shaywitz, 2005; Snow, Burns, & Griffin, 1998; Snowling, 1996; Snowling & Hayiou-Thomas, 2006; Snowling & Stackhouse, 1996; Vellutino et al., 2004; Vellutino, Fletcher, Snowling, & Scanlon, 2004) show that the root of this specific reading disorder has been quite firmly established as an inadequate ability in word identification due primarily to deficiencies in phonological skills, with the involvement of specific brain regions demonstrated through neuroimaging studies (see Frost et al., 2009; Noble & McCandliss, 2005; Shaywitz & Shaywitz, 2005 for review). Evidence for visual processing disorders as a cause of dyslexia is very weak; children with dyslexia don't reverse words and letters visually, as has been thought in the past. Instead, their primary difficulty is in the phonological awareness, memory, and coding skills that allow children to do phonemic segmentation and synthesis tasks, and learn to use the alphabetic principle—the understanding that words can be broken down into sounds and that letters stand for sounds which can be combined to produce words—to decode print. Other deficiencies in word recognition and reading comprehension stem from this basic difficulty in cracking the alphabetic code. A wide range of studies (e.g., Bradley & Bryant, 1985; Gillon, 2005b; Liberman & Liberman, 1990; Mann & Liberman, 1984; Noble & McCandliss, 2005; Scarborough, 2003; Schuele & Boudreau, 2008; Snowling & Nation, 1997; Stackhouse & Wells, 1997) has shown that phonological awareness is highly correlated with reading ability, and that treatment for phonological awareness is associated with increases in decoding skill (e.g., Ehri et al., 2001; Gillon, 2005b; Schuele & Boudreau, 2008).

Specific comprehension deficits, on the other hand, are those seen in children who typically have long-standing delays in oral language acquisition that affect their ability to comprehend

language in any form, whether oral or written. These children may learn to decode in the first few grades and may manage early classroom texts normally, when their language content is simple and the demands on comprehension limited. These students run into difficulty in middle grades, when their weak oral language skills are inadequate to support the more complex content they need to process in grade-level reading material. Of course, some children may have both kinds of difficulties, as Figure 10-1 suggests.

So what's the difference between RD and dyslexia? Most current thinking, represented by Catts and Kamhi (2005a), Catts et al., (2006), Snowling (1996), Snowling and Hayiou-Thomas (2006), and Vellutino et al. (2004), holds that dyslexia is part of a continuum of language disorders. What differentiates dyslexia from a more general LLD or RD is that dyslexia involves a specific deficit in single-word decoding that is based in a weakness in the phonological domain of the oral language base and has only a secondary impact on reading comprehension. It is a disorder affecting just one aspect of the reading process: decoding. Children with LLD, on the other hand, can have problems with both single-word reading and comprehension, and not only of written language, but of oral language, as well. These comprehension problems are thought to stem from difficulties the child has not only in phonological processing but in other language domains, such as syntax and semantics. Children with more general LLDs often have a history of delayed speech and language development as preschoolers, whereas those with dyslexia often do not (Snowling, 1996). We can think of dyslexia as a specific subtype of RD, which is a common subtype of LLD.

Will all children who fail to make progress in RTI have LLD? Since use of RTI to prevent school failure is relatively new, we don't have a lot of hard evidence to answer this question. Essentially, though, if the theory behind RTI is correct, children who do not make adequate progress given the supports provided at Tiers II and III would be considered to have a learning disability that qualifies them for special education, by definition, since the definition of LLD is a difficulty in learning literacy that is unexplained by other problems and is not the result of poor instruction. In this sense, RTI is used to identify learning disabilities (National Joint Committee on Learning Disabilities, 2005). What about the converse? Will all children with LLD fail to make adequate progress in RTI? Again, this is partly a matter of definitions. If RTI is designed to separate children who just need a bit of extra help from those with biologically based learning disabilities, we would expect that children who can keep up with grade expectations given only the limited support Tiers II and III provide would *not* have a *bona fide* learning disability. But we won't know for sure, at least until these children are followed throughout their academic careers to determine whether problems continue to crop up after early school years. In any case, the good news is that RTI approaches give the SLP an opportunity to support not only those children with identified disabilities, but to use our knowledge of language across modalities to serve a broad range of children who struggle to learn to read for whatever reason, and to increase our contribution to their success in school.

What are the communicative characteristics that we'll see in children who do have language-learning disorders? A great deal of research has been done in recent years to describe these characteristics. Let's look at some of the typical problems seen in students with LLDs and talk about what they might mean for academic achievement.

Phonological Characteristics

School-aged children with LLD do not necessarily have obvious errors in their speech production, and their speech is generally intelligible. A good deal of research has examined the relationship between preschool speech delay and later reading problems. Generally, findings suggest a higher prevalence of speech disorders in children with LLDs than in the general population, with about 25% of children with LLD showing delayed speech development at school age, whereas only 4% to 6% of the general population does (Kuder, 1997; Pennington & Bishop, 2009). Hesketh (2004) and Leitaio and Fletcher (2004) reported that, although most children with speech delays during the preschool period make adequate progress in reading once they get to school, a small number of them develop phonological awareness and literacy delays. Snowling, Bishop, and Stothard (2000) reported that reading outcomes are poorest for children with the most severe phonological disorders. As it is for other children, phonological awareness appears to be the best predictor of literacy achievement in these speech-delayed students. Stackhouse (1996) reports that these speech difficulties primarily affect the acquisition of spelling. Still, it is important to know that both Pennington and Bishop (2009) and Peterson et al. (2009) found that reading difficulties in children with a history of speech disorders were better predicted by their *language* skills (speech and language difficulties often go together in young children) than by their speech.

Even though children with LLD do not have significant articulation errors, they often show difficulty with speech perception, phonological memory and phonological awareness (Pennington & Bishop, 2009), as well as with complex phonological production in difficult words (such as *statistics*) or phrases (“Fly free in the Air Force”; Catts, 1986), or in repeating phonologically complex non-words (such as /tribabli/). Tests involving phonologically complex, multisyllabic words (such as *aluminum*) and unfamiliar nonsense words can be useful in identifying these children. Rvachew (2006) and Rvachew and Grawburg (2006) reported that speech-delayed children who have poor speech perception and low receptive vocabulary were at greatest risk. Rvachew advocates assessing both speech perception and vocabulary in making decisions about whether to provide intervention to prevent literacy difficulties in speech-delayed preschoolers.

Children with LLD have consistently shown problems with short-term memory tasks (Catts, 1989; Snowling, 1996). Bishop (1997) and Liberman and Liberman (1990) reported, though, that these deficits are restricted to memory for verbal material. Students with LLD generally have no difficulty with memory tasks involving nonverbal stimuli or environmental sounds. Moreover, children with LLD show weaknesses in the ability to do rapid naming and in non-word repetition tasks. When asked, for example, to say all the days of the week or to repeat nonsense words, such as *flipe* or *wid*, children with LLD perform more poorly than those with normal school achievement (Larrivee & Catts, 1999; Snowling, 1996; Wesseling & Reitsma, 2001). These problems may not sound phonological at first, but researchers believe that the source of this difficulty is in establishing and retrieving accurate phonological representations (or segmenting the words into sounds, then storing sound-by-sound auditory images and retrieving these images as a template for production) of verbal material. These same problems also are thought to be related to the word retrieval difficulties so commonly seen in children with LLD.

We can point to two important factors to remember about phonological skills in youngsters with LLD. First, phonological

production may sound adequate; problems with phonological processing, including memory, perception, and complex production, that appear to be related to literacy can only be tapped by specially designed tasks. These include imitation of complex sound sequences, and activities that tap phonological awareness including segmenting words into constituent phonemes, counting sounds in words, producing words with one sound left out (such as *fun* without the /f/ sound), sound manipulation (such as reversing sounds in words), and sound categorization (such as identifying words that have the same last sound, like *men* and *dawn*), as well as nonsense word imitation and rapid naming assessments. Several measures have been devised to tap these abilities. They include *The Test of Phonological Awareness* (Torgensen & Bryant, 2004), *Test of Phonological Skills* (Newcomer & Barenbaum, 2004), *The Phonological Awareness Profile* (Robertson & Salter, 1995), *The Comprehensive Test of Phonological Processing* (Wagner, Torgensen, & Rashotte, 1999), and *The Lindamood Auditory Conceptualization Test* (Lindamood & Lindamood, 2004), to name a few. Tasks that ask children to produce rapid sequences of names, such as naming the months of the year, or to imitate nonsense words also are useful in this regard. The *Rapid Automatized Naming and Rapid Alternating Stimulus Tests* (Wolf & Denckla, 2004), as well as subtests from language measures such as the *Clinical Evaluation of Language Fundamentals* (Wiig et al., 2003) can be helpful here. Second, the research on phonological skills in children with LLD suggests that some of the deficits that appear to be related to memory or semantic ability may actually stem from these “underground” phonological skills, particularly the ability to segment, store, and retrieve words from memory on the basis of their phonological properties. This finding tells us that as we think about remediating skills such as word retrieval, we need to add phonological components to the intervention program.

Syntactic Characteristics

Deficits in comprehension and production of complex syntax also are widely reported in children with LLD (Catts, Fey, Zhang, & Tomblin, 1999; Eisenberg, 2007; Fey et al., 2004; Gerber, 1993; Nelson, 2010; Roth & Spekman, 1989; Scott, 2004; Tomblin, Zhang, Buckwalter, & O'Brien, 2003). They have particular trouble understanding sentences with relative clauses, passive voice, or negation (Kuder, 1997). Paul (2000c) suggested that school-aged children with LLDs tended to rely for a longer-than-normal time on comprehension strategies for processing passive sentences and those containing relative and adverbial clauses. For example, students with LLD persist in misinterpreting sentences such as “Before you brush your teeth, put away your towel,” in which the order of clauses (“brush teeth,” “put away towel”) is the opposite of the intended order of events (first put away towel, then brush teeth). Typical children go beyond these strategies to full comprehension by 7 or 8 years of age. Students with LLD, though, continue to use strategies based on expectations of the way things usually happen or on word order throughout the elementary years and beyond.

Students with LLD do not make a large number of syntactic errors in spontaneous speech; error rates in children between 8 and 11 years of age decline from 11% to 3% in speech; although these rates are still significantly higher than the rates of peers (Eisenberg, 2007; Scott, 2004). Error rates in writing are much higher, however. Moreover, their language output is often perceived as “simple” or “immature” by adults around them. They may use fewer complex sentences, less elaboration of noun phrases with multiple modifiers

("that big, red barn"), prepositional phrases ("the house in the country"), and relative clauses ("the house that's in the country") (McCormick & Loeb, 2003). Verb phrases may be less complex (Eisenberg, 2007), containing few adverbs (such as *slowly*, *resentfully*) or combinations of auxiliary verbs ("could have been running"). Their sentences may actually be longer than those of peers, because they use fewer complex forms to condense their expression (Kuder, 1997). They show lower rates of subordination, embedding and elaboration of phrases in speech, and fail to increase these rates in writing as typical peers do (Eisenberg, 2007; Scott, 2004). Gerber (1993) reported that children with LLD have basic, functional syntactic skills but that their sentences are less elaborated than those of age-mates, and they may not encode all the relevant information within their utterances. In addition, they show reduced fluency, flexibility, and productivity in their grammatical forms than typical peers (Eisenberg, 2007).

Morphological problems also are common, accounting for two-thirds of the syntactic errors in the speech of students with LLD (Eisenberg, 2007; Scott, 2004), particularly in morphemes that are hard to hear (McCormick & Loeb, 2003; Wiig, 1990b), and typically acquired late (Kuder, 1997). Oetting & Hadley (2009) report that most problems in spoken verb morphology resolve by age 8 in these children, but these errors continue, and are especially prevalent in writing (Scott, 2004). Examples of these morphemes include those with "s," such as plurals, possessives, and third-person singular; comparatives and superlatives; irregular forms; and advanced prefixes and suffixes (*-ly*, *un-*, *re-*, *dis-*, *-ment*, *-able*, *-ness*). Other error types are also seen in speakers with LLD. These include difficulty with pronoun reference, subject-verb agreement, as well as problems with coordination and subordination (Scott, 2004). Still, many children with LLD do not exhibit any discernible problems with syntax. Doehring, Trites, Patel, and Fiedorowicz (1981) reported that only 50% of students with LLD demonstrated syntactic deficits.

Semantic Characteristics

Children with LLD have small vocabularies that are restricted to high-frequency, short words (Catts et al., 1999; Kuder, 1997). However, Snider (1989) pointed out that school-age children with normal development acquire many new vocabulary items through reading rather than through conversation. So vocabulary deficits in students with LLD are likely to be, at least in part, the result rather than the cause of reading problems. In addition to small vocabularies, other semantic problems are commonly reported in students with LLD. Knowledge of word meanings is often restricted, with poor development of associations among words and of categorization of words into semantic classes. Difficulties with multiple-meaning words also are typical of students with LLD. Excessive reliance on nonspecific terms (*thing*, *stuff*) and special difficulty with relational and abstract words have been reported as well (Wiig & Semel, 1984). Word-retrieval difficulties also are widely noted (see Catts & Kamhi, 2005b; Gerber, 1993; Kuder, 1997; McGregor, 2009, for review). These difficulties include decreased speed and accuracy in confrontation naming and word-finding problems, characterized by substitution and circumlocution in spontaneous speech. Again, not all children with LLD display these problems. Furthermore, the problems may be related not only to lexical deficits, but also to the difficulties with retrieval of phonological codes from memory, as discussed earlier (German & Newman, 2004), as well as with working memory deficits (McGregor, 2009).

Beyond the word level, other semantic problems are often seen in children with LLD. These include difficulties in understanding

complex oral directions (Murray, Feinstein, & Blouin, 1985); difficulties producing and understanding figurative language, such as metaphors, similes, and slang (McGregor, 2009; Nippold, 1998; Roth & Spekman, 1989); and in producing narratives (Catts et al., 1999; McGregor, 2009). Trouble integrating meaning across sentences (Klein-Konigsberg, 1984) also is seen. That is, some children with LLD seem to be limited in their capacity to process semantic information. They can understand information from one or two sentences as well as age-mates but have difficulty integrating information from larger discourse units.

Pragmatic Characteristics

Conversation

Many children with LLD have limited verbal fluency (Oetting & Hadley, 2009). They don't talk much, and what they say is brief and unelaborated. Damico (1991) suggested that the speech of students with LLD is particularly prone to disruptions, such as false starts, mazes, and other forms of dysfluency. Several researchers (Brinton, Fujiki, & Sonnenberg, 1988; Donahue & Bryan, 1983; Meline & Brackin, 1987) have reported that the language used by students with LLD is often more hostile, less assertive, less persuasive, less polite and tactful, and less clear and complete than that of peers. Students with LLD are less likely than peers to respond to conversational bids (Fujiki & Brinton, 2009), less sensitive to the needs of their listeners, often give incomplete or inaccurate descriptions or have trouble adjusting their speech to the age or social status of their audience (Kuder, 1997). Furthermore, these studies suggest that many children with LLD have trouble clarifying miscommunication and requesting clarification of inadequate messages, and show poor topic maintenance (Kuder, 1997). Fujiki & Brinton (2009) argue that while some of these deficits in pragmatic use of language may be attributable to limitations in language structure, there are children in whom pragmatic problems seem to go beyond those attributable to their structural difficulties. Some pragmatic deficits are seen even in students who do not have documented impairments in semantics and syntax (McCord & Haynes, 1988). In fact, conversational pragmatics may be the area of the most significant deficits in the oral language of some students with LLD (Hart, Fujiki, Brinton, & Hart, 2004). These findings stress the importance of evaluating pragmatic skills when assessing communication in students with LLD.

Other Discourse Genres

Students with LLD also often demonstrate difficulties with processing and producing other types of discourse besides conversation. Westby (2005) discussed the notion that discourse genres can be thought of as falling along a continuum of formality. This continuum extends from the least formal oral, conversational style on one end to the highly formal, literate style on the other. Literate discourse styles are those found in written and other formal modes of communication, such as those used in scientific papers, essays, sermons, and lectures. Literary language differs from basic oral conversation in several ways. One is its degree of contextualization. Oral language is generally highly contextualized. Much information that supports the exchange, such as objects being discussed, facial expressions, gestures, and intonational cues, are present in the immediate environment. Literate language, on the other hand, is highly decontextualized. Virtually all the information needed for comprehension is present within the language itself, and little support is available outside it. These two extremes also differ in function, topics, and forms. Table 10-2, as well as Ukrainetz and Gillam (2009), describes some of these additional differences.

TABLE 10-2 Differences between Oral and Literate Language

	Oral Style	Literate Style
Function	To regulate social interactions. To request objects and actions. To communicate face-to-face with a few people. To share information about concrete objects and events.	To regulate thinking. To reflect and request information. To communicate over time and distance. To transmit information to large numbers of people. To build abstract theories and discuss abstract ideas.
Topic	Everyday objects and events. Here and now. Topics flow according to associations of participants. Meaning is contextually based.	Abstract or unfamiliar objects and events. There and then. Discourse is centered around preselected topic. Meaning comes from inferences and conclusions drawn from text.
Structure	High-frequency words. Repetitive, predictable, redundant syntax and content. Pronouns, slang, jargon. Cohesion based on intonation.	Low-frequency words. Concise syntax and content. Specific, abstract vocabulary. Cohesion based on vocabulary and linguistic markers.

Adapted from Westby, C. (1991). Learning to talk—talking to learn: Oral-literate language differences. In C.S. Simon (Ed.), *Communication skills and classroom success: Assessment and therapy methodologies for language- and learning-disabled students* (Table 13-1, p. 337). Eau Claire, WI: Thinking Publications.

Westby (2005) suggested that narrative discourse falls midway between these two extremes. It does this because it relies on a very familiar structure, a “story grammar” (Box 10-3) that provides support for comprehension. Narratives differ from conversation in that they are essentially monologues rather than dyadic, but they can contain dialogue that is similar in informality to conversation. Because it covers this “middle ground” between familiar oral language styles and more difficult literate forms, Westby has argued that narrative skills can form a bridge from oral to literate language. Research on narrative skills (Bishop & Edmundson, 1987;

Boudreau, 2006, 2008; Feagans & Applebaum, 1986; Tabors, Snow, & Dickinson, 2001) has demonstrated that they are significant in predicting success in school. The development of narrative skills, then, would seem to be important in maximizing the chances for academic accomplishment in students with LLD.

Narrative discourse skills have been studied extensively in typical students and in those with LLD. These studies start from the premise that stories told by members of mainstream North American society have a more or less typical structure, which has been labeled a “story grammar.” A variety of ways of schematizing this grammar have been presented in the literature. Stein and Glenn’s (1979) scheme is presented in Box 10-3.

It is important to remember, though, that different cultures have different ways of telling stories (Fiestas & Pena, 2004). Chapter 5 outlined some non-Western storytelling styles. Although it is important for students in our schools to learn to use the mainstream story form, we should not assume that children from culturally different backgrounds are deficient if they tell a different style of story (O’Connell, 1997). Assessment of narrative skills in these children can follow some of the guidelines we discussed in Chapter 5. Using a Parent-Child Comparative Analysis (Terrell, Arensberg, & Rosa, 1992), for example, we can compare the story of a child from a culturally different home with a story sample from an adult in that culture to determine whether narrative deficits are present. Alternatively, we can ask an adult from the home culture to evaluate a story told by a child of the same culture, or use dynamic assessment to collect narratives before and after mediation (Pena et al., 2006). Still, even when cultural differences account for differences in narrative style, competence with mainstream story structures is nonetheless important for success in school. If a child with LLD from a culturally different background is having trouble producing and understanding stories in school, attention to the standard story grammar in the intervention program can be helpful, as long as we remember to present this form as another way of telling stories, not a “better” way. If a child from a culturally different background without other language or learning problems is having the same difficulty, the clinician might work with the classroom teacher to expose the student to a series of storybooks containing increasingly mature mainstream narrative forms.

BOX 10-3 Story Grammar

Story = Setting + episode structure.
 Episode = Initiating event + internal response + plan + attempt + consequence + reaction.
Setting—introduces the main characters, the protagonist, and the context of time and place.
Initiating event—the occurrence that influences the main character to action. It may be a natural event, an action, or an internal event, such as a thought, perception, or wish.
Internal response—indicates the thoughts and feelings of the main character in response to the initiating event. It may include an interpretation of the event, formulation of a goal, or some other response.
Plan—indicates the intended action of the main character.
Attempt—indicates the actions of the main character in pursuit of the goal.
Consequence—indicates the achievement or nonachievement of the main character’s goal, as well as any other events or states that might result from the attempt.
Reaction—includes any emotional or evaluative responses of the main character to the preceding chain of events.

Adapted from Johnston, J. (1982). Narratives: A new look at communication problems in older language-disordered children. *Language, Speech, and Hearing Services in Schools*, 13, 144-155; Stein, N., & Glenn, C. (1979). An analysis of story comprehension in elementary school children. In R. Freedle (Ed.), *New directions in discourse processing*, vol. 2 (pp. 53-120). Norwood, NJ: Ablex.

Understanding stories requires more than just repeating information heard or read. While literal comprehension involves recalling information explicitly stated, much of what it takes to make sense of a story has to be read “between the lines” (Westby, 2009). For example, what if a story starts out, “She was outside riding her bike when she heard the flapping of wings under the bushes. Tears came to her eyes. She ran inside to get a shoe box”? Literal comprehension would involve remembering that the sound came from under the bushes, and the girl was riding a bike when she heard it. But most of us would also be able to infer that the story is about a girl who finds and rescues an injured bird. The comprehension skills involved in drawing this conclusion are called *inferential comprehension*, because they require us to put together information given to infer something that is not directly stated. Bishop (1997), Letts and Leinonen (2001), and Westby (2009) report that children with LLD have difficulty with both literal and inferential comprehension in narratives.

Roth (1986) reported that difficulty in recall of stories by children with LLD also is characterized by (1) poor understanding of temporal and causal relations, (2) dearth of detail, (3) errors in information, and (4) decreased length of retelling. In terms of the ability to generate stories, a variety of deficits have been found in students with LLD. Newman & McGregor (2006) reported that both teachers and lay people identified deficits in the narratives of children with LLD and that objective measures of story length, grammaticality, and thematic development differentiated LLD storytellers from typical story tellers. Liles (1987) and Ripich and Griffith (1988) reported difficulty with cohesive devices, such as pronouns and conjunctions, although not all students with LLD had these problems. Even though students with LLD seem to have a grasp of the basic story grammar structure, such as that summarized in Box 10-3, Newman & McGregor (2006), Gerber (1993), and Westby (1989b) all reported that these children tell shorter stories with fewer complete episodes, fewer complex sentences, more limited vocabulary, and less overall organization. Difficulty in the use of linguistic structures in productive narrative tasks—including utterance length and cohesive adequacy, (Bishop & Edmundson, 1987; Liles, 1985; Liles & Purcell, 1987; Paul & Smith, 1993; Pearce, McCormack, & James, 2003)—is also reported. Montague, Maddux, and Dereshiwsky (1990) found that students with LLD used fewer internal responses and showed less attention to characters’ feelings and motivations than did normally achieving students in storytelling tasks. Difficulties in the linguistic structure of narratives, including deficits in lexical diversity, correct use of morphological structures, proportion of complex syntax, and fluency have been noted (Boudreau, 2006; Reilly, Losh, Bellugi, & Wulfeck, 2004). Additionally, children with LLD also experience difficulty in constructing or retelling narratives, including recall of fewer information units, propositions, utterances, and story grammar components; as well as difficulty with text cohesion (Boudreau & Hedberg, 1999). Ukrainetz and Gillam (2009) showed that children with LLD provide less expressive elaboration of narratives, rendering their stories less “artful” than those of peers.

Applebee (1978) characterized the development of narrative skills in children as progressing through a series of stages. A modification of Applebee’s system that has been used in research on children with language and learning disorders (Klecan-Aker & Keltz, 1990; Paul, Hernandez, Taylor, & Johnson, 1996; Paul, Laszlo, & McFarland, 1992) is presented in Box 10-4. Paul, Hernandez, Taylor, and Johnson (1996) found that, by first grade, children with normal language development were producing stories at stage four

or five in this sequence, whereas children with a history of language delays during the preschool period produced stories at significantly lower levels of maturity, generally around stage three. Because narrative skills are known to be related to success in school, findings such as these suggest that children with low levels of narrative development may be at risk for academic problems. This finding, in turn, suggests that narrative skill is one area that is important to assess in children with LLD. Although many older students with LLD produce true narratives, their progress toward this level may be slower than normal. If deficits in narrative maturity are found through narrative assessment, narrative skills could be a useful part of the intervention program. The aim would be to use narrative skills to build the bridge from oral to literate language.

Another type of discourse that can cause problems for students with LLD is the *expository* text (Scott & Windsor, 2000; Ukrainetz, 2009; Westby, 2005). Expository texts fall at the most literate end of the continuum of language styles. This genre provides the least contextual support and relies most heavily on purely linguistic processing. Expository texts don’t tell a story. They are explanations and descriptions that usually contain information new to the receiver. This means that strategies of applying prior knowledge to comprehend the text (“top-down,” or concept-driven, strategies) are not effective. Instead, the listener or reader must attend to the individual facts and details to get the meaning (“bottom-up,” or data-driven, processing). This puts an extra load on memory and other information-integrating processes, since there isn’t a readily available structure or framework, like a story grammar, to which to attach the information. Instead, the listener or reader has to remember all the pieces of information, organize them into some kind of schema relating to their content, then search for some kind of structure in the text to facilitate integrating the new information with what he or she already knows (Nelson, 2010; Westby & Clauser, 2005).

In primary grades, most information is conveyed through narrative formats, even in content areas such as science and social studies. By the time children reach intermediate grades, however, many textbooks are written in expository rather than narrative form, and the further students progress in school, the more expository text they encounter (Otto & White, 1982). Saenz and Fuchs (2002) reported that expository texts are more difficult to comprehend than narrative for students with LLD. We will discuss the assessment and remediation of expository text deficits in the chapters on advanced language.

There are additional text structures that students must eventually master, including *persuasive* or *argumentative* genre (Scott and Erwin, 1992), as well as the logical argument (Ukrainetz, 2007). These involve the attempt to convince a listener of something and are some of the latest discourse forms to be acquired. This alone suggests that they will be areas in which students with LLD will have considerable difficulty.

Social/Emotional Characteristics

A range of studies (e.g., Bryan et al., 2004; Elias, 2004; Elksnin & Elksnin, 2004) show that students with pragmatic deficits could be expected to have difficulty with the social interactions that pragmatic skills support. In general, children with LLD have been shown to be less accepted by peers, have poorer social skills and higher levels of problem behaviors than children with typical school achievement (Weiner, 2002). These students experience rejection by peers, have difficulties in developing reciprocal friendships and gaining admittance to social groups; when they do join a

BOX 10-4 An Adaptation of Applebee's System for Scoring Narrative Stages**STAGE 1 (Heap Stories)**

Heaps consist primarily of labels and descriptions of events or actions. There is no central theme or organization among the propositions. Sentences are usually simple declaratives. Stories at this level are used by normally developing children at 2 or 3 years of age.

Example: "Mercer went out his home. He got to the playground. Then he found a frog. Then he fell off the cliff. Frog is in the water. Doggy pulls on a stick. A boy is mad. Then he called the police. Then he rested. And then he goed in jail."

STAGE 2 (Sequence Stories)

Sequences consist of labeling events around a central theme, character, or setting. There is nothing that could be considered a plot; rather, there is a description of what a character has done. One event does not necessarily follow temporally or causally from another. Stories at this level are used by normally developing children at 3 years of age.

Example: "Little boy. Tree, frog. Tree, person, dog, bucket, and tree that he climbing on, bucket and dog. They fell off. Then they ran down the hill and trip down. And then the frog was happy. And then the dog was swimming. Then there was a dog happy. Then there's a frog sitting on the tree. So they went to the tree that fall into the water where the frog is. And then the boy caught the dog. Lookit, the dog's in the net! And then the dog go."

STAGE 3 (Primitive Narratives)

Stories have a core or central person, object, or event. They contain three of the story grammar elements: an initiating event, an attempt or action, and some consequence around the central theme. But there is no real resolution or ending and little evidence of motivation of characters. Stories at this level are used by normally developing children at 4 to 4½ years of age.

Example: "Find a frog. He sees a frog. He fell. And the frog hopped. And he caught the dog. Frog hopped again. Then he went away. The boy was angry. And the frog was pretty nervous. Then he followed the foot track."

STAGE 4 (Chain Narrative)

Stories show some evidence of cause-effect and temporal relationships, but the plot is not strong and does not build on the attributes and motivations of characters. The ending does not necessarily follow logically from the events and may be very abrupt. Four story grammar elements are present. They usually include those found at the primitive narrative level: initiating event, attempt or action, and some consequence around the central theme. Some notion of plan or character motivation may be present. Stories at this level are used by normally developing children at 4½ to 5 years of age.

Example: "A boy went for a walk with his dog to fetch water and catch fish. There was a frog. He caught the frog. The boy fell in because he tripped on the dog. The dog fell in too. The frog hopped onto a lily pad. The frog fell off. And the boy tried to catch the frog. And the boy actually caught the dog. The frog climbed onto a rock. The boy called him. They went away. The frog was sad. The frog followed him. He followed him into his house. And the frog was on the dog's head."

STAGE 5 (True Narrative)

Stories have a central theme, character, and plot. They include motivations behind the characters' actions, as well as logical and temporally ordered sequences of events. The stories include at least five story grammar elements, including an initiating event, an attempt or action, and a consequence. The ending indicates a resolution to the problem. Stories at this level are used by normally developing children at 5 to 7 years of age.

Example: "There was a little boy. And he wanted to get a frog. And he brought his dog. He saw a frog in the pond. He ran to catch it. But he tripped over a log. And he fell in the water. But the frog jumped over to a log. He told his dog to go try to get the frog. He almost caught the frog. But instead, he caught his dog. When he saw what he caught, he was mad. The little boy, he yelled to the frog. Then the boy went home and left the frog. The frog was sad alone. Then he followed the boy's footprints until he got into the house. Then he kept following them into the bathroom where the little boy took a bath with his dog. 'Hi,' said the frog. Then the frog jumped in the tub. And they were all happy together."

(1967). *A boy, a dog, and a frog*. New York: Dial Books for Young Readers.

group, the groups tend to be disproportionately those of companions who show high levels of problem behavior (Pearl, 2002). Brinton et al. (2007) reported that children with LLD did not understand the impact of displaying emotion on relationships and seemed to lag behind typical children in developing emotion knowledge. Fujiki, Brinton, Isaacson, and Summers (2001) showed that children with LLD were more withdrawn than peers with typical development (TD). Moreover, these children show increased levels of loneliness and depression relative to typical peers (Margalit & Al-Yagon, 2002). Clearly, work on pragmatic skills for these students will need to focus on improving their social interactive abilities.

In addition to these social difficulties, students with LLD, particularly boys, have been shown to have greater difficulties in regulating

their emotions than typically achieving children (Bauminger, 2008; Fujiki, Brinton, & Clark, 2002), a problem that can lead to difficulties in classroom behavior.

Background Knowledge

Catts (2009) and Snyder (2010) discuss the importance of "domain-specific" knowledge in reading comprehension. They argue that one reason many students have difficulty understanding what they read is that they lack information about the specific topic of the reading material. Just as much vocabulary is learned through reading during the school years, a lot of what we know about the world comes from reading, too (Catts & Kamhi, 2005b). If students are not reading or are having trouble understanding complex verbal

material so that reading comprehension is limited, how are they going to gain this new knowledge? They're not. As time goes on, students with LLD can fall further and further behind peers in terms of knowledge about the world. This deficit in world knowledge in itself limits learning. Since we learn essentially by relating new information to our existing background store, the smaller that background knowledge store is, the less easily new information can be added. It's a spiral that leads to increasing gaps in the knowledge base that students can apply to new information. Stanovich (1986) called this the "Matthew" effect, because as the Gospel according to Matthew tells us, the rich get richer and the poor get poorer. This suggests that as we work with students with LLD, we want to find ways to augment their knowledge about the topics of their curricular reading material, through oral language activities, as well as exposure to information in multiple modalities—including visual, digital, and experiential (Westby, 2010)—as we work on specific language goals. An enlarged knowledge base provides a foundation for more rapid acquisition of new information.

Attention and Activity

Unfortunately, many students who have learning problems also have behavioral and emotional difficulties that make it harder for them to take advantage of the instruction, both regular and special, that they receive (Ratner, 2004). We usually do not know whether the learning disorder is caused by these behavior problems, or vice versa, or whether something else entirely is causing both. For whatever reason, though, many students with LLD also qualify for diagnoses of behavior disorders or emotional disturbances such as those discussed in Chapter 4. The most common disorder associated with LLD is what mental health specialists call *attention-deficit hyperactivity disorder*, or ADHD (Tetnowski, 2004).

ADHD consists of a difficulty in marshaling attention, in knowing what to direct attention to and what to ignore, and in focusing on foreground information while filtering out background distractions. Children with attention disorders are easily distracted and have short attention spans, low frustration tolerance, inability to recognize the consequences of their actions or learn from mistakes, and difficulty organizing and completing tasks (Blum & Mercugliano, 1997; Damico, Tetnowski, & Nettleton, 2004). They appear forgetful, lose things, and behave impulsively. Some of these students also exhibit hyperactivity, which includes being fidgety and squirming constantly as well as being unable to sit still or seeming to have "ants in their pants." They are restless and run or climb excessively in inappropriate situations.

Not all students with LLD are emotionally disturbed, hyperactive, or inattentive, but a good number are. Although Tetnowski (2004) suggests it is difficult to determine the overlap of communication disorders and ADHD with any certainty, the overlap certainly exists. Forness, Youpa, Hanna, Cantwell, and Swanson (1992) estimated that 25% of students with LLD have associated behavioral or socioemotional disorders. Finneran, Francis, and Leonard (2009) suggest that children with language impairments who fail to meet full diagnostic criteria for ADHD often show reduced capacity, at a subclinical level, for sustaining attention. What this means for the SLP is that working with students with LLD may not always be easy (just in case you thought it would be!). They may not always be the docile, attentive students who can pick up what we are trying to teach them the first time around. It will be important to recognize the students who have these kinds of attentional difficulties so that

their special needs can be addressed in an educational program. We talked in Chapter 4 about strategies for addressing problems in attention and activity within the communication management plan. These strategies often include a combination of medication and behavioral interventions. A substantial portion of students with LLD need these special program considerations.

Summary

We've seen that students with LLD commonly have problems in a variety of language domains. Many students with LLD continue to have "underground" deficits in phonological processing, even when phonological production sounds OK. These phonological processing deficits are thought by many researchers to have an important impact on learning to read. Some of the semantic deficits commonly observed in students with LLD also may be related to these higher-level phonological-processing problems. Some students with LLD have difficulties with advanced syntax and morphology, but many do not have obvious or measurable errors in this area. Rather, their language production may simply be less fluent and complex than that of their peers. For students with LLD, pragmatics may be the area in which the majority of obvious deficits reside. They may be less adept than peers at ordinary conversation and probably have difficulty comprehending and producing the discourse structures nearer the literate end of the oral-literate continuum of discourse styles. These genres, such as narratives and expository texts, are necessary for success in the classroom. The general knowledge base of students with LLD also may be limited. Some have attention deficits, are restless and overly active, or have emotional problems that affect their ability to perform in school. These problems suggest areas of assessment and intervention beyond the traditional vocabulary, morphology, and sentence structures. To address the needs of students with LLD, then, we need to know where to look for their oral language problems to identify and remediate their difficulties. The characteristics of the LLD population that we've discussed here should help guide this process.

LANGUAGE, LEARNING, AND READING: WHAT'S THE CONNECTION?

We've seen that students such as Nick, who have difficulty succeeding in school even though they seem to have acquired basic oral language skills, commonly come to the attention of the SLP. We've talked about some of the oral language deficits typical of students like Nick as a way to answer the question: how can we characterize the language of children with LLD? Let's look now at the kinds of oral language skills that are needed for success in the classroom and how oral language skills relate specifically to the development of literacy. Then we will be in a better position to answer a second question: what is the SLP's role in ameliorating the deficits of children with LLD?

The Role of Oral Language in Classroom Discourse

Teacher Talk and the Hidden Curriculum

School talk is different from the kinds of conversations we have with friends and family (Christie, 2003). Wallach (2004) recently discussed the special requirements of classroom discourse.

In school, the teacher chooses the topic and students must comment on that topic, not one of their choosing. Students who do attempt to shift the topic to their own interests often find their remarks rejected or disvalued. Turn-taking rules in the classroom are quite different from those in other settings, too. The teacher decides who gets to talk, when, and for how long. Students, to be considered successful participants in classroom discourse, must learn to read subtle verbal and nonverbal cues about when they should volunteer to speak, what they should say, and when they should relinquish the floor. Westby (1998a) stressed that, in order to succeed in school, students have to be able to draw on two sets of knowledge at the same time: their knowledge of academic content (the right answers to teacher questions) and their knowledge of the social communication rules of the classroom.

Hoover and Patton (1997) pointed out that only a small part of the structure of the classroom discourse is ever verbalized by the teacher. The rest is part of the “hidden curriculum,” the unspoken set of rules and expectations about how to behave and communicate in the classroom setting (Westby, 2007). For example, Cazden (2001) reported that the typical structure of classroom discourse follows the *initiation-response-evaluation* (IRE) format: initiation of a topic by the teacher, followed by a response by the student, which then undergoes evaluation by the teacher (*T*: “What is the capital of California . . . Jose?” *R*: “Sacramento.” *E*: “That’s right, good job.”). Students who fail to realize that adhering to this structure is part of the expectation of the classroom are often perceived by teachers as rude, difficult, or unable to learn. Yet their real problem may be an inability to grasp that this context has a different set of discourse structure rules than other contexts with which they are familiar, or to learn the differing rules that apply in different classroom contexts, such as whole class versus small group lessons (Peets, 2009). Donahue (1994) reported that for many students with LLD, difficulties with classroom discourse are more likely to be the trigger for referral for special education than is academic failure. This finding emphasizes the crucial role of mastering classroom discourse rules for success in school. As Donahue pointed out, inability to adapt to classroom discourse rules not only reflects but also contributes to failure in the classroom. That’s because students who are not good at the “hidden curriculum” have restricted access to the kinds of learning experiences available in peer and teacher dialogues that lead to success in the academic curriculum (Nelson, 2009).

Classroom discourse patterns must be inferred for each instructional situation.

Decontextualized Language

Another difficulty with classroom language is that a great deal of it is decontextualized. In ordinary conversation, we often talk about things in the immediate environment, such as the ingredients we need to cook dinner, or about topics on which all the participants have a great deal of shared knowledge, such as the members of our extended families and their doings. In school, though, much of what is discussed is quite outside the direct experience of the students, not to mention its being literally outside the immediate context of the physical environment. At home, families might talk about where Dad’s shoe is. In school, teachers talk about where Australia is. A child who comes to school without much experience of such kinds of decontextualized language will find the discourse of the classroom especially difficult.

Dickinson, Wolf, and Stotsky (1993) reported that, although children from a variety of social and economic backgrounds have ample opportunities to develop adequate semantic and syntactic skills through ordinary parent-child interactions, the same is not true of opportunities to develop the discourse skills that are helpful in school. Children from middle-class families (regardless of their racial or ethnic background) are more likely than peers from low-income groups to have participated in oral language interactions at home that contribute to the development of decontextualized language skill. These interactions include narrations about personal experiences that middle-class parents both tell to and elicit from their children, as well as extended explanations of objects, events, and word meanings.

Although middle-class families in general engage in more such interactions than low-income families, it is important to remember that there is great individual variation within each group. In addition, Curreton et al. (2008) showed that low socio-economic status mothers could be taught to increase their use of decontextualized language in storytelling activities. The important thing for us as clinicians to know is this: if children are having trouble participating in classroom discourse, in spite of marginally adequate semantic and syntactic abilities, they may need additional experience and practice with decontextualized language. If, for whatever reason, a child has not gotten such experience at home during the preschool years or was unable to take advantage of it because of slowly developing basic language skills, part of our role can be to provide such experience and practice, and to help parents learn to provide similar experience in the home.

Classrooms and Culture Clash

Remember, too, that classroom discourse is a structure peculiar to our mainstream Western culture. For students entering school from culturally different backgrounds, the structure of classroom discourse is likely to be especially unfamiliar (Hammer, 2004; Westby, 2007). Differing expectations about a child’s conversational role in the home do not necessarily represent a deprived environment. As shown in Chapter 5, different cultures use language for different purposes, and each culture has its own rules about how children, specifically, are to participate in linguistic interactions. A classic example comes from Phillips (1972). Native American children, in her example, refused to respond when a teacher asked them to correct the answer of another (“No, the capitol of California isn’t San Francisco. Can you help her, Jim?”), because a display of knowledge and correction of a peer would be considered rude in their language community. Similarly, Schultz, Florio, and Erickson (1982) explained that the school requirement

Language forms the basis for success in the classroom.

that only one speaker talk at a time may be very different from the norm in some children's homes, where overlapping talk by multiple speakers is the rule. The knowledge of the way to talk in school, as we've said, is often assumed by teachers and never taught explicitly. Yet this "hidden curriculum" may be vastly different from the experience of language use with which a student comes to school.

Metalinguistic Skills

In addition to the ability to understand decontextualized language and to discern and adhere to the "hidden curriculum," other special language abilities are needed for success in school. Metalinguistic skill, the ability to use language to talk about language (Homer, 2009) is one example. Much of what goes on in the curriculum involves the ability to focus on and talk about language (Westby, 2005). Defining words; recognizing synonyms, antonyms, and homonyms; diagramming sentences and identifying parts of speech; recognizing grammatical and morphological errors in the process of editing writing assignments; recognizing ambiguity in words and structures with multiple meanings; and the metalinguistic skills needed to acquire reading and spelling competency all require an awareness of language beyond the ability to use words and sentences to communicate. We've already talked about the relations between phonological awareness and the acquisition of literacy. Wolter, Wood & D'zatko (2009) have shown that at least one other level of metalinguistic awareness, awareness of morphology, is also related to performance on reading and spelling in typical first grade children. As Webster and Plante (1992) suggested, such heightened levels of awareness may not have developed in school-age children who have just barely mastered the basics of oral language. The metalinguistic demands of the curriculum may cause problems for such children. Again, preschool experiences with talking about words and sounds at home make a big difference in the degree of metalinguistic awareness with which a child enters school (Bowey & Francis, 1991; Vellutino et al., 2004; Watson, 2003).

Metacognitive Skills and Self-Regulation

One last area of special language skill that is necessary in the classroom is the ability to reflect on, talk about, and manage one's thinking processes. Succeeding in academic settings requires the student to figure out what needs to be done to accomplish a task, create a plan, carry it out, and evaluate whether the task has been completed successfully. Moreover, the successful student needs to control impulses, such as urges to do something more appealing

than the current assignment may be. All these actions require metacognitive and self-regulatory ability.

Comprehension monitoring is one aspect of metacognition, and it is much more central to success in the classroom than to success in ordinary dyadic conversation, which provides so many more contextual cues for the person who is doing the comprehending. Elementary school students spend more than 50% of their time in school listening to the teacher, and high school students spend more than 90% of their time doing the same thing (Griffith & Hannah, 1960). You can see, then, that listening skills and the ability to monitor their effectiveness are very necessary for school success. Teachers, particularly those who teach grades beyond the primary level, use long, complex sentences for giving instruction and directions. They might, for example, give a direction, such as "Before you start your math paper, be sure to finish your spelling work." Such a sentence in which the clause that appears first (start your math) is supposed to be done second can cause errors in interpretation for a child with language-learning problems. Children with LLD, who are unable to monitor or evaluate their ability to understand what is said to them, have difficulty in overcoming these errors. Similarly, many teachers' directions have several parts ("Put your name in the upper right-hand corner of the paper, then number from 1 to 20 down the left-hand margin, and be sure to skip a line between each number."). To ask for clarification or repetition if they need it, children must be able to evaluate whether they have comprehended and remembered the entire sequence. Comprehension monitoring in expository discourse, such as class lectures, is especially important for students to figure out whether they are getting the point of the information being presented. The vocabulary of the teacher's talk also may include words with which a student is unfamiliar. Although many new vocabulary items can be deciphered from the context, the student needs to know when to apply these contextual strategies. Again, comprehension monitoring is essential for bringing such contextual support to bear. Moreover, some words cannot be figured out even when context is present. For these, the student must recognize the gap and ask someone, either the teacher or a peer, for a definition. Again, evaluating comprehension is a necessary part of this process. Dollaghan (1987) and Westby (2005) suggested that comprehension monitoring is likely to be less developed in students with LLD than in their normally developing peers.

Finally, metacognitive skills provide the foundation for *executive function*, or *self-regulation*. These functions involve allocating cognitive resources, such as attention, planning, impulse control, and organizing when faced with a complex task (Bashir & Singer, 2006). Nelson (2009) refers to these skills as "thinking language," the little voice we hear in our own heads when we have to think through how to accomplish something difficult. Although all these metacognitive skills tend to be weak in children with LLD, improvement of executive functions has been shown to predict literacy outcomes (Altemeier, Abbott, & Berninger, 2008), so curricula designed to address self-regulation skills may be quite effective in helping children succeed in school (Blair & Razza, 2007). We'll talk later about approaches to developing curricula like this.

The Role of Oral Language in the Acquisition of Literacy

Aside from the oral language demands of classroom discourse, oral language plays a second crucial role in school success: it lays the foundation for acquiring literacy. For many years, reading was

Reading is an important language skill for school-age children.

thought of as primarily a visual-perceptual skill. But since the 1970s, when Kavanaugh and Mattingly published their seminal work, *Language by Ear and Eye* (1972), researchers in reading have become convinced of the crucial psycholinguistic aspects of the reading process. Since then, most investigators studying the reading process consider reading and writing to be language-based skills that simply use visual input as a portal into the language-processing system (Catts & Kamhi, 2005a; Harlaar et al., 2008; Snowling & Stackhouse, 1996; Vellutino, 1979; Wallach, 2004; Watson, 2003). The implication of this shift in focus is that experts in language development (like SLPs) are seen as having a great deal to contribute to the understanding of literacy development and to the promotion of its growth. Because SLPs have such a strong background in oral language development, we are in an excellent position to influence how reading is taught, both in our role in assisting general education teachers provide the most effective RTI Tier I instruction to all students, as well as in developing support plans for struggling readers. Let's examine the oral language skills on which literacy builds and look at some of the ways oral and written language differ. Then we can see how oral language deficits might affect literacy acquisition. This information will help us in identifying areas for assessment and intervention in children who struggle with literacy, as well as in finding ways to educate teachers about the relations of language and literacy.

Emergent Literacy

One foundation for literacy development has been termed "emergent literacy" (Cabell, Justice, Zucker, & Kilday, 2009; Justice & Kaderavek, 2004; Justice & Vukelich, 2008; Sulzby & Teale, 1991; Van Kleeck, 1990; Whitehurst & Lonigan, 2003). Emergent literacy experiences are those in which children begin to develop ideas about how written language works and what it is used for before they actually begin decoding print. Emergent literacy skills develop primarily out of "literacy socialization" (Roberts et al., 2005; Snow & Dickinson, 1991) experiences, in which the child listens to books read by adults. In these interactions, children learn a lot about books and their literate language style. Children learn that if they cover up the little black squiggles on the page with their hands, the reader complains about being unable to see the words and therefore unable to tell the story, giving children the idea that the squiggles contain some meaning. Children learn which way the book opens, which page to look at first, and that the page must be turned to get to the next part. They learn that the print is consistent in telling the reader to say the same thing for each page each time

that page is read, regardless of who's reading. Most importantly, perhaps, these early book-reading interactions give the child experience with the genre of literary language, which is quite different from the language used for dyadic conversation (see Table 10-2). As Westby (2005) pointed out, literary language uses more precise and abstract vocabulary and has more complex syntax and different communicative functions than language used in oral conversation. A variety of studies (e.g., Justice et al., 2009; Roberts et al., 2005; and reviewed by Bus et al., 1995; Goldfield & Snow, 1984) have shown that children who are read to as preschoolers have an easier time learning to read than those who weren't. These literacy socialization experiences are especially helpful if they involve an opportunity for the child to engage in extended discussion about the books (Heath, 1982) and involve explicit attention to features of print (Justice et al., 2009). Justice and Kaderavek (2004) outlined four aspects of emergent literacy that research suggests are crucial to the development of reading and writing. These are summarized in Table 10-3.

In addition to parent-child book reading, other experiences also can foster literacy socialization. Watching TV shows such as *64 Zoo Lane*, *Arthur*, *Between the Lions*, *Blue's Clues*, *Maisy*, *Sesame Street*, etc., provides literacy socialization in the form of information about letter sounds, the structure of books, the communicative purposes of writing, and literary language exposure. Watching

TABLE 10-3 Aspects of Emergent Literacy that Support the Acquisition of Reading and Writing

Aspect of Emergent Literacy	Definition
Phonological awareness	Awareness of the fact that words can be broken down into smaller units, such as syllables (kit + ty = kitty), onset-rime units (d [onset] + og [rime] = dog), and phonemes (/d/ + /a/ + /g/ = dog); ability to blend, segment, and manipulate sounds within words.
Print concepts	Understanding that letters and print make up words and represent ideas; ability to talk about units of language, such as words and letters; understanding the structure of books such as left-to-right progression, orientation of pages, etc., understanding that print is read the same way on each repetition.
Alphabet knowledge	Knowing names and sounds of letters in upper and lower case; understanding that letters stand for sounds and can be grouped to represent words; understanding that words can be read by decoding the sounds of the individual letters within them.
Literate language	Ability to understand decontextualized language; familiarity with conventional language used in narrative genres ("once upon a time"); access to the more formal register of language typically used in print.

Adapted from Justice, L., & Kaderavek, J. (2004) Embedded-explicit emergent literacy intervention I: Background and description of approach. *Language, Speech, and Hearing Services in Schools*, 35, 201-211.

these shows with parents and siblings, like having parent-child book reading experiences, also provides a good feeling about books and reading and a pleasant association with literary activities. This ability to feel good about books is perhaps as important as any other literacy socialization the child receives.

Oral Language Foundations for Reading Comprehension

Reading is a language-based skill, and understanding meaning through reading makes use of all the same processes used to extract meaning from oral language. In other words, a second foundation for understanding a written text is the linguistic knowledge about the content, form, and use of language that is required to understand speech. Catts (2009), Kamhi and Catts (2005a) and Scarborough (2003) pointed out that understanding the comprehension process in reading is essentially no different from understanding it in spoken discourse. Once a text has been decoded, its message is treated cognitively in just the same way as oral language input would be treated. Although the cognitive processes involved in comprehension are varied and complex (Figure 10-2), they are nonetheless similar whether the information to be comprehended came in through the eyes (read) or the ears (heard). So as Fig. 10-1 shows, and as Snowling and Hayiou-Thomas (2006) discuss, some children with reading problems will not display classic dyslexia, a deficit in phonological processing. Instead, they will show deficits in comprehension without inordinate difficulty in word reading, or they may have deficits in both word reading and text comprehension.

Children with limited skills in comprehending oral discourse, then, are going to have the same problem comprehending a written text. If basic oral vocabulary is so impoverished that students cannot recognize and associate a meaning with a large proportion of the words in a text, even if they can be decoded, the student's understanding of that text will be limited. If a student still relies on nonlinguistic comprehension strategies to understand complex sentences, that student will misunderstand such sentences in either

oral or written formats. If a child has poor understanding of story grammar structure, comprehending narratives will be difficult, whether the narratives are oral or written. Nation, Clarke, Marshall, and Durand (2004) reported that children with low language abilities, even when they had not been identified as having specific language impairment (SLI), showed poor reading comprehension, even when their phonological awareness skills were adequate. Similarly, Skibbe et al. (2008) showed that children with delayed language development at age 4 continued to exhibit reading skills that were substantially lower than those of children with typical language in fifth grade. This suggests several things. First, intact, well-developed oral language skills in syntax, semantics, and pragmatics are necessary to comprehend written texts, just as they are to comprehend classroom discourse. Second, assessing a student's comprehension skills in oral formats and providing intervention for deficits in comprehension of oral semantic, syntactic, and pragmatic structures will build toward comprehension of both oral and written language. Finally, as Kamhi (2009) and Wallach, Charlton, and Christie (2009) suggest, remediation for difficulties in word reading may be addressed in the context of specific reading instruction, but problems in understanding oral or written texts will be addressed through collaboration between the SLP, the expert in development of oral language understanding, and the general education teacher who provides the curricular contexts in which comprehension instruction and guided practice will take place.

Metalinguistic Awareness

A third linguistic foundation for literacy acquisition involves metalinguistic awareness. Just as metalinguistic skills are important for participating in classroom discourse, they are essential for learning to read. Learning to read requires focusing on the language itself, at least in the early stages. A beginning reader needs to notice word boundaries; to develop letter-sound correspondences; and to talk about which printed form represents what word, words, or meanings. None of these activities is necessary for oral language development, but all are necessary as the child breaks into the code of

FIGURE 10-2 "The Reading Rope": Illustration of the many strands that are woven together in skilled reading. (Reprinted with permission from Scarborough H. (2003). *Connecting early language and literacy to later reading (dis)abilities: evidence, theory, and practice*. In S. Newman & D. Dickenson (Eds.) *Handbook of Early Literacy Research* (pp. 97-110). New York: Guilford Press.)

written language. Tunmer and Cole (1991) reported that metalinguistic skills also are crucial for allowing students to comprehend written texts and that instruction in metalinguistic awareness was effective in improving reading comprehension for these students.

One additional area of metalinguistic awareness is especially important for learning to read, even though it is not necessary for other language activities: phonological awareness, the realization that words are made up of sounds and that sound segments can be manipulated in words and represented by symbols (letters). We've already discussed the fact that phonological awareness, according to current thinking about the reading process, is central to learning to read in an alphabetic language like English (Brady & Shankweiler, 1991; Catts & Kamhi, 2005a; Gillon, 2000a; Hook & Haynes, 2009; Larrivee & Catts, 1999; Liberman & Liberman, 1990; Lyon, 1999; Snowling & Stackhouse, 1996; Torgensen, Otaiba, & Grek, 2005). To see why, let's talk about some of the differences between oral language and reading.

Discontinuities between Oral and Written Language

As we've seen, most researchers today believe that reading and writing are language-based skills. Still, although reading and writing rely on a foundation of oral language ability, they require something in addition. At first glance, it might seem that the extra piece is a visual one—the ability to process print through the visual channel. For many years, LD specialists believed that reading deficits were caused by problems in visual perception. As early as 1937, Orton noticed that children with reading problems sometimes read the word *was* as *saw*, or the letter *b* as *d*, for example, and attributed such problems to visual-perceptual deficits.

But Piasta and Wagner (2008) report that children with dyslexia make no more reversal errors than do peers with typical reading development. Current thinking on the question of the role of visual-perceptual deficits in reading disorders, dating back to Vellutino's (1977) review of research in this area, is that visual-perceptual problems play a relatively minor role in reading disorders. Most investigators in this area today believe that the primary deficits involved in reading disability are linguistic, not visual (Brady & Shankweiler, 1991; Catts, Adolf, & Weismer, 2006; Catts & Kamhi, 2005a; Goldsworthy, 1996; Scarborough, 2003; Snowling & Hayiou-Thomas, 2006). You can understand how reversals such as *was-saw* could be seen as linguistic rather than visual problems by considering the following example. Like most programs in speech and hearing sciences, the program in which I taught for many years was predominantly female. But one year I had two men in my language disorders class, a somewhat unusual occurrence. They were both quite tall, over 6 feet in height, although the resemblance stopped there. One was dark-haired, the other was fair. One was somewhat husky, the other very slim. They always sat on opposite sides of the classroom, the dark-haired one on my left, the other on my right. Yet throughout the entire year, I consistently mixed up their names! It wasn't that I couldn't perceive the visual differences between them—I just couldn't keep straight which name went with which person. This problem in association of names and referents may be similar to the difficulties children with reading disorders have in making distinctions like the one between *was* and *saw*, or between *b* and *d*. It's possible to explain this difficulty without positing a visual-perceptual deficit. If visual-perceptual problems are not the primary impediment to reading, what skills, in addition to basic oral language competency, are needed for success in literacy?

Biological Bases for Oral Language

To answer this question, one thing we need to remember is that oral language is a primary, biologically based system with a developmental progression that is similar across cultures, specialized neural structures adapted specifically for its functioning, and universal appearance in individuals with normal development (see Kamhi & Catts, 2005; Gleason, 2008; Olson & Gayan, 2003; Snow, Burns, & Griffin, 1998, for review). Speech perception, for example, is biologically programmed. We know this because infants as young as 4 weeks can distinguish between phonemes, even when they have no comprehension of language (Eimas, Miller, & Jusczyk, 1987) and infants as young as 7 months have been shown to perceive boundaries between words and syntactic units in connected speech (Jusczyk, 1999). The ability to process and use written language does not arise from biologically based neurological systems, though (Kamhi & Catts, 2005; Liberman & Liberman, 1990). There is great variability in the age and degree of proficiency of literacy acquisition in individuals within literate societies. Some typical individuals learn to read before kindergarten, some don't learn to read until adulthood, some never learn at all. Moreover, many cultures have never developed any form of written language.

Oral language is as old as the human race. Literacy, on the other hand, is a relatively recent invention (Sulzby & Zecker, 1991; Wilford, 1999). The requirement that everyone in a society be able to read is more recent still. Until well into the twentieth century, only a minority of people were literate, and there was no particular stigma or handicap attached to illiteracy. Learning to read does not come naturally to everyone, as its late development and limited penetration in human cultures suggests. For most children, learning to read does not happen as naturally and effortlessly as learning to talk does. Some direct instruction is usually needed. Why is this so? To understand fully why everyone does not learn to read naturally, we need to consider not only the lack of a biological basis for literacy but also the demands that the writing system imposes.

Writing Systems

Three kinds of writing systems have been developed in human societies. The earliest is like that used in contemporary Chinese, sometimes called *pictographic*, *logographic*, or *ideographic*. In this type of writing system, each symbol stands for a whole word. Learning to read in this writing system requires no ability to break words down into smaller units such as sounds, but does require a great deal of memory since a separate symbol has to be associated with each word in the language. It's also hard to develop a typewriter for an ideographic system! A second writing system is the *syllabary*, such as that used in the *kana* form of Japanese writing. In this system, each symbol represents a syllable, and syllables are combined to form words. This requires some awareness of the sound structure of words and places somewhat less load on the memory than an ideographic system. But a relatively large number of symbols must be learned, and it's still pretty hard to design a typewriter keyboard for a syllabary writing system. English uses the third type of writing system, an *alphabetic cipher*. In this system, each symbol represents a phoneme (more or less). An alphabetic writing system is extremely economical in terms of the load it exerts on the memory, since there are a relatively small number of symbols to learn. But it requires a great deal of phonological awareness, the ability to break words down into component sounds. The efficiency of an alphabetic system is obvious if you're trying to design a typewriter. But the concept of an alphabetic

cipher is relatively unnatural. It developed later than either of the other writing systems and was invented essentially only once in history, by the ancient Egyptians about 4000 years ago. All the alphabetic systems in use today derive from that initial alphabet.

What's the point of this digression on the history of writing? Again, it is that an alphabetic writing system is in some sense unnatural. It developed late, even within the history of writing. It was not an idea that was come upon by a lot of people in a lot different places. It was invented only once. The fact that alphabetic writing spread to many cultures is attributable to its efficiency, not to its naturalness. These facts strengthen the prediction that reading in an alphabetic writing system is not going to come naturally to every individual. There are lots of reasons to expect that it will be somewhat hard to learn, at least for some people, and that most people will need a little help, in the form of direct instruction, in breaking into the alphabetic code.

The Key to Reading in an Alphabetic Cipher

What is needed to learn to read English, over and above basic oral language skills? The answer most researchers in reading today would give is *phonological awareness*. Phonological awareness is comprised of the ability to break words down into component sounds, to realize that these units of sound can be represented by letters, to learn letter-sound correspondence rules, to analyze words into component sounds (for spelling), and to synthesize sounds represented by letters into words (for reading). Many reading researchers call this awareness of the *alphabetic principle*.

Phonological awareness is not necessarily part of normal language development. Studies of nonliterate adults show that they have limited levels of phonological awareness (Goswami & Bryant, 1990) and their phonemic awareness is clearly and strongly related to their letter knowledge (De Santos Loureiro et al., 2004). However, the following conclusions about the relationship between phonological awareness and reading in school children can be drawn from the research literature (Blachman, 1994; Kahmi, 2009; Swank, 1999; Vellutino et al., 2004):

- There is a significant relationship between phonological awareness and reading. Children who exhibit phonological awareness skills have been shown to learn to read more easily than children who don't (Adams, 1990; Ball & Blachman, 1988; Gillon, 2005b; Kamhi & Catts, 2005a; Serry, Rose, & Liamputtong, 2008; Snow, Burns, & Griffin, 1998; Swank & Larrivee, 1999).
- Performance on phonological awareness tasks in kindergarten and first grade is a strong predictor of later reading achievement (Goswami, 2008; Snow, Burns, & Giffin, 1998).
- Direct teaching of phonological awareness and letter-sound correspondences to children who are not yet reading improves their reading and spelling development more than other forms of reading readiness instruction (Adams, 1997; Ball & Blachman, 1991; Blachman, 1989; Gillon, 2000a, 2005; Hook & Haynes, 2009; Kirk & Gillon, 2007; Snow, Burns, & Griffin, 1998). Moreover, the effects of this training persist in giving children an advantage in reading even 4 years later (Bradley, 1988), and these benefits are strongest for children whose phonological awareness skills start out lowest (Chall, 1997; Lundberg, 1994).
- Phonological awareness teaching works best when combined with explicit instruction in letter-sound correspondences, especially when the two are taught in separate activities (Chall, 1997; Kaderavek & Justice, 2004; van Kleeck, 1995).

What Does It Take to Learn to Read?

Scarborough (2003) has argued that there are two main components, or strands that need to be integrated in order for children to learn to read and write. These are represented in Figure 10-2. One strand includes various aspects of language knowledge that will support reading comprehension; such as basic vocabulary and syntax, the world knowledge children acquire through experience and instruction, higher level language skills such as verbal reasoning and metalinguistics, along with basic knowledge of print concepts and conventions, as well as story schemas. The second strand includes those skills that will support word recognition, such as phonological awareness, letter-sound knowledge and, eventually, fluent and automatic recognition of an increasingly large vocabulary of sight words.

Because all these abilities need not only to be present, but to be integrated in order for fluent reading to develop, it is easy to see why disruption in any one strand can lead to difficulty in the acquisition of the entire process of learning to read. We can also see that some of these strands will be present in most children when they come to school, such as basic vocabulary and syntax; but others will be present only in children who have had literacy socialization experience, such as print concepts and conventions. And we've learned that some of these skills, such as phonological awareness and letter-sound correspondence, will have to be taught directly, even to children with typical development and strong literacy socialization. Of course these things don't happen all at once. There are a series of phases through which children pass in the process of learning to read. Chall (1983) has presented a particularly useful summary of this sequence. Although some writers (e.g., Kamhi & Catts, 2005a) have pointed out problems with stage theories like this one, and more recent examples of stage theories of reading development (e.g., Seymour, 2008) have been proposed, Chall's overview does give us a reasonable view of the kinds of reading skills generally expected at various points in the curriculum. Her sequence is outlined in Table 10-4.

In Chall's "prereading" stage, from 2 to 6 years of age, the child acquires what we've been calling literacy socialization through natural, scaffolded kinds of interactions with adults. In the first reading stage, from about the beginning of the first to the middle of second grade, decoding the print, or the processes involved

TABLE 10-4 Chall's (1983) Stages of Reading Development

Stage	Grade Level	Achievements
Stage 0: Prereading	Pre-K	Literacy socialization
Stage 1: Decoding	1-2	Phonological analysis and segmentation/synthesis in single words
Stage 2: Automaticity	2-4	Fluent reading; greater resources for comprehension available
Stage 3: Reading to Learn	4-8	More complex comprehension, increased rate
Stage 4: Reading for Ideas	8-12	Recognition of differing points of view, use of inferencing
Stage 5: Critical Reading	College	Synthesis of new knowledge, critical thinking

Reading acquisition proceeds through a series of stages.

in word recognition, is the focus. Most of the child's attentional resources are devoted to using letter-sound correspondence rules and phonological synthesis abilities to decipher single words. Comprehension, or attention to meaning, can be limited during this period because so much attention is going into decoding. More advanced comprehension skills emerge toward the end of this period, as the child begins to automatize some of the decoding processes. Of course, the child does not lose any of the language comprehension skills he or she has acquired in oral activities. But decoding requires a lot of attention at first, and children in this phase will not have as many resources available to understand what they read as they have for understanding what they hear.

By stage 2, from late second to fourth grades, reading becomes more fluent, decoding is more automatic, and more attention is available for comprehension. Children's ability to take in what they read becomes more similar to their receptive ability for spoken language. This change rests primarily on the acquisition of *fluency* in reading; the ability to recognize printed words quickly and with little effort. Bashir and Hook (2009) argue that the development of fluency allows the reallocation of cognitive resources from "sounding out" words to using higher language and cognitive processes for comprehension. Fluency, then, is an important bridge between early stages of reading focused on decoding and the later stages in which reading is aimed at gaining meaning from the text.

In Chall's terms, Stage 3, from fourth to eighth grades, marks a major change in the child's reading ability. Now instead of learning to read, the child is reading to learn, able to get new information and derive fuller meaning from print because the decoding process has become well-learned and goes on automatically, below the level of consciousness. This frees a majority of the child's attentional resources to comprehend the text, make inferences, and so on. In Chall's later stages, more sophisticated comprehension skills evolve, in concert with the child's developing intellectual capacity and metacognitive skill. But at all the stages, lower-level decoding skills can be brought to bear when an unfamiliar word is encountered.

This sequence emphasizes the fact that children need different kinds of instruction at different points in development. In the pre-reading period, they need literacy socialization opportunities, and lots of experience talking about words and sounds. In the decoding phase, phonological awareness activities—breaking words into

smaller parts, identifying sounds in words, finding words with the same first and last sound, associating sounds with letters, inventing spelling—and letter-sound correspondence instruction and practice are crucial. But children will continue to need to hear stories and be exposed to literate language, as well as to build a strong oral language base in terms of vocabulary, morphology, sentence, and discourse forms. Once basic decoding skills have been learned, children will need instruction and practice that allows them to develop fluent reading, with automatic word decoding. Snow, Griffin and Burns (2005) recommend use of repeated readings, with guided feedback, along with allowing children to choose reading material of interest to them. LeVasseur, Macarusa, and Shankweiler (2008) advocate the use of visual supports for appropriate prosody in reading materials, such as spaces between phrases, putting clause boundaries at the ends of lines, as another way to enhance fluency. In later phases, once basic decoding has been mastered, phonological awareness and fluency activities can be de-emphasized and focus shifted to explicit instruction in comprehension strategies in both oral and written texts. Catts (1999) argued against using more complex phonological awareness activities (such as sound deletion and manipulation) once basic decoding has been mastered. Instead, he suggests that most reading disabilities "occur in the context of more widespread language deficits" (p. 19). We need to continue to shore up the oral language base for these students, as well as provide them with explicit instruction in strategies for improving their comprehension of both oral and written texts they encounter in school (Mastropieri & Scruggs, 1997; Wallach, Charlton, & Christie, 2009; Westby, 2005).

But what about our children with LLD? Don't their weaknesses in language and metalinguistic awareness dictate a different kind of instructional program? According to the National Research Council (2001) report, children having difficulty learning to read do not, as a rule, require a different kind of instruction from children who are "getting it." Instead, they more often need more exposure and practice to the same basic principles of word identification and comprehension, in individualized, more intensive settings. This conclusion applies to children with specific reading disorders as well as to those from culturally and linguistically different backgrounds. These children are likely not to have an elaborated base in oral language, experience with decontextualized language use, or exposure to literate language genres, metalinguistic skills, or knowledge of letter-sound correspondences. In fact, Warren-Leubecker and Carter (1988) showed that the area of language in which poor children differed most from those from middle-class homes was in phonological awareness, which in turn was the best predictor of reading achievement. Current research advocates tackling these problems head-on with explicit instruction and focused practice in both the basic language skills needed for strong reading comprehension and the kinds of phonological awareness and letter-sound abilities known to support word recognition in children with and without language learning problems (Adams, 1997; Chall, 1997; Gillon, 2000a; Lyon, 1999; Snow, Burns, & Griffin, 1998). Gillon (2002) showed that phonological awareness training led to "sustained growth in phoneme awareness and word recognition" (p. 381) as well as in spelling in children with language impairments. Thus, in RTI environments, children who struggle to acquire basic reading skills will be given, not different, but more intensive doses of the same lessons as children who are acquiring reading skills normally. Tier II instruction will provide this intensified exposure and practice in small group settings that give struggling readers additional opportunities to learn and rehearse basic phonological

awareness, letter-sound correspondence, decoding, sound synthesis, and fluency skills; Tier III instruction will do the same in one-to-one tutoring settings.

The consensus among researchers today is that teaching metalinguistic, phonological awareness, and letter-sound correspondence skills explicitly and providing practice so these skills can become automatized in word recognition activities make better readers (Ehri et al., 2001; Podhajski, Mather, Nathan, & Sammons, 2009). This basic truth has been reaffirmed by Snow's (1998) exhaustive review. The "Great Debate" (Chall, 1996) that resurfaced during the 1990s on the most effective way to teach beginning reading has been resolved: in the early stages, direct instruction in basic decoding skills is crucial to successful reading development for all children. Reading experts today argue for a "balanced" approach to reading instruction; one that provides lots of practice in phonological awareness and letter-sound correspondence in primary grades, but also continues to present meaningful, engaging literature and multiple opportunities for children to continue their oral language growth and their appreciation of the functions of print. Explicit teaching of comprehension and spelling strategies also is important at later stages.

The Role of the School SLP in Literacy Development

What is the role of the school-based SLP in addressing written language issues? SLPs have a very important role to play in fostering balanced literacy instruction, and in supporting RTI in primary classrooms; both in our consultative role with classroom teachers and in our direct work with students who have LLD. This fact is often recognized in schools through the creation of "literacy teams": groups of educators who support the classroom teacher in her primary role as the individual responsible for basic literacy instruction by addressing the needs of children who are struggling to acquire literacy, and using their knowledge of scientifically based reading instruction in making sure all students learn to read and write. Pressures from legislation, such as the No Child Left Behind Act of 2001 (www.ed.gov) have contributed to the effort to provide more resources to teachers to make sure all children acquire proficiency in literacy skills. Because of our knowledge of the oral language bases for literacy, and of the sound structure of English, SLPs are considered important members of school literacy teams. Let's discuss how we can fulfill our roles in the area of literacy, by talking first about the beginning stages of reading, and then about our roles at higher developmental levels.

SLPs' Role in Emergent Literacy and Decoding

Vellutino et al. (1996) report that with well-designed early instruction in phonological awareness and spelling-sound correspondence, all but 3% of children can become successful readers in the primary grades. Yet we know that anywhere from 10% to 40% of children are now failing to meet grade-level expectations in reading, with the highest proportions of failure in poor, urban areas. Catts, Fey, Tomblin, and Zhang (2002) found that children with oral language impairments are six times more likely to have trouble learning to read than are typical peers, and that half the children who struggle with reading in primary grades have language impairments. SLPs can have a positive effect on these dismal statistics by helping both the teachers and the students we work with to participate in reading instruction that follows principles established by scientific research.

ASHA (2006, 2010) advocates several roles for the SLP in literacy instruction in schools. The first is in the provision of indirect services through consultation and collaboration with teachers in developing best practices in evidence-based reading instruction, or in RTI terms, developing high quality Tier I instruction. In these activities, the SLP works with these teachers to organize and implement activities that support literacy for all students throughout the school day (Justice & Kaderavek, 2004). At the preschool and primary level, it is important that we help teachers get away from the idea that "phonics" instruction means worksheets and seat work. Code-emphasis reading programs do not have to be boring lectures. Children love playing with language, as their spontaneous sound and word play attests. There are lots of enjoyable approaches to developing metalinguistic and phonological awareness skills. Examples can be found in Adams, Foorman, Lundberg and Beeler (1998); Blachman (1987); Chaney and Estrin (1987, 1989); Elkonin (1973); Estrin and Chaney (1988); Gillon (2000a); Kaderavek and Justice (2004); Lewkowicz (1980); Sulzby (1980); and Yopp and Yopp (2000). Some of these methods are discussed in Chapter 12. However, because many teachers went through training programs some years ago that de-emphasized phonics and decoding instruction, they may have had very little training on the sound structure of our language (Fillmore & Snow, 2000). Yet, Chall (1997) cites research showing that teachers who do not themselves have adequate knowledge of phonological and phonics rules have students who do less well in reading. One way SLPs can support literacy development is to help these classroom teachers, in in-service and consultative settings, acquire a deeper knowledge of the structure of our language, and to incorporate it into their Tier I instructional plans.

Justice and Kaderavek (2004) suggest a three-pronged approach to addressing literacy for the school SLP during the preschool and primary years. First, in her indirect role, the SLP collaborates with the classroom teacher in creating a print-rich environment in which signs, lists, and labels are placed prominently throughout the classroom and referred to frequently during the day's activities. The SLP also encourages and participates in storybook reading and sharing activities that include talk about the content and structure of books and stories. SLPs can also help embed a rotating set of literacy activities within daily routines, such as having a "post office" play corner in which children are encouraged to "read," and "write," at whatever level they can, and talk about these processes is modeled and encouraged during play.

The second prong involves collaborative direct Tier I instruction in activities for the entire class that focus on phonological awareness, letter-sound correspondence, and phonological analysis and synthesis. While engaging collaboratively in these lessons, the SLP can be alert to those students who seem to be having difficulty, attending less, or making less progress than others. For these students the SLP can provide, either directly or through collaboration with other classroom personnel, Tier II literacy activities with small group follow-up lessons to pre-teach, review, and provide additional practice in the literacy concepts addressed in the classroom instruction. In some cases, students already on the SLP's caseload for other speech and/or language delays will require this tier of instruction, and the SLP can simply add other children who are not on IEPs, but require Tier II support to these small group sessions. Thirdly, Tier III instruction may sometimes occur during the SLP's individual sessions with students already identified with speech/language delays. This approach makes use of dynamic assessment for identifying children at risk for literacy failure, so that

the SLP does not have to screen or assess children separately for phonological awareness or other pre-literacy deficits. Instead, she does this as an ongoing part of her participation in the classroom's daily Tier I instruction. As such, this method provides an efficient way for the SLP to fulfill her role on the literacy team at this level (see Ehren, Montgomery, Rudebusch, & Whitmire, 2006; Justice, McGinty, Guo, & Moore, 2009; Roth & Troia, 2009; Schuele & Larrivee, 2004 for additional suggestions.)

SLPs' Role in Later Literacy Development

Beyond the primary grades, SLPs continue to have important contributions to make to children's literacy acquisition. Four major areas of literacy beyond decoding are identified and defined in Table 10-5. In each of these areas, as in the others we've discussed, SLPs address students' literacy needs through both direct and indirect services. The development of fluency is clearly an area in which oral-written connections can be made by the SLP. We can, first, encourage teachers to incorporate fluency training into Tier I instruction, and use performance in these activities to identify children who may require additional help in this area. As Bashir and Hook (2009) suggest, fluency activities involve multiple rereadings of texts the students are using in the classroom. Tier II and III activities can take place in the context of small-group drama activities, such as having 2 to 3 children at a time act out the text while the SLP and the others in the group read it aloud, having "readers' theater" presentations in which the students take turns reading the same text aloud as if in different moods ("Keisha can read it as if she is happy, then Hector can read it as if he is mad . . ."), or as choral readings for recording and listening to with parents as the child reads the text along with the recording at home. Visual supports such as those suggested by LeVasseur et al. (2008) can also be used.

Enhancement of comprehension skills is an additional area in which SLPs have a role to play in later literacy development. We can follow Kamhi's (2009) and Snyder's (2010) suggestions involving working on comprehension through oral language activities that focus on curricular topics such as science, history, math, and literature. These activities may focus on deepening knowledge of vocabulary found in classroom texts; using paraphrasing activities to help process difficult sentences structures in classroom texts, such as passives and subordinate clauses; as well as using

these texts to focus on expository structures as Wallach et al., (2009) have suggested. We will look at more detailed examples of these methods in Chapters 12 and 14. The point to be made here is that SLPs can contribute to the development of reading comprehension skills by doing what we do best—helping children with oral language, but choosing the content of language activities from the academic curriculum.

Spelling is also an area of literacy where SLPs can have an impact. We'll talk more in Chapter 12 about the SLP's role in spelling development, but in general we can address the spelling needs of children with LLDs, as Apel (2004) and Kirk and Gillon (2009) suggest, using a *word study* orientation. This relies on our expertise in understanding the phonological and morphological structure of words, and providing metalinguistic discussion and strategies to help students move beyond basic phonological awareness to understanding the patterns in the English spelling system. SLPs can also help students at higher grade levels improve written composition skills, as we will discuss in more detail in Chapter 14, by focusing on the pre-writing, or planning aspects of written communication and using oral language strategies to help students plan and organize their writing.

Finally, Sawyer (2010) makes the important point that SLPs have a great deal to contribute to classroom and special education teachers' understanding of the reading process and what it takes to succeed in it. Our deep knowledge of language structure, content, and use can help inform other teachers about best ways to address gaps in their students' reading abilities. Part of our job is to work collaboratively with these other educators to enhance their understanding of the key role language knowledge and skill plays as a foundation for the development of literacy.

CONCLUSIONS

We've seen that success in school, regardless of grade level, requires a vast amount of experience and proficiency with oral language. Some of these oral language skills are part of most children's natural development, but some are higher level skills that require specialized contexts and experiences for their acquisition. As SLPs, our job is to ensure that our clients with LLD have a solid oral language basis and have moved past the developing language phase in their content, form, and use of language. Beyond this, though, we need to be aware of the special discourse requirements of the classroom and of the higher level linguistic requirements of the curriculum. This knowledge leads us to appropriate assessment strategies; we'll know what to look for in terms of problems that can impede the child with LLD. Moreover, understanding the various ways in which oral language supports and interacts with success in school, and particularly with literacy development, can help us develop interventions that contribute to that success for our clients. SLPs are central players in school literacy teams and have roles to play in each tier of RTI instruction for students who struggle with the oral and written language demands of the school setting.

STUDY GUIDE

- I. Definitions and Characteristics
 - A. What is a learning disability? Reading disorder? Dyslexia?
 - B. What kinds of phonological deficits are seen in students with LLD?

TABLE 10-5 Aspects of Literacy beyond Decoding

Literacy Area	Definition
Fluency	The ability to read connected text rapidly, smoothly, effortlessly, and automatically with little conscious attention to the mechanics of reading (Meyer and Felton, 1999, p. 284).
Reading comprehension	The ability to understand draw inferences and conclusions, recall, summarize, paraphrase, and acquire new information from written texts
Spelling	The phonological and orthographic skills that enable conventional alphabetic representations of words
Writing	The planning, production, and editing of written texts

- C. How do these relate to learning to read?
- D. How does the syntax of children with LLD differ from that of children in the developing language phase?
- E. What kinds of syntactic and morphological errors are typical of students with LLD? How prevalent are such errors?
- F. What are the vocabulary problems of students with LLD, and why do they have them?
- G. What is the role of word retrieval in LLD, and what are two alternative explanations of the problem?
- H. Describe the social interaction problems in students with LLD.
 - I. Discuss narrative and expository discourse types. How do these cause problems for students with LLD?
 - J. Why do students with LLD often have deficits in general knowledge?
 - K. What is ADHD? What role does this disorder play in language-learning disabilities?
- II. Language, Learning, and Reading: What's the Connection?
 - A. Discuss some of the special properties of classroom discourse and why they may cause problems for some students.
 - B. What is the "hidden curriculum?"
 - C. Discuss decontextualized language. How is it acquired? Why is it important?
 - D. How can classroom discourse create a mismatch for students from different cultural backgrounds?
 - E. Why are metalinguistic skills needed for school success?
 - F. What is meta-cognition? Why is it important in school?
 - G. Describe the continuum of formality of language from oral to literate. Describe how the form, function, and topics of language differ along this continuum.
 - H. Discuss the current conception of reading as a language-based skill.
 - I. What are the implications of this conception for understanding deficits in reading?
 - J. What oral language skills are needed to learn to read? Why can we not expect all children to come to school with these skills?
 - K. What is the relationship between reading and language comprehension?
 - L. What is phonological awareness, and how do children attain it?
 - M. What is literacy socialization?
 - N. What is the role of metalinguistic awareness in learning to read?
 - O. Why is learning to read an "unnatural act"?
 - P. Name and describe four aspects of emergent literacy.
 - Q. Discuss the three writing systems used throughout the world. What are the advantages and disadvantages of each?
 - R. Why does the SLP need to understand the reading process?
 - S. What oral language skills can the SLP work on to build a firm base for literacy in students?
 - T. Name and describe four aspects of literacy development that emerge after the primary school years.
 - U. Discuss Chall's stages of reading development.
 - V. What can the SLP contribute to reading instruction for clients? For all students?

Assessing Students' Language for Learning

CHAPTER OBJECTIVES

Readers of this chapter will be able to do the following:

1. Describe how families participate in educational planning for school-aged children.
2. Discuss the role of responsiveness to intervention (RTI) in identifying students for communication assessment.
3. Define and describe methods for screening at the elementary school level.
4. Discuss methods of referral and case-finding.
5. Discuss the uses of standardized tests at the elementary school level.
6. Describe nonstandardized assessment methods for students in elementary grades.
7. Carry out language analysis procedures for conversation and narratives.
8. Use dynamic and curriculum-based assessment methods.
9. Apply concepts discussed to assessment of students with severe disabilities.

Maria had been doing well in second grade until her bike accident. While riding without a helmet one day, she was struck by a car. She spent 3 days in a coma, and when she first emerged from it, she didn't speak at all. After several weeks in the hospital, where she received physical, occupational, and speech therapy, she was able to go home. She spent several months out of school, receiving home tutoring and more therapy. She returned to school the next year, by which time she had recovered her speech but still had some problems with her gait and fine motor skills. She continued to see the occupational and physical therapists but was thought to be doing all right with her language. She seemed quiet and never caused any trouble. On the playground, she kept to herself and didn't get involved in what the other children were doing. She was meek and somewhat shy, but always eager to please the teacher. She seemed to have regressed somewhat in her reading, which was above grade level before the accident, but she managed to follow the simple, repetitive material used in the reading program in her second-grade class, which she was repeating because she'd missed so much time the previous year. When she spoke, her sentences were short, but that seemed to be more because of her shyness than anything else. When she got to third grade, though, she

suddenly ran into trouble. She couldn't follow directions. She couldn't seem to answer the questions the teacher posed for class discussion. She was unable to read the books used for social studies and science. She began to withdraw, sometimes going for days without saying a word. She complained of stomach aches and often asked to spend time in the nurse's office. The nurse called her family to discuss the problem. They said that Maria had started saying she was "dumb" and didn't want to go to school because she was too "stupid." They reported being very upset to find her crying in bed on school nights. The school nurse suggested to Maria's teacher that Maria be referred for an evaluation of special educational needs.

Maria is another child who seems to have difficulties making the transition from primary to intermediate grades and keeping up with the changes in the curriculum that this transition entails. Although the basic oral language she recovered after her traumatic injury seems to be good enough to get by, Maria has trouble with the more complex language of the intermediate classroom and can't manage the reading requirements of her grade level. Maria's response to these problems is different from Nick's. She retreats rather than becoming aggressive. But the reason for both responses is similar. The demands of the classroom are taxing these students' abilities and making them feel like failures.

When we, as speech-language pathologists (SLPs), assess students like Nick and Maria, we want to bear in mind the issues we discussed in Chapter 10 about the need to look not only at basic oral language skills but also at the specialized abilities that contribute to success in the classroom in general and in reading in particular. In this chapter, we'll talk about assessment issues for students who are beyond the developing language phase, with skills above Brown's stage V. We will focus on children who have mastered the basic vocabulary, sentence structures, and functions of their language but have trouble progressing beyond these basic skills to higher levels of language performance. This chapter and Chapter 12 focus specifically on clients whose developmental levels are commensurate with those of students in the elementary grades. We will be talking about the communicative skills needed for the elementary school years, from kindergarten through fifth or sixth grade when typical children are between 5 and 12 years of age.

Of course, some children at these chronological age levels who are served in schools function at lower levels. Particularly with the push toward inclusion of students with disabilities embodied in the Individuals with Disabilities Education Act (IDEA), clinicians find students in elementary schools who function at the developing,

emerging, or even prelinguistic stages of communication. When these students are included in the caseload of a school SLP, assessment and intervention strategies appropriate for their level of functioning are needed. Information on assessment and intervention strategies for students at these levels of development can be found in Section II.

Although the stage of development we're considering in these chapters usually takes place when children are between 5 and 12 years of age, we may encounter some clients with language-learning disabilities in middle school or even high school who function at this elementary grade level. For these students and for their younger counterparts, the assessment and intervention information presented in this chapter and Chapter 12 is germane. Let's call this phase of language development the "language for learning" period (L4L for short). The L4L stage is when many of the oral language bases for school success, including the knowledge of special classroom-discourse rules, decontextualized language, metalinguistic and phonological awareness, and literacy skills that we talked about in Chapter 10 must be acquired in order for the student to meet the demands of the curriculum.

CHILD AND FAMILY IN THE ASSESSMENT PROCESS

Although IDEA legislation mandates that families be involved in the assessment and intervention process for students with special educational needs, this ideal is not always fully met in practice. Parents may not know that their child has been having difficulty until they are told a referral has been made. Because the assessment often takes place at school, the parent may not have an opportunity to observe it and contribute a family perspective. Clinicians particularly committed to curriculum-based assessment (e.g., Jenkins, Graff, & Miglioretti, 2009; Nelson & Van Meter, 2002; Nelson, 2010) may feel that the teacher has more relevant information to contribute about the student's needs than the family does. However, the principles of family-centered practice are just as relevant for children in the L4L stage as they are for younger clients.

These principles remind us that families need to be involved in each stage of the assessment process, from referral to remedial planning. This means contacting parents as soon as a referral is made, discussing the referral, and learning whether the family shares the referring person's perceptions about the student. A telephone conference can often be beneficial at this stage, using the same communication strategies as those outlined in Chapter 7 for parent contacts. Parental permission for the assessment must be obtained, and parents should be invited to attend any assessment sessions they wish. Parents should be kept informed periodically of the progress of the assessment, if it stretches over a period of time, and should be invited to attend a meeting when the assessment is complete to discuss the evaluation with the team and to provide input in the development of an Individual Educational Plan (IEP).

It is very helpful to families for one member of the assessment team to take on the role of case manager or parent advocate. SLPs are often excellent candidates to play this role, particularly if communication is a major area of deficit for a student. The case manager or parent advocate can ensure that the family stays informed and engaged, gets a chance to ask questions, and contributes to the planning process. The case manager also can check with the parents to make sure that they understand all the jargon being used by

the professionals. It is easy for us to forget that not everyone knows all the acronyms (IEP, FAPE, LRE) and jargon that we use in our profession. A simple check with the family every now and then can give them an opportunity to say whatever they need to say. Having one person, with whom an ongoing relationship has been established, to turn to with concerns and questions is comforting for families. Despite their best intentions, the assessment team may seem intimidating, overwhelming, cold, or uncaring to a family that is struggling to find the best way to meet their child's educational needs. If a case manager is not formally assigned to a family as part of the assessment process, the SLP can assume this role on an informal basis. Having someone who makes a special effort to keep in touch with the family and to build a relationship with the child can make all the difference.

One other person deserves to have some input in the assessment process at the L4L stage. That's the student. By the time they are 7 or so, children have a strong need to make some of their own decisions and to function somewhat independently. Students to whom an assessment "just happens" are less likely to give their best performance than are those who feel they have some control in the situation. An SLP can talk with students before assessment begins about why it is taking place, the questions the assessment will attempt to answer, and what to expect. This can give the impression that you see students as people whose opinions and feelings matter. Asking students to talk a little about how they see the situation is another good tactic. You can ask whether they have trouble in school, what they are good at, what they find hard, and in what areas they would like some help. This conversation can serve several purposes. It gives students the feeling that you think they are mature enough to have some say about what goes on, and it provides an initial conversational sample that can help guide you to areas of communicative function that will need to be assessed.

IDENTIFYING STUDENTS FOR COMMUNICATION ASSESSMENT

Screening

One way children make their way to the school SLP is through screenings. These are often conducted upon entrance into the school system for the first time, or at particular grade levels. This sometimes includes screening for hearing, as well. Some school systems use mass screenings in which all children beginning kindergarten are screened during a few designated periods by professionals or paraprofessionals using short standardized instruments, such as the *Fluharty Preschool Speech and Language Screening Test—2nd Edition* (Fluharty, 2000), the *Joliet 3-Minute Speech and Language Screen—Revised* (Kinzler & Johnson, 1993), or *Developmental Indicators for the Assessment of Learning—3rd Edition* (Mardell & Goldenberg, 1998). Some districts use locally developed, informal methods. Other local educational agencies (LEAs) set aside the first week or two of kindergarten for individual screenings. Each new student meets with a teacher or team for a somewhat more intensive screening. These screenings have several possible outcomes. A recommendation to wait a year before entering kindergarten may be given, to let the child mature. Alternatively, students may be placed in a developmental kindergarten program for some preschool-level instruction with the expectation that they will enter regular kindergarten the next year. Screening also can lead to a referral for an assessment in greater depth in one area, such as communication, or by a multidisciplinary team. SLPs often participate in these

screenings and may identify children who will join their caseload as a result. Finally, some schools use a responsiveness to intervention (RTI) approach to identify children with difficulties (see Chapters 3 and 10 for details). Whether the SLP participates directly in screenings or not, it is our responsibility to interpret screening information and contribute to decisions about which children need further assessment.

Many school districts use informal, locally developed methods for screening, particularly for mass kindergarten screenings. Although this practice is widespread, it is not, we would argue, advisable. A screening instrument should have well-documented psychometric properties, because that is the best way to ensure its fairness. Some critics of kindergarten screening have argued that early identification through screening is unfair to minorities, culturally and linguistically different (CLD) children, and those from low-income families (Braddock & McPartland, 1990; Pavri & Fowler, 2001). Although many of these arguments may apply to standardized as well as informal procedures, the issue of unfairness is much more pronounced when screening is done using intuitive or subjective criteria. Using nationally standardized norms, norms developed and tested locally with a relatively large normative sample, or measures that provide evidence of reliability and validity and include children from a range of ethnic and economic backgrounds helps us to guarantee that screening procedures are as fair as we can make them. One example is presented by Massa, Gomes, Tartter, Wolfson, & Halperin (2008), who used the Observational Rating Scale from the Clinical Evaluation of Language Fundamentals-3 (Semel et al., 1995) completed by parents and teachers to screen 7- to 10-year-old children for difficulties in listening, speaking, reading and writing in a culturally diverse urban setting. Results revealed that the general questions posed on this measure (such as “Does your child have trouble with spoken directions?”) showed reliability and validity for both parent and teacher responses in identifying language disorders in this population.

In addition to demonstrated reliability and validity and a large and representative norming sample, a screening test should have some additional properties. It should cover a relatively wide range of language behaviors, provide clear scoring with pass/fail criteria, have adequate sensitivity and specificity to accurately identify a large majority of children who have language difficulties, and take a short amount of time (Justice, Invernizzi, & Meier, 2002; Sturner et al., 1994). The only way to find out whether a test meets these standards is to read the manual carefully. We need to look at the norming sample to see whether it contains children such as those on whom we will be using the test. We need to review the items to evaluate their comprehensiveness. We need to look at the scores and statistics provided to determine whether the test is valid and reliable, provides adequate sensitivity and specificity (see Chapter 2), and gives a usable pass/fail standard. We need to try it a few times to see whether it is efficient to use. When we find a test that meets these standards, we can feel confident that our screening will be fair, efficient, and accurate. Some instruments that have been developed for screening communicative skills in school-age children are listed in [Appendix 11-1](#).

Still, the availability of psychometrically sound instruments is a problem. Sturner et al. (1994) found in their review of 51 standardized screening instruments that only six provided adequate validity data. Only nine were found to be adequately brief and comprehensive. Justice, et al. (2002) report that none of the six early literacy screening instruments they examined contained all essential features. Spaulding, Plante, and Farinella (2006) reported

that information on test sensitivity and specificity, which would help clinicians decide how accurately the test identifies children with language disorders, was available for only 20% of the language tests they evaluated, and acceptable accuracy (80% or better) was reported for only 12%. These findings underline the importance of being critical consumers in selecting commercial tests and screening instruments. Just because a test is published does not mean it has adequate psychometric properties. We need to review the tests we use carefully to ensure they are fair, efficient, and effective. Moreover, we should argue for careful consideration of psychometric properties in the selection of any screening instruments our schools use. This can help to ensure that we provide assessment services in a fair and appropriate way.

RTI, Referral, and Case Finding

A second way in which school children get to the SLP for assessment is through teacher referral, because of a perception on the teacher's part that something is not quite right about the child's language, either in the context of a formal RTI system, or in less formal observational situations. Teacher referral is not as simple as it sounds, though. There are lots of reasons why teachers do not refer every child about whom they have concerns. One is that the student's language may sound acceptable to “the naked ear,” as we've discussed; that language deficits seem minor in comparison to behavioral, attentional, academic, or social problems the student is experiencing; or that the child's problem is considered to be primarily in the area of reading, rather than oral language. Teachers who identify students as needing support through the RTI process may not consider the role that oral language plays in literacy acquisition, and may provide Tier II and III supports only for phonics and word identification, without considering the need for work on oral language areas such as phonological awareness, vocabulary, and language comprehension. SLPs sometimes provide in-service presentations that “update” faculty on recent findings about language-literacy connections to get this message across.

Another way to optimize the efficacy of teacher referrals, particularly in schools or grade levels where RTI is not being used, is to provide teachers with specific criteria or checklists to use. We can distribute these checklists to classroom teachers and ask them to fill out one for each student in the class who seems to be having difficulty or about whom they have some concern. Damico and Oller (1980) found that encouraging teachers to use pragmatic criteria for referral, rather than criteria based on syntactic and morphological errors, resulted in more accurate referrals. Damico (1985) developed a Clinical Discourse Analysis Worksheet to analyze a speech sample of students with language-learning disorders (LLDs). This worksheet can be modified and used as a pragmatically oriented checklist to be given to teachers as a basis for referring students. One such modification appears in [Figure 11-1](#). Any student for whom a teacher answers “yes” to several (more than four, say) of these questions could be a candidate for assessment in greater depth. Once we identify these students, of course, we can assess them in a variety of areas, including but not limited to pragmatics. Pragmatic criteria for referral, though, seem to be a valid way to identify which students are having problems with the linguistic demands of the classroom. Bishop (2003) developed the Children's Communication Checklist—2 (CCC-2), in order to identify students with specific language disorders and to differentiate problems in language form from those in the area of pragmatics. Botting (2004) showed that the CCC-2 is sensitive to children with a variety of communication impairments. The CCC-2 can also

Student name _____	Grade _____
Teacher _____	Date _____

To the teacher: Please circle the answer to each question that best describes your student's performance in class.

Does the student:

Give insufficient information when giving instructions or directions?	Yes	No
Use nonspecific vocabulary (<i>thing, stuff, whatchamacallit</i>)?	Yes	No
Perseverate or provide too much redundancy when talking?	Yes	No
Need a lot of repetition before even simple instructions are understood?	Yes	No
Give inaccurate messages; seem to talk when he or she "doesn't know what he or she is talking about"?	Yes	No
Make rapid and inappropriate changes in conversational topic without cues to the listener?	Yes	No
Seem to have an independent conversational agenda or give inappropriate and unpredictable responses?	Yes	No
Fail to ask relevant questions to clarify unclear messages so that communication frequently breaks down?	Yes	No
Use language that is inappropriate for the social situation?	Yes	No
Produce speech that is frequently disrupted by repetitions, unusual pauses, and hesitations?	Yes	No
Use many false starts, self-repetitions, and revisions in talking?	Yes	No
Produce long pauses or delays before responding?	Yes	No
Lack forethought and planning in telling stories and giving instructions?	Yes	No
Fail to attend to cues for conversational turns, interrupting frequently or failing to hold up his or her end of the conversation?	Yes	No
Use inconsistent or inappropriate eye contact in conversation?	Yes	No
Use inappropriate intonation?	Yes	No

Please use the space below to describe any other concerns you have about this student's communication:

FIGURE 11-1 Pragmatically oriented discourse analysis to be used as a teacher referral form. (Adapted from Damico J. [1985]. Clinical discourse analysis: A functional language assessment technique. In C.S. Simon [Ed.], *Communication skills and classroom success: Assessment of language-learning-disabled students* [pp. 165-206]. San Diego, CA: College-Hill Press.)

serve as tool to help teachers make referrals for students with communication difficulties (Appendix 11-2). *The Pragmatic Language Skills Inventory* (Gilliam & Miller, 2006) is also a useful tool. Additional suggestions for using checklists to identify children in primary grades who may be at risk for literacy problems come from Catts (1997) and Justice et al. (2002). A checklist based on their suggestions is shown in Figure 11-2, which can be used to help first-grade teachers identify students who may have LLD, and can be used as part of the monitoring system for tracking progress of children in RTI classrooms.

Monitoring Progress in RTI

In addition to identifying students with language disorders within the general education population who may not have been previously identified, SLPs in RTI settings also play a role in monitoring progress across the RTI Tiers. As we've seen, in RTI settings, students will be provided with scientifically based literacy instruction in general education at Tier I, and those who experience significant difficulties will receive more intensive, small group instruction at Tier II. Monitoring of progress within these tiers may include commercial reading assessments (Mellard, McKnight, & Woods, 2009), benchmark measures such as the *Phonological Awareness and Literacy Screening* (PALS; Invernizzi & Meier, 2002) to evaluate classroom performance as a whole on specific high-priority reading targets (Justice, 2006), or curriculum-based methods such as the *Dynamic Indicators of Basic Early Literacy Skills* (DIBELS; Kaminski & Good, 1998) to evaluate performance on specific indicators of progress within the

Standardized tests are used to establish eligibility for school-based services.

curriculum. Benchmark measures will usually be administered several times during the school year to track progress of the class as a whole and identify students who fail to achieve predetermined standards. Curriculum-based assessments are typically used more frequently, as often as weekly, to identify children who are not acquiring the specific skills being presented in the curriculum. According to Justice (2006), the benchmark measures differ from curriculum-based measures in that benchmark measures can be used to identify goals for future instruction, such as increasing the

number of letter-sound associations known. This level of monitoring is analogous to what SLPs do when we assess children's current level of performance in oral language, and use the information collected to plan an intervention program. Curriculum-based assessments, on the other hand, are often timed and are designed to be quick ("How many letters can a child name in 1 minute?"). Instead of translating directly into instructional goals, these measures are used to track *progress over time*, and to show that particular children have a slower rate of growth than their peers. They

Screening for Language-Based Reading Disabilities Checklist

Child's name: _____ Birthday: _____

Date completed: _____ Age: _____

This checklist is designed to identify children who are at risk for language-based reading disabilities. It is intended for use with children at the end of kindergarten or beginning of first grade. Each of the descriptors that characterize the child's behavior/history should be checked. A child receiving a substantial number of checks should be consider at-risk for language disability.

Speech sound awareness

- _____ Does not understand and enjoy rhymes
- _____ Does not easily recognize that words may begin with the same sound
- _____ Has difficulty counting the syllables in spoken words
- _____ Has problems clapping hands or tapping feet in rhythm with songs and/or rhymes
- _____ Demonstrates problems learning sound-letter correspondences

Written language awareness

- _____ Does not orient book properly during book-looking
- _____ Cannot identify words and letters in a picture book

Letter name knowledge

- _____ Cannot recite the alphabet
- _____ Cannot identify printed letters when named by teacher ("Where is the A?")
- _____ Cannot name letters when asked

Word retrieval

- _____ Has difficulty retrieving a specific word (e.g., calls a sheep a "goat" or says "you know, a woolly animal")
- _____ Shows poor memory for classmates' names

FIGURE 11-2 Screening for language-based reading disabilities in kindergarten and first grade: A checklist. (Based on Catts, H. [1997]. The early identification of language-based reading disabilities. *Language, Speech, and Hearing Services in Schools*, 28, 88-89; and Justice, L., Invernizzi, M., & Meier, J. [2002]. Designing and implementing an early literacy screening protocol: Suggestions for the speech-language pathologist. *Language, Speech and Hearing Services in Schools*, 33, 84-101.)

Continued

- _____ Speech is hesitant, filled with pauses or vocalizations (e.g., “um,” “you know”)
- _____ Frequently uses words lacking specificity (e.g., “stuff,” “thing,” “what you call it”)

Speech production/perception

- _____ Has problems saying common words with difficult sound patterns (e.g., *animal*, *cinnamon*, *specific*)
- _____ Mishears and subsequently mispronounces words or names
- _____ Combines sound patterns of similar words (e.g., saying “escavator” for escalator)
- _____ Shows frequent slips of the tongue (e.g., saying “brue blush” for blue brush)

Comprehension

- _____ Only responds to part of a multiple-element request or instruction
- _____ Requests multiple repetitions of instructions/directions with little improvement in comprehension
- _____ Fails to understand age-appropriate stories
- _____ Lacks understanding of spatial terms, such as left-right, front-back

Expressive language

- _____ Talks in short sentences
- _____ Makes errors in grammar (e.g., “he goed to the store,” “me want that”)
- _____ Lacks variety in vocabulary (e.g., uses “good” to mean happy, kind, polite)
- _____ Has difficulty giving directions or explanations (e.g., may show multiple revisions or dead ends)
- _____ Relates stories or events in a disorganized or incomplete manner
- _____ May have much to say, but provides little specific detail

Literacy motivation

- _____ Does not enjoy classroom story-time; wanders, fails to pay attention to stories read by teacher
- _____ Shows little or no engagement in classroom literacy activities, such as writing, book-looking

FIGURE 11-2, cont'd

are similar to the probes an SLP might present within an ongoing intervention program to learn whether or not the child is progressing. Figure 11-3 shows an example of curriculum-based assessment; here, progress monitoring of the number of words read from a standard word list in a first grade classroom shows that Students 10, 11, and 12 are making much slower gains on this

measure over the course of the Fall term than their peers. It is this slowed rate of growth that would lead to placement for these children in a Tier II group. Additional information and materials for progress monitoring are available at the National Center on Student Progress Monitoring Web site: www.rti4success.org/chart/progressMonitoring/progressmonitoringtoolschart.htm#.

FIGURE 11-3 Fall progress monitoring: Words read.

Once Tier II intervention is initiated, progress would be monitored just as it was in Tier I, using both benchmark and curriculum-based methods. Tier II intervention itself is, in a way, a kind of dynamic assessment (see Chapter 2), in which we provide some diagnostic teaching to determine whether it is sufficient to overcome a child's difficulty. If so, the child may move back into Tier I and be monitored there. Occasional "doses" of Tier II intervention may be sufficient to allow some children to develop proficient reading skills.

For other children, however, Tier II intervention will not be enough. Either because of inherent difficulties such as dyslexia, or because of a severely impoverished basis in oral language and emergent literacy, these children will need to move on to Tier III instruction and/or special education. In these cases, the determination of eligibility for special educational services will generally require more intensive assessment than has been conducted within the RTI framework, although many LEAs allow information from RTI monitoring to contribute to the determination of eligibility for special education.

EVALUATION FOR SPECIAL EDUCATIONAL NEEDS

Using Standardized Tests in the L4L Stage

As we've seen, many students who have trouble with academic work have at least marginally adequate oral language, particularly in the areas usually measured on standardized tests, such as syntax, morphology, and vocabulary. What good are standardized language tests for these students?

School-based clinicians will probably find that some standardized testing is needed in the L4L stage. The reason can be summed up in one word: *eligibility*. Many states require that a student perform below a designated level on some standardized measure to

qualify for special educational services, including the services of the SLP. States have differing criteria for eligibility for various kinds of speech-language services, but most include a requirement for some standardized testing. Moore-Brown and Montgomery (2005), for example, give examples of the variety of eligibility criteria used in various states within the United States. These include levels of performance on standardized tests, severity ratings, general indicators of delay, and results of the RTI process. At least one-third of the states reviewed require some form of standardized testing to establish eligibility. When a student has been referred by a teacher or identified as having language deficits as a result of a screening, a first step is often to establish the student's eligibility for services by means of standardized testing. [Appendix 11-2](#) provides a sample of standardized tests developed for students in the L4L period.

If a pragmatically oriented checklist has been used as a referral tool, the clinician may not have much sense of what the student's performance in language form and content might be. To begin to get such a sense, a short conversational interaction, such as the one we talked about for assessing intelligibility for children with developing language in Chapter 8, can be used. By talking to the student informally for a brief time (say 5 minutes), an SLP can break the ice and give both participants a chance to get to know each other a little. The SLP also can get a feel for what the child's linguistic abilities and disabilities might be. This brief conversational sample can help point us toward the assessment instruments that will help establish the student's eligibility for services.

Children who show articulation errors, syntactic and morphological mistakes, or evidence of word-finding or vocabulary problems in the conversation may be evaluated with tests that tap these areas to establish eligibility. It may be, though, that the student's language form and content appear adequate to the "naked ear" or that the problems heard are not specific to one area but seem to involve a more generalized restriction of speech, conceptual

content, organization, or pragmatic appropriateness. If this is the case, we will want to use a more broad-based approach to evaluation. Three types of standardized tests can be used to affect this approach: comprehensive language batteries, tests of pragmatics, and tests of learning-related language skills.

Comprehensive batteries are commonly used in the assessment of students with LLD. Most states allow children to qualify for services if they score below a certain level on some subtests of a standardized battery or if they score below criterion on one subtest of a similar area on two standardized batteries. In these cases, batteries that look at a broad spectrum of abilities will be most useful in identifying students, like many of our clients with LLD, who perform adequately in some aspects of language but have difficulty in a few areas that are interfering with their achievement in school. Some examples of test batteries that can be used in this way include *Clinical Evaluation of Language Fundamentals—4* (Semel, Wiig, & Secord, 2003; which also contains a checklist for assessing pragmatics), *Comprehensive Assessment of Spoken Language* (Carrow-Woolfolk, 1999b), *Test of Language Development—3—Primary and Intermediate* (Newcomer & Hammill, 1997), and the *Utah Test of Language Development—4* (Mecham, 2003). These batteries can sample a range of oral language abilities, in the hope of identifying specific areas in which students are having problems that will qualify them for services, as well as pointing out areas of strength.

As we saw in Chapter 10, students with LLD commonly have pragmatic deficits, and some have their primary deficits in this area. Standardized tests of pragmatics, then, can be useful for establishing eligibility. As we discussed earlier, using a standardized test to assess pragmatic function is something like using a sound-level meter to assess the quality of a symphony. Since pragmatic function is the ability to use language appropriately in real conversation, its assessment in a formal setting is bound to be somewhat limited and artificial. Tests of pragmatics may not be a necessary part of the assessment battery for children at earlier language levels, who will have plenty of deficits in form and content. Still, these tests can be useful for documenting deficits at the L4L stage, when children have outgrown some of the more obvious form and content problems.

Standardized tests of pragmatics in students with LLD most likely will be used to establish eligibility for services. Some students with LLD, as well as high-functioning students with autism spectrum disorders (ASD) will not score low enough on tests of language form and content to qualify for communication intervention. Using a test of pragmatics with these clients may provide information that substantiates our informal assessment of their deficits in pragmatic areas. In other words, we can use standardized tests of pragmatics for the basic purpose for which all standardized tests were designed: to show that a child is different from other children. A few examples of standardized tests in this area include the *Test of Pragmatic Language* (Phelps-Terasaki & Phelps-Gunn, 1992), the *Communication Abilities Diagnostic Test* (Johnston & Johnston, 1999), and *Test of Language Competence Expanded Edition* (Wiig & Secord, 1989). Recently, Young, Diehl, Morris, Hyman, and Bennetto (2005) showed that the *Test of Pragmatic Language* was helpful in identifying pragmatic deficits in students with autism spectrum disorder. Reichow et al. (2008) showed how subtests of the *Comprehensive Assessment of Spoken Language* (Woolfolk, 1999) can also be used in this way. The *Children's Communication Checklist 2*, (Baird, 2003), too, has been shown to be useful for this purpose.

A third type of standardized test also can help assess students that the clinician believes need help with oral language foundations for

the classroom. These tests look specifically at learning-related language skills. Some examples of these kinds of tests are the *Comprehensive Test of Phonological Processing* (Wagner, Torgenson, & Rashotte, 1999), the *Language Processing Test—3* (Richard & Hanner, 2005), the *Test of Awareness of Language Segments* (Sawyer, 1987), the *Test of Early Written Language—2* (Herron, Hresko, & Peak, 1996), the *Test of Relational Concepts-Revised* (Edmonston & Thane, 1999), the *Test of Word Finding in Discourse* (German, 1991), and the *Word Test—2—Revised* (Huisinigh, Bowers, LoGuidice, & Orman, 2004). These tests specifically tap the language skills that are likely to be less developed in students with LLD. Tests such as these are likely to show that a student with LLD is significantly different from peers in areas of language skills that influence academic performance and can be used to help establish eligibility for services.

CRITERION-REFERENCED ASSESSMENT AND BEHAVIORAL OBSERVATION IN THE L4L STAGE

Once we have established a student's eligibility for services by means of a standardized test, we can go on to the other purposes of assessment: establishing baseline function and identifying targets for intervention. Let's look at the methods available for doing this in the various areas of oral language that we need to evaluate at the L4L stage.

Phonology

Most students with LLD who function at the L4L stage do not make a large number of phonological errors. Some distort a few sounds or retain one or two phonological simplification processes. When this is the case, procedures discussed for the developing language stage can be used to assess these problems. If obvious phonological errors are not evident, though, we may want to know how phonologically "robust" the child's system is. As we've discussed, researchers such as Catts (1986); Dollaghan and Campbell (1998); and Graf Estes, Evans, and Else-Quest (2007) have shown that children with LLD often have trouble with phonologically demanding tasks, such as producing complex, unfamiliar words and phrases, even when their conversational speech is not full of errors. Such vulnerability may indicate problems with phonological awareness as well, as Webster and Plante (1992) suggested. Phonological awareness, as we've seen, is important for literacy acquisition. So part of the oral language assessment of a child with or at risk for LLD, particularly a child in the primary grades or one who is reading on a primary-grade level, should include some index of these higher level phonological skills that serve as the foundation for learning to read.

There are several ways to approach this assessment. The first is to look at production skills in phonologically demanding contexts. Hodson's (1986) Multisyllabic Screening Protocol section of the *Assessment of Phonological Processes—Revised* can be used to measure this aspect of phonological skill. Many standardized tests of phonological awareness also contain subtests that use non-word repetition tasks, since these have been shown to be markers of language impairment (Dollaghan & Campbell, 1998; Graf-Estes et al., 2007), and provide standardized scores. The *Comprehensive Test of Phonological Processing* (Wagner, Torgenson, & Rashotte, 2000) and the *Children's Test of Nonword Repetition* (Gathercole & Baddeley, 1996) are two examples. Appendix 11-3 presents a list of standardized tests of phonological awareness, indicating which contain non-word repetition subtests.

A second way to look at higher level phonological skills in students with LLD is to examine phonological awareness directly. There are a variety of tests of phonological awareness currently on the market. Appendix 11-3 profiles some of these. The pitfall in using these tests is that they can take a good deal of time to deliver a small amount of information (i.e., whether or not the child is at risk for literacy difficulty) that might be inferred as easily from a shorter assessment, information derived from the RTI process, or curriculum-based assessment.

A third approach to assessing higher-level phonological impairments was suggested by the work of Catts, Fey, Zhang, and Tomblin (2002); Powell, Stainthorp, Stuart, Garwood, and Quinlan, (2007); and Swank (1994), who advocate assessment of *rapid automatized naming* (RAN). Bowers and Grieg (2003), Brizzolara et al. (2006), and Wolf et al. (2002) have reviewed evidence showing that RAN, like phonological awareness, is also highly correlated with reading ability. In RAN tasks students are asked to name common objects presented in a series as rapidly as they can. Children also can be asked to produce overlearned series such as days of the week or months of the year. Performance on tasks such as these has been shown to discriminate between good and poor readers. Some standardized tests, such as the *Clinical Evaluation of Language Fundamentals—4* (Semel, Wiig, & Secord, 2003), contain sub-tests that tap this ability.

Despite the importance of identifying risk for reading failure, and the known strong associations among non-word repetition, RAN, phonological awareness, and reading, the main goal of this assessment must always be kept in mind. That goal is to identify children in early primary grades who are *at risk* for reading failure and to provide early, preventive intervention to give them an opportunity to avert this failure. For older students already known to have reading deficits, phonological assessment is less important, and evaluation of other areas of oral language needed to support reading should be our focus. And even for younger children, shorter, informal methods of identifying risk, such as the checklists like the one in Figure 11-2 or suggested by Justice (2006), or simply working with kindergarten and first-grade teachers in monitoring processes like RTI to quickly identify children who are having trouble with standard classroom phonological awareness activities, as Justice and Kaderavek (2004) have suggested, may be just as effective. And when we think about intervening for these problems, Catts (1999a) has reminded us that the aim of these interventions is to teach children to read and spell, not to develop phonological awareness as a “splinter skill.” Once basic phoneme segmentation, sound blending, and letter-sound correspondence have been mastered, we should move on to building other aspects of oral language skill to support reading development, such as vocabulary, fluency, text comprehension, and literate language production, rather than continuing to teach more and more advanced phonological awareness skills.

Semantics

Receptive Vocabulary

Most general language batteries have a receptive vocabulary section, usually using a picture-pointing format. If the student scores below the normal range, a problem with receptive vocabulary can be identified. Further evaluation to probe for specific receptive vocabulary items to be targeted in the intervention program should focus on the words the student needs to succeed in the classroom. There are two ways we can accomplish this classroom-based vocabulary assessment.

Instructional Vocabulary

One way is for the clinician to observe in the student's class and note the kinds of spatial, temporal, logical, and directive vocabulary the teacher uses. These can form the basis for a criterion-referenced vocabulary assessment, in which the student is asked to follow directions containing these words, one target word per direction. For example, suppose the teacher typically tells the students, “Write your name in the upper right-hand corner of the paper, write the date below your name, and number your paper to 20 down the left side.” The clinician might assess the student's understanding of the vocabulary in these directions by isolating each potential problem word and testing its comprehension in a game-like format, such as the one in Box 11-1. Any words the student has trouble comprehending that are common in the teacher's instructional language could be targeted as part of the intervention program. Alternatively, the teacher could be made aware of the student's difficulty, and consultation suggestions could be made to encourage the use of visual cues along with instructions, additional time for the student to process the instruction, and paraphrasing the instruction to give the student an extra chance to understand it.

Textbook Vocabulary

A second source of potentially problematic vocabulary is the student's classroom texts. If a student has receptive vocabulary deficits identified in the standardized portion of the assessment, we can probe for words in the texts that might be causing problems. We could then focus on expanding the understanding of these words as part of the intervention program.

There are a variety of ways to obtain lists of words from classroom texts to use as vocabulary probes. Many textbooks have glossaries at the end of each chapter or of the book that list words that would be new to most of the book's readers. These can be one source of words to probe for comprehension. Teachers sometimes base spelling lists or other classroom vocabulary work on words drawn from the texts used in class. These lists can be obtained from the teacher and used as the basis for the vocabulary assessment. The clinician also can review the student's homework with an eye toward seeing which words seem to be poorly understood.

We should remember when working with students with LLD that it is not only the technical, content vocabulary of the texts that might cause these students difficulty. More common spatial terms (*above, north*); temporal terms (*after, following*); and connectives (*however, consequently*) also may cause problems. Nelson (2010)

BOX 11-1 Criterion-Referenced Assessment of Classroom Direction Vocabulary

Clinician: Let's pretend you're a soldier. You're a good soldier. You always do what the sergeant says. Here's some paperwork the sergeant wants you to take care of. I'll be the sergeant and give some orders. You follow the sergeant's orders and write what the sergeant says to write on this paper. Listen carefully, now! Here we go!

1. OK, Private, draw a star in an *upper corner* of the paper.
2. Now, Private, draw a tank on the *right-hand side* of the paper.
3. Write today's *date*, Private.
4. Number your paper from 1 to 10.
5. Alright, Private, draw a line down the *left side* of the paper.
6. Now put a square in the *upper left-hand corner*.

suggests having students read aloud from classroom texts and identifying words they mispronounce as potential sources of vocabulary assessment.

Once we have found a list of words in the texts to probe, we need to decide how to assess whether the student understands them. We could ask the student to define them, but providing a definition is a metalinguistic skill that many students with LLD cannot do very well, even when they do know generally what a word means. We could just ask the student whether he or she knows a particular word, but comprehension monitoring deficits may cause problems here. For some nouns, we may be able to ask the student to identify pictures referring to the words in question in the textbook. Words such as *planet*, *solar system*, etc., could be assessed this way. So could geographical terms such as *mountain*, *plateau*, and *piedmont*, which are used in maps or diagrams in social studies texts.

Many of the words we'll want to assess are not easily depicted, though. In such cases, we might ask students to paraphrase a sentence containing the word, or offer several choices and have the student select the best meaning (Nelson, 2010; Ukrainetz, 2007). Alternatively, we could try to get the student to act out or indicate the meaning of the word in some nonverbal way. We might, for example, ask the student to "Show me orbit" with two tennis balls or to "Show me division" with some raisins. For more general assessment, language batteries that include subtests of words that are often difficult for students with LLD can be used. The *Clinical Evaluation of Language Fundamentals—4* (Semel, Wiig, & Secord, 2003) and the *Detroit Tests of Learning Aptitude—Fourth Edition* (Hammill, 1998) are two examples. When students score below the normal range on these subtests, an item analysis can be done as an informal assessment of the specific vocabulary items that are hard for the student to understand. For some of the spatial, temporal, and connective words we are concerned about, we can ask the student to act out several versions of the same sentence that differ only by words in the category being tested. Examples of such sentences for informal assessment are given in Box 11-2.

Expressive Vocabulary

Receptive vocabulary is larger than expressive vocabulary in people of all ages. Some students may be able to glean the meaning of an unknown word from its context but would not be able to use the same word appropriately without a more elaborated understanding of it. We talked in Chapter 8 about the complicated relationship between receptive and expressive vocabulary, and the fact that we may want to examine each aspect of word knowledge somewhat independently. In looking at expressive vocabulary skills in the L4L stage, we generally focus two basic components: lexical diversity and word retrieval.

Lexical Diversity

The ability to use a flexible, precise vocabulary contributes a great deal to the efficiency of our communication. The Type-Token Ratio (TTR; Templin, 1957) is a measure that has been used traditionally to assess lexical diversity. It involves counting the total number of words (tokens) in a 50-utterance speech sample and dividing this number into the number of different words (types) in the sample. Owen and Leonard (2002) showed that children with SLI did not generally differ from same-age peers on this measure. Watkins, Kelly, Harbers, and Hollis (1995) compared the ability of the TTR as opposed to the Number of Different Words (NDW) and number of total words (NTW) in a speech sample to differentiate children with normal and impaired language development. They found that in speech samples of various sizes, the NDW and NTW measures were more

BOX 11-2 Informal Assessment of Spatial, Temporal, and Connective Terms

SPATIAL TERMS

Materials: a paper with a sticker stuck in the middle, a pencil, a sheet with the directions written on it for the clinician to score as the student makes the dots.

- Make dots *above* the sticker.
- Make dots *below* the sticker.
- Make dots *around* the sticker.
- Make dots to the *right* of the sticker.
- Make dots *beside* the sticker.
- Make dots on the *left-hand side* of the sticker.

TEMPORAL TERMS

Materials: a whistle, bell, or other noisemaker; a sheet with the directions written on it for the clinician to score as the student uses the noisemaker.

- Make a noise *after* I say "Go." (Clinician says "Go" after a pause.)
- Make a noise *before* I say "Go." (Clinician says "Go" after a pause.)
- Make a noise *while* I say "Go." (Clinician says "Go.")
- Make a noise *as* I say "Go." (Clinician says "Go.")
- Make a noise *when* I say "Go." (Clinician says "Go.")

CONNECTIVE TERMS

Materials: a whistle, bell, or other noisemaker; a sheet with the directions written on it for the clinician to score as the student uses the noisemaker.

- Make a noise *if* I say "Go." (Clinician says "Go.")
- Make a noise *although* I say "Go." (Clinician says "Go.")
- Make a noise *unless* I say "Go." (Clinician says "Go.")
- Make a noise *until* I say "Go." (Clinician says "Go" after a pause.)

sensitive estimates of children's lexical diversity than the TTR. Klee (1992), as well as Tilstra & McMaster (2007), reported that both NDW and NTW increased significantly with age and both differentiated children with normal and impaired language. NDW and NTW produced in a conversational speech sample may, then, be the best means we have available to evaluate children's lexical diversity. These measures can be calculated automatically by computer-assisted speech sample analyses programs such as the Systematic Analysis of Language Transcripts (SALT) (Miller & Chapman, 2006). Leadholm and Miller (1992) presented data on NDW and NTW in the 100-utterance conversational speech samples of typical school-age children in the Madison, Wisconsin, Reference Data Base. These data are summarized in Table 11-1. If NDW and NTW measures are collected from conversational samples of clients' speech and the values computed fall below the normal ranges given in Table 11-1 (provided clients are from a population similar to that of the Reference Data Base), a deficit in lexical diversity could be diagnosed. Intervention could focus on increasing expressive vocabulary by focusing on words necessary for success in the curriculum. Heilmann, Miller, and Nockerts (2010) also discussed methods of investigating vocabulary diversity in narrative language samples.

Word Retrieval

Another aspect of expressive vocabulary that is important to assess in the L4L stage is word retrieval. As we discussed in Chapter 10, word-finding difficulties are very common in students with LLD. One clue to the presence of a word-retrieval problem would be a

TABLE 11-1 Normal Range of Number of Different Words and Number of Total Words in 100-Utterance Speech Samples of Children between 5 and 11 Years

Age	NDW		NTW	
	1 SD–	1 SD+	1 SD–	1 SD+
5-year-olds	156	206	439	602
7-year-olds	173	212	457	622
9-year-olds	183	235	496	687
11-year-olds	191	267	518	868

Normal range = (± 1 standard deviation from group mean).

NDW = number of different words; NTW = number of total words.

Adapted from Leadholm, B., & Miller, J. (1992). *Language sample analysis: The Wisconsin guide*. Madison, WI: Wisconsin Department of Public Instruction.

much higher score on a receptive vocabulary test, such as the *Peabody Picture Vocabulary Test—IV* (Dunn & Dunn, 2006), than on an expressive vocabulary test, such as the *Expressive Vocabulary Test—2* (Williams, 2007). Another would be a teacher report of word-finding problems on one of our referral checklists, like the one in Figure 11-1. We also might hear some word-finding problems in our short conversational interaction, with which we began the assessment session.

If we think word retrieval might be a problem, we generally want to establish the fact of the difficulty with a standardized test or a portion of a test that investigates word finding specifically. It is a good idea to document a word-retrieval problem by means of a score on a norm-referenced assessment, rather than making a subjective judgment. Several tests listed in Appendix 11-2, including the *Test of Word Finding in Discourse* (German, 1991), assess word-retrieval skill. Several others, including the *Clinical Evaluation of Language Fundamentals—4* (Semel, Wiig, & Secord, 2003), the *Test of Semantic Skills—Primary* (Bowers, LoGiudice, Orman, & Huisinigh, 2002), and the *Language Processing Test—Revised* (Richard & Hanner, 1995), also have subtests that assess word finding, on which item analyses can be done for criterion-referenced assessment. If a word-finding deficit is identified, we want to try to teach some word-finding strategies as part of our intervention program. Chapter 12 will present suggestions for such strategies.

Other Semantic Skills

Brackenbury and Pye (2005) discuss the importance of looking beyond vocabulary when assessing semantic skills. Several other aspects of semantic development that can be considered for assessment are discussed below.

Quick Incidental Learning (Fast Mapping)

The ability to acquire new words quickly, with limited meanings, from very abbreviated exposure, is one of the ways in which children's vocabularies are able to grow so rapidly. Often called quick incidental learning (QUIL), or fast-mapping, this capacity has been shown to be less well developed in children with language disorders (Dollaghan, 1987; Eyer et al., 2002). Many studies of QUIL use nonsense words to determine a child's ability to learn a new word from naturalistic interactions, and this ability is often considered a good way to assess a child's intrinsic language skill, especially in children who are not native speakers of English or who may have impoverished language experience (Brackenbury & Pye, 2005). One way to assess QUIL clinically is to use the

Diagnostic Evaluation of Language Variation (DELV; Seymour, Roeper, & de Villiers, 2005), which contains a QUIL subtest.

Semantic Relations between Clauses

One of the major changes in children's language in the school years is an increase in the use of sentences that contain more than one proposition, or main idea. We examine these kinds of expressions when we look at complex sentence development in our assessment of productive syntax. We also can look at how students attempt to convey semantic relations between propositions, even when they are not using syntactically correct forms to do so. A student who is trying to express a variety of semantic relations between propositions, even with primitive syntactic forms, is showing a readiness to learn complex syntax. A student who is not doing this may need to work on more basic sentence forms and to hear more language in which propositions are conjoined syntactically before making production of complex syntax a goal.

Suppose we do our complex sentence analysis of a speech sample (which we'll discuss in the next section) and find very little use of any syntactically complex forms. We can then look at the sample for evidence of presyntactic expression of semantic relations between propositions. In normal development, children first express these relations by merely juxtaposing two clauses ("Mommy here, Daddy gone"). Later they conjoin with nonspecific conjunctions, primarily *and*. Students with LLD may show this kind of immature attempt at relating ideas. The kinds of relations we would expect to see emerging (Lahey, 1988) include the following:

1. Temporal ("Eat dinner and go to sleep.")
2. Causal ("Go to store and buy shoes.")
3. Conditional ("Eat dinner, go outside.")
4. Epistemic ("I think draw pink.")
5. Notice-perception ("Show me how do a somersault.")
6. Specification ("I have a dog and it's brown.")
7. Adversative ("The girls sit here and the boys sit there.")

If students do not use complex syntax, we can look for presyntactic expression of these semantic relations between propositions in the speech sample. When they are present, they suggest that we teach syntactically correct forms for expressing these same relations. If neither the complex syntax nor the presyntactic expression of semantic relations between clauses is found, we may want to spend time exposing the student to literate language styles that contain complex syntax and provide opportunities for the student to paraphrase the language heard in these sessions. Such exposure may help the student see how ideas are related in language.

Syntax and Morphology

A Strategy for Assessing Receptive Syntax and Morphology

We've talked before about the need to assess syntax and morphology in the receptive and expressive modalities, and why it's important: the fact that children frequently produce sentence forms even when they fail to perform correctly on comprehension tests of these same forms in settings where nonlinguistic cues have been removed (Chapman, 1978; Miller & Paul, 1995). And there's an additional reason: as Scott (2009) shows, children with LLD are often delayed in understanding the kinds of complex sentences found in school reading materials. Identifying and remediating these delays are an excellent way for SLPs to support literacy development in students with LLD. When we help children learn to understand these sentences in oral form, this understanding will support their reading comprehension. So assessing and treating receptive syntactic difficulties in oral formats is an excellent way for the SLP to make a contribution to children's developing literacy.

We've also talked about the importance of assessing comprehension strategies. Paul (2000b) discussed the fact that children with LLD are likely to persist much longer than normally speaking peers in using several types of these strategies, particularly when confronted with complex sentences. Some of the difficulties that students with LLD have in understanding complex language can be traced to this protracted reliance on information other than that contained in the syntax of the sentence. Students at this stage may need to be taught how to get beyond their dependence on these processing shortcuts and to extract the appropriate information from syntactic forms. Sentences particularly vulnerable to this type of misinterpretation by students with LLD include passives ("A student is seen by a teacher" misinterpreted as "student sees teacher"); sentences with relative clauses embedded in the center between the subject noun phrase and the main verb ("The boy *who hit the girl* ran away" misinterpreted as "girl ran away"); and sentences that contain adverbial conjunctions ("Before you eat your dessert, turn off the TV" misinterpreted as "eat dessert then turn off TV").

We've also talked about the need to assess both contextualized and decontextualized language when we look at comprehension skills. We look at the decontextualized examples to determine how much *linguistic* comprehension a child displays and as a way to identify linguistic forms that can cause problems when few other cues are available. We also can look at comprehension in contextualized situations to find out whether a child can take advantage of the nonlinguistic cues in the environment if syntactic understanding is incomplete.

The general strategy for assessing syntactic and morphological comprehension we discussed in Chapter 8 will differ somewhat for children in the L4L period, because standardized tests may not identify all the comprehension deficits that can give students problems in the classroom. So we'll give you a version of the general strategy for assessing grammatical comprehension that can be used in the L4L stage:

1. Use a standardized test of receptive syntax and morphology to determine deficits in this area.

If the student performs below the normal range, use criterion-referenced decontextualized procedures, such as judgment tasks, to probe forms that appear to be causing trouble on the standardized measure. Look for use of comprehension strategies in responses to these tasks.

If the student scores within the normal range but teacher referral indicates problems in classroom comprehension,

observe teacher language in the classroom and textbook language (as outlined in the vocabulary section earlier in the chapter). Identify syntactic structures that may be causing difficulty. Some likely candidates include complex sentences with adverbial conjunctions (*because, so, after, although, unless*, etc.); sentences with relative clauses; passive sentences; and other sentences with unusual word order, such as pseudoclefts ("The one who lost the wallet was Maria") (Eisenberg, 2007; Wallach & Miller, 1988). Probe comprehension of these structures with criterion-referenced, decontextualized procedures, such as judgment tasks (see Miller & Paul, 1995, for suggestions). Again, look for operation of strategies.

2. If the client performs poorly on the decontextualized criterion-referenced assessments, test the same forms in a contextualized format, providing familiar scripts and nonlinguistic contexts; facial, gestural, and intonational cues; language closely tied to objects in the immediate environment; and expected instructions.
3. If the child does better in this contextualized format, uses typical strategies, or both, then compare performance on comprehension to production. Target forms and structures the child comprehends well but does not produce as initial targets for a production approach. Target structures the child does not comprehend well for focused stimulation or verbal script approaches to work on comprehension and production in tandem.
4. If the child does not do better in the contextualized format and does not use strategies, provide structured input with complexity controlled, using more hybrid and clinician-directed activities for both comprehension and production.

Criterion-Referenced Methods for Assessing Receptive Syntax and Morphology

Now that we've outlined the basic strategy for receptive language assessment in the L4L stage, let's look at some of the methods available for doing both decontextualized and contextualized assessment.

Decontextualized Methods

In Chapter 2, we talked about several basic means for evaluating comprehension in decontextualized settings. These included picture pointing, behavioral compliance, object manipulation, and judgment. We've talked already in Chapter 8 about ways of using some of these methods. These methods will continue to be appropriate for use with students with LLD. In the L4L period, we can add judgment tasks to our repertoire, since school-age children are developmentally ready to make judgments of grammaticality. Judgment tasks are very convenient for assessment, because they don't require picturing or acting out linguistic stimuli. We can simply present a set of sentences and ask the client to judge whether they are in some sense "OK." We can use judgment tasks in a variety of ways to assess several areas of language competence. For the moment, though, let's look at two ways that are well-suited to assessing syntactic comprehension: judgment of semantic acceptability and judgment of appropriate interpretation.

Judgment of Semantic Acceptability

This method involves presenting a series of sentences and having the student tell whether each is "OK" or "silly." Alternatively, we can tell the student that we have two people, one who always says normal things and the other who always says ridiculous things. The "OK" picture can be of an ordinary-looking chap, such as the one in Figure 11-4. The "silly" picture can be a clownlike, silly person, as in Figure 11-5. We can display the pictures and give examples

FIGURE 11-4 Norman Normal.

of OK and silly things each might say. We can then ask the student to point to the picture of the character who would say each sentence. We would then read the student a list of sentences that require him or her to understand a sentence type in order to decide whether a sentence is OK or silly. Passive sentences, for example, like those listed in [Box 11-3](#), can be probed this way.

Judgment of Appropriate Interpretation

A second way to use judgment tasks to assess comprehension in the L4L stage is to offer students two interpretations of a sentence and ask them to decide which is correct; alternatively we can offer one interpretation and ask students to judge whether it is correct. If we are assessing understanding of sentences with adverbial clauses, for example, we can say, "The boy brushed his teeth after he ate his sandwich." We can then mime the two actions in correct order (eat sandwich, brush teeth) and ask, "Did I do it right?" We can then present other similar sentences and offer both correct and incorrect interpretations for the student to judge. [Table 11-2](#) presents an example of this type of assessment for center-embedded relative clause sentences.

Assessing Use of Comprehension Strategies

If students respond incorrectly to these decontextualized comprehension activities, we can look for the use of strategies in their responses. The two types most likely to be used in the L4L period are *probable-event* or *probable-order-of-event strategies* and *word-order* or *order-of-mention strategies*. Evans and MacWhinney (1999) found evidence for the use of both these strategies in school-aged children with language impairments. Probable-event

FIGURE 11-5 Chris Crazy.

BOX 11-3

A Judgment Task for Criterion-Referenced Assessment of Comprehension of Passive Sentences

Here are pictures of two guys: Norman Normal and Chris Crazy. Norman Normal always says normal things like, "I like apples" and "He sees the rain." Chris Crazy always says silly things, like, "Apples like me" and "The rain sees him." I'm going to say some sentences. After each one, you tell me if you think it was said by Norman Normal or Chris Crazy. If it's a normal, OK sentence, you'll say Norman Normal said it. If it's silly, you'll say it was Chris Crazy that said it. Try this one.

- A boy catches a ball.
- A boy is carried by a flower.
- A hot dog is cooked by a girl.
- A bank is robbed by a man.
- A girl is painted by a store.
- An orange is picked by a boy.
- A boy is lifted by a box.
- A car is washed by a girl.
- A cake is carried by a boy.
- A cake is baked by a lady.
- A car is started by a man.
- A man is planted by a flower.
- A ball is kicked by a girl.
- A key is turned by a woman.
- A man is climbed by a fence.
- A ball is dropped by a woman.
- A box is opened by a girl.
- A man is cooked by an egg.

TABLE 11-2 Example of a Judgment of Appropriate Interpretation Activity for Decontextualized, Criterion-Referenced Assessment of Center-Embedded Relative Clauses

Present each sentence, and ask student to answer each question.

Stimulus Sentence	Question	Correct Answer
The boy who chased the cow was wearing a hat.	Was the cow wearing a hat?	No
The girl who rode the pony was named Sally.	Was the pony named Sally?	No
The crook who ran from the police officer was carrying a bag.	Was the crook carrying a bag?	Yes
The woman who lost her dog was wearing a sweater.	Was the dog wearing a sweater?	No
The cat that chased the dog was brown.	Was the dog brown?	No
The cow that bit the goat was called Sadie.	Was the cow called Sadie?	Yes

and probable-order-of-event strategies involve interpreting sentences to mean what we usually expect to happen. This strategy is similar to that used by preschoolers to interpret passive sentences. Preschoolers may correctly interpret “The dog was fed by the boy,” for example. They can do this not because they understand passive sentences, but because they rely more on their knowledge of how things usually happen (boys usually feed dogs, rather than *vice versa*) than on syntactic form.

Some students with LLD may continue to use this strategy, even though normally developing children move beyond it by 4 or 5 years of age. Students with LLD also may misunderstand a sentence such as, “Before you wash your hair, dry your face” for the same reason. Ordinarily we would wash our hair before drying our face, but this sentence tells the listener to do something out of the ordinary. The student with LLD may mistakenly depend more on knowledge of the order in which things usually happen than on linguistic form. If a student seems to be having trouble with sentences with adverbial clauses, we can assess use of this strategy by giving several sentences that contain unusual orders of events and have the student act them out. For passives, we can use the assessment in [Box 11-3](#) and note whether the student does more poorly on the improbable-event sentences than the probable-event ones. If so, the probable-event strategy can be seen to operate.

The second kind of strategy we are likely to find in children with LLD is the word-order or order-of-mention strategy. Evans and MacWhinney (1999) and Paul (1990) reported that children with expressive language disorders are especially likely to use this strategy. Normally speaking children move beyond it by about age 7, but students with LLD may still use it into adolescence. We can see this strategy operating in assessments such as those in [Table 11-2](#) and [Box 11-3](#). Students with LLD may consistently misinterpret these sentences. For passives, they may interpret the first noun as the agent of the action, rather than the object, as the passive sentence form requires. “A hot dog is cooked by a girl,” for example, will be understood as “hot dog cooks girl.” For center-embedded relatives, the last noun-verb-noun sequence may be interpreted as the agent-action-object message of the sentence. So, for instance, “The cow that bit the goat was called Sadie” will be interpreted as “the goat was called Sadie.” We’ll talk about some techniques for providing intervention for these difficulties in the next chapter.

Assessing Comprehension in Contextualized Settings

We’ve talked about using nonstandardized assessment both to probe comprehension of specific forms and to look at strategies for comprehending difficult input. For both these purposes we are looking at comprehension in somewhat contrived situations. If we want to know more about how a child responds to language in a more naturalistic setting, we can set up some communicative situations and observe the child’s responses. The reason for doing so, again, is as

a contrast to the performance on the decontextualized situations. If a child does just fine on a standardized comprehension test or in decontextualized probes, there is no need to assess comprehension further in a naturalistic setting. But if the child is not so good at responding to language in formal contexts, it would be nice to know whether performance is better in more natural situations.

We know that many of our students with LLD have trouble with comprehension in one more-or-less natural setting: the classroom. Many of them will have found their way to us because of this trouble. We can observe the child in other, less-demanding communicative situations, though. We might ask the child to work with a peer and some materials. We might have the peer give instructions on how to play a board game or complete a craft project. We can observe how well the client comprehends messages in this setting. This kind of interaction can also be a rich source of data on several other aspects of the client’s communicative skills, including comprehension monitoring, requests for clarification, and use of other pragmatic skills.

Expressive Syntax

As we discussed when we talked about preschool assessment, standardized tests of expressive language using methods such as sentence repetition can reliably tell when children are different from other children. But they do not necessarily tell us what kinds of errors children make in spontaneous speech. For this reason, when a problem in expressive syntax has been documented by a standardized test, we will want to obtain and analyze a sample of spontaneous speech.

We also may want to look at a sample of spontaneous speech even if the child does not score below the normal range on a standardized test of expressive syntax. The reason is that many of our students with LLD will not make gross errors in syntax and morphology, but their speech may be simpler and less elaborated than that of their peers. Alternatively, it may be more rambling and disorganized. Either type of deficit can cause problems by providing an insufficient base both for the understanding of literate language and for age-appropriate writing skills. For this reason, analyzing the spontaneous speech of students with LLD may be part of the assessment even when the child does not score below the normal range on a test of syntax and morphology.

Collecting a Spontaneous Speech Sample

Evans and Craig (1992) showed that an interview format is a valid, reliable speech sampling context for students with LLD. It requires no props, and in Evans and Craig’s study it elicited more advanced language behaviors than did free-play interactions with toys for the 7- to 12-year age group. Evans and Craig suggested using an interview protocol following the format given in [Box 11-4](#) to obtain a conversational sample from children with LLD. Nelson (1998)

School-aged language samples can involve retelling stories from classroom literature selections.

suggested supplementing the interview with “leading questions” designed to elicit an animated, emotional response. Examples of these kinds of questions have been added to the protocol in [Box 11-4](#). Hadley (1998) also presented some alternative protocols for eliciting interview samples from school-age children.

Narrative samples are another way to gather information about a student’s expressive abilities (e.g., Throne et al., 2007). Wagner, Nettelbladt, Sahlen, and Nilholm (2000) reported that narrative samples elicited more expanded phrases and grammatical morphemes than conversational samples in young children. Ukrainetz et al. (2005) showed that school-aged children’s narratives showed increasing formal complexity with age during the elementary school years. Southwood and Russell (2004) found that free-play speech samples elicited more talk but less complex language than

conversation or narrative, while narratives elicited the longest utterances. These studies suggest that, in order to see the more complex end of the student’s language abilities, conversation and narrative are appropriate contexts for eliciting language samples from school-aged students.

Transcribing the Speech Sample

We can use many of the transcription conventions that we discussed for the developing language period when recording a speech sample from a child in the L4L stage. But choosing a segmentation method is important, particularly if we are following children’s language growth over time and to avoid skewing the mean length of utterance (MLU) or other analyses by long, run-on sentences strung together with *and*. Reed, MacMillan, and McLeod (2001) examined the effects of varying rules for utterance segmentation from language samples of school-aged children and found that the type of segmentation used on a speech sample did lead to differences in findings. To get around this problem, we can use the T-unit segmentation method developed by Hunt (1965). A *T-unit* is one main clause with all the subordinate clauses and nonclausal phrases attached to or embedded in it. All coordinated clauses are separated into separate T-units, unless they contain a co-referential subject deletion in the second clause (“He goes and loses it”). Clauses that begin with coordinating conjunctions *and*, *but*, or *or* would be considered to make up a new T-unit.

Suppose a client produced the following response to leading question No. 1 in [Box 11-4](#):

Yeah, my little brother, he’s a real pain in the neck and he’s always taking my stuff and he never asks first and then he goes and loses it or breaks it and so my mom yells at me when I slug him for it, but sometimes he’s not so bad.

Here’s how we’d segment this utterance into T-units:

T1: Yeah, my little brother, he’s a real pain in the neck.

T2: (and) he’s always taking my stuff.

T3: (and) he never asks first.

BOX 11-4 Interview Protocol for Eliciting a Conversational Sample from Students with LLD

INTRODUCTION

“Let’s talk a little.”

QUESTION 1 (5 MINUTES)

“What can you tell me about your family?”

(Adult responds to the student with rephrasing of the student’s comments or “Really! Tell me more about that.”)

Leading question (to be asked after the student has talked about question 1 for a few minutes):

“Do you have any brothers and sisters? Do they ever bother your stuff?”

QUESTION 2 (5 MINUTES)

“Are you in school? Tell me about it.”

(Adult responds same as above.)

Leading question (to be asked after the student has talked about question 2 for a few minutes):

“Did your teacher ever do anything that really bugged you?”

QUESTION 3 (5 MINUTES)

“What do you do when you’re not in school?”

(Adult responds same as above.)

Leading questions (to be asked after the student has talked about question 3 for a few minutes):

“Did you ever get into an argument with a friend?”

“Do you have a favorite sports team? Tell me about your favorite player.”

T4: (and) then he goes and loses it or breaks it [co-referential subjects deleted from second and third clauses].

T5: (and so) my mom yells at me when I slug him.

T6: (but) sometimes he's not so bad.

Using T-unit segmentation provides a more realistic picture of syntactic units in the L4L phase than does the method we would use for children in the developing language period.

Analyzing the Speech Sample

Analyzing Average T-Unit Length

We can look at MLU per T-unit in children with LLD, just as we looked at MLU per utterance for children with developing language, by counting the number of morphemes in the sample and dividing by the number of T-units. Again, it may not be necessary to compute MLU for every sample we examine. We may decide that MLU is going to be a useful measure, though, perhaps as a way to track progress over a course of intervention. When this is the case, using MLU per T-unit rather than per sentence will provide a more valid assessment of utterance length. Nippold (2007) and Scott (1988) showed that MLU per T-unit increases throughout the school years, but the changes are slow. In spoken language, MLU per T-unit increases from about 7.6 in third grade to about 8.8 in fifth. More changes in MLU per T-unit are seen in writing than in speech during this age range. We should not, then, expect to see dramatic changes, even as a result of intervention, in MLU per T-unit in the spoken language of children in the L4L stage.

A question that arises for samples from school-aged children concerns the unit of analysis for MLU: morpheme or word? Gutierrez-Clennen, Restrepo, Bedore, Pena, and Anderson (2000) report that MLU in words (MLU-w or sometimes called mean length of response, MLR) is highly related to morphosyntactic production in both English and Spanish-speaking children, and Rice, Redmond, and Hoffman (2006) confirmed that MLU in words is reliable and valid index of general language development in school-aged children. Moreover, MLU-w has been used in previous research on changes in sentence length during the school years (Hunt, 1965). For this reason, MLU is usually calculated for words rather than morphemes in children in the L4L stage.

Analyzing Syntactic Forms

When looking at conversational speech in students with LLD, we probably do *not* need to look at the broad range of structures that we examine in the developing language phase. If a student's MLU is less than 4.5 or if we hear omissions of grammatical morphemes, verb markers and auxiliaries, pronoun errors, or problems with negative or interrogative sentences, we can do the same kinds of speech-sample analyses we discussed in Chapter 8. But for many students with LLD, MLU is beyond Brown's stage V, and basic sentence structures have been acquired. Eisenberg's (2007) review suggests that in these cases, we want to look at just three aspects of the child's syntactic production: (1) analysis of errors in morphological and syntactic form, (2) use of complex syntax, and (3) disruptions.

Error Analysis

Scott & Windsor (2000) showed that production of grammatical errors was the measure that was best at distinguishing children with LLD from typical peers in naturalistic language sampling. Especially at the school-age level, the persistence of grammatical errors is an important index of impairment. In addition to errors on grammatical morphemes, Eisenberg (2007) reports that common errors made by students with LLD include omission of verb arguments (such as direct ["He hit Ø"] and indirect objects of verbs ["Give Ø the ball"]) and locative elements ["I can't fit it Ø"], and errors in re-arrangement of words to form sentence variants, such

as questions, negative, and passives. If we transcribe the sample or use a computer-assisted format, we can do an error analysis by noting each grammatical error that occurs and making a list of those we find. We also might note whether these errors are consistently used at every opportunity or in every obligatory context or whether there is some correct usage. If we don't transcribe the sample but simply listen to an audiorecording of it some time later, we can make the same kind of list as we listen. An experienced clinician can even make a list of errors in real time during the collection of the interview sample, provided the errors are not too frequent. For beginning clinicians, though, it is better to work from a transcribed or audiorecorded sample. Forms that are in error in the sample can be targeted for intervention. Table 11-3 provides a sample worksheet to be used in this kind of error analysis, with some of the typical errors that may be seen in students with LLD. Clinicians using the form can add any additional error types that appear in a client's speech sample.

Paul, McNamara, Reuler, Roy, and Peterson (2001); Restrepo (1998); as well as Scott and Windsor (2000) reported that number of grammatical errors in speech samples reliably discriminated between language normal and language delayed children whether they were English or Spanish speakers. Paul et al. (2001) showed that no English-speaking 5-year-olds with typical language development produced more than 6 grammatical errors within a 50-utterance spontaneous speech sample, whereas all the children clinically classified as language delayed produced more than 6 errors. Clinicians who use computer-assisted language analysis methods, such as SALT (Miller & Chapman, 2010) or CLAN (MacWhinney, 2009), can have these programs automatically count errors entered during the transcription process.

Complex Sentence Analysis

Most students in the L4L stage will have acquired basic sentence forms. But as Eisenberg (2007) discussed, the students with LLD show less elaboration of syntax and fewer complex forms than peers with typical language. In addition, students with LLD may show limited verb variety and lack of elaboration in noun phrases (Eisenberg, 2007); we will address these forms in chapters on

TABLE 11-3 Sample Score Sheet for Recording Error Analysis from Free Speech Samples

Error Type	# Errors	# Opportunities for Error
Verb tense errors (missing -ed)	//	///
Missing verb arguments ("I told Ø so!)	/	////
Pronoun errors (me/I)		/////
Missing noun inflections (comparatives)	//	/////
Errors on <i>be</i> forms (is/are)	/	////////
Subject-verb agreement errors (missing third person singular -s)	//	////////
Auxiliary verb errors (don't/doesn't)		////
Negation errors (nobody/anybody)	///	////
Errors in questions (absent auxiliary inversion)	/	////

advanced language (13 and 14). Verb variety can be examined by simply identifying all verbs in a speech sample and looking for the presence of overly general verbs (*go*, *do*) to the exclusion of others. If verb forms appear to be limited, strategies like the verb elicitation probe discussed in Chapter 8 may be used.

Complex sentences are those that contain more than one verb phrase (Paul, 1981) in embedded or conjoined multiclausal utterances. They are used to express specific semantic relations between clauses, such as those we discussed in the semantics section. Their use increases significantly throughout the school years (Schuele & Dykes, 2005) and continues to do so through adolescence, particularly in the context of narratives and written language (Justice et al., 2006; Loban, 1976). Children who are unable to use syntactic means to combine propositions in speech consequently are at a distinct disadvantage in both talking and writing about the abstract, decontextualized content of the classroom.

Paul (1981) has presented a system for analyzing three aspects of *complex sentence* use that can be used with children in the L4L period. For many students in the L4L stage who do not make obvious errors of syntactic form, the complex sentence analysis may be the only evaluation of grammatical production we need to do. To perform this analysis, we first identify each sentence produced by the client that can be considered complex. If this is the only analysis we are doing of the transcript, we do not need to transcribe the entire sample. Instead we can listen to an audiorecording and write down just the sentences we intend to consider in the complex sentence analysis. If the *SALT* (Miller & Chapman, 2010) computer-assisted analysis procedure is used, it can identify complex sentences by means of the conjunctions contained within them and provide a list of all sentences with examples of these conjunctions. Either way, we want to generate a list of complex sentences that appear in the speech sample.

The first aspect of complex sentence use we can examine is the proportion of complex to simple sentences in the sample. Paul (1981) reported that, by the time normally developing children's MLUs reach 5 (at an average age of 4 to 5 years), 20% of the sentences they use in spontaneous speech contain embedded or conjoined clauses. Schuele and Dykes (2005) report a similar finding for a child with language delay. This suggests that one criterion for determining the maturity of a speech sample is to look at the proportion of the sentences that are complex. If we transcribe the entire sample, we can easily compute the percentage of complex sentences that appear. But if we are trying to increase our efficiency in language sampling and are using a "shortcut" of only transcribing the complex utterances, we can estimate this percentage.

One way to perform this estimation is to make a note or hash mark for each T-unit we hear as we listen to the recording of our sample. During the same pass, we can stop the recording to transcribe each complex sentence the sample contains. We can then get an estimate of the total number of T-units in the sample (by adding the number of complex sentences transcribed to the number of hash marks recorded). Then we can divide the number of complex sentences by the total number of T-units to get a percentage. If the percentage for any child in the L4L stage is substantially less than 20%, we can infer that this client is using fewer complex sentences than normally speaking peers and could benefit from intervention to increase speech complexity.

A second aspect of complex sentence analysis concerns the types of complex sentences that appear. This analysis can be done for clients who produce a smaller-than-normal proportion (less than 20%) of complex utterances. Paul (1981) assigned each complex sentence type that appeared in transcripts of normally

developing children's speech to one of Brown's stages, according to the stage at which a majority of normally developing children produced each form. The various types of complex sentences produced by the client can be tallied, or a simplified stage assignment can be made by dividing the complex types into two general groups: those that appear early in development (when MLUs are between 3 and 4) and those that appear later (when MLUs are between 4 and 5). Table 11-4 describes and gives examples of each sentence type in the early and late groups.

Before initiating intervention for use of a particular complex sentence type, though, we will probably want to use elicited production activities to probe for forms that are absent in spontaneous speech. Remember that a speech sample is just that—a *sample* of speech, not necessarily containing all the forms a client can use. Complex sentence forms can be elicited with cloze procedures, in which the clinician produces one clause and asks that client to "finish the sentence or thought" (e.g., "I think . . .," "Mary wants to . . .," "I know where . . ."). An alternative procedure is to ask the client to make up a sentence with *that*, *if*, or *when*, and so on, to probe conjunction use or to make up a sentence with *know*, *need to*, *know what to*, *wants me to*, or a similar construction to probe use of various complex sentence types. Eisenberg (2005) suggests using simple stories to elicit complex sentences. An example of this procedure appears in Box 11-5.

If a genuine deficit in the use of certain complex sentence types is seen in spontaneous speech and confirmed through elicited production procedures, we can examine the speech sample to see what kinds of complex sentences are in evidence. If the student is using only forms that are in the Early group in Table 11-4, we can develop intervention that attempts to elicit some of the more advanced forms. We can provide intensified input by means of literature-based script therapy that gives examples of the use of some of these forms. If the student is using a few forms from both the Early and Later groups, we may want to work on eliciting new forms in the Early group first. We can again target production as well as provide input in script-based formats to help the student to understand and use these structures. We'll talk about some specific methods for targeting complex sentences in our next chapter.

If a student is using hardly any syntactically well-formed versions of complex sentences, we can do the analysis of semantic relations between clauses that we talked about earlier. This analysis can be used to identify the relations the student is already expressing in less mature ways. Syntactic forms for expressing these same relations can then be incorporated into the intervention program.

The third area of complex sentence production we may want to look at concerns the use of conjunctions. By the end of the preschool period, normally developing children are using an average of six to eight different conjunctions in a 15-minute speech sample, including *and*, *if*, *because*, *when*, and *so* (Paul, 1981). If we find, in looking at the complex sentences of children in the L4L stage, that fewer than six different conjunctions appear in samples of this size, we can again probe for conjunction use with elicited production procedures. Again, this can be done by simply asking children to produce sentences that contain words such as *but*, *after*, or *either*. If the deficit is confirmed, we can target these early developing conjunctions that are not found in the transcript as part of the intervention program. If the semantic relational analysis shows that students are juxtaposing clauses without any explicit conjunctions, we can provide intervention to elicit use of these early developing conjunctions for expressing the semantic relations between clauses that the students are already encoding presyntactically.

TABLE 11-4 Complex Sentence Types Divided into Early- and Late-Appearing Groups

Sentence Type	Description	Example
EARLY GROUP (FIRST APPEAR IN NORMAL DEVELOPMENT WHEN MLU IS BETWEEN 3 AND 4)		
Simple infinitive	Not an early developing catenative such as <i>gonna, wanna, gotta, sposta, hafta, let's, or lemme</i> ; <i>to</i> is present; subject is the same as main sentence, so it is deleted.	"He has to move." "She wants to get out."
Full propositional complements	Headed by "cognitive" verbs, such as <i>think, guess, wish, know, hope, wonder</i> ; may or may not contain the conjunction <i>that</i> .	"I think that we have some." "Pretend you said it."
Simple <i>wh</i> -clause	Marked by conjunctions <i>what, who, where, when, why, how</i> ; do not contain an infinitive <i>to</i> marker.	"I know what we could do." "Look how big I am."
Simple conjoinings	Two clauses joined by a conjunction, either coordinating (<i>and, but, so, etc.</i>) or subordinating (<i>because, after, etc.</i>)	"Close the gate so he can't get out." "I eat ice cream 'cause I like it."
Multiple embeddings	Sentences containing more than one embedded clause; one may include a catenative.	"It's gonna start to fall." "I think we gotta pour some water on it."
Embedded and conjoined	Sentences containing both an embedded and a conjoined clause; the embedding may be a catenative.	"It's not a bulldozer 'cause it doesn't have a scooper thing to scoop with." "He wants to stay at home and I don't know why."
LATER GROUP (FIRST APPEAR IN NORMAL DEVELOPMENT WHEN MLU IS BETWEEN 4 AND 5)		
Infinitive clauses with different subjects	The embedded clause has a subject different from the main clause, so it is expressed.	"I want it to go chug." "Dad made this for me to drive."
Relative clauses	Function as adjectives; specify nouns; may or may not be marked with <i>which</i> or <i>that</i> .	"That's not the kind that I like." "They're boys that I know."
Gerunds	-ing forms used as noun clauses.	"I felt like turning it." "They can hear us talking on the recorder."
<i>wh</i> -infinitives	Marked by conjunctions <i>what, who, where, when, and to</i> .	"I know what to do." "You know how to make one."
Unmarked infinitives	Headed by <i>make, help, watch, or let</i> with no <i>to</i> marker.	"Watch me jump." "Help me pick these up."

BOX 11-5 Eisenberg (2005) Elicitation Technique for Complex Sentence Production

The student is presented with a simple story, accompanied by appropriate toy figures. Each story consists of several simple sentences so that sentences with embedded clauses are not modeled. The SLP tells the story while simultaneously demonstrating the actions with toy figures. At the end of each story, the SLP states the sentence subject and main verb, then asks the child to complete the story and restarts the target sentence, producing just the subject with rising intonation, obligating production of the main verb. The examiner then has the child act out the utterance by saying "Now show me."

Example:

SLP: "SpongeBob and Patrick are sitting at the Krusty Krab when Squidward walks in. Squidward looks tired. He looks for a chair but can't find one."

SpongeBob wants Patrick to stand up so Squidward can sit down.

SpongeBob says, "Stand up, Patrick!"

You finish the story: SpongeBob . . . ?" (wants/tells Patrick to stand up)

Box 11-6 presents a portion of a speech sample from a 9-year-old student. Try practicing an analysis of complex sentences on this sample and determine whether a deficit in complex sentence use is seen. Our analysis of the sample appears in [Appendix 11-4](#).

Disruptions

Dollaghan and Campbell (1992) pointed out that many descriptions of children with LLD refer to their *disruptions in speech*, or "getting tangled up" when they try to talk. Guo, Tomblin, and Samelson (2008) showed that children with SLI did produce more disruptions in their speech than age peers, though not more than children matched for language level. In some cases these disruptions are the most prominent feature of a student's expressive language disorder. Dollaghan and Campbell suggested looking in detail at speech disruptions as a way to quantify otherwise vague impressions of "tangled speech." They suggested further that we use the analysis of disruptions only for those clients whose perceived deficits in expressive language cannot be reduced to semantic, syntactic, or phonological difficulties. For these clients, whose production problems are otherwise difficult to quantify, a detailed analysis of speech disruptions can help both to make deficits more explicit and to identify strategies for intervention.

BOX 11-6 Portion of a Speech Sample Derived from an Interview of a 9-Year-Old Student

- T1. I got two brothers.
 T2. (and) one of them, Marco, is a real pain.
 T3. He never lets me play his video games,
 T4. (and) he never wants to play two players, and just keeps playing and playing
 T5. (and) he never dies or anything!
 T6. I can get onto the eighth level when I get to play for long enough.
 T7. I hardly ever do, because my dumb big brother always hogs it when I want to play.
 T8. He knows why to be nice sometimes, because he always gives me his basketball cards when he gets doubles
 T9. (and) I think I know why he does it.
 T10. He wants to get Mom to take us to the card store.
 T11. She'll only go when I ask her.
 T12. See, this card store has all kinds of stuff that's real expensive
 T13. (and) she hates it when we take all our money and spend it there
 T14. She'll go when I ask because I never have as much money as Marco
 T15. (and) she doesn't think it'll be too bad
 T16. (and then) Marco says he wants to come, too,
 T17. (and) she can't say "no" because she already said she'd take me!
 T18. See, sharing the cards that he has doubles of with me means he can get to the store more often.

Work by Rispoli, Hadley, and Holt (2008) suggests that an important distinction to be made in examining disruptions is to differentiate between *stalls* (disruptions that interrupt the flow of speech, but do not change the lexical, morphological, syntactic, semantic, or phonological material of the sentence) and *revisions* (changes of lexical and morphological material and major changes in syntactic structure). Examples of stalls include filled pauses, silent pauses, and repetition. Revisions, on the other hand, include lexical, grammatical, or phonological changes, as well as combinations of these and "orphans" defined in Box 11-7.

Dollaghan and Campbell found that the average number of disruptions, including both stalls and revisions, in the spontaneous speech of typical students in 100-word speech samples (from which mazed words were excluded) was 5.31 (with a standard deviation of 1.82). These findings suggest that students who produce *more than eight* disruptions in speech samples of this size are producing speech that is significantly "tangled." Intervention for students with frequent speech disruptions can include using self-monitoring strategies to help students become aware of their own disruptions, metacognitive strategies to help them plan speech before they begin talking, and teaching them to use "editing expressions"—such as "Let me try that again"—when they get tangled.

Pragmatics

Remember that pragmatics is the area in which we are likely to find many of the communication problems of students with LLD. For students at the L4L stage, we want to assess pragmatic skills in three of the major discourse types we identified in Chapter 10: conversation,

classroom discourse, and narrative. We'll expand our discussion to include expository and persuasive texts when we discuss advanced language in Chapters 13 and 14.

Pragmatics in Conversation

When we examine a student's skill in using conversational language, there are three major areas to think about.

1. An appropriately broad range of *communicative intentions*, or functions of communication.
2. Whether the student can *modify communicative style*, or register, for different interactive situations.
3. How the student can *manage discourse* turns, topics, and breakdowns.

We can use some of the assessments we discussed for the developing language period to get a general overview. Prutting and Kirchner's *Pragmatic Protocol* (1983), in Figure 8-17 is a good assessment tool to use at the L4L stage as well as at earlier levels. Damaico's *Systematic Observation of Communicative Interaction* (SOICI; Damaico, Oller, & Tetnowski, 1999) is another tool that may be used. Let's look at some additional methods for assessing each of these areas of pragmatic skill.

Communicative Intentions

One important question to ask concerns the range and maturity of communicative functions expressed by students with LLD. Tough (1977) examined the kinds of communicative functions expressed by typical children between 5 and 7 years old. These functions, according to Chapman (1981), reflect the cognitive changes going on during the early school years. Such changes include an increased ability to monitor one's own behavior, to reason, to relate events and ideas to each other, and to engage in complex imaginative play. Students at the L4L stage should be showing evidence of at least some of these intentions, in addition to the basic assertive and responsive intentions in Fey's scheme. These advanced intentions can be observed in an interview, free play, or a peer interactional sample and can be coded in real time or from an audiorecording. The intentions identified by Tough appear in Table 11-5. When there is a dearth of these advanced intentions in the communication of a student with LLD, new forms and meanings taught in intervention should be modeled for the student to express these kinds of intentions. Role-playing and other contexts that provide opportunities for students to use both pre-existing and newly learned language forms to serve these communicative functions also can be included in the intervention program.

Assessing Communicative Intentions

The use of more advanced intentions may be more evident in interactions with peers than with adults. For young school-aged children, observing a peer interaction around a pretend activity or interactive game can provide an opportunity to the clinician to tally the number of different intentions listed in Table 11-5 that are observed. For older students, giving a pair of peers a problem to solve, such as how to create a greeting card from a given set of materials, or how to construct a building with a set of building materials may be used in the same way. Alternatively, we can ask the client and peer to take turns explaining to each other how to play a game that each already knows but is not known by the partner.

Contextual Variation

Part of pragmatic skill is the ability to use the context of the communicative situation to decide how to say what we want to say. We use information about our listeners when we make these decisions, as well as information about the nonlinguistic context. Children talk differently to their teachers than they do to their peers and differently yet to their younger siblings, reflecting knowledge of the

BOX 11-7 System for Analyzing Speech Disruptions

1. Collect a speech sample, using a question or interview format.
2. Segment the sample into T-units.
3. Transcribe all words, portions of words, unglossable speechlike sounds, and silent pauses of more than 2 seconds in length.
4. Identify verbal mazes (false starts, repetitions, and revisions). Count the number of words *not* within mazes in the transcript. This is the "number of unmazed words" to be used to compute the percentage of disruptions in Step 6.
5. Identify each disruption in the transcript and count the frequency of each type of disruption and the total number of disruptions.

DISRUPTION TYPES**Pauses**

Filled: Nonlexical, one-syllable filler vocalizations, such as *um* or *er*

Silent: Silent intervals of 2 or more seconds in length

Pause strings: More than one silent or filled pause in succession ("He (*um*) [pause] said I could go")

Repetitions

Forward: Speaker repeats an incomplete linguistic unit and goes on to complete it following the repetition ("She she said I can go")

Exact: Speaker repeats a linguistic unit that has already been completed ("She said I can go I can go").

Backward: Speaker inserts an additional word or words before the repeated unit without changing the unit itself ("She said I think she said I can go").

Revisions

Recognizable modifications of a linguistic unit already produced by the speaker. They can be used to correct overt errors, add information, delete information, or for unknown reasons.

They may involve lexical, grammatical, or phonological changes or some combination of these. *Examples:*

"I have two sipter, sisters."

"My older brother, my brother likes baseball."

"My brother, I mean my sister is here."

"I have a brother, two brothers."

Orphans

Linguistic units with no identifiable relationship to other units.

Examples (in square brackets):

"I saved up [in] all my allowance."

"And [in] that was my car."

"And [spuh, in] that's her date."

6. Divide the frequency of disruptions by the number of unmazed words in the sample (from step 4). Multiply by 100 to get the percentage of occurrence of disruptions per 100 unmazed words.
7. Determine whether there are more than seven or eight disruptions per 100 unmazed words to decide whether the student's speech is significantly "tangled."
8. Look for unusual types of disruptions. Also, inspect for patterns with respect to where disruptions occur. For example:
 - (a) Do revisions seem to cluster in utterances that are longer than the speaker's average T-unit length or in complex sentences? If so, work on improving skills in complex syntax may be warranted. Part of the intervention monitoring could include analysis of speech to determine whether disruptions in targeted forms decrease as forms become well-learned.
 - (b) Do most revisions seem to result from a need to correct errors or add or delete information? In this case, metacognitive strategies to improve planning skills may be useful.
 - (c) Are revisions primarily phonological? This may indicate wordretrieval problems. Intervention might focus on developing word-finding strategies, using both semantic and phonological retrieval strategies.

Adapted from Dollaghan, C., & Campbell, T. (1992). A procedure for classifying disruptions in spontaneous language samples. *Topics in Language Disorders*, 12, 56-68.

different age, status, and communicative competencies of these various listeners. We also talk differently depending on who has more rights in the context. We ask for a pencil differently, for example, depending on whether the pencil belongs to us and we want it returned or it belongs to the listener and we want to borrow it. And we talk differently in different nonlinguistic contexts, depending on how formal we perceive them to be. We might talk to a student one way in the classroom and another way if we meet her in the ladies' room. These kinds of changes are called *register variation*.

Other changes involve knowledge of what our listeners know and don't know. We would describe a baseball game differently to someone who knew a lot about baseball than to someone who didn't. Similarly, you would describe your master's thesis on alaryngeal speech differently to your parents than to an otolaryngologist. These kinds of contextual variation depend on our assessment of our audience's state of background knowledge, or *presupposition*. Skills in register variation and presupposition constitute one aspect of our communicative competence.

Assessing Register Variation

We can assess register variation by setting up role-playing situations in which we ask students to express the same basic communicative intent in several different contexts. We also can assess their understanding of register changes in the same activity by displaying several different ways to convey an intention and seeing

whether they can match each with an appropriate context. It is especially helpful in our remedial planning if we choose contexts that relate to the child's performance in school. Although we know normally developing children use a different register in talking to younger children, for example (as do most children with language impairments [Fey & Leonard, 1984]), this type of variation may not be very important for success in school. The kinds of variations needed for school success are more likely to include politeness variations and variations based on rights, social status, and degree of formality. [Figure 11-6](#) gives some example role-playing activities that can be used to assess register variation in students with LLD.

If an assessment like this indicates that the student has difficulty making and understanding changes in speech style for different situations, remedial activities that target newly learned forms and meanings in a variety of situational contexts can be included in the remedial program. The clinician can model the appropriate use of these forms in various contexts and can work with the student to identify and practice use of these forms and meanings in a variety of contexts important in the client's social environment.

Assessing Presuppositional Skill

Many of the assessment activities proposed by Roth and Spekman (1984a, b) and summarized in Table 8-13 also will be useful for assessing presuppositional skills in students in the

TABLE 11-5 Cognitive Uses of Language of Young School-Age Children

Major Function		Use	Examples
Directive	Self-directing	Monitoring actions Focusing control Forward planning	Child accompanies actions with words. "It won't turn. I need help." "I'm gonna cut this clay into two, then I'll flatten it."
	Other-directing	Demonstrating Instructing Forward planning Anticipating collaboration	"Put yours here, like this." "Be careful, don't push it." "You'll need another block to finish it." "We're gonna have a crash! Make yours go fast so they can crash good!"
Interpretive	Reporting on present or past events	Labeling Elaborating Associating Recognizing incongruity Awareness of sequence	"That's a cowboy; that's a sheriff." "We went to the beach, and it was too cold to go swimming, so we picked up stones and seashells." "I got one, but it's not like that one." "That house is too small for this doll." "We went on vacation, and I got chicken pox, then Bob got them."
	Reasoning	Recognizing cause	"The ice cream got soft 'cause we forgot to put it in the fridge."
Projective	Predicting	Recognizing principles Forecasting events Anticipating consequences Surveying alternatives Forecasting possibilities	"People don't like it if you take their stuff." "My dad's gonna build me a playhouse." "My mom'll be mad if I get home late." "We could take a train or a car to my Grandma's." "If my thermos is broken, the milk'll leak all over my lunch."
	Empathetic	Recognizing problems and predicting solutions Projecting into others' feelings and experiences Anticipating reactions of others	"My zipper's broke; maybe my dad can fix it with a wrench." "She doesn't like his teasing, and she's crying 'cause she didn't like it." "She won't like that!"
	Imagining	Renaming Commentary on play Building scene Role-playing	"This'll be the house." On toy phone: "Doctor, my baby's sick!" "This is such a big hospital. Will my baby be OK?" Playing doctor: "Now, now, Mrs. Jones, I'll take good care of your baby."
Relational	Self-maintaining	Express need Protect self-interest Justify Criticize Threaten	"Watch me! I can do it!" "That's mine! Give it back!" "I want red so I can draw a fire engine." "I don't like your picture." "Give me that or I'll hit you!"
	Interactional	Self-emphasize Other-recognizing	"I'm the one that's the mommy." "Please give me my car back now."

List presented by Tough, J. (1977). *The development of meaning*. New York: Halsted Press; cited in Chapman, R. (1981). Exploring children's communicative intents. In J. Miller (Ed.), *Assessing language production in children*. Needham Heights, MA: Allyn and Bacon.

L4L stage. As outlined in the table, one activity is to have clients describe a sequence of pictures, each of which changes by one detail. We can note whether they use *ellipsis*, that is, whether they delete redundant information ("In this picture a boy is riding a bike; in this one he's not" ["riding a bike" is deleted since it is redundant]). We also can note whether clients use pronouns for nouns in subsequent pictures ("In this picture a girl is riding a bike; in this one *she's* walking"). And we can look to see whether they use indefinite articles (*a*, *an*) first and definite articles (*the*) to describe the same picture later in the sequence. ("In this picture a dog is running; in the next one *the* dog's sitting"). The peer interaction we discussed earlier, in which one student instructs another in a game or project, also can yield useful information. For looking at presuppositional skill, we would want to ask the student with LLD to explain something to the normally developing peer.

Barrier games also are useful contexts for assessing the ability to tell a listener what he or she needs to know in a situation. This type of assessment is called a *referential communication task*. Referential communication might involve choosing a large blue circle from an array of blocks of various colors, sizes, and shapes. If the student told the listener to find a circle or a "blue one," and other round or blue blocks were available, an error in presuppositional encoding could be identified. If the student made these kinds of errors consistently, a presuppositional deficit could be inferred. Lloyd (1994) provided additional suggestions for assessing referential communication skills.

Many barrier game sets are available commercially, including *Barrier Games for Better Communication* (Deal & Hanuscin, 1999), *Creatures and Critters Barrier Games* (Marquis, 2005), and *Barrier Games with Unisets* (Marquis & Blog, 1993). They also can easily be assembled by the clinician, by gathering matching

Expressive Activities

Have the student role-play producing each speech act in each context. Record the student's utterance, and make a judgment as to whether it is appropriate for each context.

Speech act	Context	Student utterance	Appropriate?
Request ice cream	1. Mother 2. Friend who has money to spend on the way home from school 3. Brother who took cone for a taste and won't give it back		
Greet	1. Principal 2. Friend 3. Grandparent		
Persuade	1. Father to give advance on allowance 2. Friend to lend a favorite sweater 3. Teacher to postpone a quiz		
Request information	1. From a teacher about a homework assignment 2. From a librarian at the town library 3. From a friend about a baseball game		

Receptive Activities

Ask the student to judge each speech act you produce according to whether it is appropriate in each context. If the student judges the act to be inappropriate, ask him or her to produce a better version.

Context	Speech act	Student judgment of appropriateness
Student requests a baseball from a friend	"Hey, dude, can I borrow your ball?"	
Teacher requests a pencil from a student	"May I please use your pencil?"	
Student requests a cookie in the cafeteria	"Give me that cookie right away!"	
Student greets a teacher	"How do you do, Ms. Hernandez?"	
Principal greets a student	"Good morning, James. How are you today?"	
Student greets a friend	"Hey, man, how's it going?"	
Student tries to get a teacher to lend a book from the class library	"Please, Ms. Jansen, I'll be especially careful with it. I'll bring it right back tomorrow!"	
Student tries to get a friend to give him a ride on the back of his bike	"You better let me ride on the back. I'm telling you, you better or else!"	
Student tries to get parent to increase allowance	"I want more money! I need it! I have to have it."	
Student asks teacher to repeat page numbers of math assignment	"I'm sorry. I didn't hear you. Could you say it again?"	
Student asks librarian to help find a book	"So where is it? Is it over here?"	
Student asks friend for the time	"Excuse me, Kim, but might I trouble you to ask the time, please?"	

FIGURE 11-6 An example worksheet for use with role-playing activities to assess register variation skills in students with LLD.

sets of objects or pictures. Barrier games also are useful for looking at the ways in which the client can improve unclear messages in response to requests for clarification from the clinician and at whether the client can request clarification in response to purposefully unclear messages from the clinician.

Discourse Management

The ability to orchestrate turns and topics and to repair breakdowns in conversation constitutes the realm of discourse management. The peer interaction we discussed before is a good context for looking at a student's ability to initiate a topic, begin a conversation, maintain a topic, and respond to requests for clarification. Having the student with LLD explain a game, recipe, or topic to a peer is

another way to gather these kinds of data on discourse management. Brinton and Fujiki (1989, 1994) and Gruenewald and Pollock (1990) also provided methods that can be used in assessing discourse skills in school-aged children.

Although we are interested in all aspects of a client's discourse-management skill, the special discourse requirements of the classroom are particularly important. We talked in detail in the last chapter about what these requirements are. Peets (2009) studied LLD children's verbal productivity and complexity, self-monitoring strategies, and turn-taking patterns in four typical contexts of the classroom, including both instructional and peer-interactional settings. She found that samples gathered from several contexts

provided a more comprehensive view of children's strengths and weaknesses than any one sample can provide. She suggested that contexts chosen for assessment represent the range of demands that are encountered in the classroom. These contexts might include peer interactions, such as cooperative learning groups, and several kinds of teacher-led formats, such as whole-class and small group instruction, and monologues related during "sharing time." Let's look now at some methods we might use to assess a student's competence with classroom discourse.

Figure 11-7 presents a checklist developed by Bedrosian (1985) to look at a client's skill in discourse management. The clinician can use the checklist to rate an observation of either conversational or classroom discourse. Ideally, the clinician would use the checklist to observe several different interactional situations, including clinician-client, client-peer, and client-teacher in a one-to-one setting, as well as observing the client in classroom discussion or peer group project. The clinician can then look across these contexts to identify problems or areas of strength. When difficulties in discourse management are identified, the particular contexts that are problematic can be incorporated into the intervention program. If classroom discourse is affected, the clinician can work with the teacher to find ways to make the "hidden curriculum" more explicit to the student and to facilitate more successful classroom interaction skills.

Pragmatics of Narrative

We talked in the last chapter about the importance of narrative skills in the acquisition of literacy and for success in school generally. Narrative skills are another area of discourse we want to address in the student with LLD in the L4L period. We can examine both comprehension and production of narrative discourse.

Comprehension and Inferencing

Understanding stories involves having expectations, or scripts, for how they will proceed. In other words, understanding and processing stories requires some knowledge of *story grammar*. But it also involves something more. Not everything that happens in stories is stated explicitly. Part of understanding a story is being able to infer some of this implicit information. In assessing how students make sense of stories, we need to look at both literal and inferential comprehension.

Literal story comprehension can be assessed by adapting a variety of materials designed to evaluate reading comprehension. The *Gray Silent Reading Tests—4th Edition* (Wiederholt & Bryant, 2000), the *Woodcock Reading Mastery Tests—Normative Update* (Woodcock, 1998), and the *Test of Reading Comprehension—Fourth Edition* (TORC-4; Brown, Wiederholt, & Hammill, 2009) are just three examples. Many such materials can be obtained from the school reading specialist. Alternatively, classroom reading material can be used. Either way, we can assess narrative comprehension by reading a story or passage to the client. Using commercial or clinician-created comprehension probes, we can have the student respond to orally presented questions about the setting, names and roles of characters, sequence of events, outcome, and resolution of the story.

Inferential comprehension can be assessed informally by asking students to explain why characters behaved as they did, to state what the character's goals and motivations were, and to talk about how characters felt at different points in the story. Some commercial reading tests include questions on inferential comprehension. Examples include *The Test of Narrative Language* (Gillam & Pearson, 2004), *The Qualitative Reading Inventory—3* (Leslie & Caldwell, 2001), and the *Flynt-Cooter Reading Inventory for the Classroom* (Flynt & Cooter, 2004). Westby (2005) suggested using

"trickster tales," in which characters attempt to deceive others, as a good way to get at inferencing ability in children in later elementary grades. Some examples of trickster tales include *Miss Nelson Is Missing* (Allard & Marshall, 1977), *Stone Soup* (Brown, 1947), and folktales such as Uncle Remus or Anansi the Spider stories. Another way to assess inferential comprehension is to stop the story at several points and ask the student to tell what will happen next. Norbury and Bishop (2003) found that students with a variety of communication disorders could make inferences in stories, but these were not always relevant to the story context, and Cain, Oakhill, and Elbro (2003) report that children with LLD were impaired in their ability to integrate information within a text in order to infer meaning of novel words. Trabasso & Wiley (2005) reported that children with LLD are capable of making inferences in story comprehension tasks, but they do not always marshal these abilities spontaneously during reading, as typical readers do. If inferential skills seem lacking, some dynamic assessment techniques can be used. These would involve actively coaching students to take pieces of information in the story and put them together to draw a conclusion. If the student does better with this kind of coaching, it can be expanded and intensified in the intervention program.

Narrative Production

Fey, Catts, Proctor-Williams, Tomblin, and Zhang (2004) reported in a large study of narrative production in school-aged children that story production tasks were found to be highly educationally relevant and should play a significant role in the evaluation of children with developmental LLD. Studies have shown narrative assessment to be sensitive to both pragmatic (Botting, 2002) and structural aspects of children's language abilities (Norbury & Bishop, 2003), and to show areas of deficit even when standardized tests do not (Manhardt & Rescorla, 2002). Hadley (1998) showed that students are more likely to show maze behaviors and to make errors in morphological marking in narrative contexts than they are in conversation. Guiterrez-Clennen and DeCurtis (2001) found that narratives collected in the native language can be used to identify disorders in children who do not speak English, although it is important to be aware of the ways in which narratives in different cultures vary (McCabe & Bliss, 2003). Narrative tasks, then, tend to be better at revealing the linguistic vulnerabilities in children with LLD than simpler conversational activities, and they continue to do so throughout the school years (Boudreau, 2008). That's one reason why assessing narrative production is an important part of the evaluation of school-age clients. There are a variety of ways to elicit narrative samples from students. Hughes, McGillivray, and Schmidek (1997) identified three types of narratives that are appropriate as assessment contexts for children in the L4L stage:

- *Personal narratives.* These involve asking the child to recount a salient personal experience. Suggestions for eliciting these include asking students to tell about a time when they were hurt, scared, or solved a problem.
- *Script narratives.* These require students to relate a routine series of events. Often it helps to give the student a reason for producing the script. For example, we can ask students to pretend they are explaining to a new student what happens in gym class or to a foreign visitor how to order food in a fast food restaurant.
- *Fictional narratives.* Children can be asked to generate a story, such as "Goldilocks and the Three Bears" or describe the plot of a TV show or movie they've watched. Alternatively, the clinician can tell a story, with or without pictorial support, and ask the student to retell it. Story generation is usually more

Name of client: _____
 Date of interaction: _____
 Type of participant interaction: _____
 Type of setting: _____
 Length of interaction: _____

Instructions: Check the appropriate skill descriptor that follows:

I. Topic initiations

A. Frequency of client's topic initiations in comparison to the other participant(s) (check one).

	Yes	No	Sometimes	NA
1. None				
2. Less than				
3. Approximately equal to				
4. More than				

B. Subject matter of topic initiations:

1. Able to get attention of listener				
2. Repeats old topics on a daily basis				
3. Initiates new topics on a daily basis				
4. Able to greet others				
5. Able to express departures when leaving				
6. Able to make introductions				
7. Able to initiate needs				
8. Able to initiate questions:				
a. Requests for information				
b. Requests for repetition or clarification				
c. Requests for action				
d. Requests for permission				
9. Talks mostly about self				
10. Talks about the other, as well as self				
11. Talks about referents in the past				
12. Talks about referents in the future				
13. Talks about referents in the present				
14. Talks about fantasy-related referents				
15. Uses people's names appropriately				
16. Uses noise or sound-word play in appropriate situations				

FIGURE 11-7 Discourse skills checklist: Molar analysis. (Used with permission from Bedrosian, J. [1985]. An approach to developing conversational competence. In D. Ripich and F. Spinelli [Eds.], *School discourse problems* [p. 239]. San Diego, CA: College-Hill Press.)

	Yes	No	Sometimes	NA
II. MAINTAINING TOPICS				
A. Able to keep a topic going				
1. Responds to questions				
2. Acknowledges topic (e.g., "Uh-huh")				
3. Offers new information that is related				
4. Requests more information about a topic				
5. Able to request repetition or clarification if message is not clear				
6. Able to repeat or answer questions about what another has talked about				
7. Agrees with others				
8. Disagrees with others				
B. Not able to keep a topic going				
1. Intentionally evades or ignores a question				
2. Initiates a topic immediately following a topic initiation by a prior speaker				
3. Engages in monologues when in a group				
III. USE OF EYE CONTACT				
A. Able to use eye contact to designate a listener in a group when initiating a topic				
B. Uses eye contact while listening				
IV. TURN-TAKING				
A. Is easily interrupted				
B. Interrupts others				
C. Answers questions for others				
D. Has long speaking turns				
E. Designates turns for others in a group				
F. Sensitive to listener cues (e.g., can tell if listener is interested or bored)				
G. Excuses self when interrupting				
V. POLITENESS				
A. Able to make indirect requests				
B. Uses commands				
C. Uses politeness markers of "Please," "Thank you," "Excuse me"				
VI. OBSERVATION OF NONVERBAL BEHAVIORS				
A. Stands or sits too close to people when talking				
B. Stands or sits too far away from people when talking				
C. Stands or sits at appropriate social distances when talking				
D. Uses nonverbal head nods to acknowledge				
E. Uses nonverbal means of getting attention to initiate a topic (e.g., taps on shoulder, points)				

FIGURE 11-7, cont'd

difficult, but it is considered more representative. In either the generation or retelling task, visual stimuli in the form of single pictures, series of pictures, film strips or videos can be used. Providing visual support generally makes either type of fictional narrative task easier. Westby (1989b) advocated having students provide the narration for a wordless picture book, such as *A Boy, a Dog, and a Frog* (Mayer, 1967) or from a short video, such as one of the Max the Mouse series (Society for Visual Education, 1989).

Hughes, McGillivray, and Schmidek (1997) provide extensive guidance in eliciting, transcribing, segmenting, and analyzing language samples. They also provide numerous practice exercises to help clinicians refine their skills in narrative assessment. Gillam and Pearson's (2004) *Test of Narrative Language* employs stories with a variety of formats, such as those listed above.

Justice et al. (2006) and Paul, Hernandez, Taylor, and Johnson (1996) found in their research on children's narratives that three characteristics distinguished the narratives of children with language disorders from those of their normally speaking peers:

1. Overall maturity of narrative, sometimes referred to as *story macrostructure*, as indexed by the degree of organization and number and type of story grammar elements included in the story, as well as the story's cohesion (Heilmann, Miller, Nockerts, & Dunaway, 2009).
2. *Story microstructure*, including measures of productivity (measures of word output, lexical diversity, and T-unit output) and complexity (measures of mean length of T-units in words and proportion of complex T-units) of words and sentences produced in the story.
3. Use of precise and diverse vocabulary, a literate language style, advanced episodic structure and linguistic highlighting of the crux, or high point, of the story to create a comprehensible and interesting tale. Ukrainetz and Gillam (2009) refer to this aspect of narrative skill as "*artful storytelling*." Let's see how we might assess each of these areas to learn more about a client's narrative ability.

Narrative Macrostructure

There are a variety of means of assessing overall level of narrative maturity in the transcriptions of story samples we collect from students with LLD. We've already discussed Applebee's (1978) system. *The Strong Narrative Assessment Procedure* (SNAP; Strong, 1998), Renfrew's *Bus Story Language Test* (Cowley & Glasgow, 1997; Renfrew, 1991), and the *Test of Narrative Language* (TNL; Gillam & Pearson, 2004) are commercially available materials that include detailed instructions for administration and scoring, as well as norm-referenced scores. Lahey's (1988) scheme for analyzing story macrostructure appears in Box 11-8. Hughes, McGillivray, and Schmidek (1997), Johnston (1982), McCabe and Rollins (1994), and Peterson and McCabe (1983) provided additional examples. Westby (2005)

BOX 11-8 Levels of Narrative Development

ADDITIVE CHAIN

Propositions in the text are essentially independent so that they can be moved around within the text without changing the meaning. For narratives at this level, the following questions can be asked:

- Was there more than a listing?
- Were there any actions?
- Was there a theme such as a repetition of an action, person, or setting?
- Did some of the propositions describe a person or place?

TEMPORAL CHAIN

Some of the propositions are sequentially related, so rearranging them would change the order of events in the story, but there is no cause-effect relation among them.

CAUSAL CHAIN

A problem is described to which other propositions are causally related by enabling or causing other states or events. There is only one such unit in the story. For narratives at this level, the following questions should be asked:

- Was the story a statement of a problem and some aspect of consequence with much information omitted, such as plans, goals, and resolution?
- Was the causal chain automatic and not related to goals or plans?
- Was the causal chain free of an obstacle between the problem and resolution?
- Did an obstacle intervene in the process of trying to reach a goal?

MULTIPLE CAUSAL CHAIN

The story includes more than one causal chain or episode. For narratives at this level, the following questions should be asked:

- Were the episodes related in an additive or temporal fashion, but not causally linked?
- Did any of the episodes provide the cause, effect, or motivation for another episode?

FOR STORIES AT THE CAUSAL CHAIN LEVEL OR ABOVE, NOTE SUBCATEGORIES CONTAINED IN THE STORY

Initiating event or complication

- Setting
- Reaction (plans, goals of characters)
- Internal response (changes of state or thought of characters)
- Attempt (to solve the problem posed in the initiating event)
- Consequence or resolution (achievement of characters' goals)

proposed a decision-tree structure for assessing the maturity of narrative organization and provided detailed instructions for assigning narrative stage using this method. Her decision tree appears in Figure 11-8. We also looked at the scheme based on Klecan-Aker and Keltz (1990) and Paul, Laszlo, and McFarland's (1992) adaptation of Applebee's (1978) narrative stages in Box 10-4. This method can also be used to rate the maturity of narrative organization. A modification of the simplified method of story macrostructure assessment, developed specifically for use with Mayer's frog stories was used in a study by Norbury and Bishop (2003) and appears in Figure 11-9. Pedersen, Gillam, and Gillam (2008) introduced the *Index of Narrative Complexity*. McFadden and Gillam (1996) also provide a

FIGURE 11-8 Story grammar decision tree. (Used with permission from Westby, C. [2005]. *Assessing and remediating text comprehension problems* [pp. 157-232]. In H. Catts and A. Kamhi [Eds.], *Language and Reading Disabilities* (2nd ed.). Boston: Allyn & Bacon [p. 181].)

scheme for measuring overall narrative quality, using a set of rubrics and anchor stories. They reported that this scheme correlated moderately well with other text-level measures of narrative maturity. Their rubrics appear in Box 11-9. Hughes, McGillivray, and Schmidek (1997) suggest developing local anchor stories by collecting narratives from children with a range of abilities and grade levels in a particular school. The clinician can then meet with teachers to rate sets of stories and identify weak, adequate, good, and strong stories for each grade level. These collaboratively established anchor stories can serve as a basis for narrative assessment. In addition, Heilman et al. (2009) provide a Narrative Scoring Scheme (NSS) for children's story retelling, shown in Table 11-6, which their research finds to be significantly related to other narrative scores and to be relatively efficient for documenting children's narrative structure development in a retell task. This approach uses rubrics (minimal, emerging, and proficient) to evaluate each of seven aspects of the macrostructure of a child's story. It can be used to identify a client's baseline level of functioning in narrative production, and to track improvements in one or more of these areas following a targeted intervention.

Cohesion in Narrative

Cohesive ties are linguistic markers that bind sentences together to make them an integrated discourse unit rather than a series of unrelated utterances. Markers used for this purpose include pronouns; conjunctions; conjunctive adverbs (*nevertheless, on the other hand*); ellipsis (deleting redundant information); and the definite article *the*. Cain (2003) found there were significant differences in cohesion abilities between students with LLD and those with normal achievement. Liles (1985) provided a detailed system for scoring cohesion in narrative samples, based on Halliday and Hasan's (1976) taxonomy. She defined cohesive markers as linguistic forms whose meanings cannot be interpreted without reference to information outside the sentence or clause in which the marker occurs. Cohesive markers signal listeners to "search" outside the sentence to complete its meaning. For clinical purposes, her system can be adapted, using the guidelines in Box 11-10. Beliaevsky (2003) reported that kindergarten children showed up to 40% inappropriate or ambiguous use of cohesion in stories, but by first grade these levels had dropped to below 15%, and remained similar through the fourth grade. These findings, in conjunction with those reported by Paul, Hernandez, Taylor, and Johnson (1996) suggest that grade school children who produce narratives with fewer than 70% complete cohesive ties could be considered as having difficulty in producing a cohesive text. Remedial activities that focus on linking propositions in discourse with complete cohesive markers would be a way to address this deficit.

Narrative Microstructure

In addition to the higher level organization and cohesion present in a client's story production, the vocabulary and sentence structures used also contribute to the story's maturity. This aspect of narrative production is referred to as narrative *microstructure*. Justice et al. (2006) have developed a system for scoring narrative microstructure, based on the analysis of transcripts entered into the SALT computer program (Miller & Chapman, 2003). The following measures, which can be automatically computed once the transcript has been input to the SALT program, were found in their study to be the strongest indicators of productivity and complexity:

- Number of different words
- Total number of words

	Definition	Example	Potential points	Normal range for 8 to 10 year old with typical development	Points earned
Global structure					
Initiating event	Problem that provides motivation for story	Boy wants to catch frog	1 for mention of characters 1 for problem	1.7-1.9	
Attempts	Things characters do to solve the initial problem	Boy attempts to catch frog with net; catches his dog by mistake	1 for each attempt reported	1.6-1.8	
Resolution	Satisfactory end to story that resolves initial problem	Frog follows boy home; he's happy when they're together	1 for mention of intention of action 1 for feelings of character	1.2-1.4	
Local structure					
Length	Total number of sentences in child's story	The boy went to the pond.	One point for each sentence	25-48	
Syntax	1. Number of complex sentences in story 2. Number of tense marking errors	Subordinate clauses (<i>When the boy saw the frog, he ran toward it.</i>) Complement clauses (<i>The boy wished he could catch the frog.</i>) Verb complements (<i>The boy was trying to catch the frog.</i>) Full passive sentences (<i>The dog was caught by the net.</i>) He look_ in the water	One point for each complex sentence One point for each error	2.3-8.8 0-1	
Semantics	Number of pieces of relevant information provided	1. Boys goes to pond 2. Boy's dog goes along	One point for each proposition	40-55	
Cohesion	Use of ambiguous pronouns	The boy and the frog looked at each other. <i>He</i> was mad.	One point for each ambiguous pronoun	0-3	
Mental state verbs	Use of verbs to describe thinking or talking	<i>Think, know, remember, forget, say, tell</i>	One point per mental verb	4.3-15.4	
Emotional terms	Use of words to describe emotions or internal states	The boy was sad.	One point per emotion term	0-3.6	

FIGURE 11-9 Narrative assessment scoresheet adapted from Norebury and Bishop (2003), using Mayer's (1967) *A Boy, a Dog, and a Frog*. (Adapted from Norbury and Bishop [2003]. Narrative skills of children with communication impairments. *International Journal of Language and Communication Disorders*, 38, 287–313.)

BOX 11-9 Scoring Rubrics for Narratives

Weak: Narrative consists of descriptions and poorly organized, uninteresting stories.

Adequate: Stories take one of four forms:

An account of events without a high point or climax.

A minimal narrative without elaboration.

A story without a resolution.

A confusing narrative with some strong descriptive elements.

Good: Narratives are captivating stories that contain problems and resolutions, but they may contain organizational weaknesses.

Strong: Narratives are easily understood and contain clear, integrated story lines; elaboration; interesting word choices; and some captivating features, such as a climax or plot twist or compelling personal voice.

TABLE 11-6 Heilman et al. Narrative Scoring Scheme

Characteristic	Proficient	Emerging	Minimal/Immature
Introduction	1. Setting: States general place and provides some detail about the setting (e.g., reference to the time of the setting, daytime, bedtime, season) Setting elements are stated at appropriate place in story 2. Characters: Main characters are introduced with some description or detail provided	1. Setting: States general setting but provides no detail Description or elements of story are given intermittently through story May provide description of specific element of setting (e.g., "The frog is in the jar.") OR 2. Characters: Characters of story are mentioned with no detail or description	Launches into story with no attempt to provide the setting
Character Development	Main character(s) and <i>all</i> supporting character(s) are mentioned Throughout story it is clear child can discriminate between main and supporting characters (e.g., more description of, emphasis upon main characters) Child narrates in first person using character voice (e.g., "'You get out of my tree,' said the owl.")	Both main and active supporting characters are mentioned Main characters are not clearly distinguished from supporting characters	Inconsistent mention of involved or active characters Character(s) necessary for advancing the plot are not present
Mental States	Mental states of main and supporting characters are expressed when necessary for plot development and advancement A variety of mental state words are used	Some use of mental state words to help develop character(s) A limited number of mental state words used inconsistently throughout the story	No use of mental state words to develop character(s)
Referencing	Provides necessary antecedents to pronouns References are clear throughout story	Inconsistent use of referents/antecedents	Excessive use of pronouns No verbal clarifiers used Child is unaware listener is confused
Conflict Resolution	Clearly states all conflicts and resolutions critical to advancing the plot of the story	Underdeveloped description of conflicts and resolutions critical to advancing the plot of the story OR Not all conflicts and resolutions critical to advancing the plot are present	Random resolution(s) stated with no mention of cause or conflict OR Conflict mentioned without resolution OR Many conflicts and resolutions critical to advancing the plot are not present
Cohesion	Events follow a logical order Critical events are included while less emphasis is placed on minor events Smooth transitions are provided between events	Events follow a logical order Excessive detail or emphasis provided on minor events, leading the listener astray OR Transitions to next event unclear OR Minimal detail given for critical events OR Equal emphasis on all events	No use of smooth transitions
Conclusion	Story is clearly wrapped up using general concluding statements such as "and they were together again, happy as can be."	Specific event is concluded, but no general statement made as to the conclusion of the whole story	Stops narrating and listener may need to ask if that is the end

Scoring: Each characteristic receives a scaled score 0-5. Proficient characteristics = 5, Emerging = 3, Minimal/Immature = 1. Scores in between (e.g., 2, 4) are undefined; use judgment. Scores of 0, NA are defined below. A composite is scored by adding the total of the characteristic scores. Highest score = 35.

A score of 0 is given for Child Errors (i.e., telling the wrong story, conversing with examiner, not completing/refusing task, using wrong language creating inability of scorer to comprehend story in target language, abandoned utterances, unintelligibility, poor performance, components of rubric are in imitation-only.

A score of NA (non-applicable) is given for Mechanical/Examiner/Operator Errors (i.e., interference from background noise, issues with recording (cut-offs, interruptions), examiner quitting before child does, examiner not following protocol, examiner asking overly specific or leading questions rather than open-ended questions or prompts).

From Heilman et al. (2009). Properties of the narrative scoring scheme using narrative retells in young children. *American Journal of Speech-Language Pathology*, 19, 154-166. Used with permission.

BOX 11-10 A Procedure for Scoring Cohesive Adequacy in Narrative Samples

1. Transcribe the narrative sample.
2. Read through the transcript once.
3. Read the transcript again. This time, underline each pronoun, conjunction, conjunctive adverb, elliptical utterance, or article that refers to information *outside* the sentence or clause in which it is used.

EXAMPLES

Pronoun: "There's a frog. He jumps off the lily pad."

Conjunction: "The frog wants to follow the boy, but the boy goes too fast."

Conjunctive adverb: "The frog was lonesome. Still, he wouldn't let the boy catch him."

Elliptical utterance: "The boy tried to catch the frog, but he couldn't" ("catch the frog" is deleted).

Article: "A frog was in the pond. And a boy wanted to catch the frog."

4. For each tie, make a judgment as to whether it is complete.

Complete ties are those that refer to information outside the sentence or clause that is easily found and is unambiguous.

EXAMPLE

"The frog wanted to go with the boy and his dog. So he followed them."

Incomplete ties are those that refer to information that is not provided or missing from the text, or to information that is ambiguous.

EXAMPLES

Missing: "The frog was hopping. Then he tripped over it."

Ambiguous: "The boy was chasing the dog and the dog was chasing the frog. And he caught him."

5. Count the total number of cohesive markers in the sample. Then count the number of complete ties. Divide the number of complete ties by the total number of cohesive markers. If this proportion is less than 70%, a cohesive deficit can be inferred.

Adapted from Liles, B. (1985). Cohesion in the narratives of normal and language-disordered children. *Journal of Speech and Hearing Research*, 28, 123-133.

- Total number of T-units in the narrative
- Average number of words per T-unit (MLT-W)
- Total number of T-units containing an independent clause and at least one dependent clause (i.e., number of complex sentences)
- Proportion of T-units that contain an independent and dependent clause (i.e., proportion of complex sentences)

Table 11-7 provides the means and standard deviations for oral stories produced in response to a single picture taken from the *Test of Narrative Language* (Gilliam & Pearson, 2004) by each age group from 5 to 12 years for each microstructure measure, as reported by Justice et al. (2006). These values can serve as a basis of comparison when evaluating narrative samples from children in the L4L stage.

Assessing Written Narrative

Many of the procedures described here can be applied to both spoken and written narratives. Nelson and Van Meter (2007) reported on written narratives produced by typically developing elementary school students in response to an open-ended prompt ("You know something about stories. Stories have a problem. They tell what happened and how the story ended. Your story can be real or imaginary"). They assessed word, sentence, and discourse-level measures in stories written by children in grades 1 through 5. The values they reported for typically developing students appear in Table 11-8. These can serve as rough guide for expectations for written narratives in the elementary grades, to help determine whether a student is falling below average for grade level, as well as to track progress toward grade-appropriate writing.

TABLE 11-7 Means (and Standard Deviations) for Selected Narrative Microstructure Measures by Age Group for Typically Developing Children

Age	TNW	NDW	Length	MLT-W	# Complex
5	66 (47)	39 (20)	8.5 (5.4)	6.8 (1.7)	3.1 (3.2)
6	77 (54)	43 (22)	9.6 (6.0)	7.5 (1.6)	3.5 (2.8)
7	96 (74)	52 (28)	11.3 (9.1)	8.5 (3.8)	4.6 (4.3)
8	137 (77)	69 (27)	15.8 (8.9)	8.1 (1.4)	7.6 (5.2)
9	162 (96)	79 (30)	17.3 (9.6)	8.4 (1.4)	8.9 (6.1)
10	237 (196)	101 (49)	21.5 (14.5)	8.9 (2.1)	12. (9.8)
11	167 (70)	84 (27)	18.8 (8.2)	8.7 (1.4)	9.2(4.3)
12	148 (95)	67 (36)	14.6 (8.7)	8.8 (1.9)	7.3 (4.4)

TNW: Total number of words

NDW: Number of different words

Length: Number of T-units

MLT-W: Average T-unit length in words

Complex: number of T-units containing 2 or more clauses

(Adapted from Justice et al. (2006). The index of narrative microstructure: A clinical tool for analyzing school-age children's narrative performances. *American Journal of Speech-Language Pathology*, 15(2), 177-191. Used with permission)

TABLE 11-8 Average range (+/– 1 SD) Values for Written Language Samples

Grade		1	2	3	4	5
Word level	NDW	13–32	13–48	30–71	40–92	44–130
	% Correct Spelling	80–90	84–95	78–97	94–99	94–98
Sentence level	MLU/T-unit	5–7	6–8	6–10	6–10	7–10
	Total # of conjunctions	0–3	0–7	0–17	4–17	0–25
	Types of conjunctions	0–3	0–3	1–4	2–5	2–6
	Grammatical errors	0–1	0–1	0–1	0–1	0–1
	% Simple correct	33–94	5–65	15–64	15–66	29–57
	% Complex correct	4–41	1–56	8–55	17–57	21–62
Merge	Total Words	19–50	15–81	34–145	63–187	50–295
	Total T-units	4–8	4–14	4–20	8–25	5–39
	Narrative Level*	0.9–3.4	1.4–3.8	2.0–4.7	2.0–6.0	1.7–5.3

* Narrative macrostructure scores:

- 1 = description of people, places, events without sequence or plot (heap)
- 2 = series of actions linked sequentially but with limited causality (temporal sequence)
- 3 = series of actions related causally but with no goals or plans (causal sequence)
- 4 = story with problem and goal but no clear ending (abbreviated episode)
- 5 = story with problem, stated goals, plans to solve problems, logical ending (complete episode)
- 6 = multiple or embedded episodes

Adapted from Nelson & Van Meter (2007). Measuring written language ability in narrative samples. *Reading and Writing Quarterly*, 23, 287–309.

A second approach to analyzing written narratives is suggested by Scott and Nelson (2009). They suggest, rather than having children write original stories, they be given stories containing simple sentences, and asked to rewrite them into a story that “sounds better.” By examining the student’s rewrite for the presence of simple sentences combined into complex ones, the clinician can form a qualitative assessment of the student’s ability to use complex syntax adaptively.

“Artful” Storytelling

What if an older elementary school student with LLD produces stories with adequate microstructure, macrostructure and cohesion, yet we still get the feeling that the stories are not quite what they should be? Good stories contain more than just complete sentences, episodes, and cohesive ties; they have what Peterson and McCabe (1983) called “sparkle.” Several elements contribute to the degree of artfulness in storytelling: the richness of the vocabulary, the complexity of the episodes in the story, the creation of a “high point” to stress the story’s climax, and the use of a literate language style. We only want to assess these aspects if narrative macrostructure, cohesion, and microstructure are found to be adequate, yet the older client’s stories still seem lacking in some way. If deficits in microstructure, macrostructure, and cohesion are identified, it will not be necessary to carry the assessment further, since these more basic elements of story generation need to be addressed before we make any attempt to add “sparkle” to the student’s stories.

Greenhalgh and Strong (2001) reported that simply counting the number of different words in a child’s narrative did not provide a valid measure of lexical richness. This trait can be measured, however, by looking at the number of *unusual* words a child produces within a sample. Heilmann, Miller, and Nockerts (2010) developed a measure of vocabulary richness specifically for Mayer’s frog stories that can be computed using the SALT program for stories told in either English or Spanish. A reference database specific to this analysis is also available from the SALT program (www.languageanalysislab.com).

Although we know that children begin using true narratives at 5 to 7 years of age, narrative development is by no means complete at this age. There are two ways in which narratives become elaborated during these years. The first has to do with the complexity of the episodes within the story. Hughes, McGillivray, and Schmedek (1997) identified the following four levels of episode complexity beyond the basic true narrative (Table 11-9):

- *Multiple episodes.* More than one complete episode, each of which contains an initiating event, action, consequence, and reaction, is included in the story. For example, a child might tell a story about a trip to the doctor, which is preceded by a story of how he got sick.
- *Complex episodes.* These contain obstacles that complicate the solution or the main character’s ability to carry out the plan developed in the story. For example, a girl might tell a story about how she wanted to get a horse, made a plan to earn the necessary money, met with opposition from her parents, but managed to overcome the opposition and achieve her goal.
- *Embedded episodes.* One episode occurs within another in the story. For example, a story about how a bride found her ideal wedding dress might have the story of how she met her groom embedded within it.
- *Interactive episodes.* The narrative tells the story from two different points of view. For example, the story of how the bride and groom met is told separately from each participant’s perspective.

The second change in narrative structure involves the inclusion of an increasingly elaborated high point, or climax to the story. McCabe (1995) and Ukrainetz et al. (2005) suggested using high point analysis to look at these higher level elaborations in the stories of school-age children and provide detailed descriptions of the categories for analysis. Table 11-10 summarizes the stages of high point development. Ukrainetz and Gillam (2009) reported that this kind of analysis is sensitive to both age- and language-level

TABLE 11-9 A Summary of Later Stages of Narrative Development

Developmental Level (yr)	High Point Analysis Level	Narrative Level	Story Structure
6	Beginning use of high point resolutions	True narrative	Mostly abbreviated episodes
7–8	Use of introducers and codas	Complex narratives	Mostly complete episodes, including goals, internal motivations, and reactions
11			Multiple episodes
13	Stories have elaborated high points, including several high point elements		Complex episodes Embedded episodes Interactive episodes

Adapted from Hughes, D., McGillivray, L., & Schmidek, M. (1997). *Guide to narrative language*. Eau Claire, WI: Thinking Publications.

TABLE 11-10 Aspects of High Point Analysis

High Point Element	Description	Example
Introducer	Occurs at beginning; gives an overview of the story; serves to get listener's attention.	"You'll never guess what happened on my block last night!"
Orientation	Gives background and setting information.	"My buddy Malcolm, him and me were sittin' around on the stoop after dinner."
Complicating action	Shows how action proceeds to the high point.	"We didn't know it, but something had scared his dog, and it came rushing up to where we were and started barking like crazy at me."
Evaluation	Gives an assessment or emotional comment about the high point.	"I was really scared because he looked like he might not stop. He was growling and coming closer. Malcolm yelled for me to take off my red cap. I did, and all of a sudden he got quiet."
Resolution	Finishes off the event, and resolves any complications.	"He got the dog calmed down and explained that when the dog was upset, he went crazy if he saw someone wearing something red, because once a man in a red uniform had hit him with a stick."
Coda	Closes the story and connects the ending to the present context.	"I was real glad I'd gotten my cap off in time."

Adapted from McCabe, A. (1995). Evaluating narrative discourse skills. In K. Cole, P. Dale, & D. Thal (Eds.). *Assessment of communication and language* (pp. 121-141). Baltimore, MD: Paul H. Brookes; Hughes, D., McGillivray, L., & Schmidek, M. (1997). *Guide to narrative language*. Eau Claire, WI: Thinking Publications.

differences in school-aged children, and suggest providing guidance in more artful storytelling for children with LLD.

The final aspect of artful storytelling refers to the sophistication of linguistic forms used to tell the story. Westby (2005) identified four elements that provide an index of literary language style in narratives. These are given in Box 11-11. Each element that appears in the story sample can be counted, and any of the four that appear rarely or not at all can be targeted for attention in the intervention program. Eisenberg et al. (2008) found that even 5-year-olds produced some complex noun phrases in their oral narratives. Greenhalgh and Strong (2001) found that measures of conjunctions and elaborated noun phrases differentiated children with LLD from those with typical development. The values Greenhalgh and Strong reported for literate

language items seen in the narratives of typically developing children between 7 and 10 years of age appear in Table 11-11. These values suggest that students who produce fewer than the lower limit of these ranges should be considered to be using few literate language markers. It is important to note, though, that in elementary students some of these markers are used relatively rarely, and their use is dependent on context.

Why not try your hand at some narrative analysis? Use the narrative sample in Box 11-12, which was collected from a first grader, using Renfrew's (1991) story retelling task. Use the criteria we talked about earlier to assess narrative macrostructure. Use Box 11-10 to guide a cohesion assessment. Assess artfulness by looking for literary language style features listed in Box 11-11. Evaluate each aspect of this client's narrative and decide whether

BOX 11-11 Elements of Literary Language Style

Conjunctions. *And* and *then* are excluded. Other conjunctions, such as (but not limited to) *when, since, so, as a result, if, until, however, before, after, while, because, therefore, however, although, etc.*, are counted.

Elaborated noun phrases. Count noun phrases with more than two modifiers preceding the noun (*the two big dogs*) or with qualifiers such as prepositional phrases and relative clauses following the noun (*the big dog in the pet store; the boy who has a fishnet*).

Mental and linguistic verbs. Count verbs that denote cognitive (*think, wish, know, forget*) or linguistic (*say, promise, report, exclaim*) processes.

Adverbs. Count all adverbs, but note especially those that code aspects of tone, attitude, and manner that would be conveyed by stress and intonation in conversation (*angrily, hotly, ominously, threateningly*).

Adapted from Westby, C. (1998). Communicative refinement in school age and adolescence. In W. Hayes & B. Shulman (Eds.). *Communication development: Foundations, processes, and clinical applications* (pp. 311-360). Baltimore, MD: Williams & Wilkins.

you would include narrative activities in your intervention program. You'll find our evaluation of the story in [Appendix 11-5](#). Some additional sources for narrative assessment ideas include Gillam, McFadden, and van Kleeck (1995); Hoffman (2009); Pena et al. (2006); Naremore, Densmore, and Harman (1995); Scott and Windsor (2000); Strong (1998); and Thorne et al. (2007).

Assessing the "Metas"

Metalinguistic Awareness

We've talked at length about the importance of metalinguistic awareness in both classroom discourse and the acquisition of literacy. Schuele and van Kleeck (1987) discussed several aspects of metalinguistic awareness that contribute to school success. These include consciousness of words, ability to segment words into sentences, and phonological awareness. Kamhi (1987) pointed out some additional metalinguistic skills of the L4L period. These are making judgments about language form and content (as in editing), analyzing language into linguistic units (such as analyzing words into syllables), manipulating these units (as in producing pig Latin), and understanding and producing

language play (such as riddles, puns, and rhymes). Nelson (2010) and Wallach and Miller (1988) discussed the role of metapragmatic abilities: the ability to talk about appropriate uses of language in social situations.

We've already looked at some methods of assessing phonological awareness. These skills will be important to assess, particularly in children who are having trouble learning to read. Other aspects of metalinguistic awareness can be assessed simply by asking questions such as those in [Box 11-13](#), drawn from Westby (2005). Justice, Skibbe, and Ezell (2007) also suggest determining whether children can use metalinguistic vocabulary (*read, word, spell*) and talk about print ("The letters in this book are big!").

Curriculum-based assessment (Nelson, 1998; 2010) can be particularly useful for assessing metalinguistic skills in the context of editing. The clinician can work with a client in the classroom to edit a writing assignment. Metalinguistic abilities to recognize and correct errors in the student's own writing can be clearly seen in this context. Deficits identified can be addressed in intervention activities that focus on editing.

Metapragmatic skills can be assessed in conversation with the client about rules for various discourse contexts. We might ask the student how the rules for asking for something politely differ from the rules for asking for something during an argument. It may be especially important to assess a student's awareness of the interactional expectations of the classroom. Difficulty with this kind of activity may suggest a need for the clinician to exert extra effort to make the "hidden curriculum" explicit for the client and to talk explicitly about how classroom discourse differs from that in other settings. Creaghead and Tattershall (1991) and Westby (2007) suggested questions such as those in [Box 11-14](#) to assess metapragmatic knowledge of classroom discourse rules.

If a student in the L4L stage has difficulty with these kinds of metalinguistic activities, a metalinguistic component should be a strong part of the intervention program. Metalinguistic activities are useful, though, for all students in the L4L stage. Metalinguistic skill is learned, remember, primarily through interactions that focus on communication itself and that use literate language styles. Many children with normal basic language skills have limited experience with metalinguistic awareness, so even children without identified language disorders can learn from these activities. Metalinguistic activities make especially good classroom collaborative lessons, because students with and without basic language deficits can benefit from them. We'll discuss some ideas for metalinguistic intervention activities in the next chapter.

TABLE 11-11 Group Mean and Standard Deviation Values for Literate Language Use by 7- to 10-Year-Olds with Typical Development

Literate Language Form	Mean (and SD) Per T-Unit	Number To Be Expected/50 T-Unit Sample*
Conjunctions	0.24 (0.2)	2-22
Elaborated noun phrases	0.17 (0.1)	3-13
Mental and linguistic verbs	0.11 (0.10)	1-10
Adverbs	0.008 (0.02)	0-2

*Based on multiplying ± 1 SD from mean values $\times$ 50 T-units.

BOX 11-13 Sample Questions for Assessing Metalinguistic Skills

Do you know what a word is? Tell me three words.
 I'm going to say a sentence. You tell me how many words are in it.

I've written a sentence on this paper. Can you circle the first word in it? The last word? How many words are in this sentence?

Max hates grapes, but he hates apples. Does that make sense? Why not?

How many syllables are in these words? Clap once for each syllable.

I'm going to say some things, and I want you to tell me whether each is a word or not:

car
 cag
 if
 bune
 this
 girl
 an
 yours
 trup

I'm going to say some words, and I want you to tell me if they are long words or short words, and tell me why:

Alligator (long word, long referent)
 Spaghetti (long word, long referent)
 Train (short word, long referent)
 Banana (long word, long referent)
 Hose (short word, long referent)
 Toe (short word, short referent)
 Fly (short word, short referent)

Do you know any jokes? Tell me one. I don't get it.

Why is that funny?

What does *run* mean? Can it mean anything else?

Adapted from Westby, C. (1998a). Communicative refinement in school age and adolescence. In W. Hayes & B. Shulman (Eds.), *Communication development: Foundations, processes, and clinical applications* (pp. 311-360). Baltimore, MD: Williams & Wilkins; Westby, C. (2005). Assessing and facilitating text comprehension problems. In H. Catts & A. Kahmi (Eds.) *Language and reading disabilities* (2nd ed., pp. 157-232). Boston: Allyn & Bacon.

BOX 11-14 Suggestions for Assessing Metapragmatic Knowledge of Classroom Discourse Rules

"What is the most important thing you should always say in class?"

"How do you know when it's time for recess?"

"When is it OK to talk aloud without raising your hand in class?"

"When is it all right to ask the teacher a question?"

"What does your teacher say when she's angry?"

"What does your teacher do when it's time for a lesson to start?"

"What's the first thing you're supposed to do when school starts?"

"How do you know when your teacher is saying something really important?"

"How do you know when your teacher is making a joke?"

"What's the most important thing you should always do in school? What should you never do?"

"What's the last thing you should do at the end of the day before you leave school?"

"What does your teacher expect you to do if you are confused?"

"What does your teacher expect when she gives you an assignment?"

Adapted from Creaghead, N., & Tattershall, S. (1991). Observation and assessment of classroom discourse skills. In C. Simon (Ed.), *Communication skills and classroom success* (pp. 105-134). San Diego, CA: College-Hill Press; Westby, C. (2007). There's more to passing than knowing the answers: Learning to do school. In T. Ukrainetz (Ed.), *Contextualized language intervention* (pp. 319-388). Eau Claire, WI: Thinking Publications/Pro-Ed.

Metacognitive Skills

Westby (2005) identified two aspects of metacognitive skills:

- *Self-regulation*: the ability to plan, organize, and execute actions efficiently using consciously selected strategies.
- *Self-assessment*: understanding of the thinking process and the ability to consciously consider and reflect on knowledge and understanding of one's self and others.

Both of these abilities represent great stumbling blocks for many students with LLD, and they represent an area in which to consider assessment and intervention activities. Informal assessment of these abilities can often be accomplished in curriculum-based activities. Nelson (2010), for example, suggests asking students in engaged in an academic activity, "What's your goal here?" and evaluating the extent to which the child can articulate the aim of an activity. Another method of assessing these skills is through activities like those used in Theory of Mind research (Baron-Cohen, 2000; Wellman, 1985). Activities based on this research are provided in Table 11-12, which are passed by 80% of typically developing children at age 7. The *Developmental Evaluation of Language Variation* (DELV; Seymour et al., 2005) also has a Theory of mind subtest. Volds and Horton (2008) also provide a summary of standard tests of executive function often used by psychologists to assess areas of mental activity including decision making, planning, inhibition, development of plans of action. Clinicians who have concerns about their clients' functioning in these areas may consider a referral for executive function assessment to a school psychologist.

TABLE 11-12 Theory of Mind Assessments for Metacognitive Skills

Task	Procedure
Know-remember	Child sees item hidden in one of two containers; after brief delay child is asked to find item, and is asked, "Did you know where it was? Did you guess where it was? Did you remember where it was?"
Guess	Child does not see where item is hidden, but must make a choice between two containers to find it. Child is asked, "Did you know where it was? Did you guess where it was? Did you remember where it was?"
Forget	Child watches toy who sees his coat put in one of two closets and is asked, "Does he know where his coat is? Why do you say he knows?" Later the character comes back to get his coat and looks in the wrong closet. Child is asked, "Did he know where his coat was? Did he remember? Did he forget? Why do you say he forgot?"

Adapted from Baron-Cohen, S. (2000). Theory of mind and autism: A fifteen year review. In S. Baron-Cohen, H. Tager-Flusberg, & D. J. Cohen (Eds.). *Understanding other minds: Perspectives from developmental cognitive neuroscience* (pp. 1-20). Oxford University Press; Wellman, H. (1985). The origins of metacognition. In D. Forrest-Pressley, G. MacKinnon, & T. Waller (Eds.). *Metacognition, cognition and human performance* (pp. 1-31). Orlando: Academic Press.

Barrier games can be used to assess self-appraisal of comprehension, as discussed earlier. The clinician can give purposefully unclear messages or can mumble essential parts of the message to see whether the student asks for clarification. The peer interaction activity, with the normally developing peer providing instructions for playing a game or doing a project, also can give us a glimpse at the ability of a client to monitor his understanding and ability to complete a task. Teacher interviews also can supply information on a student's metacognitive abilities. We can ask the teacher whether students ask appropriate questions about assignments, whether they give a signal when they have difficulty understanding, and how the teacher knows that students do not understand a direction or discussion. Think-aloud protocols are another way to get a window on the child's cognitive process. Here we present a children with a task and ask them to "think out loud" for us as they complete it, saying aloud each step in the completion of the task. We will discuss think-aloud methods more fully under dynamic and curriculum-based assessment and talk about intervention techniques for these abilities in the next chapter.

Curriculum-Based Language Assessment

Nelson (2010), Nelson and Van Meter (2002), and Norris and Hoffman (1993) advocated using curriculum-based language assessment to observe how the student uses language in learning

Assessment of school-aged children includes curricular materials.

the curriculum of the classroom. Many of the criterion-referenced assessment techniques discussed in this chapter can be done in the context of curriculum-based assessment. The tools of this type of assessment include artifact analysis, onlooker observation, and dynamic assessment. We'll look at each type, and talk about how to use it to assess one area of the curriculum that is often difficult for students with LLD: spelling.

Artifact Analysis

Artifacts, or products of the student's regular curricular activities, such as homework assignments, written work done in class, or projects completed independently or in cooperative learning groups can be examined as a form of *functional assessment*—a way to look at how the student uses communication in real, relevant situations. The clinician can look at these materials for evidence of various communicative skills, such as level of narrative development, literate language style, and use of cohesion. This analysis also can be used to document change in an intervention program. Artifact analysis done for this purpose is often referred to as *portfolio assessment*. Kratcoski (1998) discussed several ways we can use portfolio assessment as a tool for examining functional communication in school settings. She

Collaborative intervention involves learning about the demands of the curriculum.

suggested collecting the following artifacts to include in a student's portfolio:

- Initial referral forms
- Language samples
- Narrative samples
- Observation notes
- Samples of student work that address questions such as:
 - What are the strengths/needs demonstrated in the assignment?
 - What strategies are evident in the student's approach to the task?
 - What are the language demands of this assignment?
 - How did the student meet these demands?
- Teacher interviews
- Student interviews
- Parent interviews
- Test results

Often, students are encouraged to make their own choices of their best samples to be included in the portfolio. The student and teacher or clinician evaluate the collected work together, using it to document changes in the student's work over the course of the intervention period. The artifacts are evaluated to identify areas in which goals have been met or work has substantially improved and to look at areas that need additional attention in the next cycle of intervention. Hillmer and Holmes (2007) provide helpful guidance for assembling student portfolios.

Using portfolio assessment to assess spelling, the clinician would first ask the student to assemble writing samples or spelling tests at the beginning of the intervention period. The clinician might discuss these with the student, ask what was hard about the words he or she had to spell, which he or she was sure and unsure of, how hard spelling is for the student. If spelling is identified by either the student or the teacher as an area of weakness, the clinician may focus on spelling as one aspect of an intervention program, and use periodic collection of classroom writing samples or spelling tests to track the student's progress. At each collection point, the clinician can help the student compare recent work with earlier samples to celebrate progress, and identify new goals for intervention. At the end of the course of intervention, the student may include samples of "best work" both to demonstrate progress and to document current strengths and weaknesses. In an RTI context, a portfolio like this could be used to identify a child's need for Tier II or III intervention for spelling, if significant progress is not seen in the samples in the portfolio over the course of a period of Tier I instruction.

Onlooker Observation

Observation of this kind involves watching, from a distance, as the student participates in classroom activities. Onlooker observation is valuable, for example, for assessing adherence to classroom discourse rules or use of communicative intentions. In most cases, it will be helpful to develop a recording form to guide this assessment. Creation of such a form will also help the clinician focus on the elements of the child's behavior that are central to the assessment. To use our spelling example, again, a clinician might develop a form like the one in [Box 11-15](#). Here the observation shows that the student's responses are impaired by his ability to keep up with the teacher's dictation of the test material. The clinician might decide, as a result of this assessment, to give the child the same test in a quieter environment at a slower pace to determine whether such modifications would improve his performance. If so, these modifications in delivery of the test might be suggested to the teacher. If they do not make

BOX 11-15 Worksheet for Guiding Onlooker Assessment of Spelling

SETTING:

Weekly spelling test

ASSIGNMENT:

Spell words spoken by teacher from list she gave out earlier in the week

CLIENT RESPONSE TO WORD #1:

Writes, erases

CLIENT RESPONSE TO WORD #2:

Continues to erase, does not start writing word #2

CLIENT RESPONSE TO WORD #3:

Looks around, sees what others are doing; writes, then erases

CLIENT RESPONSE TO WORD #4:

Drops pencil, picks it up, begins to write

CLIENT RESPONSE TO WORD #5:

Crosses out several words

a difference, Tier II instruction, or individual intervention for spelling may be warranted.

Dynamic Assessment

In the context of curriculum-based assessment, this involves the clinician's working side by side with a student, using scaffolding techniques to facilitate the student's participation in a classroom activity. For this reason, it is sometimes called *participant observation* (Nelson, 2010). It allows the clinician to observe whether the student succeeds more fully with the scaffolding than without it. If the student does better with a little help from the clinician, then the skill being facilitated would be seen as within the student's zone of proximal development, one that the student is ready to learn in an intervention program. Elliot (2003) argued that the primary purpose of dynamic assessment should be the identification of strategies that will help the child to succeed in the curriculum. As such, dynamic assessment makes a lot of sense as a tool for RTI, deciding whether a child is likely to benefit from a relatively less intensive form of instruction at Tier II, or is more likely to need a longer, more individualized course of special education to acquire the target skill. Gillam and Justice (2010) suggest the use of dynamic assessment methods as a means of progress monitoring in classrooms using RTI, in order to track students' development in targeted skills to help decide which need to move to Tiers with higher levels of support.

Pêna (1996) discussed a variety of dynamic language assessment methods that can be adapted for participant observation in the classroom. These include the following:

- *Diagnostic teaching.* A child is given a difficult task, and then the clinician gives contextual support and cues. The clinician observes how the child responds to the cues; how much support, context, or prompting is needed to elicit the desired response. This information is used to develop a remedial plan. For example, we might give the child a writing task. Once the student does it without help, we see how providing a picture

cue helps or how using another student's work as an example improves performance. After trying several such supports, we would choose the most effective for our continued intervention with the student.

- *Successive cuing.* Several levels of cues are provided, and the clinician observes which is most effective. For example, in helping a student with word-finding difficulties acquire new words from the classroom curriculum, we might give the student a list to learn, and then ask the student to produce the words in a cloze activity. When the student gets stuck, we could sometimes offer a semantic cue, sometimes a phonological one, sometimes both. We could then assess what cues helped most. The intervention program would then develop self-cuing strategies for these supports.
- *Mediated learning experience.* This approach involves helping the student invoke metacognitive strategies. Students are given a task, such as finding synonyms for words. They are given mediation that explains the goal of the task (e.g., "We want to be able to have lots of different words to use for describing objects, events, and feelings."). Students are given strategies for finding synonyms, such as categorization, and comparing words and their meanings. They then are asked to find synonyms independently for a new set of words. The clinician observes whether the student independently invokes the strategies taught in completing the task with the new words. An example of a think-aloud protocol that might be used in this way appears in Table 11-13.

To use the example of spelling as a target for dynamic assessment, a clinician might adapt a procedure derived from Larsen and Nippold (2007) as a diagnostic teaching approach. This adaptation

appears in Box 11-16. Like the previous examples, the results of this assessment can help determine whether a spelling difficulty in present. It can also help to show whether a brief, low-intensity intervention, comparable to Tier II, is sufficient to overcome the difficulty, or whether more individualized special education will be necessary. Diagnostic teaching can also identify specific strategies that will be helpful to a student, as, for example, the procedure in Box 11-16 could be used to determine not only how quickly a student responds to scaffolding but whether the particular scaffold provided—in this case, morphological analysis—is useful.

CONSIDERATIONS FOR OLDER, SEVERELY AFFECTED STUDENTS AT THE L4L STAGE

Some adolescents and young adults with moderate to severe impairments may function at the L4L stage, with oral language commensurate with the early elementary grade levels and minimal reading or writing skills. For these students, assessment concerns are similar to those for younger students with LLD, but a few special considerations may be necessary. These students may not be participating in a regular curriculum and may be engaged in primarily vocational or independent-living programs. They will probably already be identified as eligible for services, so very little if any standardized testing is needed. Most assessment methods will be observational or criterion-referenced.

For these older clients, using chronologically age-appropriate materials and evaluating functional communicative needs are the paramount assessment concerns, just as they were for adolescents

TABLE 11-13 An Example of Dynamic Assessment of Metacognition with a Think-Aloud Protocol

Present student with task, such as reading a section of the classroom social studies textbook and answering the questions at the end.

Present Prompts

What do you think this section will be about?
How do you know?

After student reads a portion, stop him and ask,

Why did X (event) happen?
Why do you think that?
How could you find out if you don't know?

Choose a word that is likely to be unfamiliar to student.

What do you think *mesa* means here?
How could you tell?

Select a point that is not stated explicitly.

Why do you think the soldiers retreated to the mesa?
Why did you decide that?

Direct student to answer questions about section.

What is your plan for answering the questions?
What will you do if you don't know an answer?
Do you think all the answers will be found in what you read?

Observe Strategies

Scans text
Looks at title, headings
Looks at pictures
Identifies words

Prediction based on prior knowledge
Prediction based on cues in text
Rereads to find answer
Looks ahead to find answer in text

Uses contextual cues
Suggests using dictionary
Suggests teacher or other resource
Relates to personal experience

Infers based on text cues
Infers based on prior knowledge
Relates personal experience
Draws analogy
Rereads

Provides a sequence of actions
Attempts to integrate information from text, illustrations, etc.
Refers to differences between fact and opinion
Refers to prior knowledge

BOX 11-16 A Procedure for Diagnostic Teaching of Spelling, Derived from Larsen & Nippold's (2007) Dynamic Assessment Procedure

Clinician: "I am going to say some words and your job will be to tell me how you think we spell them. If some of the words are hard, I'll give you some help. Are you ready?"

PROMPT #1:

"Tell me how to spell *remake*." [use a word within the client's grade level expectations]

- A. If the client answers correctly, the examiner goes to Prompt #2.
- B. If the client does not respond or answers incorrectly, the examiner goes to Prompt #3.

PROMPT #2:

"How did you know that?"

- A. If the client's explanation refers to the individual morphemes, the examiner goes to the next word.
- B. If the client's explanation does not refer to the individual morphemes, the examiner goes to Prompt #3.

PROMPT #3:

"Does the word *remake* have any smaller parts?"

"What are those parts?"

- A. If the client answers correctly, the examiner asks, "Now can you tell me how to spell it?"

- B. If the client does not respond or answers incorrectly, the examiner goes to Prompt #4.

PROMPT #4:

"The smaller parts in this word are *re* and *make*. Now can you tell me how to spell it?"

- A. If the client answers correctly, the examiner goes to the next word.
- B. If the client does not respond or answers incorrectly, the examiner goes to Prompt #5.

PROMPT #5:

"Let's think about the sounds in the part/prefix *re*. What sounds do you hear; can you write them?"

- A. If the client answers correctly, the examiner goes to the next part of the word.
- B. If the client does not respond or answers incorrectly, the examiner goes to Prompt #6.

PROMPT #6:

"Which of these choices gives the correct spelling of *re*? (examiner presents three choices): (a) be; (b) ro; (c) re.

Adapted from Larsen & Nippold (2007). Morphological analysis in school-age children: Dynamic assessment of a word-learning strategy. *Language, Speech, and Hearing Services in Schools*, 38(3), 201-212.

Curriculum-based assessment is appropriate for adolescents at the L4L stage.

with developing language. When we do criterion-referenced or observational assessments for the older, moderately to severely impaired client, we want to use situations and props that are fitting for a person of this age, such as materials from the client's occupational training program or objects from self-care and daily living activities that the client is learning to perform independently, or from leisure activities in which the client likes to engage.

There also may be some "fine points" of the language system, such as complex sentences or mature narratives, that the young adult with moderate to severe impairment will never master. When this is the case, we would not want to withhold teaching other

important skills that are usually thought of as more advanced than these, just as we would not do so for clients with developing language. McCormick (1997a) reminds us that the premises of ecological assessment include the following:

- There are no minimal criteria or prerequisites for communication intervention. Any student with difficulty communicating can benefit from instruction and should have the opportunity to participate in classroom and social interactions. This is true regardless of whether the student's IQ is within or below the normal range.
- The focus of intervention should be providing whatever supports students need to participate in school and other important environments.

Ecological inventories such as those used for adolescents with developing language can also help us with older clients at the L4L stage to determine what communicative skills are needed to succeed in the client's daily environments. For some children, these environments will be regular classrooms, in which they are included for some or all of their instruction. McCormick (2003) outlined the steps we can use in the process of creating an ecological assessment, both for inclusion in regular educational settings, as well as for more community-referenced environments. These are summarized in Table 11-14.

For clients with very few reading and writing skills, for example, we might use an ecological inventory to determine what their literacy needs are in school, work, or independent living. These skills could be targeted even if reading and writing skills in general are at very low levels. Similarly, an ecological inventory of the client's school or work setting could be done to determine the dis-course situations and rules the client must deal with on a day-to-day

TABLE 11-14 Steps in the Process of Ecological Assessment

Step	Procedures	Outcome
1. Get to know the client.	Interview parents to learn about case history, their fears and dreams, the student's strengths and needs; observe student in classroom and other relevant settings.	Picture of student's strengths, needs, and preferences; a vision statement
2. List activities and routines in a typical day in this setting.	Compile the student's weekly schedule, observe the client in several environments, determine demands of each.	Schedule of weekly activities; a prioritized list of environments and their requirements
3. State goals, and list key activities/routines and set priorities among them.	Identify broad goals; then list 3 or 4 activities or routines that need to be mastered in order to accomplish each goal.	List of broad goals for 3–5 priority activities
4. Observe and record behaviors of typical participants or conduct interviews to determine the expectations of each activity.	Do observations and interviews to determine component skills and concepts for each activity.	List of what typical students do to accomplish each activity
5. Observe the student in each activity.	Record observations and describe what the client currently does in the activity—the degree to which he or she shows the skills necessary for participation.	Description of student's present level of performance
6. Compare the student's behavior to expectations. Note discrepancies.	Compare client's performance in each activity to expectations/desired performance.	Description of the behaviors/skills student needs to learn to participate in each priority activity
7. Identify the language/communication skills needed to achieve expectations.	Identify reasons why activities are not successfully performed (e.g., lack of skills, knowledge, strategies; interfering behaviors; instructional problem; environmental obstacles).	List of the language/communication skills student needs to learn and what may be interfering with current performance
8. Identify communication skills not currently demonstrated.	Give behavioral objectives for each activity.	List of instructional objectives for each goal above
9. Outline communication goals for each activity.	Identify physical and instructional modifications, adaptations, and supports needed. Determine an instructional focus for each objective.	List of needed modifications, adaptations, supports, and instructional objectives for each goal
10. Develop an IEP for these goals.	Plan who, when, and how each objective will be achieved.	List of environmental adaptations, resources, supports, and instructional priorities for each goal

Adapted from McCormick, L. (2003). Ecological assessment and planning. In L. McCormick, D. Loeb, & R. Schiefelbusch (Eds.). *Supporting children with communication difficulties in inclusive settings* (pp. 235-258). Boston: Allyn & Bacon.

basis. These particular discourse needs could be addressed in the intervention program.

For students using augmentative or alternative communication (AAC) devices, the development of literacy continues to be an especially important goal, since AAC devices that use some form of the printed word provide the most viable means of communication for these students. Fallon, Light, McNaughton, Drager, and Hammer (2004) have shown that these students can acquire literacy skills, and such skills make an important contribution to their ability to communicate with the broadest range of interlocutors. Light and McNaughton (1993) have suggested that there are two crucial pieces to literacy programs for AAC students at the L4L level: developing appropriate expectations and fostering functional literacy.

The research of Blischak, Shah, Lombardino, and Chiarella (2004) and Fallon et al. (2004) suggests that traditional direct instruction that includes work on both oral language bases in vocabulary knowledge, as well as work on phonological awareness and guided practice in single word reading is effective with these students, as it is with typical children. Paul (1998) has reviewed

literature showing that literacy development in children who use AAC benefits from the use of communication devices with voice output. Erickson, Koppenhaver, Yoder, and Nance (1997) report that voice output devices can benefit both literacy and general communication in these children. It is thought that these devices help their users match auditory images to intended meanings and improve their phonological awareness. This, as we know, is an important foundation for reading.

If children have not yet had the opportunity to use voice-output AAC devices when literacy emergence seems near, these opportunities should be provided, if at all possible. New technology is making these resources more readily available, with voice-output software now easily and cheaply accessible on smart phones and notepad computers. These resources can be tested for use with a particular client, using a diagnostic teaching approach, to determine whether there is a good fit. Onlooker assessment will also be an important element in the AAC assessment to determine whether the client is using his or her device in the classroom setting and, if not, what might be getting in the way. Procedures for fostering functional literacy in these students are discussed in more detail in Chapter 12.

CONSIDERATIONS FOR SPEAKERS WITH ASD AT THE L4L STAGE

Many speakers with autism spectrum disorders are included in mainstream classrooms today, and many can benefit from or even excel at the academic curriculum. Still, it is important to remember, as we saw in Chapter 4, that even high functioning individuals with ASD can have a range of language skills, from superior to more like those of children with LLD. For speakers with ASD, then, we will need to do the same sorts of evaluation of language skills that we do for other children with special needs, in order to establish baseline function and identify appropriate goals for intervention. However, there is one wrinkle: children with ASD will have their most significant impairments, and in some cases their only impairments, in the area of pragmatics. Many will achieve scores within the normal range on most standardized language tests, which typically focus on knowledge and use of basic words and sentences, and for this reason, it may be difficult to establish eligibility for language services. There are tests designed to measure pragmatics, such as the *Test of Language Competence* (TLC; Wiig & Secord, 1989), the *Test of Problem Solving* (Zachman, Huisinigh, Barrett, Orman, & LoGiudicia, 1994), the *Test of Pragmatic Skills* (Shulman, 1985), and the *Test of Pragmatic Language* (Phelps-Terasaki & Phelps-Gunn, 1992), as well as those that have subtests focused on pragmatics, such as the *Comprehensive Assessment of Spoken Language* (CASL; Carrow-Woolfolk, 1999b) and the *Diagnostic Evaluation of Language Variation* (DELV; Seymour, Roeper, & de Villiers, 2005). But, as we've seen, testing pragmatic function is difficult, because the very structure of the testing situations makes it different enough from real interaction to render the results invalid much of the time. Many speakers with ASD will score within the normal range on these measures, despite their real-world pragmatic difficulties. Normed checklists can sometimes be used to establish eligibility for services on the basis of pragmatic deficits. Two that have been used extensively with this population are the *Children's Communication Checklist—2* (Bishop, 2003) and the *Vineland Adaptive Behavior Scale—Communication Domain* (Sparrow, Cicchetti, & Balla, 2005). Both these measures are usually sensitive to the pragmatic problems experienced by students with ASD, and can be used to demonstrate that they have significant difficulties in this area, even when they test well on standard instruments. The *Pragmatic Language Skills Inventory* (Gilliam & Miller, 2006) can also be helpful. Timler (2009) suggests that one of the most telling assessments for these students is the use of a language sample taken during a peer interaction. This assessment can focus on the pragmatic skills that appear to be hindering interaction and can serve as a valid basis for developing an individualized pragmatic intervention program.

CONCLUSIONS

Nick and Maria are just two of the kinds of students with LLD that you may encounter in the elementary school. They express their language and learning deficits somewhat differently, and they react emotionally or behaviorally to their difficulties in different ways. Assessing their needs and those of other students at the L4L stage is a somewhat different problem than it was for children at earlier language levels. With younger children, we were looking primarily at deficits in language form and meaning. With students in the L4L stage, we need to investigate how they process and use language in

an important but unique communicative environment: that of the classroom. This means that assessment must, to a great extent, focus on that environment. It must attempt to discover errors and gaps in the child's language competence and also to look at mismatches and misperceptions reflected in the student's language performance in this environment. Finally, the clinician needs to look at how a student's oral language processing and use may be affecting the ability to move beyond oral language to the new modalities so necessary for success in school: the acquisition of literacy and literate language.

Let's take Maria as our example this time and see how her clinician might develop an assessment plan to begin to answer these questions and move toward developing an intervention program.

When Mr. McMahon, the school's SLP, circulated a teacher referral form to all the third-, fourth-, and fifth-grade teachers, the third-grade teacher was eager to fill one out for Maria. Mr. McMahon reviewed the form and convinced Maria's teacher and parents to place Maria in Tier II intervention so accommodations might be made for her in class. He observed her during academic subjects, and noted that she did not actively contribute to group activities, and seemed to be lost on many of her assignments. He suggested that, in addition to providing her with some extra small group instruction in Tier II, the teacher also try pairing her with a higher achieving classmate who would help her organize her work and make sure she understood the directions, as well as giving her extra time to complete assignments and respond to questions. After a month, Maria was continuing to have difficulty and to complain of stomachaches and so on. It was decided a full evaluation was necessary.

The school learning disability and reading specialists were part of the assessment team. They arranged a preassessment conference with the teacher and parents to discuss concerns and plan the assessment program. In addition, Mr. McMahon had a talk with Maria. He asked her how she was getting on in school and whether she had any trouble there. He explained that he would like to help her do better and have an easier time in school. At first she was resistant and sullen, but she warmed up after a while and agreed she would like to do better. Mr. McMahon told her about some of the things he would be doing with her and asked if she would agree to help him help her. She said she would, and they made a date to begin the assessment the following week.

Mr. McMahon developed the following plan for Maria's language evaluation:

- Review Medical and Educational History: Obtain the records from Maria's hospital stay following her accident. Note the nature and extent of her injuries, the length of her coma, and her rate of recovery. Study school records from before and after the accident. (She had had standardized achievement testing done in second grade before the accident and again after the accident when she repeated the grade.) This information can show where she had started out academically and what kind of regression, if any, took place.
- Standardized Testing to Establish Eligibility: *Clinical Evaluation of Language Fundamentals—4* (CELF—4) (if Maria

scores within normal range in all areas, give Test of Problem Solving or Test of Word Finding).

- Criterion-referenced assessments and behavioral observation to establish baseline function and identify intervention targets (to be done in the context of regular sessions once eligibility has been established and the student has begun an intervention program): 5-minute conversational speech sample to assess intelligibility, syntactic, errors, and word-finding problems; onlooker assessment in classroom to assess participation.
- Assess Phonological Awareness: *Lindamood Auditory Conceptualization Test—3*.
- If results of the receptive-language sections on the CELF—4 indicate problems, use curriculum-based onlooker assessment of the student's receptive vocabulary and syntax during a time when the teacher is giving instructions to the class. If classroom problems are evident, look for any signs that Maria can monitor her comprehension. Probe further in criterion-referenced assessments, using vocabulary and sentences drawn from teacher's instructional language and textbook material. Again, look for metacognitive as well as comprehension problems. Use both decontextualized (e.g., judgment tasks) and contextualized probes, and look for use of comprehension strategies in the decontextualized examples. Because of history of traumatic brain injury (TBI), expect delayed responses and inconsistent performance. Give extra time to respond, and give items several times if responded to incorrectly at first. Because Maria may do better in the less-distracting atmosphere of an individual assessment, contrast performance observed in the classroom-based onlooker assessment with performance in the individual settings.
- Audiorecord a sample of speech using an interview format. Evaluate the sample for syntactic and morphological errors and complex sentence use. If complex sentences are few, probe for complex forms and conjunctions that don't appear in the sample, using elicited production techniques. Also check for presyntactic semantic relations expressed in the sample. Because of history of TBI, consider analyzing speech disruptions as well.
- Do another curriculum-based onlooker assessment in the classroom, during a class project or discussion. Note Maria's use of advanced communicative intentions and adherence to classroom discourse rules. Because of TBI history, look carefully for difficulty in reading others' non-verbal cues, difficulty in integrating information received, difficulty knowing what aspect of a question needs to be answered, apparent lack of responsiveness that may result from information overload, difficulty in processing a series of directions, and reduced ability to use abstract language. If problems are evident, probe register variation in role-playing situations and presuppositional skills in barrier games. Use this information and that derived from the classroom observation to work with the teacher to develop a pragmatic intervention program to address classroom discourse problems.
- Collect a narrative sample by asking Maria to tell a story from a wordless picture book. Assess level of narrative macrostructure. If structure is immature, assess cohesion. If both areas are weak, address narrative skills in the intervention program.

- Assess metalinguistic skills using curriculum-based artifact assessment. Have Maria bring in a writing sample from class. Go over it together to edit it. Assess whether and how well Maria can attend to metalinguistics in editing. Assess metacognitive skills using dynamic participant observation in the classroom. This area may be of particular importance because of the history of traumatic injury.

Mr. McMahon was able to establish Maria's eligibility for services based on her performance on the CELF—4 as well as her medical history. The family agreed to an IEP that involved direct services by Mr. McMahon and the reading specialist, with consultation from the learning disabilities teacher. Mr. McMahon spent the first 2 weeks of his program completing the assessment plan. When he had accomplished all the assessments, he felt he knew a good deal about Maria and her strengths and needs and also about what her teacher expected from her in the classroom. He felt in a good position to design an intervention program that would address her needs and help her to succeed in the academic environment.

STUDY GUIDE

- I. Child and Family in the Assessment Process
 - A. Discuss family-centered practice as it relates to the school-age child.
 - B. What role should the client have in the assessment process?
 - C. What is the role of a case manager in an assessment of a school-age child?
- II. Identifying Students for Communication Assessment
 - A. Discuss kindergarten screening. How is it best accomplished? What are its advantages and disadvantages?
 - B. Discuss criteria for choosing a screening instrument for school-age children.
 - C. Describe several methods of case finding for the SLP in an elementary school setting.
 - D. Describe the role of assessment in RTI.
- III. Using Standardized Tests in the L4L Stage
 - A. For what purpose are standardized tests used in the L4L stage?
 - B. Why can establishing eligibility sometimes be a problem for children at this stage?
 - C. When should standardized tests of pragmatics be used?
- IV. Criterion-Referenced Assessment and Behavioral Observation in the L4L Stage
 - A. What aspects of phonology are part of the assessment of a child in the L4L stage?
 - B. Discuss two methods of assessing phonological awareness.
 - C. How can we assess receptive vocabulary using curriculum-based methods? Using other informal methods?
 - D. Discuss some aspects of expressive vocabulary that can be assessed with criterion-referenced procedures.
 - E. Outline a general strategy for assessing receptive syntax and morphology in the L4L stage.
 - F. Discuss some decontextualized methods of criterion-referenced comprehension assessment that are appropriate for children with LLD.

- G. How can we assess comprehension strategies in the L4L period?
- H. Discuss contextualized comprehension assessment techniques.
 - I. Outline a strategy for assessing expressive syntax and morphology from a speech sample in children with LLD.
 - J. Describe how to assess speech disruptions in a spontaneous speech sample. Under what conditions would you do this analysis?
- K. Describe the areas of conversational speech that can be assessed in a pragmatic evaluation of students with LLD. Give methods for assessing each.
- L. What are some methods for eliciting narrative samples in students with LLD?
- M. What aspects of narrative can be assessed in children in the L4L period? Discuss procedures for assessing each.
- N. What contributes to “artfulness” in children’s stories?
- O. Why and how would you assess metalinguistic awareness in students with LLD?
- P. How can metapragmatic awareness be assessed? Why would you want to assess it?
- Q. Discuss reasons and methods of assessing comprehension monitoring.
- R. What are the three types of curriculum-based assessment? Describe how you might use each one as one aspect of the assessment of a student with LLD.
- V. Considerations for the Students with ASD and Severe Impairment
 - A. What are the primary areas of impairment in speakers with ASD?
 - B. How can ecological inventories be used for students at the L4L stage?
 - C. Outline the steps in developing an ecological inventory for a student at the L4L stage.
 - D. What are the main issues to be concerned about for a child with ASD at the L4L stage? How can assessment address these issues?

A Sample of Language Screening Instruments for Grades K-5

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Assessment of Children's Language Comprehension, 1983 Revision</i> (Foster, R., Giddan, J.J., & Stark, J. [1983]. Rolling Meadows, IL: Riverside Publishing)	3–7 yr	Comprehension of word classes and utterances of increasing length and complexity	Normed on 311 individuals. Internal consistency: .80–.86. Administration time: 10–15 min.
<i>Bankson Language Screening Test</i> (Bankson, N.W. [1977]. Baltimore, MD: University Park Press)	4–6;11 yr	Semantics, morphology, syntax, auditory and visual perception	Yields standard and percentile rank scores. Lists 38 of the most discriminating items as appropriate for quick screen, but no norms for this screen. Administration time: 25 min. See BDI-2 in Table 11-2 . Administration time: 10–30 min.
<i>Battelle Development Inventory, Second Edition (BDI-2) Screening Test</i> (Newborg, J. [2004]. Itasca, IL: Riverside Publishing)	Birth–7;11 yr	Receptive and expressive language, cognitive, personal and social, adaptive, and motor	Informal screening. Looks at functional structural aspects of language.
<i>Bilingual Classroom Communication Profile</i> (Roseberry-McKibbin [1993]. Oceanside, CA: Academic Communication Associates)	4–11 yr	Distinguishes between communication differences and communication disorders	Child names common nouns, which are listed in English, French, Italian, and Spanish in manual.
<i>Bilingual Vocabulary Assessment Measure</i> (Mattes, L.J. [1995] Oceanside, CA: Academic Communication Associates)	3 yr and above	Expressive vocabulary	A separate form must be ordered for English/Vietnamese. Administration time: 20 min. Criterion-referenced.
<i>Carrow Elicited Language Inventory (CELI)</i> (Carrow, E. [1974]. Austin, TX: Learning Concepts)	3–8 yr	Morphology and syntax including pronouns, prepositions, conjunctions, articles, adverbs, WH questions, negatives, nouns, adjectives, verbs, infinitives, and a gerund	Normed on restricted group (white, middle-class) of 475 children. Test-retest reliability: .98. Interrater reliability: .98–.99. Administration time: 20–30 min.
<i>Children's Communication Checklist, Second Edition (CCC-2)</i> (Bishop, C. [2006]. San Antonio, TX: Pearson Assessment)	4–16 yr	10 areas: speech, syntax, semantics, coherence, inappropriate initiation, stereotyped language, use of context, nonverbal communication, social relations, and interests	Yields standard scores and percentiles for each of the 10 areas. 70-item checklist used to distinguish between children who have a specific language impairment and those who have more of a pragmatic deficit, such as autism. Administration time: 5–15 min. Criterion-referenced scores. Administration time: 15 min.
<i>Clinical Evaluation of Language Fundamentals-4 Screening Test (CELF-4 Screening Test)</i> (Wiig E.H., Secord, W., & Semel, E. [2004]. San Antonio, TX: Psychological Corporation)	5–21;11 yr	Receptive and expressive language, grammatical skills, and semantic skills	

Continued

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Compton Speech and Language Screening Evaluation-Revised Edition</i> (Compton, A. [1999]. San Francisco, CA: Carousel House)	3–6 yr	Expressive language, receptive language, articulation, auditory memory, oral mechanism, and motor coordination	Little statistical data available. Available in Spanish. Administration time: 10 min.
<i>Denver II</i> (Frankenburg, W.K., Archer, P., Bresnick, B., Maschka, P., Edelman, N., & Sharp, H. [1990]. Denver, CO: Denver Developmental Materials)	2 wk–6;11 yr	Expressive and receptive vocabulary, concepts, personal/social, fine and gross motor	Yields pass/fail criterion. Standardized on more than 2000 children in Denver (mixed SES, race). Good concurrent validity. Interrater reliability: 0.61–0.79. Available in Spanish. Administration time: 15–20 min. Provides standard deviation and percentile cutoff points by chronological age at 2-month intervals.
<i>Developmental Indicators for the Assessment of Learning-Third Edition (DIAL-3)</i> (Mardell-Czudnowski, C., & Goldenberg, D.S. [1998]. Circle Pines, MN: American Guidance Service)	3–6;11 yr	Motor, cognitive/basic concepts, language, self-help, and social	Normed on 1,560 English speaking and 605 Spanish-speaking children throughout the United States. Yields standard and percentile rank scores. English and Spanish materials included in one kit. Scoring software available. Administration time: 20–30 min. Shortened version of <i>DIAL-3</i> . English and Spanish materials included in one kit. Normed on same population of <i>DIAL-3</i> .
<i>Developmental Indicators for the Assessment of Learning-Speed DIAL</i> (Mardell-Czudnowski, C., & Goldenberg, D.S. [1998]. Circle Pines, MN: American Guidance Service)	3–6;11 yr	Language, motor, and cognitive/basic concepts	Administration time: 15–20 min. Yields standard, percentile rank, and age equivalent scores. Normed on 2,216 typically developing children. Parent/caregiver checklist available when interview is not possible. Administration time: 20–40 min. Clinical manual for assessing grammatical structure of spontaneous language.
<i>Developmental Profile- Third Edition (DP-3)</i> (Alpern, G.D. [2007]. Los Angeles, CA: Western Psychological Services)	Birth–12;11 yr	Expressive and receptive language, adaptive behavior, and social emotional, cognitive, and physical abilities	Criterion referenced scoring. Yields degree of language variation and degree of risk for a language disorder. Web-based product training. Administration time: 15–20 min.
<i>Developmental Sentence Analysis</i> (Lee, L. [1974]. Evanston, IL: Northwestern University Press)	2–6 yr	Syntax and morphology	
<i>Diagnostic Evaluation of Language Variation, Screening Test (DELV-Screening Test)</i> (Seymour, H.N., Roeper, T.W., & de Villiers, J. [2005]. San Antonio, TX: Psychological Corporation)	Language variation status: 4–12;11 yr. Variation status: 4–9;11 yr.	Comprehensive speech and language, including pragmatics, syntax, semantics, and phonology	
<i>Dos Amigos Verbal Language Scales-1996 Version (DAVLS-1996)</i> (Critchlow, D.E. [1996]. Novato, CA: Academic Therapy Publications)	5–13 yr	Semantics	Criterion referenced. Gives information to compare a child's development in Spanish and English and determine mixed language proficiency, language dominance, or if remediation is necessary. Administration time: 20 min. by an examiner fluent in both languages.
<i>Fluharty Preschool Speech and Language Screening Test-Second Edition (FPSLST-2)</i> (Fluharty, H.B. [2000]. Austin, TX: Pro-Ed)	3–6;11 yr	Receptive language, expressive language, and articulation	Administration time: 10 min.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Joliet 3-Minute Speech and Language Screen (Revised)</i> (Kinzler, M.C., & Johnson, C.C. [1993]. San Antonio, TX: Harcourt Assessment)	K, 2nd and 5th grades	Expressive syntax, receptive vocabulary, articulation, voice, and fluency	Provides pass/fail, cutoff score for each grade. Standardized on 2, 587 children from three different SES and ethnic backgrounds. Has computer program for record keeping. Administration time: 3 min.
<i>Kaufman Survey of Early Academic and Language Skills (K-SEALS)</i> (Kaufman, A.S., & Kaufman, N.L. [1993] Circle Pines, MN: AGS Publishing/Pearson Assessments)	3–6:11 yr	Receptive language, expressive language, numerical skills articulation	Yields standard, percentile rank, and age-equivalent scores, and descriptive categories. Internal consistency for subtests: .88 to .94. Test-retest reliability for subtests: .87 to .92. Administration time: 15–25 min.
<i>Kindergarten Language Screening Test, Second Edition (KLST-2)</i> (Gauthier, S.V. & Madison, C.L. [1998] Austin, TX: Pro-Ed)	3;6–6:11 yr	Receptive and expressive language including question and command comprehension, sentence repetition, object comparison and contrasting, spontaneous speech, and preschool knowledge	Yields standard and percentile rank scores. Normed on 154 kindergartners. Test-retest reliability: 0.87. Administration time: 5 min.
<i>Phonemic-Awareness Skills Screening (PASS)</i> (Crumrine, L., & Lonigan, H. [2000]. Austin, TX: Pro-Ed)	1st and 2nd grades	Phonemic and phonological awareness including rhyming, sentence segmentation, blending syllable segmentation, deletion, phoneme isolation, phoneme segmentation, and substitution	Criterion referenced with cutoff scores based on a sample of 166 students. Administration time: 15 min.
<i>Pragmatic Communication Skills Protocol</i> (Academic Communication Associates [1989]. Oceanside, CA: Academic Communication Associates)	3–11 yr	Pragmatics	Observations of child's use of language are recorded. Administration time: 20 min.
<i>Pragmatic Language Observation Scale</i> (Newcomer, P.L., & Hammill [2009]. Austin, TX: Hammill Institute on Disabilities)	8–17;11 yr	Expressive language and pragmatics	Norm-referenced teachers' rating scale. Normed on 994 persons in 15 states. Administration time: 5–10 min.
<i>Pre-Reading Inventory of Phonological Awareness (PIPA)</i> (Dodd, B., Crosbie, S., McIntosh, B., Teitzel, T., & Ozanne, A. [2003]. San Antonio, TX: Pearson)	4–6:11 yr	Phonological Awareness	Yields percentile ranges for 6-mth intervals. Can be administered by speech-language pathologists, teachers, and paraprofessionals. Administration time: 25–30 min.
<i>Preschool Language Scale-4 Screening Test (PLS-4 Screening Test)</i> (Zimmerman, I. L., Steiner, V. G., & Pond, R. E. [2005]. San Antonio, TX, Psychological Corporation)	3–6:11 yr	Receptive and expressive language, articulation, voice, fluency, and pragmatics	Norm-based criterion-referenced scores for language and articulation. Descriptive information for social/interpersonal, communication skills, fluency and voice. Administration time: 5–10 min.
<i>The Primary Language Screen (TPLS)</i> (Eger, D. L. [1990]. Norcross, GA: Speech Bin)	Ages 5-7 yr Grades K-1st	Receptive and expressive language and speech skills	Individual or group administration. Administration time: 5–10 min.
<i>Screening Kit of Language Development (SKOLD)</i> (Bliss, L.S., & Allen, D.V. [1983]. East Aurora, NY: Slosson Educational Publications)	2-5 yr	Vocabulary, comprehension, story completion, sentence repetition, auditory comprehension (commands).	Normed for Standard and "Black English." Administration time: 15 min.

Continued

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Selective Auditory Attention Test (SAAT)</i> (Cherry, R. [1980]. St. Louis, Missouri: Auditec)	4–9 years	Auditory processing	Closed-set picture point task. Words in quiet and words with a competing message presented. Administration time: 15–20 min.
Slosson Auditory Perceptual Skill Screener (SAPSS). (Erford, B. T. [2005]. East Aurora, NY: Slosson Educational Publications)	5–10 years	Auditory processing and auditory perception	Administration time: 15 min.
<i>Speech-Ease Screening Inventory (SESI)</i> (Speech-Ease [1985]. Austin, TX: Pro-Ed)	K-1 st grade	Articulation, language association, auditory recall, expressive vocabulary, and concept development	Has optional section with similarities and differences and language sample. Administration time: 7–10 min.
<i>Test of Auditory Analysis Skills (TAAS)</i> . (Rosner, J. [1979]. Novato, CA: Academic Therapy)	5–8 years	Auditory sequencing, phonemic analysis and synthesis skills with single word phonetic deletion (beginning sound, ending sound, or part of a blend)	Criterion-referenced. Administration time: 3 min.
<i>Wepman's Auditory Discrimination Test (ADT), Second Edition</i> (Wepman, J.M., & Reynolds, W.M. [1986]. Los Angeles, CA: Western Psychological Services)	4–8 yr	Auditory discrimination	Normative sample approx. 2,000 children. Yields standard and percentile rank scores. Administration: 5 min.
<i>The WH Question Comprehension Test</i> (Vicker, B. [2002]. Bloomington, Indiana: Indiana Resource Center for Autism)	4 yr–adults with cognitive impairments	WH question form comprehension	Designed for use within the classroom and other settings. Designed for use with speakers with autism spectrum disorders, Down syndrome, and language difficulties. Administration time: 20–30 min.
<i>The Wilson Syntax Screening Test</i> (Wilson, M.S. [2000]. San Antonio, TX: Psychological Corporation)	Pre-K–Kindergarten	Screening for children with specific language impairments	20-item screener that uses 20 grammatical markers. Administration time: 2–4 min.
<i>Woodcock-Munoz Language Survey-Revised</i> (Woodcock, R.W., Munoz-Sanoval, A.F., Ruef, M.L., & Alvarado, C.G. [2005]. Rolling Meadows, IL: Riverside Publishing)	2;5 yr–adult	Oral language, reading, and writing in the areas of picture vocabulary, verbal analogies, letter-word recognition, and dictation	Establishes language proficiency in English and Spanish. Administration time: 25 min.

A Sample of Language Assessment Tools for Grades K-5

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Assessing and Teaching Phonological Knowledge</i> (Munro, J. [1998]. Victoria, Australia: Australian Council for Educational Research Press)	First 3 years of school and older children experiencing reading difficulties	Phonological awareness including sound patterns in words, segmentation, sound blending, sound manipulation, and phonemic recoding	Administration time: variable
<i>Assessing Semantic Skills through Everyday Themes (ASSET)</i> (Barrett, M., Zachwn, L., & Huisin, R. [1988]. East Moline, IL: LinguiSystems)	3–9;11 yr	Receptive and expressive semantics including labels, categories, attributes, functions, and definitions	Test designed around six common everyday life themes. Normed on 706 school-age children.
<i>Assessment and Treatment of Narrative Skills: What's the Story?</i> (Apel, K., & Masterson, J. [1998]. Rockville, MD: American Speech-Language-Hearing Association)	School-age	Narrative	4-hr videotape and manual. This CE course examines procedures, strategies, and ideas for evaluating and treating narrative deficiencies in school-age children with language-learning impairments
<i>Assessment, Evaluation, and Programming System for Infants and Children, Second Edition (AEPS-2)</i> (Briker, D. [2002]. Baltimore, MD: Paul H. Brookes Publishing)	Birth–6 years	Social communication, social development, cognitive, adaptive, fine motor, and gross motor	Administration time: varies
<i>Assessment of Comprehension and Expression 6–11 (ACE 6–11)</i> (Adams, C., Coke, R., Crutchley, A., Hesketh, A., & Reeves, D. [2001]. Berkshire, UK: NFER-Nelson)	6–11;11 yr	Receptive and expressive language including sentence comprehension, inferential comprehension, naming, syntactic formulation, semantic decisions, non-literal comprehension, and narrative	Administration time: 30–45 min.
<i>Assessment of Literacy and Language (ALL)</i> (Lombardino, L. J., Lieberman, R. J., & Brown, J.C. [2005]. San Antonio, TX: Psychological Corporation)	Preschool-1st grade	Spoken language, written language, language comprehension, semantics, syntax, phonological awareness, alphabetic principles/phonics, and concepts about print	Subtests correspond with Reading First Program instructional components. Administration time: 60 min or less.
<i>Aston Index-Revised</i> (Newton, M., & Thomson, M.E. [1982]. Wisbech, Cambridgeshire, UK: LDA)	5–14 yr	Receptive language, written language, reading, visual perception, auditory discrimination	Index contains 16 tests. Picture recognition scale: criterion-referenced. Vocabulary Scale: norm-referenced. Auditory Sequential Memory Scale: Criterion-referenced.
<i>Auditory Perception Test for the Hearing Impaired, Revised (APT/II)</i> (Allen, S.G. [2008]. San Diego, CA: Plural Publishing)	5 yr and up	Linguistic processing, suprasegmental processing, speech decoding	Profiles allow for pre- and post-treatment comparison. Can be used with children who have other auditory processing difficulties, although designed for those with hearing impairment. Includes CD. Administration time: 30 min.

Continued

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Auditory Processing Abilities Test (APAT)</i> (Ross-Swain, D., & Long, N. [2004]. Novato, CA: Academic Therapy Publications)	5–12;11 yr	Auditory processing including linguistic processing and auditory memory	Administration time: 45 min.
<i>Bader Reading and Language Inventory-6th Edition</i> (Bader, L. [2008]. Upper Saddle River, NJ: Prentice Hall)	K–12 and adult	Inventory of tests to assess reading and language abilities	Graded reading passages for all ages and skill levels. Pre-literacy tests, including cloze tests to assess knowledge of semantics and syntactic processing, phonics, and structural analysis. Interest and attitude section to determine type of environment student might flourish most in. Emphasis on portfolio assessment. Includes an ESL test.
<i>Bankson Language Test-Second Edition (BLT-2)</i> (Bankson, N.W. [1990]. Austin, TX: Pro-Ed)	3–6;11 yr	Semantics, syntax, morphology, pragmatics	Yields standard and percentile rank scores. Standardized on more than 1,200 children in 19 states in the United States.
<i>Battelle Developmental Inventory-Second Edition (BDI-2)</i> (Newborg, J. [2004]. Itasca, IL: Riverside Publishing)	Birth–7;11 yr	Speech and language, social/emotional, cognitive, motoric skills, learning, and hearing	Administration time: 10–15 min. Normative data gathered from over 2,500 children. Yields standard, age equivalent scores. BDI-2 Spanish also available. Scoring CD and Web-based computer scoring available. Administration time: 1–2 hr.
<i>Bilingual Syntax Measure II</i> (Burt, M.K., & Dulay, H.C. [1978]. San Antonio, TX: Pearson)	6–11;11 yr	Receptive and expressive language including sentence comprehension, inferential comprehension, naming, syntactic formulation, semantic decisions, non-literal comprehension, and narrative	
<i>Bilingual Verbal Ability Tests (BVAT) Normative Update Edition</i> (Munoz-Sandoval, A.F., Cummins, J., Alvarado, C.G., & Ruef M.L. [2005] Itasca, IL: Riverside Publishing)	5 yr–adult	Overall verbal ability	For bilingual individuals. Norm-referenced. Provides assessment in 17 languages (Arabic, Chinese, French, German, Haitian-Creole, Hindi, Hmong, Italian, Japanese, Korean, Navajo, Polish, Portuguese, Russian, Spanish, Turkish, and Vietnamese) plus English. Computerized scoring available. Administration time: 20–30 min.
<i>Boehm Test of Basic Concepts-Third Edition (Boehm-3)</i> (Boehm, A.E. [2000]. San Antonio, TX: Psychological Corporation)	K–2nd grade	Receptive language concepts	Yields percentile scores and performance ranges. Separate fall and spring norms to evaluate progress in beginning and ending of school year Normed on 6000 students in Fall 2000 and 4000 students in Spring 2000. Spanish edition available: normed on 300 children for each term from bilingual classroom as in the United States. Provides norms for English and Spanish speakers. Administration time: 15–25 min individual and 30–45 min classroom

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Bracken Basic Concept Scale- Expressive (BBCS-E)</i> (Bracken, B.A. [2006] San Antonio, TX: Pearson)	3–6;11 yr	Receptive and expressive language, cognitive development, and school readiness	Yields scaled, composite, percentile, and age-equivalent scores and descriptive classification. Normed on 750 children including those with language and learning impairments. Spanish (criterion-referenced) version available. Scoring software (Bracken Scoring Assistant available). Administration time: 20–25 min.
<i>Bracken Basic Concept Scale-Third Edition: Receptive (BBCS-3:R)</i> (Bracken, B.A. [2006] San Antonio, TX: Pearson)	3–6;11 yr	Expressive and receptive language, cognitive development, school readiness	Yields scaled, composite, percentile, and age-equivalent scores and descriptive classification. Normed on 750 children including those with language and learning impairments. Spanish (criterion-referenced) version available. Scoring and reporting software (Bracken Scoring Assistant available). Administration time: 10–15 min.
<i>Carolina Picture Vocabulary Test (CPVT)</i> (Layton, T.L., & Holmes, D.W. [1985]. Austin, TX: Pro-Ed)	4–11;5 yr	Receptive sign vocabulary	Designed for deaf and hearing impaired. Yields scale scores, percentile ranks, and age equivalents. Standardized on 767 children who use manual sign. Administration time: 10–15 min.
<i>Children's Communication Checklist, Second Edition (CCC-2)</i> (Bishop, C. [2003]. San Antonio, TX: Pearson)	4–16 yr	10 areas: speech, syntax, semantics, coherence, inappropriate initiation, stereotyped language, use of context, nonverbal communication, social relations, and interests	Standard scores and percentiles for each of the 10 areas. 70-item checklist used to distinguish between children who have a specific language impairment from those who have more of a pragmatic deficit, such as autism. Administration time: 5–15 min.
<i>Clinical Evaluation of Language Fundamentals-Fourth Edition (CELF-4)</i> (Semel, E., Wiig E.H., & Secord, W. [2004]. San Antonio, TX: Pearson)	5–21 yr	Semantics, syntax, memory, receptive and expressive composite, and pragmatics checklist	Yields, standard, percentile, age-equivalent scores. Normed on 2,650 students in regular and special education and students with language disorders (4%). Scoring Assistant available for calculating scores and generating customizable reports of test results. Training CD available. Administration time: 30–60 min.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Clinical Evaluation of Language Fundamentals-Fourth Edition, Spanish (CELF-4 Spanish)</i> (Semel, E., Wiig E.H., & Secord, W. [2006]. San Antonio, Pearson)	5–21;11 yr	Semantics, syntax, memory, receptive and expressive composite, and pragmatics checklist	Designed as a parallel test to the CELF-4 for Spanish speakers living in the United States. Normed on Spanish speakers in the U.S. of the following descents: Caribbean (from Puerto Rico, Dominican Republic, and Cuba)—25%; Central and South American—28%; and Mexican—46%. Includes appropriate grammatical forms and familiar themes for Spanish-speaking students. Yields, standard, percentile, age-equivalent scores. Scoring Assistant provides reports for parents in both Spanish and English. Administration time: 20–60 min. Yields standard scores, percentile ranks.
<i>Communication Abilities Diagnostic Test (CADET)</i> (Johnston, E.B. & Johnston, A.V. (1990). Austin, TX: Pro-Ed)	3–9 yr	Syntax, semantics, pragmatics	Normed on over 1000 nationwide. Administration time: 30–45 min. Designed for measuring language delay, expressive language disorders, dyslexia, and aphasia. Computerized scoring available. Administration time (for core battery): 30–45 min. Highlights discrepancies between receptive and expressive vocabulary. Allows for documentation of oral vocabulary progress post-intervention. Provides measurement of oral vocabulary for research studies. Administration time: 20–30 min.
<i>Comprehensive Assessment of Spoken Language (CASL)</i> (Carrow-Woolfolk, E. [1999]. Circle Pines, IL: American Guidance Services)	3;9–21;11 yr	Language processing (lexical/semantic, syntactic, supralinguistic, and pragmatic)	Two versions: Ages 5–6 and Ages 7–24. Yields standard, percentile rank, and age- and grade-equivalent scores. Administration time: 30 min. Various approaches used for computerized analysis of language samples. Programs for scoring African American Vernacular English. Administration time: variable
<i>Comprehensive Receptive and Expressive Vocabulary Test-Second Edition (CREVT-2)</i> (Wallace, G., & Hammill, D.D. [2002] Austin, TX: Pro-Ed)	4–89;11 yr	Receptive and expressive vocabulary	Criterion-referenced language probes. Administration untimed. Yields standard, percentile, and age-equivalent scores. Presents construct validity and reliability. Administration time: 15–45 min. Criterion-referenced. Administration time: 20–30 min.
<i>Comprehensive Test of Phonological Processing (CTOPP)</i> (Wagner, R., Torgesen, J., & Rashotte, C. [1999]. Austin, TX: Pro-Ed)	5–24 yr	Phonological processing including phonological awareness, phonological memory, and rapid naming	
<i>Computerized Profiling 9.7.0 (CP 9.7.0)</i> (Long, S.H., & Fey, M.E. [2005]. Cleveland, OH: Case Western Reserve University)	All ages	Semantics, syntax, phonology, prosody, pragmatics, and narrative	
<i>Criterion Referenced Inventory of Language (CRIL)</i> (Wigg, E. (1990). San Antonio, TX: Pearson)	4–13 yr	Pragmatics, semantics, syntax, and morphology	
<i>Detroit Tests of Learning Aptitude-Primary, Third Edition (DTLA-P:3)</i> (Hammill, D.D., & Bryant, B.R. [2005]. Austin, TX: Pro-Ed)	3–9;11 yr	Domains: linguistic, cognitive, attentional, and motoric	
<i>A Developmental Assessment for Students with Severe Disabilities-Second Edition (DASH-2)</i> (Dykens, M.K., & Erin, J. [1999]. Austin, TX: Pro-Ed)	Birth–6;11 yr	Receptive and expressive language, activities of daily living, social-emotional, sensory motor, and basic academic skills	

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Developmental Profile- Third Edition, DP-3</i> (Alpern, G.D. [2007]. Los Angeles, CA: Western Psychological Services)	Birth–12;11 yr	Expressive and receptive language, and adaptive behavior, and social emotional, cognitive, and physical abilities	Yields standard, percentile rank, and age-equivalent scores. Normed on 2,216 typically developing children. Parent/caregiver checklist available when interview is not possible. Administration time: 20–40 min.
<i>Developmental Test of Auditory Perception (DTAP)</i> (Reynolds, C.R., Voress, J.K., & Pearson, N.A. [2008]. Austin, TX: Pro-Ed)	6-18;11 yr	Auditory perception including phonemes in isolation, word discrimination, rhyming sounds, tonal patterns, and environmental sounds	Yields standard and percentile rank scores and descriptive categories/severity levels. Normed on 1,920 children and teens in 13 states. Includes two Auditory Perception Indexes: Language and Nonlanguage. Administration time: 30 min.
<i>Diagnostic Evaluation of Language Variation (DELV-Criterion Referenced)</i> (Seymour, H.N., Roeper, T.W., & de Villiers, J. [2005]. San Antonio, TX: Pearson)	4–9 yr	Comprehensive speech and language, including pragmatics, syntax, semantics, and phonology	Helps distinguish language differences from language disorders. Criterion referenced scoring. Administration time: 45–50 min.
<i>Diagnostic Evaluation of Language Variation (DELV-Norm Referenced)</i> (Seymour, H.N., Roeper, T.W., & de Villiers, J. [2005]. San Antonio, TX: Pearson)	4–9;11 yr	Comprehensive speech and language, including pragmatics, syntax, semantics, and phonology	Helps distinguish language differences from language disorders. Domain scaled scores, composite standard scores, percentile ranks, and age equivalents. Normed on national sample of 900 children. Web-based product training. Administration time: 45–50 min.
<i>Differential Screening Test for Processing</i> (Richard, G. J., & Ferre, J. [2006]. East Moline, IL: LinguiSystems)	6–12 yr Grades 1–7	Processing including acoustic skills (dichotic digits, temporal patterning, auditory discrimination), acoustic-linguistic skills (phonemic manipulation, phonic manipulation), and linguistic skills (antonyms, prosodic interpretation, language organization)	Normed on 509 subjects from across the United States in regular and special education and across socioeconomic levels. Administration time: 35 min.
<i>Dynamic Assessment and Intervention: Improving Children's Narrative Abilities</i> (Miller, L., Gillam, R., & Peña, E. [2001]. Austin, TX: Pro-Ed)	School-age	Narrative	Uses wordless picture books. Allows determination of students' responses to different types of supports.
<i>The elementary HELP Test</i> (Lazzari, A.M. [1996]. East Moline, IL: LinguiSystems)	6–11 yr	Expressive language, including semantics, general and specific vocabulary, word order, question grammar, and defining	Normed on 2,131 students. Yields standard, percentile rank, and age-equivalent scores. Correlates with the HELP series therapy materials for oral and written practice. Administration time 25–30 min.
<i>Emerging Literacy & Language Assessment (ELLA)</i> (Wiig, E., & Secord, W. [2006]. Greenville, SC: Super Duper Publications)	Ages 4;6–9;11 yr	Emerging literacy and language including phonological awareness, sign and symbol recognition, reading comprehension, rapid naming, word associations, and story retell	Yields standard, percentile rank, and age-equivalent scores. Normed on over 1,200 children in 40 states in the United States including those receiving reading remediation and those with language and learning disorders. Administration time: 30–45 minutes (ages 4;6-5; 5 yr); 1 hr (ages 5;6-9;11 yr)

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Evaluating Acquired Skills in Communication-Third Edition (EASIC-3)</i> (Marcott, A. [2009]. Austin TX: Pro-Ed)	3 mo–6;3 yr	Semantics, syntax, morphology, and pragmatics	Designed for use with children with severe cognitive and language disorders. Profile allows for comparison of performance over time. Developmental age charts included. Criterion-referenced. Administration time: 15–30 min. Criterion-referenced. Administration time: 45 min.
<i>Evaluating Communicative Competence, Revised 2nd Edition</i> (Simon, C.S. [1994]. Tempe, AZ: Communi-Cog Publications)	10–18 yr	Language processing, metalinguistic skills, and functional uses of language	
<i>The Expression Connection</i> (Klecan-Aker, J.S., & Brueggeman, L. [1991]. Norcross, GA: Speech Bin)	6–12 yr	Narrative skills	Criterion referenced. Administration time: 1–20 min.
<i>The Expressive Language Test</i> (Huisin, R., Bowers, L., LoGiudice, C., & Orman, J. [1998]. East Moline, IL: LinguiSystems)	5–11;11 yr	Expressive language, including sequencing, metalinguistics, grammar and syntax, concepts, categorizing, and describing	Normed on 2,666 children. Yields standard, percentile ranks, and age equivalent scores. Manual includes an extensive section of remediation suggestions specific to each subtest. Administration time: 40–45 min. Norming sample related to ROWPVT. Yields standard, percentile, age-equivalent scores. Administration time: 20 min. For speakers who are bilingual in Spanish and English. National norming sample of Spanish-bilingual individuals. Designed to reveal total acquired vocabulary, as examinees may respond in either language. Administration time: 30–45 min. Normed on over 4,000 people. Yields age- and grade-based standard scores, growth scale values, percentiles, normal curve equivalents, stanines, and age- and grade-equivalents. ASSIST software and reporting software available. Administration time: 10–20 min. Appropriate in any setting: school, hospital, and immediate care facilities. No scoring system. Reporting software available. Administration time: 40–90 min. Imitation and prompting used to elicit simple & complex utterances. Appropriate for use with individuals with language impairments, learning disabilities, hearing impairments, autism, and aphasia.
<i>Expressive One-Word Picture Vocabulary Test-2000 Edition</i> (Brownell, R., (Ed.) [2000]. Novato, CA: Academic Therapy Publications)	2–18 yr	Expressive vocabulary	
<i>Expressive One-Word Picture Vocabulary Test: Spanish-Bilingual Edition (EOWPVT-SBE)</i> (Brownell, R., (Ed.) [2000]. Novato, CA: Academic Therapy Publications)	4–12 yr	Expressive vocabulary	
<i>Expressive Vocabulary Test-Second Edition (EVT-2)</i> (Williams, K.T. [2007]. San Antonio, TX: Pearson)	2–90+ yr	Expressive vocabulary and word retrieval	
<i>Functional Communication Profile-Revised (FCP-R)</i> (Kleinman, L.I. [2003]. East Moline, IL: LinguiSystems)	3 yr–adult	Receptive, expressive, and pragmatic/social language, speech, voice, oral, fluency, non-oral communication, sensory/motor/behavior, and attentiveness.	
<i>Grammatical Analysis of Elicited Language-Pre-Sentence Level (GAEL-P)</i> (Moog, J.S., Kozak, V.J., Geers, A.E. [1983]. St. Louis, MO: Central Institute for the Deaf)	3–6 yr	Syntax, language processing and language production	

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Illinois Test of Psycholinguistic Abilities-Third Edition (ITP-3)</i> (Hammill, D.D., Mather, N., & Roberts, R. [2001]. Austin: TX: Pro-Ed)	5-12;11 yr	Spoken and written vocabulary, spelling, rhyming, sentence sequencing, grammar, and phonology	Provides general language, spoken language, and written language composite scores. Includes software for scoring and reporting.
<i>Language Assessment Scales-Oral (LAS-O)</i> (Duncan, S.E., & De Avila, E.A. [1990]. Monterey, CA: CTB/McGraw-Hill)	Grades 1-12	Assesses listening and speaking in limited or non-English speakers	Administration time: 45 min-1 hr. Available in English and Spanish. Designed for bilingual or ESL program placement.
<i>Language Assessment Scales-Reading and Writing (LAS R/W)</i> (Duncan, S.E., & De Avila E.A. [1994]. Monterey, CA: CTB/McGraw-Hill)	Grades 2-12	Assesses reading and writing in limited or non-English speakers	Administration untimed. Available in English and Spanish. Designed for bilingual or ESL program placement.
<i>Language Processing Test 3: Elementary (LPT 3: Elementary)</i> (Richard, G. J. & Hanner, M. A. [2005] East Moline, IL: LinguiSystems)	5-11;11 yr; grades K-6	Labeling, stating function, associations, categorization, similarities, differences, multiple meanings, and attributes	Administration untimed. Yields standard, percentile rank, and age-equivalent scores. Normative sample of 1,313 subjects. Test-retest coefficients for test score range from .69 to .92 across age levels.
<i>Lindamood Auditory Conceptualization Test-3rd Edition (LAC-3)</i> Lindamood, C.H., & Lindamood, P.C. [2004]. Austin, TX: Pro-Ed)	5-18;11 yr	Phonological analysis	Administration time: 35 min. Provides standard scores, percentile ranks, age and grade equivalents.
<i>The Listening Test.</i>) Barrett, M., Huisinigh, R., Bowers, L., LoGiudice, C., & Orman, J. [1992]. East Moline, IL: LinguiSystems)	6-11;11 yr	Listening and comprehension skills including the following areas: main idea, details, concepts, reasoning, and story comprehension	Has English and Spanish versions. Administration time: 20-30 min. Designed to rate listening performance within the classroom setting.
<i>Montgomery Assessment of Vocabulary Acquisition (MAVA)</i> (Montgomery, J.K. [2008]. Greenville, SC: Super Duper Publications)	3-12;11 yr	Receptive and expressive vocabulary	Administration time: 35 min. Evaluates knowledge of basic (tier one), high frequency (tier two), and curriculum-based (tier three) words. Yields standard, percentile rank, age equivalent scores. Receptive test normed on over 1,300 children. Expressive test normed on over 1,200 children. Test-retest, inter-rater reliability, and concurrent validity all over .90. Includes an online qualitative response analyzer.
<i>Oral Communication Battery (OCB)</i> (Peins, M., & Knolmayer Glazewski, B. [1997]. Oceanside, CA: Academic Communication Associates)	3-8yr	Phonology, syntax, semantics, morphology, pragmatics, following directions, storytelling, word and sentence comprehension, voice, fluency, articulation/phonology, and phonological awareness	Administration time: 30 min. Informal assessment tool. Vocabulary measures are included in English and Spanish.

<i>Oral and Written Language Scales (OWLS)</i> (Carrow-Woolfolk, E. [1996]. Circle Pines, MN: American Guidance Service)	3–21;11 yr (listening comprehension/ oral expression; 5–21;11 yr (written expression)	Receptive and expressive language and written language skills	Contains 3 scales: Listening Comprehension, Oral Expression, and Written Expression. Age-based raw scores can be converted to standard scores, percentile ranks, normal curve equivalents, stanines, and age-equivalents. Administration time: Listening Comprehension Scale, 5–15 min; Oral Expression Scale: 10–25 min.
<i>The Oral Language Acquisition Inventory (OLAI)</i> (Gentile, L. [2003]. Carlsbad, CA: Dominic Press)	Pre-K–3rd grade	Repeated sentences, sentence transformations, story reconstruction, narrative comprehension, picture drawing, narration, dictation, information processing, and critical dialogue	Yields frequency counts and individual profile of language structures. Oral Instructional Guide available.
<i>Patterned Elicitation of Syntax Test (Revised) with Morphophonemic Analysis (PEST-R)</i> (Young, E.C., & Perachio, J.J. [1993]. San Antonio, TX: Pearson)	3–7;6 yr	Expressive syntax and morphology	Uses delayed imitation. Includes morphophonemic analysis. Provides means and standard deviation for age, and percentile ranks. Normed on 651 children in four states. Administration time: 20 min.
<i>Peabody Picture Vocabulary Test-4 (PPVT-4)</i> (Dunn, L.M., & Dunn, D.M. [2007]. Minneapolis, MN: Pearson)	2;6–90+ yr	Receptive vocabulary	Provides standard error of measurement and confidence intervals for score. Norming sample related to EVT. Yields standard scores, percentile ranks, age equivalents, and stanines. Spanish version available. ASSIST scoring and reporting software available. Standardized on 4012 children, ages 2–18 yr. Administration time: 10–20 min. Criterion-referenced. Gives performance profile. Administration time: 10–20 min.
<i>The Phonological Awareness Profile</i> (Robertson, C., & Salter, W. [1995]. East Moline, IL: LinguSystems)	5–8;11 yr	Phonological processing and phoneme-grapheme correspondence including the following tasks: rhyming, segmentation, isolation, deletion, substitution, blending, & decoding	
<i>The Phonological Awareness Test 2</i> (Robertson, C., & Salter, W. [2007]. East Moline, IL: LinguSystems)	5–9;11 yr K–4th grade	Phonological processing and phoneme-grapheme correspondence including the following tasks: rhyming, segmentation, isolation, deletion, substitution, graphemes, blending, decoding, invented spelling	Normative sample of 1,582 subjects from both special and general education, several U.S. racial and ethnic groups, and across socioeconomic levels. Yields Phonological Awareness and Phone-Grapheme Correspondence scores and total test composite score. Test-retest coefficients exceed .90. Scoring software available. Administration time: 40 min.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Porch Index of Communicative Ability in Children (PICAC)</i> (Porch, B.E. [1981]. Albuquerque, NM: PICA Programs)	3–12 yr	Verbal, gestural, and graphic abilities	Scores responses qualitatively. Two batteries: ages 3–5 and 6–12. Provides means and percentiles. Standardized on several hundred children representative of U.S. census.
<i>Pragmatic Language Skills Inventory (PLSI)</i> (Gilliam, J.A., & Miller, L. [2006]. Austin, TX: Pro-Ed)	5;0–12;11 yr	Pragmatic language skills including personal interaction, social interaction, and classroom interaction skills	Administration time: 30–60 min. Norm-referenced rating scale. Utilizes cut-off scores to characterize presence of a pragmatic language disorder.
<i>Preschool Language Scale-Fifth Edition (PLS-5)</i> (Zimmerman, I. L., Steiner, V. G., & Pond, R. E. [2011]. San Antonio, TX: Psychological Corporation)	Birth–6;11 yr	Receptive and expressive language	Administration time: 5–10 min. Yields standard, percentile rank, and language age-equivalent scores. Normed on 1,500 children including those with special needs. Test retest reliability .90–.97 for the total language score. Includes caregiver questionnaire. Includes items that evaluate phonological awareness skills for 5- and 6-year-olds. Spanish Edition available.
<i>Preschool Language Scale-Fourth Edition Measure of Progress (PLS-4 Measure of Progress)</i> (Zimmerman, I. L., Steiner, V. G., & Pond, R. E. [2007]. San Antonio, TX: Psychological Corporation)	Birth–6;11 yr	Receptive and expressive language	Administration time: 20–45 min. Yields progress scores using current and past obtained PLS-4 raw scores. Helps quantify therapy and intervention results.
<i>Receptive One-Word Picture Vocabulary Test-2000 Edition (ROWPVT-2000)</i> (Brownell, R. (Ed.) [2000]. Novato, CA: Academic Therapy Publications)	2–18;11 yr	Receptive vocabulary	Administration time: 10–15 min. Yields standard, percentile, and age-equivalent scores. Percentiles based on over 2,000 individuals for English Edition. Spanish-bilingual edition available (Ages 4–12;11 yr).
<i>Renfrew Language Scales Action Picture Test, Fourth New Edition of Revised Edition</i> (Renfrew, C., & Hancox, L. [1999]. Milton Keynes, UK: Speechmark Publishing)	3–8 years	Semantics, Syntax	Administration time: 15–20 min. Norm-referenced. Yields age-equivalent scores. Administration time: untimed
<i>Rhode Island Test of Language Structure (RITLS)</i> (Engen, E., & Engen, T. [1983]. Austin, TX: Pro-Ed)	3–20 yr (hearing impaired); 3–6 years (normal hearing)	Receptive syntax	Designed for hearing impaired, but can be used for learning-disordered or for English-as-a-second-language populations. Standardized on 513 children with hearing impairment and 283 hearing children. Administration time: 30 min.
<i>Rice/Wexler Test of Early Grammatical Impairment</i> (Rice, M.L., & Wexler, K. [2001]. San Antonio, TX: Pearson)	3–8 yr	Morphemes and syntactic structures that children with language disorders characteristically lack	Helps identify children with specific language impairments who might be missed by other tests.
<i>S-MAPS, Rubrics for Curriculum-Based Assessment and Intervention</i> (Wiig, E.H., Lord Larson, V., & Olson, J.A. [2004]. Eau Claire, WI: Thinking Publications)	K–12th grade	Basic and advanced language and communication skills, literacy and discourse development, thinking and creativity	Administration time: 45–60 min. 27 rubrics in the three categories. Student performance can be evaluated on continuum from beginner to expert. Rubrics available on CD. Helps adapt skills to curriculum.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Social Emotional Evaluation (SEE)</i> (Wiig, E.H. [2008]. Greenville, SC: Super Duper)	6–12;11 yr	Receptive and expressive social skills including recognizing and labeling emotions, comprehending social and emotional situations, and understanding conflicting messages	Separate scores for students with autism spectrum disorders or language/learning disabilities. An online Qualitative Response Analyzer available. Administration time: 20–25 min. Yields standard, percentile rank, and age equivalent scores. Normed on 1,494 subjects in 47 states including both regular and special education populations and all socioeconomic levels.
<i>Social Language Development Test-Elementary</i> (Bowers, L., Huisingsh, R., & LoGiudice, C. [2008]. East Moline, IL: LinguiSystems)	6–11 yr; grades 1–6	Language-based skills of social interpretation and interaction including making inferences, interpersonal negotiations, multiple interpretations, and supporting peers	Yields standard and percentile rank scores, behavior levels, and frequency and importance ratings. Scoring software available. Spanish version of parent and student forms. Administration time: 10–25 min. Prerecorded narrative and wordless picture books used. Manual describes procedure for elicitation, transcription, segmentation, and analysis of story retelling samples. Description of intervention program development based on results.
<i>Social Skills Improvement System Rating Scales (SSIS Rating Scales)</i> (Gresham, F., & Elliott, S. N. [2008]. Bloomington, MN: Pearson)	3–18 yr individuals Reading level: parent—5th grade; student—2nd grade	Pragmatics in Social Skills section, problem behaviors, and academic competence	Administration time: 20 min. Yields standard, percentile, age-equivalent scores. Standardized on more than 1800 children nationwide. Has guidelines for scoring African-American English dialect. Spanish version available (2nd Edition). Administration time: 15–20 min. IQ test battery. A brief form of 5 subtests can be administered. Internal consistency reliability coefficient of .80. Administration time: variable.
<i>The Strong Narrative Assessment Procedure (SNAP)</i> (Strong, C.J. [1998]. Eau Claire, WI: Thinking Publications)	7–12 yr	Narrative skills	
<i>Structured Photographic Expressive Language Test 3 (SPELT-3)</i> (Dawson, J., Eyer, J., & Stout, C. [2003]. DeKalb, IL: Janelle Publications)	4–9;11 yr	Syntax and morphology	
<i>Swanson Cognitive Processing Test (SCPT)</i> (Swanson, H. L. [1996]. Austin, TX: Pro-Ed)	5 years–adult	Cognitive Abilities related to information processing includes 11 subtests: semantic association, story retelling, auditory digit sequencing, phrase recall, spatial organization, mapping and directions, picture sequencing, nonverbal sequencing, rhyming words, and visual matrix	
<i>Teacher Assessment of Grammatical Structures (TAGS)</i> (Moog, J. S., & Kozak, V.J. [1983]. St. Louis, MO: Central Institute for the Deaf)	Birth–12 years (hearing impaired); 2–5 years (normal hearing)	Comprehension and use of grammatical structures (noun modifiers, pronouns, prepositions, adverbs, verbs, and questions) in sentences	Designed for hearing impaired, but may be used with children with normal hearing and notable language delay. Available on 3 levels: pre-sentence, simple sentence, and complex sentence. Administration time: variable.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Test for Auditory Comprehension of Language-3rd Edition (TACL-3)</i> (Carrow-Woolfolk, E. [1999]. Austin, TX: Pro-Ed)	3–9;11 yr	Auditory comprehension, word classes and relation, grammatical morphemes, elaborated sentence constructions	Yields standardized scores, percentile, and age-equivalent scores. Standardized on 1003 children. Internal consistency: 0.96. Test-retest reliability: 0.89–0.95. Computer scoring available. Administration time: 15–25 min.
<i>Test of Auditory Processing Skills-Third Edition (TAPS-3)</i> (Martin, N.A., & Brownell, R. [2005]. Novato, CA: Academic Therapy)	4–18 yr	Word discrimination, word memory, phonological segmentation, sentence memory, phonological blending, auditory comprehension, numbers forward, auditory reasoning, and numbers reversed	A revamping of the <i>Test of Auditory Perceptual Skills</i> . Provides information for diagnosing auditory processing, language, and learning difficulties. Yields standard, percentile ranks, age-equivalent scores. Normed on over 2000 children and teens. Spanish version available. Administration time: 1 hr.
<i>Test of Auditory Reasoning and Processing Skills-Third Edition (TARPS)</i> (Gardner, M.F. [1993]. Hydesville, CA: Psychological & Educational Publications)	5–13;11 yr	Auditory processing skills including reasoning, developing new ideas, drawing inferences, solving problems, and acquiring and organizing knowledge.	Yields scaled, percentile rank, stanine, and age-equivalent scores. Normed on over 1,100 students enrolled in regular education classes. TARPS performance correlates well with Similarities and Vocabulary subtests on WISC-III and WPPSI-R ($r = 0.58$ to 0.63). English and Spanish test booklets available. Administration time: 10–20 min.
<i>Test of Early Language Development-3rd Edition (TELD-3)</i> (Hresko, W.P., Reid, K., & Hammill, D.D. [1991]. Austin, TX: Pro-Ed)	2–7;11 yr	Receptive and expressive syntax, semantics	Yields standard, percentile, normal curve equivalent, age-equivalent scores. Normed on 1184 children in 30 states. Reliability: 0.90/ Content validity: 0.40–0.52 Administration time: 15–20 min.
<i>Test of Early Written Language-2 (TEWL-2)</i> (Herron, S., Hresko, W., & Peak, P. [1996]. Austin, TX: Pro-Ed)	3–11 yr	Emerging writing skills	Helpful for identifying students with mild deficits. Yields means, standard deviations, and percentiles.
<i>Test for Examining Expressive Morphology (TEEM)</i> (Shipley, K., Stone, T., & Sue, M. [1983]. Austin, TX: Pro-Ed)	3–7;11 yr	Morphemes in sentence completion tasks	Provides means and standard deviation for age and age-equivalent scores. Has companion intervention program- Teaching Expressive English Morphology. Normed on 540 children. Interrater reliability: 0.94/ Construct validity: 0.87 Administration time: 7 min.
<i>Test of Grammatical and Syntactical Skills (TGSS)</i> (Gardner, M.F. [2002]. Burlingame, CA: Psychological and Educational Publications)	8–15 yr	Grammar and syntax including parts of speech, nouns, pronouns, articles, verbs, subject-verb agreement, verb tense, adjectives, adverbs, sentence types and use, grammatically incorrect sentences, punctuation and capitalization, word meaning, and spelling.	Yields standard, scaled, percentile, stanine, and age-equivalent scores. Administration time: 40–50 min.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Test of Language Competence-Expanded Edition (TLC-E)</i> (Wiig, E.G., & Secord, W. (1989). San Antonio, TX: Pearson)	Level 1: 5–9;11 yr Level 2: 9–18;11 yr	Metalinguistics, multiple meanings, inferences, figurative usage, and conversational sentence production	Yields standard, percentile ranks by age, and age-equivalent scores. Has companion intervention program, which uses cognitive-linguistic approach. Administration time: Less than 1 hr
<i>Test of Language Development-Primary-Fourth Edition (TOLD-P:4)</i> (Hammill, D.D., & Newcomer, P.L. [2008]. Austin, TX: Pro-Ed)	4–8;11 yr	Receptive and expressive semantics, morphology, syntax, and phonology	Normed on demographic representative sample of the 2005 U.S. population. Administration time: 30 min–1 hr.
<i>Test of Language Development-Intermediate-Fourth Edition (TOLD-I:4)</i> (Hammill, D.D., & Newcomer, P.L. [2008]. Austin, TX: Pro-Ed)	8–17;11 yr	Receptive and expressive semantics, morphology, and syntax	Yields standard, percentile rank, composite, and age equivalent scores. Normed on demographic representative sample of the 2005 U.S. population. Administration time: 30 min–1 hr.
<i>Test of Morpheme Usage.</i> Stevens, N., & Isles, D. [2004]. Milton Keynes, UK: Speechmark Publishing)	Children and adults	Morphology	Designed following developmental norms. Administration time: 10–15 min.
<i>Test of Narrative Language (TNL)</i> Gillam, R.B., & Pearson, N.A. [2004]. Austin, TX: Pro-Ed)	5–11;11 yr	Literal and inferential comprehension and use of language in narrative discourse	Normed on 1,059 children from 20 states. High validity and reliability. Administration time: 15–20 min.
<i>Test of Phonological Awareness, Second Edition: PLUS (TOPA-2+)</i> (Torgensen, J.K., & Bryant B.R. [2004]. Austin, TX: Pro-Ed)	5–8 yr	Phonological Awareness	Yields standard and percentile rank scores. Internal consistency, test-retest, and interscorer reliability exceed or meet .80 across all ages. Normed on national sample of 2,085 students for 26 states: 1,035 for the kindergarten version and 1,050 for the Early Elementary version. High validity and reliability. Administration time: Kindergarten 30–45 min; Early elementary 15–30 min.
<i>Test of Phonological Awareness Skills (TOPAS)</i> (Newcomer, P., & Barenbaum, E. [2003]. Austin, TX: Pro-Ed)	5–10 yr	Phonological Awareness including sound comparison, phoneme blending, and phoneme segmentation	Yields standard, percentile rank, composite, and age-equivalent scores. Reliability coefficients ranging from .87–.97. Normed on national sample of 926 children. High validity and reliability. Administration time: 15–30 min.
<i>Test of Pragmatic Language –Second Edition (TOPL-2)</i> (Phelps-Terasaki, D., & Phelps-Gunn, T. [2007]. Austin, TX: Pro-Ed)	6–18;11 yr	Pragmatics	Determines individual strengths and weaknesses. Allows for documentation of progress. Yields standard, percentile, and age-equivalent scores. Administration time: 45–60 min.
<i>Test of Problem Solving-3-Elementary (TOPS-3: Elementary)</i> (Bowers, L., Barrett, M., Huisinigh, R., Orman, J., & LoGiudice, C. [2005]. East Moline, IL: LinguiSystems)	6–12;11 yr	Explaining inferences, determining cause of events, answering negative questions, sequencing, determining solutions, and avoiding problems	Yields standard, percentile, age-equivalents scores. Total test scores test-retest coefficients average .84 Administration time: 20 min.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Test of Relational Concepts-Revised</i> (Edmonston, N., & Thane, N.X. [1999]. Washington DC: Gallaudet University)	3–7;11 yr	Conceptual/relational language including dimensional, spatial, temporal, comparative, and quantitative concepts	Yields standard, percentile scores. Administration time: 10–15 min.
<i>Test of Semantic Skills-Primary (TOSS-P)</i> (Bowers, L., Huisinigh, R., LoGiudice, C., Orman, J. [2002]. East Moline, IL: LinguSystems)	4–8;11 yr	Receptive and expressive semantics: labels, categories, attributes, functions, and definitions	Yields standard, percentile, age-equivalent scores. Standardized on 1,510 students nationwide. Test-retest coefficients for total test scores average .88. Administration time: 25–30 min. Previously called <i>Assessing Semantic Skills Through Everyday Themes (ASSET)</i> .
<i>Test of Word-Finding-Second Edition (TWF-2)</i> (German, D.J. [2000]. Austin, TX: Pro-Ed)	4–12;11 yr	Multisyllable and compound word retrieval and progressive and past tense verb forms	Yields standard and percentile rank scores. Standardized on 1,836 students. Administration time: 20–30 min. Provides word-finding behaviors index and productivity index.
<i>Test of Word-Finding in Discourse (TWF-D)</i> (German, D.J. [1991]. Austin, TX: Pro-Ed)	6;6–12;11 yr	Word retrieval in discourse	Yields standard scores and percentile ranks. Nationally standardized on 856 students. Administration time: 15–20 min.
<i>Test of Word Knowledge (TOWK)</i> (Wiig, E.H., & Secord, W. [1992]. San Antonio, TX: Pearson)	Level 1: 5–8 yr; Level 2: 8–17;11 yr	Expressive and receptive semantics, definitions, antonyms, synonyms, multiple meanings	Yields standard, age-equivalent, and percentile rank scores. Administration time: Level 1: 25 min for core battery; 6 min for supplementary subtest. Level 2: 40 min for core battery; 25 min for supplementary subtest.
<i>Test of Written Expression</i> (McGhee, R., Bryant, B., Larson, S., & Rivera, D. [1995]. Austin, TX: Pro-Ed)	6;6–14;11 yr	Provides a comprehensive assessment of writing achievement	Yields standard and percentile rank scores. Normed on 1,226 students in 21 states.
<i>Test of Written Language-4 (TOWL-4)</i> (Hammill, D.D., & Larsen, S.C. [2009]. Austin, TX: Pro-Ed)	9–17;11 yr	Assesses written expression including: vocabulary, spelling, punctuation, logical sentences, sentence combining, contextual conventions, and story composition	Two forms available, so post-test results not confounded by memory. Yields standard, percentile, composite, and age- and grade-equivalent scores. Standardized on 2,505 individuals from 18 states. Administration time: 60–90 min.
<i>Token Test for Children- Second Edition (TTFC-2)</i> (McGhee, R.L., Ehrler, D.J., & DiSimoni, F. [2007]. Austin, TX: Pro-Ed)	3–12;11 yr	Auditory comprehension, temporal and spatial concepts	Yields age- and grade-equivalent scores. Standardized on 1,310 children in 22 states. Administration time: 10–15 min.
<i>Utah Test of Language Development-4</i> (Mecham, M.J. [2003]. Austin, TX: Pro-Ed)	3–9;11 yr	Receptive and expressive language	Yields standard scores and language quotient. Administration time: 30–45 min.
<i>Wiig Assessment of Basic Concepts (WABC)</i> (Wiig, E. [2004]. Greenville, SC: Super Duper Publications)	2;6–7;11 yr	Receptive and expressive concept knowledge in 7 categories: color or shape; size, weight or volume; distance, time, or speed; quantity or completeness; location or direction; condition or quality; sensation, emotion, or evaluation	Test is presented in interactive storybook format. Normed on 1,200 children. Yields standard scores, percentile ranks, and age-equivalents. Spanish version available. (<i>Wiig Assessment of Basic Concepts-Spanish [WABC-S] [2006]</i>). Administration time: 10–15 min.

Test Name (Author[s]/Date/Publisher)	Age Range	Areas Assessed	Comments
<i>Wiig Criterion-Referenced Inventory of Language</i> (Wiig, E.H. [1990]. San Antonio, TX: Pearson)	4–13 yr	Semantics, pragmatics, syntax, and morphology	Criterion-referenced scores. Record forms designed to determine progress over time. Administration time: untimed.
<i>Woodcock Language Proficiency Battery-Revised</i> (Woodcock, R.W. [1991]. Chicago, IL: Riverside Publishing)	2–95 yr	Oral language, vocabulary, antonyms and synonyms, reading, and writing	Yields standard, age- and grade-equivalent scores. Nationally standardized on 6,359 students. Reliability coefficients: 0.95. Compuscore software for scoring. Administration time: Over 90 min.
<i>Woodcock-Munoz Language Survey-Revised</i> (Woodcock, R.W., Munoz-Sanoval, Ruff, M., & Alvardo, C. G. [2004]. Rolling Meadows, IL: Riverside Publishing)	2;5 yr–adult	Oral language, reading, writing in the areas of picture vocabulary, verbal analogies, letter-word recognition, and dictation	Establishes language proficiency in English and Spanish. Administration time: 55 min.
<i>Word Finding Referral Checklist (WFRC)</i> (German, D.J. [1992]. Rolling Meadows, IL: Riverside Publishing)	Elementary, middle, and secondary school	Language processing including language comprehension word-finding skills in both single word and discourse contexts	Yes/no checklist designed to be used by educators and caregivers. Administration time: variable.
<i>The Word Test-2 (Elementary)</i> (Huisinigh, R., Bowers, L., LoGiudice, C., & Orman, J. [2004]. East Moline, IL: LinguiSystems)	7–11;11 yr	Associations, synonyms, antonyms, semantic absurdities, definition, and multiple meanings	Yields standard, percentile, and age-equivalent scores. Standardized on more than 1,282 students. Administration time: 30 min.
<i>Writing Process Test (WPT)</i> (Warden, M., Hutchinson, T. [1992]. Novato, CA: Academic Therapy Publications)	8–19 yr; grades 2–12	Assesses writing and critical thinking including writer's sentence structure and variety, grammar and usage, purpose, focus, audience, vocabulary, style, tone, support and development, organization, coherence, capitalization, punctuation, and spelling	Administration time: 45 min–90 min.
<i>Written Language Assessment (WLA)</i> (Grill, J., & Kirwin, K. [1990]. Novato, CA: Academic Therapy Publications)	8–18+ yr	Assesses language with writing samples including expressive, instructive, and creative writing	Norm-referenced. Administration time: untimed, but allot 15–20 min per writing task.

Tests of Phonological Awareness

Answers to Complex Sentence Assessment Exercise In Box 11-6

Percentage Complex Sentences

15/18 = 83.3%

Complex Sentence Types

Early Developing

Simple infinitive: T4, T6, T7, T10, T16

Full propositional clause: T9, T15, T16, T17, T18

Simple *wh*- clause: T9

Simple or multiple conjoining: T4, T7, T8, T11, T13, T14

Multiple embedding: T9, T10, T16, T18

Embedding and conjoining in one sentence: T4, T6, T7, T8, T17

Later Developing

Infinitive clause with subject different from main sentence: T10

Relative clause: T12, T18

Gerund clause: T4, T18

wh- infinitive clause: T8

Unmarked infinitive clause: T3

Conjunctions Used

and, when, because, why, that

Evaluation

Adequate use of complex sentence constructions; small repertoire of conjunctions.

Plan

Probe conjunction use with elicited production tasks (e.g., ask student to “make up a sentence with *if* . . .”). If difficulties appear in elicited as well as spontaneous production, develop intervention activities to facilitate production of sentences with early developing conjunctions that are missing from the repertoire, such as *if, so, but, and how*. Target more advanced conjunctions (e.g., *unless, until, before, after, although*, etc.) when earlier-developing ones are used spontaneously.

Narrative Analysis of Sample in Box 11-12

Narrative Macrostructure

T1 = Setting

T2 = Initiating event

T3–6 = Description of characters' actions without much sense of plot, plan, or motivation

T7 = Attempt (use of verb *know* indicates some internal response)

T8 = Consequence

T9 = Reaction (does not include character motivation; physical reaction only; contains temporal element then)

T10 = Abrupt end

Narrative stage using scheme in Box 10-3: 4 (Chain)

Narrative stage using scheme in Box 11-8: Temporal Chain

Narrative stage using scheme in Figure 11-8: Action Sequence

Cohesion Analysis Based on Scheme in Box 11-10:

Cohesive Marker T-Unit No./Item	Cohesive Adequacy Analysis Tied to Information in T-unit No./Item	Marker Judgment*
2/the bus	1/a bus	C
3/the bus	1/a bus	C
3/the grass	-	I
4/the bus	1/a bus	C
4/the train	—	I
4/but	conj.	I
5/they	4/bus and train	C
5/couldn't	ellipsis	I
5/the train	4/bus and train	C
5/because	conj.	I
6/then	conj.	C
6/they	4/bus and train	C
6/the country	5a town	C
7/it	—	I
7/its	—	I
7/because	conj.	C
7/it	—	I
7/know	ellipsis	I
8/it	—	I
8/the water	-	I
9/then	conj.	C
9/the owner	1/a man	C
9/it	—	I
10/then	conj.	C
10/they	—	I

*C = Complete tie; I = incomplete tie.

12/25 = 48% complete ties.

Literary Language Style (Box 11-11)

1. Conjunctions: but, because, who, then
2. Elaborated noun phrases: T1—"who was driving . . ."
3. Mental and linguistic verbs: T7—*know*
4. Adverbs: none

Evaluation

Little evidence of literary language style, poor use of cohesion, immature macrostructure, marginal lexical richness. Include narrative goals, focusing first on macrostructure and cohesion, within intervention program.

Intervening at the Language-for-Learning Stage

CHAPTER OBJECTIVES

Readers of this chapter will be able to do the following:

1. List the elements needed in a plan for communication intervention at the elementary school level.
2. Name the required elements in an Individualized Educational Plan.
3. Define and describe appropriate intervention goals at the elementary school level.
4. List a variety of intervention activities at the elementary school level.
5. Describe several service delivery models at the elementary school level.
6. Discuss the role of various intervention agents at the elementary school level and the ways in which they structure collaboration.
7. Carry out language analysis procedures for conversation and narratives.
8. Apply concepts discussed to the education of students with autism spectrum disorders and severe disabilities in elementary schools.

Willie had been late to begin talking when he was a toddler. His parents were concerned about him and asked their pediatrician about it. The pediatrician had Willie's hearing tested and found that he had a mild sensorineural loss in the right ear and a moderate loss in the left. He began wearing hearing aids and was enrolled in an early intervention program. His oral language skills began to improve, and by the time he reached kindergarten, he was able to pass a screening for entrance into a mainstream program. The regular kindergarten teacher referred him for additional speech and language intervention midway through the year, though, because of some mild problems with the intelligibility of his speech and a concern about "immature language." He worked with a speech-language pathologist (SLP), Ms. Johnson, during kindergarten and first grade on basic oral language skills, including increasing intelligibility, use of auxiliary verbs and verb marking, increasing vocabulary, and other skills at the developing language level. Ms. Johnson helped his teachers set up and use a classroom amplification system to improve Willie's reception of the teacher's language input. His first grade classroom included an responsiveness to intervention (RTI)

program for reading development, and Willie was placed in Tier II instruction for one marking period when he began to struggle with early reading achievement. By the end of first grade, though, he had mastered most of the basic oral language skills his Tier II group had targeted, and he moved back into Tier I. Language analysis showed he was functioning at or above Brown's stage V in most areas of productive language. He scored within the normal range, although at the low end, on receptive language and vocabulary assessments. Ms. Johnson put Willie on monitoring status at the end of first grade, and Willie went on to second grade.

Toward the end of his second-grade year, Ms. Johnson received another referral for Willie. His second-grade teacher reported that Willie was "not listening" in class; was having trouble with reading and writing; couldn't organize his materials or complete independent work; and was "acting out," getting attention by being silly and boisterous. Generally, he seemed unable to keep up with the other second-graders in "getting" the information being studied in the subject areas. The second-grade teacher felt he could not function in a mainstream classroom and needed a special program for children with hearing impairments.

Willie was seen by the Student Success Team. They made modifications in his assistive listening system, moved his seat to the front of the room, and advised the teacher to look directly at him when she spoke to him. However, when another marking period went by without much improvement in his classroom performance, it was decided that he needed more help. After an intensive evaluation including both standardized and criterion-referenced assessments in collaboration with the audiologist and learning-disability and reading specialists on the school assessment team, as well as two classroom observations for some curriculum-based evaluation, Ms. Johnson concluded that Willie could benefit from speech/language services. This time, though, his needs were different. They were not in the area of basic oral language skills, but concerned his ability to use and understand language to participate fully in the life of the classroom and to move beyond basic oral language to higher level linguistic functions, including reading, writing, and the complex discourse demands of the classroom. Still, Ms. Johnson felt that Willie had enough language skill to continue to progress in a mainstream classroom if he received the appropriate support. Ms. Johnson began to work with Willie's family and with the reading and learning-disability specialists and audiologist to design a program for Willie's third-grade year that would meet his needs and help him succeed in the mainstream setting.

Although Willie's hearing impairment figures in his difficulties in school, the pattern of his development is in some ways typical of many children with problems at the language-for-learning (L4L) level. They may start out with a primary problem in oral language, grow out of that (with some help from the SLP), and grow into a different kind of problem, one with managing in school. Let's talk about how to plan and deliver intervention for children whose language skills lead to difficulty in meeting the demands of the school curriculum.

PLANNING INTERVENTION IN THE L4L STAGE

Students being seen for language intervention in the L4L period usually require *transdisciplinary planning*, which, you'll remember, means that specialists and teachers work together, not just within but across their disciplines, to design an effective intervention program. Services need to be coordinated among the specialists, in consultation with the regular or special education teacher, to ensure that the student's program is coherent and addresses all aspects of the student's needs and includes the family's perspective (Prelock, Beatson, Contompasis, & Kirk, 1999), since family involvement predicts academic achievement, social and emotional development, and a variety of other positive school outcomes for all children, including those with special needs (Howland et al., 2006).

The Individualized Educational Plan (IEP) meeting provides an excellent opportunity to engage in this kind of collaborative planning. Since the IEP meeting is required by law, everyone involved in the student's program will be present. Parents will be there, too, so their input can be incorporated. If the SLP serves as service coordinator, he or she can initiate a discussion among the team as to who will do what and when and how to be sure the program flows smoothly and makes sense for the student. To make the intervention truly transdisciplinary, the SLP needs to work with the other educators to outline the client's needs and figure out how each can best be served. Take Willie, for example. His hearing impairment needs to be carefully monitored and his aids and assistive listening devices managed. He needs to work on basic reading and writing skills. He also needs to learn to communicate more effectively in the classroom, be more organized in his work habits, and improve his use of the hearing he has in classroom situations. And he needs help learning the material being presented in the classroom. Who helps him with what?

In transdisciplinary intervention, specialists don't work independently on separate intervention agendas. Instead they decide with the classroom teacher what Willie's most immediate needs are and divide up the responsibilities according to the strengths of each professional. Monitoring his hearing and managing his audiometric equipment would fall to the audiologist. Work on basic reading and writing skills would obviously be under the direction of the reading specialist. The learning-disability (LD) teacher might work with Willie or in consultation with the classroom teacher to develop better organizational and study skills and help with mastering classroom content. The SLP might work with the classroom teacher to give Willie some listening strategies in the classroom and might help the teacher to modify some of the classroom procedures to make it easier for Willie to succeed. The speech-language pathologist also might consult with the full team about some of the higher level oral language skills that Willie needs to work on to

succeed in the other areas of the curriculum. The SLP could address these skills in oral language activities, developing comprehension-monitoring and metacognitive strategies for Willie to use in focusing on these higher level targets. The SLP might share these strategies with the classroom teacher, who would encourage Willie to use them in the classroom. The reading and LD specialist also might encourage Willie to use the same comprehension monitoring and metacognitive strategies in their work with him. In this way, a focused and coherent program might be developed in which the work of each specialist would contribute interactively to fostering Willie's development (Silliman, Ford, Beasman, & Evans, 1999).

Planning Intervention with the IEP

The IEP for a school-aged child differs somewhat from the Individual Family Service Plan (IFSP) for infants and toddlers, as we have discussed. It still requires participation and signature of all parties, from both the family and the school, at the IEP meeting. And, since the law emphasizes including children with disabilities in the mainstream curriculum, the regular education teacher must also be part of the team. The IEP also includes a statement of the student's present levels of educational performance, a statement of annual goals and objectives with criteria for determining whether each has been achieved, a summary of all special educational and related services (such as transportation) to be provided, a statement of the extent of participation in the regular education program, a justification of the student's placement in the least-restrictive setting for that pupil, a statement of modifications needed in the regular classroom program to accommodate the student, the projected dates for initiating services, the duration of services, and the proposed date of review.

IEP goals at the L4L stage may include targets in traditional oral language areas, such as increasing sentence length, expanding vocabulary, and increasing use of appropriate request forms. They also can include goals directed at improving classroom performance and integrating oral language and literacy. Sample IEP goals for these kinds of targets might include following classroom directions, demonstrating comprehension of classroom textbooks, producing a cohesive story, or explaining the meaning of technical terms in the curriculum. Nelson (2010) and Simon (1999) provided some examples of ways to design curriculum-based goals for the IEP. They suggested, for example, that objectives be embedded into larger goals based on the curriculum. An IEP goal might state "Willie will be able to define target vocabulary with 80% accuracy *when discussing key vocabulary items from classroom lessons*," or "Willie will demonstrate understanding of -ing and -ed morphemes by correctly spelling words with these endings on weekly spelling tests." Farber, Denenberg, Klyman, and Lachman (1992); Nelson (1988, 2010); and Prelock, Miller, and Reed (1993) also provided extensive examples of IEP goals that can be written to address classroom performance and literacy development in students with language-learning disorders (LLDs).

Procedures for modifying the classroom environment so that the child with special needs can participate are an especially important aspect of the IEP for a child at the elementary school level. These modifications might include providing auditory training equipment for a child like Willie or modifying grading so that a child with a developmental disability can be graded on a pass/fail basis. Other modifications might involve providing an aide to help a student with ASD participate in classroom activities or a Sign or oral

interpreter to translate classroom language for a hearing-impaired or deaf-blind student. Tests might have to be modified for a student with attention-deficit hyperactivity disorder (ADHD), so that there are only a few questions per page. Written texts might need to be read to a blind student or to one with a severe reading disorder. Any such modification would have to be stated on the IEP.

Justifying a placement as least restrictive is also important in this age range. Any placement that moves the student away from the regular classroom or neighborhood school must be justified on the basis of an inability to provide appropriate education in the mainstream setting. Particularly for students with mild to moderate disabilities, the Individuals with Disabilities Education Act (IDEA) gives strong support for inclusion, or integrated education within the general classroom. Silliman, Ford, Beasman, and Evans (1999) provide one model for achieving this *inclusion* for students with LLD. Appendix 12-1 provides a model of what an IEP form might look like. Each educational agency must develop its own form, so the one your school uses may not look just like this. Although there are no mandatory forms for use in creating IEPs, the 2004 reauthorization of the IDEA provides for the development of model IEP forms. However, as of this writing, these models have not yet been disseminated. Whatever form is used, however, it must contain the components we've discussed.

Section 504 of the Rehabilitation Act of 1973

One other area of federal legislation affects intervention planning for school-aged children. Section 504 of the Rehabilitation Act of 1973 prohibits agencies that receive federal monies from discriminating against people on the basis of their disabilities. This legislation actually laid the basis for IDEA, since it meant, in practice, that schools could not exclude children because they had a disability (as they had up until that time). Some children have "504 plans" rather than IEPs in schools because they may not qualify for services under the special education eligibility laws of their states. For example, children with a diagnosis of ADHD who do not have other learning disabilities may not qualify for special education. Many of these students will have accommodation plans under Section 504.

Family-Centered Intervention for the School-Aged Child

IDEA requires that families participate in the IEP meeting and in designing the educational program for a student with special needs. What does this mean for a school-aged child, for whom intervention will take place primarily in the educational setting, often without direct involvement of parents in the day-to-day program? For us as SLPs it means keeping the family in mind and informed throughout the assessment and intervention processes, not just at the IEP meeting. Parents usually appreciate weekly notes or newsletters sent home with students. A regular telephone call every few months (not just when problems come up) to discuss progress and get input and feedback from parents also can be helpful. Again, the key to family-centered practice in the L4L stage, just as for younger clients, is an attitude of openness, respect, and concern for the family as well as for the client. Using the communication strategies outlined in Appendix 6-1 can be helpful in working with families of school-aged children as well as those of younger children. Howland et al. (2006) and Prelock et al. (1999) also provide guidance on including families in programs for our students.

Students and their families can participate in planning intervention at the L4L stage.

Students in the L4L stage are old enough to have their own perspectives considered in planning the intervention program, as well as those of their parents. Enlisting clients in identifying their own areas of strengths and weaknesses and in setting priorities for working on goals identified in the assessment can help to ensure cooperation and make clients feel that the intervention is really for them. A short questionnaire such as that in Figure 12-1 can be used as a basis for an interview with the client in the beginning of an intervention program. The clinician can ask these questions; record the clients' responses; and discuss the intervention program with the student, pointing out how the activities will address the needs and preferences the client expressed. This kind of collaborative planning with school-aged children not only helps them to take responsibility for their own learning, but maximizes the chances for their cooperation in the intervention program.

Behavioral Issues in Intervention Planning

We've talked before about the fact that students with LLDs frequently have attentional and behavioral problems that interfere with their ability to take advantage of instruction, both in the classroom and in the intervention setting. This is a fact of life in working with children with special needs, one that unfortunately will not go away. Our best approach is to be prepared to deal with behavior problems, to expect them, and to have some strategies in place for addressing them. Most specialists in the management of problem behaviors today advocate the use of positive behavior support (PBS; e.g., Bopp, Brown, & Mirenda, 2004; Peck & Scarpatti, 2004; Samuels, 2009). PBS represents a movement away from punishment-based approaches that emphasize obedience and compliance and toward instruction that emphasizes functional skill development. In addition, PBS includes engineering environments that make problem behavior less likely to occur (Carr et al., 2002; Gunlap, 2005; Renzaglia, Karvonen, Drasgow, & Stoxen, 2003). PBS consists of two procedures: conducting a *functional behavior assessment* (FBA) and implementing comprehensive intervention.

FBA is a procedure used to identify why problem behavior occurs and what purpose it serves (Scott & Caron, 2005). Functional assessment procedures usually consist of collecting information about the maladaptive behavior through checklists, interviews,

Name _____

Date _____

Teacher _____

Grade _____

Please answer the following questions to help me figure out ways to make school more interesting and fun for you.

What's your best subject in school? Why is that your favorite?

What part of school is hardest for you? Why is it hard?

What would you like to read more about?

_____ Famous people	_____ Adventures
_____ Space or science fiction	_____ Sports
_____ Hobbies	_____ History
_____ Other? _____	

What kinds of things do you like to read?

_____ Books	_____ Comics
_____ Newspapers	_____ Magazines
_____ Poems	_____ Plays
_____ Other? _____	

What do you like to write?

_____ Letters	_____ Crossword puzzles
_____ Poems	_____ Stories
_____ Reports	_____ Diaries
_____ Other? _____	

How do you learn best?

_____ Large group, when the teacher explains something to everyone	
_____ Small group	_____ Working with one other student
_____ Working alone with the teacher	_____ By yourself
_____ Watching films	_____ Listening to audio recordings
_____ Doing "hands on" experiments	_____ Working on a computer
_____ Other? _____	

What would you like to do better on in school?

What do you think we could do together to help you do better?

What do you wish your teacher did that would make it easier for you to do well in school?

Tests are hard for everyone, but what would help you do better on tests?

_____ Having extra time to finish	_____ Having fewer questions on each page
_____ Having someone read you the questions	_____ Having the questions recorded to listen to
_____ Being able to tell someone your answers instead of writing them down	

What would you like to change about the way you work in school?

FIGURE 12-1 A sample questionnaire for including school-aged clients in intervention planning. (Adapted from Waldron, K. [1992]. *Teaching students with learning disabilities*. San Diego, CA: Singular Publishing Group.)

and direct observation of the problem behavior, recording important aspects of the situation in which it occurs. O'Neill et al. (1997) provide detailed instructions for conducting FBA. Typically, FBA is performed by the school psychologist or behavior specialist, although the SLP may be one of the professionals who responds to the questionnaires or checklists.

The second component of positive behavior support is developing and implementing comprehensive interventions that address

the functions of the behavior, as determined by the functional assessment. The program is implemented throughout the day across settings by means of multiple intervention strategies developed by the team. Although FBA may be conducted by the psychologist, the delivery of PBS intervention requires the collaboration of everyone on the student's educational team. The SLP's role is often to deliver functional communication training (FCT), in which we teach students to replace socially unacceptable behavior

with a more adaptive communicative act (Bopp et al., 2004; Prelock, Paul, & Allen, 2011). Buschbacher and Fox (2003) discuss the components of a comprehensive PBS intervention plan, which include the following:

- *Behavior hypotheses:* Statements of the most probable antecedents, maintaining factors and communicative functions of the problem behavior, as suggested by the FBA. For example, the team might hypothesize that Willie is clowning because he does not understand the directions for particular class activities.
- *Long-term supports:* Strategies to assist the student's overall development and interactions to create the optimum quality of life for the student. These might include, for example, having the school nurse check Willie's hearing aid batteries each morning to be sure he is hearing optimally.
- *Prevention strategies:* Changes in the environment that will minimize the likelihood that the problem behavior will occur. These will be inferred from the FBA, but must fit into the natural routines of the classroom. For example, the teacher might provide written or pictured directions on the blackboard as she explains them, and assign Willie a "buddy" to work with in case he still has trouble understanding what to do.
- *Functional communication training (FCT):* Adaptive and conventional communication skills are taught so they can replace maladaptive behaviors. For example, Willie might be told to address questions about classroom instructions to his buddy, rather than acting out. Replacement behaviors should be functionally equivalent to the problem behavior, and should result in faster and more consistent achievement of the behavior's goal.
- *Consequential strategies:* Outlines of how the team responds to both the replacement skills and the maladaptive behavior. It is important to ensure that rewards for the replacement should exceed those for the problem behavior. In Willie's example, the teacher might assiduously ignore any clowning, but provide rapid and lavish praise, perhaps combined with tokens that can be accumulated for a prize or special privilege, when Willie works quietly with his buddy to complete an assignment.

A related strategy was suggested by LaVigna (1987): *differential reinforcement of other behavior* (DRO). In this method, the student is reinforced after a specified period in which an undesirable behavior has *not* occurred. Reinforcement is not dependent on the production of any specific behavior, only on some target behavior's being omitted. Suppose Willie is constantly getting up out of his seat and wandering around the room and talking to other students, when he should be working on a written assignment. Using DRO, the teacher or clinician would provide reinforcement for every 3 minutes in which he did *not* wander around and bother others. He would not have to be completing his own work to receive the reinforcement; he would only have to *not* engage in the disruptive behavior. Once some success was achieved, the intervals between reinforcements would be lengthened. Eventually, behavior that substitutes for the undesired one can be shaped into the behavior in which we really want the student to engage. If Willie is first reinforced for not bothering others, eventually we can up the ante, requiring him to stay in his own seat to get the reinforcement. When that has been accomplished, reinforcement can become contingent on his completing his own work.

Another strategy that appears useful for managing problem behavior is the Social Story (Gray, 1995a). These stories were developed to assist children with autism to manage their behavior

in social settings, but can be used with any child who needs positive behavioral support (Schneider & Goldstein, 2009). A fairly large literature (e.g., Kuoch and Mirenda, 2003; Ozdemir, 2008; Reynhout & Carter, 2007) has now demonstrated that using these stories provided replacement of appropriate behaviors for maladaptive ones. Social Stories can be written individually for children, or taken from commercial materials that present a range of social stories for common situations (Gray, 2000a). The Social Story contains three basic elements:

- Descriptive sentences identify a social setting the child finds problematic and describe it. (The bell rings when recess is over. Everyone gets in line.)
- Directive sentences tell what the child should do to be successful in the target situation. (When the bell rings I stop playing. I get in line. I wait for the teacher.)
- Perspective sentences: describe internal states of others during the target situation. (My teacher will feel happy when everyone is in line. I will feel good that I followed the rules.)

For children identified as having special educational needs, IDEA provides protections against penalties for behavior that is part of their disability. Although many schools, in the wake of recent episodes of violence on school premises, have adopted "zero tolerance" policies for certain behavior such that the first infraction leads to automatic suspension or expulsion, children with disabilities cannot be punished this way if the infraction was related to their disorder. For example, a school may have a "zero tolerance" policy for wearing a hat in school (as part of regulations against "gang paraphernalia"), but if a child with autism insists on wearing a hat because he has a need for sameness and removing his hat would cause him inordinate disorganization and distress, he cannot be punished for breaking this rule. However, the team certainly can work with him to help him overcome his need for the hat, or to replace it with an alternative more acceptable to school administrators.

Managing behavior is an unavoidable part of the work of any clinician who deals with children. Clinicians who want to engage in transdisciplinary and collaborative intervention need to be especially aware of discipline issues and to work with the team to establish consistent strategies. The best offense here is a good defense. Being prepared for behavior problems before they happen, with plans and strategies for addressing them as a team effort, keeps them to a manageable minimum.

INTERVENTION PRODUCTS IN THE L4L PERIOD

Many of the language difficulties we discussed in Chapter 10 and assessed in Chapter 11 will be important objectives of the intervention programs we design for children in the L4L stage. We want to address the language forms that appear in normal development during this period. These include use of advanced morphological markers, complex sentences, abstract vocabulary, adverbial marking, precise conjunctions, and linguistic cohesion markers, and elaboration of noun phrases (Nippold, 2007). We also want to help students with LLD to make better use of the language they have. This goal would include reducing word-finding problems, and increasing the flexibility and sensitivity of use of language forms employed to accomplish a range of pragmatic goals, such as politeness, persuasiveness, explicitness, and clarification. Developing use of more varied discourse structures, such as the classroom discourse and narrative structures we outlined in Chapter 10, will

also be important. As we saw in Chapter 10, though, language intervention in the L4L period entails more than targeting specific oral language objectives. It also means finding ways to help the student learn the language needed and use the language learned to succeed in the classroom. Let's think about how this basic goal influences intervention planning in the L4L period.

We've been referring to the period of language development that normally takes place between 5 and 12 years of age as the "language for learning" stage. Westby (1991) suggested that, during the elementary school years, children move from learning to talk, which was the prime accomplishment of the preschool period, to "talking to learn." In talking to learn, children acquire, among other things, a new style or register of language. Westby called this the *literate language* style. We discussed aspects of this style and contrasted it to oral language use in Table 10-2. One important goal of intervention in the L4L period is to develop a literate language style. Access to this "language for learning" register enables a student to engage in "talking to learn," as well as to understand written forms of communication, which generally have a literate language format. One of the reasons narrative skills are so important in the L4L stage is that they form a bridge, or middle ground, between the familiar, contextualized language of conversation and the abstract, decontextualized style of literate language (Westby, 2005; 2007). In helping students develop a literate language style, improving oral narrative skill is often a useful first step. What else is needed? Let's look at four principles that can guide intervention in the L4L period. Using these principles to help us choose intervention targets and procedures can ensure that our intervention not only addresses oral language skills but also works toward developing a literate language register that will contribute to success in the mainstream curriculum.

Guiding Principles of Intervention at the L4L Stage

Principal 1: Use Curriculum-Based Instruction

The first principle was articulated by Nelson (2010), Wallach (1989) and is reinforced by regulations in IDEA. SLPs working with clients at school-age levels should refrain from having their own independent intervention agenda. Instead, they should target goals that are curriculum based (Ehren, 2000b; Ukrainetz, 2007). Wallach (2010) goes further, and argues that goals based on a purely developmental or specific deficit model, such as improving sequencing or "auditory processing," are less central to the needs of school-aged clients than the need to provide functional improvement in their literacy and performance in the curriculum. Let's take Willie as our example again. Suppose that we find as a result of our assessment that Willie has very limited complex sentence production. Following the principle of curriculum-based instruction, we might use onlooker assessment procedures to find out what aspects of Willie's participation in the curriculum require complex sentence use. We would then work on his complex productions within those curricular contexts. Perhaps he needs to be able to answer content questions more concisely in class. We could work on using complex sentences to answer questions modeled after teacher questions drawn from a classroom observation. Maybe he needs to report on past events more precisely, using appropriate temporal conjunctions, such as *when*, *before*, and *after*. If so, we could have him "practice" for sharing times or group discussions by "prepping" him to organize his contribution with complex sentences and

conjunctions. The point is to avoid work on a language agenda isolated from the ways the language will be used to participate in the curriculum. Instead we want to integrate our language intervention with the demands our students face in the classroom every day.

Principle 2: Integrate Oral and Written Language

The second principle that should guide intervention in the L4L period was suggested by Berninger (2000) and Gerber (1993). They advocated another type of integration: the integration of oral and written language. This means that we want to provide both oral and written opportunities for students to practice the forms and functions targeted in the intervention.

For students functioning at primary-grade levels, we want to address skills that contribute to both oral and written language development. In addition to basic oral language approaches, then, we want to include literacy socialization, metalinguistic and phonological awareness, as well as narrative and simple writing activities. We might work on comprehension and use of abstract vocabulary, for example, not just in oral exercises but also in activities that involve printed forms. Vocabulary sessions might include literacy socialization activities such as book reading and discussion of the words in the text. We might ask students to identify target words in the book we've discussed. In a similar vein, we could include phonological awareness (PA) activities in the vocabulary program. We could have students decide whether a word we were working on was a "long" or "short" word, how many syllables it had, what words rhyme with it, what sounds it begins and ends with, how many sounds are heard in the word, what letters might be used to represent those sounds, and so on. All this discussion could go on right along with talking about the word's meaning and use.

For students functioning at the intermediate-grade levels, integrating oral and written language remains important. Even if these students are seeing the reading or learning disability specialist, we need to encourage them to "pull together" the oral language skills we are helping them develop. The best way to attain this goal is to provide a variety of language experiences addressing each objective. Experiences early in the program might be primarily oral and highly contextualized, such as face-to-face conversation. But as we continue to work on a goal, it can be addressed in increasingly literate, decontextualized activities, such as oral narrative contexts, and eventually in reading comprehension, writing, and spelling activities.

Principle 3: Go Meta

The third principle guiding intervention in the L4L stage was presented by Wallach (2010); Wallach and Miller (1988); and Wallach, Charlton, and Christie (2009). In their words, intervention in the L4L period should focus on the "metas": activities that direct conscious attention to the language and cognitive skills a student uses in the curriculum. "Meta" skills include talking about talking and thinking about thinking. All the activities we do around any of our language objectives ought to be done on two levels. On the first level, we demonstrate through models and practice how particular forms and functions of language work, just as we would for a child at an earlier language stage. On the second, or "meta," level, the client and clinician talk about the language forms and functions being used and state rules and principles explicitly, focusing attention on the structure of language.

"Going meta" can involve a variety of activities aimed at bringing the clients' language use and comprehension to a higher level of awareness. Basic comprehension activities for vocabulary and

syntax can be supplemented by comprehension-monitoring instruction. Activities aimed at production of language forms, such as advanced morphemes, complex sentences, and adverbial usage, can be introduced with basic-level activities and expanded with metalinguistic discussions. In these, the client can state when and why these forms are used, tell what meaning they encode, explain how to use linguistic or nonlinguistic context to decide what form is appropriate, and so on. Work on improving classroom discourse skills, such as listening, making relevant contributions, knowing when to talk and when not to, what to talk about and what not to—all the aspects of the “hidden curriculum”—are ideal contexts for metapragmatic activities. The clinician can get students to state classroom rules explicitly, role-play appropriate and inappropriate language use, role-play the teacher as the clinician role-plays the student making various classroom discourse errors, discuss why things go wrong for the client in the classroom, and brainstorm alternative language strategies.

Principle 4: Collaborate to Prevent School Failure by Participating in RTI, Incorporating Principles 1 through 3

Finally, when providing Tier II and III services for students in classrooms using RTI, SLPs can contribute our unique expertise to the RTI process by using our first three principles as we plan activities for these students. We can work on semantic and syntactic targets in curriculum-based activities, for example, using language from the literacy materials children are practicing in their RTI activities not only for guided oral reading, but also for talking about the words and sentences in the material, pointing out long words, short words, discussing meanings of words that may be unfamiliar, or talking about rhymes, synonyms, and opposites for words that are known. We can integrate oral and written language approaches by focusing on meanings and connections among words in sight word reading activities (see [Box 12-1](#) for an

example). We can also “go meta,” by, for example, talking explicitly about strategies for increasing comprehension with students struggling with understanding what they read. Appropriate Tier II and III reading comprehension activities can include meta approaches such as strategic reading (Ukrainetz & Ross, 2007). Such approaches explicitly teach and guide students to employ strategies before (e.g., recall what you already know about this topic, give a purpose for reading), during (e.g., restate what you read in your own words, identify main ideas in each paragraph), and after reading (ask yourself what you learned, relate what you learned to what you knew before reading). We’ll talk more about these and other strategies later in this chapter and in Chapter 14.

Summary

We might say, then, that in addition to the basic language goals we’ve outlined for the L4L stage, four additional considerations should guide our intervention planning. These are (1) making intervention curriculum based, rather than independent and isolated; (2) integrating oral and written forms of expression in addressing language goals, moving from oral to literate formats for communication as we work on language objectives; (3) “going meta,” attempting to bring all the language we work on to a higher level of awareness; and (4) using the first three principles to guide our participation in RTI instructional models to prevent school failure before it happens. Let’s see how we might use these principles to design intervention activities for the wide range of issues students in the L4L period will face.

INTERVENTION PROCESSES IN THE L4L PERIOD

Remember that we’ve been discussing intervention procedures under three basic categories: clinician directed (CD), child centered (CC), and hybrid. Although our interactions with school-aged

BOX 12-1 Example of Integrating Oral and Written Language Activities in RTI: Learning Second-Grade Sight Words

SIGHT WORDS	WRITTEN LANGUAGE ACTIVITY	ORAL LANGUAGE ACTIVITY
Cold, green	Concentration game: students match words written on cards	When a student draws the <i>cold</i> card, the adult encourages the child to read the word, provides help if necessary, encouraging the child to say the sound of the first letter, then the second, etc. When the child reads the word, the adult encourages the child to talk about a time when he or she was cold/saw something green, to think of a word that rhymes with cold/green and guess how to spell it (e.g., fold/seen), and to talk about when else they can use the word <i>cold/green</i> besides talking about weather (e.g., emotionally cold) or color (e.g., environmentally friendly). After discussing the word, the student is asked to find its matching card in the Concentration game and read it, or whatever card is drawn.
Found, fast	Buried: cards with <i>found</i> , <i>fast</i> , and other target words written on them are “buried” in a bowl of Styrofoam peanuts. Students “dig up” each card and read the word on it aloud.	The adult calls the child’s attention to the first sound in the word, and asks him or her to think of other words with same first sound. The adult asks to child to talk about a time he or she <i>found</i> something or went <i>fast</i> . The adult asks the student to think of other words that mean the same thing as <i>found</i> (discovered) or <i>fast</i> (quick), or the opposite (lost, slow).

children don't fit quite so neatly into these categories as many of our preschool intervention approaches do, these points on the continuum of naturalness can still present a framework that is helpful in organizing our thinking about intervention methods the L4L period. Let's take a look at some of the approaches at the L4L level that might fall in each category.

Clinician-Directed Intervention in the L4L Stage

CD activities, using drill play contexts, can be used for a variety of goals at the L4L stage. PA is often targeted in a drill play format. For example, students can be given a set of tokens, nickels for vowels and pennies for consonants, perhaps. The clinician demonstrates segmenting a vowel-consonant (VC) word, such as *oat* (/ot/), by moving the nickel as /o/ is pronounced and the penny as the /t/ is produced. The students are then instructed to follow the clinician's model and move their coins as the sounds are pronounced. When students can accomplish this kind of phonological segmentation, CVC (*coat*) words can be introduced. Eventually, CCV (*blue*), CCVC (*stone*), CVCC (*taps*), and CCVCC (*blast*) words can be incorporated into the activity. Many of the PA programs used in research demonstrating the efficacy of PA training on literacy (e.g., Ehri, et al., 2001; Gillon, 2000b; Scheule & Boudreau, 2008) make use of this format.

CD activities can, of course, be used to target morphological markers, vocabulary, and sentence structures at the L4L stage, just as they can at the developing language period. In using CD activities for these targets, though, we want to be sure *not* to be operating on an independent agenda, targeting forms just because they are identified as deficits in the assessment. The principles we discussed earlier still apply. We can address goals with drill and operant procedures, but we want to be sure that the drills focus on using these forms in ways that are relevant to the curriculum.

We might decide, for example, that a first-grader with deficits in advanced morphological markers really needed to develop proficiency with *-er* and *-est* because these were used frequently in the math curriculum (e.g., "Find the larger number"). In this case we would develop *-er* and *-est* drills in number-related contexts. The student might be asked to repeat, and demonstrate with chips or counters, a list of number statements containing *larger*: "Two is *larger* than one, three is *larger* than two," and so on. The student could then be asked to complete a series of cloze statements, such as "Of 10 and 9, 10 is ____." The same process could be repeated with *smaller*. The next step would be to use cloze statements in which the student had to decide, with the help of chips or counters, whether *smaller* or *larger* were appropriate ("Of 6 and 7, 6 is ____; and so on). The same process could be followed for *largest*, then for *smallest*, then for the two combined in cloze drills ("Of 6, 7, and 8, 8 is ____; and so on). Eventually all four terms would be included in an activity. The point to remember about CD activities at the L4L stage is that they are appropriate methods for addressing goals, so long as the goals themselves conform to the four principles we discussed earlier. We want to avoid isolated CD drills that do not relate in any way to the classroom curriculum.

Another application of CD techniques is what Marshall (1991) and Silliman (1987) referred to as cognitive behavior therapy (CBT). CBT is a CD approach to developing comprehension-monitoring and metacognitive strategies for increasing learning skills. It is, essentially, an operant way to "go meta" that has strong

empirical support (e.g., Henin, 2008; Kazdin & Weisz, 2003). CBT involves three basic steps:

1. The clinician tells the client explicitly what strategy will be developed, why it is important, and what procedures will be used to attain the strategy. The clinician might, for example, tell clients that they were going to work on deciding whether they had understood all the information in a paragraph read by the clinician. The clinician might explain that it is important to know when we don't understand something so that we can ask questions, ask for repetition, or seek further information. The clinician would then explain that she will model how to talk through the process of deciding whether the paragraph was understood and will have the clients follow this model.
2. The clinician "thinks out loud" to demonstrate how the strategy is accomplished. She might read a paragraph out loud, then ask herself, "Now, do I understand what it was about? Let's see, it was about X. OK, do I remember the details about X? Well, there was A, B, and I think there was another one, but I can't remember it. I'll have to ask about that one. Did I understand all the words? There was one word I didn't know. I think it was 'magna' or something like that. I'll have to ask the teacher or look that up in the dictionary." The clinician could write each question she asked herself and make a note as to the answer she gave herself after each question.
3. The clinician has each client model this thinking out-loud process in turn. For our comprehension-monitoring example, the clinician would read the paragraph again and ask a student to talk through the list of questions that she generated. In this example she would have the students ask themselves "Did I understand what it was about? Did I remember the details? Did I understand all the words?" Students would then note their own answers to each question and take the actions needed, such as looking up one of the words in the dictionary. This process would be repeated numerous times, until clients were able to generate self-monitoring questions spontaneously. Then more advanced material, such as longer passages or text the clients read themselves, would be used, with the same procedures. CBT is another way we can use explicit, CD procedures to find ways to help students with LLD succeed in the classroom.

Child-Centered Intervention in the L4L Stage

Scaffolding

The most common CC techniques at the school age level involve *scaffolding*. Scaffolding involves identifying the student's zone of proximal development (ZPD) in curricular language skills, and devising activities that scaffold his current level of function into the ZPD by means of clinician support. These techniques can be used by the clinician in interactions with students with LLD and also can be provided to classroom teachers in consultative formats. When we give teachers very specific techniques to use, our chances of influencing their interactions with the students with LLD in their classrooms are greatly enhanced, and the chances for success of our consultative efforts in general increase. Gerber (1993) described three forms of scaffolding that can be used in working with students with LLD.

Creation of Optimal Task Conditions

This form of scaffolding involves reducing the amount of stress and undue effort a student uses to complete a curricular task. In practice, it means working with the classroom teacher to reduce

the amount of material a student has to process and to present the material in smaller units with extra time allowed for task completion. Suppose Willie is required to write one book report a month on a book he reads independently. The clinician can discuss modifying this requirement with the classroom teacher. Instead of having Willie choose any book from the class library, as the mainstream children do, he might be given his own “shelf” in the library with books that are written at his level of reading or narrative development. For example, when a book report is assigned, the clinician can provide several books for Willie’s “private shelf” in the classroom library that are at the level of narrative development just above his current level, as

identified by assessment. After reading or listening to these books and preparing appropriate book reports, Willie can be reassessed. If narrative stage has improved, the shelf can be stocked with books at the next, higher level. Box 12-2 contains examples of well-known books at a range of narrative complexity levels, compiled from suggestions of Wallach (1989) and Westby (2005).

In addition to providing scaffolding in terms of narrative structure, clinicians can also create optimal task demands by structuring the written work the student is required to produce. Take our book report example again. The clinician might suggest to the teacher that instead of being asked to produce a free-form book report,

BOX 12-2 Suggestions for Books at Various Stages of Narrative Macrostructure Development

1. For students currently producing narratives at the Heap stage, provide books at the Sequence level, in which there is a recurring theme but the order of events doesn’t matter:
Abuela’s Weave by Omar Castenada
Charlie Needs a Cloak by Tommie DePaola
King Bidgood’s in the Bathtub by Audrey & Don Wood
The Gingerbread Boy by Paul Galdone
The Goat and the Rug by Charles L. Blood, Martin Link, & Nancy Winslow Parker
The House that Jack Built by Paul Galdone
The Snowy Day by Ezra Jack Keats
The Very Hungry Caterpillar by Eric Carle
2. For students currently producing narratives at the Sequence stage, provide books at the Primitive Narrative level, which have a main theme and involve some understanding of attempts and actions and ability to interpret events:
Alexander and the Terrible, Horrible, No Good, Very Bad Day by Judith Viorst
Alice Gets Ready for School by Cynthia Jabar
George and Martha by James Marshall
Kevin’s Grandmother by Barbara Williams
Mr. Happy; Mr. Fussy; Mr. Bounce; Mr. Worry; etc. by Roger Hargraves
Rotten Ralph by Jack Gentos
Round Robin by Jack Kent
3. For students currently producing narratives at the Primitive Narrative stage, provide books at the Chain level, which involve some understanding of cause-effect and character motivation:
Drummer Hoff by Ed Emberley
Feelings by Alike
If I Had by Mercer Mayer
If You Give a Mouse a Cookie; If You Give a Moose a Muffin by L. Numeroff
Just for You by Mercer Mayer
Keep Your Mouth Closed, Dear by Alike
The King’s Tea by T.H. Nonle
The Little Red Hen by Paul Galdone
Tingo, Tango, Mango Tree by Marcia K. Vaughan & Yvonne Buchanan
Today I Feel Silly by Jamie Lee Curtis
What are YOU so Grumpy About? by Tom Lichtenheld
Why Mosquitoes Buzz in People’s Ears by Vernal Aardema & Leo and Diane Dillon
Why the Sun and the Moon Live in the Sky by Elphinstone Dayrell
4. For students functioning at the Chain level, provide books with a simple True Narrative structure, plots that have character development, sequences of actions motivated by characters’ goals and plans, and a resolution of the story’s problem:
Bread and Jam for Francis by Russell Hoban
Elbert’s Bad Word by Audrey & Don Wood
Fantastic Mr. Fox by Roald Dahl
Franklin in the Dark by Paulette Bourgeois & Brenda Clark
Hetty and Harriet by Graham Oakley
Ira Sleeps Over by B. Waber
Owl at Home by Arnold Lobel
The Three Little Pigs by Paul Galdone

Intervention for children with LLD often includes scaffolding and guidance of selective attention in classroom materials.

Willie be given a form to complete. The clinician might give the teacher a series of increasingly complex forms to use, suggesting that when the student becomes adept at writing reports using one form, the next in the sequence can be required for subsequent reports. Westby (2005) provided such a series of book report formats that can be used to scaffold a client's performance. An adaptation of her series appears in Box 12-3. An example book report form can be found in Figure 12-2.

BOX 12-3 Book Report Sequence

BOOK REPORT 1: DESCRIPTION

Identify title.
Identify author.
Draw a picture of a favorite part of the story.
Describe the pictures in the book.

BOOK REPORT 2: SEQUENCE 1

Identify title.
Identify author.
Name the major characters.
Tell the first thing that happened in the story.
Tell how the story ends.

BOOK REPORT 3: SEQUENCE 2

Identify title.
Identify author.
Name the major characters.
Tell three things, in sequence, that happened in the story.
Retell the story with pictures.

BOOK REPORT 4: PRIMITIVE NARRATIVE

Identify title.
Identify author.
Respond to a "why" question about a physical cause (Why did the first little pig's house fall down?)
Tell three things, in sequence, that happened in the story.
Retell the story with pictures.

Guidance of Selective Attention

This form of scaffolding involves highlighting important information by using visual, verbal, and intonational cues. Using this device, a clinician can, for example, use a highlighting marker to call attention to potentially difficult words in a photocopied passage from a textbook. Before students read they can be told to look for these words, try to guess what they mean, or to let the clinician know whether they need to look them up in the dictionary. Similarly, the clinician can read the passage with heavy intonational stress on the same words, telling the students beforehand to listen for them because they may be tricky and to decide whether they can guess their meaning or need to look up their definitions.

Provision of External Support

The clinician can "prime" students to succeed in classroom activities. This can be done especially effectively in service delivery systems that combine collaborative intervention with some clinical sessions. Suppose the clinician is doing a collaborative lesson on listening skills in a client's classroom. She can "prep" clients for the lesson in a clinical session, previewing what she will be covering and some of the questions she will be asking. She might tell the clients ahead of time that she will be asking the class to think about and make a list of "good listening behaviors." She could preview the activity with the clients, helping them to generate their own list. When she gives the lesson in the classroom, the clients already know the right answers! Allowing them to demonstrate their knowledge to the mainstream students not only reviews and reinforces the information for the clients, but also allows them to "look smart" before the other students. Such an opportunity can give a real boost in self-esteem to clients who often find themselves trailing behind the rest of the class.

This technique is also an important tool for helping teachers learn to support students within their classrooms. Scheule and

Boudreau (2008) discuss the provision of this kind of support in everyday question-answer interactions in classrooms. They argue that teachers need to do more than just ask questions in teaching activities; instead they should explain, model, highlight important ideas, and provide practice and scaffolding tailored to the child's current level of performance. At the beginning of learning a new skill, adults should provide multiple input models, showing the child how to move from question to answer, with the child at first simply repeating the correct answer provided by the adult. Over time, the adult guides the child to complete the pieces of the task, providing less and less support. They suggest that we think of learning not as moving a child from 20% correct to 80% correct, but of moving a child from successful performance with maximal support to successful performance with little or no support. Box 12-4 provides an example of the kinds of sequenced levels of scaffolding that characterize this technique. We can help teachers working at both Tier I and Tier II instruction to organize instruction along these principles.

Hybrid Intervention in the L4L Stage

A great number of the intervention methods we use with students at the L4L stage are of the hybrid variety, with some degree of direction by the clinician but less structure than traditional operant procedures. We'll look at examples of hybrid procedures that might be used to address some of the major goals of the L4L period, but these examples are by no means exhaustive. Additional sources of ideas include DeKemel (2003); Dodge (1998); Falk-Ross (2002); Gerber (1993); Haynes, Moran, and Pindzola (1999); Kuder (1997); Nelson (2010); Paul (1992b); Secord (1990); Simon (1991a); Ukrainetz (2007); Wallach and Butler (1994); Wallach and Miller (1988); Westby (2005); and Wiig and Semel (1984). The suggestions here are meant only to start you thinking about how hybrid intervention activities for this developmental period

BOX 12-4 Sequenced Scaffolding Approach Example: Teaching Initial Phoneme Identification

SCAFFOLDING LEVEL	DESCRIPTION	EXAMPLES
Maximal support	Provide multiple modes of target concept.	Listen to the word <i>wolf</i> . The first sound in <i>wolf</i> is /w/. Listen to <i>walk</i> . The first sound is /w/, too. Listen to <i>waffle</i> . The first sound there is also /w/ . . .
Moderate support	Provide opportunity for child to practice adult model.	Listen to the word <i>wolf</i> . The first sound in <i>wolf</i> is /w/. Say the first sound in <i>wolf</i> with me, /w/ . . .
Moderate support with modeled test question	Provide the same moderate level of support, with opportunity for child to practice adult model, then provide opportunity for child to produce the answer to a question.	Listen to the word <i>wolf</i> . The first sound in <i>wolf</i> is /w/. Say the first sound in <i>wolf</i> with me, /w/. What's the first sound in <i>wolf</i> ? /w/ . . .
Moderate support with unmodeled test question	Provide the same moderate level of support, without opportunity for child to practice adult model, then provide opportunity for child to independently produce the answer to a question.	Listen to the word <i>wolf</i> . The first sound in <i>wolf</i> is /w/. What's the first sound in <i>wolf</i> ? /w/.
Minimal support	Provide a model with guidance of selective attention to target concept. Then independently produce the answer to a question.	Listen to the word <i>wolf</i> (with emphasis, elongation on first sound). What's the first sound in <i>wolf</i> ?
No support	Provide opportunity for child to demonstrate knowledge of the concept independently.	What's the first sound in <i>wolf</i> ? How about in <i>watch</i> ?

Based on Scheule & Boudreau (2008). Phonological awareness intervention: Beyond the basics. *Language, Speech, and Hearing Services in Schools*, 39(1), 3-20.

might be designed. The rest is up to your own creativity. Remember, too, that when we talk about hybrid activities that can be used to address specific intervention targets, the targets themselves should always be selected with our guiding principles of intervention at the L4L stage in mind.

One other consideration needs to be kept in mind. When working on oral language skills with school-aged children, particularly in the areas of vocabulary, semantic integration, complex syntax, literate language forms, and discourse comprehension, we are *not* doing only “language therapy.” We are also building essential skills for improving reading comprehension. Clarke, Snowling, True-love, and Hulme (2010) showed in a randomized controlled trial (our scientific gold standard) that including oral language training in reading comprehension programs resulted in greater gains than programs focused on written language and traditional reading comprehension activities alone. That means when SLPs in schools are asked to be part of literacy instruction, we can show that we *are* doing literacy instruction when we address the oral language skills that lay the foundation for understanding written texts. Let’s look at some of the specific areas of oral language we can address as we help to support students in reading comprehension.

Semantics

Vocabulary: A Basis for Reading Comprehension

Research (Biemiller, 2003; Dole, Sloan, & Trathen, 1995; Wise, Sevcik, Morris, Lovett, & Wolf, 2007) has shown that students with more extensive vocabularies do better in reading comprehension as well as in oral language activities. But these studies also demonstrate that having students look words up in a dictionary does not transfer word knowledge very effectively to reading comprehension tasks. Something more is needed to develop the kind of understanding that improves reading skills. Blachowicz (1986) and Marzano (2009) outlined the essential elements of programs aimed at deepening both receptive and expressive lexical skills:

- *Activate what students already know* about the new words. To accomplish this, Blachowicz suggested *exclusive brainstorming*. The adult can select a list of words from a curricular topic, and others that are also new but do not fit with the topic, and present the words to the students in oral and written form. The students discuss the words and decide which ones go with their topic for the day and which don’t. To make this decision, students are encouraged to use a knowledge rating

checklist like the one in Table 12-1 to foreground whatever knowledge they have about the words.

- *Provide a description, explanation, or example of the new term:* an explanation by an adult works better than having students consult a dictionary. The explanation can relate the word to current curricular topics and to students’ experience in a way that makes the meaning easier to retain. Biemiller and Boote (2006), for example, showed that in primary grades, children learned significantly more words from stories when the stories were read repeatedly and when the teachers stopped to give an explanation of new words in the course of the story reading.
- *Ask students to restate* the description, explanation, or example in their own words, connecting it to their own experiences and knowledge. Having students rephrase the adult’s explanation helps them to assimilate it into what they already know.
- *Have students construct a picture, pictograph, or symbolic representation* of the term. Marzano (2009) found this step to be particularly important and most highly related to successful learning of new words. If students keep vocabulary notebooks or card files, they can record words and illustrations for each word there. An example of a card with a word and illustration appears in Figure 12-3.
- *Make connections among words and topics.* Have the students deepen their associations between the new words and the curriculum topic to which they relate. For example, give students a list of words from a textbook or literature selection and ask them to guess the topic of the selection. Various graphic organizers can also be helpful in making connections among words. Examples of several types of graphic organizers may be of found at: www.educationoasis.com/curriculum/GO/vocab_dev.htm

As just one example, a “Predict-O-Gram,” like the one in Box 12-5, can be used to help students predict how the words will be used in the selection. In this example, a story grammar format is used to guide the predictions. In this way, work on story macrostructure can accompany vocabulary development.

Another way to foster connections among words is to use “word maps” (Westby, 2005). Figure 12-4 shows one type of map, relating words around a theme. Phillips, Foote, and Harper et al. (2008) suggest using word “ladders” relating synonyms by their level of intensity, with the “weakest” word placed at the

Boston, MA: College Hill.)

bottom of a vertical array of the words and the strongest at the top. If words are written on “sticky” notes, students can work together to order them, discussing their relative “strength” as they complete the task by placing each word “sticky” in correct order on the rungs of a ladder. Figure 12-5 provides an example word ladder.

- *Use both spoken and written contexts.* Rosenthal and Ehri (2008) showed that both pronouncing and providing written forms of new vocabulary increased elementary students’ retention of both spelling and meaning. Our goal, then, is to expose students to new words in a variety of language experiences. Using a science lesson as an example, the adult could first read the science passage to the students, asking them to raise their hand when they hear one of the words on a list of new vocabulary. The students could then write a list of the words and discuss what they know about each one. They might be asked to do the knowledge rating checklist again, to list the words they now feel they can define and read their list to the group. The group could together generate definitions for each word, then compile a group glossary, by writing down the definition they gave orally for each word.
- *Ask students to discuss the terms with one another* to refine and reformulate meanings. Here, again, we need to expose students to the words in varying contexts. The students could be asked to tell each other as much as they know about each word and name the words they still have trouble understanding. The adult could help the students look these words up in the dictionary and discuss their meanings further. The clinician might read the students the passage containing the words from their science text and from a library book on the same topic. The students could talk in small groups about how the words are used in each selection. They might comment on which selection helped them learn more about what the words mean, whether any have parts in common with other words

FIGURE 12-5 Example word ladder. (Adapted from Phillips, D., Foote, D., & Harper, L. [2008]. Strategies for effective vocabulary instruction. *Reading Improvement*, 45 [entire issue].)

they know, which was easier to understand, and which they liked better and why.

- *Use the words for writing and additional reading.* Over the course of the next few days following initial instruction, adults give have students additional opportunities to use the new words. A teacher might have students write a fictional story about the curricular topic, using words from the list, then ask students to listen to each other read their stories. Finally, they can write a group story using their favorite parts from each of the individual stories, with the stipulation that the group story must contain all the words on the list.
- *Return to the words periodically in following weeks*, using games that enable them to play with terms, such as Concentration, Password, or Charades. Game play with words appears to be especially helpful in making them part of the students’ active vocabulary (Marzano, 2009).

The main thrust of this approach is that vocabulary development should be an in-depth procedure that takes place, not on a one-shot basis, but continually, over time. I like to call this approach *elaborated exposure*. For both typical students (Coyne et al., 2009), and more especially for those with LLD (Lovelace & Stewart, 2009), listing and defining words is just not enough to get the words firmly implanted in their lexicon. They need to engage with words repeatedly over several different occasions, both receptively and expressively, in speech and in print, in a variety of experiences that intensify and expand knowledge of their meanings. Elaborated exposure helps to ensure that the newly learned words are retained and accessible for recall.

A second method of vocabulary development was suggested by Dole, Sloan, and Trathen (1995) and Boulware-Gooden, Carreker, Thornhill, & Joshi (2007). This is a *metacognitive* approach, which attempts to teach students strategies for learning new words, rather than a particular set of new words themselves (we’ll talk more about learning strategies approaches to intervention in Chapter 14). Students are taught first to use three criteria to select important unknown words from their classroom reading sections:

1. They must not know what the word means.
2. The word must be used in the assigned selection.
3. The word must be key to describing a character, event, or idea in the selection.

Students must justify their choice of each word on these grounds. Teachers first model this procedure, then students select their own words and write them in a list. After each word, they:

- write a guess as to what it might mean, based on their review of the context in which they encountered it.
- look up the word in the dictionary and write down the one meaning most appropriate for this context.
- reread the words aloud in context and read the definition they found most appropriate.
- talk about how each word’s meaning relates to the plot or main point of the selection and why each word might have been chosen by the author to convey this meaning.

Dole et al. (1995) report significant improvement in students’ understanding of word meaning when they are taught this strategy, as opposed to a more traditional program in which students simply look up words the teacher gives them, without contextual discussion. In the Boulware-Gooden et al. (2007) study, semantic webbing to connect the part of speech, synonyms, antonyms, and other related words to a new word was added to the process, with modeling from the teacher on how to construct the webs. Children who received instruction with semantic webs did significantly better

on vocabulary assessments after instruction than children who only received dictionary definition instruction. An example of a semantic web appears in Figure 12-6.

Still, DeKemel (2003) stressed that although building curricular-related vocabulary through elaborated exposure is an important aspect of language instruction for students with LLD, we cannot ignore the fact that children will encounter words they do not know, and will need to develop dictionary skills to understand such words. She advocated combining elaborated exposure with specific instruction in the use of the dictionary and thesaurus, using the following methods:

- Keep a dictionary and thesaurus available in each classroom and therapy room.
- Teach skills for alphabetizing and using the alphabetic system to find words in reference books in clinical pre-teaching and classroom collaborative lessons.
- Explicitly teach the various parts of dictionary entries, including pronunciation key, etymology, and the meaning of the order of definitions.
- Focus on word study; pointing out parts of words (roots and affixes) and the concept of identifying roots they know within new words.
- Explain the meaning of abbreviations used, such as *n.* for *noun*.
- Point out the use of sentences in the dictionary to help illustrate meaning and usage.
- Once a definition is found, use the thesaurus to identify words related in meaning.
- Teach how to use synonyms to eliminate redundancy and create more precise expression through paraphrasing activities.
- Always take newly defined words back to usage contexts, such as curricular themes and texts.

Biemiller (2003) reports that research supports the use of oral reading contexts for introducing new words. His studies suggest that reading texts to children, picking out words likely to be unfamiliar and explaining them within the context of the story or passage is sufficient for typical students to acquire two or three new words per session. Students with LLD will need additional exposure, but consulting with teachers to provide this kind of direct instruction

and then providing more elaborated exposure in therapy sessions can help our students' vocabulary keep up with their peers. Biemiller also advocates teaching all students to *ask* the teacher or SLP about words they do not know, so students can be actively encouraged to use the strategies they have learned on these unfamiliar words.

We've talked a bit already about helping children identify *roots*, or parts of words within words, to help then guess the meaning of unfamiliar words. This *Word Study* approach lends itself to the development not only of vocabulary, but of morphology and spelling, as well. Bloodgood and Pacifici (2004) suggested several activities that can be used in a word study approach to vocabulary development. These are outlined in Table 12-2. Box 12-6 lists children's books suggested by Bloodgood and Pacifici that can be used in a word study approach. Williams, Phillips-Birdsong, Hufnagel, Hungler, and Lundstrom (2009) report improvements in spelling and vocabulary after using a Word Study approach with children as early as the primary grades. We'll talk more about using Word Study to help children with spelling later in this chapter.

Whatever specific approach is used, research (Throneburg, Calvert, Sturm, Paramboulas, & Paul, 2000) suggests that an in-class, collaborative model is more effective for teaching curricular vocabulary to students who qualified for speech or language services than a traditional clinical model. So, however we decide to teach new vocabulary to students with IEPs, incorporating a collaborative approach will be advantageous. And explicitly linking word study to spelling can also be helpful for students struggling with this aspect of literacy, as well (Bauman et al., 2002). In classrooms using RTI, the approaches outlined here can be used as small group Tier II and individual Tier III instruction for students with or without IEPs who are struggling to acquire grade-appropriate vocabulary and spelling.

Word Finding

In Chapter 10 we talked about the fact that word-finding problems are frequently observed in students with LLD. We said they may be caused by semantic or phonological problems or some combination of the two (German & Newman, 2004). Therefore, to address word-finding problems, we need to work on several levels. One way to address the semantic side of word-retrieval difficulties is to do the kind of elaborated exposure work on vocabulary that we just discussed. By expanding and deepening students' knowledge of word meaning, we increase the connections among words in the students' semantic network. These stronger links and more elaborated understanding will, in themselves, decrease word-retrieval problems.

Wallach and Miller (1988) suggested using visual maps to help increase the semantic associations among words around a specific curriculum topic. For students in primary grades, topics with which students have some direct experience may be used. Yoshinaga-Itano and Downey (1986) suggested using familiar scripts, such as going to the doctor or visiting the post office, as bases for visual mapping. Figure 12-4 gives an example of a visual map for a "going to the post office" script that might be used in conjunction with a "community helpers" unit with primary students who show word-finding difficulties.

Massed practice can help increase speed of retrieval. Here students time themselves as they produce a list of vocabulary words associated with a curriculum-based unit. Students in intermediate grades could, for example, name all the layers of the rain forest that they have studied or all the parts of the food pyramid. Students at

FIGURE 12-6 Example semantic web.

TABLE 12-2 Activities for Supporting Vocabulary, Morphology, and Spelling through Word Study

Activity	Grade Level	Activity	Resources
Root of the day	3–6	Teacher/SLP writes a Greek or Latin root on the board at the beginning of the week (e.g., <i>tele</i>). Students add words they think are related (e.g., telephone, telegraph, television). Later, students discuss what the root might mean based on the words in their list. Volunteers check meaning in the dictionary; students add these to notebooks or cards.	<i>Word Journeys</i> (Ganske, 2000) <i>Words Their Way</i> (Bear et al., 2000)
Roots and branches	4–6	Teacher/SLP places a root word in the center of a tree trunk drawn on chart paper. Students in groups record derived words on branches in one color. Volunteers find the meanings in the dictionary and record them on the branches in a second color.	Greek mythology, <i>American Heritage Dictionary of Indo-European Roots</i> (Watkins, 1985)
Word sorting	3–6	Teacher/SLP introduces two related sound patterns (e.g., short <i>i</i> , long <i>i</i>), and a list of words for each (stick, time, find, guide, miss, wild, blimp); students sort the words into the two patterns (short: miss, blimp, stick; long: time, find, guide). They then attempt to find spelling patterns (e.g., what determines whether the <i>i</i> is long or short).	<i>Explorations in Developmental Spelling</i> (Bear & Templeton, 1998)
Homophone rummy	4–6	After introducing the concept of homophones (words that sound the same but are spelled differently), homophone pairs are written on cards, and various matching games (Rummy, Concentration, Uno, etc.) are played with them. To make a pair, however, students must give correct definitions for each word. Challenges are resolved by looking the words up in the dictionary.	<i>Eight Ate: A Feast of Homonym Riddles</i> (Terban, 1982)
Homograph concentration	4–6	After introducing the concept of homographs (words that are spelled the same but pronounced differently), pairs of sentences containing homographs are written on card stock. Cards are placed face down, as for Concentration. Players turn over pairs of cards until a match is found. Players must read the two matching sentences aloud and give a description of the meaning of the homograph in each of the two sentences.	<i>The Dove Dove: Funny Homograph Riddles</i> (Terban, 1988)

Adapted from Bloodgood, J., & Pacifici, L. (2004). Bringing word study to intermediate classrooms: Here are four original word study units teachers can easily implement themselves. *The Reading Teacher*, 58, 250-264.

the primary level can be asked to name all the days of the week or months of the year. The listing would be timed and repeated until retrieval was rapid and effortless. Timed trials, with small incentives for reaching particular time milestones (such as saying all the months of the year in 10 seconds), can be used to increase motivation. When one set of terms reaches criterion, new vocabulary could be introduced.

Hanly and Vandenberg (2010) showed that children with LLD were more likely to make errors in word retrieval based on phonological, rather than semantic, features of words, and research by Best (2005) and German (2002) has suggested that approaches that incorporate phonological cues can be especially effective in helping these students recall words. Vocabulary work can, then, be organized around phonological similarities. We might do a session on *bl* words, for example, using some of the words from a current classroom theme, work of literature, or classroom discourse activity. At the primary grades, such words might include *blaring*, *blackened*, *blast*, and *blazing* during a classroom unit on fire prevention. At the intermediate level, we might use words such as *blatant*, *blunder*, *blush*, and *blame* in conjunction with work on classroom discourse skills. Work on meanings and uses of the words could be supplemented with cloze activities in which the clients supply the words in sentences constructed by the clinician.

The clinician might write sentences such as the following for the intermediate-grade students:

When I talk out of turn in class, the teacher gives me a dirty look and I _____.
When someone gives the wrong answer, it's _____ly obvious because the teacher says, "Any other ideas?"
Talking without raising your hand is a _____.

If students have trouble remembering the word needed to fill in the blank, the clinician can remind them, "Remember, all the words we've been working on begin with *bl*. Try to remember the word by saying the beginning to yourself, and see whether that helps you remember the rest. When the teacher gives you a look, you /bl/. . . ?" Later, a second set of words with a different phonological pattern can be introduced and the two patterns can be used in the cloze procedure, with the clinician encouraging the students to try to remember which of the two beginnings start the word.

Best (2005) and Gerber (1993) suggested further work to focus students' attention on the phonological properties of words. Students can be given phonological cues in games in which they

Booklist from Bloodgood, J.W., & Pacifici, L.C. (2004, November). Bringing word study to intermediate classrooms. *The Reading Teacher*, 58, 250-263. Reprinted with permission of the International Reading Association.

guess a word after a clinician's clue. Again, the words can be drawn from classroom themes. The clinician might say:

Here are pictures of five people in our school. I'm thinking of one whose job has four syllables. (secretary)

Here are pictures of six foods. I'm thinking of one that rhymes with *seen*. (bean)

Here are maps of three countries we've studied. I'm thinking of one that starts with /s/. (Spain)

Another application of phonological retrieval strategies combines work on vocabulary and spelling. Carpenter, Gehsmann,

Smith, Bear, and Templeton (2009) and Fulk and Stormont-Spurgin (1995) emphasized the importance of teaching spelling through analogy by pointing out, for example, that when two words rhyme, the last part of each word is often spelled the same. We can use these spelling analogies to highlight a variety of phonological similarities among words (for example, same ending, same beginning sound, same sound in the middle represented by double letters, same short vowel sound). By focusing on the structural similarity among words and pairing these sound similarities with written forms, we provide students with both auditory and visual images of the word for storage, again deepening and elaborating knowledge of words. In this way, we not only build vocabulary strength, but adhere to our principle of integrating oral and written instruction and provide a

good foundation for increasing knowledge of words' written representation—their spelling—as well.

German (2002) investigated a word retrieval program that made use of words drawn from the curriculum and included three elements: metalinguistic reinforcement, phonemic neighbor cues, and rehearsal. These strategies are summarized in Box 12-7. German reported that these strategies were effective in improving students' access to words trained, but not to untrained words. German (2009) suggests integrating vocabulary learning with word retrieval strategy instruction in Tier II interventions for children with word finding difficulties. This approach would include supplementing the teaching of the meaning of new curriculum-related words with focus on the phonological structure of the new words as well. So children would be encouraged, for example, to divide newly learned words into syllables and to rehearse the pronunciation of the word during the initial learning process. German (2009) also encourages classroom accommodations for children with word finding difficulties, such as replacing oral reading assessments with silent reading, and using recognition formats such as multiple choice rather than cloze tasks.

Helping students learn to use both semantic and phonological cues to aid in word finding provides the students with a broad-based strategy for improving their word-retrieval skills. There also are commercially available programs that target word finding, such as German's (2005) *Word Finding Intervention Program*. Either commercial programs or clinician-created activities on word retrieval can be used both to pre-teach vocabulary from classroom curricula for students on IEPs, and as Tier II and III vocabulary reinforcement in RTI programs.

Semantic Integration and Inferencing: Enhancing Reading Comprehension

Understanding what we read involves pulling together ideas from different sentences in a text, and drawing inferences by integrating information given in the text with information presented earlier

and with background knowledge. For example, if you read, "The family put their gear in the car and drove to the park for a game of softball. When they got to the parking lot, they opened the trunk and found they'd forgotten to bring a catcher's mitt," you would need to infer that the family put their sports equipment in the trunk of the car, even though that is never stated in the text. As we have seen, students with LLD appear to have difficulties in spontaneously putting information together and drawing inferences from language they hear or read (Botting & Adams, 2005; DeKemel, 2003; Letts & Leinonen, 2001), although they do better in listening contexts than during reading (Wright & Newhoff, 2001). This suggests helping these students improve reading comprehension ability should begin with material the clinician tells or reads to the student before working on inferencing in material the student reads himself. Literature-based activities are an excellent framework for developing semantic integration—the ability to synthesize ideas from several linguistic units—and inferencing skills that build on this ability. McGee and Johnson (2003) showed that specific training in drawing inferences resulted in significant improvement in primary aged children with LLD.

One way to develop inferencing and semantic integration is to use prediction activities. Students can be read part of a short story or picture book from the classroom literature selection and asked to predict what they think will happen next and why. They can be asked to draw a picture of what they think the next part of the story will look like and to label or describe the picture in writing. Commercial materials also are available, such as Matthews' (1995) *Jump to a Conclusion!*

Older students can write their own stories around classroom themes or curricular content, individually or in small groups. They can be told to leave off the ending or to write the ending on a separate sheet of paper. For the second part of the lesson, the stories (without the endings) can then be passed to another student or group for a meaningful ending to be added. The completed stories

BOX 12-7 Word Retrieval Strategies

1. **Metalinguistic Reinforcement:** Make student aware of syllable structure of target word. Present a grid of cells representing the number of syllables for the target word:

Segment the word into syllables for the student, and have student write each syllable in one of the boxes:

hip	po	po	ta	my

The student is then asked to say each syllable while touching its box, and to pronounce each syllable along with a clap.

2. **Phonemic Neighbor Cue:** The student is given a prompt word that is a "phonemic neighbor," or shares some phonemic properties of the target word. Examples include *hip* for hippopotamus, *try* and *angle* for triangle, *help* and *mitt* for helmet, *card* for cardinal. Students are taught to link each cue to the target word and to think of the prompt word but not say it (so the prompt will not interfere with access to the target: "Think *card*, say cardinal").
3. **Rehearsal:** Massed practice, in response to picture or written cues is used, but the requirement also to use each target word in a sentence is added.

might then be read aloud and the reasons for the chosen endings discussed and evaluated. If the original authors wrote the endings on a separate sheet of paper, these can be shared and compared with those produced in the second part of the activity. The students could evaluate which ending was better and why. Book series such as the *TwistAPlot* (Scholastic) and *Choose Your Own Adventure* series (Bantam Books), which are designed to allow readers to select among endings, also can be used in these activities.

Interactive computer games also are very useful for this purpose. Many computer games used in schools allow students to select what comes next in a story or simulation activity. These programs, if available, can be used with students with LLD, with clinician assistance, if necessary, in reading the text on the screen. When working with computer games with students, we need to provide a lot of contextual and metalinguistic support. We want to be sure that the students are really attending to the semantic integration of the information and not getting so involved in the game that they are not focusing on the goal of the activity. Reminding students to remember the information in the story that they already know, think about what might happen next, and guess about the consequences of characters' actions can help to keep their inferencing at an awareness level.

Wallach and Miller (1988) also discussed some semantic integration and inferencing activities that can be done around smaller pieces of text. They cited Johnson and von Hoff Johnson's (1986) suggestion to present students with various sentences, following each one with a question that requires an inference. The sentences can relate to a curricular unit or be drawn from a classroom literature selection or theme-based unit. For example, if a primary grade class is reading *The Fox Went Out on a Chilly Night* (Spier, 1961), the following sentences and inferential questions might be presented:

1. The fox went out on a chilly night.
What season of the year was it?
2. Then old mother Giggie-gaggle jumped out of bed.
What was she doing before she heard the fox?
3. She cried, "John, John, the gray goose is gone and the fox is on the town."
Who is John?
4. There were the little ones 8-9-10. They said, "Daddy, better go back there again, 'cuz it must be a wonderful town."
Who are the little ones? Have they ever been to town before?

Inferencing activities also can be done around classroom themes. For example, if students are studying Mexico in geography or social studies, they can be presented with a selection such as the following:

Señora Rodriguez got out her cornmeal. She mixed it carefully with a small amount of water, then rolled the dough into a very thin circle. She filled it with some beans she'd fried, then put it in the oven. What was she doing?

Wallach and Miller also suggested helping students become more conscious of inferencing by producing "sentence bridges" to make inferred information explicit. For example, students working on a

weather unit in science might be presented with the following two sentences:

Sam and Dave looked up at the dark and cloudy summer sky.
They decided to listen to the game on the radio.

Students could be asked to explain how the second sentence might follow from the first. They could then be asked to fill in the middle with the clinician's guidance, after discussing why cloudy weather might lead to listening to a ball game on the radio. They might generate sentence bridges such as:

It looked as if it would rain.
They didn't want to drive all the way to the city in bad weather and sit in the rain all day.
It would be more fun to stay home and be warm and dry.

And of course, all these activities are appropriate not only for intervention sessions with children on IEPs, but also as consultative suggestions to teachers, as classroom collaborative lessons on reading comprehension, and as Tier II and III reading comprehension activities in RTI programs.

Syntax/Morphology: Integrating Advanced Language Forms with Reading and Spelling

The most important reason students need to learn advanced syntax and morphology is to support their understanding and use of literate language in reading, writing, and spelling (Nelson, 2010; Scott, 2009). This suggests two things to the SLP: first, following one of our basic principles for work with children with LLD, we want to select targets for syntax and morphological instruction that are drawn from the reading and writing children will need to do in the classroom; second, we want to provide guided practice in using these targets in both spoken (listening and speaking) and written (reading and writing) contexts. Work on syntax and morphology, then, doesn't have to be restricted to children with identified oral language IEP goals. It will also be useful for Tier II and III activities with students in RTI classrooms, to help them improve their reading comprehension of texts that include these advanced forms.

In choosing syntactic forms to target at the L4L period, then, we want to remember to take into account data from *both* the assessment of a student's syntactic abilities *and* from assessment and understanding of the demands of classroom discourse as well as the literary language requirements of the curriculum. The following sections contain some examples of these kinds of forms that contribute to classroom success in reading comprehension as well as more literate writing.

Advanced Morphology: Support for Spelling and Reading Comprehension

Wolter (2007) reviewed evidence demonstrating that working on awareness of morphology improved both vocabulary and reading comprehension for middle grade students. Windsor, Scott, and Street (2000) showed that although children with LLD had relatively high levels of correct morphological production in speech after age 7, they had significantly more errors in writing. When we work with students with LLD on morphology, then, it is important to practice both saying and writing the markers in appropriate

contexts. Gerber (1993) suggested that one way to address advanced morphological usage is to develop an understanding of the relationships between root words and derivations. Students can play matching or “Concentration” games with pairs of cards. Each pair would contain two words that share a common root. One of the words in each pair can be drawn from classroom activities. Students would be required to match the related words, for example:

social	monster	video	medicine	danger
society	monstrous	videographer	medical	dangerous
school	giant	muscle	serene	intent
scholastic	gigantic	muscular	serenity	intention

In discussing how the words are related in meaning, we also can point out the relations both in meaning and spelling. For example, we can ask students what *videographer* means and, if they don’t know, suggest they look for a smaller word inside it that they recognize. Once they identify the root *video*, they can be encouraged to think about other words that have similar parts beside *video* (*photographer*), then make a guess about what a *videographer* is. Additionally, we might, as Chomsky (1980) suggested, show students that *muscle* and *muscular* both have a *c* in them, although the *c* is pronounced only in *muscular*. Students can be told that if they have trouble remembering how to spell *muscle*, they can remind themselves of the word *muscular*, in which the sound of the letter *c* is clearly heard. The same approach can be used to discuss the spelling of *medicine*. If the students can’t remember whether to spell the /s/ sound in *medicine* with an *s* or a *c*, they can remind themselves of *medical*, in which a *c* is clearly the spelling. Similar reasoning can be used to discuss *social* and *society*, and many other terms. In fact, the students can be told that one of the reasons spelling in English has so many irregularities is that our writing system often preserves these connections among related words by retaining similar spelling patterns even when pronunciation changes over time (Chomsky & Halle, 1968). Frequently reminding students of these connections in succeeding work on morphology and vocabulary can help to build not only oral language skills but spelling ability. Evidence (Bhattacharya & Ehri, 2004) suggests that analytic approaches such as these help struggling readers both to recognize and spell new words more effectively. Many of the books and activities suggested in Table 12-2 and Box 12-6 will be helpful here.

By increasing students’ ability to apply strategies like these to unfamiliar words they encounter in reading, we improve their ability to get as much meaning as possible from the texts they read. These strategies, too, with guided practice, can apply to spelling skills as students become more able to take advantage of what they know about relations among words to learn and retain new spellings. And as we’ve seen so often already, these kinds of activities work not only as intervention for children on IEPs, but for consulting with teachers about improving spelling instruction, as collaborative classroom lessons, and as material for Tier II and III reading comprehension and spelling groups in RTI programs.

Literate Language Forms: Support for Reading Comprehension and Writing Complex Sentences

Scott (2009) discussed the importance of the ability to understand complex sentences to reading comprehension. In this discussion, she emphasized the need to avoid using isolated,

decontextualized exercises for these forms. Instead, she suggests intervention for complex sentences be carried in the context of real academic tasks. Literature-based script approaches are a great way to accomplish this, as they are for so many other language goals. Some examples of books for complex sentence development were provided in Appendix 9-1. Just one example that is especially appropriate for school-aged children is *When I Was Young in the Mountains* (Rylant, 1982). This book has more mature content than most of those listed in Appendix 9-1 and can be used to encourage use of temporal conjunctions, among other things.

Suppose, for example, a fourth grade class is reading *Gentle Ben* (Morey, 1965). If passive sentences were identified as an area of weakness for a child on an IEP, or if RTI activities identified difficulty with comprehension of the text for other students, one intervention activity might involve giving the student pairs of sentences taken from book being read in class:

Fog Benson always kept Ben chained.
Ben was always kept chained by Fog Benson.

Students could be asked to discuss the characters in the story, to recall that Fog was the man who owned the bear, Ben. They could then be asked to draw a picture to illustrate the first sentence, decide whether the first and second sentences meant the same or different things, and tell why they knew (“Ben couldn’t keep Fog chained, since Fog was the owner”). The clinician could then focus metalinguistically on the structure of the sentence, discuss what the *was* and *by* signaled, and give other examples of passive sentences. Students could be asked to generate more sentences about what characters in the story did to someone (“Mark’s mother protected him, Mark’s father frightened him, Fog shot Ben in Mark’s dream”). The clinician could write the sentences down, give a passive equivalent for some, then ask students to generate the passive equivalents. At the end of the activity, the structures that signal the passive could be discussed again. Subsequent activities could use the same procedures applied to different classroom material. A similar approach could be used for other sentence forms on which assessment data indicate strategies are operating. These forms might include sentences with *before* and *after*; those with center-embedded relative clauses (“The man who owned the bear was named Fog Benson.”); and other sentences, such as clefts, with unusual word order (“It was Fog Benson who owned the bear.”).

Other approaches to the development of complex syntax were suggested by Wallach and Miller (1988). They had students analyze complex sentences taken from classroom content or newspaper stories on topics of interest. The students first identify propositions included within the meaning of a complex sentence. Then they write out the propositions. For example, the clinician might choose a sentence from a classroom literature selection like *Charlotte’s Web* (White, 1952):

Every afternoon, when the school bus stopped in front of her house, [Fern] jumped out and ran to the kitchen to fix another bottle for [Wilbur].

Students might identify which of the following sentences' meanings were contained in the complex one:

The school bus stopped at Fern's house every afternoon.
Fern jumped out of the school bus as soon as it stopped at her house.
Fern ran to the kitchen as soon as she got home from school.
Wilbur's bottles were kept in the kitchen.
Fern jumped in the kitchen.

We can also work the other way: combining simple sentences to complex ones. In fact, research (e.g., Andrews et al., 2006; Eisenberg, 2007; Saddler & Asaro-Saddler, 2010; Scott & Balthazar, 2008; Scott & Nelson, 2009) shows that combining sentences is one of the few techniques that has solid evidence behind it for improving both understanding and use of complex sentences in school-aged children. Taking *Charlotte's Web* as our literature base again, we might ask students to combine the following sentences into one:

Wilbur climbed up on top of the manure pile.
Wilbur was full of energy and hope.
The rat and the spider were watching Wilbur climb.

Paraphrasing is another way to develop complex sentence skills. Paul (1992b) suggested giving students sentences in two different forms, such as:

Charlotte wove some words in the web.
Some words were woven in the web by Charlotte.

Students can discuss whether the sentences mean the same thing and why they might choose one over the other. The clinician might ask, "Which one would you say to a friend? Which one would you use if you were writing a book?" and other questions. Students can then be given sentences to paraphrase (or "say a different way") on their own or in groups.

Wallach and Miller (1988) used picture sequences to discuss clause order in complex sentences. Students can be given pictures to place in correct order corresponding to a spoken or written sentence. Alternatively, the students can draw the pictures themselves, based on a literature selection. For example, they can draw a picture of Fern holding Wilbur on her lap and another of Fern feeding Wilbur a bottle. The clinician can present the following sentences and ask the students to arrange the pictures according to what the sentences say:

Fern held Wilbur before she fed him.
Fern held Wilbur after she fed him.
After she fed Wilbur, Fern held him.
Before she fed Wilbur, Fern held him.

Other hybrid methods that we discussed in Chapter 3 for increasing sentence length for young children can be adapted for enhancing

sentence complexity in older children, as well. These include focused stimulation, vertical structuring, and contrastive modeling. Metalinguistic approaches, in which the clinician explicitly describes the forms being targeted ("Today we are going to work on subordinate clauses. These are groups of words we include in sentences to expand their meaning. Here are some examples . . ."). Additional suggestions can be found in Eisenberg (2007).

In line with one of our principles of intervention at the L4L stage, we would follow up such activities with metalinguistic discussions about how the different sentences convey different meanings, which pairs mean the same thing, in what situations each sentence would be most appropriate, and so on. Focusing on the development of complex sentences in the context of increasing children's understanding of what they read and hear in the classroom makes these activities, too, excellent candidates for consultative suggestions, collaborative lessons, and Tier II and III reading comprehension instruction, in addition to remediation for children on IEPs.

Noun Phrase Elaboration

As we saw in Chapter 11, Eisenberg et al. (2008) showed that, by 8 years of age most typically developing children are using noun phrases with at least three elements (*the funny little kid*), and by 11 most are using complex noun phrases with modifiers like relative clauses after the noun (*The man who is wearing a yellow hat is tall*). These elements are often found in children's literature and classroom texts, so they make appropriate targets for activities to increase syntactic complexity in the service of improving reading comprehension.

To encourage use of *multiple modifiers* and *prepositional phrases* to elaborate noun phrases, the clinician might write modifiers, prepositional phrases, or both, taken from the classroom literature selection or from a theme-based unit, on cards given to each student or group. Several nouns from the selection would be displayed on similar cards. Students would be asked to choose noun cards that could be elaborated with the modifiers and phrases they have. After discussing how the modifiers and phrases give more information about the nouns, students could be asked to put the noun phrases they've developed into sentences relating to the story or theme. They could then be asked to generate other modifiers or prepositional phrases that could modify the same nouns and to talk about how the meanings of the noun phrases would change accordingly. They might then write sentences with these new elaborated noun phrases. Eventually, new nouns could be introduced for which the students can generate modifiers and prepositional phrases, based on the ones with which they have become familiar in the earlier exercises. As always, it will be important to do these activities in the context of classroom texts and assignments, so new learning can be quickly applied to real academic tasks.

To increase noun phrase elaboration with *relative clauses*, the clinician might use a story the group has read in class, such as "The House that Jack Built." Gerber (1993) suggested writing each clause in the story on a strip and allowing students to add their strip to the story as it is read. Students can then write their own version of the story, such as "This Is the House that Miguel Built," using different clauses to elaborate the tale.

To work on relative clause development at a higher level, Gerber (1993) and Eisenberg (2007) suggested sentence expansion activities. These start with a simple, kernel sentence and encourage students to expand on the kernels. For example, each student or group might be given a relative clause relating to a classroom theme (for example, *who study the earth's atmosphere*), written on a strip. The strip can be color coded so it can be referred to as "the red one" instead of as "the relative clause." Each student/group

may then receive a different-colored strip containing a subject noun phrase (for example, *The astronauts*) and one with a verb phrase (for example, *gather information for scientists*). The students see how many different, meaningful sentences they can form with their strips, writing each sentence down as they form it. The groups can compare their sentences and talk about how placing the relative clause (or red strip) in different places changes the meaning of the sentence.

Verb Phrase Elaboration

Auxiliary Verbs Both DeKemel (2003) and Eisenberg (2007) noted that students with LLD often show limited variety in their verb forms and tenses, and include fewer arguments—direct objects, indirect objects, and locative terms—in their sentences. Again, these difficulties will impact not only the intelligibility of the students’ speech, but also their ability to understand complex verb phrases when they read classroom texts. Using multiple auxiliaries to modulate the meaning of verbs in sentences (*he could run*, *he could have run*, *he could have been running*) is an important aspect of elaborating meaning, and provides opportunities to discuss roots and affixes in a metalinguistic, word study format. Literature-based script approaches can be used here, too. Texts familiar to students can be modified to include repeated instances of present perfect tense (*have arrived*), past perfect tense (*had arrived*), and auxiliary combinations (*could have arrived*, *could have been delayed*). These “homemade books” can be read repeatedly to children, following the procedures developed by Kirchner (1991) and outlined in Chapter 9. For example, if *Mr. Brown Can Moo, Can You?* (Seuss, 1970) is being read in the clients’ classroom, the clinician can make a photocopy of each of its pages and paste over the usual text with versions that contain target forms. The book might be made to read, “Mr. Brown has mooed, have you?” and so on. As just one more example, the texts of Joslin’s books on manners in silly situations, *What Do You Do, Dear?* (Joslin, 1961) and *What Do You Say, Dear?* (Joslin, 1986), could be modified to be read as “What could you have done, dear?” and “What could you have said, dear?”

Fey (1986) suggested that advanced auxiliary marking also can be taught by setting up a discourse context in which such forms are required. For example, the clinician might retell a story the students are reading in class, asking questions that create a context for the use of the past perfect tense. After reading the students the story, the clinician might say the following:

A little old woman decided to bake a gingerbread boy. She had made the dough and put it in the oven, but when she opened the door, the oven was empty. What had happened? (The gingerbread boy had run away.)
The woman yelled for him to stop, but the gingerbread boy ran on. The gingerbread boy ran past a little old man, who had stopped his work. What had happened to make him stop?
(He had heard the little old woman yelling.)

Verb Arguments To enhance use of verb arguments, activities like those described under Noun Phrase Elaboration, including writing verb arguments taken from the classroom literature selection or from a theme-based unit, can be given to each student or group. Several verbs from the selection would be displayed on similar cards. Students would be asked to choose verb cards that could be elaborated with the arguments they have. An example

activity based on *Charlotte’s Web* might include the following cards for students to combine into sentences:

Noun	Verb	Arguments		
		Direct Object	Indirect Object	Locative
Fern	gave	a bottle	to Wilbur	in the kitchen
Charlotte	wove	her radiant web	for the people	at the fair

Adverbs Another aspect of verb phrase elaboration involves modulating verb meaning with adverbs. Nippold (2007) suggested working on the relative magnitude of adverbs. Students can be given cards with words such as *slightly*, *somewhat*, *quite*, *unusually*, and *extremely*. They can be asked to use the adverbs (or “words on blue cards”) to fill in blanks in a passage relating to curricular content. For example, the clinician might write the following:

Scientists worry that global warming is increasing average temperatures. Weather in some parts of the county has been _____ hot.

Students could decide which of their words best completes the sentence. Alternatively, the clinician could write three versions of the second sentence and ask students to discuss the meaning of each and talk about why they might choose one over the other as the best follow-up to the first sentence:

Weather in some parts of the county has been slightly hot.
Weather in some parts of the county has been unusually hot.
Weather in some parts of the county has been quite hot.

Another way to encourage adverbial use is to present a list of adverbs relating to emotions. This can be combined with “word ladders” like the one in Figure 12-5. Dialogue can be drawn from a classroom literature selection and students can be asked to choose the adverb (or “blue card”) that could be used to show how the character would say that part of the story. Suppose students are reading *Curious George Rides a Bike* (Rey, 1952) in class. The children could be given the adverbs *sadly*, *angrily*, *curiously*, and *excitedly*. Then they could be asked to choose which one could be used to describe the way characters might speak in the following parts of the story:

“I wonder what the river is like further on,” said George _____.
“We cannot use little monkeys who don’t do as they are told!” said the director _____.
“I won’t be able to play the trumpet in the show now,” George said _____.
“There’s George!” said the Man in the Yellow Hat _____.

Pragmatics

Conversational Discourse

We've talked about some of the conversational difficulties of our students with LLD. When assessing conversational discourse, we looked at the *range of advanced intentions expressed*; the way the client can *modify the message depending on the context*; and the management of *discourse turns, topics, and breakdowns*. We can address each of these areas in intervention.

A variety of conversational pragmatic programs are available commercially, many geared toward working with students with autism spectrum disorders. Some examples of these appear in Table 12-3.

As just one example, Dodge (1998) presented a program on general communication skills for elementary students that can be presented in classrooms for both mainstream and LLD students. Suppose you found that a client expressed few advanced intentions, such as using language to reason and report. You might set up an activity in which students had to solve a problem, such as how to make a spider web out of black yarn (continuing our *Charlotte's Web* theme). After letting students try on their own, you might report their success to them ("You figured out how to start the web. You wound the yarn around your hand. Then you put the yarn on the desk, cut off a piece, and lay a bigger circle of yarn around it"). You might then "think out loud" about how to proceed with the next step. When the project was completed, you could ask the students to think about how they might tell another student how to do the task. You might ask them to reason about why they had trouble at first, or about other ways to approach it. As they do this, you can provide additional models of reporting and reasoning as expansions or extensions of the clients' comments.

Contextual variation can be practiced through role-playing. Variations can be made for the following purposes:

1. Politeness ("Let's pretend you're a mom asking her son to get her a pencil. Now pretend you're a teacher asking a student. Now be a teenager asking his friend. Now be a boy asking his sister for the pencil she borrowed.")
2. Tact ("Pretend you're a doctor telling a patient she needs an operation. Pretend you're telling a friend you already have the book she gave you for your birthday.")
3. Assertiveness ("Pretend you want to tell your friend something, but she's not listening. Pretend your sister is hurt and you need to tell your mother, who is talking on the telephone.")

Bedrosian (1985); Brinton and Fujiki (1989, 1995); Brinton, Robinson, and Fujiki (2004); Mentis (1994); Naremore, Densmore, and Harman (1995); and Paul and Sutherland (2005) presented many suggestions for activities that can be used to address a variety of *discourse management* skills. As one example of a topic-maintenance activity, Brinton and Fujiki (1989) suggested engaging the client in a conversation about a topic of the child's interest. The clinician provides scaffolding to remain on the topic. If the child begins to wander from the topic of how he liked the basketball game he saw over the weekend, the clinician might comment, "That sounded like a great game you saw. Tell me about the most exciting play." Gradually, the scaffolding should be reduced, so that only cues are provided (for example, "Is that what we're talking about?" can be used at first and then later just a tap on the wrist). The client can then be asked to have a similar conversation with a peer. The clinician can sit beside the client and give the cue (a tap on the wrist) if the client strays from the topic, whispering a verbal cue or a prompt for an appropriate comment in the client's ear, if necessary. Paul and Sutherland (2003) suggested activities such as

conversational mapping, in which children make a “scrapbook” containing one page for each friend. Each page contains a picture or drawing of a child the client would like to talk with, along with pictures of things the client knows each “friend” likes or is interested in. They role-play talking to each “friend” with the clinician, by asking one question about what the “friend” likes, and saying two things about that topic before introducing a new topic. After role-playing, they try approaching the new “friend” in a similar way, and report back to the clinician on how it went. An extension of role-playing activities involves video modeling; that is, having peers make a video of a conversational interaction, rather than using role-playing or live observation. Research summarized by Bellini and Akullian (2007) and Prelock, Paul, and Allen (2011) suggests that having a client view, discuss, rehearse, and practice the interaction observed on video first with a clinician and later with a peer is especially effective conversational intervention for students with ASD. Clinicians may wish to develop their own videos for modeling, based on the individual needs of their clients, and some video models are also available commercially from vendors such as www.modelmekids.com, www.watchmelearn.com, and www.silverliningmm.com.

Brinton et al. (2004) presented a case study of a conversational treatment program, which is summarized in Box 12-8. It is important to note that their program lasted for 2 years, suggesting that, in order to make significant changes in a client’s conversational style, extensive intervention will often be required. Brinton and Fujiki (2007) presented guidelines for assisting students who have difficulty participating in peer groups. These appear in Box 12-9.

We talked about the use of barrier games, or referential communication activities, for assessment of *presuppositional* skills and of the ability to clarify and request clarification. Barrier games also can be used in intervention for discourse management. The clinician, as speaker, can model appropriate presuppositional behavior, pointing out to the client how the clinician’s message was effective because it contained appropriate information. Again, vocabulary and sentence structures being targeted in intervention can be used in these barrier games, to help the student learn to use new forms and meanings in presuppositionally appropriate ways.

Troia (2009) emphasizes that developing presuppositional skills is especially important for improving writing, since novice writers often make inaccurate assumptions about what knowledge is shared with their audience. This suggests that, again, the principle of integrating oral and written language should be applied to work on presupposition. That is, students should be encouraged to check their presuppositions in written activities as well as oral ones. Troia suggests that targeted peer editing, in which students read each other’s writing and point out where the writer has not given them adequate background information, can be helpful here.

For work on *clarification and communicative repair*, the client can be given a turn as speaker in a barrier game, with the clinician requesting clarification as frequently as possible during the exchange. Discussion about the interaction can follow, with the clinician pointing out how important it is to ask when we don’t understand something. Roles can then be reversed. This time the clinician can give purposefully unclear messages. Nonsense words can be inserted in the message, or part of it can be mumbled. If the

BOX 12-8 Elements of Conversational Treatment Study of Brinton, Robinson, and Fujiki (2004)

1. Watch short film clips from movies client had seen and role-play scenarios in them to increase awareness of the social, emotional, and contextual information needed to function appropriately in conversation.
2. Have client consider and comment on the exchange of messages between conversational partners.
3. Review video clips depicting clinic personnel role-playing events and interactions similar to those client had experienced at school, portraying difficult, isolating, or harassing incidents (e.g., peers ridiculing a student who was standing alone) and have client describe how various characters felt and what their intent was at different points in the interaction.
4. Generate possible conversation topics, write them on slips of paper, place them in a can; pick one at random.
5. Clinician models steps for the “conversation game”: read the paper and take a moment to think about the topic, then make one comment on the topic, ask a question, and listen to the response.
6. Increase complexity of “rules” for the “conversation game” as client masters previous level:
 - Make two comments on the topic, ask a question, and listen to the response.
 - Make two comments on the topic, ask a question, listen to the response, and comment on that response.
 - Make two comments on the topic, ask a question, listen to the response, comment on that response, ask a related question, and listen to the response.
 - Make several comments on the topic, ask a question, listen to the response, make some comments on that response, ask a related question, and listen to the response.
7. Additional strategies initiated at later points in the program include:
 - Ask for your partner’s opinion.
 - Talk approximately the same amount of time as your partner does (balance the conversation).
 - Determine what interests your partner.
 - Draw your listener(s) into the conversation.
 - Respond to your listener’s needs.
8. Later sessions provide cues to client’s failure to adhere to appropriate conversational give and take. Each cue is demonstrated, then given in context if client begins dominating the conversation or ignoring listener needs:
 - Yawn
 - Look at watch
 - Look away from client
 - Client is taught first to recognize these cues, then to develop appropriate responses to them.

BOX 12-9 Brinton and Fujiki's Guidelines for Facilitating Peer Group Access

STEPS	INSTRUCTIONS
1. Why?	Explain that it is fun to do things with others; discuss how to choose a group to join based on what the group is doing or talking about.
2. Walk	Have the student approach a group after practice with toy figures, pictures, or written cue cards.
3. Watch	Have the student observe the others and identify a topic or task before entering the group, after practice with toy figures, pictures, or written cue cards.
4. Talk	Encourage student to give a compliment (You're building a cool building), offer a suggestion, ask a question, or offer help, after practice with toy figures, pictures, or written cue cards.
5. Try again	Help the student understand that the first bid may not work and we may need to try again. Practice scenarios with toy figures, pictures, or written cue cards to try several strategies for modifying the approach. Have peers coach the student.
6. Reflect	Discuss the process, rehearse alternate strategies, model mistakes and have student correct them (e.g., approach a group and grab materials. Ask student, "Did I do it right? What should I have done?"[watch])

Adapted from Brinton, B. & Fujiki, M. (2007). Peer interaction. In Ukrainetz, R. (Ed.). *Contextualized language intervention*. (pp. 289-318). Eau Claire, WI: Thinking Publications.

student fails to request clarification, the clinician can allow the task to be completed. Then errors in completion can be discussed and the clinician can point out that some of the message was unclear, ask the client whether he or she detected the miscommunication, and ask what he or she might have done. The interaction can then be replayed, with the client coached to request clarification at appropriate points. Additional activities can provide opportunities for the client to experience such unclear messages and respond to them. As we saw in Chapter 11, many commercial materials, such as *Make-It Yourself Barrier Activities* (McKinley & Schwartz, 1987), *Barrier Games for Better Communication* (Deal & Hanuscin, 1999), and *Creatures & Critters* (Marquis, 2004), and *Developing Oral Language with Barrier Games* (Jarred & Reolofs, 2010) are available for use in these activities. Musselwhite (2007) also provides ideas and templates for a variety of barrier games at www.aacintervention.com.

Classroom Discourse Skill

We talked in the last chapter about using classroom observation methods to identify any difficulties a student might be having with the "hidden curriculum" of classroom discourse (Christie, 2003; DeKemel, 2003). Some of the work to improve classroom discourse

performance involves working with the teacher in a consulting role to modify the demands of the classroom. We'll talk about this role a bit later. We also can work with the student, though, to improve some classroom discourse skills.

Westby (2007) discusses some aspects of classroom discourse that can be addressed in this work. Table 12-4 provides some components of classroom scripts that can be part of metalinguistic discussions of classroom discourse. Ripich and Spinelli (1985) suggested using the intervention setting to construct a "miniclassroom" for discussing and practicing these classroom discourse structures. Each miniclass session begins with a discussion of a school event or routine. After discussing the hidden rules and structure of each script, the students do an activity involving the script, with some taking roles of students and one taking the role of the teacher. The miniclass might, for example, role-play coming to class and doing a science experiment, cooperative learning group, or book report. The student playing the teacher role would be encouraged to provide specific correction to students who fail to adhere to the rules the group generated to describe the hidden curriculum of the activity. When the clinician plays the role of teacher, he or she can

TABLE 12-4 Components of Classroom Scripts

Component	Elements	Explanation
Rules for participation in class discussion	Gatekeeping	Teacher determines who can talk, when, where, why, with whom
	Sequencing	Students must wait their turn or wait to be called on
	Topic management	Teacher chooses topic; teacher determines which contributions are/are not relevant
Turn taking	Automatic	Follows pre-set order (e.g., alphabetical)
	Nomination	Teacher calls students by name to respond
	Invitation	Teacher allows students to reply by raising hands, or as a whole group
Feedback	I-R-E	Teacher initiates a turn sequence, child responds, teacher evaluates the response ("That's right!")
	Revoicing	Instead of evaluating response, teacher reframes or rephrases it ("So you're explaining that when plants are put in the dark they can't grow. Plants need light, don't they?")

Adapted from Westby, C. (2007). There's more to passing than knowing the answers: Learning to do school. In T. Ukrainetz (Ed.) *Contextualized language intervention* (pp. 310-388). Eau Claire, WI: Thinking Publications.

purposefully give unclear directions or violate the rules of the script to encourage students to ask for clarification and assert themselves in a group setting.

Narrative Skill: The Bridge from Oral to Literate Language

We've already discussed some ways to develop inferencing in narrative and to scaffold narrative macrostructure. Let's look at a few more examples of activities that can be used to increase narrative comprehension and production to fortify this important bridge from oral to literate language.

Comprehending Narratives: Gateway to Reading Comprehension

For students in the L4L stage, story understanding is a major portal to improving reading comprehension. As Nelson (2010) and Westby (1985) have argued, narratives form a bridge from simpler to more literate forms of language understanding because they contain a relatively familiar, though still complex, structure. For children with LLD or those who struggle with reading comprehension, SLPs have a central role to play in improving reading comprehension by scaffolding and providing extended guided practice with narrative texts in both oral and written form. Work on narrative understanding can take place at several points: before encountering the story, during story reading/telling, and following story exposure.

Let's talk first about activities we can introduce before a story. Norris and Hoffman (1993) advocated developing a *preparatory set* with students before they read a story to activate their background knowledge about the story's topic and to get them ready to take in the new information the story will provide. Hoggan and Strong (1994) suggested using the story's title to establish a preparatory set by asking students to talk about what they know about specific words in the title and to identify words or concepts with which the students are unfamiliar. Unknown words can be discussed, and students can act out meanings of words. Wallach et al. (2009) discuss the importance of helping develop students' knowledge not only of vocabulary, but also of content that relates to curricular topics. She advocates helping students develop a preparatory set by encouraging them to relate their own experiences to previewing activities and using the opportunity to expand their background knowledge by adding new information to this discussion. Stahl (2004) suggests targeted discussions of background knowledge guided by the teacher with focused discussion of what students know about relevant topics before reading or listening to a text, as well as open-ended questions invoking background

knowledge relevant to specific events during the story. Kamhi, (2009) argues that providing students with additional background knowledge in content areas important to school achievement will optimize their chances for improved reading comprehension. All this implies that part of developing preparatory sets involves providing students with the background information they need to fully understand a story. Discussing what students already know about the story's setting or content during previewing activities, and giving brief chunks of new information about them in anticipation of reading the story can contribute to this goal.

Ambe (2007), Nessel (1989), and Stahl (2004) suggest using *directed reading-thinking activities* to establish preparatory sets. Here students are shown the book to be read and told the title, but not told the story's topic. Students are asked to make predictions about the topic of the story and to give support for their opinions. Predictions are listed, so they can be compared to the events in the story after it is read in its entirety. Students then hear the first few paragraphs and are asked whether they want to change their predictions. After reading the whole story, students are asked to compare their predictions to what happened in the story, identify predictions that were correct, and contrast those that did not turn out to be true. Students can explain what events in the story led to different conclusions than the ones they predicted.

Literature webbing is another prediction technique reported to have significant effects on young readers' ability to predict and retell story events (Stahl, 2004). The teacher or SLP writes key events from a story on cards, and gives each group of students a set of these cards in random order before hearing a story. Each group organizes the cards into the order they predict will occur in the story. They then hear or read the story, check their predicted order, and discuss any changes they need to make and why. Nelson (2010) advocates prereading/prelistening tasks that encourage children to develop a set of prereading/prelistening questions to guide their reading/listening. Examples of such question sets appear in [Box 12-10](#).

Activities aimed at improving comprehension during the process of oral reading are also available. Again, these techniques involve inserting questions within the reading to guide and deepen students' comprehension. Crowe (2005) compared the use of communicative reading strategies (CRS)—teacher questions posed during reading that are designed to engage the children in constructing a meaningful message from the text—with the use of questions that focus on decoding words. She reported that using CRS questions with struggling readers during oral reading

BOX 12-10 Advance Organizers to Aid Narrative Comprehension

"STEWES" QUESTIONS

Skim through the pages of the story; what clues do they give you?

What does the **title** tell you the story may be about?

Examine pictures, headings, maps for clues. What new predictions can you make?

What are the **words** that might be important to the story.

What words that are new to you will you need to understand before you read/listen?

Think about the story's **setting**; does it make you think the story will be fact or fiction?

STORY GRAMMAR ORGANIZING QUESTIONS

Listen for the answers to these questions as you read/listen:

- Who is in the story and where does it take place?
- What happens in the beginning?
- What do the characters try to do about it?
- What happens at the end?

improved their ability to retell stories, an index of story comprehension. Examples of CRS questions that can be used in this way appear in [Box 12-11](#). A related technique uses teacher “think-alouds” to model processing of the story during oral reading. The teacher/SLP voices all the things she notices, does, visualizes, feels, and asks herself during the reading of a text. Wilhelm (2001) showed that this strategy also improved comprehension.

Following story reading with additional discussion is, of course, another way to address narrative comprehension. Westby (2005) suggested using repeated, scaffolded exposure; that is, reading the story more than once and providing follow-up questions at varying levels of complexity. Questions after an initial reading, for example, might ask students to identify story grammar elements with a series of questions:

- Where did the story happen?
- Who were the important people in it?
- What problem got the story going?
- How did the people try to solve the problem?
- How did it end?

Additional readings might involve questions that require higher level responses. For example, a second reading might be followed by a request for a summary of the story in students’ own words. A third might require students to explain why characters did what they did, and to analyze the results of their actions.

Stull and Mayer (2007) reviewed evidence demonstrating that graphic organizers that highlight text structure assist students in comprehension. As one example, a story flow chart (Ollman, 1989) can be used to help students visualize the relations among events. After reading, the clinician can ask students to call out the major events they remember from the story. The students’ ideas are listed on the board. The clinician then draws the chart and has the students place the events they listed in the appropriate place on the chart. [Figure 12-7](#) illustrates a flow chart developed from A.A. Milne’s (1926) “In which Pooh Goes Visiting and Gets into a Tight Place.” Garner and Bochna (2004) showed that instruction like this provided lasting improvements in typical first graders’ reading

comprehension. Boyle (1996) demonstrated that this kind of mapping resulted in LLD students’ showing substantial gains in both literal and inferential comprehension. Stahl (2004) also suggests using visual imagery to improve story comprehension. Teachers demonstrate how to “paint a picture in your mind” first of several displayed objects, then of events heard or read in stories. Think-aloud protocols can be used to model the visualization process. Stahl reports that visualization training increased both comprehension and retelling in primary grade children.

For students at True Narrative levels of development, Westby (1991) suggested using stories that highlight aspects of the story grammar that are most likely to be difficult for students with LLD. She advocated helping students become aware of character traits by reading several books about one set of characters and having students discuss and list the character’s attributes. This procedure lends itself well to having students write their own stories about the characters they have been discussing, being sure to maintain the personalities they have described. Series popular with children, such as *Harry Potter* (Rowling [Scholastic]), *Artemis Fowl* (O. Colfe [Hyperion]), *Little House on the Prairie* (L.I. Wilder [HarperCollins]), *Encyclopedia Brown* (D. Sobel [Random House]), or the Narnia books (C.S. Lewis [HarperCollins]) can be used in this way.

Students with LLD also are likely to have trouble understanding how feelings can motivate actions in stories. Westby (2005) suggested that students can be encouraged to talk about the feelings portrayed by characters in the pictures, to give words for the feelings, and to talk about how the feelings drive the action of the story. Students can then make posters by cutting out or drawing pictures of people who exemplify emotions they discussed in the story. Alternatively, Hoggan and Strong (1994) suggested making an “Internal States Chart.” Each character in a story is listed, and students are encouraged to talk about how that character felt at different points in the story. An example of an Internal States Chart, based on the story of “Androcles and the Lion” (Baldwin, 1955), is given in [Table 12-5](#).

BOX 12-11 Examples of Communicative Reading Strategies to Improve Story Comprehension during Oral Reading

STRATEGY	EXAMPLE FROM A TALE OF THREE WISHES (SINGER, 1962)	EXAMPLE CRS QUESTION
Summarize as you read	Child reads first two paragraphs of story	“So now you’ve read the setting of the story; tell us where it happens and who is in the story.”
Explain and define new words	Child reads: “Each Thursday was market day . . . [when people came to town] to sell grain, potatoes, . . . and buy salt, kerosene . . .”	“So lots of things were being bought and sold on market day. Why do you think they needed to buy <i>kerosene</i> ? Do you know what they used it for? Has anyone ever used kerosene? It was used in lamps before people had electricity.”
Clarify pronoun reference	Child reads: “. . . Someone told them that on [a certain day] the sky opens . . . Those who happen to see it have a minute’s time to make a wish.”	“So who gets to make a wish?”
Provide cohesive ties	Child reads, “Children must go to bed early but the three stayed up until their parents fell asleep.”	“Even though children usually had to go to bed early in those days, these three stayed up late. Why? Yes, they stayed up to try to see the sky open. They should have gone to sleep <i>but</i> they stayed up.”

Adapted from Crowe, L. (2005). Comparison of two oral reading feedback strategies in improving reading comprehension of school-aged children with low reading ability. *Remedial and Special Education*, 26, 32-42.

Student Ideas

Pooh wants to visit Rabbit in Rabbit's hole.
Rabbit is worried.
Pooh eats all Rabbit's food.
Pooh tries to get out.
He gets stuck.

Rabbit tries to help.
Rabbit gets Christopher Robin.
Christopher Robin says Pooh has to wait to get thin.
He reads to Pooh.

In Which Pooh Goes Visiting and Gets into a Tight Place

FIGURE 12-7 Flow chart of A.A. Milne's (1926) "In Which Pooh Goes Visiting and Gets into a Tight Place." (Adapted from Hoggan, K., & Strong, C. [1994]. The magic of "once upon a time": Narrative teaching strategies. *Language, Speech, and Hearing Services in Schools*, 25, 76-89; and Ollman, H. [1989]. Cause and effect in the real world. *Journal of Reading*, 33, 224-225.)

TABLE 12-5 An Internal States Chart for the Story "Androcles and the Lion"

Character	Feeling	Event	Motive
Androcles	Fear	Meets lion	Lion may eat him
Lion	Pain	Roars and frightens Androcles	Thorn in foot
People who watch Androcles and Lion in arena	Surprise	Lion will not eat Androcles	They expected lion to be fierce

Adapted from Hoggan, K., & Strong, C. (1994). The magic of "once upon a time": Narrative teaching strategies. *Language, Speech, and Hearing Services in Schools*, 25, 76-89; and Baldwin, J. (1955). Androcles and the lion. In *Favorite tales of long ago*. New York: J.P. Dutton.

Students with LLD often have trouble recognizing how characters' plans and intentions affect events in the story. Here Westby (2005) suggested using "trickster tales," in which a character achieves goals through deceit. Some examples include *Miss Nelson Is Missing* (Allard & Marshall, 1977), *Tales of an Ashanti Father* (Appiah, 1989), *Stone Soup* (Brown, 1947), *Iktomi and the Boulder: A Plains Indian Story* (Goble, 1988), *Anansi and the Moss-Covered Rock* (Kimmel, 1990), *How Rooster Saved the Day* (Lobel, 1977), and *Raven the Trickster: Legends of the North American Indians* (Robinson, 1982). Jarvey and McKeough (2003) found that using character webs to help students map out the strengths, weaknesses, desires, and fears of characters in trickster tales was particularly helpful in understanding these story forms

(Figure 12-8). Students can discuss how the character tricked others in the story, how their actions did not match their intentions, and whether the characters were right to deceive as they did. For follow-up, older students can write a story about a time, real or imagined, that someone tricked them and how they felt when they realized what happened.

Other procedures for working on story comprehension can be adapted from material designed for reading comprehension activities. The clinician can adapt these materials by reading the text to the students, reading the students the comprehension questions, allowing the students to work on answering the questions in cooperative learning groups, and having the students generate their own comprehension questions to follow up the texts provided in the

FIGURE 12-8 Character web for use with trickster tales.

materials. It is important, though, to avoid too-heavy reliance on these traditional kinds of comprehension materials that focus on the details, sequences, facts, and literal interpretations necessary but not sufficient for authentic comprehension of texts. Kamhi (1997) and Westby (2005) argued that these basic comprehension activities should be supplemented by those that involve the reader in a more elaborated and personal response to the story. These activities include connecting personal experiences to the story; finding similarities between the story and others the students have read or heard; and talking about not only what characters do but about how they feel and what their plans, goals, and motivations for action are.

One way to approach this more elaborated level of comprehension was proposed by Hoggan and Strong (1994). They described the question-answer relationship techniques (QART) developed by Raphael (1984) to deepen students' understanding of narrative texts. Here, a clinician would first introduce four types of questions most frequently asked about stories. The clinician would ask example questions of each type about a story the group had read or heard. Students would then be encouraged to find the answers, using information from both the text and their own background knowledge. Examples of the four question types used in this technique, using *Three Billy Goats Gruff* (Rudin, 1982) as the sample text, can be found in [Box 12-12](#). Mastropieri and Scruggs (1997) have shown that teacher-led questions such as these are an especially effective technique for improving text comprehension in students with LLD, particularly if the activity is followed by instruction that leads students to use self-questioning strategies in their independent reading.

Whatever techniques are used to enhance story comprehension, recent research (Adams, 1997; Catts, 2009; Pressley, 1998; Pressley & Wharton-McDonald, 1997; Stahl, 2004) has demonstrated that comprehension skills must be addressed with direct instruction that teaches children explicit strategies for getting meaning from what they read or hear, and this is even more true for students with LLD (Catts, Adolf, & Weismer, 2009; Gleason, 1995; Nation, Clarke, Marshall, & Durand, 2004; Rabren, Darch, & Eaves, 1999). Activities such as the ones outlined in this section, then, make excellent collaborative teaching lessons, as well as direct service activities. All the students in the classroom, as well as those with special needs, benefit from this kind of direct comprehension instruction. And, of course, they are appropriate activities for Tier II and III reading comprehension instruction.

Composing Narratives: Supporting the Development of Writing

Narrative production provides an excellent context for implementing our principle of integrating oral and written language in intervention. Norris and Hoffman (1993) suggested some ways to start the process of producing stories with students at low levels of writing ability. Beginning writers can be given a photocopy of a page or pages from a favorite story and some typewriter correction fluid. They can be asked to change as many elements of the story as they like by "whiting out" a word or words and supplying their own replacement words. Later, specific kinds of alterations can be used, such as asking the student to add to the text by putting in adjectives, prepositional phrases, or new clauses.

Ukrainetz (2007) suggests another strategy for this level of story production. She uses "stickwriting" to help children at early narrative levels preserve the stories they produce. This technique

BOX 12-12 Question Types Used in the QART Technique

QUESTION TYPE 1: RIGHT THERE

The answer can be found easily in the story. The words for the question and the words for the answer can be found in the same sentence.

Q1: Why did the littlest billy goat decide to cross the bridge?

A: He couldn't wait any longer to eat the sweet grass on the other side.

QUESTION TYPE 2: THINK AND SEARCH

The answer can be found in the story but requires information from more than one sentence or paragraph.

Q2: Why were the billy goats afraid to cross the bridge?

A: A mean troll lived under the bridge, and he threatened to eat anyone who tried to cross.

QUESTION TYPE 3: AUTHOR AND YOU

The answer is not in the story. Students need to think about what they already know about the topic and combine that knowledge with what the author provides in the story to infer the answer to the question.

Q3: Why did the troll let the littlest billy goat go by without eating him?

A: He was greedy and thought that he could get more to eat by waiting for the bigger brother.

QUESTION TYPE 4: ON MY OWN

An inferential question that encourages students to search their knowledge base. The answer to the question is relevant to the text but does not appear in it.

Q4: What would you do if a bully like the troll in the story was keeping you and your friends from going somewhere?

Adapted from Hoggan, K., & Strong, C. (1994). The magic of "once upon a time": Narrative teaching strategies. *Language, Speech, and Hearing Services in Schools*, 25, 76-89; and Raphael, T. (1984). Teaching learners about sources of information for answering comprehension questions. *Journal of Reading*, 27, 303-311.

encourages students to plan and record stories using simple pictographs in order to give developmentally younger students a quick and easy method for representing characters, settings, and sequences of actions, while avoiding the frustration often involved in writing at this level. She suggests using "stickwriting" to help students plan and represent time sequences in their stories. This technique, along with verbal prompting, can help students to sequence events in their stories ("What happened first. Draw a quick picture of that. Then what? Draw that next. Remember to

keep the drawing quick and easy."). After the stickwriting is completed, the student "reads" the story back to the clinician with support from the pictographic cues. Research on this technique demonstrates its benefits for increasing length and quality of early narratives and for allowing a greater focus on content, rather than the mechanics of writing (Ukrainetz, 1998). After stories are initially represented this way, they can be translated into more conventional written form. Figure 12-9 presents two examples of students' "stickwriting" stories.

FIGURE 12-9 Two examples of a pictogram from (A) a fourth-grade student with language impairment showing a boat rescue story and (B) a typical second-grade student showing a frog escaping from a restaurant. (Reprinted with permission from T. Ukrainetz [1988]. Stickwriting stories: A quick and easy narrative representational strategy. *Language, Speech, and Hearing Services in Schools*, 29, 200.)

For students with some facility in the mechanics of writing, who are ready to do more independent narrative production, McCabe, Bliss, Barra, & Bennett, (2008) suggest beginning with personal narratives (“Where did you go on your vacation?”), which are a relative strength for students with LLD, before moving on to fictional stories. Stewart (1991) suggested introducing and discussing the parts of the story grammar, as we did in the comprehension activities, and using these as a basis for students to produce their own stories. This can be done whenever students reach a True Narrative stage of story development. Posting the story grammar elements on a wall chart can serve as a guide to the composition, which may be spoken, dictated, written, or typed, depending on the students’ abilities. Other visual aids, such as the Story Grammar Marker (Moreau & Fidrych, 1998), also can be useful.

Story maps or webs also can be used to guide students’ composition of stories, using formats like the one in Figure 12-7 and leaving the nodes blank for students to fill in and use later to structure their written productions. Zipprich (1995) showed that these techniques were effective in increasing planning time and improving quality of story writing in children with LLD.

Students also can be asked to generate group stories by modifying stories they have read or heard. They might listen to the clinician tell “Goldilocks and the Three Bears,” for example, and then read James Marshall’s (1988) humorous version of the tale. Another possibility is to listen to “Little Red Riding Hood,” then read the Chinese version, *Lon Po Po* (Young, 1989). They could then be asked to write their own version. The resulting story can be illustrated and read to the rest of the class or to younger students. Later activities can include generating stories about students’ own experiences as they relate to a literature selection they hear. If students are reading *Little House in the Big Woods* (Wilder, 1932) in class, for example, they might write stories about a time they helped their parents make or do something at home. Students can be reminded to refer to the story grammar visual aid to guide their compositions. Many additional ideas for facilitating narrative skills can be found in Apel and Masterson (2005); DeKemel (2003); Falk-Ross (2002); Merritt, Culatta, and Trostle (1998); and Roth (2000).

Word-processing computer programs also can be used in these kinds of activities. Software programs, such as *Kidspiration* (Inspiration Software, Portland, OR), *Kidwriter* (Spinnaker Software,

Cambridge, Mass.), *Explore-a-Story* (D.C. Health, Cambridge, Mass.), and *Logowriter* (Log Computer Systems, New York), allow students to produce text and select graphics to illustrate stories and to rearrange elements of classic stories to create new versions. Cochran and Bull (1991) discussed additional ways to integrate word processing in language instruction at the L4L stage. Roth (2000) summarized a range of strategies, in addition to those already mentioned that can be used to improve narrative production in students with LLD. These are summarized in Box 12-13. Many of these approaches will be discussed in more detail later in this chapter and in Chapter 14.

Cohesion

Although cohesive markers such as pronouns, conjunctions, and articles (*a/an/the*) are used in a variety of texts in addition to narratives, stories rely especially on cohesion as an important element in their structure, and they are excellent contexts for developing cohesion skills. Let’s look at some ideas for developing awareness and use of cohesive markers in narratives. As usual, we want to choose narratives that come from classroom literature selections or coordinate with curriculum themes.

Wallach and Miller (1988) provided a variety of activities for developing cohesive skills. They suggested working on pronouns by taking sentences that contain a referent and a pronoun from a literature selection. If we use the example of *Little House in the Big Woods* again, we might choose the following sentences:

Every evening before he began to tell stories, Pa made bullets for his next day’s hunting. Laura and Mary helped him.

The clinician can help the students to identify pronouns and referents in the sentences. The students can look for additional examples of pronouns and their referents in the text and generate their own sentences with pronouns about the characters in the story. The clinician can then present sentences with ambiguous referents, like the following:

He told them a great story.

Students can be asked to guess what characters from the story might go with the pronouns. They can then write more text around

BOX 12-13 Procedures for Improving Narrative Production

Prewriting: Drawing by hand or with computer programs such as *The Amazing Writing Machine* (Broderbund, 1999), *The Ultimate Writing and Creativity Center* (The Learning Company, 1996), and *Curious George Paint and Print Studio* (Pearson Software, 2000).

Story web: A graphic organizer in which each element of story grammar is represented as a node on a web.

Schematic story structure: Each story grammar component is sequentially introduced and defined. Students identify these elements in stories, and build their own stories using the following:

Story frames: written starters for each story grammar element are provided in a cloze task.

Scrambled stories: a written story is presented with one element out of sequence; students recognize it and restructure.

Story grammar facilitation: students are given cards with story grammar elements written on them, which they use to organize their story.

Story grammar cue cards: students are given a check list containing the story grammar elements that they check off as they include each element in their story.

Story prompts: a set of questions or prompts the student answers to produce each story grammar element.

Acronyms: SPACE (Setting, Problem, Action, Consequence, End), for example, are used to help students remember to include all story parts in order.

Self-regulated strategy development (SRS): This approach involves teaching the planning, production, and revision processes. It can make use of “think sheets” that serve as cues for student to carry out specific activities within each of these phases.

the sentence to remove the ambiguity. Other activities might involve substituting pronouns for some of the nouns in the text to see whether it can still be understood; substituting nouns for some of the pronouns; and writing summaries of individual chapters in the book, using pronouns carefully to provide cohesion. As always, metalinguistic discussion should accompany each phase of the activity, to give the students opportunities to evaluate the effect of using and changing pronouns on the cohesion of the text (or on “how the story hangs together and is easy to follow”).

Work on the development of cohesion through conjunction use is particularly helpful because complex sentences that encode various semantic relations between propositions can be used in the process. These sentences and relations are frequently identified as intervention targets in our assessment of students with LLD. Working on complex sentence forms and on combining semantic relations between propositions in the context of narrative is another way to adhere to one of our guiding principles; that is, to integrate intervention targets identified in the assessment with work toward a literate language style. Let’s look at some ideas for doing this.

Wallach and Miller (1988) suggested taking propositions from classroom literature selections and working on combining them using appropriate conjunctions and relations. Following Lahey’s (1988) sequence as discussed earlier, we would work on relations and conjunctions in the following order:

1. Temporal relations with conjunctions *then, when, before, after, etc.*
2. Causal relations with conjunctions *because, so, etc.*
3. Conditional relations with conjunctions *if-then*
4. Epistemic relations with conjunction *that*
5. Notice-perception relations with *wh-* conjunctions such as *what, where, how, etc.*
6. Specification relations with conjunctions *that, which*
7. Adversative relations with conjunctions *but, though, although, etc.*

Let’s use *Little House in the Big Woods* as our example again. Suppose you were working at early stages with third-graders. You might ask students to combine the following propositions from the story:

Laura touched the shiny, hot bullet.
Laura burned her finger.

For later stages of development, perhaps with fifth-graders, you might choose the following propositions:

The bullet was too hot to touch.
The bullet shone so brightly that Laura couldn’t help touching it.

Either way, you would encourage the students to think about how the two ideas might go together and discuss possibilities for how they might be combined in one sentence. Students could then

generate a sentence, with the clinician’s help at first, that combined the two ideas with a conjunction or “hooking-up word.” A wall chart listing conjunctions, each with a hook drawn from it to symbolize its linking function, could serve as a reference. Students might be asked to generate, orally or in writing, other ideas in the story that could be “hooked up” with the same conjunction. Students might then write their own story, with the stipulation that the target conjunction appear three times in it. When other conjunctions have been addressed, stories can be required to contain one instance of each of the conjunctions the students have been learning. As always, stories should be discussed when completed, to allow students to evaluate how well they have used the target conjunctions to “hook up” ideas in the story.

Naremore, Densmore, and Harman (1995) suggested a strategy-based approach for helping children produce cohesive narratives. They begin by having students identify the main idea in a story read to them and then in a story they intend to produce. They are then instructed to find a way to tie each sentence to the main idea by using one of the four following devices:

1. Pronouns
2. Repetition of key words
3. Substitutions for key words
4. Lists of items relating to the main idea

Ukrainetz (2007) suggests giving students clinician-written examples of stories that omit these cohesive ties asking the students to change them to improve their cohesion. They can then develop their own versions, using appropriate cohesive markers.

Artful Story Telling

Ukrainetz & Gillam (2009) caution that students with LLD need help with more than just the “basics” of story production. They advocate helping clients become more artful storytellers. Ukrainetz et al. (2005) studied the development of artful story telling in typically developing children. Using the elements in Box 12-14, they found that appendages were used least frequently; orientations were more common, and evaluations were most frequent, while use of all elements increased with age from 5 to 12 years. Ukrainetz and Gillam also report that children with LLD improve when given opportunities for subsequent retellings of stories; this implies that getting students to produce narrative more than once (as in “rehearsals” for telling the story to family and classmates) can be helpful in eliciting higher levels of story production. In addition, these findings suggest that students in middle elementary grades (3 through 5) should begin using features in Box 12-14 in their in their stories. Clinicians may want to begin working on increasing artfulness in story-telling for struggling writers in intermediate grades, starting by encouraging increased use of evaluations, then orientations, and finally appendages. Again work in oral contexts might precede transitioning to their use in writing.

The Metas

Many of the activities we’ve been discussing in this chapter have metalinguistic components. We want to provide students with the opportunity to talk about and evaluate all the language they use in our intervention program, to bring it to a higher level of awareness. The following activities provide some additional suggestions for helping students attend to, think about, and use “meta” skills.

Phonological Awareness: A Foundation for Decoding and Spelling

We’ve already talked at length about the importance of phonological awareness in the process of learning to read and about the need to integrate phonological awareness with other approaches to

BOX 12-14 Elements of Artful Story Telling

CATEGORY	ELEMENT	EXAMPLE
Appendage	Introducer	<i>Once upon a time . . .</i>
	Abstract	<i>Alexander was having a bad day.</i>
	Theme	<i>"It was a terrible, horrible, no good very bad day."</i>
	Coda	<i>"Some days are like that, even in Australia."</i>
	Ender	<i>And they lived happily ever after.</i>
Orientation	Character names	<i>Alexander, Doggie</i>
	Character roles	<i>His mother, the mail carrier</i>
	Ongoing conditions	<i>It was a dark and stormy night.</i>
	Personality attributes	<i>He was always friendly.</i>
Evaluation	Modifiers	<i>Angrily, slyly</i>
	Phrases and expressions	<i>"terrible, horrible, no good, very bad . . ."</i>
	Repetition	<i>Very, very dark, He tried and tried</i>
	Dialogue	<i>"I've found it!" he cried.</i>
	Internal state words	<i>Wanted, attempted, hoped, wondered, enthusiastically</i>

Adapted from Ukrainetz, T. (2007). Assessment and intervention within a contextualized skill framework. In T. Ukrainetz (ED.) *Contextualized language intervention* (pp. 7-58). Eau Claire, WI: Thinking Publications.

reading instruction. Phonological awareness may be part of the intervention program for primary grade children with higher-level phonological difficulties that were identified during assessment using tasks or the checklists we discussed in Chapter 11, with classroom-based methods like those suggested by Justice et al. (2002), or through ongoing monitoring in RTI programs. Even students in intermediate grades who are having reading difficulty can benefit from explicit phonological awareness instruction with the SLP (Ukrainetz, 2007), in conjunction with remedial reading help from the reading or LD specialist. Remember, though, that we don't want to develop PA as an isolated skill. We only want to address it to the extent that it helps students decode words for reading and encode for spelling. For older students, PA activities should be used only until students can accurately segment words into sounds, represent sounds with appropriate letters, and synthesize letter sounds to decode words. At that point, more targeted reading and spelling instruction should be implemented (Catts, 1999a; Torgesen, Otaiba, & Grek, 2005).

But don't children who are struggling to learn to read need a different kind of instruction than faster learners? Shouldn't these children be given more visually-based or context-based whole language strategies rather than PA training? Foorman and Torgesen (2001) reviewed literature that indicates children who struggle to learn to read do *not* need a different program of instruction than other children; instead they need more of the same: more intensive provision of explicit and comprehensive instruction in individual and small group settings that provide additional guided practice with developing phonological awareness and alphabet knowledge, along with high levels of both emotional support and cognitive scaffolding. Ryder, Tunmer, & Greaney (2008) tested this hypothesis and found that explicit instruction in phonological awareness was more effective than whole language instruction for improving word recognition and reading comprehension for struggling first graders, and effects persisted over 2 years. Blachman et al. (2000) showed that the same applied to children in grades 2 and 3 with poor reading skills. And Wright and Jacobs (2003) demonstrated that combining phonological awareness instruction with direct teaching of metalinguistic concepts (such as letter, word, syllable, vowel, consonant) and metacognitive strategies (such as planning

and self-monitoring) was even more advantageous for struggling readers than PA alone. That's why it makes such good sense for SLPs to work with teachers in primary classrooms to deliver this kind of explicit Tier I instruction to all children, and observe who has trouble with it, as Justice and Kaderavek (2004) suggested. Research (Hadley, Simmerman, Long, & Luna, 2000) provides some evidence that an SLP/classroom teacher collaborative approach is more effective in preventing reading failure than is the traditional classroom teacher-alone model. And for children who have difficulty mastering early reading and are referred for Tier II and III instruction, extended, intensified opportunities to practice PA and enhance alphabet skills and letter-sound correspondence is the best prescription (Snow, Burns, & Griffiths, 1998).

Phonological awareness training can take place in a variety of contexts. PA activities can be used in kindergarten and primary grades with groups in Tier II or III instruction, in individual clinical sessions, or in collaborative classroom lessons. Some materials for phonological awareness activities are commercially available, including Adams, Foorman, Lundberg and Beeler's (1998) *Phonological Awareness in Young Children: A Classroom Curriculum*; Blachman, Ball, Black, and Tangel's (2000) *Road to Code*; DeBruin-Parecki's (2008) *Effective Early Literacy Practice*; Donnelly, Thomsen, Huber, and Schoemer's (1992) program; Gillon's (2000b) *Phonological Awareness Training*; Haager, Dimino, and Windmueller's (2006) *Interventions for Reading Success*; Spector's (2009) *Sounds like Fun*; and Stone's (1992) *Animated Alphabet*, to name but a few. In addition, computerized programs on phonological awareness have also been shown to be useful adjuncts to classroom PA instruction, especially when modules include both phonological awareness and phonics (letter-sound association) activities. Macaruso and Walker (2008), Segers and Verhoeven (2004), and Wild (2009) for example, showed that supplementary computer-assisted PA activities significantly improved PA scores for kindergarten children, particularly for those with the lowest pretest scores. Ecalte et al. (2009) found similar results in both reading and spelling for older students with dyslexia.

Scheule and Boudreau (2008) presented a sequence of acquisition of PA skills that can serve as a curriculum guide for developing

a clinician-constructed PA program. This sequence is summarized in Figure 12-10. As their figure shows, the PA skill most closely related to reading is phoneme segmentation (that is, being able to break a word into its component sounds [for example, segmenting *dog* into /d/, /a/, and /g/]), although they argue that children eventually need not only to segment sounds but to practice segmentation in activities in which sounds are represented by letters. Catts (1999b), Gilbertson & Bramlett (1998), and Nation & Hulme (1997) demonstrated that letter-sound correspondence (knowing that the letter *B* stands for the sound /b/) and blending (being able to combine sounds to form a word [for example, what do /d/ and /at/ make when you put them together? (*dot*)] are also critical for learning to read. These are the skills, then, that we will want to focus on in providing intervention in this area.

We would start with rhyming and syllable segmentation for children with very low levels of PA. Using rhyming texts from classroom literature selections, we would encourage students first to listen to the rhymes in the stories. Scheule and Boudreau suggest also having children judge if two words rhyme, match words that rhyme, and play “odd one out” games identifying which word of three given does not rhyme. Eventually we will want to offer students the chance to generate rhymes by substituting other words that rhyme as they listen to rhyming books, make up nonsense words that rhyme, and write alternate or additional verses for the rhymes in group story contexts. The focus in these activities is on awareness of sound patterns, not yet on spelling. But when two

rhyming words that are spelled with the same final sequence of letters come up, we can take the opportunity to write them, pointing out that they not only sound the same, but use the same letters at the end.

Rhythmic activities are fun for developing syllable awareness. Scheule and Boudreau suggest starting with compound words (*cupcake, hotdog*), moving the two-syllable words (*candy, mitten*), and then to longer ones (*elephant, hippopotamus*). Students can form a rhythm band and “play” the number of syllables in words taken from classroom literature or a theme-based unit. Paul (1992b) suggested “dances with words” in which students perform a different movement for each syllable in words from classroom reading selections.

Working on alliterative words is a common practice in primary classrooms, and Gilbertson and Bramlett (1998) have shown that this skill, too, is predictive of reading achievement. Scheule and Boudreau suggest starting this work with continuent sounds, which are easier to “stretch.” Children can be given practice, judging if two words start with the same sound, which of three words starts with a sound different from the other two, generating a word that starts with the same sound as one given by the adult, and sorting sets of picture cards into groups that start with the same sound. Students can then make group or individual books with drawings or cut out pictures of words that have the same first sound. The books can be theme based to relate to classroom content. They might focus on foods that begin with /m/ in a nutrition unit

FIGURE 12-10 Sequence of phonological awareness development. (From Schuele, C., & Boudreau, D. [2008]. Phonological awareness intervention: Beyond the basics. *Language, Speech, and Hearing Services in Schools*, 39, 3-20.)

or vehicles that begin with /t/ for a transportation unit. Letters also can be associated with the sounds, by writing the letter for the sound the words share on each page of the book. The same process can be repeated for final consonant sounds. Students in phonological therapy can be encouraged to produce these theme-related picture albums using sounds from their intervention targets.

Yopp (1992) provided songs and rhymes to be used in practicing these skills in large group activities. For example, a jingle can be sung to the tune of “Jimmy Crack Corn”:

Who has a word that begins with /s/?
Who has a word that begins with /s/?
Who has a word that begins with /s/?
It must begin with /s/!

The group sings the song together, then each student volunteers a word to be sung in the lyric:

Sun is a word that begins with /s/!
Sun is a word that begins with /s/!
Sun is a word that begins with /s/!
Sun starts with the /s/ sound!

Alternatively, students can be encouraged to identify initial sound similarities among words. Yopp (1992) suggested an activity using an “Old MacDonald” variation:

What is the sound that starts these words:
Toad, train, top (Wait for response from students.)
/t/ is the sound that starts these words:
Toad, train, top
With a /t/, /t/, here . . .

The same format can be used to help students identify words that share a common final (*duck, cake, beak*) or medial (*leaf, deep, meat*) sound. Scheule and Boudreau (2008) suggest following up these kinds of activities with having children explicitly identify the first (“What sound does *fun* start with?”) and last (“What sound do you hear at the end of *sun*?”) sounds of familiar words.

Counting sounds and segmenting sounds in words is the next phase of the development of PA and is crucial to reading development. Several activities have been suggested in the literature to achieve this step. Yopp proposed using the tune of “Twinkle, Twinkle, Little Star” as a basis for sound counting:

Listen, listen to my word
And count all the sounds you heard. (spoken): top
/t/ is one sound
/a/ makes two sounds
/p/ makes three sounds
Top has three sounds, it's true
What a good listener that makes you!

Additional suggestions from Yopp and Yopp (2000, 2009) appear in Box 12-15.

Elkonin's (1973) sound-counting technique used small disks or coins to represent sounds. Children are presented with a picture of a CV (*me*), VC (*up*), or CVC (*sun*) word, with a small box drawn under the word for each sound it contains, as shown in Figure 12-11. The clinician says the word, prolonging the first sound while modeling moving one coin into the leftmost box. The next sound is pronounced as the clinician moves another coin into the next box. Students are then encouraged to try the same thing. Later words with CV, VC, and CVC shapes are provided for students to do independently. They can be asked to count how many coins they need for other words with these shapes. Eventually, more complex word shapes can be added. When students are proficient at this segmentation task, one type of coin can be provided for the consonants in the word and a different coin for the vowels. Eventually, students are given disks with the letters to represent each sound in the word they are segmenting, and the correspondence between the letter and the sound is highlighted during the activity. The words used in the activity can then be incorporated in stories or poems the students produce around classroom themes, with the students providing spellings for the words based on their segmentation activities. Torgesen et al. (2005) suggested additional activities along this line. Gillon's (2000b) program, which demonstrated positive effects of PA training on reading, follows similar procedures.

Word sorts are another technique that has been shown to facilitate PA (Joseph, 2000). Here, each child in the group receives a set of chips and three cards, each with a word exemplifying a different word family, such as:

The clinician then reads a word from one of the families (e.g., *pen* [hen family]). The students put a chip on the card the new word belongs to; the clinician then gives each a card with the new word written on it to exchange for the chip. After a number of examples, the clinician gives each student a set of cards with words from the three families written on them for the students to sort visually, calling attention to the similarities in letters in the words among the family (*hen*: *pen, ten, den*; *cat*: *hat, mat, sat*; *sit*: *hand*: *sand, land*).

Another thing we have learned from recent reading research is the importance of combining instruction on letter-sound correspondence and print concepts with PA (Blachman, 1997; Kaderavek & Justice, 2004). Slingerland's (1971) method is another way of reinforcing letter-sound correspondence knowledge in a PA activity. It uses small letter squares, like Scrabble tiles, to allow children to “play” with sounds to segment and synthesize words. A small group of students can be given one vowel tile and several consonant tiles. The sounds associated with each letter can be discussed (“the *o* you have can spell the sound /a/. So you can make words that have the sound /a/ in them. Who knows what sound this letter *b* can spell?”). Students can be asked to see how many words they can form with the five or six letters they are given. Allowing them to synthesize nonsense words adds to the fun of the activity. They can then read one of their words to

BOX 12-15 Additional Suggestions for Phonological Awareness Activities

ONSET-RIME AWARENESS

Mail a Package: Use a large box or container with a lid to serve as a mailbox. Cut a slit in the lid through which cards can be deposited into the box or container. Give each child a picture card of an object and ask each child to show his or her card to the class and name the object. The objects should be single-syllable words such as *cup, ring, flag, street, rug, dog, cat, plum, brick*. The leader says the name of an object by segmenting it into its onset and rime components (c-up, r-ing, fl-ag, str-eet, and so on). The child who has the picture of the object named holds the card in the air, blends the sounds to say the word, and brings the card forward to mail as the group chants:

A package! A package! What can it be? A package! A package! I hope it's for me!

SOUND SYNTHESIS

Make a Word: Select rime units (such as -at) to focus upon. Have a card with the letters written on it. In a bag have letter cards that may serve as the onset for this family. A child draws a card from the bag. The class says the sound of the letter drawn, blends it with the -at and determines whether or not a real word is made. Students give a thumbs up or thumbs down. For instance, a student draws the card b. Students say /b/ and blend it with /at/, /b/—/at/: bat. Everyone indicates thumbs up because this is a real word. Someone else draws the letter g. Students say /g/—/at/: gat! Thumbs down for this one.

PHONEME AWARENESS

Find Your Partners: Using a set of picture cards with which the children are familiar, distribute the cards so that each child has one. Be sure that each card can be matched with another that begins or ends with the same sound or has the same sound in the medial position. For example, if you choose to focus on ending sounds, you should select cards such as dog and flag, and hat and nut. Then tell the children that once you give the signal, they are each to circulate and find a classmate whose card shares the same sound in the targeted position.

Bag Game: Have a large grocery bag or box that contains many small plastic bags that can be sealed so that objects do not fall out. In each of these smaller bags place one object and the same number of interlocking cubes as there are sounds in the name of the object. For instance, one bag might contain a key and two cubes that are connected (representing the two sounds in key: /k/ and /i/). Another bag might contain a dime and three cubes that are connected for the three sounds in dime, etc. To begin the activity, ask a volunteer to draw a small bag from the large grocery bag. The child opens the small bag, pulls out the object and the cubes. He or she names the object and then says the sounds in the object, breaking apart the cubes as he or she speaks each sound.

Scavenger Hunt: Organize children into teams of about three. Give each team a bag or box that has on it a letter and picture of an object that begins with that letter. For instance, one team receives a bag with the letter *M* on it and a picture of a monkey; another team receives a bag with the letter *S* on it and a picture of a snake. Children then set off on a scavenger hunt to find objects in the classroom that begin with their target sound. Children with the *B* bag may locate a baby doll in the housekeeping center, a block in the building area, a brush in the painting area, and a book from the library corner. Children with the bag that has the letter *P* written on it may find a pencil, pen, and paper to put in their bag. Give the children enough time and support to be successful, then bring them together to state their target sound and share their objects. Then they may return their objects, trade bags, and repeat the activity.

Guess Which One: Show two objects or pictures that start/end with different sounds. Tell the student you are thinking of one of them and they have to guess which. Produce the initial or final sound of one the items, or segment the word into individual phonemes and pronounce them separately (/l/ /i/ /f/), or leave off the first or last sound.

Adapted from Yopp, H., & Yopp, R. (2000). Supporting phonemic awareness development in the classroom. *Reading Teacher*, 54, 130-143; Yopp, H., & Yopp, R. (2009). Phonological awareness is child's play. *Young Children*, 64, 12-21.

FIGURE 12-11 Phonological segmentation task for words *me, up, and sun*. (Adapted from Elkonin, D. [1973]. U.S.S.R. In J. Downing [Ed.], *Comparative reading*. New York: MacMillan.)

another group, who must guess what letters they used to form it. Later, more tiles can be introduced into the activity. Students can write stories around classroom themes with the words they form or write silly poems with the nonsense words.

One additional lesson of the recent literature (Gilbertson & Bramlett, 1998; O'Connor & Jenkins, 1995) is the usefulness of incorporating spelling activities in PA programs. O'Connor and Jenkins developed a series of steps in a combined PA/spelling program for kindergartners. Their sequence is presented in [Box 12-16](#).

They were able to demonstrate that kindergartners who practiced representing sounds in spoken words with letters developed more complete generalization of their phonological knowledge, which facilitated their acquisition of decoding and spelling skills. Joseph's (2000) program, for example, includes a third step in which children are given a piece of paper with the three word families they have been using for sorting activities written for them at the top:

Hen	Cat	Hand

BOX 12-16 Sequenced Tasks Used by O'Connor and Jenkins (1995) in a Combined Phonological Awareness/Spelling Program for Kindergartners at Risk for LLD**LESSONS 1–2 (10 MINUTES EACH)**

1. Show me the [magnetic] letter that makes this sound.
2. Write the letter that makes this sound.
3. Show me the [magnetic] letter that starts this word.
4. Write the letter that starts this word.
5. Show me the [magnetic] letter that ends this word.
6. Write the letter that ends this word.

LESSONS 3–18 (10 MINUTES EACH)

1. Show me how you spell these words with your [magnetic] letters (6–7 words chosen from selections the children had read or heard in their literature program).
2. Write these words (same 6–7 words).

CORRECTIVE FEEDBACK (IF CHILDREN HAD DIFFICULTY SPELLING A WORD)

1. Say the sound at the beginning of the word. (Model or correct, if necessary.)
2. Show me the letter for the first sound. (Model or correct, if necessary.)
3. Say the next sound in the word. (Model or correct, if necessary.)
4. Show me the letter for that sound. (Model or correct, if necessary.)
5. Say the last sound in this word. (Model or correct, if necessary.)
6. Show me the letter for the last sound. (Model or correct, if necessary.)
7. Now write the first sound, etc.

From O'Connor, R., and Jenkins, J. (1995). Improving the generalization of sound/symbol knowledge: Teaching spelling to kindergarten children with disabilities. *The Journal of Special Education*, 29, 255-275.

The clinician then says words they have worked with in the sorting activities (*hat, pen, sand, ten*), and the students spell each word beneath the word that shares its family.

Higher level PA activities for older students who struggle with reading can involve additional word play and sound manipulation practice. One excellent sound manipulation technique is pig Latin. The word formation rules for pig Latin require taking the first sound (not letter) from a word, putting it at the end, and adding /e/. In pig Latin, *teacher* becomes “eachertay.” “*Shoe*” becomes “oo-shay.” When students are proficient, they can create their own secret languages, specifying the rules, discussing exceptions, and writing out how the code works. Launer (1993) also suggested using the popular “oldie,” “The Name Game,” which specifies rules for changing the pronunciation of names (“Anna, Anna, bo-banna, banana-fanna,” etc.). Again, when students have mastered the rules of this game, they can attempt making them explicit (“First you say the name twice, then say ‘bo’ and change the first sound in the name to /b/ . . .”) as well as devise alternatives of their own. These kinds of activities help to bring the sound structure of words to a higher level of awareness and also provide students with important opportunities to talk about and manipulate the sounds of language. They fit in especially well with classroom science units on sound energy; social studies units on communication; and literature selections about spies, detectives, people who have trouble understanding each other, or children who form secret clubs. But always keep in mind Catts’s (1999a) advice not to focus on PA to the exclusion of other literacy skills. Instead, use a limited amount of these activities to help focus students’ attention on sound structure, then work with teachers and specialists to provide more focused instruction and practice in decoding, comprehension, and spelling. PA activities make excellent points of collaboration on spelling instruction, if the SLP works closely with the teacher to choose words for PA activities that are related to classroom spelling

lists. And Berninger et al. (2003) showed that combining PA and comprehension instruction resulted in higher gains in reading than PA instruction alone.

Wright and Jacobs (2003) demonstrated that instruction in metalinguistic and metacognitive strategies, in conjunction with PA instruction, also improved reading performance in elementary students with LLD significantly more than PA instruction alone. In addition to increasing PA skills, we want to help students with LLD become more aware of a variety of other aspects of language (metalinguistics) and become more conscious and able to plan their thinking processes (metacognition). Let’s examine how we can achieve these goals with elementary school students.

Metalinguistics, Reading Fluency, and Writing

Being aware of how we talk and read involves metalinguistic skills. Fluent reading and writing are the result of both practice of basic skills, such as decoding and graphomotor skills, as well as an awareness the connection between “style” (tone of voice and prosody in reading, for example; word and sentence choice in writing) and the intended meaning. We can use metalinguistic discussions, then, to support the development of students’ reading and writing fluency.

Reutzel (2009) defines reading fluency as accurate and effortless decoding at grade-appropriate reading rates using appropriate prosody and phrasing. Bashir and Hook (2009) discuss the fact that fluent reading, one of the key goals of reading instruction identified by the National Reading Panel (2000), requires rapid word identification which, in turn, enables reading comprehension. In fact, they identify fluency as a crucial link between decoding and comprehension. Leahy and Justice (2007); Reutzel (2009); Robertson (2009); and Snow, Griffin, and Burns (2005) identify evidence-based methods for promoting fluency, which include:

- **Echo reading:** the adult reads a short passage to the student(s)/ the student rereads the same passage aloud
- **Choral reading:** groups of children read passages together, so that weaker readers are supported by stronger ones

- **Guided oral reading:** students reread passages 3 to 5 times with feedback and guidance from the adult
- **Partner reading:** two students read the same text aloud in unison, or alternate turns reading while the partner listens and provides feedback
- **Assisted reading:** students listen to a prerecorded reading, such as an audiobook, while reading along out loud
- **Performance reading,** or Readers' Theater: students reread passages multiple times as "rehearsal" for a performance of the reading for friends and/or family, which may utilize costumes and props

Metalinguistic activities, which involve talk about the language within the text, are great follow-up activities to integrate with repeated readings. For example, when reading aloud with an individual student, the SLP can talk about how characters felt in the passage, and encourage the student to read the passage again, with that emotion in his voice (after some metalinguistic discussion about how we use our voice to convey feelings). For additional repeated readings, the students' attention can be drawn to other metalinguistic aspects of the text. They can be asked to identify punctuation marks, and they can be reminded to "pause when you come to a comma," or "raise your voice when you come to a question mark"; we can ask them to attend to the ends of paragraphs in the passage (after some metalinguistic talk about what a paragraph is and why we need them), and to stop briefly when they come to end of each paragraph in the passage; between repeated readings, they can be asked metalinguistic questions, such as "What's your favorite word in the passage?" or "Which word appears more than once?" or "Can you find two words you read that mean pretty much the same thing (synonyms)?"

Readers' Theater rehearsals can also provide opportunities for metalinguistic discussions about why the author chose a particular word, how the author uses the language s/he chose to create a feeling within the story, and how they can best convey that feeling through their performance. Leahy and Justice (2007) provide additional discussion on using Readers' Theater. Haager et al. (2007) provide additional activities for developing fluency.

Other metalinguistic activities can support the development of students' writing. Students can be asked to rephrase a sentence or paragraph, simply finding another way to say the same thing. Later activities can include rewriting a textbook passage for a younger student, recasting a text selection as a picture or cartoon, and reworking material from textbooks as diagrams or maps. All these activities can help students focus on the form of communication.

Editing is an excellent activity to develop metalinguistic awareness. Students with LLD can edit their own and each others' classroom written work with input from the SLP, either in small groups or in metalinguistic activities taught collaboratively with the whole class. The clinician can begin by offering a sample, in which some intentional mistakes have been inserted. Errors of syntax ("We took bus a on a field trip"), morphological marking ("Our class visit a museum yesterday"), word use ("Everything in it was modern, at least a hundred years old"), conjunction choice ("We were late so the bus had a flat tire"), spelling ("We were glad to have a day away from skool"), capitalization and punctuation ("the bus ride was long?"), and logic ("We knew we'd get back in time for lunch, so we ate at the museum") can be included, depending on the students' levels and the activity's goals. In initial editing work, one type of error at a time should be included. Later, errors of different types can be interspersed in the selection. As the students identify the clinician's errors, discussion about what the error is, why it

is wrong, and what should be done to change it can occur. Books that encourage metalinguistic awareness, like those in Box 12-6 can also provide opportunities for metalinguistic discussion.

Students can then be asked to write a related sample, intentionally including errors of the type they just discussed. Work can be exchanged so that students can discover these intentionally inserted errors. This introduction helps students to feel that errors are OK and that working with errors is what editing is all about. No one produces perfect work the first time. What is important is to be able to evaluate our own writing and recognize and correct errors when they appear. As a final step, students' classroom assignments can be exchanged for editing. Pretending to be newspaper editors working on each other's copy (even wearing green eye shades or using a blue pencil, like old-time editors) can add extra interest to this activity. Using the edited writing to compile a class newspaper or magazine that is distributed to other students or parents on paper or via the Web can provide a meaningful outcome.

Spelling activities are another excellent context for metalinguistic discussion. Using word study approaches to spelling, like those discussed earlier, sets the stage for focusing attention on the sound structure and meaning relations among words. Apel and Masterson (2001) and Scott (2000) provide additional ideas for metalinguistic spelling instruction.

Metacognition: Organizational and Self-Regulation Skills

We've talked about the importance of helping our students with LLD become more aware of the processes needed for successful participation in school. Developing skills for organizing and evaluating a variety of thinking processes involves *metacognition*—the ability to assess our own cognitive processes. Although the development of metacognitive skills is a dominant theme in our work with adolescents with LLD, we can begin to build these skills at the L4L level. Moreover, work on metacognition is an additional source of material for classroom collaborative lessons. What teacher wouldn't want a specialist to help his or her whole class improve organization and study skills? In this chapter, we'll look at some beginning metacognitive activities and examine some more advanced ones in Chapter 14.

Comprehension Monitoring

Dollaghan (1987) presented a series of activities that has been successful in helping elementary students learn to monitor and assess their comprehension. Using this method, the clinician tells the student to do something in a voice that is too soft to be heard, spoken too fast to be understood, or spoken with competing noise (knocking on the table with a wooden block). Before hearing each direction, students are told to ask if they don't understand the message. To follow our principle of making intervention relevant to the classroom, we can use directions like those the teacher typically gives. When students have experienced several sessions of this training and consistently request clarification for the inadequate messages, more complex inadequacies are introduced. At this next level, adequate directions are interspersed with those that are inexplicit or ambiguous, contain unknown words, or are inordinately complex. Students might be told, for example, to "Write an *epistle* to your mother" (unknown word), "Put your name here" (no gestural cue; inexplicit), or "If you have ever been to California and have never been to Arizona, then put your name in the lower left-hand corner of the paper" (overly complex). Again, each direction is preceded by an instruction to ask if the message is not clear. Dollaghan (1987) reported that 10 sessions of this type of training over 4 to 5 weeks was effective in increasing comprehension monitoring

in students with LLD, even after the intervention had ended. She advocated comprehension-monitoring instruction as a beneficial supplement to other activities to increase classroom comprehension skills in these students.

Organizational and Learning Strategies

These strategies involve teaching students to actively control, coordinate, and monitor their learning activities and processes. Several kinds of strategies are available, such as the following:

- *Creating inferential sets* by invoking all the background information and prior knowledge we have about a topic when attempting to learn new information about it and asking ourselves a set of prereading questions, such as “What do I already know about this topic? What questions can I ask about it?” These questions help students foreground their prior knowledge and look for relevant information in the text. Heller (1986) proposed using a “What I Know” chart to follow up the reading. On the chart, students fill in what they knew before reading, what they learned from the reading, and what they still need to know. An example of a “What I Know” chart appears in Figure 12-12.
- *Self-questioning.* After creating an inferential set, students are taught to stop during an assignment and ask themselves questions, such as those that could fill in their “What I Know” chart. In addition, students are taught to ask themselves a series of self-guiding questions as they work through a classroom assignment, individually or in cooperative learning groups. After the clinician models and has the students practice asking themselves the questions, they can be posted prominently on a poster in the class or intervention room. Students can make the poster themselves, as one of the activities that use the self-guiding questions. Questions appropriate for students in the L4L period can be posted and students can be referred to them:
 - What is my job; what am I supposed to do?
 - What is my plan; how can I do it?
 - Am I using my plan?
 - How did I do?
- *Think alouds.* The clinician models the thought processes that go into the completion of a literacy-based task by voicing each

Intervention for students with LLD can involve using language for planning and problem solving

step. For example, you might model writing a book report for students by saying, “OK, I need to tell who the characters in this book are. Well, I remember a character is someone who is important in the story. In this story, the important characters are Fantastic Mr. Fox, and . . . Then I want to talk about where the story happened. I remember a lot of what happened in this story is in the Fox’s den, and the Farmers’ cellar, so I’ll put that in the book report . . .”

- *Reciprocal teaching and buddy programs* involve grouping or pairing students to accomplish a task, and having students cue each other to use the following strategies while completing their assignment:
 - Predict
 - Generate questions
 - Summarize
 - Clarify
- *Graphic organizers and sensory imaging.* Students are taught to draw, map, or visualize material to help them comprehend and recall it.

Metacognitive strategies like these can be introduced by the clinician in clinical sessions, or in classroom collaborative lessons. They can also form part of the Tier II and III intervention in areas of reading comprehension for classrooms using an RTI model. Follow-up can be provided by the classroom teacher in consultation with the SLP. SLPs can also consult with classroom teachers about incorporating learning strategies like these into Tier I instruction for all students. Boulware-Gooden et al. (2007) showed that using these strategies is effective in increasing reading comprehension.

Topic: Solar system		
What I need to learn: How do the parts of the solar system move?		
What I knew before reading	What I know now	What I don't know yet
Earth goes around sun	Moon goes around earth	Why isn't moon always full?
Earth turns to make day and night	Axis	Why is there midnight sun in Alaska?
Other planets are in solar system	Mars is near Earth	Names of all planets

INTERVENTION CONTEXTS IN THE L4L PERIOD

Scheduling

One problem that often comes up in choosing contexts for intervention in school settings is the scheduling difficulties attendant on providing services in more than one school building. Traveling from one school to another often makes it difficult for an SLP to

engage in collaborative work or to provide curriculum-based instruction because there is little time for working with teachers and other school personnel. Besides limiting the SLP's ability to provide innovative service, this situation often leaves SLPs feeling isolated and not really a member of the community of any of the schools served.

Taylor (1992) suggested a solution to this problem: *intensive cycle scheduling*. Instead of seeing students for 30 to 45 minutes once or twice weekly over the course of a school year, students are seen in more concentrated time periods, perhaps four or five times a week for 6 to 10 weeks, then "furloughed" to be picked up during another cycle later in the year. This schedule allows SLPs to spend longer periods in each school, get to know the faculty, have time to do classroom observations and curriculum-based assessments, coordinate with teachers to provide collaborative lessons, consult with teachers on Tier I instruction, and meet with parents. It is especially helpful for SLPs in rural districts, where schools may be far apart. Here intensive cycle scheduling can eliminate the need to spend large amounts of the day traveling between sites instead of delivering service. IEPs can easily be written to stipulate a total number of hours of service to be provided over the course of the school year, rather than a number of hours per week. This type of intervention planning gives the SLP flexibility to develop the scheduling model that serves students best.

Soliday (2004) described another alternative, the 3:1 model. Here, traditional, direct intervention to students is delivered for three consecutive weeks, followed by a week of consultative services. Intervention time is planned on the IEP by the month, rather than the week. Activities during the consultative week include the following:

- Consultation with teachers, paraprofessionals, parents, other specialists
- Student evaluations
- Completion of third party medical billing
- Participation in special education meetings
- Participation in small group workshop/instruction

Soliday (2004) reported that this model allowed for greater planning opportunities with classroom teachers, in order to bring therapy goals into line with the general curriculum and also resulted in high levels of satisfaction among clinicians, teachers, and parents.

These examples demonstrate that a creative clinician has a variety of options for planning and delivering services "outside the

box" of traditional intervention where all students are seen only in direct therapy settings on the same schedule every week.

Agents of Intervention

We talked in Chapter 9 about using paraprofessionals and peers as agents of intervention. The National Joint Committee on Learning Disabilities (1999) emphasizes that the main purpose of paraprofessionals in schools is to increase the frequency, intensity, efficiency, and availability of instructional help and to assist with generalization of newly learned skills to multiple settings. Blosser and Neidecker (2002) review the guidelines for permitted and non-permitted activities for SLP assistants under the supervision of SLPs in schools. These appear in Table 12-6.

Paraprofessionals can deliver structured CD or hybrid intervention to individuals or small groups, under the direction of the clinician, who decides on intervention goals and procedures. The clinician designs a lesson plan in detail, including the linguistic stimuli to be used; materials and activities to be employed; targeted responses; and reinforcement or corrective feedback to be given; and gives the plan to the paraprofessional to administer. Alternatively, the clinician might provide a commercially available lesson. Either way, responsibility for assessment, IEP development, intervention planning, ongoing evaluation, and parent-teacher communication remains with the clinician.

Another potential agent of intervention for the school-aged client is an older or same-age peer. Algozzine et al. (2009) showed that peer "coaches" were especially effective in improving reading fluency and comprehension in struggling elementary school readers. Some portion of Tier II instruction may include coaching by peers, particularly when reading fluency is the goal. Peer coaches can be enlisted in Readers' Theater activities to provide extra practice in rereading to increase fluency.

Beverly (2009) also suggests that peer coaching is an effective tool for improving student writing. She suggests assigning roles to peers within a group, such as "capitalization captain," "spelling supporter," "conclusion coach," "punctuation pilot," and "content commando." Each student is then instructed to focus on his assigned skill in editing the paper of a classmate. Students are then directed to have their rough draft edited by each type of editor before doing their final draft.

Cooperative learning groups are another excellent opportunity for peer interaction and instruction. In these groups, a problem or

TABLE 12-6 Examples of Permitted and Nonpermitted Activities for SLP Assistants

Permitted Activities	Nonpermitted Activities
Conduct speech, language, and hearing screenings. Follow documented treatment plans. Document client progress in therapy and mainstream settings. Assist during assessment. Prepare clinic materials and perform clerical duties (filing, etc.). Program AAC devices. Prepare schedules. Display data on charts, graphs, etc. Check and maintain equipment	Conduct standardized testing or diagnostic assessment. Interpret test or assessment results. Provide counseling. Write IEPs. Implement treatment without supervision. Select or discharge students from intervention. Make referrals. Share clinical information with anyone or communicate with family or staff without SLP direction. Represent self as SLP.

Students with LLD can benefit from the use of technology to aid the development of metacognitive skills.

assignment must be completed by the group as a whole, students work together to devise a solution that involves the entire group. For example, each group can be assigned to write a story about a classroom topic, with at least one sentence contributed by each group member. The students can help each other edit their sentences, but each member must provide an original contribution. In activities like these, peers can share their skills, and students with LLD can see competent skills modeled. Using cooperative learning groups in collaborative classroom work requires careful placement of students in groups, so that students on IEPs get exposure to more linguistically advanced peers. It's also a good idea to include a task in some part of the activity that the students with LLD are good at, so they can feel competent, too. If one student with LLD is a good artist, build drawing into the assignment. If another is a sports expert, require knowledge of sports trivia as part of the activity. Kuder (1997), McCormick (1997a), and Paul (2003b) presented guidelines for facilitating interactions between students with disabilities and their typical peers in learning groups. These are summarized in [Box 12-17](#).

Service Delivery Models

We've talked before about the major contexts for intervention: the RTI model, the clinical model, the language-based classroom, and the collaborative and consultant models. For clinicians working in school settings, any of these models can be relevant. The spirit behind IDEA legislation urges that children should in every case possible be placed in the general education class that they would attend if they did not have a disability. This placement option is referred to as *inclusion*. Inclusion should be about restructuring classrooms and schools to support and provide for the special needs of children with disabilities (McCormick, 1997b), not just having them passively "sit in." Although this ideal is not always met in practice, it does mean that children with all types and degrees of communication disorders will be found in public school settings, because IDEA says that, generally, they belong there and not in segregated special placements. Although we have concentrated in Chapters 11 and 12 on the assessment and intervention needs of children with LLD who function close to the same level as their chronological-age peers, we should remember that school SLPs will find children functioning at all levels of development on their caseloads. If schools adhere to the spirit of IDEA, many of these lower-functioning students will be served, at least part of the time, in general education classrooms. McCormick, Loeb, and Schiefelbusch (2003) provide extensive guidance to clinicians working in inclusive settings for meeting the wide range of educational and communicative needs these children present. Like everything else in our field, though, inclusion is not universally accepted as the optimal approach for all students. Simon (1998), for example, raised questions about whether students with moderate to severe disabilities can receive sufficiently intense language intervention in a full inclusion setting. And the American Speech-Language and Hearing Association (ASHA; 2010) reminds us that inclusive practices consist of a range of service-delivery options and recommends that an array of models be used to implement services to students with communication disorders. One size doesn't fit all, and some students can benefit from specialized services, at least some of the time.

BOX 12-17 Guidelines for Facilitating Interactions between Typical Students and Those with Disabilities in Learning Groups

Provide service in the least-restrictive environment, as required by law.

Students with LLD can tutor younger peers to practice communication strategies.

Increase the clients' opportunities for interacting with the mainstream teacher and peers, decreasing the amount of classroom content "missed" because of being pulled out, and making the students' day more cohesive and integrated.

Target success in the natural environment with relevant tasks that encourage participation in both the overt and the hidden curricula.

Make students and teachers see language intervention as more meaningful because they perceive its relation to their daily work in school.

Provide greater opportunities for generalization across curriculum areas.

Provide beneficial input or modification of classroom instruction that helps not only the identified client but other students in the class.

Encourage teamwork and transdisciplinary practice among teachers, special educators, and SLPs, making SLPs a more integral part of the school community.

Provide peers with concrete strategies to use in interaction, such as prompting the student with a disability to produce a particular behavior (you make a list of all the cities in the state we need to study), and praising completed work.

McCormick, D. Loeb, & R. Schiefelbusch (Eds.). *Supporting children with communication difficulties in inclusive settings* (2nd ed.). (pp. 235-258). Boston: Allyn & Bacon; Paul, R. (2003). Enhancing social communication in high functioning individuals with autistic spectrum disorders. *Child and Adolescent Psychiatric Clinics of North America*, 12, 87-106.

With such variation in the level of functioning and extent of the needs of their students, school SLPs have a big job to do! Unfortunately, the scope of our responsibilities does not always limit the size of our workload as it should. O’Connell (1997) reported that the national caseload average is 52, and some school SLPs have caseloads in the 70s, 80s, or even 90s! Although ASHA (2002) does not recommend a workload maximum, it does argue that the workload should be compatible with appropriate and effective intervention. Moreover, it advocates using the concept of workload, which subsumes all the activities in which the SLP participates, rather than just the number of “cases” served. Workload takes into account not only the number of students an SLP treats, but also the paperwork, consultation, collaboration, conferencing, and supervision we provide. Clearly, we have some work to do in advocating for both caseloads and workloads that allow us to serve our varied client base in public schools with the level of service they require. That said, let’s discuss the various service delivery models that are appropriate at the L4L level.

The RTI Model

Montgomery (2008) explains that RTI models have the potential, through serving children within the general education program, to significantly decrease special education paperwork by preventing special education identification and thus eliminating the need for IEPs, yearly meetings, parent contracts, etc. This results in more time available to serve students’ needs. As we’ve discussed before, the SLP has an important role to play in RTI classrooms. This role includes many of the other service delivery options we’ll be discussing, including:

- Consulting with classroom teachers on providing the highest quality, scientifically based instruction in language and literacy for all students, at Tier I
- Participating in assessment and progress monitoring of students in Tier I to determine need for additional support
- Developing and monitoring intensive small group instruction programs to be delivered by paraprofessionals, volunteers, or peers for children requiring Tier II instruction
- Monitoring progress in Tier II to identify when students no longer require additional help, or show needs for Tier III instruction or special education
- Participating in evaluations to determine the need for individualized instruction at Tier III, or special education placement
- Designing and delivering Tier III and special educational support in language and literacy

The Clinical Model

The traditional clinical, or “pull-out,” model of intervention is, of course, one aspect of service delivery in schools. Many children in the L4L period can benefit from the relatively quiet, less-distracting setting provided in the clinical model, as well as from the intensive attention and scaffolding that can be given in this setting. We also may want to consider, though, supplementing the clinical model with some other forms of service delivery. One possibility is the “pull-out/sit-in” approach. Here, part of the client’s intervention time is spent in a clinical setting and part is spent in the classroom with participant observation-based intervention (Nelson, 2010) or with the clinician doing a collaborative lesson with the whole group.

The advantage of this approach is that the student with LLD can be “prepped” in the clinical session. That is, the clinician can give the client a preview of a classroom lesson and prime the student to

produce appropriate responses. Alternatively, the clinician can use clinical sessions after classroom work to evaluate and “go meta” on some of the material introduced in the classroom. Using participant observation, the clinician can sit in with the student during a classroom activity, then talk about his or her performance and how to improve it in a clinical session later.

O’Connell (1997) also suggested that clinical sessions are useful for developing basic skills that may not be relevant to the rest of the classroom, such as motor placement cues for sound production. She also advocates using clinical sessions to review recordings of the client’s communication during classroom activities. This is a “sit-in/pull-out” rather than “pull-out/sit-in” approach, in which the clinician does work in the classroom, then encourages the client to monitor his or her own performance from the recorded information.

The Language-Based Classroom

Feinberg (1981), McBride and Levy (1981), and Moore-Brown and Montgomery (2001) provided models of self-contained language stimulation classrooms at the primary-grade level. Generally, these classrooms will be designed to serve more severely impaired students with communication deficits that would make it difficult for them to participate in the mainstream class. In these programs, the SLP serves as the classroom teacher and creates a program focused on developing oral language skills and emergent literacy. Some SLPs especially like this model because it allows them to spend the whole day with a small group of students, getting to know them in a way they never could get to know a caseload of 40. Many of the activities we have discussed for addressing vocabulary, syntax, classroom discourse, and literate language styles are appropriate in these settings. Theme-based and naturalistic approaches are often incorporated in these programs, along with more structured activities focused on the development of listening, speaking, and reading and writing skills.

Some SLPs in schools may work as resource-room teachers in classrooms for children with LLD. The clinician may work closely with a special educator in these settings. Students generally spend part of their day in the resource room and part in the regular classroom. Often resource rooms focus on content mastery; that is, helping students to succeed in the curriculum being taught in the regular classroom. For this aspect of the resource-room curriculum, the SLP is especially well-equipped to provide metacognitive instruction that focuses on comprehension monitoring and learning strategies. In addition, the SLP can help provide curriculum-based assessment of the linguistic demands of the curriculum. Reviewing textbooks and observing in the mainstream class for teacher talk and hidden curriculum patterns can help the clinician provide focused intervention activities that address the specific requirements of the classrooms in which our clients must function.

A second function of the SLP in the resource-room setting is to provide instruction in general communication skills, especially in literate language style. The activities that we have discussed for developing more elaborated language, in conversation and classroom discourse and in work on narrative and other literate language materials, can all be used in the resource room, as well as in the clinical model. These activities help students to build the oral language foundation needed for success in school. Bruder (2005), Dodge (1998), Hesley (2005), and Plourde (1985; 1989) provided additional materials for developing a variety of communication skills at the elementary level that can be used effectively in the resource-room setting (see Table 12-3).

Consultation and Collaboration

Simon (1987) was one of the first to argue for the importance of moving SLPs out of the “broom closet” and into the mainstream of the school environment. As of this writing, staying in the closet is no longer an option for most school SLPs; the need to “leave no child behind” in terms of literacy development has created an “all hands on deck” atmosphere in schools, where SLPs are actively recruited to assist with literacy instruction and preventing reading failure. And the 2004 reauthorization of IDEA puts the law behind the effort to bring SLPs into the classroom and our services to bear on success in the curriculum. Let’s look at each of these service-delivery models and talk about how they can be implemented.

Consultation

When working in a consultative role in an RTI framework, our goal is to help teachers identify the most effective literacy instruction, based on the most current scientific evidence, and to support the development of literacy through enhancing oral language skills, especially for children who struggle to learn to read. Other consultative goals include helping teachers support students on IEPs within the mainstream setting. Let’s take these one at a time.

Consultation in an RTI format involves helping teachers select programs and instructional strategies for providing Tier I lessons in literacy. Here, SLPs can focus on making sure teachers attend to all five key components of effective reading instruction identified by the National Reading Panel (2000):

- Phonemic Awareness
- Phonics
- Vocabulary
- Fluency
- Comprehension

When consulting with primary grade teachers, SLPs will want to help teachers focus their instruction on the first three of these, being especially careful to help teachers understand the difference between phonemic awareness (being able to segment words into their component sounds) and phonics (the rules for associating sounds with letters, and spelling), and to realize that children will need explicit, direct instruction with extensive guided practice in both these areas. SLPs’ special expertise is in phonemic awareness and vocabulary instruction, and many of the activities discussed in this chapter can serve as a basis of consultation suggestions in these areas.

For teachers of intermediate grades, SLPs will want to support their instruction in vocabulary, fluency, and comprehension. We’ve already talked about ways SLPs can support vocabulary and fluency, and these can be shared with teachers or modeled in collaborative classroom lessons. To support comprehension, SLPs can work with teachers to implement the seven evidence-based strategies identified by the National Reading Panel, many of which we have already discussed in this chapter:

- Comprehension monitoring, where readers learn how to be aware of their understanding of the material
- Cooperative learning, where students learn reading strategies together
- Use of graphic and semantic organizers (including story maps), where readers make graphic representations of the material to assist comprehension
- Question answering, where readers answer questions posed by the teacher both before and after reading
- Question generation, where readers ask themselves questions about various aspects of the story

- Story structure, where students are taught to use the structure of the story as a means of helping them recall story content in order to answer questions about what they have read
- Summarization, where readers are taught to integrate ideas and generalize from the text information to produce a brief synopsis of the material they read

By working with teachers to become aware of and implement these scientifically-validated instructional strategies, SLPs can have an important impact on Tier I instruction.

Consultation to Support Students on IEPs

In working with teachers in a consultative role, it is important to remember that teachers are the experts on classroom issues. Our job is not to criticize or tell the teacher to teach differently. An effective approach to consultative sessions is to present the problems that we see our client having in the classroom and ask teachers how we can best help them to help the student succeed. Once areas of shared concern and ways in which the teacher is willing to modify the curriculum have been identified, the SLP can make concrete, specific suggestions. The SLP ought to be willing to do some of the modification for the teacher, if necessary, such as recopying tests with larger print and fewer questions per page or arranging for a volunteer to audio record classroom readings for the student to use. This makes the modification a shared activity, not one imposed on the teacher by the SLP. Sharing responsibility for the student’s success is what consultation should be all about.

O’Connell (1997) reminds us that serving in a consultant role does not need to mean being an “expert” who knows more about everything than the teacher. In many cases, in fact, we can learn a lot from teachers about managing classroom lessons, or choosing developmentally appropriate curricula and materials. What consultation does mean is using the special insight we have developed into the nature and structure of communication to help teachers sharpen their observation skills in these areas and perhaps think about their own and their textbooks’ language more critically. For example, a teacher may tell us that a student “refuses” to complete social studies assignments. The consulting SLP might suggest that he or she and the teacher review the instructions in the textbook. While reviewing them, the SLP might exclaim, “Wow, look at this sentence! It’s got three subordinate clauses. I wonder if that’s why Maria isn’t doing her work. Maybe she can’t understand what she’s supposed to do. Is there anything we could do to simplify these directions for her?”

Another important function the SLP can serve in a consulting role concerns in-service education for teachers. Cirrin (1989) suggested three formats for in-service education that can help us to share information about the needs of our students and foster a sense of joint responsibility for their learning. In the *demonstration* format, specialists from several disciplines can demonstrate materials (such as Westby’s [2005] book report forms), methods (such as cognitive behavior therapy), or activities (such as PA) that could be used in the classroom to foster success for clients as well as mainstream students. The *case-study* method provides an opportunity for specialists and regular educators to discuss a particular case in depth, so that principles and problems can be seen from a variety of points of view. Using a case from a previous year, for example (with names removed, of course), is a great way to practice trans-disciplinary program planning. A *literature* session allows professionals to get together to talk about some readings they have selected. One or two disciplines might choose articles to provide to the participants, who would read them before the in-service. The in-service itself would give participants an opportunity to discuss

their responses to the material. Another way to use the literature format is to provide the group with selected children's literature and work together to find ways to address oral and written language goals through the use of these selections. Prelock, Miller, and Reed (1995) also provided an outline of a series of in-service presentations to encourage collaboration between SLPs and classroom teachers. It appears in [Box 12-18](#).

Collaboration

Providing collaborative intervention by "sitting in" or "guest teaching" in mainstream classrooms is another extension of our role as SLPs. While it may be challenging to those of us who consider our primary role to be clinician rather than teacher, collaborative intervention's advantages, such as the ones previously discussed, are powerful enough to warrant taking on this challenge. There have been

BOX 12-18 In-Service Training for Teachers and SLPs Who Are Collaborating to Provide Services to Children with Communication Disabilities in the Regular Classroom

TRAINING COURSE OUTLINE

Session I: Language in the Classroom: Getting Perspective on Collaborating, Sharing Roles, and Teaming

Objectives

1. To share the perspectives of participants involved in collaborative service delivery on meeting the needs of at-risk students with communication disorders in the regular classroom.
2. To recognize those roles shared by teachers and speech-language pathologists as they assess and intervene with students.
3. To understand a transdisciplinary philosophy for teaming, including role exchange, role release, and role support.

Activity

Video viewing of collaborative planning meetings, classroom activities, and follow-up

Session II: Normal Communication Development and Communication Disorders in the Classroom

Objectives

1. To understand normal communication and language development in school-age children.
2. To recognize communication disorders common to the classroom.
3. To understand the pervasive nature of language deficits in children with disabilities.

Activity

Role playing an initial collaborative meeting

Session III: Identifying and Managing Classroom Language Demands: What Are the Scripts?

Objectives

1. To gain a broader understanding of the impact traditional classroom methods have on the student with communication disorders.
2. To identify scripts in the classroom.
3. To explain a process-based approach for managing classroom language demands.

Activity

Developing and implementing a communication skills "script" in the classroom

Session IV: Assessing Communication Problems in the Classroom: A Collaborative Approach

Objectives

1. To understand curriculum-based language assessment.
2. To provide a framework for collaborative assessment using language-based curriculum analysis, checklists, and observation logs.
3. To suggest ways of establishing collaborative data collection practices during classroom activities.

Activity

Practicing team assessment

Session V: Strategies for Managing the Language of Math

Objectives

1. To recognize the language complexity in the math curriculum and in text materials.
2. To gain skills in adapting curriculum materials for elementary students with communication disorders.
3. To learn strategies for collaborating with students to enhance their performance in math application, computation, and problem solving.

Activity

Explaining math problems in third grade

Session VI: Using Literature in the Classroom

Objectives

1. To examine the development of oral and written language.
2. To learn strategies for implementing literature use in elementary classrooms.
3. To recognize and manage the reading difficulties of at-risk students and students with communication disorders.

Activity

Sharing a writing project

Session VII: Issues in Collaborative Service Delivery: Scheduling, IEP Development, and Conflict Resolution

Objectives

1. To explain a process for determining the type(s) of service delivery a student with communication disorders should receive.
2. To recognize the role of regular and special education teachers, parents, and students in developing IEPs for students with communication disorders.
3. To discuss barriers to effective communication when working with a team.

Activity

Conflict resolution through role-play

a few studies, too (Cirrin et al., 2010; Ellis, Schlaudecker, & Regimbal, 1995; Farber & Klein, 1999; Throneburg et al., 2000) that demonstrate the effectiveness of this approach, at least in early primary grades. Creaghead (1994) discussed the essential elements in successful collaboration. They include building administrative support, developing relationships with teachers, and creating effective collaborative lessons and curricular units. Let's see how we can accomplish each aspect of the development of these intervention programs.

Building Administrative Support

SLPs interested in collaborative intervention may need to do some groundwork with school administrators to convince them to provide the coordination time necessary, especially in settings that do not use RTI models. One important aspect of this support is the availability of time for collaboration with other teachers. We need to talk with the teachers involved, not in the hall or during recess duty, but in regular, specified meetings. These meetings are a crucial first step in establishing workable collaboration and consultation. Administrative support for the development of these service delivery models is essential for their success. DeKemel (2003), Moore-Brown and Montgomery (2001), and Prelock, Miller, and Reed (1995) discussed some methods of building this administrative support. RTI and the mandates of No Child Left Behind also argue for collaborative service. By working alongside classroom teachers and modifying and enhancing the learning both of students with a variety of difficulties, as well as those who are struggling but who do not have identified special needs, we help to ensure the success of all students.

Using intensive cycle scheduling or the 3:1 model (Soliday, 2004) are additional ways to support collaboration for SLPs. By working consistently in one building for some time, scheduling collaborative or "pull-out/sit-in" service delivery models becomes less of a strategic nightmare. Keeping faculty and administrators aware of your schedule by posting it in the school office or Webpage helps to increase your visibility and accountability.

Developing Collaborative Relations

Building relationships with teachers is the next step in successful collaboration. Blosser and Neidecker (2002) and O'Connell (1997) suggested that the best relationships are usually built one teacher at a time. SLPs frequently begin collaborative intervention with one teacher with whom they have a good personal relationship, work in that class for a few months, and let the word spread. Prelock et al. (1995) suggest that SLPs attend curriculum and grade-level meetings to become familiar with classroom content and procedure. They also advocate offering teachers a "gift of time" by grading the papers of students on IEPs or decorating classroom bulletin boards. These activities not only delight the teacher, but allow the SLP to get to know clients' class work and support language goals within the classroom environment. Pena and Quinn (2003) emphasize the importance of providing meaningful incentive to teachers for collaboration, particularly through recognition by administrators. And of course, in-service presentations are always a good opportunity to plug your program.

A variety of ways to implement collaboration in classrooms are discussed by Blosser and Neidecker (2002), DeKemel (2003), Moore-Brown and Montgomery (2001), and O'Connell (1997). These arrangements are displayed in graphic models, suggested by Friend and Bursuck (2002), in Figure 12-13.

It is probably unrealistic to expect that collaboration is possible with every teacher in a school. But after a successful year, you might approach a teacher with whom you work particularly well and ask whether he or she would be willing to cluster several of your clients in that class for the following year. If the teacher is

FIGURE 12-13 Models of collaborative teaching. (Reprinted with permission from Friend, M., and Bursuck, W.D. [2002]. *Including students with special needs: A practical guide for classroom teachers* [3rd ed.] Boston: Allyn & Bacon.)

willing, administrative support should also be sought. Clustering this way maximizes the efficiency of your intervention and ensures a receptive classroom for your clients.

Effective Lesson Planning

The third piece of the collaborative intervention program is the classroom lesson itself. Christensen and Luckett (1990) provided helpful guidelines on developing these lessons. It is a good idea for the SLP to take the lead, at least at first, in lesson development. This approach avoids the potential difficulty of the SLP being "used" as an aide in the classroom. It is important, though, to consult with the teacher about the lesson, to ensure that it is something he or she wants for the whole class, and to intertwine it with other activities and themes going on in the classroom. Many of the activities we discussed in the sections on hybrid intervention techniques also can be adapted to the classroom setting.

In addition to the content of the lesson, the structure also is important. One way to structure the lesson is by means of cooperative learning groups. The SLP can present the lesson, break the class into groups, and supervise half of the groups directly while the classroom teacher supervises the other half. Usually the SLP arranges to have the clients with IEPs in the groups he or she supervises. A second way is to use what Waldron (1992) called "Academic Clubs." In this model, the SLP works in the classroom with part of the group on a lesson developed for those "club" members, while the teacher works on another lesson with the rest of the class. The "club" includes the students on IEPs but also includes others in the class. The "clubs" can be organized around student interests. For example, the client and all other students in the class who are interested in basketball might join the "Dribblers' Club." The SLP can prepare lessons with a basketball theme that address the needs of the client as well as other class members. They might use statistics on the web to write a report of a recent game, for example, then edit, rewrite, and "publish" the report. The "club" can last for several weeks, then another "club" can be formed with a different theme, involving different mainstream students. A "Secret Agents' Club,"

for example, might address higher level PA skills for the client and others in the class whose reading might need improvement. Letting students in the club just because they want to learn secret agent techniques is fine, too!

Kuder (1997) suggested some techniques that can work well in these groups. They can be given an assignment to complete with a set of materials from which they must choose. For example, if the collaborative lesson is on predicting story outcomes, students may be given four incomplete stories. Their job is to choose the group's favorite, then choose an ending for it together. Rewriting for varying audiences is another activity that can be useful. Each group in the class, for example, may be assigned to write their story's ending for a different audience. One might be assigned to a kindergarten audience, another, an audience of science teachers, and so on. Once each group has written its story, they then can be asked to listen to the other groups' stories and then rewrite their ending for a different audience.

Christensen and Luckett (1990) also stressed the importance of providing a well-structured lesson plan, both for the teacher's benefit and for our own. If you are not too familiar with classroom intervention, you will probably feel more secure having a written-out plan to refer to in case nerves interfere with your memory! Christensen and Luckett provided a structured framework for classroom lessons, which appears in [Box 12-19](#).

Christensen and Luckett reminded us to involve the teacher in the lesson by providing him or her with the lesson plan ahead of

time and by suggesting specific activities for the teacher to perform during the lesson. In addition, it is crucial to maintain discipline during the lesson. Talking with the teacher before beginning the collaborative program about the discipline techniques to which the students are accustomed is often helpful. Working with the teacher to gear the lesson to classroom themes and content, being on time, and providing materials for follow-up also help to keep the collaboration going smoothly. And it is smart to ask the classroom teacher for a critique of your lessons. This can provide helpful feedback and let teachers know that we are willing to learn from their expertise in the classroom.

Collaborative Curriculum Planning

As we've seen, IDEA legislation promotes including children with disabilities in the regular education curriculum. This means that one of our important roles will be finding ways to work with classroom teachers to design and modify the curriculum and provide appropriate accommodations so that our students learn what the other students in the class do. Freedman and Wiig (1995) developed a set of forms to aid in this collaborative planning process. The forms appear in [Appendix 12-2](#). They can be used to help structure our interactions with teachers and provide a means of thinking together about the prerequisites, content, and accommodations necessary to enable our students to get the most out of their participation in the classroom. Once team members have used forms like these a few times to plan curriculum units, the process becomes familiar and routine, so that planning can proceed quickly and efficiently.

BOX 12-19 A Framework for Collaborative Classroom Lesson Plans

CREATE AN ANTICIPATORY SET

Focus students' attention on the topic to be discussed. ("Today we'll talk about how characters in a story make plans to solve their problems.")

STATE THE OBJECTIVE

Tell the students what you expect them to learn as a result of the lesson. ("We'll learn to look for ways characters plan their actions in a story.")

GIVE THE PURPOSE OF THE LESSON

Tell students how the learning will benefit them. ("It helps us understand stories better if we look for the ways characters make and carry out their plans.")

PROVIDE AN INPUT MODEL

Tell the students what to look for; provide an example, check for understanding, monitor and adjust the instruction if necessary. ("You read the story *Curious George Rides a Bike*. Remember that George wanted to make a boat. He used his newspapers and made a whole fleet. But then he had another problem! What was it? Can you tell how he tried to solve that problem?")

PROVIDE GUIDED PRACTICE

Have the students complete an activity under adult supervision and scaffolding. ("How did George try to solve this next problem? What was his plan? Can you think of another way he might have tried to solve it? Let's make a list.")

CLOSE THE LESSON

Review the objective and purpose and ask students to tell what they learned. ("Poor George got himself into trouble quite a few times in this story. Each time he came up with a plan to solve his problem. What was his first problem? How did he plan to solve it? What was the next . . . ? Each time George came up with a plan. The plan didn't always work out just the way he wanted, but he tried to solve his problems by planning his actions. That's what characters in stories often do. They try to plan a way to solve their problems.")

PROVIDE DISTRIBUTIVE PRACTICE

Leave follow-up activities for the teacher to do so students can review and practice in a different setting what they learned in the lesson. ("Your teacher will be reading you another story this week. When I come back, I'd like each of you to have a list of some of the plans the character in your new story used to solve the problem in that story. Maybe you can act them out for me!")

CONSIDERATIONS FOR THE OLDER CLIENTS WITH MODERATE TO SEVERE DISABILITIES AND THOSE WITH ASD

Older Students with Moderate to Severe Disabilities Who Function at the L4L Level

For adolescents and young adults functioning at elementary grade levels of language and literacy, the main goal of intervention is to foster independence in vocational and living situations to as great an extent as possible. Having functional social discourse skills is very important in making this transition, as is having some functional literacy. Bedrosian (1985), Kilman and Negri-Schultz (1987), and Paul (2003) presented examples of programs for developing social discourse skills in older clients with moderate to severe language disorders. Since these clients may not develop all the “fine points” of language, intervention targets must be chosen on the basis of providing a functional repertoire, whether spoken or employing AAC, for the environments in which the client must manage. Matching the client’s language skills to the requirements of the social or vocational situation is vital.

Falvey, Grenot-Scheyer, and Luddy (1987) argued that curricula for these students should be *community referenced*. That means we should relate targets to the major domains in which the student must function. These domains would include domestic, recreational, and vocational settings. For each, ecological inventories can be used to assess what communication skills are needed. This often involves making contact with community settings to which the student will eventually transition and beginning to set up links before the student leaves school. Intervention can focus on providing the skills needed for these most crucial environments.

For all students with moderate-to-severe disabilities, teaching functional communication skills is essential (Sigafoos et al., 2004). Functional communication skills, as we’ve discussed before, are those that can be used to express basic wants and needs, and enable the speaker to obtain desired outcomes through the mediation of a listener. These will need to be matched to the environments in which the student will be involved, relying on ecological inventories and observations.

While these students are in school, every effort should be made to maximize literacy. Besides continuing to read and hear stories,

the adolescent at the L4L stage should be given focused instruction in PA, letter-sound correspondence, reading comprehension, writing, and spelling. Erickson, Koppenhaver, Yoder, and Nance (1997) found that the *Making Words Program* (Cunningham & Cunningham, 1992), which teaches children to systematically combine letters to form words, was easily adapted for use with a student with multiple disabilities. An additional promising technique that has some research support for increasing literacy in students with disabilities is *Precision Reading* (Freeze & Cook, 2005), which is outlined in Box 12-20. Basil and Reyes (2003), as well as Hetzroni and Schanin (2002), report that computer-assisted programs that involved massed practice and scaffolding were successful in promoting literacy in students with severe disabilities.

For older students at the L4L level, practice reading job applications, newspaper and web advertisements, and magazines on topics of interest should be part of the literacy program. Writing work should focus on filling out forms of various kinds, writing letters of inquiry about jobs and housing, and developing writing skills important for domestic independence, such as copying and organizing recipes, paying and filing bills, making shopping lists, and keeping household records. Clients also should be taught “meta” skills for deciding when they do not understand something they read, such as a contract or work agreement, so they know when they need to seek assistance to avoid being taken advantage of.

Ideally this literacy instruction should be integrated with other activities in the student’s educational program (Blackstone, 1989). For example, reading vocabulary for ordering food from a restaurant menu can be taught in the context of a community living or recreation unit on going out to eat. Writing skills can be taught in conjunction with a unit on shopping and menu planning, as the student writes a shopping list and searches for the food on the list on the grocery shelves. Reading and writing should be integrated within the student’s program systematically throughout the day, rather than in one short instructional session (Calculator & Jorgensen, 1991; Erickson, Koppenhaver, Yoder, & Nance, 1997).

Students with ASD

While most students on an SLP’s caseload struggle with oral language and literacy development, students with ASD may be exceptions to this rule. Many show normal to superior skills in vocabulary and syntax. They may be precocious readers, and may excel in some aspects of the curriculum such as math, science, art, or music. The areas in which they have difficulty center on the ability to engage in conversation, to interact successfully with peers, to regulate their emotions, and to master the organizational skills necessary for academic success. These difficulties fall into two main areas of SLP practice: metacognition and pragmatics.

Addressing Metacognition for Students with ASD

Students with ASD often have trouble regulating their feelings and behaviors, and these difficulties can lead to school problems in both academic and social areas. In addition, Abdelal (2009) pointed out that many of the metacognitive problems these children show affect their ability to use language and interact with others appropriately, so pragmatic and metacognitive areas really are related. Robinson and Westby (2009) suggest that using stories to work on metacognitive skills, by having students recognize the feelings, thoughts, and intentions of characters, and guiding them to talk about feelings explicitly can help them learn to make reasonable inferences about these internal states in ordinary pragmatic settings.

Intervention for older clients at the L4L stage is community referenced.

BOX 12-20 Components of Precision Reading

COMPONENT	EXAMPLE
Format texts	Make materials more accessible by increasing print size, adding additional spacing for lines and paragraphs, simplifying sentence structure (but not vocabulary).
Focus on fluency	Use repeated readings with corrective feedback to increase speed, smoothness and word recognition: Student reads same passage each day for 10 days; readings last only one minute. Over the ten days, the amount the student can read in one minute increases. Teacher identifies misread words, which are presented to students on cards for additional practice.
Support vocabulary	Once words originally misread are read fluently, teachers work on meaning of these words through elaborated exposure techniques.
Teach comprehension strategies	Teach retelling, QART, reciprocal teaching, and other evidence-based comprehension strategies to enhance understanding.
Use complementary strategies	Supplement instruction with sustained silent reading, choral reading, buddy reading, and home-based reading.

Adapted from Freeze, R., & Cook, P. (2005). Learning to read against all odds: Using precision reading to enhance literacy in students with cognitive impairments, extreme academic deficits, and severe social, emotional, and psychiatric problems. *Exceptionality Education Canada*, 15 (1), 79-109.

Many of the metacognitive techniques we talked about earlier for students with LLD can help with the academic organizational side of this issue. In addition, Timler, Olswang, and Coggins (2005) developed a program specifically for addressing these problems in children with social-communicative difficulty. “Do I Know What I Need to Do?” is a small group intervention program that targets mental state verb production, uses role-play, and provides a checklist to elicit the thinking about others’ perspectives. A clinician reads a script that introduces a hypothetical situation, such as needing a friend to play a game with. The clinician then assigns roles to play out the problem, and periodically “stops the action” in the role play to prompt the children to read and answer questions from the checklist. The checklist guides the children’s thinking about actions and perceptions, using questions such as:

Did I pay attention to the problem?
 What do I know? How do I know it?
 Did I pay attention to what others saw, heard, and thought?
 What does everyone else know about the problem? How do they know it?
 Do I know what I need to do? What is my best choice? Why?

Another approach that has evidence of efficacy for improving self-regulation in students with ASD is the use of social stories. We talked about this method earlier in this chapter and, although it has been shown to be helpful for children with a variety of diagnoses, it was first developed as a self-regulation tool for students with ASD, and a large literature with this population supports its use (e.g., Graetz et al., 2009; Karkhaneh et al., 2010; Ozdemir, 2008; Spencer et al., 2008). Abdelal (2009) suggests a variation on social stories for children with ASD: personal pragmatic stories (PPS). The clinician develops these stories, which follow a simple narrative format that incorporates a problem faced by a particular child. The target child’s name is used for the story’s main character. For example, if “Jayden” frequently has trouble allowing peers to

choose a topic during a group Writers’ Workshop project, the clinician might write the following PPS:

Jayden and his friends were told by their teacher to choose a topic from their American History chapter and write a paragraph about it. Jayden wanted to write about the different kinds of engines on the trains that met when the first coast-to-coast railroad was completed. But his friends wanted to write about the golden spike that was used to connect the last set of tracks. Jayden was mad that his friends didn’t want to write about his idea. But he decided not to argue about it. Instead, he told them he would draw a picture of the two engines that met up at the golden spike, and he would show all the ways they were different from each other in his picture. That way his friends could write about what they were interested in, and he could make a good picture to go with their story. Jayden explained his idea to his friends, asked what they thought about it, and said they could come up with the paragraph together, but he would draw the picture, since he knew a lot about how train engines looked. Everyone agreed it was a great idea. He was glad he had thought of a compromise.

Using Peer Models

Research on improving social interactions in children with ASD has one other clear result: interventions for social skills are more effective when peer models are involved (Paul, 2008b; Timler, 2009). Several programs that involve peer models have demonstrated efficacy in case studies. Some examples are outlined in Box 12-21.

Evidence-Based Pragmatic Programs for Students with ASD

Although there have been a huge number of commercial programs and social skills interventions developed to address these needs for student with ASD in recent years, there is not a lot of evidence about their effectiveness. For example, Bellini et al. (2007) reported that,

BOX 12-21 Examples of Evidence-Based, Peer-Mediated Social Interaction Programs for Students with ASD

PROGRAM	REFERENCE	DESCRIPTION
Peer group entry	Beilinson & Olswang, 2003	Student with ASD is taught to: • Walk over to your friend. • Watch your friend. • Get a toy like your friend is using. • Do the same thing as your friend. • Tell an idea. Peers are coached to welcome and facilitate group entry.
Special interest game group	Baker, et al. 1998	• Student with ASD is encouraged to develop a board game based on special/obsessive interest. • Game time with small group of peers is arranged (e.g., “lunch bunch”). • Target student teaches game to peers. • Group takes turns choosing games to play during interactive game time (target student must play games of others’ choice as well as his own).
Peer support networks	Banner, 2008	Popular peers chosen based on teachers’ recommendation. Peers receive four training sessions: • Introduce the nondisabled peers to the characteristics of students with ASD. • Following three sessions include the student with ASD. • Social interactions are observed in conversation; taking turns, and sharing are modeled and practiced. • Peers assigned to “buddy” target child for specific periods; each responsible for coaching/mentoring the student with ASD for one period of time (e.g, lunch, Phys. Ed.).
Pivotal response training	Harper, Symon, & Frea, 2008	Peers given 7 training sessions and taught to: • Gain attention: say the target student’s name and then give the prompts “look” and “listen” while making eye contact. • Vary activities: offer target student different play options using cue cards or by verbally giving choices of preferred activities. • Narrate play: comment and narrate their own play; provide examples of appropriate play with play materials; describe what he or she is doing with materials (e.g., “let’s bounce the ball,”). • Reinforce attempts: praise the target student for any attempt at functional play. • Take turns: offer turns or demonstrate sharing.

despite the wide use of social skills groups in school settings for students with ASD, a meta-analysis of the efficacy of these approaches showed they were minimally effective. Prelock, Paul, and Allen (2011) reviewed the literature on programs for children with ASD and identified only two evidenced-based techniques for improving pragmatic skills: script-fading and video modeling.

Script-Fading

This technique is aimed at providing students with ASD a starting point in making conversation and interacting with peers. The clinician develops a script to show the student what to say in a particular social interaction. McClannahan and Krantz (2005) have provided a detailed guide for developing these scripts, including procedures for addressing communication from the prelinguistic level up through procedures that are appropriate for fluent readers. The scripts can consist of audiorecorded material, picture symbols, or written text. Students are taught to imitate or read the script in a role-played interaction with the clinician. Once the child can produce the script, portions of it are “faded” or deleted from the model, so that a script that originally read, “I like to play videogames,” would be faded first to “I like to play . . .,” then, “I like . . .,” then to “I . . .,” until the child can produce most of the script independently. Then the child would continue to rehearse the scripts with various adults and peers. Krantz and McClannahan

have presented data suggesting this method leads to improvement in conversation for children with ASD.

Video Modeling

Video modeling takes a similar approach. Here, a child watches the prerecorded behavior of another, and uses what was observed on the video in his own interactions. Generally video models are produced by individual clinicians, using either peers or children with ASD themselves as “actors.” There are also some commercially produced materials designed for use in video modeling activities (e.g., “My School Day” by Silver Lining Multimedia, 2009). Video modeling helps focus the attention of the child with ASD on the relevant behaviors in the video so that with practice and rehearsal the child retains and displays the targeted language and behavior that was modeled (Prelock, 2006). Video modeling also fosters a child’s ability to take what is learned in a video modeling session and generalize that information to aspects of daily life (Bellini & Akullian, 2007; Shipley-Benamou, Lutzker, & Taubman, 2002). Charlop-Christy and colleagues (2000) showed that video modeling resulted in faster acquisition of skills than did modeling from live demonstrations, and was effective in promoting generalization.

When designing a video model, it is important to incorporate motivating play and interaction activities in the conversational language being modeled. The video can be paused to point out

specific information that the child is expected to consider. Viewing can be followed by a debriefing to review what was seen and heard, identify any new language heard as well as note the prosody and emotional expression of the models (Charlop & Milstein, 1989). Research suggests that generalization and maintenance are increased when children watch the video interaction, then rehearse it verbally before re-enacting the scenario. Re-enactments occur first with the clinician, later with other adults, and finally with peers (Paul, 2003b). New, inexpensive methods of videorecording on computers, cameras, and smart phones make this method now very accessible.

CONCLUSIONS

Children like Willie—whose difficulties in school include not only basic oral language but also reading, writing, and functioning in the classroom—need help that goes beyond addressing vocabulary and syntactic skills. Work with these students must focus on the oral and written language skills needed for success in school and in life. To be fully successful, this kind of intervention involves more than a few sessions a week of isolated “speech therapy.” It needs to be coordinated and integrated with the rest of his educational program. Let’s see how we might design an intervention plan for a student like Willie to achieve this kind of integrated service delivery.

In May of Willie’s second-grade year, Ms. Johnson met with the assessment team that had recently completed Willie’s evaluation. The first order of business was to review Willie’s audiometric data and design an assistive listening system that would increase his ability to receive auditory input from the teacher. It turned out that Willie’s hearing aids needed adjustment and that the classroom amplification system had not been working properly. As a result, Willie had not been receiving optimal auditory input. Ms. Johnson felt that this could be part of the reason for the deterioration in Willie’s behavior. Ms. Johnson and the audiologist worked with the classroom teacher to show her how to “troubleshoot” Willie’s auditory equipment each day and to report any malfunctions to them immediately. Willie also was taught to check the batteries on his hearing aid himself, to increase his independence and “ownership” of his hearing needs.

The team agreed that Willie also needed help with basic reading comprehension. Ms. Johnson explained that, although Willie’s oral language sounded adequate to the naked ear, he needed to work on understanding and producing more complex language forms and meanings that are used in the literate language style. His classroom discourse skills, particularly in understanding teacher talk and textbook language, were poor. Ms. Johnson felt this might be a result of his not having heard very well throughout the year, and also might be the cause of some of his behavior problems. The team discussed behavioral issues and decided to see how the change in his aural rehabilitation devices and the work on reading and language skills would affect behavior before taking any further steps.

The team met with Willie’s family to plan his third-grade program. Initially, the classroom teacher suggested that Willie spend half his day in a resource classroom to work on curricular

content mastery, behavioral issues, and language and reading skills. Willie’s parents were opposed to this plan, however. They felt Ms. Johnson had worked with him before to good effect and thought that with her help as well as that of the other specialists, he could function in a regular classroom. After some discussion, the team decided that Willie would be placed in Ms. Dunthorpe’s third-grade classroom for the first semester of the next school year. Ms. Dunthorpe had two other of Ms. Johnson’s clients slotted to be in her class and had been working collaboratively with Ms. Johnson for 2 years now. Ms. Johnson thought that she and Ms. Dunthorpe could develop an appropriate program for Willie in the classroom, if the parents would agree to support all the behavioral interventions the team suggested, to manage his hearing aids carefully at home, and to learn along with Willie to troubleshoot the devices daily. They also were asked to agree to reassess the situation at the end of the first semester to see how it was working. The family agreed to this plan.

Ms. Johnson was using a 3:1 schedule that year. She arranged with Ms. Dunthorpe to see Willie in a small group for curriculum-based language work 3 times a week during her direct service weeks and to present three collaborative lessons in the classroom for each of her collaboration weeks. During week 2 of the 3:1 schedule, Ms. Johnson and the reading specialist worked collaboratively to address comprehension of both oral and written language. The learning disability specialist worked on a consultative basis with Ms. Dunthorpe to keep on top of behavioral issues in the classroom and to help devise modifications of classroom instruction that would help Willie succeed. The audiologist worked with both Willie and Ms. Dunthorpe to make sure they understood how to test and troubleshoot his hearing aids and auditory-training device, and consulted monthly on how the troubleshooting was going. Ms. Johnson met monthly with the team—consisting of the teacher, reading specialist, LD specialist, audiologist, and herself—to monitor and provide input and consultation on Willie’s classroom program. At the end of the third 3:1 cycle, Ms. Johnson “furloughed” Willie from direct speech and language service, but continued to meet monthly on a consultative basis with his team, and to provide a monthly collaborative session in Willie’s class on “listening skills.” At the end of the first semester, Ms. Johnson did a classroom-based assessment. Willie was managing in class, and behavioral problems were significantly reduced. The parent-educator team met again, and everyone felt that Willie was progressing satisfactorily, although he still had some difficulties. Willie’s mother was eager for Willie to receive some more direct service from Ms. Johnson, who agreed to pick him up again for once-a-week sessions during her direct service weeks.

STUDY GUIDE

I. Planning Intervention in the L4L Stage

- A. What is transdisciplinary intervention? How can it be incorporated into IEP development?
- B. What kinds of modifications of the classroom program might be included in an IEP for a school-aged child?
- C. Discuss family involvement in the intervention program for a school-aged child.

- D. How can the student be involved in intervention planning?
- E. Discuss behavior management techniques that can be used in classroom intervention for students in the L4L stage.
- II. Intervention Products in the L4L Period
 - A. What principles should guide intervention at the L4L stage?
 - B. How does the SLP function in an RTI model?
- III. Intervention Processes in the L4L Period
 - A. What is the role of CD intervention in the L4L period?
 - B. What kinds of goals are appropriately targeted with CD approaches at the L4L level?
 - C. Discuss forms of scaffolding that can be helpful to students with LLD.
 - D. Describe the basic principles and some activities for addressing vocabulary development in the L4L stage.
 - E. How is vocabulary development related to reading comprehension?
 - F. Discuss approaches to word-retrieval problems.
 - G. What are some ways to work on semantic integration and inferencing ability?
 - H. How does advanced syntax support reading comprehension?
 - I. Discuss methods for addressing the development of advanced morphological markers. How can this work be used to work on spelling, too?
 - J. What is the connection between literate language forms and reading comprehension?
 - K. How can conversational discourse skills be targeted in an intervention program?
 - L. Describe methods for working on classroom discourse skills.
 - M. What are some intervention approaches for developing narrative comprehension?
 - N. Describe a story-grammar approach to intervention for narrative production.
 - O. Discuss some methods for developing cohesive marking in stories.
 - P. Describe the sequence of development of phonological awareness and give some activities that can be used to develop each level.
 - Q. Discuss some curriculum- and literature-based metalinguistic awareness activities.
 - R. How can editing student writing be used as a metalinguistic activity?
 - S. Describe Dollaghan's comprehension-monitoring program.
 - T. Describe some organizational and learning strategies that can be taught at the L4L stage.
- IV. Intervention Contexts in the L4L Period
 - A. Discuss some alternative forms of scheduling for the school SLP.
 - B. Discuss the role of SLP assistants in school settings. How should they interact with clients?
 - C. What are the advantages and disadvantages of a clinical or pull-out model of service delivery in schools?
 - D. Discuss the roles an SLP can play in a language-based or resource classroom. In RTI?
 - E. Why is collaborative or consultative intervention an important adjunct to service delivery in schools?
 - F. How can SLPs support teachers in their development of scientifically-based Tier I instruction in RTI models?
 - G. Describe three types of in-service presentations an SLP might give in a school setting.
 - H. What are some strategies for developing administrative support for a collaborative program?
 - I. Discuss positive behavioral support and the SLP's role in it.
 - J. Describe several different forms of implementation of collaborative teaching.
 - K. Describe the framework for an effective classroom lesson.
 - L. What are some ways we can involve teachers as we develop collaborative programming?
- V. Considerations for the Older Client and the Student with ASD at the L4L Stage
 - A. What is the goal of intervention for an adolescent or young adult at the L4L stage of development?
 - B. What is a community-referenced curriculum, and how can it be implemented?
 - C. What are some ways to develop functional reading and writing skills for these students?
 - D. Describe some evidence-based methods for improving pragmatics, social skills, and self-regulation in students with ASD.

Sample Format for an Individualized Education Program

Student _____	Estimated hrs/yr _____	Anticipated dates Start _____ End _____
Birthdate _____	Placement _____	
Least Restrictive Environment Considered _____	Regular classroom _____	
1. Placement Options: _____ Full-time regular education _____ Regular class with support _____ Full-time special education _____ Other _____	Special education _____	
Provide reasons for rejecting other options _____	Support services _____	
2. Location: _____ Neighborhood school _____ Other school in district _____ Home-based instruction _____ Other (specify) _____	Speech and language _____	
Provide reasons for rejecting other options _____	Extended school year (ESY) _____ Student qualifies for ESY _____ Student does not qualify for ESY _____ Decision deferred until May _____	Physical Education _____ Regular _____ Special ed. _____ P.E. requirement completed _____
3. Opportunities for interaction with peers: _____ Lunch _____ Recess _____ Class time _____ Transportation _____ Small group/tutoring _____ Other (specify) _____	Vocational program _____ Special designs _____ Regular education _____	
4. Nonacademic and Extracurricular Involvement _____ Sports _____ Intramurals _____ Clubs _____ Performing arts _____ Other (specify) _____	Signatures of IEP participants _____	
If none, explain _____	Parent or surrogate parent _____	
	Teacher or therapist _____	
	District representative _____	
	Other _____	
	Other _____	

PARENTAL DECISION

My rights and responsibilities have been shared with me in writing in a manner which I fully understand. I have had the opportunity to participate in the development of the Individualized Education Program for my child and agree with its contents. I fully understand my child's present levels of performance and understand all programs and services which will be provided. I have participated in the development of the annual goals and objectives and I understand that the objectives which I have reviewed will be revised as progress is demonstrated towards the attainment of annual goals. I am aware that my participation and cooperation are needed if the Individualized Education Program is to be successful and I offer my support. I grant permission for my child/ward to participate in all aspects of this program. I understand that the program will be revised no later than one year from the date of my signature and that I will be notified if major changes in the program are necessary.

Parent or guardian (or adult student)	APPROVAL	Signature _____	Date _____
Parent or guardian	REJECTION	Signature _____	Date _____

Form for Planning Curriculum Lessons and Units

CURRICULUM – SPECIFIED GOALS OR OUTCOMES

- PRIORITYIZE
- LOOK BEYOND THE OBVIOUS
- BE MEANS-END DIRECTED
- IF THEY LEARN NOTHING ELSE . . .
- WHAT IS MEANINGFUL . . .

CORE VOCABULARY	ESSENTIAL EVERYONE MUST LEARN THIS	MOST SHOULD LEARN THIS	IF THEY CAN .. I WANT SOME TO LEARN THIS
	What prior knowledge or PRECONCEPTS must they have? What processes or skills must they know?		
	How can I probe for these preconcepts, processes? What questions can I ask? Will this be part of an orienting unit?		

SEQUENCING THE UNIT

1. What will I do for students who do not have the necessary precepts, processes, or skills—preteach, use cooperative learning, design a preteaching unit for some and enriching activities for others, extend the orienting unit . . .

**MODIFICATIONS FOR
STUDENTS WITH
SPECIAL NEEDS**

2. **TEACHING THE CONCEPTS—(IN OUTLINE)**
REMEMBER TO USE GUIDED QUESTIONING, MEDIATION, AND SCAFFOLDING.
How will I develop the **VOCABULARY** for the **CONCEPT(S)**?

Continued

What activities or aspects of the whole unit will ensure generalization and develop:

ORAL LANGUAGE	READING	WRITTEN LANGUAGE	SPECIAL SKILLS (e.g., study skills research, etc.)	MODIFICATIONS FOR STUDENTS WITH SPECIAL NEEDS

3. **EVALUATION**

- Did every student have equal access to the learning opportunity because I ensured that they all had the necessary precepts, vocabulary, skills, and modifications for special needs?
- Has every student learned something and how can I evaluate this range of learning?

Assessing Advanced Language

CHAPTER OBJECTIVES

Readers of this chapter will be able to do the following:

1. Describe typical language development in adolescence.
2. Discuss issues of student-centered assessment at the secondary school level.
3. Discuss screening, case-finding, and eligibility for services for students in secondary schools.
4. Describe the uses of standardized tests, criterion-referenced methods, and observational assessment at the secondary level.
5. Outline methods of assessment of functional communication for adolescent students with severe disabilities and autism spectrum disorder (ASD).

Crystal had two younger brothers who were both diagnosed with fragile X syndrome when she was in third grade. At that time, Crystal was tested, too, and found to be positive for the syndrome. Before that, she'd been thought of by her teachers as something of a "slow learner," who had barely managed to stay at grade level. Once the diagnosis was established, she received a thorough assessment. She was found not to be eligible for services in third grade, since she was functioning within normal limits, although near the borderline. She was put on monitoring status and reevaluated 1 year later. By that time, her scores on a battery of oral language and reading tests had slipped below the cut-off and qualified her for services in language and reading. She received intervention throughout fourth and fifth grades and was able to function in regular classes. By the end of fifth grade she was making satisfactory progress, had age-appropriate oral language skills in most areas, and was reading on a fourth-grade level. It was decided to send her on to middle school with her class, to furlough her from direct intervention, and to monitor her progress.

Mr. Janis was the speech-language pathologist (SLP) charged with monitoring Crystal's progress in middle school. He gave her the *Clinical Evaluation of Language Fundamentals—4* (CELF-4) Screening Test (Semel, Wiig, & Secord, 2004) during her sixth-grade year and found her performance to be broadly within normal limits, although at the low end. In talking to her teachers, Mr. Janis gathered that Crystal was having a few problems but wasn't failing any courses and wasn't showing any behavioral difficulties, although they noted that she had some trouble paying attention. The teachers felt they could give her a little extra help in the classroom, and she would be able

to get by. Mr. Janis gave them some information about fragile X syndrome in girls, provided some tips for modifying classroom assignments and presentation, and asked them to let him know whether things changed. He placed Crystal on monitor status for another year. When he gave her the CELF-4 screening again in seventh grade, though, her score fell just short of passing. He talked to some of her teachers and found that she was beginning to have trouble with the lecture material presented in class, with completing independent assignments, and with keeping up with reading. They felt she sometimes seemed lost in the shuffle. Mr. Janis decided to do a full-scale assessment and find out what Crystal needed to help keep her on track.

Crystal is like many children who have language learning disorders (LLD) that stem from a variety of sources. She is one of what Launer (1993) called "the porpoise kids," whose deficits go below the surface at times and then leap up again at points when the demands of the curriculum increase. These points often occur in fourth and seventh grades, where, in each case, new and taxing changes in the curriculum and in teachers' expectations of students come into play. Crystal is typical of adolescents with LLD in another way, too. Most don't appear on the SLP's doorstep with no history. Almost always, unless they have recently suffered a traumatic injury, they have been assessed and have received services before. That means that they don't enter our caseloads as clean slates. A great deal of information about their language and learning history is available. The goal of assessment for this period of advanced language development is to use the data available in their files to select assessment questions and focus on the most relevant areas for in-depth appraisal.

LANGUAGE DEVELOPMENT IN ADOLESCENCE

What do we mean by *advanced language development*? In general, we mean the language normally learned when children are in the adolescent years, from age 12 through early adulthood, when they attend middle and high school. Of course, some students in secondary schools are functioning at lower levels of language development. Some are still in the language-for-learning (L4L) stage, with few literate language and literacy skills. Some with severe disorders are still at developing language levels. There may be students with profound disabilities who still function at emerging language or prelinguistic stages. For these students, the SLP uses assessment procedures appropriate for developmental level, using functional assessment, such as ecological inventories, to determine these

students' communicative needs in community-referenced environments, as we discussed previously.

Adolescents who are functioning at advanced language levels have not only mastered the basic skills of the developing language period but also achieved some of the goals outlined in Chapter 12. They can produce and understand true narratives and some complex sentences, make some inferences, carry on marginally adequate conversations, engage in some metalinguistic discussions, and so on. While these abilities may be present in some aspects of their interactions, though, their skills are, in Nelson's (1998) words, "wobbly." Oral language facility can easily be disrupted by stress, when dealing with unfamiliar material or new vocabulary, or when faced with some new communicative goal (such as asking for a date) or cognitive function (such as formulating a scientific hypothesis). Word finding often continues to be a problem.

The new skills that normal adolescents are learning during the period of advanced language are primarily concerned with the development of language for more intensive social interactions, with language at the literate end of the oral-literate continuum, and with abilities related to critical thinking (Whitmire, 2000) and executive function (Ciccia, Meulenbroek, & Turkstra, 2009). Vocabulary acquisition involves literate language forms (Nippold, 2007; Westby, 2005) such as the following:

- Advanced adverbial conjuncts (*similarly, moreover, consequently, in contrast, rather, nonetheless*)
- Adverbs of likelihood (*definitely, possibly*) and magnitude (*extremely, considerably*)
- Precise and technical terms related to curricular content (*abscissa, bacteria, pollination, fascism*)
- Verbs with presuppositional (*regret*), metalinguistic (*predict, infer, imply*), and metacognitive (*hypothesize, observe*) components
- Words with multiple meanings (*strike the ball, strike at the factory; run for office, run the office*)
- Words with multiple functions (*hard stone, hard water, hard feelings*)

Adolescents acquire more than just a larger vocabulary. They learn to elaborate and expand the meanings of known words (*cold* meaning temperature; *cold* meaning affect) and to understand connections among words related in various ways, such as by derivation (*clinic, clinician*) or by meaning (antonyms [for example, *reluctant* and *enthusiastic*]; synonyms [for example, *huge* and *enormous*]; or sound (homonyms [for example, *pair* and *pear*]) (Nippold, 2007). They also acquire more sophisticated abilities for defining words. Nippold, Hegel, Sohlberg, and Schwarz (1999) showed that, between sixth and twelfth grades, students increased in their ability to provide the most advanced type of definition for abstract nouns, the *Aristotelian* type. This type of definition contains a superordinate term and a description with one or more characteristics (for example, *happiness* is a feeling [superordinate term] of pleasure or gladness resulting from a positive experience [description of characteristics]). Sixth-graders produced only one or two of 16 responses at this level, whereas twelfth-graders produced an average of six of 16. Finally, vocabulary development in the secondary years includes increasing understanding of derivational morphology (Nippold & Sun, 2008), the recognition of root words, prefixes, and suffixes that can change the part of speech and pronunciation of base words (e.g., *graph, telegraph, telegraphic*). Larsen and Nippold (2007) outline the ways in which morphological development not only supports advanced vocabulary development,

but also the expansion of decoding, reading comprehension, and spelling skills.

New syntactic skills include growth both within sentences (intrasentential) and between sentences (intersentential). Growth within sentences is seen in small but regular increases in sentence length throughout the school years. Longer sentences are used for particular purposes, though, including narrative, persuasion, and writing. Nippold (2007) reported data showing children used longer sentences in narrative than conversational tasks. Reed, Griffith, and Rasmussen (1998) reported that adolescents used morphosyntactic markers (verb marking, negative forms, etc.) more frequently than did younger children. Nippold, Ward-Loneragan, and Fanning (2005) showed that persuasive contexts elicited the most advanced syntactic forms in adolescents' writing; Nippold, Mansfield, and Billow (2007) showed that explanation of peer conflicts elicited the longest and most complex sentences in oral discourse. These results indicate that the use of increasing numbers of basic grammatical markers is one means by which sentences become longer during the adolescent years. Intrasentential growth, then, is seen both in the use of newly acquired forms, as well as in increased density of earlier-acquired forms within sentences.

Intrasentential growth also is seen in the increasing use of subordinate and coordinate clauses, as well as in the use of low-frequency syntactic structures associated with literate language style. Intersentential growth in the forms used to link sentences also is an important part of adolescent language development. The use of conjunctions and other forms of cohesive devices becomes more frequent and effective during the secondary school years (Nippold, 2007).

In addition to these new semantic and syntactic skills, typical adolescents develop a variety of new pragmatic abilities. They begin to use and understand language that has a figurative, rather than literal, function (Nippold, 2007; Nippold & Haq, 1996; Nippold, Moran, & Swartz, 2001; Qualls & O'Brien, 2003). They make puns, use sarcasm, and gradually learn to use and comprehend metaphors ("she's a whirlwind"), similes ("like a diamond in the sky"), proverbs ("a stitch in time saves nine"), and idioms ("raining cats and dogs"). Slang and in-group language become important, and the ability to discern the appropriate uses of this slang helps to determine group membership and peer acceptance (Nippold, 2007). Also, adolescents become significantly more proficient at using communication for purposes such as persuasion, negotiation, and establishing social dominance (Nippold, 1994). Moreover, unlike in earlier childhood when friendship revolved around shared activity, in adolescence, talk itself becomes the major medium of social interaction. It represents a new aspect of the teen's relation to the social world, where friendship is negotiated primarily by "just talking," sharing intimacies and experiences for the sake of communication alone (Raffaelli & Duckett, 1989).

School also plays a role in the normal adolescent's language development. New forms of discourse, such as class lectures and expository texts, are introduced in the curriculum, and students need to learn to process and produce them. Secondary school requires students to produce more extended written forms of communication than they did at the elementary grades. Students are required to produce not only stories, but expository and persuasive texts. The understanding of these texts undergoes a predictable sequence of development during the secondary school years (Scott, 2005). These written forms require a great deal of metacognitive and metalinguistic activity.

Formal operational thought is the new cognitive development of the adolescent period. It allows teens to move beyond concrete

experiences and begin to think abstractly, reason logically, draw conclusions from the information available, and apply all these processes to hypothetical situations. Formal operational thought greatly extends the student's capacity to think about thinking processes and to entertain hypotheses, coordinate abstractions, and use logical operations. Formal operational thought emerges during this period in normal development (Kamhi & Lee, 1988; Nippold, 1998) and is elaborated throughout the secondary school years. School work builds on formal thought capacities by teaching mathematics and science that make use of and provide practice in exercising these skills. Formal operational thinking also allows teens to develop a variety of verbal-reasoning and critical-thinking skills (Nippold, 2007). Analogical or inductive reasoning ("Apple is to fruit as potato is to vegetable") develops. Adolescents learn to use syllogisms or deductive reasoning, in problems such as "John is taller than Mary. Mary is taller than Pete. Who is tallest—John, Mary, or Pete?" These formal-operational and verbal-reasoning skills, in normal teens, also allow for a much greater range of metacognitive activities than are typical of elementary-age children. Again, the school curriculum both demands and provides forums for practicing these skills.

Adolescents with LLD

The kinds of demands that the middle and high school curriculum place on students were discussed by Montgomery and Levine (1995), Schumaker and Deshler (1984), and Whitmire (2000b). These are summarized in Box 13-1. These demands draw on many of the abilities we've been discussing that normally evolve during the adolescent years. For adolescents with LLD, as we've seen, the oral language and literacy skills developed during the elementary years may still be "wobbly." These shaky skills can form a weak foundation for the advanced language required by the more intense demands of the secondary curriculum.

For these reasons, children who had difficulties acquiring oral language and literacy at the L4L stage continue to have problems with advanced language during the secondary school years. A variety of studies looking at children with histories of language impairments find that these impairments do not disappear in older children and adolescents. Both Conti-Ramsden et al. (2009) and Rescorla (2009) reported on adolescent outcomes of children with histories of language delay. Both report that not all of these individuals require special education throughout their school years, although they do continue to score, on average, lower than peers on tests of language, verbal memory, and verbal reasoning. Still, Durkin et al. (2009) reported that three-quarters of these students received some form of academic support, and that educational attainment was consistently poorer than that of typically developing peers. They and Nippold (2010a) emphasize the importance of evaluating children with a history of language delay as they make the transition from primary to secondary school, in order to provide the levels of support they need to complete their education. Moreover, Wadman, Durkin, and Conti-Ramsden (2008) also report that it is not only academic abilities that are affected. Older student with LLD are at risk for low self-esteem and shyness, despite a desire to make friends and "fit in." These findings should lead us to conclude that secondary students with LLD will continue to require targeted supports for both academic and social functions. Let's talk about how we can assess these advanced language skills to identify ways to help our students with LLD manage in the secondary school environment and its social setting.

STUDENT-CENTERED ASSESSMENT

We've talked often about the importance of the client's family in any successful program of assessment and intervention. We still want to keep families involved and informed in an adolescent's program,

BOX 13-1 Curriculum Demands at Advanced Language Levels

- Deal with multiple teachers, with varied teaching styles and modes of communication, and follow classroom rules for each.
- Use already automatized skills (e.g., reading fluency) and increasing base of knowledge to gain information from material written at middle and high school reading levels.
- Be able to retrieve prior knowledge of several different procedures (e.g., writing a business letter; recalling technical names for parts of a business machine written about in letter; using writing conventions such as spelling, capitalization, punctuation) simultaneously in order to complete classroom assignments.
- Be able to increase the amount of work produced (e.g., write longer reports, more frequent written assignments), necessitating quicker, more efficient production, use of organizational strategies and problem solving skills for scheduling tasks, etc.
- Be able to use "working memory" to reason, process large chunks of material, follow multistep instructions.
- Be able to deal with the stress of using more focused and sustained attention for increasing periods of time.
- Use self- and comprehension-monitoring and metacognition to determine priority and saliency of classroom material.
- Work independently with little help from the teacher.
- Master increasingly decontextualized, abstract, symbolic material to participate in discussions and assignments about curricular material.
- Complete homework and other assignments independently.
- Gain information from lectures, films, and student reports.
- Take notes independently.
- Demonstrate knowledge by studying and recalling information for tests with various formats (essay, multiple choice, true/false).
- Express oneself in writing in various formats (essays, descriptions, narratives, and explanations).
- Use logical and critical thinking to evaluate information presented.

Adapted from Montgomery, J., & Levine, M. (1995). Developmental language impairments: Their transactions with other neurodevelopmental factors during the adolescent years. *Seminars in Speech and Language, 16*, 2; and Schumaker, J., & Deshler, D. (1984). Setting demand variables: A major factor in program planning for the LD adolescent. *Topics in Language Disorders, 4*, 22-40.

using some of the techniques we talked about in Chapters 11 and 12. However, one of the hallmarks of adolescence is the beginning of a movement away from the family of origin as the primary social unit, toward more independence and peer-group orientation. We need to think about this developmental shift in planning assessment for this age group. We can attempt to provide a *student-centered* program when working with clients at advanced language levels. Let's see how we might do it.

McKinley and Larsen (2003) discussed the importance of student motivation in assessing adolescents. They suggested, first, that the clinician have no "hidden agenda" in the assessment process. Larson and McKinley (1995) advocated telling the student what behaviors (listening, speaking, thinking, writing, etc.) are going to be assessed. Tests and other methods to be used in the assessment can be introduced to the client and the purpose of each explained. Other assessment methods to be used, such as speech, narrative, or writing sampling, also can be previewed, with an explanation of the uses to which the clinician will put each procedure. Teens also need to know why particular behaviors are being assessed. Clinicians can explain, for example, that it is important to know about the student's listening and understanding of words and sentences in order to figure out how problems with listening might be getting in the way of succeeding in the classroom or interacting successfully with friends. It is important to emphasize to adolescents that the skills we are assessing are important not only for succeeding in school but also for interacting with peers and for developing vocational and independent-living opportunities.

The goal of such a student-centered approach to assessment is to establish a cooperative partnership between the teen and the clinician. Only through this partnership can we get the clearest picture of the adolescent's abilities. And, if we decide intervention is warranted, this partnership stands us in good stead for achieving the full cooperation of the client and eliciting the most highly motivated performance. One method that can be used to assist in this student-centered assessment is to ask the student to do some self-assessment. Grambau (1993) provided one example of such a self-assessment inventory; an adaptation is given in Figure 13-1. This form can be given to the student at the beginning of the evaluation. The student's self-assessment can be used to guide the process, focusing the clinician's attention on areas in which students perceive themselves to be having trouble. These areas can be investigated in depth as part of the assessment.

SCREENING, CASE FINDING, AND ESTABLISHING ELIGIBILITY WITH STANDARDIZED TESTS IN THE ADVANCED LANGUAGE STAGE

Some secondary school programs may use responsiveness to intervention (RTI) models to identify students who struggle with curricular demands (e.g., Vaughn et al., 2008). However, this approach does not yet have strong evidence at the secondary level (Brozo, 2009; Cobb et al., 2005) and is difficult to accomplish in the block-scheduled culture of most secondary schools. While some students may be referred to SLPs and other special educators through the progress monitoring process in RTI programs, most secondary students will find their way onto SLP caseloads in other ways.

Larson and McKinley (1995) suggested that mass screening for language disorders in secondary schools is probably not an efficient use of the SLP's time. Instead, they proposed focusing

screening on at-risk populations. These would include adolescents placed in special classrooms, students receiving remedial reading assistance, those in danger of dropping out of school, and those having academic problems that aren't caused primarily by lack of motivation. Both Blanton and Dagenais (2007) and Sanger et al. (2003) have reported an unusually high prevalence of unidentified language disorders among adolescent delinquents, so it is important to screen students who seem to be having behavioral or social difficulties, even if they have not been previously thought to have communication problems. Such students may have unidentified LLD and could benefit from assessment and intervention with the speech-language pathologist. A sampling of screening tests available for use with students at advanced language levels appears in Appendix 13-1. These screening measures need to be used with some caution, though. Nelson (1998) pointed out that many screening tests developed for adolescents may not be sensitive to the problems that can occur at advanced language levels and have an impact on school and personal adjustment. If an at-risk student passes one of these screenings but the clinician has a "hunch" that the passing score is not a good reflection of the student's functional language ability, a talk with some of the student's teachers may be warranted. If the teachers confirm the clinician's hunch that language disabilities are getting in the student's way, some standardized testing in greater depth may be warranted to determine whether the student would be eligible for services on the basis of scores from more extensive testing.

Other sources of referral are most likely to be the teachers and counselors who work with students in the school. For these referral sources, it is especially important to provide practical criteria for making referral. Using a pragmatically oriented checklist, like the one in Figure 11-1, can be helpful for eliciting referrals from these sources. So can a referral checklist that focuses on skills that are required by the secondary curriculum. Figure 13-2 gives an example of a checklist that incorporates the pragmatic aspects of Figure 11-1 and adds some of the curricular demands of Box 13-1. A checklist like this can be given to teachers at in-service programs that discuss adolescent language and the needs of students with LLD at this level. Alternatively, it can be distributed to teachers with a short cover note explaining the clinician's interest in helping students to acquire language skills that will increase success in the classroom. Teachers can be asked to fill out the form for any student whom they suspect may have "wobbly" language abilities. If teachers are unwilling to fill out the forms, the SLP might arrange a short meeting with the teacher and ask the teacher to think of any students who might be having trouble. The clinician can simply ask the questions on the form and record the answers for each student about whom the teacher has concerns.

Students who show significant problems on an inventory like the one in Figure 13-2 can be assessed for eligibility using standardized test batteries. A screening test would not be necessary, since the screening was done by the teacher by filling out the checklist. When choosing and interpreting standardized tests at advanced language levels, we need to bear in mind all the warnings we have discussed all along for standardized tests. Several are particularly germane in the advanced language period. The need to identify pragmatic as well as semantic and syntactic areas of need is especially important, since pragmatics may be the area of greatest deficit in adolescents with LLD. And of course, we will need to attend to the ways in which the student's oral language skills support reading and writing in the curriculum.

Like screening tests, standardized tests at advanced language levels may not be sufficiently sensitive to higher level language

Learning skills	I'm good	I'm ok	I get by	I need some help	Aah! Help! Help!
Answering questions about my reading					
Asking questions when I don't understand					
Editing my writing					
Engaging in extended discussions of curricular topics with teacher and peers					
Finding main ideas in textbooks					
Finding time to finish all my work					
Finishing assignments					
Following directions					
Interest in school work					
Organizing my thoughts					
Participating in class discussion					
Participating in group assignments					
Penmanship					
Reviewing and studying for tests					
Spelling and punctuation					
Taking notes					
Taking tests					
Understanding teachers' lectures					
Understanding what I read					
Using a dictionary or other reference books					
Vocabulary					
Writing papers					

FIGURE 13-1 A sample student self-assessment form for focusing evaluation in the advanced language stage. (Adapted from Grambau, M. [1993]. *Study smarter, not harder*. Kent, WA: Classic Printing; and Westby, C. [2007]. There's more to passing than knowing the answers: Learning to do school. In T. Ukrainetz [Ed.], *Contextualized language intervention* (pp. 310-388). Eau Claire, WI: Thinking Publications.)

skills to identify deficits in students with minimally adequate basic oral language abilities who are still having trouble with secondary school work. They also may fail to sample the extended discourse contexts that are necessary for success in school, like narratives and expository prose. Nelson (1998) suggested that the most appropriate uses of standardized tests of advanced language include identifying the dimensions of the language disorder—dimensions such as oral language, written expression, and comprehension of language forms in listening and reading. We can, then, select standardized tests for adolescents using a strategy similar to the one discussed for elementary students in Chapter 12. That is, we can use standardized tests that sample a broad spectrum of oral and written receptive and expressive abilities. If necessary, the assessment for eligibility can be supplemented with tests of pragmatics and tests of learning-related skills to establish eligibility, as we

discussed in Chapter 11. At the advanced language level, some tests particularly helpful in this regard include the following:

- *Test of Word Knowledge* (Wiig & Secord, 1992a): assesses aspects of lexical skill including definitions, synonyms, antonyms, metalinguistics, and figurative language.
- *Test of Language Competence—Expanded* (Wiig & Secord, 1989): provides assessment of structural ambiguities, figurative language, and ability to draw inferences.
- *Test of Adolescent and Adult Language—4* (Hammill, Brown, Larsen, & Wiederholt, 2007): provides broad assessment of syntactic forms in the Listening Grammar, Speaking Grammar, Reading Grammar, and Writing Grammar subtests.
- *Clinical Evaluation of Language Fundamentals—4* (Semel, Wiig, & Secord, 2003): the Formulating Sentences, Recalling

Student name _____	_____ Produces responses without long delays
Grade/subject _____	_____ Discusses everyday topics appropriately
Teacher _____	_____ Participates adequately in class discussions on curricular topics
Date _____	_____ Uses appropriate specific vocabulary
To the teacher: Please mark any item below if it is of concern (+) or serious concern (++).	_____ Organizes thoughts adequately when speaking
Reading	_____ Keeps to the point in speaking, without undue redundancy
_____ Gains information from independent reading assignments at grade level	_____ Asks questions when clarification is needed
_____ Studies for tests effectively	_____ Follows classroom rules for speaking
_____ Identifies main ideas in reading	_____ Uses and "gets" humor appropriately
_____ Follows written directions without difficulty	_____ Is polite and tactful
_____ Uses references (dictionaries, Internet, atlases) effectively	_____ Can express opinions clearly
Writing	_____ Has no trouble finding words during speaking
_____ Expresses thoughts clearly in writing	Listening
_____ Uses forethought to plan writing assignments	_____ Follows oral direction the first time
_____ Has legible handwriting	_____ Can understand class lectures
_____ Uses adequate spelling	_____ Understands idioms, proverbs, slang in context
_____ Uses correct punctuation/capitalization	_____ Can follow material presented in films, student reports, Web-based materials
_____ Uses appropriate grammatical complexity	_____ Can answer questions based on lecture and other orally presented material
_____ Takes adequate notes	_____ Can later recall and relate information from orally presented material
_____ Completes written assignments	Organization
_____ Applies adequate editing skills	_____ Can work independently
_____ Can perform on short-answer tests	_____ Organizes material in assignment books, planners, calendars, etc.
_____ Can perform on essay tests	_____ Seems "with it" in class discussions
Speaking	_____ Can think problems through, using reasoning skills and thinking out loud
_____ Speaks with adequate pronunciation, fluency, and correct grammar	
_____ Uses age-appropriate complexity	
_____ Gives accurate information	
_____ Can follow discussion agenda set by teacher	

FIGURE 13-2 A sample checklist for referral at the advanced language level. (Adapted from Damico, J. [1985]. Clinical discourse analysis: A functional language assessment technique. In C.S. Simon [Ed.], *Communication skills and classroom success: Assessment of language-learning disabled students* [pp. 137-139]. Gaithersburg, MD: Aspen.)

Sentences, and Sentence Assembly subtests tap various aspects of grammatical production.

- *Test of Language Development-Intermediate—4* (Hammill & Newcomer, 2008): the Sentence Combining and Word Ordering subtests have shown good correlations with production in spontaneous discourse (Scott & Stokes, 1995).
- *Test of Written Language—4* (Hammill & Larsen, 2009): measures structural elements in writing in students to age 17.
- *Comprehensive Assessment of Spoken Language* (Carrow-Woolfolk, 1999b): measures semantic, syntactic, pragmatic, and supralinguistic aspects of language.
- *Oral and Written Language Scales* (OWLS; Carrow-Woolfolk, 1996): Measures written expression, oral expression, and listening comprehension for children ages 5 through 21.

Appendix 13-2 provides a list of standardized tests that are appropriate for students at advanced language levels.

A third source of referral at the secondary school level is the students themselves. In order to make this referral route a viable option, several conditions need to be met:

Activity with the SLP must result in academic credit toward graduation (Larson, McKinley, & Boley, 1993). Students will not be willing to devote time voluntarily to activities for which they receive no credit.

Standardized assessments of advanced language include written and spoken language.

Larson and McKinley (2003b) also suggested taking care in naming programs, so that they sound like academic courses rather than therapy. *Communication Studies*, *Effective Communication*, and *Communication Laboratory* are some examples of likely titles.

The program should emphasize the interactions among speaking, listening, reading, and writing and their effects not only on academic but also on interpersonal and vocational success. Pamphlets, notices, and talks to classes about communication services should focus on how improving language skills helps students succeed in both school and life.

Of course, students who refer themselves must qualify for services, just as students referred from other sources do. Using a self-assessment checklist like the one in Figure 13-2 can be an effective screening measure for adolescent self-referrals. If the student checks only a few of the areas on the form, the student's problem may not qualify him or her for intervention services. The clinician might talk briefly with such students to give them focused tips on study skills or peer communication or in whatever area they were feeling inadequate. Alternatively, the SLP might refer these students to the school counselor.

CRITERION-REFERENCED ASSESSMENT AND BEHAVIORAL OBSERVATION IN THE ADVANCED LANGUAGE STAGE

We've talked several times about the fact that standardized tests are needed to establish eligibility for services but are limited in their ability to serve as a basis for intervention planning. This principle still holds at the advanced language level. Criterion-referenced assessments and structured behavioral observations form the bulk of the assessment procedure at this stage. The errors and difficulties seen in the speech and writing samples we collect early in the assessment can point us toward the kinds of criterion-referenced evaluations we will want to complete. Let's look at the major areas of development of advanced language and give some ideas for criterion-referenced procedures to use to examine each one. Remember, though, that it probably won't be necessary to assess all areas for all students. Standardized testing, referral information, and the conversational and writing samples we collect can be used to focus the evaluation. And because our students at advanced language levels almost always have histories of assessment and intervention, this information, too, is important in focusing on areas for assessment.

The first thing we need to do after establishing a student's eligibility for services is to decide whether the student is functioning in the advanced language stage or at a lower level. In the L4L stage, we used a short conversational sample to place the student in a general level of development to plan further assessments. This sample can be useful in the advanced language stage, too. A good supplement to the conversational sample, though, is a short sample of the student's writing. We can ask the student to come to the first assessment session with a sample of a homework assignment or an English composition recently completed. Examining these artifacts can help us to decide whether the student has achieved some of the basic skills of the L4L stage, such as the ability to write more-or-less grammatical sentences, to spell with some degree of accuracy, and to organize a sequence of thoughts and express them somewhat comprehensibly. We'll talk more about detailed analysis of writing skill later. It's important to remember, too, that adolescents referred for assessment may have significant difficulty with written expression, even when they are functioning at the advanced language stage of oral expression. However, looking at a writing sample briefly as part

of the preassessment decision-making can help to decide whether advanced language tasks are relevant for this student or whether the student is functioning more at an elementary level of oral and written language.

Students at an L4L level will probably make a few grammatical errors in speech and will display writing samples that are brief; contain short, simple sentences; show difficulty with the mechanics of spelling, capitalization, and punctuation; have little or no organization or macrostructure; and show sparse expression of ideas. In other words, their writing will be like that of a second- or third-grader rather than a secondary student. Students functioning at advanced language stages may display word-finding problems, limited vocabulary, and pragmatic errors in conversation, but will have mastered basic oral language rules. Their writing will be less mature and sophisticated than that of their peers but will display some competence with mechanics, some limited use of complex sentences, and some degree of organization and semantic content (Dockrell, Lindsay, & Connelly, 2009; Scott, 1999). For students appearing to function at L4L stages in the secondary school years, assessment can focus on areas outlined in Chapter 11 along with some assessment of functional skills needed to survive in the academic and vocational environments that students must face. For students who have basic oral and written language skills, assessment of areas of advanced language development can proceed. Let's look at some of the areas that can be a part of this assessment.

Semantics

The Literate Lexicon

Nippold (2007) discussed the importance of the development in adolescence of a "literate lexicon," the words needed to understand and produce language near the literate end of the oral-literate continuum. Table 13-1 provides some examples of the kinds of words and morphemes secondary students typically encounter in the academic curriculum. Many of these words will be new to our clients, and will have to be learned in order to participate in this curriculum. Nippold (2007) highlights three main avenues of vocabulary learning for older students:

- Direct instruction
- Contextual abstraction
- Morphological analysis

Direct instruction may take place in the mainstream classroom, but, unfortunately, students with LLD may not be able to absorb all the information presented there. In addition, they may have a smaller base of lexical knowledge to begin with, so that many of the words they do not know will be assumed to be familiar and not directly taught. It will be important, then, to assess students' ability to acquire new words using the other two learning strategies available to them.

Contextual abstraction (Sternberg, 1987) is the ability to infer the meaning of a new word from the linguistic cues that accompany it. We can assess students' ability to do this by having them read (or listen to the clinician read) a passage that has some difficult, unfamiliar words. We can ask students to guess what the difficult words mean and to tell why they think so. Students who have trouble using context to infer meaning in these activities can be given practice in doing so as part of the intervention program.

TABLE 13-1 Examples of Words and Morphemes Typically Encountered in the Secondary Curriculum

Example Words	
MORPHEMES	
Prefixes:	
Anti-	anticlimax, antifreeze, antiaging
Co-	coauthor, coexist, copilot
Dis-	disability, dishonest, distrust
Mal-	maladaptive, malpractice, malnourished
Mis-	misfire, mislead, mismatch
Multi-	multicultural, multimedia, multisensory
Non-	nonfat, nonverbal, nonprofit
Pre-	precautions, pre-existing, prefabricate
Re-	rebuild, recall, refinance
Sub-	subgroup, submarine, substandard
Un-	unable, unavailable, uneasy
Noun Suffixes:	
-cide	genocide, germicide, homicide
-ism	criticism, symbolism, journalism
-ist	activist, colonist, pathologist
-ology	biology, geology, herbology
Verb Suffixes:	
-ate	activate, evaluate, gravitate
-ize	colonize, fertilize, naturalize
Adjective Suffixes:	
-able	enjoyable, manageable, testable
-ese	Japanese, legalese, motherese
-ful	artful, painful, pitiful
-less	ageless, flawless, matchless
-some	bothersome, wearisome, wholesome
Adverb Suffixes:	
-fully	gratefully, peacefully, skillfully
-ly	angrily, quietly, sadly
CURRICULAR AREAS	
Math	additive, algebraic, associative, commutative, factorization, tessellation
Science	alkaline, bimetallic, crystalline, echolocation, endothermic, ferromagnetic, molecular, unsaturated
Social Studies	circumnavigate, domesticate, federalism, imperialism, mercantilism, nationalism, pilgrimage, subcontinent

Adapted from Nippold, M. (2007). *Later language development: School-age, children, adolescents, and young adults* (3rd edition), (pp. 50-55). Austin, TX: Pro-Ed.

Morphological analysis can be assessed in a similar way; that is, we can give students a list of words such as

copilot	misadventure
counterattack	nondairy
herbicide	reform
illegible	predate
irresponsible	unaware

They can then be asked to tell what the words mean and how they know. If they cannot demonstrate use of morphological analysis strategies in this brief exercise, such strategies might be targeted as part of the vocabulary intervention program.

Nippold (2007) identified several categories of words particularly important for the literate lexicon. These include nouns for technical and curriculum activities (*salutation, oppression, circumference, proton*). Words like these can be identified and assessed using curriculum-based methods such as those discussed in Chapter 11. Artifact analysis is a particularly useful format here. Students' written work can be analyzed to see which curricular vocabulary items are misused or avoided. These words can be focused on in the intervention program.

Another class of words in the literate lexicon is verbs used in discussions of spoken and written language interpretation and for talking about cognitive and logical processes (Nippold, 2007). They include verbs that refer to both metacognitive (*remember, doubt, infer, hypothesize, conclude, assume*) and metalinguistic (*assert, concede, imply, predict, report, interpret, confirm*) activities. Verbs with presuppositional aspects in their meaning also would be included in the category. Two types of verbs have presuppositional components: *factives* and *nonfatives*. Factive verbs presuppose or assume the truth of the following clause ("We regret that your application is denied."). They include examples such as *know, notice, forget, and regret*. With nonfactive verbs, the truth of the following proposition is uncertain ("I suppose my application was denied.") They include verbs such as *think, believe, figure, say, suppose, and guess*.

Nippold (1998) reported that these verbs continue to develop and expand in meaning in the vocabularies of normally developing adolescents. There is good reason to believe, then, that they can cause difficulties for students with LLD. Assessment of vocabulary with standardized tests can be supplemented with informal assessment of verbs like these, since they are likely to cause problems and are necessary to establish competency with literate language. Here a metalinguistic approach to assessment can be used. The clinician can simply present a list of curriculum-related words gathered from classroom teachers and ask clients to tell what they know about them. A "Knowledge Rating Checklist" like the one in Table 12-1 can be helpful. Students can fill out the chart for each word on the clinician's list, and the clinician can work with students on words whose meanings are shaky for them.

Scott (2010) suggests using qualitative analysis of literate vocabulary. She reports that asking college students to identify "high level" words in the writing of secondary students resulted in high levels of agreement, even with only minimal instruction as to what constituted a "high level" word (i.e., find words that are more adult-like and less frequent). You might like to try your hand at identifying the "high level" words in the passage in Box 13-2 (our answers appear in Appendix 13-3). Another qualitative metric for assessment of literate vocabulary is simply word length. Scott suggests using word processing software that calculates the average number of characters/word as one index. Similar software can also be used to identify words that are *not* among the most common 1000 words in an on-line word frequency list (e.g., Word Frequency Text Profiles [Edict, 2008]). These counts can be used both to compare values between a client's writing sample (or speech sample transcribed by the clinician), and a similar sample from several peers. They can also be used to track change in vocabulary over the course of an intervention program.

BOX 13-2 Sample for "High-Level" Word Analysis

Identify the "high level" words in the following passage

"Although numerous studies have examined the ability of children and adolescents with language impairments . . . to read and write expository discourse, very few have examined listening comprehension and verbal production of expository discourse. As previously noted, this is a critical area of investigation in light of the fact that . . . adolescents are required to comprehend and produce expository discourse on a daily basis in order to achieve academic success in . . . school . . ."

—Ward-Lonergan, J. (2010), pp. 157

Word Retrieval

Research suggests that 25% to 50% of children with LLD have problems with word finding (Messer and Dockrell, 2006). When we talked about word-finding difficulties for children in the L4L stage, we discussed the fact that a large discrepancy between scores on a receptive vocabulary test and an expressive vocabulary test is one signal of this problem. At the advanced language level, tests such as the *Receptive One-Word Picture Vocabulary Test—2000 Edition* (Brownell, 2000) and the *Expressive One-Word Picture Vocabulary Test—2000 Edition* (Brownell, 2000), as well as the *Peabody Picture Vocabulary Test—IV* (Dunn & Dunn, 2006) and the *Expressive Vocabulary Test—2* (Williams, 2006), might be used for this purpose. Tests specifically designed to assess word retrieval include the *Rapid Automatized Naming Task* (Wolf & Denckla, 2005) and the *Test of Adolescent/Adult Word Finding* (German, 1990). Teacher report of word-finding problems or referral checklists would be another. A clinician-made form, like those we've discussed, or a commercially available one, like German and German's (1993) *Word-Finding Referral Checklist* can be used. German and Newman (2007) suggest further that oral reading assessments that include unusual or unfamiliar words be used, followed with recognition responses (e.g., multiple choice) for words missed in the oral reading, since children with word finding difficulties can often recognize words that they have difficulty retrieving on their own. We also might hear some word-finding problems in the short conversational interaction with which we began the assessment session. In fact, Tingley, Kyte, Johnson, and Beitchman (2003) suggest that it is always important to supplement single-word testing with a conversational sample in assessing word finding, since their research suggests only weak relationships between single-word tests and disruptions in conversational speech.

Word Definitions

We use the standard expressive and receptive vocabulary tests just discussed to give a general picture of vocabulary development. Crais (1990), however, emphasized the limitations of these tests in that they give a "yes or no" answer as to whether a particular word is "known," when in reality there are many levels of "knowing" involved in lexical acquisition. Having a partial representation of the meaning of a word is not adequate, for example, to produce a complete definition of the word.

Using word definition tasks to assess advanced language stages is appropriate, since the ability to define words is generally acquired by the time normally developing children reach this stage (Nippold,

2007). Several tests of adolescent language have definition subtests that can be used as criterion-referenced assessments. These include *The Comprehensive Receptive and Expressive Vocabulary Test—2nd Edition* (Wallace & Hammill, 2002), *The Test of Word Knowledge* (Wiig & Secord, 1992a), and *The Word Test 2—Adolescent* (Huisinigh et al., 2005). We also can simply ask students to give definitions for words derived from textbook or literature selections that they are studying in class. We can assess these informally elicited definitions using the following scoring rubric suggested by Nippold, Hegel, Sohlberg, and Schwarz (1999) and Pease, Gleason, and Pan (1993):

- **2 points:** contains an accurate superordinate term and describes the word with one or more accurate characteristics (X is a Y that Z; a robin is a bird that has a red breast)
- **1 point:** contains an accurate superordinate term but does not describe the word accurately (X is a Y; "happiness is a feeling"); describes the word with one or more accurate characteristics, but does not contain an accurate superordinate term (X is when Y; "happiness is when you're glad")
- **0 points:** attempts a response, but it does not contain an accurate superordinate term or accurate description/characteristic; no response

Nippold and Haq's (1996) results suggest that students in sixth grade should receive at least one point for more than half the words presented; those in ninth grade should receive at least one point for more than 75% of the words presented, and those in twelfth grade should receive 2 points for more than half the words presented.

If students have difficulty producing definitions, then we should work on enhancing their understanding of the meanings and uses of the words in the intervention program. We should also provide students with experience in word definition tasks as part of the program. These experiences include looking up, reading, reproducing, and eventually generating definitions for the words targeted in the treatment program.

Word Relations

To be competent with words, we need to know more than what the words mean. It also is necessary to know how words are related. Students at advanced language levels need to be able to consider that words may have more than one meaning. They have to be able to substitute words with similar meanings to avoid using the same word over and over again in their writing. They need to compare and contrast word meanings to choose the best word to express their idea. They also must choose correct spellings for words that are pronounced similarly (*their*; *there*) and use context to decide which meaning is being expressed by a spelling with more than one pronunciation ("I *read* the paper every day," "I *read* the paper yesterday").

Again, subtests of standardized instruments are available to use as criterion-referenced assessment for looking at these kinds of skills. *The Clinical Evaluation of Language Fundamentals—4* (Semel, Wiig, & Secord, 2003) has sections testing semantic relationships, as does the *Detroit Test of Learning Aptitude—4* (Hammill, 1998), the *Test of Language Competence—Expanded Edition* (Wiig & Secord, 1989), the *Test of Language Development—Intermediate—III* (Hammill & Newcomer, 2008), the *Woodcock Language Proficiency Battery—Revised* (Woodcock, 1991), and *The Word Test 2—Adolescent* (Huisinigh et al., 2005).

Understanding of multiple meanings can be assessed with definition tasks. We might give a student a word, such as *run*, that has several common meanings and ask the student to give one

definition, and then give another one. We can observe whether students are able to generate alternative meanings without support. If they can't, some dynamic assessment can be tried, in which we give "clues," such as "Tell me what *run* means when you're talking about a race. What does it mean when you're talking about an election?" If these clues help students who were at first unable to generate multiple meanings, a learning-strategy approach might be used to help the student use self-questioning to determine whether multiple meanings of a word need to be invoked, to understand jokes, for example. If the "clues" don't help, more direct attention to words with multiple meanings might be provided in the intervention program.

Artifact analysis is another way to obtain criterion-referenced assessment of word-relation skills. Going over a student's writing to look for inability to substitute words with similar meaning, so that the same word recurs frequently, can clue us in to the need to work on synonyms and develop sets of synonymous words in the intervention program. Other usage errors in writing, such as writing *red* when the student means *read*, are also clues to the need for work in the area. So are misuses of words, such as using *assess* when *access* is meant.

Other curriculum-based forms of assessment also can be used. These would include reading a passage with a student, from a classroom literature selection, for example. The clinician could ask the student to substitute a synonym for several of the words, ask for antonyms for words, have the student compare and contrast the meanings of related pairs of words in the passage, and ask the student to generate other meanings for a word in the passage that could have more than one. For example, the clinician might present the following passage from *The Call of the Wild* (London, 1963, pp. 3-4):

Buck did not read the newspapers, or he would have known that trouble was brewing, not alone for himself but for every tidewater dog . . . Because men, groping in the Arctic darkness, had found a yellow metal, and because steamship and transportation companies were booming the find, thousands of men were rushing to the Northland . . . These men wanted dogs . . . to toil . . .

You might ask the student to supply a word that could be substituted in this context for *brewing*, *groping*, or *booming*. You could ask what *brewing* means in this context and what else it could mean, what the opposite of *Arctic* or *toil* is (*tropical*, *play*), and how the words *Arctic* and *Northland* are related in meaning. All these activities, of course, require a good deal of metalinguistic skill. If the student cannot perform them, the failure may be a result of poor metalinguistic ability rather than a lack of lexical knowledge. Still, both levels of knowledge, lexical and metalinguistic, are necessary to be fully competent with language at the literate end of the continuum. Assessing these skills with metalinguistic tasks will give us an idea of whether students can handle the demands of the metalinguistics of word relations. If they can't, practice with such activities in a curriculum-based intervention program will improve both lexical and metalinguistic ability.

Figurative Language

As we've discussed, the ability to use language in nonliteral ways is one of the important developments of the advanced language period. Both Cain and Towse (2008) and Rinaldi (2000) showed

that children with LLD had difficulty inferring the meaning of unfamiliar figurative language forms in both oral and written contexts. A few adolescent test batteries have figurative-language processing subtests. The *Test of Language Competence—Expanded* (Wiig & Secord, 1989) and the *Comprehensive Assessment of Spoken Language* (Carrow-Woolfolk, 1999) are two examples. We also can use curriculum-based assessment to document deficits in this area. Literature selections from the student's English class can be analyzed by the clinician for similes, metaphors, idioms, and proverbs. These figures can be presented in context to the student, who is asked to provide an interpretation. We can look at our *The Call of the Wild* (London, 1963, pp. 4-6) example again:

Buck lived in a big house in the sun-kissed Santa Clara valley . . . And over this great domain Buck ruled . . . for he was king . . . He had a fine pride in himself, was ever a trifle egotistical as a country gentleman . . .

A clinician could ask the student to decide whether the sun really kissed the valley and whether Buck were really a king. The student could be asked to explain what these metaphors did mean and why the author might use them. A similar procedure could be used for the simile *egotistical as a country gentleman*. Again, these metalinguistic activities require more than basic comprehension of the figurative language forms. But these activities are the kind that will be demanded by the curriculum in which students must function. If assessment of figurative language in contexts like these indicates weakness on the part of the student, intervention that encourages work with figurative forms at a variety of levels can be instituted. In general, figures that refer to concrete objects ("The early bird catches the worm") are easier than those with abstract words only ("Two wrongs don't make a right"). Familiar sayings ("Too many cooks spoil the broth") are easier than unfamiliar ones ("Two captains will sink a ship"). However, Nippold and Taylor (2002) showed that there is a developmental progression in the understanding of idioms from childhood to adolescence so that the familiarity of the idiom becomes less important in determining its difficulty for older students, as they gain greater skill in using context to determine meaning. Qualls and O'Brien (2003) showed that context generally facilitates idiom comprehension (although less for students with LLD than for typical students), so that presenting idioms within a story setting may help students in determining their meaning. We can give students practice hearing, reading, interpreting, talking about, and creating figurative forms in a variety of contexts to increase both comprehension and metalinguistic awareness of these modes of expression.

Qualls and O'Brien (2003) selected a list of 24 idioms that represented a range of familiarity to speakers of English. These are presented in Table 13-2. Students who have difficulty inferring and explaining the meaning of common figures in tasks such as these can benefit from exposure to and metalinguistic discussion about idioms in the intervention program that employs contexts in which the students are encouraged to infer the idiom's meaning.

Semantic Integration

We talked at length in Chapter 11 about assessing semantic integration in the L4L period. Many of the same procedures, using grade-appropriate material, can be used in the advanced language stage

TABLE 13-2 Common Idioms in English, at Three Levels of Familiarity

Low Familiarity	Moderate Familiarity	High Familiarity
Take down a peg	Go into one's shell	Let off some steam
Vote with one's feet	Strike the right note	Go around in circles
Paper over the cracks	Keep up one's end	Put one's foot down
Hoe one's own row	Cross swords with someone	Breathe down someone's neck
Talk through one's hat	Blow away the cobwebs	Put their heads together
Lead with one's chin	Make one's hair curl	Skate on thin ice
Rise to the bait	Throw to the wolves	Beat around the bush
Have a hollow ring	Go against the grain	Read between the lines

Adapted from Nippold, M., Taylor, C., & Baker, J. (1996). Idiom understanding in Australian youth. *Journal of Speech and Hearing Research*, 39, 442-447; Qualls, C., & O'Brien, R. (2003). Contextual variation, familiarity, academic literacy and rural adolescents' idiom knowledge. *Language, Speech and Hearing Services in Schools*, 34, 69-79.

as well. The Inference subtest of the *California Test of Mental Maturity* (Sullivan, Clark, & Tiegs, 1961) and of the *Test of Language Competence—Expanded Edition* (Wiig & Secord, 1989) also can be used as a criterion-referenced procedure to assess this area. Kamhi and Johnston (1992) devised the Propositional Complexity Analysis, which looks at the semantic content in spontaneous speech samples. This procedure can provide an additional means of assessing how the client combines ideas in discourse.

Verbal Reasoning

The language of thinking—used to solve problems, to plan, organize, predict, speculate, and hypothesize—becomes a major function of communication in the advanced language stage. The ability to use language to extend thinking, reflect on thinking, and entertain several cognitive viewpoints at once are hallmarks of formal operational thought. Students who cannot engage in this kind of language use will be at a distinct disadvantage in many areas of the curriculum, including science, mathematics, and in social studies topics such as history and geography. Several standardized tests assess verbal reasoning. These include the *Cornell Reasoning Tests* (Ennis et al., 1965), and the *Matrix Analogies Tests* (Naglieri, 1985). Subtests of some comprehensive batteries also can provide helpful criterion-referenced information on a student's facility with verbal reasoning. The *Woodcock Language Proficiency Battery—Revised* (Woodcock, 1991), the *Illinois Test of Psycholinguistic Abilities—3rd Edition* (Hammill, Mather, & Roberts, 2001), *Wechsler Intelligence Scale for Children—4th Edition* (Wechsler, 2005), *Differential Aptitude Test—5th Edition* (Bennett, Seashore, & Wesman, 1990), and the *Test of Problem Solving—2* (Dawes et al., 2007) have verbal reasoning sections. Students who have significant difficulties in these areas are helped by working on analogies, syllogisms, and using language to talk through logical problems in the intervention program. Nippold, Ward-Lonergan, and Fanning (2005) also suggest using persuasive writing contexts to scaffold students' verbal reasoning abilities.

Syntax and Morphology

Comprehension

Students at advanced language stages should be able to comprehend virtually all the sentence types in the language and should no longer use comprehension strategies for processing difficult sentences. Several language batteries for adolescents have receptive syntax

subtests that can be used as criterion-referenced assessments. Some examples include the *Clinical Evaluation of Language Fundamentals—4* (Semel, Wiig, & Secord, 2003), the *Test of Adolescent and Adult Language—4* (Hammill, Brown, Larsen, & Wiederholt, 2007), and the *Test of Language Development—Intermediate—3* (Hammill & Newcomer, 1997). If deficits are identified on receptive syntactic testing or if comprehension strategy use is seen to persist on these measures, intervention should include an input component, as we've discussed for earlier stages of development. Activities aimed at eliciting production of advanced language forms should be supplemented with literature-based and curriculum-based script activities. These activities should provide intensive exposure in context to the forms for which comprehension is "wobbly," and metalinguistic discussion about their meaning to build the comprehension base for these structures.

Production

You probably are familiar by now with the arguments about using a language sample to assess syntactic production. Sampling how a student uses language to communicate in real interactive situations provides the most ecologically valid assessment of productive syntax. But what kind of sample should we elicit from a student in the advanced language stage? The use of forms toward the literate end of the oral-literate continuum is the major area we are interested in assessing at this age range. Hadley (1998) suggested that contextual factors are especially important for selecting a sampling situation at this stage. Many interactive situations, such as peer conversations or even informal discourse with adults, do not elicit the advanced forms we are interested in sampling. So we want to select a context that gives us a good chance of observing some of these advanced language forms. This suggests that communication tasks near the literate end of the continuum may be a better source of information on these variables than conversation.

Sampling Contexts for Literate Language

Many researchers looking at the syntax of advanced language have used narrative tasks (Blake, Quartaro, & Onorati, 1993; Hadley, 1998; Klecan-Aker & Hedrick, 1985; Morris & Crump, 1982; Nippold, 1998; O'Donnell, Griffin, & Norris, 1967; Scott & Stokes, 1995; Scott & Windsor, 2000; Ukrainetz & Gillam, 2009; Wetherell, Botting, & Conti-Ramsden, 2007). These sampling contexts have several advantages. First, much of the data on syntactic production in adolescents is based on these kinds of tasks. Using them in assessment, then, makes the client's sample more directly comparable to those in the literature. Second, narrative

samples also can be analyzed for other aspects of advanced language, such as cohesion, use of literate lexical items, and narrative stage. Finally, narratives from students at this developmental level have been shown to contain more complex language forms than conversation does (Hadley, 1998). Narratives are, then, more likely to provide examples of the literate language that we hope to elicit. For these reasons, narratives provide one important context for speech sampling with adolescents.

A second important sampling context for adolescent oral language is exposition, or explanation. Nippold, Mansfield, Billow, & Tomblin (2008) showed that expository, but not conversational, samples, differentiated adolescents with LLD from those with typical development, and T-unit length and complexity were greater in expository texts than in conversation for both groups. Both narrative and expository samples can be helpful for getting a picture of the most complex syntax a student has available.

Finally, it will be important to contrast syntactic complexity in oral samples with that in written contexts. For this reason, we will want to examine syntax in the student's writing, as well as in speech. Let's talk about how we might elicit each of these kinds of language samples.

Eliciting Narrative Samples

As we discussed when we talked about assessing narrative in younger children, there are several ways to elicit these samples. Weiss, Temperly, Stierwalt, and Robin (1993) suggested using cartoon strips from the newspaper, with the words "whited-out," to elicit narrative samples. Ukrainetz et al. (2009) used a short picture sequence of a common event, such as having trouble getting to school on time. Wordless picture books, such as *A Boy, a Dog, and a Frog* (Mayer, 1967), or films, filmstrips, or videos based on them (for example, *Frog, Where Are You?* [Osbourne & Templeton, 1994]) can also be used, by asking the student to first look through the pictures and then to tell the story as if reading to a child for whom he or she is baby-sitting. Hadley (1998) suggested a two-step procedure. Students are first asked to retell an episode from a story after looking at pictures or a film of it. They then are asked to generate an ending for the story. This procedure provides an opportunity for clinicians to see whether students do better (as we would expect) when some visual support is provided, and how a student is able to organize and generate a story episode independently.

Eliciting Expository Samples

Nippold et al. (2008) used an interview about favorite games to get adolescents to elicit exposition. Nippold, Mansfield, Billow, & Tomblin (2009) used an addition expository task involving an explanation of peer conflict resolution. The prompts used for both these tasks appear in Box 13-4.

Using Written Samples to Assess Syntactic Complexity

Because of the importance of written expression at the advanced language stage, it is wise to assess syntactic and morphological production in written as well as oral samples. Windsor, Scott, and Street (2000), for example, showed that middle schoolers with LLD were more likely to make morphological errors in their written language samples than in spoken language samples. Beers & Nagy (2009); Nippold, Mansfield, and Billow (2007); and Nippold, Ward-Loneragan, and Fanning (2005) all reported on the use of persuasive writing as a context likely to evoke higher levels of syntactic complexity than other sampling contexts in adolescents. So it seems that asking students to write, or share a written sample from a curriculum area that attempts to persuade is a valuable piece of information about students' maximal levels of syntactic complexity. And getting both a written and a spoken sample using the same sampling context—whether it be a personal narrative, retelling a film plot, narrating a picture book or comic strip, or making a persuasive argument—can be valuable for looking at the ways in which oral and written skills compare.

Nippold (2007) and Scott and Stokes (1995) suggested analyzing three aspects of syntactic and morphological production at the advanced language stage: T-unit length, use of subordination, and use of literate language structures. All three have been analyzed in the literature in both spoken and written language samples of students at advanced language levels (Scott, 2005). Let's see how we might apply these three analyses to samples of spoken and written language that we collect from our adolescent clients.

T-Unit Length

We talked in Chapter 11 about the use of T-units to analyze speech samples from children in the elementary years. We use this method to correct for long, run-on sentences that could bias scoring. A T-unit, remember, is one main clause with all the subordinate clauses and nonclausal phrases attached to or embedded in it. All coordinated clauses are separated out into separate T-units, unless they contain a co-referential subject deletion in the second clause ("She swings and misses"). Clauses that begin with the coordinating conjunctions *and*, *but*, or *or* would be considered to comprise a new T-unit.

Loban (1976) documented small but steady increases in T-unit length in words during adolescence, with bigger changes in writing than in speech. Table 13-3 gives the values Loban reported for T-unit lengths in words for oral and written samples from students from sixth through twelfth grades. Notice that T-units for adolescents in the literature have been calculated in words, not in morphemes. When we do T-unit analyses for adolescents and want to compare them to published norms, then, we need to remember to use words rather than morphemes as the unit of analysis.

TABLE 13-3 T-unit Lengths in Words for Spoken and Written Samples Collected from Adolescent Students

Grade	Average T-Unit Length in Words Produced in Spoken Samples	Average T-Unit Length in Words Produced in Written Samples
6	9.8	9.0
8	10.7	10.4
10	10.7	11.8
12	11.7	13.3

Adapted from Loban, W. (1976). *Language development: Kindergarten through grade twelve*. Urbana, IL: National Council of Teachers of English.

We should note another important feature of the information in Table 13-3. In early adolescence, in sixth and seventh grades, oral T-unit lengths are greater than those produced in written samples. In mid-adolescence, at eighth or ninth grade, the oral and written samples have about equal T-unit lengths. By late adolescence, in about tenth grade, though, written samples contain longer T-units than do oral ones, and this difference increases up through twelfth grade. It is useful, then, to use T-unit length to document this important shift. When sampling oral and written expression at these age levels, it will be important, particularly for students in mid- to late adolescence, to determine whether T-unit length in written production is catching up to and eventually exceeding that of oral language. If it is not, we need to be sure to augment work on advanced oral language forms with activities aimed at increasing the complexity of written language as well. But it is also important to remember the importance of sampling context, and that several studies by Nippold and colleagues (2007, 2008, 2009) showed that more demanding expository and persuasive contexts elicit longer T-units, in both speech and writing.

Box 13-3 contains a sample of an oral narrative describing a movie seen by an adolescent student, “Charlie.” Why not try dividing it into T-units and computing average T-unit length in words for this sample? Our analysis appears in Appendix 13-4. You may want to consider whether Charlie’s T-unit length in spoken narrative is appropriate for a tenth-grader.

Clause Density

Scott and Stokes (1995) suggested another index of syntactic complexity that can be used to assess adolescent language samples: an index of the density of clauses within sentences, often referred to as the subordination index. They define clause density as “a ratio of the total number of clauses (main and subordinate) summed across [T-units], and divided by the number of [T-units] in a

sample” (p. 310). In other words, if a T-unit contains just one main clause, it receives a clause count of 1. The T-unit from Charlie’s sample, “It was for monkeys and chimpanzees,” contains just one main clause. A T-unit such as, “Then after they graduated, they took them into this plane,” would receive a clause count of 2: one for the main clause, “they took them into this plane,” and one for the adverbial clause, “then after they graduated.” The T-unit, “There was a boy who was about 21 who stole a plane with a woman and champagne in the cockpit,” would receive a clause count of 3: one for the main clause “there was a boy,” one for the relative clause “who was about 21,” one for the relative clause “who stole a plane with a woman and champagne in the cockpit.”

The number of clauses for each T-unit in the sample would be summed, then divided by the number of T-units, to obtain the subordination index for the sample. Nippold (1998) reported values for Loban’s (1976) study of subordination in speech and writing of secondary school students. These appear in Table 13-4. Notice again that in early adolescence, the subordination index is higher in speech than in writing. In mid- to late adolescence, the values in written samples are similar to or slightly higher than those seen in speech. Note, too, that the increases in this score throughout adolescence are very small, suggesting that we should not expect to see big changes in this measure through the secondary school years. Nippold et al. (2005) and Scott (2005) remind us, too, that the use of subordination is highly dependent on the situation and audience. That’s why it is especially important to choose a sampling context that falls near the literate end of the continuum if we are looking for more advanced sentences.

To interpret clause density analysis, a rule of thumb would be to see whether the subordination index is at least 1.3 in spoken samples for all adolescents and whether the index in written samples is at least equal to the index in a spoken sample for students in

BOX 13-3 Oral Narrative Sample: Retelling of a Movie Plot Produced by “Charlie,” A Tenth-Grade Student

There was a boy who was about 21 who stole a plane with a woman and champagne in the cockpit, and then he got court-martialed for that and then they sent him to a research study. It was for monkeys and chimpanzees. They taught them how to fly, and then what they would do is to have three classes. White would be a freshman, blue a junior, and red a senior and they would teach them how to fly. Then after they graduated, they took them into this plane. There’s this one area, called the radiation area and they put them in a simulator and exposed them to radiation treatment and they wanted to see how long they would fly until they would die and so they could see how long humans could fly if they could pilot their missions if the Russians had an attack on us and then what the boy did is he had a friend, a chimpanzee that knew sign language and he talked to him and he taught the other apes and they were going to kill his friend with the radiation thing. There were these people from the Air Force Patrol and they were watching the studies and he didn’t want them to kill his monkey and so what he did was he called the lady who taught him sign language and she came and they stole a plane with the monkeys in it and they finally escaped.

TABLE 13-4 Subordination Index Figures in Spoken and Written Samples from Secondary School Students

Grade	Average Subordination Index Produced in Spoken Samples	Average Subordination Index Produced in Written Samples
6	1.4	1.3
8	1.4	1.5
10	1.5	1.5
12	1.6	1.6

mid- to late adolescence. If we see subordination indices at these levels, we can conclude that the student's expressive language is of adequate complexity. If the subordination index is close to 1.0 or if the index in a written sample from a student in eighth grade or higher is noticeably less than that of the spoken sample, work on increasing use of subordination in formal speech and writing can be included in the intervention program. Why not try computing a subordination index for Charlie's sample in [Box 13-3](#)?

Use of Literate Language Structures

Scott and Stokes (1995) and Nippold (2007) discussed a variety of syntactic structures that appear with relatively low frequency but serve as markers of an advanced, literate language style. [Table 13-5](#) lists these structures. We can examine the oral and written narrative samples collected from adolescents for the presence of the forms listed in [Table 13-5](#) as one aspect of our assessment. Students who provide several instances of several categories of these markers in a short narrative, expository, or written sample can be considered to be producing adequately complex forms of expression.

Two caveats need to be kept in mind when looking for these higher level structures. First, context is very important in eliciting these forms. They only appear in relatively formal situations (Eckert, 1990), and their use is never obligatory. It is always a matter of making an appropriate choice of form for a particular audience or genre.

Scott and Stokes suggest choosing contexts that involve cognitive planning in order to elicit these forms. Again, narrative is a good example of this kind of planned discourse. To increase the chances of finding some in our narrative samples, we can ask students, "Tell me the story of a movie you saw recently. I haven't seen it, so try to tell the story as clearly as you can. Tell it the way it would sound if I read about it in a magazine." For written samples, we can ask students to "write the story of the movie as if you were writing a book or magazine article about the movie." The Peer Conflict probe in [Box 13-4](#) is also a task that may elicit these forms.

The second warning we need to bear in mind is that these are low-frequency forms. It is not likely that we will find more than a few instances of any of these forms in one short sample. Nippold et al. (2005) reported that 15% to 20% of adolescents' utterances included relative and adverbial clauses, for example, and this result was in the context of persuasive discourse, which tends to elicit higher-than-normal levels of these forms. Nippold et al. (2008) reported that the frequency of use of relative clauses was a somewhat sensitive indicator of the difference between typical students and those with language disorders in an expository task, though not in conversation. Furthermore, a given sample will not contain instances of all the types listed. In this analysis, we are not really looking for the appearance of any one particular structure, but only at whether several examples of these kinds of structures appear. If

TABLE 13-5 High-Level, Low-Frequency Structural Markers of Advanced Syntax

Syntactic Category	Structure	Examples
Morphology	Prefixes and suffixes	<i>Unplanned, replay, helpless, requirement</i>
	Nominalization (noun forms of verbs)	<i>Adaptation, establishment</i>
	Use of past and present participle forms of verbs as adjectives	<i>Her broken CD player; a growing plant</i>
	Later developing conjunctions	<i>Otherwise, instead, after all, only, still, though, anyway, in all, finally, when, because</i>
Noun phrase (NP) elaboration	Adverbial sentence connectives (conjuncts)	<i>Nevertheless, furthermore, therefore, for example, in addition</i>
	NP pre-modification with two or more adjectives	<i>Her cute, black puppy</i>
	NP post-modification with:	
	Past participles	<i>A tree called the willow</i>
	Present participles	<i>A machine controlling his brain</i>
	Infinitives	<i>A good way to fish</i>
	Appositives	<i>Mr. Smith, the mail carrier</i>
	Relative clauses	<i>A woman who lives nearby</i>
	Elaboration	<i>Dogs such as Collies, Spaniels, and German Shepherds</i>
	Prepositional phrases	<i>The cyclist in the lead position</i>
Verb phrase (VP) elaboration	Multiple auxiliaries	<i>We could have missed it</i>
	Perfect aspect	<i>We had been studying all night</i>
	Passive voice	<i>The house was designed by a famous architect</i>
Adverbial use	With adjectives	<i>extremely large</i>
	Adverbial phrases	<i>Awfully quickly</i>
Complex sentence types	More than one clause type in a sentence	<i>He wants to pass, but he doesn't know how to study</i>
	"Left-branching" clauses (clauses that appear near the beginning of the sentence):	<i>Getting into college won't be hard for Amy to do</i>
	Preposed adverbial clauses	<i>After we study, we'll go for pizza</i>
	Center-embedded relative clauses	<i>The boy who sits behind me in English is cute</i>
	Noun clauses as subjects	<i>Passing Mr. Haywood's class is tough</i>
	Sentences using word order variations for theme and focus, such as cleft sentences	<i>To get a C in biology is an accomplishment</i>
		<i>It was our team that won the game</i>
		<i>The one who got there first was the winner</i>
		<i>What I really want is a different English teacher</i>

Measures of syntax in school-age children and adolescents. *Language, Speech, and Hearing Services in Schools*, 26, 309-317.

BOX 13-4 Prompts for Eliciting Oral Exposition in Adolescents**TASK 1:**

Favorite Game or Sport:

1. Can you tell me about your favorite game or sport?
2. Why is that your favorite?
3. I don't know too much about that. Can you tell me about it? Tell me about the rules, how many people play, what the object of the game is. Tell me whatever you can think of about it, so that someone like me who has never played before would know how.
4. What do you have to do to win this game? Are there some strategies that a good player should know?

TASK 2:

Peer Conflict Resolution:

1. Introduction: Everyone has to work out problems with other people sometimes. I'm going to read you a story about these kinds of problems. Then I'll ask you to tell the story back to me and answer some questions about it.
2. Story: Science Fair
John's teacher assigned him to work with three other boys on a project for the science fair. They decided to build a model airplane that could actually fly. Everyone except Bob worked hard on the project. Bob refused to do anything and just let the others do all the work. This bothered John very much.
3. Please tell the story back to me in your own words. Tell me everything you can remember.
4. Here are some questions to answer about the story:
 - a. What is the main problem?
 - b. Why is that a problem?
 - c. What is a good way for John to deal with Bob?
 - d. Why is that a good way?
 - e. What do you think will happen if John does that?
 - f. How do you think they both will feel if John does that?

Expository discourse in adolescents with language impairments: examining syntactic development. *American Journal of Speech-Language Pathology*, 17(4), 356-366; and Nippold, M. A., Mansfield, T. C., Billow, J. L., & Tomblin, J. B. (2009). Syntactic development in adolescents with a history of language impairments: a follow-up investigation. *American Journal of Speech-Language Pathology*, 18(3), 241-251.

they do, and findings on T-unit length and subordination index confirm the finding, we can conclude that the student has some command of literate syntax. If they do not and findings on T-unit length and subordination yield corresponding information, we can identify a deficit in advanced syntax. If such a deficit is identified, intervention would focus on developing a range of literate syntax forms. Exposing the student to literate language forms in reading material (reading to the student if necessary) will be part of this intervention.

Take a look at Charlie's sample in [Box 13-3](#). Try making a list of the literate language structures from Scott and Stokes's list in [Table 13-5](#) that appear in the sample. What would your assessment of Charlie's use of high level structures in this sample be? Our list is in [Appendix 13-4](#). Looking across the three measures of expression computed for this sample, how would you rate Charlie's syntactic complexity? Our computation and evaluation are given in [Appendix 13-4](#). [Figure 13-3](#) presents a sample of Charlie's written expression. Try doing these three measures on the written sample and compare them to the spoken one. What would your conclusion about his expressive syntactic skill be on the basis of this comparison? Our assessment of the written sample appears in [Appendix 13-5](#).

Pragmatics

Pragmatic skills acquired in adolescence, like skills children learn in the L4L stage, function to allow the student to operate in wider social circles and in a greater variety of discourse genres. While the changes that take place in semantic and syntactic development in adolescence are often subtle and need special contexts to be

observed, the pragmatic changes that take place at this time are major and often painfully obvious to the adults who deal with young people in this stage of development. Sarcasm, for example, is one of the new functions of language that emerges in teenagers, often to their elders' dismay. We can look at two areas of pragmatic development that undergo these significant changes in adolescence: *conversational skills* and the expansion of competence in several *discourse genres*.

Conversational Pragmatics

Lapadat (1991) showed that adolescents with LLD performed like younger normally developing children in terms of their pragmatic skills. This work suggested that the flexible use of language finely tuned to interpersonal nuances, which is normally acquired during the teen years, may be lacking for our clients, even when basic semantic and syntactic skills are present. Both Adams (2002) and Gumpel (2007) reported on data that suggests pragmatic problems to be common in many students with a variety of communication and language-learning disorders. Adams (2002) suggested organizing conversational analysis around four major areas:

- Initiation and responsiveness
- Turn-taking and repair
- Topic structure
- Cohesion/coherence

These major aspects of conversation can serve as a starting point for developing a conversational analysis method. However, Reed, Bradfield, and McAllister (1998) reported that, although SLPs believed that discourse management skills were the most important pragmatic areas to address with adolescents, the youngsters themselves believed that language used for empathy and affiliation was

FIGURE 13-3 Charlie's written language sample (tenth grade)

more crucial for positive peer relationships. Turkstra, Ciccia, and Seaton (2003) examined conversational behaviors in typically developing adolescents engaged in 3-minute interactions with peers and found that behaviors occurring at the highest rates were looking at the partner (especially during listening), nodding and showing positive facial expressions, using back-channel responses indicating understanding and agreement (such as “uh-huh” or “yeah”), and giving contingent responses. Behaviors that occurred with very low frequency included negative emotions, turning away, asking for clarification, and failing to answer questions. These findings suggest that we need to be careful about choosing pragmatic targets in this age range. That is, while focusing on discourse structure and content aspects of conversation are important, these areas should be supplemented by a look at the use of appropriate paralinguistic behaviors in peer interactions. Moreover, we need to help teens find ways to express empathy and establish affiliation through conversation. Again, involving the student in the assessment process is a good way to keep priorities on track. And observing a peer-to-peer conversation, even a short one, such as Turkstra et al. used, can provide especially useful information. It is also important to know that Turkstra (2001) showed that there were significant differences in conversational behaviors of students with LLD when talking to adults as opposed to peers.

Using a general pragmatic assessment, such as Prutting and Kirchner's (1983) *Pragmatic Protocol* (see Figure 8-14), Damico's *Systematic Observation of Communicative Interaction* (1992), Bedrosian's (1985) *Discourse Skills Checklist* (see Figure 11-7), or Bishop's *Children's Communication Checklist* (2003) may point to some areas of difficulty for adolescents with LLD. But the specific deficits most likely to cause problems for this age group are often not represented on more global scales designed for younger children.

Larson and McKinley (2003a) designed a conversational assessment specifically for clients in the advanced language stage. Their *Adolescent Conversational Analysis* looks at linguistic and paralinguistic features and examines use of communicative functions and conversational rules. Figure 13-4 provides an abbreviated version of Larson and McKinley's procedure, which can be used to analyze an unstructured conversation between the adolescent and a familiar partner. Larson and McKinley suggested looking at several samples of the client interacting with different partners in various settings to get a complete picture of conversational competence.

Another method that can be considered for assessing conversational skill is Landa et al.'s (1992) *Pragmatic Rating Scale* (PRS). This measure was designed for use in a conversational context with adult family members of children with autism and related conditions. Paul et al. (2009) report that PRS scores from adolescents with typical development differ significantly from those of high functioning teens with autism spectrum disorders. Subjects in the typical group uniformly scored 5 or lower on this measure. These data suggest that scores above 6 on the PRS are likely to be indicative of a deficit in pragmatic ability. A rating form for the PRS appears in Figure 13-5. Additional assessments that can be considered include Bishop et al.'s (2000b) *Assessment of Language Impaired Children's Conversation* and Rinaldi's (2001) *Social Use of Language Programme*.

Looking at conversational skill in free speech interactions can yield valuable information. This method is, however, extremely time consuming and labor intensive. When doing initial evaluations to determine whether conversational pragmatics needs to be targeted in the intervention program, there are some shortcuts to conversational analysis that can give us useful information. These include norm-referenced instruments, structured behavioral observations, and nonstandardized role-playing procedures.

Norm-Referenced Conversational Assessments

Russell and Grizzle (2008) reviewed 24 instruments aimed as assessment of pragmatic language skills, including questionnaires, checklists, and portions of standardized tests. They identified the following as having the highest content validity:

- Children's Communication Checklist—2 (Bishop, 2006)
- Observational Rating Scale and Pragmatic Checklist from the Clinical Evaluation of Language Fundamentals—4th Edition (Semel, Wiig, & Secord, 2004)

- Teacher Assessment of Student Communicative Competence (Smith, McCauley, & Guitar, 2000)

Several norm-referenced instruments are available for probing pragmatic skills at the adolescent level. These include the *Test of Language Competence—Expanded Edition* (Wiig & Secord, 1989), the *Comprehensive Assessment of Spoken Language* (Carrow-Woolfolk, 1999b), the *Test of Pragmatic Language—2* (Phelps-Terasaki & Phelps-Gunn, 2007), and the *Test of Problem Solving—Adolescent* (Bowers, Huisinigh, & LoGiudice, 2007). These norm-referenced measures can be helpful for establishing eligibility for students at advanced language stages, who may perform adequately on tests focusing on semantics and syntax. Russell and Grizzle (2008) suggest using measures such as these to identify areas that we may want to examine in structured observations to determine whether intervention in these areas would be of use to the student.

Structured Observations

Adams (2002) suggested that, while natural conversational sampling is the most ecologically valid method, there may be some critical behaviors that simply fail to appear in natural interactions. We must not assume these behaviors are absent from the child's repertoire, simply because they don't appear in a short sample. Brinton and Fujiki (1992) suggested using probes within the interaction to solve this problem. That is, instead of, or in addition to, observing an unstructured peer-to-peer conversation with the client, the clinician can provide stimuli to examine critical aspects of conversational behavior within the interaction and evaluate the client's response to each probe. Table 13-6 presents the probes Brinton and Fujiki suggested. If using probes as a screening measure, students who are unable to respond to these probes appropriately can be given more intensive assessment, using a procedure like Larson and McKinley's (2003a) or Bishop et al.'s to examine a broad range of conversational skills.

Several authors have designed methods of structured observation that can be used to look at conversational pragmatics in the adolescent years. Simon's (1994) *Evaluating Communicative Competence* provides activities for looking at conversational skill in adolescents. Brown, Anderson, Shillcock, and Yule (1984) supplied procedures for examining presuppositional abilities. Adams and Bishop (1990) also provided a framework for looking at conversational exchanges in adolescents. They used pictures of common situations, such as a doctor examining a sick child, a girl

Conversational skill can be assessed in peer interactions.

having a birthday party, and a couple with a broken-down car, and asked students to describe experiences *of their own* that were similar to those in the pictures.

Role-Playing

Role-playing is a third method that can be used to assess adolescent conversational skill. Nippold (2007) discussed the development of two specific skills that contribute to conversational competence in adolescence: interpersonal negotiation strategies and the use of special speech registers for a variety of specific interactional contexts. Both these skills can be examined by creating hypothetical situations for students to act out in role-playing activities.

Negotiation Strategies

The ability to use language effectively to persuade others, to present our point of view, and to resolve conflicts has a great effect on self-esteem, popularity, and successful adjustment in adolescence and adulthood. These skills develop considerably during the secondary school years (Ciccia et al., 2009; Nippold et al., 2005; Nippold et al., 2007; Selman et al., 1986; Whitmire, 2000b) and represent areas in which adolescents with LLD can be expected to have difficulty.

We can use role-playing and hypothetical situations to get a sense of a student's ability to use linguistic negotiation strategies. McDonald and Turkstra (1998); Nippold et al., (2007); and Selman, Beardslee, Schultz, Krupa, and Podorefsky (1986) presented adolescents with

TABLE 13-6 Probes for Eliciting Conversational Behavior in Adolescents

Clinician's Probe	Example	Target Elicited Behavior	Example
Topic initiation	"By the way, I was at the beach over the weekend."	1. Responsiveness 2. Topic maintenance 3. Relevance	"I went skiing." "My girlfriend went, too." "I love weekends!"
Questions	"So how was the dance?"	1. Responsiveness 2. Topic maintenance 3. Relevance	"It was OK." "I danced with four or five girls." "I knew most of the dances."
Requests for repair	"What kind of group?"	4. Informativeness 1. Responsiveness 2. Adjustment to listener 3. Repair strategies	"They had a hiphop group." "A hiphop band." "You know, they play rap music." "Do you know what hiphop is?"
Sources of difficulty	"Can you get that marker for me?" (no marker present)	1. Assertiveness 2. Comprehension monitoring 3. Clarification requests	"There's no marker here." "Did you say marker?" "Do you mean a pen?"

Adapted from Brinton, B., & Fujiki, M. (1992). Setting the context for conversational language sampling. In W. Secord (Ed.), *Best practices in school speech-language pathology* (vol 2, pp. 9-19). San Antonio, TX: Psychological Corp, Harcourt Brace Jovanovich.

hypothetical situations such as the following to determine the kinds of negotiation skills present in secondary school students:

Dan and his girlfriend are out on a date together. Dan wants to start going out with other girls, but he doesn't think his girlfriend will like that. What should he say?

Juan works in a grocery store after school. He is only supposed to work for 10 hours a week, but his boss keeps asking him at the last minute to work really late on Friday nights. Even though his boss pays him for his extra time, Juan doesn't like to be asked to work at the last minute. What should he say?

Caitlin wants to go camping for the weekend with her friend Ani, but she knows her parents don't like Ani much. What should she say to them to convince them to let her and Ani go?

We can ask our clients to tell us, for each hypothetical situation, "What should he or she say?" We also can ask clients to describe the potential conflict, say why they chose the language they did, and talk about what feelings might come up in such a situation. In analyzing the student's response to situations like these, we can look at the degree to which the student can talk about feelings and long-term consequences of the protagonist's actions and determine whether the student attempted to find a solution that would preserve the two characters' relationship using compromise and mutual agreement. Less mature responses would involve solutions that benefit only one of the characters, that show less awareness of the participants' feelings and desires, and that opt for short-term over long-term solutions.

Assessing Register Variation

We can set up role-playing situations similar to those used for children in the L4L stage (see Figure 11-6) to look at the ways a student might change the form of speech to fine-tune to the interactive situation. Some examples of situations that can be presented to

adolescents for role-playing appear in Figure 13-6. McDonald and Turkstra (1998) also suggested assessing the ability to produce hints. These are indirect requests that do not directly mention their object. For example, a hint for a taste of some fresh-baked cookies might sound like, "Umm, something smells good in here!" Adolescents can be asked to produce a very polite hint in response to hypothetical situations such as hinting to a friend's mother that the student needs a ride home (e.g., "My dad wants me home right after school today.")

Another important aspect of register variation for adolescents is the ability to use slang and in-group language (Nippold, 2007; Rue, 2000; Whitmire, 2000b). Cooper and Anderson-Inman (1988) emphasized the importance of the ability to use slang to help teens achieve group identity, to separate themselves from adults and younger children, and to foster peer solidarity. Adolescents with LLD often lack the linguistic facility and flexibility to master the constantly evolving lexicon and subtle pragmatic rules of the slang vernacular.

Assessment of use of slang vernacular can follow procedures used by Nelsen and Rosenbaum (1972). Students can be asked to list all the slang words they know that can be used to talk about a particular topic. Topics such as popular people, unpopular people, dates, sports, money, music, parties, cars, and clothes can be listed on a sheet of paper for the student, who can be asked to list as many of the slang terms as he or she can think of for each. The clinician also can ask several normally achieving students of the same grade and gender to fill out a similar form. The client's responses can be compared with those of the mainstream students. If the client produces very few slang terms in comparison to peers or produces terms that are different from those given by the typical peers, some difficulty in using in-group language can be inferred. A metapragmatic approach may be used to address this area in intervention (see Chapter 14).

Discourse Genres

Some of the discourse genres we discussed for younger students continue to be a concern for adolescents. These include classroom discourse, which changes to include more formal lecture formats in

Expressive activities

Have the student role-play producing each speech act in each context. Record the student's utterance and make a judgment as to whether it is appropriate for each context.

Speech act	Context	Student utterance	Appropriate?
Request use of car	1. Father		
	2. Friend who owns own car		
	3. Older sister who borrowed parents' car without permission		
Persuade	1. Supervisor to give time off so student can attend party		
	2. Friend to lend money		
	3. Teacher to accept late assignment		
Speculate	1. With a friend about what will happen on prom night		
	2. To teacher about the outcome of a science experiment		
	3. To parent about what grades will be this term		
Express opinion	1. To parent on appropriate curfew time		
	2. To teacher on current events topic		
	3. To friend on best musical group or sports team		

FIGURE 13-6 An example worksheet for use with role-playing activities to assess register variation skills in adolescents with LLD.

secondary school; and narratives, whose structures become more complex and elaborated during the adolescent years. Some new discourse genres also come to the fore in secondary school. These include increasing demands for a variety of written forms of expression on the part of the student, as well as the need to process expository and persuasive text structures in both receptive (e.g., textbooks and reference works) and expressive (essays, oral reports, research reports, laboratory reports) modalities. Let's look at how we can assess some of these discourse structures in adolescents with LLD.

Secondary-School Classroom Discourse

Classroom observation at the secondary level may be more complicated than it was for elementary school students, because adolescents participate in so many different classrooms in the course of a day. In addition, Nelson (1998) pointed out that adolescent students may be very easily embarrassed and would not respond well to a classroom visit by the SLP. Teachers can be asked to audiorecord a class in which the client is enrolled, so that the SLP can get a feel for the rules and expectations of the class and how the student with LLD responds to them. Alternatively, the SLP may interview teachers about the classroom performance of the client, with an eye toward gathering the kind of information that would help identify areas likely to present problems for the student. **Box 13-5** presents a sample interview form that might be used to obtain information from teachers about a student's classroom performance.

Reed and Spicer (2003) reported on the communication skills high school teachers consider most important for students to display. Those receiving the teachers' highest ratings included the following:

- Narrative skills
- Logical communication
- Ability to clarify messages
- Ability to take another's perspective
- Appropriate turn-taking

Knowing these teacher priorities can help SLPs focus on helping students improve their classroom performance in areas that teachers consider most important.

Students also can provide information about their own classroom performance. Talking with students about their performance in various classes and asking questions similar to those in **Box 13-5** can point the clinician toward the teachers who will be most crucial to interview. We would, of course, want to talk to teachers in whose

classes our clients are having difficulty. But it would also be a good idea to interview the teachers with whom the client feels things are going well, or toward whom the client feels especially positive. These interviews can help us assess the accuracy of the client's perceptions about academic work. They also can help us identify environments that are supportive for our students, so we can find ways of extending that support to other settings in which the student needs to function.

One aspect of classroom discourse performance that is especially crucial in the advanced language period is listening skill. Recall that the majority of students' time in secondary classrooms is spent listening. Moreover, the listening demands of the secondary classroom include more than literal comprehension of the verbal material presented. Secondary students need to engage in what Larson and McKinley (1995) called *critical listening*; that is, the ability to differentiate fact from opinion; to detect a speaker's intent to persuade the listener or "sell" an object or idea; and to identify false reasoning, bias, or propaganda.

Larson and McKinley (2003a) suggested a two-stage analysis of listening skills for secondary students. The first involves looking at informational or literal-level listening. To examine informational listening, they suggested using a recorded lecture—either from one of the client's classes or perhaps a clip of a lecture from a video on the web. The student can be shown a 5- to 10-minute segment of the lecture, then asked to give the main idea and several relevant details. For additional dynamic assessment, Larson and McKinley suggested having the student listen to a second portion of the lecture, this time with a printed outline of the segment that lists major topics covered. If the student has difficulty with the unguided listening, but does better when the guide is available, consultation with the teacher can be used to find ways to provide such an outline to help the client function in the class.

To assess the second aspect of listening skill, critical listening, Larson and McKinley advised having a student watch a video of a commercial or a segment of a political speech. The client is then asked to draw an inference about what the communicative goal, or hidden agenda, of the segment was (to persuade, sell, or encourage listeners to rethink an opinion, etc.). The student can be asked to judge whether the text contained factual material, opinion, or propaganda. The client also can be asked to judge how effectively the intended message was conveyed. Was it convincing? What additional information would be needed to evaluate the claims

BOX 13-5 A Sample Interview to Conduct with Teachers of Secondary Students with LLD

How is (client) doing academically in your class?
 What are (client)'s strengths in your class?
 How well-organized is (client)?
 How does (client) do at following directions? Answering questions? Completing assignments? Understanding written material?
 Getting along with peers?
 How would you rate (client)'s listening skills? Does he or she understand lectures and classroom conversation?
 How would you rate (client)'s vocabulary?
 What problems is (client) having in your class?
 Are there particular routines in which (client) has trouble "getting with the program?"
 Can you describe a recent classroom activity in which (client) took part that will give me an idea of the kinds of trouble he or she has?
 What aspects of your curriculum present the greatest stumbling block for (client)?
 What changes would you like to see in (client)'s performance in class?
 What is your view of (client)'s realistic potential in this class this year?

presented in the segment? Students who are unable to engage effectively in this kind of discussion would benefit from some intervention in critical-listening skill, even if their informational listening abilities are adequate.

Other Discourse Genres

Narrative Text

Rather than assessing story structure in general for secondary students, as we would for elementary students, we want to focus on aspects of narrative that cause the greatest difficulty and are likely to continue to show impairments in adolescents with LLD. A large body of research (summarized by Johnson, 1995; Scott, 1999; Westby, 2005) suggested that these areas include the use and understanding of story-grammar elements relating to characters' internal responses, plans, and motivations; the ability to draw inferences from narrative material and to summarize the story; and the provision of adequate cohesive marking within the text. Use of literate language forms in stories also would be a likely area in which deficits might persist and is one in which we might want to assess adolescents with LLD (Greenhalgh & Strong, 2001).

Assessing Story Microstructure. Wetherell, Botting, & Conti-Ramsden (2007) used story generation and personal narratives to assess narrative in adolescents with LLD and with typical development, using the protocols outlined in Box 13-6. They reported that there were differences between the two groups, including a greater number of semantic/syntactic errors on the part of students with LLD. They also found that these students needed more adult support, in the form of prompts, in order to complete their stories. Unlike younger children, adolescents with LLD did not produce shorter stories or significantly fewer complex sentences than their typically developing peers. Table 13-7 provides average ranges of the percentage of complex sentences and semantic/syntactic errors found in both types of narrative by Wetherell et al. (2007). These can serve as points of comparison when we assess narratives of our students with LLD.

Assessing Story Macrostructure. Normally developing children have acquired a basic story grammar by early school age (Richards & Singer, 2001), and even students with LLD produce narratives containing basic story grammar elements in the secondary school years (Roth & Spekman, 1989; Scott, 2005). However, Stephens (1988) showed that the internal responses of characters, including their intentions, goals, and plans for dealing with the

problems central to the story's plot, are the last story grammar elements to emerge in normally developing children. Westby (2005) pointed out that these elements are particularly difficult for students with LLD. In addition, we should be aware of an important change that takes place in narrative abilities in typical teenagers, as documented by McKeough and Genereux (2003). They found that at about 12 years of age, and increasingly throughout the teen years, students increase in two aspects of narrative ability: structural complexity and interpretive understanding. In terms of structure, they find adolescents increasingly able to embed complete episodes, such as flashbacks, within a narrative. In their use of interpretive understanding, they report a shift during adolescence from understanding behavior in terms of immediate feelings, thoughts, and plans to understanding characters' actions in terms of their personal history and experiences, and long-standing personality traits. As we work with adolescents on narrative tasks, we will want to help guide them toward these more mature perspectives.

We can use curriculum-based assessment to look at students' narrative skills. We can ask the student to choose a story that was read in English class and review the story with the student, having him tell about the main character, asking questions such as the following:

What was _____'s problem?
How did _____ plan to solve it?
What does _____ do to solve the problem?
Do any of the other characters know about the plan? If so, who, and how do they know? If not, why not?
What do other characters in the story think about what _____ is doing to solve the problem?
How does the plan work? Does _____ achieve the goal?
How does _____ feel at the end? Why?
What do other characters feel at the end? Do they feel differently than they did before they knew _____'s plan? Why or why not?

Asking the student to articulate the internal plans and responses of characters can give us an idea about whether these elements are perceived by the client. Having the client describe any deception the character plays on others in the story is especially helpful for

BOX 13-6 Protocols for Eliciting "Frog" Stories and Personal Narratives

"FROG" STORY GENERATION:

- Two envelopes, each containing the same "frog" story book, are placed before the student.
- The student is told the two books are almost the same, with a few differences.
- The student is invited to choose one envelope, look at the book inside away from the examiner, and tell her the story. She will then guess which of the two books he chose.
- The student takes the book aside, looks through it, then returns to the examiner, and is given a screen to put the book behind so she cannot see it.
- The student is asked to tell the story "as if it happened yesterday/last week, so I will know exactly what happened and can guess which story you have."
- The examiner provides prompts to continue only when the student stops or looks away from the book.

PERSONAL NARRATIVE:

- The student is asked to think of the most annoying person he or she knows and tell the things the person does that are annoying.
- The examiner provides prompts to continue only when the student stops narrating.

TABLE 13-7 Narrative Production Measures from Adolescents with Typical Development (TD) and LLD

	Mean (and Average Range) % Complex Sentences	Mean (and Average Range) % Utterances with Semantic/ Syntactic Errors
TD Story Generation	17 (16–18)	4 (3–5)
LLD Story Generation	15 (13–17)	12 (10–13)
TD Personal Narrative	32 (24–39)	7 (5–9)
LLD Personal Narrative	24 (18–29)	15 (12–19)

Adapted from Wetherell, D., Botting, N., & Conti-Ramsden, G. (2007). Narrative in adolescent specific language impairment (SLI): A comparison with peers across two different narrative genres. *International Journal of Language & Communication Disorders*, 42(5), 583-605.

looking at whether the student comprehends the distinction between action and intention that is so important in understanding plans and goals. If students are unable to give adequate accounts of these elements of internal response in stories they read in classroom literature, some work on them in the intervention program will be of use.

Assessing Narrative Inferencing. We've talked before about the importance of being able to use prior knowledge to "read between the lines" and infer information that is not stated explicitly in a text. Stephens (1988) reported that, although normally developing elementary students are able to draw inferences from stories, inferential questions are more difficult for them than are questions about material that is directly stated. Similarly, Rinaldi (2000) and Roth and Spekman (1989) reported that, although students with LLD do make some inferences in comprehending texts, they do not use inferencing as efficiently as a strategy to aid processing and memory as students with normal language development do, and they have more difficulty with drawing inferences from nonliteral language forms. These findings suggest that students with LLD are less adept than their peers with advanced language at going beyond what is on the page both to draw conclusions and to organize information for the purpose of providing concise and accurate summaries.

We talked earlier about some ways to assess inferencing skill. To look specifically at inferencing in narrative texts, we've talked about reading students a part of a classroom literature selection, stopping at a crucial point, asking students to guess what will happen next and to tell why they think so. This kind of activity can tell us something about whether the student is able to use information in the text to make a plausible conjecture about where the story may be going. Inferential performance also can be elicited by reading a description of a character in a story and asking the student to infer something about the character from the description. For example, suppose clients are reading *Around the World in Eighty Days* (Verne, 1873) in English class. You might have the students read the following passage describing the main character, Phileas Fogg (pp. 11–12):

Was Phileas Fogg rich? Undoubtedly. But those who knew him best could not imagine how he had made his fortune, and Mr. Fogg was

the last person to whom to apply for the information. He was not lavish, nor, on the contrary, avaricious; for, whenever he knew that money was needed . . . he supplied it quietly and sometimes anonymously. He was, in short, the least communicative of men. He talked very little, and seemed all the more mysterious for his taciturn manner. His daily habits were quite open to observation; but whatever he did was so exactly the same thing that he had always done before, that the wits of the curious were fairly puzzled.

Students could then be asked to draw some inferences about Mr. Fogg by answering questions, such as the following:

What would Mr. Fogg do if a street beggar asked him for money?
What would Mr. Fogg say if you asked him what he did for a living?
Would Mr. Fogg own a big mansion?
If Mr. Fogg were alive today, would he go on a TV reality show his daily life?
What did Mr. Fogg's neighbors think about him?
Did Mr. Fogg like parties?

If students have trouble taking the information in the description and using it to make guesses about some of the character's hypothetical actions in questions like these, they may have problems in inferential comprehension. These problems can be addressed in the intervention program.

Assessing Summarizing Skills. Summarizing is a skill that typical students develop during the advanced language period (Stephens, 1988). When we retell a story, we report all the events included in the original narrative, recounting each episode and including all the events and elements that make it up. Summarizing, on the other hand, requires integration and condensation of the material in the story. Johnson (1983) identified six abilities that go into summarizing a narrative:

1. Understanding the individual propositions and events of the story
2. Understanding the connections among the individual propositions of the story
3. Identifying the story grammar elements that organize the story
4. Remembering the sequence of events in the story
5. Selecting the most salient information to be included in the summary
6. Generating a concise and cohesive version of that information

Before we assess the ability to summarize, then, we need to be assured that the student can perform the earlier steps in this sequence. These steps, which comprise what we might call basic, informational, or propositional comprehension, can be assessed using standard reading comprehension instruments. Examples of such tests would include the passage comprehension section of the *Woodcock Reading Mastery Test—Revised* (Woodcock, 1998), the paragraph reading subtest of the *Test of Reading Comprehension—3rd Edition* (Brown, Hammill, & Wiederholt, 1995), the *Stanford Diagnostic Reading Test—4th Edition* (Karlsen & Gardner, 2004),

or the *Gray Silent Reading Tests (Fourth Edition)* (Wiederholt & Blalock, 2000).

If students perform at primary levels on these measures, they are not ready to address higher level skills such as summarization. Instead, they need to develop more basic skills in comprehending the literal content of written material. Work addressed at comprehension of both spoken and written information at the L4L level, using techniques like those suggested in Chapter 12 is appropriate for these students. If, on the other hand, clients perform at least at a fourth-grade level on these measures (most of our adolescents with LLD will not be reading on grade level), we can infer that the student has minimally adequate propositional comprehension skills. We can then assess their higher level summarization skills by asking students to summarize short stories or book chapters they have read in English class or that we present them in the assessment session. It is important to be sure that the material we present them for summarizing is not at a reading level higher than the level they attained on the basic comprehension test. The adequacy of the summary can be judged by evaluating whether:

1. The summary presents an acceptable representation of the sequence of events in the story.
2. The information presented includes the most central elements of the story and excludes minor details.
3. The summary is concise and coherent, so that someone who had not read the text could get the gist of the story.

Students who demonstrate basic comprehension skills but who have trouble providing adequate summaries can be encouraged to develop this skill in an intervention program.

Assessing Cohesion in Narrative. We talked in Chapter 11 about using a procedure based on Liles's (1985) work (see Box 11-10) for assessing use of cohesion in narratives produced by elementary students. This procedure also is appropriate for students at advanced language levels. If you collected a narrative sample to look at syntactic production, as discussed earlier, this sample also can be examined for use of cohesive devices, using the scheme in Box 11-10. As we've also discussed, written samples are especially informative in the assessment of students with advanced language. If both a spoken and written narrative were

collected for assessing syntactic production, the written narrative is an especially fertile source of information on use of cohesive markers. If a written narrative was not collected as part of the assessment of expressive syntax, it may be useful to collect one to look at these markers of cohesion. If deficits in use of cohesive markers are identified with the assessment suggested in Box 11-10, intervention can focus on improving use of cohesive markers in both spoken and written narratives.

In addition to the categories suggested in Box 11-10, several other types of cohesion identified by Halliday and Hasan (1976) Horton-Ikard, 2009, and Richard and Elder (2008) can be examined in the written narratives of adolescents with LLD. These include the use of *lexical cohesion*, *reference*, and *substitution*. Definitions and examples of these markers appear in Box 13-7.

Students who demonstrate appropriate usage of these types of cohesive markers tend to be better writers than students who do not (Strong, 1985). Nelson and Friedman (1988) reported that there was a large decrease in errors of usage related to the first three categories of cohesion between fourth and seventh grades, although even college students made some errors on these markers. Nelson and Friedman found that the error rate for normally achieving secondary students was *one or two errors per 100 words in written samples*. If a written narrative sample of a secondary student contains more than three or four errors of cohesive markers per 100 words, some problems with the use of cohesion can be inferred. These problems also can be addressed in the intervention program.

Assessing Artful Storytelling with Literate Language. In looking at literary language markers of artful stories, we can refer to the list of low-frequency, advanced syntactic forms in Table 13-5. If it hasn't already been done, we can analyze a client's written narrative sample for these forms. We also can look for evidence of a literate lexicon. This would include looking for the presence of metalinguistic and metacognitive verbs, as Nippold (2007) suggested. In addition, we can look for the use of adverbs and conjunctions as evidence of a literate language style, as Westby (2005) proposed (see Box 11-13).

One additional factor of artful storytelling that pertains to both cohesion and a literate language style can be inspected in

BOX 13-7 Some Categories of Cohesive Markers for Assessment at the Advanced Language Stage

LEXICAL COHESION

The use of several words at different points in the text to link ideas to the same concept. These would include the use of comparative and superlative markers:

"They were very proud of their team. Still, ours was *better*."

"He eats the most junk food in our family. I eat *the least*."

It also includes the use of more general comparatives such as *same*, *similar*, *other*, *different*, *else*, and *likewise*:

"Matt thought the student council was too conservative. Mandy held a *similar* opinion."

"There were several dishes on the table. Jesse tried the caviar, and I tried the *others*."

"Jamie's painting won first prize in the contest. I never dreamed he had *such* talent."

REFERENCE

The use of pronouns as well as the use of pro-verbs:

"The plates beneath the earth move. When they *do*, an earthquake can occur."

SUBSTITUTION

The use of a synonym for a co-referent:

"A goat had attacked our flower bed. When we saw it, we were amazed at the damage the *animal* had done."

adolescents' written narrative samples. This is the use of connectives. Connectives are another class of cohesive markers identified by Halliday and Hasan (1976) as a significant means of linking propositions within texts. They also are an important component of the development of literacy and the ability to encode and interpret the connections between propositions in literate discourse (Nippold & Undlin, 1992), and they are considered additional forms of high-level syntax (Scott & Stokes, 1995; see Table 13-5). Connectives include both *conjunctions*, which link propositions within a sentence, and *conjuncts*, which link ideas across sentences. A list of these forms appears in Box 13-8. Nippold et al. (2005) found that use of adverbial conjuncts doubled (from .3% to .7%) between the ages of 11 and 17 in students' persuasive writing. We can examine the written narrative samples of adolescent clients for the presence of these connectives as a measure of literate language growth. If samples contain examples of several connectives (Scott's [1988] data suggested a minimum of five different connectives would be expected in a writing sample of 30 to 50 T-units in length), we can assume minimally adequate use of these markers. If connective use is very sparse in the sample, we would probably want to attempt to elicit use of connectives, using a sentence generation procedure ("Make up a sentence with *although* [or *but* or *if* or *unless*] in it"). Alternatively, we might write several conjunctions on cards and provide students with pairs of written sentences to combine by choosing one of the cards and coming up with a complex sentence that uses the conjunction to link the propositions. For example, the student might be given the propositions: "Jaime wanted to ask Megan to the dance" and "Megan had gone to the junior prom with Malik" and the conjunctions *and*, *if*, *when*, *although*, and *until*.

Nippold and Undlin (1992) provided an additional method for testing use of advanced connectives. They gave secondary students a sentence followed by a connective and had students complete the second sentence so that the whole passage made sense. Here's an item from their task (p. 35):

Michael has become an excellent distance runner for the cross-country team. Similarly, _____.

Analogous passages can be constructed to assess other connectives of interest. If students perform adequately on probes like these, further work on connectives may not be necessary. If the students seem unable to use the connectives appropriately, though, we may want to probe their comprehension of these forms with a judgment task. Students can be read a list of sentences like those in Box 13-9 and asked to judge whether each "makes sense."

Students who have difficulty with comprehension and production of these advanced connectives can benefit from an intervention program that provides additional exposure to the forms, in literature-based script activities and metalinguistic talk about forms encountered in curriculum-based comprehension and comprehension monitoring work. If comprehension appears adequate and only production is sparse, intervention might focus on activities that encourage sentence combining (see Chapter 14).

At this point you may want to look at Charlie's written sample in Figure 13-3 again and try some of the analyses we've been discussing. Our version appears in Appendix 13-6.

BOX 13-9 Sample Sentences for a Judgment Task to Assess Adolescents' Comprehension of Advanced Connectives

Instructions: Listen to each sentence and tell me whether it makes sense (OK) or is silly (S).

I like heavy metal, so I'll use my birthday money to buy some new discs. (OK)

I failed my exam because I gave all the right answers. (S)

Our team will have a chance at the state championship if we can get into the play-offs. (OK)

After you feel full, you always eat a big sub sandwich. (S)

Before you ask someone for a date, ask your folks for the car. (OK)

I'll graduate when I pass all my courses. (OK)

I'd like to go to the movies, although there's a movie I really want to see. (S)

Since you work after school, come home as soon as school lets out. (S)

Don't go to the basketball game until you've finished your homework. (OK)

I'll get a Super Video system for Christmas unless I get an A in English. (S)

I was looking forward to my date with Sam. However, I was worried about his car. (OK)

Brian has a history test tomorrow. Nevertheless, he studied hard. (S)

Min needs to take his medication at noon every day. Therefore, he never brings his pills to school. (S)

Carmen doesn't like to practice the piano. Instead, she works on the instrument at least an hour a day. (S)

Expository Texts

Understanding Expository Texts. We talked earlier about the role of expository texts in the secondary school curriculum. Much of the curricular material that adolescents encounter, either as orally presented lectures or in written texts, takes an expository form. Conte, Menyuk, and Bashir (1992) showed that adolescents with LLD comprehend expository texts significantly less well than their normally achieving peers, although Scott and Windsor (2000) demonstrated that these texts are difficult for typically developing students, as well. Ward-Lonergan (2010) summarized the available literature to report that the kinds of deficits in expository text comprehension commonly found in students with LLD include:

- Poorer accuracy in answering questions about the literal content of the text
- Reduced ability to respond to inferential questions on the text
- Recall of fewer propositions and events from the text on retelling or summarizing
- Shorter retellings with reduced syntactic complexity and increased grammatical errors

These areas, then—the ability to answer both literal and inferential questions and to summarize or paraphrase a text heard or read—constitute important targets of assessment of expository comprehension skills.

Adaptations of reading comprehension tests can be a first step in assessing this area. If already completed by other educators, these test results can be used for criterion-referenced assessment by contrasting performance on the standard administration with what the student can do when the text is read aloud by the clinician. This comparison will help to determine whether the problem lies in reading skill alone (if the student does better when read to) or in more basic comprehension difficulties (if he or she does not). Kamhi (2009) suggests that reading comprehension tests used for this purpose should be those that focus primarily on basic reading and literal comprehension skills, such as *The Peabody Individual Achievement Test* (Dunn & Markwardt, 1970), the *Woodcock-Johnson Passage Comprehension Test* (Woodcock, McGrew, & Mather, 2001), and the *Qualitative Reading Inventory* (Leslie & Caldwell, 2005). Dynamic assessments can follow this initial comparison. For example, when “high level” vocabulary words are explained and discussed before reading or listening, does comprehension improve?

Nelson (2010) suggested that the best assessment of comprehension of expository texts is the use of curriculum-based activities. We will probably want to look at a student's comprehension of expository texts in a variety of settings. We've talked already about assessing informational comprehension in class lectures. We also might want to look at comprehension of written expository material using a classroom textbook. Laing Gillam, Fargo, and St. Clair Robertson (2009) and Sudweeks et al. (2004) provide empirical support for asking students to paraphrase or summarize an expository passage as an assessment technique. We can have the student read a passage, paraphrase or summarize it, and answer both literal and inferential questions posed by the clinician. Alternatively, we can have students answer questions in the review section of a textbook or demonstrate comprehension by drawing a map or diagram.

As Carlisle (1991) advocated, comparing students' comprehension of expository texts they read themselves with the same texts read to them can be informative. If listening comprehension exceeds comprehension of the same material when read independently, we can consult with teachers to provide recorded versions of reading assignments and work with the reading specialist to improve reading comprehension. If comprehension of oral exposition is no better than that of written material, though, we will need to concentrate on improving the student's overall ability to process this kind of text, starting with oral formats and integrating written texts as we go along.

If students have trouble with independent processing of any kind of expository material, we can, again, use dynamic assessment, providing scaffolding and support to see whether this aid is sufficient to allow them to complete tasks with expository texts. Just as we may have tried providing an outline to guide comprehension in a lecture format, a similar procedure could be used for written material. We might supply students with an outline of the written text, listing main headings with lines under each for the students to fill in relevant details. After reading and outlining the passage this way, students can be asked to summarize the passage, recall details, and answer literal and inferential questions. If these kinds of scaffolding improve comprehension of the text, then working on getting students to use a learning-strategies approach (see Chapter 14) to use these supports independently will probably be helpful. Some consultative intervention to encourage teachers to

provide such support in their classroom materials also would be beneficial. If dynamic assessment does not demonstrate much improvement of expository text comprehension with scaffolding and support, we may want to work more directly on expository text structure in the intervention program. We'll discuss some approaches to this procedure in the next chapter.

Snyder and Caccamise (2010) identify three processes that support the comprehension of exposition: *memory*, *strategic processing*, and *domain-specific knowledge*. When we find students who have difficulty with expository understanding, we may want to probe each of these processes to locate the source of the trouble. We might have students read or listen to an expository passage, and ask a series of literal questions regarding specific facts or events, using a multiple choice format to minimize the intrusion of other difficulties, in order to assess memory. To assess students' access to strategic processing, Snyder and Caccamise's discussion suggests presenting students with passages that contain incoherent or anomalous elements and asking the students to tell if there is anything in the text that is hard to understand, for example:

"The oil slick extended throughout the Gulf of Mexico; fishing fleets were required to stop **its** activity for weeks"

or

"The Boston Tea Party was a *direct action* by colonists in Boston . . . against the *British government* After officials in Boston refused to return three shiploads of taxed *tea* to Britain, a group of colonists . . . **saved** the tea by throwing it into *Boston Harbor*."

Students who do not identify these anomalies may not be using comprehension-monitoring strategies to check one portion of a passage against another to be sure that the meaning they are constructing as they process the passage coheres.

Finally, Kamhi (2009) as well as Snyder and Caccamise (2010) have argued for the importance of domain-specific knowledge in comprehension. That is, without adequate background information about a specific topic, understanding expository text on that topic becomes very difficult, as you can see for yourself, by reading the following passage from [Wikipedia.org](#):

In fluid dynamics, Bernoulli's principle states that for an inviscid flow, an increase in the speed of the fluid occurs simultaneously with a decrease in pressure or a decrease in the fluid's potential energy.

Even if you remember from your Speech Science course what the Bernoulli principle is, I would venture to guess you had trouble understanding this sentence, probably because you (like most people) have limited knowledge about the topic of fluid dynamics. This kind of difficulty can be especially acute for students with LLD, whose limited language processing abilities may have resulted in their acquiring less information about a range of topics than typically developing peers. Kamhi (2009) suggests that we treat the problem of the acquisition of domain-specific knowledge as separate from the basic problem of expository

comprehension, and work with students to develop adequate strategies to decode words and comprehend "domain-general" material—material that requires little specialized knowledge of any kind. In assessing comprehension of expository texts, then, we may want to follow Nippold's (2010b) advice to assess this skill using texts about familiar, motivating topics, such as instructions for playing a game popular with peers, building an engaging project like a terrarium, or making an appealing craft item like a duct-tape wallet.

Producing Expository Text. Scott and Windsor (2000) reported that students with LLD produce less mature expository structures, in terms of both form and content, than typically achieving peers. Many students in middle and high school participate in national and state-wide assessments that include the production of expository writing. These written samples, if they are available to the SLP, can serve as a starting point for artifact analysis. They can be examined, as Espin et al. (2005) recommended, for the following elements:

- *Premise*: a statement of the writer's position on the topic; stated in an introductory section
- *Reason*: an explanation to support or refute the premise
- *Elaboration*: an extension or examples of a premise, reason, or conclusion
- *Conclusion*: a closing statement

Scott (2010) suggests the alternative of using individualized standard assessments for the same purpose. Several standardized measures of written language include expository text production tasks, including the *Oral and Written Language Scales—Written Expression Scale* (Carrow-Woolfolk, 1996) and the *Test of Written Language-Fourth Edition* (Hammill & Larsen, 2009). Finally, we can use artifact analysis to look at the student's expository assignments from class work as a way of analyzing these elements. Weak or absent elements can be addressed in an intervention program. Because so many typical students have trouble with expository writing, this is an excellent area for collaborative teaching.

Many important aspects of advanced language that we have already discussed, including literate vocabulary, clause density, complex syntax, and discourse cohesion can be assessed in the context of expository text samples like these. In fact, Nippold (2010b) has argued that expository texts are ideal for this purpose because they are more likely than other genres to elicit the use of these literate language elements. However, Nippold cautions us that to see students' best performance we should encourage them to write about topics that interest and motivate them in settings that provide them with a real communicative purpose, such as teaching someone how to play a game or accomplish a task. She also reminds us, as Kamhi (2009) did, that there is a reciprocal relationship between skill with expository language and knowledge of domain-specific topics. While greater knowledge of a topic results in more organization, accuracy, coherence, and logic in expository productions (Nippold, 2010b), writing itself can serve to increase this domain-specific knowledge by requiring the writer to read and learn more about the topic being written about. Just as you had to do research and learn a lot of new information in order to write your last term paper, clients who are engaged in writing about topics that interest them will be motivated to search out new sources and information about the topic in order to complete their task. Our role as SLPs for students with LLD includes consulting with teachers on identifying topics that will be both educationally relevant and motivating to these students, providing scaffolding and encouragement as they plan and execute their research, supplying feedback and guidance as they compose and revise their texts, and

developing meaningful communication opportunities in which they can share their writing and celebrate their newly acquired knowledge. We'll talk more about these roles in the next chapter.

Persuasive and Argumentative Texts

Nippold (2007) and Scott and Erwin (1992) identified persuasion or argumentation as a new discourse genre that confronts secondary students. They suggested that competence with this genre develops even later than exposition, and as such, it may not enter the student's repertoire until late in the adolescent period. We looked at some ways to assess the comprehension of these kinds of texts when we talked about critical listening. Assessment of production of persuasive texts can be examined in oral modes using the role-playing procedures we talked about earlier. We'll look, too, at production of written argumentative texts in the next section as one aspect of the assessment of written communication.

Written Communication

One of the major new demands of the secondary school years is the increasing requirement to produce longer, more elaborated forms of written expression in a variety of discourse genres (Nelson, 2010), and writing has become an especially important area for intervention since the requirement of the No Child Left Behind (NCLB) legislation that students in special education must participate in district- and state-wide assessments, which frequently include writing (Schumaker & Deschler, 2003). Barry and William (2004) point out that students with learning disabilities are required to pass the same competency exams as students enrolled in general education in order to graduate to new grade levels and to earn a high school diploma.

Like most aspects of development, writing acquisition proceeds through a series of phases (Nippold, 2007; Scott, 2005; Silliman, Jimerson, & Wilkinson, 2000). And, as we would expect, students with LLD show slow progress through these phases and have significant difficulties (Ward-Loneragan, 2010). Mackie and Dockrell (2004) and Scott (2005) reported that students with LLD produce written texts that are shorter, contain more errors, are rated lower in overall quality, show less sensitivity to audience and genre, and contain less information than writing of typically achieving peers. Still, writing is difficult for everyone. Typically developing adolescents take years to master basic skills in effective written communication, and adolescents with LLD have even more difficulty (Englert & Raphael, 1988; Schumaker & Deschler, 2003; Ward-Loneragan, 2010).

There are some norm-referenced measures that assess writing ability. These include the *Picture Story Language Test* (Myklebust, 1965), the *Writing Process Test* (Warden & Hutchinson, 1992), and the *Test of Written Language—4* (Hammill & Larsen, 2009). Other standardized batteries for adolescents have written language sections. The *Test of Adolescent and Adult Language—4* (Hammill et al., 2007) and the *Woodcock-Johnson Psycho-educational Battery—Revised* (Woodcock & Johnson, 1990) are two examples. Like all standardized measures, these tests tell us whether an adolescent is different from other students in terms of written language abilities. To establish baseline function and identify intervention targets, we are likely to need to do some criterion-referenced assessment for students who demonstrate written language deficits on standardized instruments.

Scott (2005) and Scott and Erwin (1992) identified a variety of types of writing required of adolescents in school. These include personal experience narratives ("describe the best experience you ever had"), story retelling (book reports), factual retelling ("summarize the passage on the exploration of Antarctica"), fictional stories or guided stories ("write your own myth to explain how we

came to have four seasons, as the myth of Ceres does"), explanations on how to do something ("explain how to build a log cabin"), descriptions ("write a description of Massachusetts's main industries"), reporting ("write a report of a sports event you watched"), persuasive pieces ("write an editorial about why students should be allowed to eat lunch at local restaurants instead of the cafeteria"), business letters ("write a letter of application for a job"), and friendly letters ("write a letter to a friend asking him or her to visit during the summer"). When we assess writing in our students, we want to sample the kinds of writing required by the curriculum. We also want to find out to what extent students have access to, and know how to use, word processors for written assignments. This information will help us to determine whether to emphasize word processing or hand-written work in the intervention program. To the extent that word-processing equipment is available for student writing, it is to our advantage to make use of it, since students who learn this technology in school have an advantage in the transition to employment settings. If word-processing equipment is available, we may want to counsel students to take a keyboarding course to improve typing skills. It is important to be aware, though, that Scott (1999) has shown computer-produced writing of students with LLD contains more errors than hand-written products, but does not differ in terms of length, structure, or amount of revision. While using a computer may make writing less laborious, it does not automatically improve its quality. In addition, students may need to take high-stakes tests, such as state-wide assessments and SATs, by hand. Unless a student's disability qualifies him or her for access to a word processor during such testing, we need to support students in learning to produce writing legibly by hand, as well.

Phases of Writing. Jencks (2003) suggested that there are five steps involved in producing written texts. The first two are often referred to as the *writing process* or *planning*. The others can be considered the writing product. These appear in Table 13-8. A major difference between the written work of adolescents with LLD and that of their peers is that good writers spend much more time in the planning and revision processes than do poor writers (Espin et al., 2004). This suggests that assessing these processes may be just as important as evaluating the written product itself for understanding what a student needs to improve written communication.

TABLE 13-8 Writing Process

Writing Phases	Writing Stages	Elements in Each Stage
Process	Prewriting	Classroom discussion Graphic organizers Brainstorming

	Publication	Word processing Author's theater Binding and illustrating

Adapted from Jencks, C. (2003). *Process writing checklist*. ERIC Document No. ED479389.

Written language assessment involves both the process and product of writing.

Assessing the Writing Process. We can assess the planning aspect of writing by asking students to produce a written sample under our observation. When we choose the kind of sample we ask the student to write, again, curricular considerations should be paramount. **Box 13-10** provides some questions suggested by Scott and Erwin (1992) for learning about the writing demands of a student's curriculum. We can use the answers to questions like these to guide our choice of a writing assignment to use for process assessment.

Scott and Erwin (1992) discussed using a "Think-aloud Protocol," in which we ask students to verbalize all thoughts about writing as they write. The main goals of this procedure are to find out the following:

- Whether the student identifies the goal or purpose of the writing. This decision often includes the choice of the discourse genre to be used in the composition. In many cases, for students, the goal and genre are set by the demands of the assignment. Students may be asked to write an autobiography (narrative), a research or book report (exposition), or an advertisement or editorial (persuasive). When we set the goal by giving the student an assignment, we want to observe whether the student uses the goal as a guide to the writing, chooses the correct genre to fit the goal, and uses self-reminders of the goal throughout the process.

- Whether the student takes the audience into account. For students, the audience is often the teacher. We would like to see whether the student takes the teacher's presumed state of knowledge into account by giving the teacher all the necessary background information. On the other hand, often the teacher already possesses much of the information the student is being asked to convey, particularly in expository assignments. In this case, we want to observe whether the student understands the obligation to demonstrate knowledge to the teacher, even though the teacher may already have that knowledge.
- Whether the student uses the planning process to revise and refine thinking. This is perhaps the most critical aspect of planning in writing and the reason that many authors claim that they don't know what they think until they write it. *The Writing Process Test* (Warden & Hutchinson, 1992) also can be used in this phase of the assessment.

If students show very poor or limited planning abilities, providing some dynamic assessment through modeling alternative think-aloud procedures, suggesting the use of graphic organizers and outlines, and encouraging students to focus on planning as well as producing written communication can help to determine which elements of writing can best be addressed in the intervention program.

Assessing the Written Product. Espin et al. (2004) discussed the various forms of assessing student writing that are in common use. Often, these assessments involve presenting students with a writing "prompt." Example writing prompts appear in **Table 13-9**. Alternatively, students may be presented with a story starter in the form of a picture or sentence. The four primary methods of assessing writing samples such as these include the following:

- *Holistic:* The rater provides a numerical score, based on an overall impression of the writing. The score is norm-referenced in that the rater has in mind what typical writing for a given grade level should look like. This method is most useful for placing writing within a category or level that can be used to evaluate change with intervention, rather than for evaluation of the writer's instructional needs.
- *Primary trait:* The rater measures the sample against predetermined criteria, often in the form of a rubric that provides numerical ratings on a 4- to 5-point scale, with anchors such as

BOX 13-10 Questions to Determine Writing Demands of Curriculum

1. Did you write anything in school this month that was more than a paragraph long? What was the assignment?
2. Do you have homework for chapters in your textbooks that require writing a paragraph or more? What is the wording on these assignments?
3. Do you have essay questions on exams? Can you give me an example of one? How long is your answer? Half a page? A whole page? More?
4. Do you have to write book reports? Research reports? Biographies? Autobiographies? Journals? Lab reports? If so, how are they done? In school or at home? How long are they? Do you write them alone or with other students? Do you have to write more than one draft?
5. Where does the information for your writing come from? Is it all in your textbooks, or do you have to do additional research?
6. What does your teacher think about your writing?
7. What is the longest thing you ever wrote?
8. Do you do any writing on a computer? What kind of writing?
9. Do you take notes in class? Is there anything to copy from the board, or do you write down what you hear?
10. Do you plan before you write? Do you go back over your writing and make changes when you are through?
11. What kinds of writing are easiest for you? What kinds are hardest?

Adapted from Scott, C., & Erwin, D. (1992). Descriptive assessment of writing: Process and products. In W. Secord (Ed.), *Best practices in school speech-language pathology* (vol. II) (pp. 60-73). Austin, TX: Psychological Corp: Harcourt Brace Jovanovich.

TABLE 13-9 Example Writing Prompts for Secondary Students

Genre	Sample Prompt
Narrative	Everyone has a frightening experience once in a while. Think about a time when you were very worried or afraid. Write a story about this time. Tell what happened in the order it occurred and tell how it turned out.
Expository	There are many exciting places to visit in the USA. Think about a place you would like to visit. Write about what makes this place special or interesting to you and why you would want to visit there.
Persuasive	Some schools allow teachers or principals to censor the school newspaper and decide if certain articles will be published or not. Write a letter to your principal explaining why you think school newspapers should or should not be censored by teachers.

unsatisfactory, minimal, satisfactory, elaborated, or superior. This method is a criterion-referenced form of assessment, in that it measures the student's writing against a standard rather than against the work of peers.

- *Analytic*: Several specific aspects of the writing are each evaluated separately, using a standard evaluation tool. For example, syntax might be rated by using an index of subordination, or vocabulary might be rated using number of different words. This method is usually used with writing elicited through a prompt.
- *Curriculum-based measurement (CBM)*: A short, timed sample of writing is elicited in response to a curriculum-based topic or story starter. The writing is analyzed according to criteria drawn from the curriculum goals in terms of both form (vocabulary, sentence structure, and spelling) and content. Alternatively, writing artifacts collected in a student's portfolio can be analyzed.

Because secondary students are required to produce several varieties of written products, we may want to look at more than one writing sample in doing this assessment. For this purpose, artifact analysis is especially useful. We can ask the student to bring writing samples from several class assignments for us to analyze. We can use the questions in [Box 13-10](#) to guide us as to which kinds of assignments are most important to assess. We would probably want to focus on a few types of writing that are required most often and that the student perceives as most troublesome.

Scott and Erwin (1992) suggested a hierarchy of approaches to writing assessment that makes use of all Espin et al.'s (2004) methods. The clinician may choose to assess all of these at an initial evaluation; later we may want to track just one or two aspects of writing to assess progress in intervention.

The first element in this hierarchy is *fluency*. Fluency refers to the ability to provide products that are sufficiently long and elaborated for the topic and audience. Malecki and Jewell (2003) report that three analytic measures of fluency are typically used to assess timed writing samples (of 3 to 5 minutes), elicited with the CBM method. These measures are:

- The number of words written.
- The number of words spelled correctly.
- The number of correct word sequences; that is, each pair of adjacent words is examined, and the rater decides if the pair is correct and in terms of spelling, grammar, punctuation, and meaning. The number of correct sequences is counted.

The first two measures have been shown to be most important for writing at the elementary school level (Malecki & Jewell, 2003). However, many of our students with LLD will be writing below grade level, and these measures give us a way to easily document change over time in students' writing. As such, they can be helpful

pre-/post-intervention measures of fluency for secondary students with LLD. For students writing at higher levels, Espin et al. (2008) found that using 7-minute writing samples produced in response to prompts, and computing the number of correct word sequences minus the number of incorrect sequences, produces the most valid index of fluency.

A second aspect of student writing is *lexical maturity*. This can be assessed using a primary trait analysis. A simple method was suggested by Isaacson (1988). We can count the number of words with more than seven letters in a composition. This value has been shown to have a high correlation with scores on achievement tests. Alternatively, we can use the same criteria we talked about earlier in our discussion of the literate lexicon to examine the vocabulary used in the student's writing samples. We could look for the presence of words associated with technical and curriculum topics, metalinguistic and metacognitive verbs, and the use of adverbs and connectives. Scott and Erwin (1992) and Westby and Clauser (2005) suggested further that we look at the use of low-frequency words that add precision and color to the writing. As we saw in our exercise in [Box 13-2](#), these can usually be identified with relatively high reliability. If students produce very few such words in their writing, work on exposing them to these words in literature- and curriculum-based activities and practice in producing written passages with such words may form part of the intervention program.

The third aspect of writing product assessment is to use an analytic approach to examining sentential syntax. Here we can use the same procedures we used earlier to look at syntax in the narrative samples we collected to analyze students' grammatical production. In examining T-unit length, subordination index, and use of higher level, low-frequency syntactic structures, we want to assess whether the student is using sentences that include the syntactic characteristics of a literate language style. If these forms are lacking in the student's writing, we will want to use literature- and curriculum-based activities to provide intensive exposure to these forms. Practice producing written passages modeled after the ones with complex syntax in literature-based activities also can be part of the intervention program.

An alternative method is to use a measure of the percentage of correct word sequences (%CWS), derived from the fluency measure we discussed earlier. The %CWS measure is computed by dividing the number of CWS from the fluency measure by the total number of possible two-word sequences in the writing sample. Several researchers (Espin et al., 2005; Malecki & Jewell, 2003) have shown this measure to be a valid index of writing accuracy. Moreover, Malecki and Jewell found that it takes less than 2 minutes to compute a %CWS on a writing sample taken from a 3-minute CBM probe. As such the %CWS provides an efficient way to measure change in writing maturity over time.

Both Jewell and Malecki (2005) and Espin et al., (2008) report that the number of correct word sequences minus the number of incorrect sequences (CIWS), discussed above, is another useful measure for this purpose.

At our initial evaluation, or for students who show low scores on the %CWS or CIWS, we may also want to look at students' writing for specific *grammatical* and *mechanical errors*. Remember that Scott and Windsor (2000) showed that the number of grammatical errors in writing is one of the best ways to distinguish the writing samples of students with LLD from typical peers. In doing grammatical error analysis, we are looking for misuse of tense; poor subject-verb agreement; failure to mark plurals, possessives, and other inflections; and use of nonstandard forms such as *ain't* and *I seen*. If these errors reflect dialect usage, we want to deal with them as "second-dialect" issues, as we discussed in Chapter 5. They may be appropriate speech forms within the home community but are not acceptable in the context of formal writing. Some grammatical errors, however, may be merely "slips of the pen," the result of inattention to details as the student focuses on the composition process. We know (Scott, 1999) that students with LLD make more of these errors than their typically achieving peers. For errors of this type, the function of the editing process must be emphasized in the intervention program. We want to convey the idea that writing is not finished with a first draft and that editing for grammatical and mechanical errors must *always* be part of the writing process.

Mechanical errors include poor legibility and errors in spelling, punctuation, capitalization, and paragraph segmentation. When legibility is very poor, it may be wise to use word-processing equipment instead of insisting students write by hand. This suggestion could be part of the consultation program, when the SLP talks with teachers about curricular modifications for the student with LLD. Other mechanical errors may be "slips of the pen" or they may be the result of incomplete understanding of the rules of writing mechanics. We can determine this by asking students to edit their work and determining whether the student can detect and correct mechanical errors. If not, we should include some work on spelling, punctuation, capitalization, and paragraphing as part of the intervention program, or consult with the LD specialist about including them.

An additional method of writing assessment includes the *holistic* rating (Espin et al., 2004). Here we rate the overall quality and effectiveness of the writing, taking into account its content, organization and macrostructure, cohesion, the transition from thought to thought, and the degree to which the writing accomplishes the intended purpose and provides for the audience's informational needs. Espin et al. (2005) and Jencks (2003) discussed the ways in which holistic assessment can be accomplished. Table 13-10 presents a holistic scoring system adapted from Dagenais and Beadle (1984), Espin et al. (2005), Malecki and Jewell (2003), and Wiig (1995) that can be used to guide the formation of this global judgment.

Westby and Clauser (2005) suggested, in addition, using rubrics, or sets of rules or benchmarks, to differentiate among levels of writing performance, and to provide direction for intervention. They provide example rubrics for evaluating various genres of written language, which appear in Appendices 13-7 through 13-10. Figure 13-7 provides a general writing assessment rubric adapted from Popp, Ryan, Thompson, and Behrens (2003). The clinician assigns a level from 0 to 6 to each element of writing identified, and writes a brief note in the corresponding cell of the form. For example, a clinician might score "ideas" with a 3, and write in the "3" row under ideas "shows some insight."

In addition to assessing writing skills at the beginning of an intervention program, we want to assess changes in writing through the course of the treatment, to decide when objectives have been achieved. Hewitt (2001) advocated using *portfolio assessment* for this purpose. Portfolio assessment involves systematically collecting samples of the student's writing throughout the course of the intervention program and using these samples to evaluate progress. Students are involved in the choice of material to be included in the portfolio and are encouraged to use self-evaluation as well as the teacher's or clinician's judgment to assess their progress. Mitchell, Abernathy, and Gowans (1998) emphasized the importance of clearly defining the focus of the portfolio, so that students know what is being assessed. If the focus is to show progress over a term, students should select materials from beginning, middle, and final periods of time. If it is to showcase the student's "best work," then the student should be clear on the guidelines to use in selection. Griffith, Dastoli, and Rogers-Adkinson (1994) argued that using student self-evaluation in the context of portfolio assessment helps students reflect on their strengths and weaknesses, set personal goals, appreciate their own progress, and take more ownership of their work. Figure 13-8 provides a form for summarizing the range of writing assessment we have been discussing. A form like this one can be used by both the clinician and student to evaluate each element in the portfolio. Students can compare their self-assessment with the clinician's and talk about how much progress their writing has shown and what still needs to be improved.

Figure 13-9 presents a writing sample of Crystal's, our client from the beginning of the chapter. You might like to try completing Figure 13-8 with an analysis of her writing. Our assessment appears in Appendix 13-11.

Assessing the "Metas"

We've talked a lot about the importance of metalinguistic and metacognitive skills for success in school, and in secondary school this need is even more pronounced. We've already looked at some ways to assess certain advanced language skills at a "meta" level, such as the ability to define words and to edit writing. Let's look at four additional areas we may want to assess in adolescents with LLD to get a picture of "meta" skills: metalinguistic skill, metapragmatic ability, comprehension monitoring, and metacognition.

Asking students to edit peers' writing samples provides an informal assessment of metalinguistic ability.

TABLE 13-10 A Sample of Holistic Evaluation Criteria for Assessing Students' Written Products

Score	Description
1. Below basic, inadequate	A below-average paper may present some content; contains errors such as the following: • Omits information or makes only cursory reference to required information, gives insufficient detail or provides irrelevant information; ambiguous or incomplete cohesive marking, meaning is unclear. • Lacks adequate organization. • Contains significant omissions, digressions; may be a disconnected list. • Uses inappropriate tone. • Shows poor control of conventions of standard English; lacks variety in language choice.
2. Basic, but minimal	A low-average paper. It shows most of the following: • Contains sparse number of ideas or propositions, omits important information; some cohesion errors. • Shows some organizational pattern, but has little elaboration. • Rambles; may contain irrelevant details. • Shows limited variety in word and sentence choice. • Shows limited use of conventions of standard English. • Inappropriate tone for purpose and audience.
3. Proficient	An average paper. It may exhibit some of the following: • May imply but not specify certain key information, may lack certain necessary details. • Shows some organization and use of appropriate cohesion, but may be disjointed in moving from one thought to another. Some segments may be out of sequence, omitted, or marked by digressions. • Shows some range of vocabulary and sentence types. • Shows a few errors of standard English usage. • May lack appropriate tone for purpose and audience.
4. Elaborated	A good paper, above average, but not top. • May be less rich in language and detail than a top paper and not so well organized or appropriate, but it is basically well written. • Shows reasoning, clear and useful examples, adequate sentence variety, and general facility with the conventions of standard English.
5. Advanced, superior	A top paper, but not necessarily perfect. It does most of the following: • Includes adequate number of ideas, or propositions; provides sufficient information with adequate details. • Has clear cohesion and organization and moves logically from one paragraph to the next; a clear structure is followed; reader gets a sense of "wholeness"; parts of the composition are related to overall theme or topic. • Shows insightful reasoning, clear and useful examples. • Shows good sentence variety, and general facility with the conventions of standard English. • Uses a consistent and objective tone appropriate to the purpose and audience.

Metalinguistics

Asking students to edit their own or others' writing samples is, of course, an excellent metalinguistic assessment task, one that can provide information on students' ability to focus on the form rather than the content of written language. If we find students having difficulty with editing, we may want to use dynamic assessment to explore further. For example, if we learn that students are unable to detect errors in writing without any scaffolding, we might provide them with a writing sample in which errors have been highlighted but not corrected. We can then see whether guiding the students' selective attention to the error allows them to make appropriate corrections. If so, we might consult with teachers and ask them to return the student's papers with errors highlighted but not corrected so the student can practice making the corrections. Eventually, focus can shift to error detection.

Paraphrasing is another important metalinguistic skill for secondary students. It is needed to write information gathered from library or internet research as they prepare papers and to summarize information from classroom texts. We can assess paraphrasing

ability by asking students to read sentences at their reading level or listen to sentences and restate them. Material for paraphrasing can be drawn from classroom texts or literature materials. Complex sentences, such as "When the pioneers traveled west, they often encountered hardships," will probably be the best sources of paraphrasing activity. Ambiguous sentences, such as those used in proverbs and humor, also are excellent sources. Here the student can be asked to paraphrase a sentence such as "Visiting relatives can be boring." We can then ask, "Can it mean anything else?" If students are unable to detect ambiguity in sentences, some work with ambiguous sentences may be included in the intervention program.

Metapragmatics

We can probe metapragmatic skills by asking students to describe the rules of various interactive situations. Nelson (1998) suggested that, for example, we ask students to describe how the rules for taking a conversational turn politely differ from the rules for taking a turn in an argument. Walker, Schwarz, Nippold, Irvin, and Noell

	Ideas	Organization	Voice	Word choice	Sentence fluency	Conventions
0: Unscorable; inadequate						
1: Marginally acceptable; needs improvement						
2: Shows emerging skills						
3: Average for grade level, shows adequate performance						
4: Shows proficiency; basic skills mastered						
5: Above average for grade, well-constructed, shows some insight						
6: Superior, shows insight, logic, varied forms						

FIGURE 13-7 Example rubric. (Adapted from Popp, S., Ryan, J., Thompson, M., & Behrens, J. [2003]. Operationalizing the rubric: The effect of benchmark selection on the assessed quality of writing. ERIC Document # 481661.)

(1994) suggested using video technology to assess pragmatic skills. Students can be shown a videorecorded scenario (such as a student attempting to enter a conversation with other teens; or a student responding to teasing or provocation), then asked to select an appropriate ending from several displayed on the screen or simply to predict an appropriate ending. Since classroom pragmatics are so important for school success, we may wish to focus on student's awareness of the rules for interaction in the classroom. Creaghead (1992) posed a set of specific questions that we can ask students to assess their awareness of the rules of the classrooms of individual teachers. These appear in Box 13-11. In addition, we may want to interview certain teachers to ask them whether the student is aware of classroom rules. We might rephrase each of the questions in Box 13-11. We might ask for example, "Does (client) know when to be quiet?"

Comprehension Monitoring

We talked in Chapter 11 about assessing comprehension monitoring in the L4L period. Barrier games can be used to assess comprehension monitoring in the advanced language stage as they were in the elementary grades. Lloyd (1994) reported that students in secondary grades should be able not only to detect missing information in these games, but to be able to identify what is missing and ask an appropriate, specific question to resolve the problem. Secondary students who are unable to use such strategies in barrier games would benefit from training and practice in monitoring their comprehension and resolving problematic messages in this context. The difference here would be that the material we ask students to process would be more complex. Instead of asking them to "Find the (mumble)," as we did with younger children, we might ask students to "Draw a circular (mumble)," or "Choose the rhomboid shape."

FIGURE 13-8 Worksheet for summarizing information from written language evaluations. (Adapted from Dagenais, D., & Beadle, K. [1984]. Written language: When and where to begin. *Topics in Language Disorders*, 4, 59-85)

Because so much information is presented in the form of class lectures during this period, it will be very important to assess whether the student can monitor comprehension during classroom presentations. Here curriculum-based assessment, using recorded lectures, is useful. This kind of assessment can be integrated with the assessment of basic comprehension that we discussed earlier. After determining whether the student is able to grasp the information presented in the lecture, we might have the student listen again, this time fast-forwarding the recording during a critical piece of information, then continuing the play without comment. We can observe what, if anything, the student does to indicate that some information was missed. If the student fails to indicate a need for further information, we might use a dynamic assessment technique. We can stop the recording, tell the student to be sure to ask if he or she missed anything or needs to hear something again, then repeat the fast-forward procedure. If such cueing helps, we can use a learning-strategies approach to teach the student to provide self-cues to monitor comprehension (see Chapter 14). If the cueing provided in dynamic assessment does not make a significant

BOX 13-11 Questions for Assessing Awareness of Classroom Pragmatic Rules

When is it important to be quiet in this class?
 When is talking OK?
 When can you talk without raising your hand?
 When can you ask questions?
 Is it all right in this class to ask another student for help?
 What are you supposed to do when you need help?
 When are you supposed to give a short answer, and when
 should you given an elaborated answer?
 How important is using correct grammar and spelling when
 you write for this teacher?
 Does this teacher care if you put an "X" when the directions
 say, "Put a check"?

Adapted from Creaghead, N. (1992). Mutual empowerment through collaboration: A new script for an old problem. In W.A. Secord (Ed.), *Best practices in school speech-language pathology* (vol. II) (pp. 109-116). Austin, TX: Psychological Corporation: Harcourt Brace Jovanovich.

change in the student's performance, a more direct approach, like Dollaghan's (1987) method, described in Chapter 12, may be tried.

In addition to monitoring comprehension of spoken language, our students with LLD need to learn to monitor their reading comprehension. Yu-Fen (2006) suggests that comprehension monitoring skill is particularly important in the development of critical reading, the kind necessary for many secondary school tasks. Again, as we did for comprehension of spoken language, we want to assess basic informational comprehension of written material before looking at comprehension monitoring. We can use the standard reading comprehension tests discussed earlier to do this basic-level assessment. If students' basic reading comprehension is above a fourth-grade level, we can examine monitoring of reading comprehension. Here we might present photocopies of text material at the student's reading level, or instructions from a board game, a how-to pamphlet, or written instructions for a craft project or homework assignment, with critical words blurred so they are illegible, or substituted by

words that make little sense in the context. If the student does not protest or ask for further information, some deficit in monitoring comprehension in reading can be inferred.

Metacognition

Metacognition, or *executive function* (EF), includes a range of cognitive control mechanisms that enable goal-oriented behavior, cognitive flexibility, inhibition of irrelevant information, and self-control, or *self-regulation* (Bashir, & Singer, 2007; Turkstra & Byom, 2011). Executive function is typically assessed by neuropsychologists using standard tests such as the *Wisconsin Card Sort* (Heaton, 1981), but these often fail to identify EF difficulties in real life and academic situations. McDonald's (2010) *Functional Assessment of Verbal Reasoning and Executive Strategies* was developed to evaluate EFs in communicative contexts, and can be of use to SLPs in evaluating this area. In addition, we can assess metacognitive skill by using "think-aloud protocols" similar to those we used to assess the planning process in writing. Here we would present students with a task, such as studying a text passage to be tested for recall later, generating an inferential set for a textbook chapter to be read, or planning what might be done to improve a grade in a course. We can ask students to think out loud as they attempt to solve the problem and listen to the strategies used in the thinking. Saldana (2004) suggested supplementing this form of assessment with some dynamic cueing. Here the clinician provides focused assistance, such as reminding the student what the task is, suggesting the use of a new strategy if the student is having difficulty, reminding the student to use the strategy discussed, and so on. Bannert & Mengelkamp (2008) suggested an alternative dynamic assessment: giving students a problem to solve or task to complete without cueing, having them think out loud, and then periodically prompting them to reflect on their thinking as they go through the task. With this method, the ability of the student to use metacognition when cued can be compared to performance when uncued. If students do better with either form of cueing, we may want to continue such modeling and practice in the intervention program. If not, a more structured approach to metacognition, such as the cognitive behavior therapy (CBT) program discussed in Chapter 12, may be a useful addition to the intervention program.

ASSESSING FUNCTIONAL COMMUNICATION IN THE ADVANCED LANGUAGE STAGE

In addition to assessing students' academic communication, we also want to look at their functional communicative skills. This is especially true for older adolescents, at 16 to 21 years of age, who will soon be making the transition from secondary school to higher education or vocational placement, and from family to independent living. As we said when we talked about older clients at the L4L stage, these students will probably already be identified as eligible for services so very little, if any, standardized testing will be needed. Most assessment methods will be observational or criterion referenced. When we do criterion-referenced or observational assessments for the older, moderate to severely impaired client, we want to use chronologically age-appropriate tasks and materials, of course. We also need to focus on community-referenced assessments.

For students with LLD who are between 16 and 21 years old, Individualized Transition Plans (ITPs), similar to IEPs, are required by the Individuals with Disabilities Education Act (IDEA) legislation. A sample from McNamara (2007) appears in [Appendix 13-12](#). They may be developed for students from the age of 14, if appropriate. Generally, the ITP addresses progress toward high school graduation, outlines the post-secondary education or training the student needs, discusses the community-living support required, and makes preliminary plans to help the student succeed in employment and daily living settings. The communication assessment involved in developing the ITP is community referenced, as we discussed earlier. If a job or on-the-job-training placement has been decided on during the student's last years in school, the clinician may want to visit the site to do an ecological inventory of the kinds of listening, speaking, reading, and writing demands placed on the student. If college, community college, or vocational training is part of the plan, assessment of the communicative demands of these settings also will be necessary. Lunday (1996) developed a "Communication Checklist" for assessing the communicative demands of post-secondary and vocational settings. This appears in [Figure 13-10](#). Singh et al. (2009) report evidence for the validity of the *Questions About Behavioral Function* (QABF; Singh et al., 2006) for this purpose. Communicative demands of post-school settings can form the basis of the functional communication program designed for the student while still in school.

In addition, we want to talk with the family about their plans for having the student make the transition to independent living. Their input on the student's needs is especially important, since they are most familiar with how the student communicates in everyday life. The family can tell us what they feel are the most important areas in which the student's social communication must improve for an independent-living situation to succeed. Using a checklist such as Bedrosian's (1985) in [Figure 11-7](#) can help parents to focus on the interactive skills with which the student may need additional help to function autonomously. These skills should get high priority in the intervention program during the student's last years in school.

Special Considerations for High-Functioning Students with Autism Spectrum Disorder (ASD)

Although many adolescents with ASD will benefit from assessment of functional and community-referenced aspects of communication skills as students with other disabilities do, those with high

levels of language and cognition may be preparing to enter higher educational settings along with their peers. For these students, who may have strong academic skills, at least in some areas, social communication will often lag behind. Although they may need support for the development of daily living and self-care skills in a variety of areas, it is in the domain of developing conversational and social interactional skills that the SLP can be of most help. Assessment of these areas, as these students begin their transition from high school to secondary education and independent living, is the job of the SLP.

Norm-referenced rating scales can be used to get an initial picture of the student's areas of social communication difficulty. The *Children's Communication Checklist—2* (Bishop, 2006), which is normed to 16 years, is especially useful because it allows the identification of a discrepancy between semantic/syntactic forms and functional use of language. Two additional rating scales that can be helpful for assessing social communication are the *Social Responsiveness Scale* (Constantino, 2000), and the *Social Skills Rating System* (Gresham & Elliot, 1990), both of which can be completed by parents and teachers to provide multiple perspectives on the student's interactive skills and are normed to age 18. Gilliam and Miller's (2006) *Pragmatic Language Skills Inventory*, though normed only to 13 years, may also be helpful. Examining the items endorsed as deficits by parents and teachers on these measures can help to pinpoint areas for intervention.

Many of the observational measures of conversational pragmatics that we examined earlier in this chapter will be relevant for speakers with ASD. It is also important to remember, though, that many speakers with ASD may do better with adults, who are more supportive and tolerant, than they do with peers. For this reason, observation of a peer interaction, using formats like the Nippold et al.'s (2007) Peer Conflict Resolution Task or Favorite Game/Sport task directed to a peer, can be more informative. Unlike in the Nippold study, however, here the goal is to examine not syntax but the pragmatics of explanation and negotiation. Paul et al. (2009) reported that the areas of conversational skill most likely to be affected in ASD are the management of topics and information and the ability to keep a smooth back-and-forth flow to the conversation. A form such as the one in [Figure 13-5](#) can be used to record these observations. These are areas that can serve as the focus of observation in peer interactions. In addition, speakers with ASD often show difficulty with the understanding and use of prosody (Paul et al., 2005). Prosody is an additional focus when doing observational analysis. [Table 13-11](#) provides an example form for rating prosodic production. Deficits identified in peer conversations can serve as the basis for the development of intervention, using methods described in the next chapter.

CONCLUSIONS

Assessment of advanced language has much in common with the assessment of students in the L4L stage. Both must focus not only on form and content, but also on the way language is used in the unique environment of the classroom. Both must look at how oral language skills support that acquisition of new information from spoken and written material alike. Both must investigate how a student's communicative abilities match the demands of the curriculum and the school environment, and both look beyond the processing of language itself to the ability to focus on metalinguistic and metacognitive activities.

Student: _____				Teacher: _____							
Observer: _____				Class: _____							
Date: _____				Hour: _____							
Teacher's Expectation			Student's Success			Teacher's Expectation			Student's Success		
yes	no	n/a	pos	+/-	neg	yes	no	n/a	pos	+/-	neg
I. Vocabulary						describe equipment breakdown?					
Does the student need to:						explain errors?					
understand technical terms/jargon?						retrieve previously learned information?					
use technical terms/jargon?						IV. Organization					
use terms in question form?						Does the student need to:					
comprehend abstract or figurative expressions?						keep an organized notebook?					
read terms in manuals or textbooks?						follow prescribed schedule or routine?					
read terms on diagrams, charts, and graphs?						anticipate direction from the classroom routine?					
write terms in notes, reports, or tests?						manage time based on a syllabus?					
spell terms accurately?						use classroom materials independently?					
summarize project in written report?						V. Form					
identify abbreviations/symbols?						Does the student need to:					
II. Use						comprehend multilevel directions in complex syntax?					
Is the student required to:						listen for organizational cues or signal words?					
converse with others in group settings?						decipher complex information?					
request tools, supplies, or parts from a stock depot?						understand test directions independently?					
follow a step-by-step procedure?						use writing mechanics correctly?					
plan or design a schedule/procedure?						relate worksheet information to test format?					
explain a procedure to instructor/other student?						VI. Pragmatics					
ask for specific help?						Is the student expected to:					
verbally detail equipment malfunction?						differentiate speech/register when interacting (e.g., peers, teachers, authority figures, general public)?					
identify and report safety hazards?						use language appropriate to various settings (e.g., classroom, private conversations, group project activities)?					
orally report assignment/project completion?						give and react to nonverbal cues?					
attend lecture presentations?						listen for content importance transmitted by prosody?					
maintain a topic focus?						modify communication based on feedback?					
III. Function						initiate, take turns, and terminate interactions?					
Is the student required to verbally:						display responsive and appropriate language behavior?					
participate in classroom discussions?						handle concerns and complaints appropriately?					
define technical terms?						provide and support an opinion?					
sequence step-by-step procedures?						Other Comments:					
report progress?											
paraphrase information?											
formulate specific questions?											
respond to procedural questions?											
express/support ideas?											
provide suggestions?											
give detailed advice?											
acknowledge others?

Intonation (melody patterns of speech)			
Voice quality			
Voice resonance (nasality)			

The major difference between the focus of assessment at the L4L stage and that of advanced language is that in assessing advanced language we are working almost exclusively at the literate end of the oral-literate continuum. We are trying to establish the degree to which a student can make sense and make use of the low-frequency, high-density, abstract, and decontextualized language that characterizes literate speech and writing. To do this, we often need to set up special contexts and look not for how often forms are used, but whether they are used at all. And we need to focus even more sharply on the “meta” in assessment, since these skills are essential to success in producing and understanding literate discourse.

Let’s look at Mr. Janis’s assessment plan for Crystal to see how he would use these principles to guide his selection of evaluation procedures.

Mr. Janis met with Crystal to tell her about her score on the CELF-4 screening test, to report to her about her teachers’ comments, and to ask her what she thought about her performance in school. He said he would like to do some more testing and talk some more with her teachers to come up with some ideas for helping her improve her grades. He went through the self-assessment form (see Figure 13-1) with her to get some insight into what she considered her strengths and weaknesses. He asked whether it would be OK with her if he asked her teacher to record some of her classes so he could listen to them later. He said he would call her parents, too, and talk the idea over with them.

Crystal’s parents told Mr. Janis on the phone that they knew Crystal was having trouble again, because her first-term grades had been poor and she was starting to say she hated school. They were willing to have Mr. Janis do some more assessment to see whether there were things that could be done to help.

Mr. Janis contacted the school LD specialist, Ms. Naninger, who also had been monitoring Crystal, and called the district reading specialist to plan a transdisciplinary assessment. The reading specialist agreed to assess reading comprehension, and Ms. Naninger arranged to interview Crystal’s teachers about her performance. Mr. Janis asked Ms. Naninger to include in her interviews questions from Box 13-5 to get a sense of how her various teachers saw her communication needs and whether there was a consensus among them.

To establish eligibility for services, Mr. Janis gave Crystal the *Test of Adolescent and Adult Language—4* (TOAL-4;

Hammill, Brown, Larsen, & Wiederholt, 2007). Her ranks on all the subtests were below the tenth percentile, with listening a relative strength, and speaking, reading, and writing weaker. Mr. Janis’s initial conversation with Crystal had convinced him that she was functioning at an advanced language level; he’d heard few grammatical errors, but did detect some word-finding problems. He found her to be a good conversationalist who was easily engaged in interaction, although she seemed to use an inordinate number of self-corrections and a run-on style in her speech.

He reviewed the information gathered in the teacher interviews by Ms. Naninger. The teachers’ comments indicated a consensus that Crystal had trouble with using appropriate vocabulary, planning for and completing assignments, participating in class discussions, writing and note-taking, understanding material presented in texts and lectures, and solving problems with verbal reasoning. All the teachers agreed that Crystal’s strengths were in peer interaction. She was popular with other students and had few obvious difficulties interacting with them, despite her somewhat run-on speech style. Crystal’s self-assessment also identified writing papers, understanding written material, using a dictionary, organizing and finding main ideas, and participating in class discussion as areas that gave her trouble. The reading specialist’s testing showed that Crystal’s comprehension was at about a fifth-grade level in most areas.

Mr. Janis decided not to do an assessment of conversational pragmatics at this time, because Crystal’s interactive skills were reported to be a strength. He did tell Crystal, though, that if she started to have trouble conversing with peers or understanding their slang, she should let him know and he would look into it. Similarly, he decided not to do a great deal of criterion-referenced assessment of her basic listening skills, since these, too, were a relative strength, according to the TOAL-4. He did want to look at classroom comprehension, though, because of the special demands of that listening situation. Mr. Janis designed the following plan to gather criterion-referenced information on her communication skills:

- Use the *Test of Adolescent/Adult Word Finding* to document word-retrieval problems. Conduct a curriculum-based assessment, using passages from her English text, which she said she liked, and her science text, which she said was the most difficult for her. Use the passages to look at her comprehension of advanced vocabulary and word relations,

her comprehension of advanced syntax, and reading comprehension-monitoring skill. Probe her ability to produce word definitions by asking her to define some of the more unfamiliar words in the passages. Use dynamic assessment to assess expository text comprehension in the science passage. Ask Crystal to read the description of one of the characters in a literature selection in the English text and make inferences about the character.

- Collect a spoken narrative and written narrative sample, each describing an episode of a favorite TV show, to examine T-unit length, subordination index, use of low-frequency forms, %CWS, expression of internal responses, and use of cohesive markers.
- Have Crystal bring a writing sample from an English and a science homework assignment she's completed. Assess her writing in terms of fluency, lexical maturity, sentential syntax, grammar and mechanics, and overall quality. Assess metalinguistic ability by asking her to edit one of the papers that contains errors.
- Ask Crystal to write a set of instructions on how to knit a sweater (her hobby). Assess planning and metacognitive processes in writing, using a "think-aloud" protocol. Use dynamic assessment to prompt reflective thinking and determine whether the prompts improve Crystal's performance on subsequent trials.
- Assess Crystal's classroom pragmatic skills by listening to an audio recording of her class performance and noting any problems in Crystal's participation or lack of it. Have Crystal listen to a portion of the lecture and provide a summary. Have her listen to another portion and take notes on it. Ask her to give the main idea of the lecture. Use dynamic assessment, providing a written outline of one portion of the lecture with blank lines for Crystal to fill in with notes. Have her summarize this portion and note differences from the unguided summary. Use the "fast-forward" procedure to assess comprehension monitoring skill.

Although the evaluation process took some time, Mr. Janis was able to use dynamic assessment as a diagnostic teaching procedure, so that he was doing some intervention as he was gathering the data. When he'd collected all his information, he felt in a good position to develop a strong transdisciplinary intervention program that would improve Crystal's chances of successfully completing her schooling.

STUDY GUIDE

I. Language Development in Adolescence

- A. What is meant by advanced language development?
- B. What is formal operational thought?
- C. What literate language skills are learned during this period?
- D. How does the development of formal operations affect language use?
- E. What are some of the new demands of the secondary classroom?

II. Student-Centered Assessment

- A. How can students be involved in the assessment process?
- B. Why is student involvement important?

III. Screening, Case Finding, and Establishing Eligibility with Standardized Tests in the Advanced Language Period

- A. What is the purpose of screening in the advanced language period?
- B. For what populations does screening make most sense?
- C. What other sources of referral are available for adolescents? How can they be accessed?
- D. What is the role of standardized testing at the advanced language stage?

IV. Criterion-Referenced Assessment and Behavioral Observation in the Advanced Language Stage

- A. How can we establish that a student is functioning at the advanced language stage?
- B. Discuss methods for assessing the literate lexicon.
- C. How can word-retrieval difficulties be documented in adolescents?
- D. When and how should word definition skill be assessed?
- E. What aspects of word relations can we examine in adolescents? What methods can be used?
- F. How can understanding of figurative language be analyzed?
- G. Discuss procedures for examining semantic integration and verbal reasoning.
- H. How would you assess syntactic comprehension in a teenager?
 - I. Discuss three methods of assessing syntactic production. What sampling context(s) would you use for the assessment?
 - J. Discuss methods and contexts for evaluating conversational pragmatics in adolescents.
 - K. How can we assess an adolescent student's classroom discourse performance?
 - L. Discuss the difference between *informational* and *critical* listening. How can each be evaluated?
 - M. Discuss narrative analysis at the advanced language level. What will we be looking for? How will we analyze it?
 - N. Describe methods for assessing understanding of expository text structure.
 - O. How would you evaluate a student's processing of persuasive texts?
 - P. Describe methods for assessing the process and products of students' writing.
 - Q. What are the "meta" skills we can examine in secondary students? How can each be evaluated?

V. Assessing Functional Needs in the Advanced Language Stage

- A. What are Individual Transition Plans? For whom are they done? What do they contain?
- B. What kind of transition planning can be done for a student going directly from high school to employment? To a higher educational setting?
- C. What kinds of assessments are necessary for transition planning?
- D. What are the area(s) most important to assess in high-functioning students with ASD?

A Sample of Language-Screening Instruments, Grades 6 through 12

Test	Age Level	Areas Assessed	Comments
<i>Adolescent Language Screening Test</i> Morgan, D.L. & Guilford, A.M. (1984). Austin, TX: Pro-Ed	11–17 yr	Pragmatics, receptive and expressive vocabulary, concepts; sentence formation; morphology; phonology	Outlines dimensions needing further testing. Administration time: 15 min.
<i>CELF-4 Screening Test</i> Semel, E., Wiig, E.H., & Secord, W. (2004). San Antonio, TX: Harcourt Assessment	5–21 yr	Receptive, expressive, grammatical, and semantic skills	Correlates with CELF-4. Yields a criterion score. Administration time: 15 min.
<i>Speech and Language Evaluation Scale</i> Fressola, D.R., & Hoerchler, S.C. (1989). Columbia, MO: Hawthorne Educational Services	4:6–18 + yr	Articulation and voice, fluency, pragmatics, form, content	Has teacher rating scale plus speech and language scale. Normed on 4501 students. Administration time: 20 min.

A Sample of Language Assessment Tools, Grades 6 through 12

Test Name, Author(s), Date, Publisher	Age Range	Areas Assessed	Comments
<i>Adapted Sequenced Inventory of Communication Development for Adolescents and Adults with Severe Handicaps</i> (McClennen, S.E. [1989]. Melbourne, Australia: Psych Press)	Adolescent–adult	Speaking, listening	For use with people with hearing loss, legal blindness, epilepsy, spastic quadriplegia, nonambulation. Similar to Sequenced Inventory of Communication Development. Yields age-equivalent scores. Administration time: 30–60 min. Group or individual administration. Administration time: 25–45 min.
<i>Assessment of Classroom Communication and Study Skills</i> (ACCS) (Simon, C.S. [2000]. Tempe, AZ: Communi-Cog Publications)	9–16 yr	Oral and written directions, inferences, math word problems	
<i>Bader Reading and Language Inventory—6th Edition</i> (Bader, L. & Pearce, D. [2009]. Upper Saddle River, NJ: Prentice Hall)	K–12 and adult	Inventory of tests to assess reading and language abilities	Graded reading passages for all ages and skill levels. Preliteracy tests, including cloze tests to assess the knowledge of semantics and syntactic grammatical processing and phonics and structural analysis. Interest and attitude tests for a more accurate diagnosis. Yields criterion-referenced “levels of proficiency.” Administration time: 10–15 min. Software scoring package available (CELF-4 Clinical Assistant). Screening also available for ages 5–21. 11 subtests. Yields standard, percentile, age-equivalent scores. Normed on 2400 students. Administration time: 30–60 min. Software package for scoring available. Yields percentiles, stanines, standard scores, and age equivalents. Administration time: 30–45 min. for core battery.
<i>Bilingual Syntax Measure II</i> (Burt, M.K., & Dulay, H.C. [1980]. San Antonio, TX: The Psychological Corporation)	Grades 3–12	Syntax mastery (expressive); tests in English and Spanish	
<i>Clinical Evaluation of Language Fundamentals—Fourth Edition</i> (Semel, E., Wiig, E.H., & Secord, W. [2003]. San Antonio, TX: Harcourt Assessment)	5–21 yr	Semantics, syntax, memory, receptive and expressive composite	Spanish version available. Yields standard, percentile, age-equivalent scores. Co-normed with the <i>Receptive One-Word Picture Vocabulary Test</i> . Administration time: 15–20 min. Yields criterion-referenced information. Administration time: 45 min.
<i>Comprehensive Assessment of Spoken Language</i> (Carrow-Woolfolk, E. [1999]. Circle Pines, MN: AGS Publications)	3–21 yr	Lexical, semantic, syntactic, pragmatic awareness of appropriate forms, complex comprehension	
<i>Expressive One-Word Picture Vocabulary Test—2000 Edition</i> (Brownell, R. [Ed.]. [2000]. Novato, CA: Academic Therapy Publications)	2–18 yr	Naming	
<i>Evaluating Communicative Competence</i> (Simon, C.S. [1994]. Eau Claire, WI: Thinking Publications)	10–18 yr	Language processing, metalinguistic skills, functional uses of language	

Continued

Test Name, Author(s), Date, Publisher	Age Range	Areas Assessed	Comments
<i>Fullerton Language Test for Adolescents—Second Edition</i> (Thorun, A.R. [1986]. Austin, TX: Pro-Ed)	11 yr–adult	Auditory synthesis, morphology, oral commands, convergent and divergent production, syllabification, grammar competency, idioms	Yields standard scores. Standardized on 762 adolescents. Administration time: 1 hr.
<i>Functional Communication Profile—Revised</i> (Kleiman, L.I. [2003]. East Moline, IL: LinguiSystems)	3 yr–adult	Functional communication profile in 11 areas: sensory, attentiveness, receptive language, expressive language, pragmatic/social, speech, voice, oral, fluency, non-oral communication	Targets practical skills that people encounter daily. Especially useful for clients diagnosed with autism or severe disorders. Administration time: 45–90 min.
<i>Language Assessment Scales—Reading and Writing</i> (LAS R/W) (Duncan, S., & DeAvila, E. [1994]. Monterey, CA: CTB-McGraw-Hill)	Grades 2–12	Language proficiency	Administration time: 60–90 min. Measures English language reading and writing proficiency of students whose first language is not English.
<i>Oral and Written Language Scales</i> (OWLS) (Carrow-Woolfolk, E. [1996]. Austin, TX: Pro-Ed.)	5–21 yr	Measures Written Expression, Oral Expression, and Listening Comprehension	Normed on 1700 individuals. Administration time: 15–25 min.
<i>Peabody Picture Vocabulary Test—IV</i> (Dunn, L.M., & Dunn, L.M. [2007]. Circle Pines, MN: American Guidance Service)	2:6 yr–adult	Receptive vocabulary	Spanish version available. Yields standard, percentile, age-equivalent scores, stanine. Provides standard error of measurement. Standardized on 4012 subjects 2–18 yr old. Administration time: 10–15 min.
<i>Receptive One-Word Picture Vocabulary Test—2000 Edition</i> (Brownell, R. (Ed.). [2000]. Novato, CA: Academic Therapy Publications)	2–18 yr	Receptive vocabulary	Spanish version available. Yields standard, percentile, age-equivalent score. Similar to norming population for Expressive One-Word Picture Vocabulary Test. Administration time: 20 min.
<i>Rhode Island Test of Language Structure</i> (Engen, E., & Engen, T. [1983]. Austin, TX: Pro-Ed)	3–20 yr	Receptive syntax	Designed for hearing impaired, but can be used for ESL populations or for students with LLD or developmental disorders. Yields criterion-referenced information. Standardized on 513 children with hearing impairments and 283 normal-hearing children.
<i>Test of Adolescent and Adult Language—4</i> (Hammill, D.D., Brown, V.L., Larsen, S.C., & Wiederholt, J.L. [2007]. Austin, TX: Pro-Ed)	12–24:11 yr	Receptive and expressive vocabulary and grammar, reading and writing, auditory comprehension	Administration time: 1–3 hr. Has software scoring program. Yields standard scores, means, and standard deviations for age. Normed on 1671 students in 35 states.
<i>Test of Adolescent/Adult Word Finding</i> (German, D.J. [1990]. Austin, TX: Pro-Ed)	12–80 yr	Naming, nouns, verbs, sentence completion, description, categories	Administration time: 20–30 min. Has 40-item brief test. Measures accuracy, speed, and secondary characteristics such as extra verbalization, gesturing, substitutions. Provides standard, percentile scores. Nationally standardized on 1753 students. Has grade norms for grades 7–12; age norms for 12–80 yr.

Test Name, Author(s), Date, Publisher	Age Range	Areas Assessed	Comments
<i>Test of Language Competence—Expanded Edition</i> (Wiig, E.H., & Secord, W. [1989]. San Antonio, TX: Harcourt Assessment)	Level 2: 10–18:11 yr	Metalinguistics, multiple meanings, multiple inferences, figurative usage, conversational sentence production	Administration time: 20–30 min. Has companion intervention program, <i>Steps to Language Competence—Developing Metalinguistic Strategies</i> (Wiig, 1989); which uses cognitive-linguistic approach. Yields standard, percentile, age-equivalent score. Receptive and expressive composite scores. Administration time: 1 hr. Administration time: 30–60 min.
<i>Test of Language Development—Intermediate</i> (Hammill, D., & Newcomer, P. [2008]. Austin, TX: Pro-Ed)	8–17:11 yr	Sentence combining, word ordering, grammatical comprehension, and picture vocabulary	
<i>Test of Problem Solving 2—Adolescent</i> (Bowers, L., Barrett, M., Huisinigh, M., Orman, J.L., & LoGuidice, C. [2007]. East Moline, IL: LinguSystems)	12–17:11 yr	Fair-mindedness, oversimplification, analyzing, thinking independently, evaluating and clarifying, generating solutions	Yields standard, percentile, age-equivalent scores. Standardized on 1051 students. Administration time: 40 min.
<i>Test of Word Knowledge</i> (Wiig, E.H., & Secord, W. [1992]. San Antonio, TX: Harcourt Assessment)	Level 2: 8–17 yr	Expressive and receptive semantics, definitions, antonyms, synonyms, multiple meanings	Yields standard, percentile, age-equivalent scores. Provides confidence interval, receptive and expressive composite. Administration time: 1 hr.
<i>Test of Written Expression</i> (McGhee, R., Bryant, B., Larson, S., & Rivera, D. [1995]. Austin, TX: Pro-Ed)	6:6–14:11 yr	Provides a comprehensive assessment of writing achievement	Individual or group administration provides raw scores, percentile ranks, standard scores. Provides evidence of reliability and validity.
<i>Test of Written English (TWE)</i> (Anderson, V., & Thompson, S. [1988]. Novato, CA: Academic Therapy Publications)	6–11+ yr	Screens mastery of capitalization, punctuation, written expression, and paragraph writing	Administration time: less than 30 min.
<i>Test of Written Language—4 (TOWL-4)</i> (Hammill, D.D., & Larsen, S.C. [2009]. Austin, TX: Pro-Ed)	9–17:11 yr	Cognitive and linguistic components of language	Can be given to individual or group. Yields standard score, written language quotient. Standardized on more than 2505 students in 18 states. Administration time: 20–60 min.
<i>Woodcock Language Proficiency Battery—Revised</i> (Woodcock, R.W. [1991]. Chicago, IL: Riverside Publishing)	2–95 yr	Oral language, vocabulary, antonyms and synonyms, reading and writing	Has Compuscore software. Yields standard, age- and grade-equivalent scores. Nationally standardized on 6300 students.
<i>The Word Test—2—Adolescent</i> (Bowers, L., Huisinigh, R., Orman, J., & LoGuidice, C. [1989]. East Moline, IL: LinguSystems)	12–17:11 yr	Brand names, word associations, synonyms, antonyms, signs of the times, definitions	Administration time: 30 min. Yields standard, percentile, age-equivalent scores. Standardized on more than 1500 students.
<i>Writing Process Test</i> (Warden, M., & Hutchinson, T. [1992]. Austin, TX: Pro-Ed)	Grades 2–12	Writing, critical thinking	Provides normative data. Can be administered in groups or individually.
<i>Written Language Assessment</i> (Grill, J., & Kirwin, K. [1990]. Novato, CA: Academic Therapy Publications)	8–18 yr	Assesses language with three types of writing samples: expressive, instructive, and creative	Can be administered to groups or individuals. Uses writing prompts. Administration time: 15–20 min.

"High Level" Words in Ward-Lonergan (2010) Passage in Box 13-3 (Each Word Identified only on First Appearance):

"Although **numerous** studies have **examined** the **ability** of children and **adolescents** with language **impairments** . . . to read and write **expository discourse**, very few have examined listening **comprehension** and **verbal production** of expository

discourse. As **previously** noted, this is a **critical** area of **investigation** in light of the fact that . . . adolescents are **required** to **comprehend** and produce expository discourse on a daily **basis** in order to **achieve academic** success in . . . school . . ."

Analysis of T-Unit Length, Low-Frequency Structures, and Subordination Index in Charlie's Oral Narrative Sample in Box 13-3

T-unit Segmentation, Length in Words, Number of Clauses per T-unit

T-Unit	Length	No. of Clauses
T1: There was a boy who was about 21 who stole a plane with a woman and champagne in the cockpit,	20	3
T2: (and) then he got court-martialed for that	6	1
T3: (and) then they sent him to a research study.	8	1
T4: It was for monkeys and chimpanzees.	6	1
T5: They taught them how to fly,	6	2
T6: (and) then what they would do is to have three classes.	10	3
T7: White would be a freshman, blue a junior, and red a senior	12	1
T8: (and) they would teach them how to fly.	7	2
T9: Then after they graduated, they took them into this plane.	10	2
T10: There's this one area, called the radiation area	8	2
T11: (and) they put them in a simulator and exposed them to radiation treatment	12	2
T12: (and) they wanted to see how long they would fly until they would die	13	4
T13: (and) so they could see how long humans could fly if they could pilot their missions if the Russians had an attack on us	23	4
T14: (and) then what the boy did is he had a friend, a chimpanzee that knew sign language	16	4
T15: (and) he talked to him	4	1
T16: (and) he taught the other apes	5	1
T17: (and) they were going to kill his friend with the radiation thing.	11	1
T18: There were these people from the Air Force Patrol	9	1
T19: (and) they were watching the studies	5	1
T20: (and) he didn't want them to kill his monkey	8	2
T21: (and so) what he did was he called the lady who taught him sign language	13	4
T22: (and) she came	2	1
T23: (and) they stole a plane with the monkeys in it	9	1
T24: (and) they finally escaped	3	1

Average T-unit length = $226/24 = 9.42$.

Subordination index = $46/24 = 1.92$.

Use of Low-Frequency Structures

Structure	Found in T-Unit
Morphology	T2, T10, T11, T17
Noun phrase postmodification	
With past participles	T10
With present participles	
With infinitives	
With appositives	T14
With relative clauses	T1, T2, T4, T5, T8
With prepositional phrases	T1, T18
Complex verb phrases	
Perfect aspect	
Multiple auxiliaries	
Passive sentence	T2 (less advanced truncated passive form)
Adverbial markers and conjunctions (e.g., <i>otherwise, instead, after all, only, still, though, anyway, in all, finally, when, because, etc.</i>)	T9, T12, T13, T24
Complex sentence types	
More than one clause type	T6, T12, T13, T14, T21
Clefting	T6, T14, T21
Left branching	T9

Evaluation: Adequate complexity in speech.

Analysis of T-Unit Length, Low-Frequency Structures, and Subordination Index in Charlie's Written Sample in Figure 13-3

T-Unit Segmentation, Length in Words, Number of Clauses per T-unit

T-Unit	Length	No. of Clauses
T1: My best personal quality is that I am very friendly with people and to anyone that needs a friend.	19	3
T2: Where I go to school there are some people that are not nice.	13	3
T3: I don't know that many kids at my school could be nice.	12	2 (Conjunction error)
T4: The people that go to my school could be nice.	10	2
T5: But there are people that are nice to [other] people like me.	12	2
T6: I am very outgoing.	4	1
T7: For example, I like to work on school plays and help the new students around school.	16	3
T8: I am very hardworking at [every thing] that I do.	9	2
T9: For example, I do my homework, [thing] on the computer and [puzzles].	12	1

Average T-unit length = $107/9 = 11.89$.

Subordination index = $19/9 = 2.1$.

Use of Low-Frequency Structures

Structure	Found in T-Unit
Morphology	
Noun phrase postmodification	
With past participles	
With present participles	
With infinitives	
With appositives	
With relative clauses	T1, T2, T4, T5, T8
With prepositional phrases	
Complex verb phrases	
Perfect aspect	
Multiple auxiliaries	
Passive sentence	
Adverbial markers and conjunctions (e.g., <i>otherwise, instead, after all, only, still, though, anyway, in all, finally, when, because, etc.</i>)	T7, T9 (not used appropriately; overused)
Complex sentence types	
More than one clause type	T2
Clefting	T2
Left branching	T4

Evaluation: Adequate T-unit length, subordination, and use of relative clauses. Probe use of adverbials and conjunctions.

Cohesion and Literary-Language Analysis of Charlie's Written Sample in Figure 13-3

T-Unit	Cohesive Device	Adequate?
T1: My best personal quality is that <i>I</i> am very friendly with people and to <i>anyone</i> that needs a friend.	Pronoun	Yes
T2: Where <i>I</i> go to school there are some people that are not nice.	Substitution	Yes
T3: I don't know that many <i>kids</i> at my school could be nice.	Pronoun	Yes
T4: The people that go to my school could be nice.	Substitution	Yes
T5: <i>But</i> there are people that are nice to [other] people like me.	Conjunction	Yes
T6: <i>I</i> am very outgoing.	Pronoun	Yes
T7: <i>For example</i> , I like to work on school plays and help the new students around school.	Conjunction	Yes
T8: <i>I</i> am very hardworking at [every thing] that <i>I</i> do.	Pronoun	Yes
T9: <i>For example</i> , I do my homework, [thing] on the computer and [puzzles].	Conjunction	No

Literate Lexicon

Metalinguistic and metacognitive verbs: *know*.

Adverbs, conjunctions, and connectives: *for example* (overused and used inappropriately), *but*.

Evaluation: Possible difficulty with cohesion; probe in longer sample. Again, probe use of adverbials and connectives.

Narrative Rubric

APPENDIX 13-7

Score	Setting and Mood	Character Development	Plot and Narrative Structure	Voice and Tone
1	The place or time in which the story takes place is unclear or altogether absent	All characters are one-dimensional and stereotypical; little or no background is given on them; little or no relationship between characters or characters who have no relation to the plot; characters do not think or feel	Events are unconnected or contain no conflict; no climax or resolution	Little attention to word choice; emotional atmosphere is not developed; no variety in sentence structure
2	Vague idea of the place and time in which the story is set ("Long ago in a faraway land . . .")	Physical description of characters is given; actions are displayed by characters	Events are told in sequence, but trivial events are mixed in with important ones; conflict is present but unrelated to characters or significance of conflict is not clearly communicated	Inappropriate word choice at times; very little variety to sentence structure; style is limited to presenting information in a factual manner
3	Enough vivid details are included for the reader to identify or imagine the location, but the setting merely functions as a backdrop to the story or is an unrealistic setting for the story; the details of the setting are told rather than shown	Main characters are identifiable and are given more detail, but lack background information; characters react in stereotypical ways to the plot in which they are placed; characters' thoughts are recorded	Conflict is clear; characters struggle with problems; emotional reactions and outcomes become part of the story; has a familiar plotline in which the reader can guess what will happen next; may not have a resolution	Sentence length and structure is more varied; minimal dialogue; mood is in beginning stages of development
4	Setting is identifiable/ imaginable and realistic; some elements of the setting are revealed through the story rather than told by the narrator; sensory information is included	Beginning development of motivations for actions; letting the character speak and interact with others	Conflict is clear and importance to characters told but not demonstrated; characters struggle with problems; relationships between events are demonstrated; there is a logical climax and resolution	Narrator is identifiable but may not have a clear voice; imagery begins to be used; sentence structure is varied; dialogue is predictable
5	Setting is identifiable/ imaginable and realistic; many elements of the setting are revealed through the narrative at appropriate junctures	Protagonists and antagonists emerge and interact with one another in believable ways	Conflict is clear and complex and its importance to the characters nearly convincing; characters struggle with problems; story has a logical climax and resolution, although perhaps forced; events of the story flow in chronological order; subplots are introduced although not resolved	Narrator has a clear voice; sentence structure is varied; figurative language and action verbs are used; dialogue becomes more interesting
6	The time and place are incorporated at appropriate turns in the story; the setting provides an overall mood that reflects that of the characters and/or unfolding drama; the world depicted is believable and internally consistent and enhances the narrative; techniques such as foreshadowing are used	Character development is complete; characters behave in ways that seem natural to their development; characters become dynamic and psychologically complex; characters are developed through appearance, action, thoughts, and speech	Conflict is clear and complex and its importance to the characters convincing; series of events are interesting and draw the reader in; characters struggle with problems in interesting and meaningful ways; story has a logical climax and satisfying resolution; techniques such as flashbacks and foreshadowing are used to vary the structure from a straightforward, chronological sequence of events; subplots are introduced and resolved	First person narrative is used; variety in sentence structure matches intentions of story; precise and varied word choices are used; lively language, including the use of similes, metaphors, and analogies, are used; imagery and symbolic language are used; dialogue is interesting and lively

Developmental Rubric—Expository Writing

Score	Organization (Text Structure)	Context/Theme (Coherence)	Written Language (Development of Syntax, Cohesion Strategies, Vocabulary)	Written Conventions (Mechanics)	Sense of Audience
1	May be extremely brief or confused	Tendency to write either partially or completely in the narrative mode; associated ideas; much content extraneous to the topic or indirectly related to topic	Use of simple sentences (NVO); sentences juxtaposed; if connectors between sentences are used, they are primarily “and,” “then”; may use pronominal reference with numerous ambiguous pronouns (referent not retrievable from text); use of simple vocabulary	Beginning differentiation of drawing and printing; use of recursive letter-like shapes when printing; some phoneme-grapheme awareness for initial sounds; text not readable by others	No sense of audience; writes for self from own perspective; often references based on personal experiences that are not retrievable from text
2	May attempt structure, attempting to chain ideas, but it may be difficult to determine the structure; many ideas included in one paragraph or each idea written as a paragraph, or the response may be so brief that its organization cannot be evaluated	May have misleading introductions and/or conclusions; first-hand experiences; some content extraneous to the topic; ideas are quite disjointed	Compound subjects; compound predicates; within text pronominal reference; coordinating conjunctions—primarily “and,” “then,” “but,” “because” (used for motivational, not logical reasons); use of adequate vocabulary	Printing/writing recognizable letters; use of invented spelling with most sounds represented; no spacing between words or inconsistent spacing, incomplete sentences; a variety of grammatical errors; errors likely to affect readers’ comprehension	Writes with knowledge that others will read text; does not adjust writing for specific audiences
3	Structure is somewhat unclear; lack of clear opening; some of the support and elaborations are paragraphed correctly; most ideas relate to main topic or issue with no specific connections; may include major rambling from the main topic	Topic knowledge developing; some content extraneous to the topic may be present; may have misleading introductions and conclusions; moderately disjointed; misleading statements	Adverbial subordinate clauses, particularly with conjunctions “when,” “while,” “because” (now used for logical justification); relative clauses, primarily those that post-modify object nouns; use of appropriate vocabulary	May continue to have some difficulty with handwriting; invented spelling continues; use of capitals on words at beginning of sentences and persons’ names, periods, question marks, exclamation points, apostrophes; pronominal reference may be unclear, errors may affect readers’ comprehension	Usually writes for teacher; depends on teacher to set organization format

4	Structure of the paper is clear; some clusters of ideas are paragraphed appropriately; planned opening and closing to paper when appropriate; use of specific expository structures (e.g., definitions, comparison/contrast, cause/effect, sequences, problem/solution); ideas relate to the topic without specific connections; may include off-topic material	Development may be uneven with some clusters of ideas elaborated, others not; lacks depth of content	Use of low-frequency adverbials—"though," "although," "even if," "as," "unless," "provided that"; nominal clauses as subjects; use of some precise vocabulary	Handwriting automatized; spelling mostly conventional; developing use of a greater variety of punctuation (comma, colon, semicolon, quotation marks); few run-on sentences; subject/verb agreement and tenses consistent; paragraphing developing	Given an assignment, student begins to select independently the organizational format appropriate to task and audience; may not select the most appropriate format or may not be able to maintain the chosen format
5	Structure of paper is clear; most of the major clusters of ideas are paragraphed effectively; planned opening and closing to paper, if appropriate; coherence may be demonstrated by overall structure (topic sentences in paragraphs); cohesion developed by various methods (pronouns, parallel structure, some repetition); may include minor off-topic material	Main ideas developed with appropriate and varied details; some risks may be taken that are mostly successful; may have minor flaws; progresses logically	Use of concordant conjuncts "similarly," "moreover," "consequently," "therefore," "furthermore," "for example"; and discordant conjuncts "instead," "yet," "however," "nevertheless," "conversely"; use of vocabulary precise and carefully chosen	Spelling mostly automatized and conventional (student self-edits); more consistent use of correct punctuation; appropriate text formatting for different genres; consistently clear pronominal reference	Given an assignment, student begins to select independently the organizational format appropriate to task and audience; selects from several possible structures the one most appropriate for purpose and audience

Continued

Score	Organization (Text Structure)	Context/Theme (Coherence)	Written Language (Development of Syntax, Cohesion Strategies, Vocabulary)	Written Conventions (Mechanics)	Sense of Audience
6	Structure of paper is clear; all of the major points; opening and closing when appropriate; effectively paragraphed; transitional devices used to develop coherence and cohesion; all ideas are presented logically and are interrelated; no off-topic material; use of a wide variety of organizational structures	Main ideas developed with appropriate and varied details; writer may take compositional risks, resulting in effective, vivid response	Use of structures to achieve literary style, e.g., subject-verb split, absolute phrases; use of vocabulary precise and carefully chosen	Errors in spelling, punctuation, grammar, usage are rare	Response has a coherent sense of purpose and audience; careful consideration of organizational structure from a wide variety of organizational structures that best highlight information for a particular audience

Developmental Rubric—Persuasive Writing

Score	Organization (Text Structure)	Argument	Content/ Theme (Coherence)	Written Language (Development of Syntax, Cohesion Strategies, Vocabulary)	Written Conventions (Mechanics)	Sense of Audience
1	May be extremely brief or confused	No claim is made, or claim is made but no reasons are given to support the claim, or reasons given are not relevant to the claim	Tendency to write either partially or completely in the narrative mode; some content extraneous to the claim present	Use of simple sentences (N + V + O); sentences juxtaposed; if connectors between sentences are used, they are primarily "and," and "then"; may use pronominal reference with numerous ambiguous pronouns (reference not retrievable from the text); use of simple vocabulary	Displays severe mechanical errors or may be so brief that knowledge of mechanics can not be determined (errors may interfere with readers' comprehension)	No sense of audience; writes for self from own perspective; often references based on personal experiences that are not retrievable from text
2	May attempt to structure, but structure is difficult to determine; many ideas included in one paragraph or each idea written as a paragraph, or the response may be so brief that its organization cannot be evaluated	Claim is made and reasons are given to support it, but the self-centered reasons are not developed or are rambling or disjointed	May have misleading introductions and/or conclusions; some content extraneous to the claim present	Compound subjects, compound predicates; within text pronominal reference; coordinating conjunctions primarily "and," "then," "but"; "because" used for motivational reasons; use of adequate vocabulary	Displays numerous severe errors in mechanics (errors may interfere to a degree with readers' comprehension)	Writes with knowledge that others will read text; does not adjust writing for specific audiences
3	Structure is somewhat unclear, some of the support and explanations are paragraphed correctly, most ideas related to claim or issue with no specific connections, may include major rambling from the main topic	Claim is made and supported by self-centered reasons to support the claim; some further explanations made but not elaborated; may mention briefly an opposite point of view	May have misleading introductions and/or conclusions; some content extraneous to the claim may be present	Adverbial subordinate clauses, particularly with the conjunctions "when," "while," "because" (now used for logical justification); relative clauses, primarily those that post-modify object nouns; use of age-appropriate vocabulary	Displays a pattern or errors in mechanics (errors may interfere with readability)	Increasing ability to assume another's perspective; begins to adjust writing for the audience and to identify problems in own writing that may be difficult for others to understand

Continued

Score	Organization (Text Structure)	Argument	Content/ Theme (Coherence)	Written Language (Development of Syntax, Cohesion Strategies, Vocabulary)	Written Conventions (Mechanics)	Sense of Audience
4	Structure of the paper is clear; some clusters or arguments are paragraphed appropriately; planned opening and closing to paper; ideas related to the topic without specific connections; may include minor off-topic material	Claim is made and supported by a non-self-centered reason; at least one explanation included with formal development; may have a brief summary of the opposite point of view	Development may be uneven with some clusters of ideas elaborated, others not	Use of low-frequency adverbials: "though," "although," "even if," "as"; "unless," "provided that"; nominal clauses as subjects; use of some precise vocabulary	May display errors in mechanics but there is no consistent pattern	Can take a third-person perspective; recognizes what might be difficult for a reader to understand; makes appropriate changes
5	Structure of the paper is clear; most of the major clusters of ideas are paragraphed effectively; planned opening and closing to paper; coherence may be demonstrated by overall structure (topic sentences in paragraphs); cohesion developed by various methods (pronoun, parallel structure, some repetition); may include minor off-topic material	Claim is made that is supported by general reasons with explanations; includes an attempt to discuss or disprove the opposite point of view	Main ideas developed with appropriate and varied details; some risks may be taken that are mostly successful; may have minor flaws; progresses logically	Use of concordant conjuncts "similarly," "moreover," "consequently," "therefore," "furthermore," "for example"; and discordant conjuncts "instead," "yet," "however," "nevertheless," "conversely"; use of vocabulary precise and carefully chosen	Few errors in mechanics	Considers potential readers' perspective as text is written; presents persuasive information with beliefs and values of readers in mind
6	Structure of the paper is clear; all of the major points, opening and closing, are appropriately paragraphed; transitional devices used to develop coherence and cohesion, all ideas are presented logically and are interrelated; no off-topic material	Claim is made that is supported by general reasons with explanations, including a thorough discussion and/or refutation of the opposite point of view; summarizes this view and discusses why it is narrow or incorrect	Main ideas developed with appropriate and varied details; writer may take compositional risks resulting in an effective, vivid response	Use of structures to achieve literary style, e.g., subject-verb split, absolute phrases; careful crafting in choice of vocabulary	Minor, if any, errors in mechanics	Able to consider the opposite point of view, presents it, and discusses the reason it is incorrect

6 + 1 Trait Writing: Scoring Continuum

The 6+1 Trait® Writing Scoring Continuum

⚙ Wow!

Exceeds expectations

◎ Strong

Shows control and skill in this trait; many strengths present

↓ Effective

On balance, the strengths outweigh the weaknesses; a small amount of revision is needed

→ Developing

Strengths and need for revision are about equal; about half-way home

↑ Emerging

Need for revision outweighs strengths; isolated moments hint at what the writer has in mind

← Not Yet

A bare beginning; writer not yet showing control

- Ideas
- Organization
- Voice
- Word Choice
- Sentence Fluency
- Conventions
- Presentation

6+1 Trait® Writing Rubric

Ideas

Ideas: The heart of the message, the content of the piece, the main theme, with details that enrich and develop that theme	
⑤	<i>This paper is clear and focused. It holds the reader's attention. Relevant anecdotes and details enrich the central theme.</i> A. The topic is narrow and manageable B. Relevant, telling, quality details go beyond the obvious C. Reasonably accurate details D. Writing from knowledge or experience; ideas are fresh and original E. Reader's questions are anticipated and answered F. Insight
③	<i>The writer is beginning to define the topic, even though development is still basic or general.</i> A. The topic is fairly broad B. Support is attempted C. Ideas are reasonably clear D. Writer has difficulty going from general observations to specifics E. The reader is left with questions F. The writer stays on topic
①	<i>The paper has no clear sense of purpose or central theme. The reader must make inferences based on sketchy or missing details.</i> A. The writer is still in search of a topic B. Information is limited or unclear or the length is not adequate for development C. The idea is a simple statement or a simple answer to the question D. The writer has not begun to define the topic E. Everything seems as important as everything else F. The text may be repetitious, disconnected, and contains too many random thoughts

6+1 Trait® Writing Rubric

Organization

Organization: The internal structure, the thread of central meaning, the logical and sometimes intriguing pattern of ideas	
⑤	<i>The organizational structure of this paper enhances and showcases the central idea or theme of the paper; includes a satisfying introduction and conclusion.</i> A. An inviting introduction draws the reader in; a satisfying conclusion leaves the reader with a sense of closure and resolution B. Thoughtful transitions C. Sequencing is logical and effective D. Pacing is well controlled E. The title, if desired, is original F. Flows so smoothly, the reader hardly thinks about it
③	<i>The organizational structure is strong enough to move the reader through the text without too much confusion.</i> A. The paper has a recognizable introduction and conclusion B. Transitions often work well C. Sequencing shows some logic, yet structure takes attention away from content D. Pacing is fairly well controlled E. Organization sometimes supports the main point or storyline F. A title (if desired) is present
①	<i>The writing lacks a clear sense of direction.</i> A. No real lead B. Connections between ideas are confusing C. Sequencing needs work D. Pacing feels awkward E. No title is present (if requested) F. Problems with organization make it hard for the reader to get a grip on the main point or storyline

6+1 Trait® Writing Rubric

Voice

Voice: The unique perspective of the writer coming through in the piece through honesty, conviction, integrity, and believability	
⑤	<i>The writer of this paper speaks directly to the reader in a manner that is individual, compelling, and respects the purpose and audience for the writing.</i> A. Adds interest; appropriate of purpose and audience B. The reader feels a strong interaction with the writer C. The writer takes a risk D. Expository or persuasive reflects understanding and commitment to topic E. Narrative writing seems honest, personal, and engaging
③	<i>The writer seems sincere but not fully engaged or involved. The result is pleasant or even personable, but not compelling.</i> A. Obvious generalities B. Earnest, pleasing, safe writing C. The voice fades in and out D. Expository or persuasive writing lacks consistent engagement E. Narrative writing is reasonably sincere
①	<i>The writer seems indifferent, uninvolved, or distanced from the topic and/or the audience.</i> A. No concern with audience B. Monotone C. Hum-drum and risk-free D. Lifeless or mechanical E. No point of view is present

6+1 Trait® Writing Rubric

Word Choice

Word Choice: The use of rich, colorful, precise language that moves and enlightens the reader	
⑤	<i>Words convey the intended message in a precise, interesting, and natural way</i> A. Words are specific and accurate B. Striking words and phrases C. Natural, effective, and appropriate language D. Lively verbs, specific nouns and modifiers E. Language enhances and clarifies meaning
③	<i>The language is functional, even if it lacks much energy</i> A. Words are adequate and correct in a general sense B. Familiar words and phrases communicate C. Attempts at colorful language D. Passive verbs, everyday nouns, mundane modifiers E. Functional with one or two fine moments F. Occasionally, the words show refinement and precision
①	<i>The writer struggles with a limited vocabulary</i> A. Words are nonspecific or distracting B. Many of the words don't work C. Language is used incorrectly D. Limited vocabulary, misuse of parts of speech E. Words and phrases are unimaginative and lifeless F. Jargon or clichés, persistent redundancy

6+1 Trait® Writing Rubric

Sentence Fluency

Sentence Fluency: The rhythm and flow of the language, the sound of word patterns, the way in which the writing plays to the ear—not just to the eye	
⑤	The writing has an easy flow, rhythm and cadence. Sentences are well built. A. Sentences enhance the meaning B. Sentences vary in length as well as structure C. Purposeful and varied sentence beginnings D. Creative and appropriate connectives E. The writing has cadence
③	The text hums along with a steady beat, but tends to be more pleasant or businesslike than musical. A. Sentences get the job done in a routine fashion B. Sentences are usually constructed correctly C. Sentence beginnings are not ALL alike; some variety is attempted D. The reader sometimes has to hunt for clues E. Parts of the text invite expressive oral reading; others may be stiff, awkward, choppy, or gangly
①	The reader has to practice quite a bit in order to give this paper a fair interpretive reading. A. Sentences are choppy, incomplete, rambling, or awkward. Phrasing does not sound natural B. No “sentence sense” present C. Sentences begin the same way D. Endless connectives E. Does not invite expressive oral reading

6+1 Trait® Writing Rubric

Conventions

Conventions: The mechanical correctness of the piece; spelling, grammar, and usage, paragraphing, use of capitals, and punctuation*	
⑤	The writer demonstrates a good grasp of standard writing conventions (e.g., spelling, punctuation, capitalization, grammar, usage, paragraphing). A. Spelling is generally correct B. Punctuation is accurate C. Capitalization skills are present D. Grammar and usage are correct E. Paragraphing tends to be sound F. The writer may manipulate conventions for stylistic effect; and it works!
③	The writer shows reasonable control over a limited range of standard writing conventions. A. Spelling is usually correct or reasonably phonetic on common words B. End punctuation is usually correct C. Most words are capitalized correctly D. Problems with grammar and usage are not serious E. Paragraphing is attempted F. Moderate (a little of this, a little of that) editing
①	Errors in spelling, punctuation, capitalization, usage and grammar, and/or paragraphing repeatedly distract the reader and make text difficult to read. A. Spelling errors are frequent B. Punctuation missing or incorrect C. Capitalization is random D. Errors in grammar or usage are very noticeable E. Paragraphing is missing F. The reader must read once to decode, then again for meaning
* Grades 7 and Up Only: The writing is sufficiently complex to allow the writer to show skill in using a wide range of conventions.	

Analysis of Crystal's Writing Sample in Figure 13-9

Student: Crystal Grade 7

Written assignment: Write about your weekend

	Sample 1	Sample 2	Sample 3
Date of sample:			
Teacher/clinician grade*:			
Student self-assessment grade:			
No. of samples			
Handwriting	B		
Spelling	C		
Punctuation	C		
Capitalization	C		
Paragraphing			
Grammar	B†		
Use of literate vocabulary	C		
Length of sample/total words	14 T-units (B)/117 words		
No. of different words (NDW)	80		
Average T-unit length	8.4 (B)		
Subordination index	1.2 (B)		
Use of low-frequency syntactic forms	2 (1 used incorrectly): C		
Number or % correctly spelled words	87 or 74% (C)		
Number or % CWS	28 or 47% (C)		
Organization	C		
Provides sufficient information	B		
Use of appropriate detail	C		
Cohesion	B		
Tone	B		
Holistic evaluation score (1–6) (Table 13-10)	2–3		
Expository Rubrics (1–6) (Appendix 13-8)	2, 3–4, 2, 3, 1–2		

*A = grade-level work.

B = below-grade level but no intervention required.

C = deficits warrant remediation.

†Some errors may be spelling rather than grammar; e.g., *work/worked*.

APPENDIX 13-12

Transition Planning Summary

TRANSITION PLANNING SUMMARY

1. **Statement of Transition Service Needs for students age 14 and older:** (Must be completed at each annual review following a student's 13th birthday)
Crystal will benefit from coordination of educational, prevocational and community participation supports to prepare her to function at her optimum capacity in a supported vocational or community experience programs.
2. **Student Preferences/Interests - document the following:** (Sections 2, 3, and 4 must be completed at each annual review following a student's 15th birthday)
 - a. Was the student invited to attend her/his planning and placement team (PTT) meeting? ☒ Yes ☐ No
 - b. Did the student attend? ☒ Yes ☐ No
 - c. How were the student's preferences/interests, as they relate to planning for transition services, determined? ☒ Personal interviews ☐ Informal/formal testing
☒ Vocational assesment ☐ Comments at meeting ☒ Other: (specify) Interview of student's family
 - d. Summarize student preferences/interests as they relate to planning for transition services: Crystal has demonstrated an interest in prevocational activities and community experiences that involve consistent routines, physical activity, and opportunities to socialize with others. Activities that Crystal has experienced and responded favorably to include volunteer activities ("Meals on Wheels"), landscape work and gardening, and building maintenance. She demonstrated a distinct dislike of sedentary assembly work, unpredictable schedules, and work routines with long periods of inactivity, as evidenced by her verbal and behavioral responses to such experiences.
3. **Agency participation:**
 - a. Were any outside agencies invited to attend the PPT meeting? ☒ Yes ☐ No (If no, specify reason) _____
 - b. If yes, did the agency's representative attend? ☒ Yes ☐ No
 - c. Has any participating agency agreed to provide or pay for services/linkages? ☐ No ☒ Yes (specify) 4 hours/week prevocational training and community experience
4. **Justification statements for transition services not being addressed:**
 - a. If an annual goal and related objectives were not developed for independent living or community participation, provide a justification statement.
NA (goals developed)
 - b. If activities/training are not provided in both the community and the classroom, provide a justification statement:
NA - Activities/training are provided in both locations
5. At least one year prior to reaching age 18, the student must be informed of her/his rights under IDEA, if any, which will transfer to her/him at age 18.
NA (student will not be 17 within 1 year)

Intervention for Advanced Language

CHAPTER OBJECTIVES

Readers of this chapter will be able to do the following:

1. State a rationale for providing treatment for communication disorders in secondary school students.
2. List the appropriate products of intervention at the secondary school stage.
3. Describe a range of intervention methods for working with students at the advanced language stage.
4. Describe connections among oral language, learning, and literacy at the secondary level.
5. Discuss the appropriate contexts for intervention at the secondary school level.
6. Discuss the process of transition planning for students over the age of 14.
7. List appropriate goals and procedures for secondary age students with severe communication disorders.
8. List methods of improving social communication skills for speakers with autism spectrum disorder (ASD).

Michael had been diagnosed with autism when he was 3. At that time, he was not talking at all, was withdrawn and preoccupied with spinning things. He received intervention throughout his preschool years, and by the time he was 6, he was speaking in full sentences. IQ testing at that time showed that his nonverbal IQ was in the superior range. He was able to draw complex, scaled drawings of buildings and memorize train and airplane timetables. He was placed in mainstream classrooms and received supportive services throughout elementary school. Consultative services were provided to his teachers in middle school, to help them adapt their programs to his communicative abilities. He always did well in math and science. His vocabulary was enormous, as one of his hobbies was reading the dictionary. But he had trouble with subjects such as English, history, and geography that required any kind of social understanding. He was perplexed by the feelings described in the literature he read for English class and had a great deal of difficulty understanding the plots of stories. He had a hard time getting along with others, too. Although he no longer spent hours spinning objects, he continued to be preoccupied with his obsessive interests of drawing, map reading, timetables, and dictionary reading. All of his attempts at conversation with peers, teachers, or family centered on these subjects, and he seemed both mystified by and uninterested in conversations about anything else. Despite his obvious talents in architectural drawing and his superior memory, Michael was unable to use his abilities in a functional way, always falling back into his preoccupations. As he entered high school, his family's

concern about his future increased, and they requested an assessment of his current educational needs, so that some intervention to improve his functional skills could go on during his last years in school.

Michael needs help with several areas of communication to be ready to make the transition from school to higher education or employment. Students like Michael, who have communication abilities at the advanced language level, require help with a variety of skills at the literate end of the oral-literate continuum, as well as with using the skills they have in the most functional manner possible. Let's look at some of the issues we will need to address in designing language intervention programs for adolescents before we get into our discussion of the intervention itself.

ISSUES IN INTERVENTION AT THE ADVANCED LANGUAGE STAGE

Rationale for Services to Adolescents

It is fair to ask what benefit can be provided to an adolescent like Michael who has received services throughout his school career and will never be "cured" of his disability. Wouldn't he do just as well if left alone to do his best to get through high school without lavishing additional expensive services on him that will probably not make a great deal of difference in his final status at the end of his school years? Although the question is legitimate, there are good reasons for continuing to provide services to adolescents in advanced language stages. Larson and McKinley (2003a) and Nippold (2010) summarized them:

1. The ante is continually "upped" as the student proceeds through the secondary grades. Even if intervention allowed students to function in mainstream settings in elementary school, the more intense demands of the secondary curriculum can often cause students who could "make it" in earlier grades to sink beneath their weight, creating the "porpoise kid" phenomenon (Launer, 1993). The transition from one educational setting to another and from school to work or higher education also places stressful requirements on the shaky communication skills of adolescents with language learning disorders (LLD). Students may need special services in secondary school to allow them to maintain the same level of performance in these new high-demand settings that they were able to achieve in earlier grades.
2. A transition from concrete to formal operational thinking that typically takes place during adolescence is necessary to succeed in the secondary school curriculum. The level of abstract thinking and language use required at this level may not be accessible without support for students with disabilities.

The speech-language pathologist (SLP) can provide important linguistic scaffolding to this new level of thinking.

3. Administrators often ask whether the communication needs of students with LLD cannot be managed in the context of the mainstream language arts curriculum, again questioning the need for special services. Here it is important to remember that only academic communication needs are stressed in these settings. Communication skills needed for interaction and functional communication for vocational and independent-living environments are only addressed through services delivered by an SLP, and instruction in these areas is mandated by the 1997 Individuals with Disabilities Education Act (IDEA).
4. Communication programs targeted for adolescents pay off in terms of reduced dropout rates (Larson & McKinley, 2003a). Kaufman, Kwan, Kline, and Chapman (2000) and Rukeyser (1988) have documented that every potential dropout who stays in school saves taxpayers money—in terms of the costs of adult literacy programs, welfare, basic job training, and incarceration—that would have to be spent later if the student dropped out of school. Language services can make the difference for students at risk for leaving school without graduating.

The Role of the SLP in the Secondary Curriculum

Just as SLPs at elementary levels are being included increasingly in literacy instruction and responsiveness to intervention (RTI) models, SLPs in secondary schools are also more frequently being expected to contribute to the development of literacy for struggling readers and writers. The reason is simple: there is a literacy crisis in our secondary schools. Twenty-seven percent of eighth graders perform below the basic level in reading comprehension (Roberts et al., 2007). Jacobs (2008) cites statistics showing that 13% of U.S. 17-year-olds are functionally illiterate, and this percentage rises to 40 among minority groups. No wonder SLPs, with our deep understanding of the roots of literacy disabilities and our expertise in the remediation of these disabilities in oral language, are being recruited to address this crisis. But just as we said when we talked about our role in elementary schools, these facts do *not* mean we should become reading tutors. So what is our role?

Just as SLPs in elementary schools provide direct instruction, consultation, and collaboration around oral language bases of literacy acquisition in an RTI framework, SLPs in secondary schools with or without RTI programs provide the same range of services. By that I mean that we can support students, through all these service delivery models, in elaborating their vocabulary; increasing their understanding and use of figurative language, verbal reasoning, and complex syntax; using oral and written formats to increase comprehension and production of the genres relevant at this stage of development, including conversation, classroom discourse, narrative, expository, and persuasive texts; and the use of metacognitive strategies. All these activities, the proper province of the SLP, will result in better literacy skills for struggling students. What is not within the scope of practice for SLPs at this level is tutoring in basic decoding skills, teaching specific spelling lists, or assisting with homework or class assignments outside a comprehensive program of oral language support for literacy. These latter activities are more appropriate for reading, learning disability, or special education professionals. While we can certainly support these educators in their work with struggling readers through consultation

and collaboration, we cannot do it for them. As Ehren (2009) advised, SLPs should use the curriculum as the context for their intervention, but should not teach the curriculum itself. Let's see how we negotiate this delicate balance.

Student-Centered Intervention

We've talked before about the importance of engaging the client and fostering a feeling of collaboration between the teen and the clinician to maximize our chances for success. Just as we asked the student to do some self-assessment, we also can involve the student in planning the intervention program. We can review the assessment results with the student, point out what our testing revealed were strong and weak areas, and ask whether the findings jibe with the student's perception of his or her own problem areas. We can then invite the student to set priorities among the needs identified and choose the skills in which he or she would most like to improve. Adolescent students should be present at the Individualized Educational Plan (IEP) meeting, should discuss service-delivery options with parents and professionals, and should feel a part of the process of determining the intervention program. Adolescent students also should sign the IEP or Individualized Transition Plan (ITP) themselves, along with their parents, to indicate their participation. Myer and Eisenman (2005), in fact, suggest that secondary students should lead the development of their own IEPs, using the planning session as a context for discussion of the students goals, strengths, and needs, allowing the student to choose sections of the IEP that he or she will lead the discussion on in the meeting, and developing a script and role-play activities to prepare the student to present his section of the IEP to the team. What's more, Branding, Bates, & Miner (2009) showed that special education personnel who viewed students participating in their own IEP planning rated the students higher in self-determination capability than they did when they observed the same student in a passive role. This finding suggests that allowing students with disabilities to participate in IEP and ITP development leads to higher expectations and greater attributions of autonomy on the part of their teachers.

Larson and McKinley (2003a) suggested drawing up a *communication contract* with the adolescent. The contract can state the goals listed in the IEP or ITP and can ask the student to take responsibility for achieving them. By placing responsibility for

Communication contracts involve students in their intervention planning.

achieving goals firmly on the student's shoulders, motivation and cooperation are likely to increase. Again, though, it is important to remember that, if we expect adolescents to take responsibility for their own goals, we must involve them in the goal-setting process first. Figure 14-1 contains an example of a student communication contract that might be drawn up in collaboration with Michael.

I _____ hereby agree to complete this contract
(name)
starting on _____ and ending on _____. I understand
(date) (date)
that my overall contract grade for the term will be decided by averaging the letter grades for each behavioral objective in the contract.* Grading will be done by the adult who signs the contract.

If I do not complete this contract by the date stated, earning an overall grade of at least a C, I will undergo following consequences:

Have my drawing materials confiscated for 1 week. Give up trips to the dictionary in the school library for 2 weeks.

Student signature _____	Professional's signature _____

Annual goal: improving conversational interaction

Behavioral Objective	Student's grade				
	A	B	C	D	F
Have three conversations with peers about school sports events.	—	—	—	—	—
Make a list of slang terms I hear other students use. Discuss them with (clinician).	—	—	—	—	—
When talking is allowed, ask another student to explain something I don't understand about a story I read in English, at least three different times during the term.	—	—	—	—	—
Make a plan with (clinician) to convince my parents to give me a new privilege. Have a conversation with parents and try to convince them. Discuss conversation with (clinician) to see how it went. Get suggestions for improvement.	—	—	—	—	—

*Make an agreement with the student that full achievement of the objective will earn an A for that objective, nearly full achievement a B, and so on.

FIGURE 14-1 A sample communication contract for Michael. (Adapted from Larson, V., & McKinley, N. [2003a]. *Communication Solutions for Older Students*. Eau Claire, WI: Thinking Publications.)

Apel and Swank (1999) and Novak (2002) talked about the importance of developing self-esteem and increasing motivation in our adolescent students. They point out that years of difficulty in school may have led these students to feelings of inadequacy, reduced motivation, and a reluctance to devote effort to additional intervention activities. For this reason, students in the advanced language stage may need counseling, as well as language intervention. Larson and McKinley (2003a) defined counseling in this context as talking with adolescents about their communication problems, giving them information, and providing them with support in facing their feelings about their disability. Adolescence is a turbulent time of life for everyone, and students who are having trouble communicating with others, establishing peer relations, and succeeding in school are likely to be even more frustrated and confused than typical teens. Even if we are offering no direct intervention to an adolescent with LLD and are primarily consulting with teachers and designing curricular adaptations, we can arrange to have a few "chats" with each student. We can talk about how communication is going and where most help is needed, and lend an ear to whatever each student feels a need to tell us. Although it is important to confine our counseling role to issues of communication, we may be able to help direct students to other adults who can help, such as the guidance counselor, school nurse, or another special educator, if additional problems arise. Naturally, we are not psychotherapists, and if a student is having serious emotional problems, referral may be necessary. But very often some understanding remarks from a respected adult and the opportunity to "talk things out" a bit with an accepting listener can be helpful, at least in the short term. In having these "chats," we want to emphasize to students that confidentiality is strictly maintained about any personal information, but if the student tells us about something illegal or dangerous (such as suicidal thoughts), we have to report it.

PRODUCTS OF INTERVENTION IN THE ADVANCED LANGUAGE STAGE

New Intervention Purposes at the Advanced Language Level

We talked earlier about several different purposes intervention might have. Intervention can attempt to eliminate or "cure" a disorder, change or ameliorate the disorder, or change the way the client responds to the disorder by providing compensatory strategies. In our discussions of intervention up to this point, we have usually identified the purpose of intervention as the second of these choices: changing the disorder. We have had as our purpose the provision of basic communication skills that lessen the client's disability. With adolescents, particularly those in the advanced language stage, however, the third of these purposes also comes into play. That is, for some clients at advanced language stages, who have had years of intervention aimed at changing their disorder, the time has come to help them find ways of compensating for it instead.

Larson and McKinley (1995) suggested that, to succeed at a learning-strategies approach in intervention, students need to function within the average range of intelligence and have reading and oral language skills at least at a fourth-grade level. In other words, students need to be in the advanced language stage as we have defined it here. Students functioning at earlier levels of communicative ability would not be good candidates for this approach because of its reliance on reading and writing skills and its demands for metacognitive capacity. Adolescents who are functioning at

Learning-strategy approaches to intervention are used with students at the advanced language stage.

language-for-learning (L4L), developing, or emerging language levels should continue to be served with methods appropriate for those levels.

The advantages of a learning strategies approach, for students for whom it is developmentally appropriate, are that it helps them move toward more independent functioning by teaching them not a basic skill, but a more “meta”-level ability (Englert et al., 2009). A learning-strategies approach, as defined by its originators, Alley and Deschler (1979), includes “techniques, principles, or rules that will facilitate the acquisition, manipulation, integration, storage, and retrieval of information across situations and settings.” As such, it gives students the tools to improve their own learning abilities, both during the intervention program and after it’s over. Ehren (2002) helps to define *strategies* by distinguishing them from *knowledge* and *skills* in the following way:

- Knowledge is information we have; for example, vocabulary *knowledge* is having the information to link a referent to a word.
- A skill is something we can do; for example, syntactic *skills* allow us to formulate sentences.
- A strategies is a deliberate attempt to use the knowledge and skills we have effectively; for example, deciding to summarize a passage we read in order to remember its content is a reading comprehension *strategy*.

Providing students with learning strategies and giving them the opportunity to practice them on curriculum-related material becomes an important role the SLP can play in intervention for students at the advanced language stage.

The Functional versus the Academic Curriculum

A good number of adolescents with LLD will go on to higher education or vocational training after high school. Aune and Friehe (1996) reported that one-third of youth with learning disabilities enrolled in postsecondary school within 5 years of high school graduation, although only 13% enrolled within 2 years of high school graduation (National Center for Education Statistics, 2000). Horn and Neville (2006) found that 11% of college students report having a disability. For these students, academic

skills continue to be important. We need to address aspects of students’ communication problems that impede their success in the mainstream curriculum.

But, as the statistics show, not all students with LLD go on to higher education. And even those who do may have problems with “survival communication,” the language skills that allow people to function successfully and autonomously in their homes, jobs, and communities (Novak, 2002). For these reasons, not only academic language, but functional communication skills, too, need to be part of the intervention program for adolescents with LLD. Functional language skills include the ability to ask questions, follow verbal and written instructions, initiate and maintain conversations, use language to initiate and maintain social interactions and relationships, negotiate and solve interpersonal conflicts, gain basic information from writing, use written language to provide basic information on forms, questionnaires, letters, and so on (Novak, 2002). For students with advanced language who need functional communication skill development, a remedial approach focused on changing the disorder will probably be necessary. For work directed at improving academic communication, a learning-strategies approach should be at least one aspect of the intervention program.

PROCESSES OF INTERVENTION IN THE ADVANCED LANGUAGE STAGE

Let’s talk now about specific processes of intervention for students with LLD in the advanced language stage. As we do, you’ll notice that the organizational scheme of the discussion is somewhat different from the one we’ve been using up to now. Since the purpose of most of our intervention up to this stage has been to provide remediation to change the disorder by alleviating deficits in basic communication skills, we described the process of intervention using the three approaches to this type of remediation that were advanced by Fey (1986): clinician-directed, child-centered, and hybrid. However, in the advanced language stage, we want to look also at intervention aimed not only at remediating deficits but at teaching compensatory strategies. The National Joint Committee on Learning Disabilities (2008) has recommended that intervention programs for adolescents with LLD address both basic skill acquisition and strategy development. For this reason, we’ll organize our discussion of intervention at the advanced language stage along somewhat different lines: we’ll talk first about intervention directed at remediating basic deficits in language used for academic and functional contexts, then about intervention using a learning strategies approach. This latter approach is aimed at giving clients the tools for compensating for their difficulties.

Basic Skills Approaches to Intervention in the Advanced Language Stage

A variety of commercial materials are available for providing basic skill instruction at this level, as are numerous computer software programs. Many suggestions for these materials appeared in Larson and McKinley (2003a). When we use basic skills approaches with adolescents, they can be aimed at both academic and functional skills. Let’s look at some of the areas of academic performance for which basic skill intervention is still appropriate. Then we’ll talk about some basic skills procedures for improving functional communication in our secondary school students.

Academic Communication

Semantics

Work on semantic skills in the academic context focuses on words and usages at the literate end of the oral-literate continuum. Snow (2010) pointed out that sophisticated and abstract vocabulary and precise word choice are among the central features of academic language, which requires presenting complicated ideas in efficient ways. Jitendra, Edwards, Sacks, and Jacobson (2004) emphasized the close connection between vocabulary knowledge and reading comprehension. They report that students with LLD typically have nonspecific knowledge of word meanings and do not spontaneously use strategies for learning new words from context. They argue that direct instruction in vocabulary is necessary for these individuals. In fact, Biemiller (2003) advocates teaching 300 to 400 new words by direct instruction each year.

The Literate Lexicon

Flanigan et al. (2011) point out that the average student knows about 13,000 words in third grade and about 40,000 by high school graduation. This rate of growth means that the average child is learning 7 new words every day, and as we've seen, after fourth grade, most of these new words are learned from reading, not conversation. Flanigan et al. point out that these facts result in a *huge* vocabulary gap for children who are poor readers throughout these years. In fact, Bryan, Freer, and Furlong (2007) showed that vocabulary was one of the greatest weaknesses found in a sample of juvenile offenders, suggesting that students with poor vocabularies are at high risk for getting into various kinds of trouble. The moral of this story is that, because word knowledge is essential to understanding what we hear and read, vocabulary development is a critical area for students with LLD.

Classroom texts, lectures, and themes can be the source of much of the literate vocabulary secondary students need to learn to help bridge this gap. Flanigan and Greenwood (2007) suggest working with classroom teachers to identify words critical to students' understanding *before* they read a curricular assignment and to pre-teach these essential words. They then recommend identifying the words students should have learned *from* reading the material and providing additional instruction and practice to be sure students with disabilities acquire the material's critical new vocabulary. In our consulting capacity, SLPs can work with classroom teachers to encourage them to provide direct instruction on the *before* and *after* vocabulary of their subject, using the approach advocated by Flanigan and Greenwood. Once such *before* and *after* words are identified in curricular material, clinicians can devise activities to address them in pre-teaching and review activities, whether in a team-taught mainstream classroom or an intervention setting. Roberts et al. (2008) suggest that difficult words that appear frequently across contexts, such as adverbial conjunctions, subordinating conjunctions, and quasicoodinators listed in Box 13-8, are also primary targets for vocabulary work. SLPs are the ideal professionals to work on these complex but commonly used words, either in pull-out sessions, small groups in team-taught language arts classes, or communication groups.

Once appropriate vocabulary for instruction has been identified, direct instruction can be provided. Direct instruction in vocabulary has been found to be highly effective in increasing word knowledge and reading comprehension (Jitendra et al., 2004). Direct instruction involves traditional activities such as giving students lists of words to look up in the dictionary, define orally, use in sentences, find synonyms for, and select correct meanings and uses in multiple choice formats. It is important to remember, though, that if students are required to use a dictionary, they need to be taught how to do so. Explicit explanation of

dictionary features, such as alphabetical organization, use of guide words on each page, pronunciation keys, and selection from among several meanings will be necessary. If this instruction has been given in the classroom, the SLP will need to provide reinforcement and practice in the therapeutic setting.

Direct vocabulary instruction can also involve more activity-based methods, such as matching words and meanings in a Concentration game, or "hunting" for words with certain characteristics (roots of *graph*, *tele*, or prefixes such as *inter-* and *un-*, for example) in assigned texts. Beck, McKeown, and Omanson (1987) suggested designating students as "Word Wizards" who can earn points by reporting on their own or others' use of new words outside the intervention setting. Moats (2004) suggests using the book *Language! Roots* (Bebko, Alexander, & Ducet, 2001) as a source for sequenced activities involving root words and affixes. When using direct instructional methods, it is important to remember that practice is necessary to achieve solid knowledge. Hearing, defining, or using a new word only once will not make it a permanent part of the student's lexicon. Clinicians need to provide multiple opportunities for students to interact with their new words. And Bryant, Goodwin, Bryant, and Higgins (2003) reported that students who received some activity-based methods or elaborated exposure along with traditional instruction did better in learning new vocabulary than students who received dictionary instruction alone.

Another way to increase vocabulary knowledge is to expand understanding of words already in students' vocabulary (but maybe just barely!). Elshout-Mohr and van Daalen-Kapteijns (1987) suggested ways to help students consolidate what they know about words and to extend their current meanings. They advocated using Knowledge Rating checklists like the one in Table 12-1 to summarize students' existing knowledge of word meanings drawn from curricular topics. They also suggested having students draw tree diagrams to illustrate how word meanings are connected. Students can choose some related words from a curricular topic, such as a health unit on drug abuse, and work together to construct a tree diagram like the one in Figure 14-2. Fleming and Forester (1997) suggested using materials such as *The Word Kit—Adolescent* (Lanza & Wilson, 1991), *All-Star Vocabulary* (LoGiudice & LoGiudice, 2004), *LanguageBurst* (Whiskeyman, 2000), and *Vocabopoly* (Linguistics, 2002).

Bryant, Goodwin, Bryant, and Higgins (2003) advocate using semantic feature analysis to expand vocabulary knowledge. Here we would present students with a grid, like the one in Table 14-1, with related curriculum words on one axis and a set of attributes relevant to the words on the other. We would first show students a completed grid, like the one in Table 14-1, and discuss the words and attributes. Then students could be given a blank grid and asked to fill it out. New words and attributes can be added to the grid, and new grids developed to work with additional sets of words.

Gerber (1993) supplied ways to capitalize on the relatedness of words. She advised giving students sets of words that relate in meaning, each on a different card. Students can then be asked to place the cards under related base words. For example,

<u>look</u>	<u>exit</u>
glance	desert
peek	vacate
observe	abandon
glower	depart

FIGURE 14-2 Tree diagram for relating word meanings associated with a high school unit on drug abuse. (Adapted from Elshout-Mohr, M., & vanDaalen-Kapteijns, M. [1987]. Cognitive processes in learning word meanings. In M. McKeown & E. Curtis [Eds.], *The nature of vocabulary acquisition*. Hillsdale, NJ: Erlbaum.)

TABLE 14-1 A Vocabulary Grid for a Curricular Unit on Prehistoric Biology with Semantic Feature Information

Word	Feature				
	Marine	Extinct	Carnivorous	Winged	Bipedal
Tyrannosaurus	—	+	+	—	+
Stegosaurus	—	+	—	—	—
Crocodile	+	—	+	—	—
Plesiosaur	+	+	+	—	—
Archaeopteryx	—	+	?	+	+
Pterodactyl	—	+	+	+	+

Adapted from Crais, E. (1990). World knowledge to word knowledge. *Topics in Language Disorders*, 10, 45-62.

The similarities as well as the differences in meaning in these words can be discussed, and students can be encouraged to talk about contexts in which each of the words would be the most appropriate choice. Other techniques for encouraging students to understand the relations among words include visual mapping techniques, like that shown in Figure 14-3. Bryant et al. (2003) showed that visual and graphic organizers were effective in helping students with LLD to acquire new vocabulary. Work on words related by root forms (*clinic*, *clinician*), using the methods we discussed in Chapter 12, also can be useful for adolescents with LLD, so long as we remember to draw vocabulary items from relevant curriculum topics.

We talked in Chapter 12, too, about Word Study, using the systematic relationships among word roots, prefixes and suffixes to enhance vocabulary and spelling. Scammacca et al. (2007) reported moderate to large effects of word study intervention on both word reading and comprehension performance of students with LLD. Word study, then, is one of the more effective methods for improving reading comprehension, and it falls well within the expertise of the SLP. Nippold and Sun (2008) advocate word study as a particularly important aspect of vocabulary development for adolescents with LLD. Flanigan et al. (2011) provide a broad range of ideas and activities for using words study at the secondary level. As just one example, they suggest “Root Word Jeopardy,” which appears in Box 14-1.

Another way to expand vocabulary knowledge is to work on words with multiple meanings, or *polysemous* words. Vespoor and

Lowie (2003) suggested that helping students establish a “core” meaning for each of these words, then elaborating the core with alternate meanings is helpful for improving comprehension and retention. Paul (1992b) suggested one procedure. Students are given, or generate for themselves, a list of words that have multiple meanings and discuss all the meanings they know for each. A dictionary can be used to get additional meanings for the words. Then students write sentences, each containing one of the words used twice, with a different meaning each time. They read their sentences, with “BEEPs” inserted for the target multiple-meaning words. Other students guess what word could be substituted for the BEEP, for example:

I BEEP open this BEEP of beans. (can)

Interactive computer games—such as *Vocabulary Development 2* (Optimum Resource, Inc., 2003), *Accelerated Vocabulary* (Renaissance Learning of Canada, 2002), *WordSmart Software* (Kaplan Writing and Vocabulary Essential Review, Kaplan, 2011), *WORDS* (Torgesen & Torgesen, 1985), and *Vocabulary Super Stretch, Set 1 and 2* (Merit Software, 2007)—can also be a source of vocabulary development. However, Jitendra et al. (2004) in their review of vocabulary instruction found that results of computer assisted instruction were more mixed than those of direct instruction, so perhaps these methods should be reserved for practice rather than initial introduction of new words.

FIGURE 14-3 Graphic organizer for vocabulary development.

BOX 14-1 Root Word Jeopardy

THE ANSWERS:

VIS (SEE)	THERM (HEAT)	AUD (HEAR)	TELE (DISTANT)	JECT (THROW)
100 Something that can be seen	100 A device used to measure temperature	100 A group of people who listen to a concert or lecture	100 A device for watching broadcast programs	100 To refuse to accept
200 The ability to see	200 Clothing designed to be worn in the cold	200 Something that can be heard	200 A device used to speak to people at a distance	200 To send a substance into a space, as with a needle used to give medicine
300 Unable to be seen	300 A device used to regulate temperature in a room or building	300 A place people come to listen to a speaker or event	300 A device used to view distant objects	300 To protest
400 To oversee the work of another	400 A reaction that releases heat	400 A try-out; as for a part in a play	400 A type of lens that allows photographers to take pictures of distant objects	400 To send out of
500 To change or edit in order to improve, as in writing	500 The study of energy conversion between heat and mechanical work	500 A person whose hobby is high-quality recordings and their play-back devices	500 The ability to read the minds of others	500 To insert between other things

THE QUESTIONS: WHAT IS . . . ?

	VIS (SEE)	THERM (HEAT)	AUD (HEAR)	TELE (DISTANT)	JECT (THROW)
100	Visible	Thermometer	Audience	Television	Reject
200	Vision	Thermal	Audible	Telephone	Inject
300	Invisible	Thermostat	Auditorium	Telescope	Object
400	Supervise	Exothermic	Audition	Telephoto	Eject
500	Revise	Thermodynamics	Audiophile	Telepathy	Interject

Finally, an important avenue to learning new words is to encourage students to *ask* about words they do not know. Biemiller (2003) reported that older students benefit from being encouraged to identify and ask for help with unfamiliar words, in an atmosphere that validates and approves their asking.

When working on vocabulary, an important adjunct for older students is attention not only to word meaning and use but also to spelling. Masterson and Crede (1999) pointed out that children with learning disabilities make more frequent spelling errors than age-mates. Scott and Brown (2001) emphasize the importance of ongoing attention to spelling as part of the SLP's role in literacy development. When we work on vocabulary with advanced language students, it is important to remember our principle of integrating oral and written formats. As we call attention to the meaning properties of new words, we also can call attention to their visual (spelled) forms and encourage students to think of words that have related spelling patterns or are derivationally related (e.g., *photograph* is related to *photography*; the short *a* heard in the last syllable of *photograph* can help them remember that *photography* has an *a* in its second-to-last syllable because it is related to this root word. Also, *graph* is a root meaning "writing," seen in other words such as *telegraph*, *monograph*, and *graphic*. This root is always spelled with the vowel *a*. Flanigan et al. (2011) provide a range of activities to address this area.

Word Retrieval

Brackenbury and Pye (2005) have argued that a primary semantic difficulty that students with disabilities show is reduced familiarity, and so reduced automaticity of access to words in memory, and reduced number of connections between words. To put it another way, children with LLD have trouble retrieving words because they know less about the words to begin with, so paths to them are less traveled and less strongly linked to other words and ideas. The implication of this finding is that one way to reduce word retrieval problems is to increase knowledge and connections among the words the student knows. Many of the techniques we discussed in Chapter 12 for addressing word-retrieval problems, including providing elaborated, multiple exposure to deepen word knowledge and build semantic network connections, also are appropriate for adolescents who continue to have word-finding difficulties. Bryant, Goodwin, Bryant, and Higgins (2003) reviewed literature showing that using these kinds of "concept enhancement" approaches to vocabulary acquisition are more effective than instruction through definitions alone.

German (1992) provided additional suggestions for improving word retrieval. She advocated having students stabilize the phonological form of words by practicing saying, then writing the target words several times alone, and then saying and writing each word in five different sentences. While practicing saying the target word, students are told to tap once for each syllable. While writing the word, they are told to draw a line between syllables. Semantic information about target words also can be stabilized. This task can be done by having students discuss a group of words within the same semantic category and list the semantic attributes that differentiate them. German emphasized the importance of carrying this work out in groups, rather than in one-to-one settings exclusively, and of providing the intervention in a variety of settings to generalize the program's effects. We also can address these problems through a learning-strategies approach, by teaching students to consciously invoke both semantic and phonological cues to help recall words. German (2009), in fact, advocated combining vocabulary instruction with work on retrieval

strategies. We'll discuss these approaches in the section on learning strategies.

Figurative Language

Norbury (2004) pointed out that the most important aspect of an intervention program on figurative language is repeated exposure. Because of their deficits in reading, students with LLD may not have encountered figurative language as often as their peers; the latter absorb more secondary-level reading material, where figurative language appears more frequently than it does in conversation. It is important for students with LLD to hear figurative language in poetry and literature read to them by teachers and clinicians. Several books for teens include many examples of these forms. *Not Quite Human: Batteries Not Included* (McEvoy, 1985), *The Phantom Tollbooth* (Juster, 1961), *Ace Hits the Big Time* (Murphy & Wolkoff, 1981), *The Realm of Possibility* (Levithan, 2004), *Bucking the Sarge* (Curtis, 2004), and *Airborn* (Oppel, 2004) are some good examples. Poetry is an especially rich source of figurative language and may be easier for students with LLD, since it is typically short. Collections that might interest adolescents include *Once upon a Poem* (Crossley-Holland, 2004), *Things I Have to Tell You: Poems and Writing by Teenage Girls* (Franco, 2001a), and *You Hear Me? Poems and Writing by Teenage Boys* (Franco, 2001b). In addition, Palmer and Brooks (2004) provide a list of resources for work on figurative language. These appear in Box 14-2.

Exposure alone, of course, is not enough. Some supportive scaffolding is necessary to help students assimilate the figurative language they hear. Literature selections from English class can be read to students, who can be encouraged to be "detectives" looking for similes and metaphors. Students can be asked to raise a hand whenever they hear one of these figures, so the teacher can write it down for discussion at the end of the selected reading. Advertisements from newspapers or magazines also are good sources of figurative language.

Gerber (1993) suggested giving students pairs of words that lend themselves to figurative usage (*eyes* and *stars*, *snake* and *river*) and asking students to use them to construct similes and metaphors, in the context of advertisements for fictitious products or descriptions of people the student knows. Wallach and Miller (1988) suggested further that students be asked to generate their own lists of word pairs, exchange them with other students, and

come up with figurative forms suggested by their peers' sets of words.

Other forms of figurative language, such as idioms and slang, which are common in everyday speech, can be addressed in a similar way. Here students can be asked to keep a notebook, in which they write down every slang or idiomatic expression they hear people using over the course of a week and to role-play appropriate contexts for using each expression. Gerber (1993) provided additional suggestions for work on figurative language, and commercial materials, such as Spector's (1997) *Saying One Thing, Meaning Another, Figures of Speech, Multiple Meanings for the Young Adult* (McCarr, 1995), *Slangman Guides* (Burke, 2003), *The Idiom Game* (Wisniewski, 2003), *Idioms* (Paris & Paris, 2005), and *Figurative Language* (Gorman-Gard, 1992) also are helpful.

Humor is another common figurative language vehicle, and students with LLD often have trouble understanding the humor used by peers. Again, students can be asked to collect jokes they hear in a notebook and discuss them with the clinician or communication class. Students also can be guided to produce their own jokes in an effort to help them learn the flexible language use and awareness of ambiguity that humor involves. Hamersky's (1995) *Cartoon Cut-Ups* is another useful commercial program for this purpose.

Verbal Reasoning

Masterson and Perry (1999) developed a program that included direct instruction and activities from the school curriculum to train verbal reasoning skills. They reported that students involved in the program showed significant improvement in verbal reasoning

relative to peers with LLD who did not receive the training. Their training procedure is outlined in Box 14-3.

Wegerif (2002) demonstrated that using a verbal reasoning program in which students were taught in a group to "talk through" nonverbal problems, such as science or math assignments, resulted in significantly better verbal reasoning test scores for trained than untrained students. This finding suggests that using groups or communication classroom opportunities to help students develop verbal reasoning skills in peer interactive settings can be helpful in addressing this area.

Simon (1991b) also described a program designed to improve verbal reasoning in students with LLD. Activities include, first, helping students differentiate emotional from logical arguments. Students look for "hidden persuaders" in advertising and identify logical, as opposed to emotional, appeals. A second activity involves reading letters to the editor in local or online newspapers and identifying the premise and conclusion in the letter. The clinician then helps the student to state the letter's argument as a syllogism ("New taxes are needed if and only if there is no waste in government. There is waste in government; therefore, new taxes are not needed."). Students can then be asked to argue against the letter writer by stating a different syllogism and translating it into a letter to the editor. (Some may even be sent to the local paper or posted as comments online, if students use especially cogent reasoning!)

Commercial programs, such as *Analogies for Thinking and Talking* (Nelson & Gillespie, 1992) and *501 Word Analogies Questions & Answers* (LearningExpress, 2002), have been designed to assist

BOX 14-3 Masterson and Perry's (1999) Program for Training Verbal Reasoning Skills

PHASE I: MEDIATED LEARNING (SESSIONS 1-5)

Step 1: Define terms and model solution of verbal reasoning problems.

Encoding: Picture each term of the problem and think of a list of attributes for it.

Example: (A)horse:[is to] (B)foal::[as] (C)cow:[is to] (D)_____.

I'll picture horse, foal, and cow in my mind, and make a list of features for each, such as:

Horse	Foal	Cow
Animal	Animal	Animal
Adult	Baby	Adult
Eats grass	Eats grass	Eats grass

Inferring: Find the relationship between terms A and B in the problem.

Example: How are horse and foal related? A foal is a baby horse.

Mapping: Use the relationship found for A to B, and find a similar relationship for C and D.

Example: If a foal is a baby horse, then I need to find a baby for the cow.

Applying: Choose an answer that has the same relationship to C as B had to A in the problem.

Example: A foal is a baby horse, and a calf is a baby cow; so calf is the correct answer.

Step 2: Picture analogies. Present problems in the form of pictures. Use group practice, then individual practice on worksheets.

Example: Picture of horse, picture of colt, picture of cow, picture of calf

Step 3: Present analogies in sentence form. Have students read and complete them.

Example: A baseball player makes a home run, just like a soccer player makes a _____.

Step 4: Present paragraphs that contain similes and have students explain the relationship.

Example: Astronauts are like Christopher Columbus because _____.

Then have students construct analogous paragraphs as a group.

Individually complete a worksheet with verbal analogies.

Step 5: After reviewing previous lessons, read a story such as *The Lorax* (Seuss, 1971). Have the students think of real-life situations that are similar to the story. Then have each student generate an analogy from the story and solve each other's analogies.

PHASE II: BRIDGING (SESSIONS 6-16)

A series of activities is presented that help students use the processes of analogical thinking in everyday activities.

Example: Students are given a recipe that feeds two people and must figure out how to use it to feed 12.

students in developing deductive or analogical reasoning skills. Standardized tests students take for college admission have traditionally involved analogical problems, and the books designed to prepare students for these tests frequently contain examples of analogies that students can practice and discuss. Some computer-assisted analogical reasoning programs also are available. *Analogies Tutorial* (Hartley Software, 1992) is one example.

Simon (1991b) also suggested using visual aids to help understand logical relations. For example, students can be given the syllogism, “Ray runs faster than Tim, and Zack runs slower than Tim. Who runs the slowest?” They can then be encouraged to write the initial of each person to represent his position in order to help process the problem:

R	T	Z

Eventually, the clinician can help the students translate these logical problems to symbolic equations by providing examples such as:

If J = H Jessica is as tall as Hank, and M = J Marie is as tall as Jessica, Then Marie is as tall as Hank. M = H

Newton, Roberts, and Donlan (2010) demonstrated that visual supports such as these provide significant improvement in verbal reasoning performance for students with LLD.

Other logical relationships can be depicted using Venn diagrams, to show how categories are related (Figure 14-4). Simon also suggested a program on practical logic by Lipman and Sharp (1974), entitled *Harry Stottlemeier's Discovery*, as useful for addressing this area.

Syntax

The goal of syntactic intervention in the advanced language stage is to increase flexibility and help students process and produce language at the literate end of the oral-literate continuum. Nippold, Ward-Lonergan, and Fanning (2005) showed that by age 11, typical students are near adult levels in most aspects of syntax in writing, so that increasing syntactic complexity needs to be part of an intervention program for writers with generally simple sentence structures during the secondary school years. Strong (1986) suggested sentence-combining activities as an effective way to achieve

these goals. Students are given sets of simple sentences, drawn from curricular themes or literature selections, and asked to find a variety of ways of combining them into one complex sentence. Gerber (1993) advocated providing sets of sentences that can be combined with a particular syntactic device, such as a relative clause:

Sound waves strike the eardrum. The eardrum sends vibrations to the middle ear. (Sound waves strike the eardrum, which sends vibrations to the middle ear.) The refugees moved away. The community rejected the refugees. (The refugees that the community rejected moved away.)

Later another device, such as the temporal clause, can be introduced:

The European settlers in North America had friendly relations with Native Americans. Disputes over land and treaties caused conflict. (At first, European settlers in North America had friendly relations with Native Americans, but later disputes over land and treaties caused conflict.)

Killgallon and Killgallon (2000) and Westby (2007) suggest a sequenced program to develop sentence-combining skills, which is outlined in Table 14-2.

Gerber also suggested working with sentence manipulation as another avenue to increasing syntactic flexibility. Here, she advocated writing phrases or clauses on cards and having students physically manipulate the cards to arrive at different combinations. For example, the following phrases and clauses could be written, each on a separate card:

at night at our house we aren't allowed to watch television until we have finished our homework

Students can then be encouraged to see how many different sentences they can make by coming up with different orderings of the phrases and clauses.

Teaching students to combine sentences will move toward increasing two of the indices of syntax that we assessed: T-unit length and the subordination index. To improve students' use of the low-frequency forms listed in Table 13-5 we need to provide exposure to literary language in which the forms appear. If students' reading skills make comprehension of grade-level textbook and literature material difficult, we can encourage parents to read this material to students as part of the students' homework. In addition, we can encourage parents to read other grade-level appropriate literature to the student. If students balk at being read to, parents might try reading the material onto an audio file and having the student listen to the file on a personal listening system. Also, many excellent books are available in audio form at libraries, and students who refuse to be read to can be assigned to listen to these books in audio format as part of their communication-class homework (Wolfson, 2008). The school

TABLE 14-2 Sequenced Steps for Teaching Syntactic Patterns

Syntactic Form	Step	Example from <i>Holes</i> (Sachar, 1998)
Prepositional phrases	Define: Direct instruction in target form	A prepositional phrase starts with a preposition (give list of examples) and is followed by a noun and modifiers (give examples). It is used to describe and elaborate the meaning of the word it modifies.
	Identify: Students find and underline target forms in classroom text.	"If you take a bad boy and make him dig a hole every day in the hot sun it will turn him into a good boy."
	Combine: Students combine given sentences from classroom text by putting the underlined part of the second sentence at the (^) symbol in the first, using the target form, then write the new sentence.	If you take a bad boy and make him dig a hole every day <u>in the hot sun</u> it will turn him <u>into a good boy</u> .
	Unscramble: Students are given a list of sentence parts from classroom text to unscramble, then write out, underlining the target form in each.	If you take a bad boy and make him dig a hole every day ^ he will turn^; <u>in the hot sun, into a good boy</u> .
		it will turn him and make him dig a hole every day in the hot sun if you take a bad boy into a good boy
	Expand: Students are given a sentence and told to complete it with a target form where the ^ symbol appears.	If you take a bad boy and make him dig a hole every day <u>in the hot sun</u> it will turn him <u>into a good boy</u> .
	Combine to imitate: Students are given a model sentence from a classroom text, then several related sentences to combine, following the model.	If you take a bad boy and make him dig a hole every day in the hot sun it will turn him into a good boy. There was once a lake there. It was a large lake. That was over a hundred years ago.
Participial phrases	Write your own: Students are given a writing prompt related to the literature selection, and are asked to write a paragraph using a least three examples of the target form.	Everyone feels "cursed" sometimes. Write about a time you did. Use three prepositional phrases.

librarian can help the clinician identify grade-appropriate audiobooks.

Exposure to literary language is, of course, necessary but not sufficient. Scott (2005) reported that students with LLD show less diversity of sentence types in their writing than typical students do. This suggests that an important intervention activity will be to help students learn to say what they mean in a variety of ways, using a range of sentence forms. Paraphrasing activities are one way to accomplish this. Paraphrasing can be used to encourage students to try out low-frequency forms in their own communication. Here students can choose sentences from textbooks and provide several alternate forms for each one. To increase use of low-frequency forms in this activity, students can be given a list of “dandy language” forms, like the list in Table 13-5. The clinician can discuss the forms with students and work together to identify examples of these forms in the text selection. After some discussion, students can be encouraged, with the clinician’s model, to use the forms in some of their paraphrases. Paraphrasing is an important skill to learn, in and of itself, since it helps students in summarizing and in using information from other sources for inclusion in their own writing. Additional suggestions for working on advanced syntax can be found in Haussamen’s (2003) *Grammar Alive! A Guide for Teachers*.

Nippold (2007) reminds us of the importance of context in language complexity. Nippold et al. (2005) demonstrated the use of significantly more complex syntax in persuasive than in other forms of discourse. This suggests that clinicians should use contexts such as persuasive talks and essays when working on complex syntax. As we do so, we can help students incorporate more complex forms into these discourse situations by reminding them to use introducers such as *in my opinion*; verbal organizers such as *first*, *next*, and *finally*; conjuncts such as *consequently* and *as a result*; and markers such as *in summary*. Owens (2009) suggests giving students prompt cards like the one in Figure 14-5 and requiring them to use these forms appropriately within their persuasive talk or essay can help students increase the complexity of their syntax in a pragmatically appropriate way. Another important source of complex syntax is, of course, curricular materials. These make excellent sources of complex language for paraphrasing and analysis.

Pragmatics

Classroom Discourse

Creaghead (1992) suggested a series of activities that can be used to improve students’ ability to function in the secondary classroom. Box 14-4 summarizes an adaptation of Creaghead’s program for students at the advanced language stage. Using this approach, students would first learn to recognize scripts, like those we looked at in Table 12-4 that describe the routines of the classroom with which the student is having trouble. Students can identify these routines by reviewing information derived from self-assessments or teacher interviews like the one in Box 13-5, in consultation with the clinician.

Norris and Hoffman (1993) suggested using graphic organizers to help students with LLD manage the rules of the classroom. Secondary students can, for example, develop diagrams to summarize classroom rules, and contrast the rules they have to follow in different classes. They can first be asked to list rules for each class, using a script analysis procedure like the one in Box 14-4. They can examine the scripts for each class, noting the similarities and differences. The clinician can then help them to develop

Instructions: Include the following sections and use at least one suggested form in each section in your persuasive piece:

Sections	Suggested forms
Introduction	In my opinion... I believe... From my point of view,... I think...
Body:	
Connecting words, such as	... if... ... although... ... even though... ... although... ... as a result... ... consequently...
Counter-opinions, such as	Although... However... On the other hand... To/on the contrary... Even though...
Logical organizers, such as	First, next, last... For example... Most importantly... In addition...
Mental words, such as	Think... Consider... Remember... Believe... Know...
Conclusion	To summarize... In summary... In conclusion... After considering...

BOX 14-4 A Program for Using Script Analysis to Improve Classroom Discourse Skills in Adolescents with LLD

STEP 1: OUTLINE THE SCRIPT

Have the students tell everything they know about the script, including participants, sequence of events, objects needed, and so on. ("Let's list everything that happens when you have to write a composition in English class.")

STEP 2: BRAINSTORM VARIATIONS

Suggest some variations, and ask students how they would react to each. ("What would you do if the principal came in while the class was writing?")

STEP 3: SPECIFY THE CUES FOR ACTIVATING THE SCRIPT

Many students with LLD miss crucial verbal and nonverbal cues given by the teacher during class routines. Encourage students to identify the cues they need to identify. ("What does the teacher do when it's time to stop writing?")

STEP 4: ROLE-PLAY THE SCRIPT

Have students take turns acting out student and teacher roles in this routine. Playing the teacher may help to make students more aware of subtle cues teachers give.

STEP 5: PROVIDE STRATEGIES FOR COPING WITH WEAKNESSES

Identify areas in which the student continues to have trouble, and provide reminding systems. Consult with teachers to encourage them to offer similar reminders in the classroom. A teacher might be encouraged to say to the student, for example, "Remember, it's our rule that if you finish your composition before time is up, you should edit your work. Check the editing guide on the board to help you remember where to begin."

FIGURE 14-6 Flow chart for comparing classroom rules. (Adapted from Norris, J., & Hoffman, P. [1993]. *Whole language intervention for school-age children*. San Diego, CA: Singular Publishing.)

a diagram like the one in Figure 14-6 to describe the rules for various classes.

Gallagher (1991) also suggested using peers in informal modeling contexts to improve the classroom communication skills of students with LLD. Many secondary classrooms use some form of cooperative learning, in which students complete assignments by working in groups. These settings provide ideal opportunities for students with LLD to experience peer modeling of cooperative

communication. The SLP can offer to run the first few cooperative learning group sessions, in which students practice social skills as well as the "rules of the game" for cooperative interaction. Activities that teach social skills and promote bonding within the group benefit students with LLD and ASD in providing peer models of appropriate interaction.

Finally, Westby (2007) reminds us that teachers can change the conditions of the classroom to meet students with disabilities

Cooperative learning groups provide opportunities for inclusion of students with LLD.

“half-way.” With consultation from the SLP, teachers can provide graduated task sequences for students with LLD, beginning with short assignments with explicit instructions and rubrics to guide production, and moving gradually to longer, more open-ended assignments with fewer cues. We can also advocate providing multi-modality instruction, including visual, digital, and experiential input (Westby, 2010), not to replace, but to augment written language input and response modes. We’ll come back to this option when we talk about consultation models of practice.

Narrative

Comprehension. Basic-skills approaches to narrative comprehension involve, again, exposure to the complex, multipisode narratives that characterize adolescent and adult literature. Reading and listening to good stories are key here. Again, students whose reading levels preclude independent reading of books like these might listen to parents read them, as homework, or listen to audiobook versions. *A Northern Light* (Donnelly, 2003), *Gabriel’s Story* (Durham, 2002), *Perfect Chemistry* (Elkeles, 2008), *Stone Fox* (Gardiner, 1980), *Phoenix Rising, or How to Survive Your Life* (Grant, 1989), *Jumping off Swings* (Knowles, 2009), *Sarah, Plain and Tall* (MacLachlan, 1985), *Dope Sick* (Myers, 2009), *Saving Lenny* (Willey, 1991), and *Emako Blue* (Woods, 2004) are some examples of books with these structures that will appeal to teens. The “Reluctant Reader List,” published with yearly updates by the American Library Association, provides additional suggestions and is available from school librarians, through public libraries, and on the Web site www.ala.org/ala/mgrps/divs/yalsa/booklistsawards/quickpicks/qphome.cfm.

We talked in Chapter 12 about the importance of fluency for younger readers’ comprehension development, and about the use of repeated readings to support its development. For students in the advanced language stage, who may read at close to a fourth-grade level, although they are in middle or high school, fluency is likely to be an area that will need work. Since SLPs are not reading teachers, we may not work directly on fluency in secondary settings, but there are ways we can combine other oral language work with fluency practice, especially since Roberts et al. (2008) found in a meta-analysis that repeated readings, the main method of fluency development for younger children, had little effect on improving fluency for older students. Roberts et al. suggest instead that repeated reading be used only in conjunction with work on vocabulary or word study, to improve

students’ familiarity with words encountered in reading. So rather than using a Readers’ Theater approach, as we did for elementary students, we might use repeated readings to provide elaborated exposure to new words and then engage in varying types of word study. Box 14-5 provides some suggestions along these lines. An important point to note here is that this approach provides a way for SLPs to use their expertise in semantic intervention to contribute toward the development not only of vocabulary, but of an important component of skilled reading, fluency.

Staskowski and Creaghead (2001) and Gillam and Ukrainetz (2006) suggest a sequence of activities that can help students comprehend stories that they hear or read. These include the following:

- *Establish a purpose:* Help students decide why reading or hearing this story is important. Reasons might include learning classroom content, answering questions provided by the teacher or clinician, or finding new information of interest to the student.
- *Activate prior knowledge:* Help students remember what they already know. For example, in preparing to read Shirley Jackson’s *The Lottery*, students can be encouraged to tell what they know about lotteries, share experiences with buying lottery tickets, skim through the story and put “sticky notes” at points where they recognize similarities or differences to the lotteries with which they have had experience.
- *Make predictions:* Have students preview the text, pictures, chapter headings, etc., to make guesses about what the story will contain; read one section then have the students predict what may happen next.
- *Ask questions:* Have students generate a list of questions, based on their predictions, to be asked during and after reading. Make a chart to record answers.
- *Visualize:* Encourage students to “draw a picture in their minds” of objects and events in the story. Have them describe their image of what characters and scenes from the story look like, or draw pictures to illustrate the story.

BOX 14-5 Using Repeated Reading Combined with Vocabulary Activities to Build Reading Fluency

Reading 1: Student writes down all unknown words in a passage.

Activity 1: Student constructs “Knowledge Rating Checklist” chart for listed words (see Table 12-1), discusses w/SLP and/or group.

Reading 2: Student reads passage again, stopping at each word on the list, and provides a definition with scaffolding from SLP and/or group.

Activity 2: Student writes a definition for each word, checks against the dictionary.

Reading 3: Student reads the passage again, substituting a synonym for each word on the list.

Activity 3: Student draws a semantic web (see Figure 12-6) for each word on the list, connecting word to others with similar meaning, root, affixes, etc.

Reading 4: Student reads the passage, then summarizes it, using words from the list.

From Roberts, G., Torgesen, J.K., Boardman, A., and Scammacca, N. (2008). Evidence-based strategies for reading instruction of older students with learning disabilities. *Learning Disabilities Research & Practice* (Blackwell Publishing Limited), 23: 63-69.

• *Focused skill activities:* Provide follow-up activities to target vocabulary and complex syntax encountered in the story, and the production of a “parallel story” to enhance understanding. Page and Stewart (1985) suggested working on narrative comprehension by having students use inferencing and prediction skills to sequence paragraphs contained in a story or episode. The clinician can photocopy a chapter from a literature selection, cut it into one- to two-paragraph segments, scramble them, and have students put them in correct sequence.

Stanfa and O’Shea (1998) and Stanford (2006) suggested several ways to use drama to enhance students’ narrative comprehension. Some examples include the following:

- *Use oral reading to create characters.* Have students skim a scene in a story to identify characters. Assign the student a character and have the student read what the character says and does, using voice, pauses, and stress to show what kind of person the character is or how he or she feels in the scene.
- *Use improvisational scenes* to activate a preparatory set before reading. For example, if students are going to read *Romeo and Juliet*, they might talk first about an experience they had of meeting a new boy or girl at a party, and wanting to talk more with the stranger. Students can discuss what they did, what they wish they had done, etc. They can then act out the situation. These improvisations can be recalled during the reading of the literature selection.
- *Use improvisations* to explore and enhance understanding of characters in the story. For example, if students are reading a biography of Ben Franklin, they might talk about what kind of person Franklin was, and how he might react to situations such as arriving in a new country or meeting a new person. Students can then act out their impressions and discuss why they had the character act as they did.
- *Involve students in writing and acting* in plays to enrich their understanding of stories they read or hear. Students can convert stories or novels they read to plays or adapt literature selections to their own experiences or to contemporary themes and write a new play based on the adaptation. For example, if students read *The War of the Worlds*, they might write a play about what an alien invasion would be like if it happened today. If video equipment is available, the students may record their play to show to family members.

Activities in which students write or act out fictional interviews, using a book such as *Interview with a Vampire* (Rice, 1976) as a

model, can help work on inferencing and character motivation. The clinician might provide students with a list of questions to “ask” their favorite character, and the students must infer or predict what their character would say in response. The clinician can help students refine their answers with probes such as the following:

- Why would (character) answer that way?
- Does that answer go along with everything else you know about (character)?
- What happens in your book that makes you think (character) would answer that way?

Work on summarizing is another way to develop narrative comprehension. If students need to write book reports for English class, the clinician can use these as an opportunity to develop summarizing skills with the student. A communication class might also develop its own “Book Review” magazine. With guidance and feedback from the clinician, students would write “reviews” that include a summary of the book’s plot and the student’s assessment of the book’s literary quality and potential appeal for other students. Students also can give “book talks” for younger classes or in the communication class, in which they give similar information orally.

Swanson and De La Paz (1998) suggest teaching story summarizing skills by having students locate story elements in the text and list them on paper, or use a graphic organizer. The list or map can then be transferred to paragraph form. Ae-Hwa, Vaughn, Wanzek, and Shangjin (2004) have shown that using graphic organizers improves reading comprehension for students with LLD.

Westby and Clauser (2005) emphasize the importance, as part of work on narrative comprehension, of helping students understand the “landscape of consciousness,” that is, the way characters plans, emotions, and intentions govern actions, as well as the way in which point of view determines how events are perceived. Understanding these internal states is crucial to full comprehension of many stories. To address this issue, they suggest using stories such as “The Blind Men and the Elephant,” *Voices in the Park* (Browne, 2001), *Passage to Freedom: The Sugihara Story* (Mochizuki, 1997), and *John Brown, Rose, and the Midnight Cat* (Wagner, 1980), all of which tell the same story from several characters’ perspectives. Students can then create visual organizers, like the one in Table 14-3, to discuss and describe the various perspectives in the story.

Narrative Production. Narrative writing is also an appropriate target of basic instruction at this level. Wetherell, Botting, and Conti-Ramsden (2007) showed that adolescents with LLD were poorer than typically speaking peers at relating even relatively simple narratives, suggesting that basic skills in this area will frequently be an area of need for these students. Larson and McKinley (2003a) reiterate the importance of explicit, direct instruction that helps students understand the sequence and cause-effect relationships in stories. They also emphasize the importance of using oral storytelling as a context for addressing some of the oral language difficulties so often seen in students with LLD, such as speech disruptions, syntactic errors, and word-finding problems.

Scaffolding Narrative Composition. Montgomery and Kahn (2003) provide suggestions for teaching students with language-learning disabilities using a scaffolded composition process. This process can include the following:

- *Introduce concept of author:* Explain that the author has control of an entire fictional universe with power to make all the decisions about it. Tell students, “You are going to be an author!”

Acting out narratives can deepen students’ understanding of this genre.

TABLE 14-3 Character Perspective Map for *Passage to Freedom: The Sugihara Story* (Mochizuki, 1997)

Story Event	Mr. Sugihara's Perspective	Perspective of Jewish Families
Outbreak of WWII	Doing his job; obeying orders	Worried, unsure of what will happen
Jewish families arrive from Poland	Torn between duty to superiors and desperate needs of families seeking visas	Desperate to escape deportation
Lithuania is conquered by Russia	Determined to carry his humanitarian efforts as far as possible	Frantic for last chance at escape

Adapted from Westby, C., & Clauser, P. (2005). The right stuff for writing: Assessing and facilitating written language. In H. Catts & A. Kahmi (Eds.). *Language and reading disabilities* (2nd ed.). (pp. 274-340). Boston: Allyn & Bacon.

- Refer to the aspects of the story, using a poster or graphic organizer:

- Setting
- Characters
- Problem
- Attempt
- Consequence
- Resolution

Assist the student to make a decision about each element in planning the story (e.g., “Who will your characters be?” “I don’t know” “They could be teenagers, adults, children, animals, aliens, anybody. You decide.” If the student cannot make a decision, suggest teenagers. Continue with a similar process until each element has been addressed).

- Have the student draw a sequence story: Divide a sheet of paper into six or eight sections, and have the student draw a simple stick figure drawing to outline the story.
- Have the student describe the main characters: Encourage the students to give detailed descriptions of who the characters are, what they look like, what they like and do.
- Use the poster or graphic organizer: Encourage the student to write or tell each aspect of the story, following their picture sequence and incorporating the information they produced about their characters. Use questions to scaffold the student’s production, giving suggestions only when the student refuses or is unable to make a choice.
- Support the student in writing or dictating the story: Help select words, sentence forms, and spelling. Encourage students to try various forms orally to see how they sound before writing them.
- Revise: Use the opportunity for incidental teaching about spelling, punctuation, capitalization, and so on, whether the student writes the story himself or dictates it. Encourage the student also to think about word choice and consider alternative wordings, using a dictionary or thesaurus.

When working on producing narratives, we want to talk frequently with students about characters’ motivations and internal responses. Using some of the “trickster tales” we discussed in Chapter 12 can be a starting point for younger adolescents. Discussions of all the stories we work on should center on plans, motivations, and internal responses. When students write stories or plays, for example, the clinician can help them focus on making internal response elements explicit by asking questions such as:

Why does (character) do that?
What is (character)’s plan?
How does (character) feel about what happened?

Narrative Cohesion. Basic skill instruction in narrative production can also include use of cohesive elements: pronouns, connectives, and other advanced markers of cohesion, such as those in Box 13-7. Many of the activities we outlined for working on use of pronouns and conjunctions as cohesive markers in Chapter 12 can be adapted to include these more advanced cohesive forms using grade-appropriate materials for secondary students. Work on conjunctions and other advanced forms of cohesion can begin, again, with exposure. We can explain to students about the use of one or more types of these cohesive markers and give them texts containing marked examples. Students can be asked to explain how the two elements are linked. If students are reading *A Wrinkle in Time* (L’Engle, 1962) in class, for example, we might give them the following pairs of sentences adapted from the story and ask them to identify the cohesive element present in each:

Now they were in the clouds. They could see nothing but drifting whiteness. (lexical cohesion)
In front . . . Charles Wallace sat quietly. Once he turned . . . (pronoun cohesion)
Below them were still rocks . . . but now . . . Meg could see where the mountain at last came to an end. (substitution)
As they moved through the greyness, Meg caught a glimpse of slaglike rocks. Still, there were no traces of trees or bushes. (conjunction)

After talking about the cohesive devices they encounter in their reading, students can be asked to produce several different pairs of sentences, each containing one of the devices discussed. When they have practiced producing series of sentences with different devices, they can write a group story in which each member has the responsibility for including one of the devices studied. Eventually, students can be asked to write individual stories with some of these cohesive elements in them. Nelson (2010) suggests further that cooperative learning groups be given passages with poor cohesion (perhaps drawn from the pre-intervention narrative productions of students who are no longer in school) and asked to work together to identify and correct cohesive errors. Jago (2002) presents additional ideas for enhancing cohesion in student writing.

One particularly useful technique for improving cohesive writing is sentence combining (Keen, 2004). Keen showed that encouraging students to combine sentences during rewriting, modeling and prompting the use of grammatical forms, such as the subordinate clauses, results in improvements in the coherence of students’ writing. This finding is just another example of the ways in which SLPs, in their legitimate role of helping students expand their grammatical development, can achieve improvements in students’

ability to elaborate their meaning and establish cohesion in both speech and writing.

Other Discourse Genres

In addition to work on narrative, basic skills instruction in other written language genres will often be necessary for students at the advanced language stage.

Writing Mechanics

Dockrell, Lindsay, and Connelly (2009), in examining the writing skills of students with LLD at age 16, found that these students not only experienced problems with written composition—including short texts, poor sentence structure and vocabulary, and difficulties with ideas and organization—but spelling and handwriting problems were also significant contributors to their low performance. These findings suggest that basic-level writing instruction will undoubtedly include mechanics: spelling, punctuation, capitalization, and handwriting. Although these skills have often been taught in the mainstream language arts program and students in secondary school “should” have mastered these basics, many of our clients with LLD probably did not “get it” the first time around. Intelligible writing requires these fundamentals, and students who have trouble with written communication need help with these building blocks, just as a preschooler with unintelligible speech needs help in producing fundamental speech sounds. Delpit (1988) pointed out that many secondary teachers refuse to teach these basics, because they consider it the elementary teacher’s job. They tend to concentrate instead on the process and content aspects of writing. That’s why it is sometimes necessary for us as language specialists to step into the breach and provide some basic-level instruction in writing mechanics for our older students with LLD. Remembering our unique role in the curriculum, however, it is important for us to embed this instruction in a language-based context, so that we are not teaching spelling lists or punctuation rules or tutoring students on particular classroom assignments, but rather are having students generate language to be written down and working with the language they generate to address the conventions of writing that improve its communicative function.

The revision process is a prime incidental teaching opportunity for addressing these mechanics in a communicative context (Kervin, 2002). Moore (1989) presented a concise set of rules for capitalization and punctuation that can be made into posters, “rule books,” or “crib sheets.” Posters with sets of such rules for individual students can be used in the communication class. Students can bring writing samples from other classes to the communication class. Work on editing them can proceed through several passes over the document: one for appropriate spelling, one for capitalization, and one for each type of punctuation in turn (period, comma, question mark, apostrophe, quotation mark, etc.). At the beginning of each pass, students can be referred to the rules governing use of the element being examined. In the context of a communication class, a unit on editing might include exercises in which students are given writing samples of the teacher’s in which they are to identify errors. As we discussed earlier, these could at first contain cues such as highlighting on sentences that have a mistake for the student to find. Gradually, the cues can be faded.

Handwriting problems can often be addressed by allowing students to use word-processing equipment for written work. This is not always the easy solution it sounds, since students with fine motor problems that impair handwriting have fine motor problems on a keyboard, too (Berninger & Wolf, 2009). And in some contexts keyboarding may not be an option; for example, the SAT writing test requires handwritten responses. Still, this form of

compensatory programming can make it possible for the student’s work to be read, even if it remains laborious for the student to produce. Most secondary schools have keyboarding courses, and students using word processors for written work should be encouraged to take these as electives. Using a keyboard for class note-taking, examinations, and assignments is a legitimate accommodation for students with LLD, and can be included on their IEPs.

MacArthur, Haynes, and DeLa Paz (1996) suggested using speech synthesis and word prediction software to help students with poor legibility and spelling. This software is often used to enable students with severe speech disorders to express themselves by “writing out loud.” While the intention is to speed up message transmission for students with severe speech disorders, this software also can help students with poor spelling abilities to produce correct versions of intended words more quickly, recognize them, and increase their chances of retaining them for later use.

Spelling can also be addressed using the procedures we’ve already discussed for identifying root words and relations among words that are preserved in spelling (our *clinic-clinician* example, again). In addition, students can be encouraged to create personal dictionaries in which they record frequently used spellings, spellings of new words they learn in the curriculum, and words they come across in their reading that they think might be useful in their own writing. Again, technology can be helpful here. If students use word processors for their writing, they can be taught to use the spelling checker. While this is not a substitute for learning to spell, it does reinforce the idea that it is important to check spelling as one aspect of the editing process. Electronic, hand-held spelling aids and programs or “apps” on smart phones and other devices also are available.

Beyond these mechanics, we will want to assist students to become more effective writers for a variety of purposes. We will discuss a range of learning strategies that can assist students in this development a bit later. But in a review of writing intervention programs for students with LLD, Gersten and Baker (2001) found that there were three critical elements that should be part of any instructional program for these students. These elements include the following:

- Explicit teaching of the steps in the writing process (planning, composing, revising)
- Discussion of purposes and audiences for writing
- Scaffolding and feedback on the quality of the writing product, not only from adults but also from peers

Incorporating these components in the intervention we provide for struggling writers will help us maximize the effectiveness of our writing intervention.

Expository and Argumentative Texts

New discourse genres that come to the fore at the secondary level are *expository* texts that explain or relate factual material, and *argumentative* or persuasive texts that attempt to convince or discuss opinions. These discourse genres will form the bulk of school-sponsored writing during adolescence, and some direct instruction will be presented in the course of classroom English and language arts classes. In fact, many state-required writing assessments, as well as the SAT writing section, require the production of persuasive essays. These often form a large part of the writing curriculum in secondary grades. And there is ample evidence (summarized by Ward-Lonegan, 2010) that students with LLD perform significantly below their typically-achieving peers on these important tasks. As such, these are ideal collaborative intervention opportunities for the SLP, who can work with the teacher to outline, pre-teach, guest

teach, and do follow-up instruction in these areas for students with IEPs.

Students are generally expected to use the “five-paragraph essay,” as the basic structure for much of the expository and persuasive discourse they are required to produce in school. The first paragraph introduces the thesis of the essay and foreshadows the main supporting subtopics. The second through fourth paragraphs are all similar in format. They individually restate the subtopics, and are developed by giving supporting information. The fifth paragraph restates the main thesis idea and reminds the reader of the three main supporting ideas that were developed. Each paragraph begins with a topic sentence that states the paragraph’s main idea, and ends with a “clincher” sentence that sums up the paragraph. Basic skills approaches to helping students develop this form in expository and persuasive writing are outlined by Westby and Clauser (2005). These employ three phases of instruction:

- *Modeling*: The genre is introduced in the context of curriculum-related material. The communicative function and the structure of the genre are discussed, examples from classroom texts are displayed, and features are pointed out and highlighted.
- *Joint construction*: Teachers and students work together to transform information students have collected (from library and Internet research, interviews, videos, field trips, etc.) into an essay. Students do research on a curriculum-related topic in cooperative learning groups. The teacher guides them in summarizing the information, displaying their organization of it into headings and subheadings on the blackboard. Once it is organized, the teacher has students orally dictate individual sentences. These are discussed and critiqued by the group as the teacher records them.
- *Independent construction*: Students are given a curriculum-related “writing prompt.” For example, after reading *Passage to Freedom* (Mochizuki, 1998), they might be told, “Mr. Sugihara was extremely courageous. Write about someone you admire for courage. Explain why this person deserves to be called courageous.” Students write a draft of their essay, referring to the purposes and structures discussed in the earlier lessons. They then consult with a teacher about the draft and receive guiding feedback.

All genres of writing are difficult for students with LLD. However, the persuasive essay is both most difficult (Nippold, 2005) and the one required in the majority of “high stakes” situations, such as school-wide achievement tests and SATs. As such, special attention should be paid to its structure and function when working with struggling writers. Westby and Clauser (2005) outline the three parts that need to be present in making an effective argument:

- *Claim*: the basic assertion being made; e.g., students should be allowed to choose their own clothing for school.
- *Warrant*: the principles that connect data to the claim; e.g., uniforms don’t make students behave better in school.
- *Data*: factual information that supports that warrant; e.g., research shows no improvements in behavior or achievement in schools that require uniforms (Brunsma, 1998).

The basic structure of the persuasive essay includes the following:

1. Clear opening statement that expresses the argument, opinion, or position of the writer.
2. Development of the argument by supplying three or more reasons, with data and warrants.
3. Attempt to influence the audience’s opinion by providing a statement of personal belief based on the arguments made, a prediction based on these arguments, or a summary of the major ideas presented.

Westby and Clauser (2005) point out that one reason for the difficulty with persuasive texts is that students tend to have less exposure to them than to narratives or exposition. This suggests that one way to improve persuasive writing is to precede writing instruction with work on reading persuasive texts, such as editorials in newspapers and magazines, opinion blogs, or political advertisements. Having students critique these, by looking for identifying their claims and examining how well they are supported by warrants and data, can be helpful in getting students more familiar with this discourse genre.

Nelson and Van Meter (2002) discuss one additional issue that is crucial in improving students’ writing. This concerns the need for students to perceive writing as an authentic activity; one that has relevance for the real world and is not important solely for “getting through” school. Fortunately, young people’s facility and fascination with the Internet provides an important forum for authentic writing. Many teenagers have discovered the joys of “blogging,” in which they chronicle their lives and discuss issues of interest to them, as well as read the blogs of others. Many sites, including Googleblogspot.com, Blurty.com, Blogger.com, and Blogtext.org, offer free blogging facilities. Clinicians can help students establish blogs, review others’ blogs for ideas to respond to, and write and post their own responses to issues being discussed on-line by their peers. Although blogging is more tolerant of misspelling and grammatical errors than more formal writing settings, it provides one opportunity—which clinicians and teachers will augment with other more standard, formal opportunities—to express thoughts in writing for an audience of peers. As such, it can motivate students to try writing as a means of expression that has a part in the big picture of their lives, not just in the small corner of the classroom. We’ll talk more about ways to improve student writing in the section on learning strategies.

Functional Communication

Conversation

A variety of published programs for helping adolescents improve social and conversational skills are available (Frank & Smith-Rex, 1997; Hanken & Kennedy, 1998; Hazel, Schumaker, Sherman, & Sheldon-Wildgen, 1981; Hoskins, 1999; Jackson, Jackson, & Bennett, 1998; Kelly, 2001; La Greca & Mesibov, 1981; LoGiudice & McConnell, 1998; Marquis & Addy-Trout, 1992; Mayo & Waldo, 1994; Minskoff, 1982; Reese & Challenner, 2001; Schrieber & McKinley, 1995; Walker, Todis, Holmes, & Horton, 1988; Wanat, 1983; Wiig, 1982b). Larson and McKinley (2003a) outline seven crucial elements for social skills instruction:

1. *Introduction*: Tell the students about the skill, what they will learn and why it is important to them. Have students share experiences related to the skill.
2. *Guided instruction*: Lay out the steps to be taught. Define the skill and list the steps involved in accomplishing it.
3. *Modeling*: Demonstrate with role-playing or audio or video recordings the skill to be learned. Model self-talk about thinking through how/when to apply the skill.
4. *Rehearsal*: Students describe verbally the sequence of actions involved in the skill and then role-play with a group of peers.
5. *Feedback*: Provide encouragement for the use of appropriate behaviors and ask students to describe the successful behavior they used; when giving corrective feedback use a positive, nonthreatening tone and have students describe the appropriate behavior.

6. *Planning*: Have students discuss how/when/with whom they can use the new skill. Encourage them to use the following formula to help plan future interactions:
 STOP: think before talking, use self-control strategies if necessary
 PLOT: plan ahead and brainstorm options before deciding what to say/do
 GO: choose the best option from brainstorming and implement it
 SO: evaluate. Encourage students to ask themselves how it went, what they did well, what they might *change next time*
7. *Generalization*: Encourage students to try their new skill at home with family or in class with friends. Have them report back to the clinician to discuss the outcome. If more help is needed, the clinician can discreetly “sit in” on an interaction in which the student uses the skill with a peer, and give feedback.

Bryan (1986) reported that structured situations in which peers provide models of a target behavior, such as a talk-show format in which the “host” must ask open-ended questions to elicit conversation from the guest, are very effective in eliciting functional communication targets from adolescents with LLD. In general, peer modeling is a tool with demonstrated effectiveness for helping adolescents develop conversational styles that lead to greater acceptance (Paul, 2003b). Peers involved in direct instruction can be trained to model positive conversational behaviors. Such behaviors might include appropriate topic initiation and continuation, using open-ended and follow-up questions to keep the conversation moving, and providing affirmative comments on the contributions of the student with LLD. Instruction to peers can be relatively informal or more highly structured. Several programs have provided very structured training, using behavioral technology, to organize the interactions between students with LLD and peer tutors. Gaylord-Ross, Haring, Breen, and Pitts-Conway (1984), for example, used highly structured interactions between students with autism and peers to teach basic communicative skills, such as requesting, offering objects, greeting, and elaborating greetings.

Kilman and Negri-Schultz (1987) described a social-skills program designed for high-functioning autistic students like Michael that can be adapted for use with advanced language students with a variety of disabilities. Their program involved a social “club” for students with disabilities in which the students work with clinicians to create a satisfying interactive experience. Clinicians plan discussion groups with preset topics, such as the problems of meeting people, the loneliness of being different, and school stress. Students discuss their experiences on these topics with models provided by the clinician. Other meetings include interactive games, such as charades or “Pictionary,” that involve communication and take advantage of nonverbal strengths of the participants. Still others involve planning and preparing refreshments for special events put on by the “club.” These might include shows displaying participants’ artwork or dances to which members may invite friends. Throughout these activities, careful modeling of appropriate behavior is provided by professionals, and discussion about the effectiveness of the clients’ communication, within and outside the “club,” goes on. Although this program was designed as “extracurricular,” it could be incorporated as a social skills unit within a communication class for secondary students with LLD. Strulovitch and Tagalakakis (2003) also provided guidelines for running groups for students with social disabilities. Other approaches

Discussing emotions can be part of social skills training.

derived from the literature on autism include *Pivotal Response Training* (Bregman & Gerdtz, 1997), *The New Social Story Book*, and *Comic Strip Conversations* (Gray, 1994, 2000b), which can be adapted for use with students with other disabilities who need help with functional communication.

Another approach is the *Model, Analyze, Practice* (MAP) program (Hess & Fairchild, 1988). Here students view pairs of peer interactions on video, one in which the interaction is successful and one in which it is less so. Students analyze the pairs of interactions for features identified by the clinician to understand why one is more successful. These features include topic initiation, use of questions, appropriate turn-taking, and similar concerns. After analyzing the videos, students practice using the techniques they identified as effective and video-record themselves doing so. They then critique the videos of their own performance. As we saw, video modeling programs like these have demonstrated efficacy with younger children (Prelock et al., 2011), so they are a reasonable method to try with adolescents who need to develop conversational skills. Such a program could be incorporated as one unit of a communication class.

Walker, Schwartz, Nippold, Irvin, and Noell (1994) discussed the importance of following up activities like these with scaffolded opportunities to apply newly learned skills in natural settings. They recommended having the clinician structure interactions between clients and normally developing peers. In these interactions, the clinician can act as a “coach,” providing cues and prompts first during and later before the interactions. Special student helpers can be designated to provide this coaching at a later point in the program. Clinicians should establish incentive systems, such as earning days off from homework for successful conversations with peers. Debriefing, or having students relate and analyze their experiences in these scaffolded conversations, is also important to support the students’ extension of newly learned skills into their behavioral repertoire. Paul (2003b) and Strulovitch and Tagalakakis (2003) discussed a variety of social skills training programs aimed primarily at adolescents with autism that can also be adapted for students with other disabilities.

Paul and Sutherland (2003) identified several skills to be taught in these kinds of programs. One is the use of communicative rituals. Rituals are scripted conversational patterns such as greetings (“Hi, how are you?” “Fine, thanks, and you?”). A variety of rituals such as partings, introductions, asking for help, entering conversations, and asking for clarification can be written out in script form,

practiced, and memorized. Although these ritualistic interactions are not completely natural, they are often improvements over the unusual behaviors students like Michael may use. Krantz and McClannahan (1998) showed that fading these scripts, by gradually cutting off increasingly larger segments of the written form, and requiring students to rely on their memory rather than the written script, increased generalization of these procedures to settings outside the therapy context.

A second area conversational programs might address is topic management. Here students can be taught to listen first and talk later, taking time to identify the topic under discussion before entering the conversation. They also can be instructed to check the appropriateness of their topic ("Do you want to talk about a movie I saw?") or to confirm the topic they identify ("Are you talking about last night's game?"). Students with a tendency to "get stuck" on a favorite topic can also be encouraged to say, for example, just three things about their topic, and then offer to switch to a topic of their interlocutor's interest. Conversational maps, like the one in Figure 14-7, can be used to help students think ahead to choose appropriate topics for different partners, based on what they know about each one. Brinton, Robinson, and Fujiki (2004) developed a game called "The Conversation Can" to address these issues. They emphasize that the program took a long period of time before generalized change was achieved, however, so clinicians should not expect changes in these behaviors over night. The program's basic sequence is as follows:

- Brainstorm a list of topics classmates might want to discuss.
- Write each on a slip of paper.
- Put slips in can.
- Take turns pulling out a topic.
- Start conversation:
 - Think first: What should I say?
 - Say two things about the topic.
 - Ask interlocutor a question about the topic.
 - Listen while interlocutor answers.

FIGURE 14-7 Conversational map. (Adapted from Hallenbeck, M. [1996]. The cognitive strategy in writing: Welcome relief for adolescents with learning disabilities. *Learning Disabilities Research and Practice*, 11, 107-119.)

Again, these strategies are somewhat artificial but can help to build skills that will eventually allow more fluid and natural participation in conversations. And again, visual cues and organizers can be helpful.

A final element of conversation that improves chances for success, according to Brinton and Fujiki (2007), is the use of *validating comments*, those that are responsive to others in a positive way. They point out that popular students tend to use lots of these, and using them will help students with disabilities gain greater acceptance in peer conversations. Communication classroom work in this area can include practicing consistent responsiveness to questions, comments and interactive bids of other students, as well as helping student learn to give validating feedback, including compliments on actions ("Nice job!"), encouragement ("You can do it!"), consolation ("That bites! But it happens to me all the time, too!"), offers of help ("Let me get that for you."), and ritualized social acknowledgements ("Thanks!" "Sorry.")

Mentis (1994) emphasized the importance of access to flexible syntactic forms in the conversational skills of students with LLD. In taking a remedial approach to conversational development, it is important to integrate work on improving conversational ability with the use of linguistic markers that can elaborate discourse. Mentis pointed to adverbial conjuncts, question forms, relative clauses, ellipsis, and other cohesive devices as being especially important in this regard. As we work on basic conversational skills with students at the advanced language level, we want to adhere to the same principle we've talked about for working on pragmatics with younger clients. That is, we want to use conversational contexts as a means to practice semantic and syntactic forms. By integrating these forms into pragmatic contexts, such as conversation, we have the greatest chance to effect an overall improvement in the student's communication.

It is also important to bear in mind the findings reported by Turkstra (2007), who argued that teaching "social skills" may not be sufficient to improve performance in students with pragmatic disorders; it is also necessary to increase their competence in understanding the thought processes involved in social understanding, which include theory of mind, executive functions, and memory. These capacities fall under the umbrella of *social cognition*. Helping students develop these kinds of understanding involve thinking about others, planning, and self-regulation. As such, they bring us, again, to the development of compensatory strategies, rather than basic skills, and we'll talk about some strategic approaches to social skills training a later bit on.

Survival Skills

In addition to improving social communication, adolescents with LLD may need help in developing the daily interaction skills they need to make the transition to adulthood. Work, Cline, Ehren, Keiser, and Wujek (1993) described several secondary school programs that contain functional communication strands. These programs address skills needed by students to function in home, work, and community contexts.

Vocational skill development can focus on exploring realistic career options. Work et al. described one vocational exploration program in which each student in a communication class is required to research and orally report on two careers in which he or she has a realistic interest. Each student compiles a portfolio on the two careers. The portfolio includes a resume of the student's qualifications for the position, a completed job application form, and information on the training needed for the position. In addition, each student participates in a practice interview for the position,

which is video-recorded and critiqued by the clinician and classmates. The student can then redo the interview, using suggestions from the critique. Montague and Lund (1991) and Sigler and Fitzpatrick (2000) also provided commercial programs for working on vocationally related communication skills.

Survival skills needed for family or independent living also can be addressed. Here students would be given assignments to research nutrition and meal planning, consumer skills such as label reading and unit pricing, housing searches using ads for rental units, and similar topics. Students would present the results of their research orally to the class. Role-playing activities, similar to the practice job interview, could be used to rehearse such tasks as applying for an apartment, asking a store manager about sale prices, and planning and shopping for a week's worth of balanced meals. Drug abuse, family planning, and hygiene information might also be part of this unit, with collaboration from the school health teacher. A curriculum such as *Smooth Sailing in the Next Generation* (Plumridge & Hylton, 1987), which discusses prevention of birth defects, also may be an appropriate addition to the functional curriculum. Other commercial programs, such as Mannix's *Life Skills Activities for Secondary Students with Special Needs—2nd Edition* (2009a), *Social Skills Activities For Secondary Students with Special Needs—2nd Edition* (Mannix, 2009b), *Life Skills: 225 Ready-to-Use Health Activities for Success and Well-being* (McTavish, 2003), and *That's LIFE! Life Skills* (Smith, 1998), also are available.

Larson and McKinley (2003a) and Novak (2002) emphasize another important survival skill for adolescents with LLD: emotional expression. All teenagers experience a wide range of strong emotions; they feel angry at adults who set limits on them, frustrated at their own limitations, anxious about what others think of them, and so on. For students with LLD, their poor communication skills often make it difficult to acknowledge, share, and manage these feelings. The role of the SLP in this area is to provide the words and opportunities to practice talking about these feelings, first in a therapeutic atmosphere, and later in supported naturalistic settings. Gajewski, Hirn, and Mayo (1998) and *Room 28* (LoGiudice & McConnell, 2004) provide materials for practicing communication skills in a variety of social settings and include activities for emotional expression.

Finally, Westby (2010) suggests that another “survival” skill is the ability to manage not only written language, but also other forms of information that are so prevalent in our digital society. She argues that students need assistance in making sense of visual information, as well as information that comes at all of us from multimedia sources such as television and the internet. She advocates providing students with LLD with scaffolded experiences in becoming critical consumers of such information, and suggests using books that have accompanying Web sites as one way to begin this kind of work. Two examples of this kind of material include *The Invention of Hugo Cabret* (Selznick, 2007) and its accompanying Web site www.theinventionofhugocabret.com and *The 39 Clues* (Scholastic Books; www.the39clues.com).

Learning-Strategies Approaches to Intervention in the Advanced Language Stage

Learning strategies methods of intervention are essentially “meta” approaches. As such, they conform to one of the basic principles of intervention for school-age clients that we outlined earlier. In

addition, they provide the other advantages we discussed for students in the advanced language stage, those with normal intellectual ability and reading skills at a fourth-grade level or higher. That is, they help these students move toward more independent functioning and give them the tools to improve their own learning abilities. Santangelo, Harris, and Graham (2008) and Swanson and De La Paz (1998) outlined seven steps that comprise a learning-strategy, or what they call a “self-regulated strategy development” (SRSD) approach. These are given in Box 14-6. In their review of instructional approaches for students with LLD, Vaughn, Gersten, and Chard (2000) found that, along with small group instruction and controlling the difficulty of the task, the use of learning strategies was one of the three key elements that produced the strongest impact on students' learning. Faggella-Luby, Schumaker, and Deshler (2007) showed that learning strategies approaches were effective in improving reading comprehension for students with and without LLD. Still, Englert et al. (2009) showed that learning strategies are difficult for all students to learn, and even more so for students with LLD. They suggested beginning with learning strategies approach early, in middle school, to provide time for students to practice and assimilate them on a range of curricular material. And as Ehren (2009) emphasized, best practice dictates that we take materials and topics related to the curriculum and use them to teach students how to improve their own mastery of the content, rather than tutoring students in the material itself. Although we may need to use materials that are below the students' grade level for initial strategy instruction, these materials should still be selected to enhance the students' curricular knowledge. As students become more adept at using the strategies we teach, materials closer to grade level can be added. Let's look again at some of the areas that we assessed in adolescents with LLD and see how we might use these compensatory-strategy approaches to improve academic functioning and increase autonomy in our secondary school students.

Semantics

Learning New Words

Several “meta” approaches for increasing lexical skills were presented by Crais (1990). The *root word* strategy is one. Here the clinician introduces a root word and helps students identify possible additions of inflectional endings (-ing, -ed, -s) and derivational suffixes (-less, -ly, -tion) and prefixes (un-, in-, dis-). The clinician can discuss how each affix changes the meaning or part of speech of the root word. Students can then be encouraged to hunt for affixed roots in textbooks and literature selections and to talk about how identifying root words can help to elucidate word meaning. The clinician also might introduce some roots from Greek (e.g., *tele* [distance], *phon* [sound]) and Latin (e.g., *amor* [love], *terra* [earth]) that are relevant to curricular topics. Students can hunt for words containing these roots in their textbooks and talk about how the roots can be used to help identify word meaning. Students can be asked to keep a root-word dictionary, recording new roots as they learn them, listing all the words they know that contain the roots, and adding new entries as they are encountered. The strategy to be taught here is to look for relations among words and to consult prior knowledge when confronted with a new word.

Sternberg and Powell (1983) provided a set of strategies for helping students to use *context* to decipher the meaning of new words. Their approach involves encouraging students to focus on specific cues available in the context to make their guesses. They direct students to use a range of cues including temporal, spatial,

BOX 14-6 Seven Steps to Teaching Self-Regulated Learning Strategies**STEP 1**

Describe the strategy. The teacher explains the strategy (e.g., summarizing) and students and teacher review the student's current performance (e.g., on a pretest).

STEP 2

Activate and develop background knowledge. Review information students have already learned that is important for learning this strategy (e.g., taking notes; students will use summarizing to help with more efficient note-taking). Guide students on ways to acquire the information they need but don't currently have to complete the assignment.

STEP 3

Discuss current performance level. Have students examine and discuss their current skill level and identify at least one aspect of their skill in this area they would like to improve. Provide feedback to students about their current functioning in this area, and explain benefits of using the strategy to improve performance (e.g., summarizing will make it easier to take notes, remember information for tests, write book reports).

STEP 4

Model the strategy and self-instructions. The teacher shows how to use the strategy, using a "think-aloud" procedure to demonstrate each step (e.g., "This paragraph seems to be talking about trade routes to India. Let's see, it says the major routes were [a], [b], and [c] . . .") and provide "why" and "how" for each step. Self-statements such as "What should I do first?" or "Am I using the strategy?" demonstrate to students how to manage their performance. Also model using positive self-statements ("This

is tough, but I know I can do it"). Have each student set an individual goal for improving in this skill area.

STEP 5

Collaborative practice. The teacher and students, as a group, model and rehearse the strategy. The teacher provides multiple opportunities for practicing the strategies and self-cues as a class, in small groups, and in pairs. The teacher provides practice with the strategy so that students gradually assume more independence in using it. The teacher monitors students' progress and provides prompts or re-instruction, when necessary, and provides frequent feedback and positive reinforcement.

STEP 6

Independent practice and mastery. Students apply the strategy to materials at a low level of difficulty for them. The teacher provides prompts and corrective feedback, when necessary. Practice sessions are repeated with materials of increasing difficulty. Students and teacher collect data and evaluate their own performance on the materials used. Encourage students to recognize how the strategy improves their use of the skill.

STEP 7

Generalization. Practice using the strategy on curricular material. The students apply the strategy to textbooks and a variety of regular classroom content. The teacher discusses with students times/situations when the use of the newly learned strategy will be helpful, and provides additional feedback. Strategy use is then tested. Additional instruction and models are provided, if necessary.

Adapted from Santangelo, T., Harris, K. R., & Graham, S. (2008). Using self-regulated strategy development to support students who have "trubol giting thangs into werds." *Remedial & Special Education*, 29(2), 78-89; Seidenberg, P. (1988). Cognitive and academic instructional intervention for learning-disabled adolescents. *Topics in Language Disorders*, 8, 56-71; and Swanson, P., & De La Paz, S. (1998). Teaching effective comprehension strategies to students with learning and reading disabilities. *Intervention in School and Clinic*, 33, 209-218.

descriptive state or function, causal, class membership, grammatical category, and equivalence information. The clinician can start by using sentences containing nonsense words and encouraging students to recognize clues to the word's meaning in the other words in the sentence. For example, we might write on the board:

At dusk, the *cleeb*s began to appear and twinkled behind the moon in the darkening sky. Their sparkle was reflected in her starry eyes.

The clinician can model using the following cues to detect the word's meaning from the context:

temporal = dusk
 spatial = behind moon
 descriptive (state or function) = twinkle
 class membership = same as moon; something we see in the sky
 grammatical = -s ending, comes after the; therefore, is probably a noun
 causal = began to appear; therefore, not visible all the time
 equivalence = starry

Students can then be encouraged to find an unfamiliar word in a textbook selection and use as many of the cues as are available to make a stab at its meaning. We might provide the student with a list of the category of cues to complete. For example:

temporal =
 spatial =
 descriptive (state or function) =
 class membership =
 grammatical =
 causal =
 equivalence =

Students can then check their guesses by looking up the word in the dictionary. Additional practice can be provided and the importance of using contextual strategies to disambiguate unknown words can be emphasized as we teach the strategy.

Ebbers & Denton (2008) suggested guiding students to combine word study and contextual cueing when they come across an unknown word. For example, if students don't know the meaning of the word *belfry* as they read *Paul Revere's Ride* (Longfellow, 1863), they can be asked to first examine the context clues, such as the fact that *belfry* appears in the same line as *church tower*; then

to look for a familiar word part in *belfry*, reminding the students that spellings of word parts can be different from the spelling in a whole word. Once the students discover *bel* (a form of bell) in the word, they can be encouraged to associate “bell” with the concept of “church tower,” and make an educated guess about the meaning of *belfry*. Repeated practice with the use of such combined strategies will help students increase their access to and independent use of such compensatory mechanisms.

Levin et al. (1984) proposed a strategy for helping students retain the meanings of new words or roots, the *keyword method*. Here students are taught to link a new word (for example, *truculent*: fierce and aggressive) or root (*terra* for earth) with a familiar keyword that shares some sound or visual feature; for example, *tear* could be a keyword for *terra*; *truck* could be a keyword for *truculent*. To learn the new word, the students are told to do the following:

- Draw a picture that links the meaning of the keyword and the new word. Write the connection underneath (“*Terra* means ‘earth’; let’s not tear it apart;” “The truck driver was *truculent*” beneath a picture of a truck with a fierce-looking driver.)
- To learn the new word, the student is told to do the following:
 - Say the new word (*truculent*) and think of its keyword (*truck*).
 - Think of the picture with the keyword in it.
 - Remember the connection that symbolized the picture (The [fierce] truck driver was *truculent*).
 - Retrieve the meaning of the new word (*truculent*: fierce and aggressive).

The keyword then becomes a retrieval cue for the new word or root. Terrill, Scruggs, and Mastropieri (2004) showed that using a keyword strategy was more effective than traditional instruction in terms of the number of new words maintained by high school students with LLD.

Word Retrieval

Since many students with LLD have word-finding difficulties (Messer & Dockrell, 2006), this is another area in which compensatory strategies are especially helpful. We can encourage students to activate consciously all the semantic and phonological information they can about a word they want to retrieve. A variation of the “Password” game is a good first step toward developing these strategies. One student (or the clinician) thinks of a word and gives either a semantic or phonological clue to the partner, whose job it is to guess the password. If the first clue is insufficient for the partner to guess, another is given, until the word is guessed. The game also can be played in teams of two students. The teams alternate turns, with one team member providing clues and the other trying to guess the password from the accumulated clues given by both teams. The first team whose “guesser” gets the password wins. Semantic and phonological clues can be alternated, or the game can be restricted to one type of clue.

After practice with this game, students can be encouraged to give themselves similar clues when they are having trouble finding a word. They might start out by writing down each clue they can give themselves and recording how many they need to find the word. They can keep track of their self-cueing and try to reduce the number of clues they need to give themselves before they retrieve the word. Again, a compensatory-strategy approach is intended to help students learn to cue themselves, rather than depending on the clinician to help them when they get stuck. Teaching students to activate their keyword strategies can also help with word retrieval.

German (1992; 2009) provided additional compensatory strategies. She suggested teaching students *reflective pausing*, or the constructive use of pause time to use retrieval strategies and reduce inaccurate competitive responses. Students can be encouraged to “wait and think” when they have trouble finding a word, rather than saying the first competing response that enters their head. Once the ability to use reflective pausing has been established, students can be encouraged to use a variety of self-cueing strategies to try to retrieve the target word. In addition to the phonemic and semantic cues we’ve already discussed, German suggested teaching students to use graphemic cueing (trying to remember what the word looks like in writing), imagery cueing (revisualizing the referent as a cue to the target word), gesture cueing (motor schemes or actions associated with the target word, such as twisting the lid to retrieve jar), and associative cueing (using an intermediate word to cue the target, such as *story* for *book*). German also recommended focusing on phonological properties of new words students are learning, having them rehearse saying the words both alone and embedded in common phrases and dividing them into syllables. German (2009) also suggests placing icons on a student’s computer desktop, notepad or smart phone that are hyperlinked to Internet sites that define and pronounce words, such as www.dictionary.com.

Figurative Language

Norbury (2004) showed that children with a variety of communication disorders were less likely than typical peers to use the available context to help them understand *figurative language*. So in this aspect of semantics, too, one of our roles is to help students learn and use a strategic approach when they encounter something they don’t understand. Palmer and Brooks (2004) recommend a three-step strategy for improving figurative comprehension:

1. Have the students identify figurative language in passages they read or hear. For each possible non-literal expression, they can be trained to ask themselves, “Does the writer mean exactly what the words say, or is something else being conveyed?” The clinician can model a think-aloud procedure for deciding this by saying, for example, “Does this make sense here, considering the usual meaning of these words?”
2. For each expression they decide is not literal, students are encouraged to decide what the author is really trying to say. They can use the cues we talked about earlier (temporal, spatial, causal, etc.) to decide what the expression might mean.
3. Finally, students are encouraged to activate everything they know about the words in the figurative expression to attempt to make a connection between the intended meaning and the surface form.

Students can be asked to keep logs of new figurative expressions they decipher using this strategy, for discussion with the clinician and for future reference.

It is also important to provide students with LLD with strategies to use when they encounter new figurative language forms. Cain & Towse (2008) found that poor inference from context was the major source of idiom understanding difficulties in children with poor reading comprehension. They suggest it is important to provide students with poor comprehension with support and guided practice in the use of context to understand unfamiliar figurative language.

Syntax

Learning strategies approaches to syntax, like those we discussed for semantics, also involve teaching students self-cueing. Much of this self-cueing can go on in the context of editing written work for syntactic accuracy and maturity. Students can be encouraged to make several passes through their writing in the editing process,

with one pass dedicated to looking for errors in syntax and how syntax can be improved by using connectives, cohesive devices, and other “dandy language” forms listed in Table 13-5. Students can be encouraged to ask themselves as they edit each paragraph of their writing, “Have I said it clearly? Have I connected the ideas? Have I used a formal style?” If students are writing on word processors, the grammar-checking program in the word processor may help identify sentences that could use rewriting. Alternatively, the clinician can underline sections that could benefit from rewriting. These might be coded with a “C” for providing connectives between ideas, a “CH” for using cohesive devices, and a “D” for writing with “dandy language” forms. Eventually, students can be encouraged to use these codes in editing their own syntax. Scott (2005) showed that students do better at first editing *others’* writing, rather than their own. An initial phase in this instruction then, could be to have students go through each of the steps outlined above on a peer’s writing sample. The next phase would involve repeating these steps on their own written product.

Scott (2009) cites several studies that advocate helping students become aware of the structure of complex sentences as a strategy for increasing their comprehension. This research suggests having students first find complex sentences within classroom literature selections, then underline each clause within the sentence, circle the conjunctions, and finally paraphrase the sentences. This kind of attention, first to structure, then to meaning, appears to improve both oral and written language in children with LLD.

Pragmatics

Classroom Discourse

Silliman and Wilkinson (1991) advocated facilitating classroom discourse skills by using what they call “dialogic mentoring.” This is a form of supportive prompting that offers verbal cues or choices as external support to students for accessing a solution to a problem or an answer to a question. The goal of this support is to give students a model for doing this scaffolding for themselves. To use dialogic mentoring, it is important that problems posed to students with LLD be within their zone of proximal development; not so easy as to require little cognitive processing, but not so hard as to be beyond their current cognitive grasp.

An approach to dialogic modeling was presented by Brown and Campione (1990), which they referred to as *reciprocal teaching*. Reciprocal teaching (RT) is a learning-strategy approach that employs guided, cooperative learning and includes expert scaffolding by the teacher, direct instruction, modeling, and practice and multiple strategy instruction (Pilonieta & Medina, 2009). Brown and Palinscar (1987) outlined four steps in the reciprocal teaching process: Predict, Question, Summarize, and Clarify. The “facilitator” (teacher or clinician) first models each step on a segment of curricular material, such as a lecture, reading selection, or mathematics or science problem. The facilitator then assigns one of the students to use the same series of steps on a related passage or problem. Each student is given a turn to act as facilitator for the group. The student with LLD can serve as facilitator last, to take advantage of the additional modeling provided by the other students. Figure 14-8 provides a graphic organizer, in the form of a bookmark, to remind students of the four basic steps to follow as they participate in RT.

Hoskins (1990) and Sharpe (2008) provided additional techniques that can be used in conjunction with RT or in other collaborative intervention settings to provide scaffolding for students’ learning strategies. Hoskins suggested using *postscript modeling* as an additional approach for increasing students’ learning strategies in

 Predicting	Predict: - Scan headings and bold type. - Think about what you know about what you scanned. - Guess what will happen next. - What clues helped you to think about what will happen next? - Is your prediction logical?
 Questioning	Question and Connect: - Ask questions a teacher would ask - Is there anything that you did not understand? - Is there anything that did not make sense? - Has anything like this ever happened to you? - Have you ever known anyone like this character? - What are you curious about?
 Summary	Read and Summarize: - What are the most important things you read? - What does the author want you to remember or learn from this? - What is the most important information in this passage? - What was this passage mostly about? - In your own words....
 Clarifying	Clarify: - Was there a word or idea you weren't sure about? - What is it? What page is it on? - What can we predict it means? - How can we check it; What strategies can we use to figure this out?

FIGURE 14-8 Bookmark to support students’ participation in reciprocal teaching. (Adapted from Brown, A., and Palinscar, A. [1987]. Reciprocal teaching of comprehension strategies. In J. Day and J. Borkowski [Eds.]. *Intelligence and exceptionality: New directions for theory, assessment, and instructional practice* [pp. 81-132]. Norwood, NJ: Ablex; Gerber, A. [1993]. *Language-related learning disabilities: Their nature and treatment*. Baltimore, MD: Paul H. Brookes; Meyers, K. [2010]. Diving into reading: Revisiting reciprocal teaching in the middle years. *Literacy Learning*, 18, 41-52; and www.readingrockets.org.)

classroom discourse situations. Here the facilitator provides scaffolding comments about students’ remarks in the discussion of the class material. The clinician can provide an accepting but corrected version of a student comment, encourage brainstorming to solve comprehension problems, identify areas of misunderstanding or inadequate skill development (need for instruction in punctuation or capitalization, for example), and provide appropriate instruction as needed. Postscript modeling can also scaffold by taking a student comment to a higher

cognitive level. Suppose, for example, that Michael answers a question about how a story character feels with, “She feels sad, she feels sorry her dad is not home.” A postscript model would take Michael’s answer to a deeper level of character motivation by replying, “Yes, Meg feels sad because her father had been away for some time, and no one knows where he is. Not knowing probably makes her feel worse. How do you think you might feel if someone in your family were gone and you didn’t know where he was?”

Sharpe (2008) reported on several other dialogic techniques that were found to enhance student learning. These include repeating student remarks with recasting (Michael: “It would make me feel bad,” SLP: “Yes, it would make you feel bad, and probably somewhat angry, confused, and anxious.”), recontextualizing language (Michael: “It would make me feel bad,” SLP: “Yes, whenever we are uncertain, or feel we can’t understand a situation, we are likely to feel upset or anxious.”), cued elicitation (SLP: “Michael, the book says Meg didn’t know where her father was; not knowing often makes people feel anxious or confused. How do you think Meg felt?”), and modifying questioning to extend or reformulate student’s reasoning (SLP: “Yes, you’re right, she probably did feel upset; can you talk more about all the different things that might be running through her head?”).

Vaughn et al.’s (2010) and Sharpe’s (2008) reviews suggest that the use of RT techniques, and other activities that involve interactive dialogue between teacher and student as well as among students, are some of the most effective ways of improving both reading and writing skills in students with LLD. All these forms of dialogic mentoring are ideally suited to collaborative intervention settings, in which the teacher presents some curricular material and the clinician follows up the teacher’s lecture with a small group reciprocal teaching session on the same material or provides scaffolding questions to increase students’ control of their learning. In our role as SLPs, we can encourage teachers to make use of these highly effective practices, modeling them in collaborative teaching sessions. These techniques also can be used in a communication class setting. We can also use RT approaches in therapeutic oral language activities with students, as a bridge toward helping them acquire skills and strategies they can apply to written language formats. Alternatively, these methodologies can be presented in consultative or in-service training sessions as particularly appropriate techniques to use in classrooms in which students with LLD are placed. We can emphasize that these techniques have been shown to benefit all the students in the classroom (Sharpe, 2008; Vaughn et al., 2010).

Conversational Discourse

Most of our intervention for conversational pragmatics is done in the functional strand of our curriculum. We also can, when assessment indicates the need, work on self-cueing approaches to encourage students to use advanced discourse intentions such as persuasion, negotiation, and to use presuppositional devices and flexible speech styles. Here role-playing; barrier games; and, when possible, video modeling procedures like those used in the MAP program can be used. After initial practice in persuading, negotiating, presenting adequate information, or using an appropriate speech register in activities like those outlined in Chapter 12, work can “go meta.”

Let’s take persuasion as an example. Students can talk about what is needed to be persuasive, such as taking the other person’s needs and point of view into account. They can read some political speeches or advertising copy and identify elements in the text that are intended to persuade, then write their own advertisement or speech. In doing so, they can be required to list first what they will try to persuade the reader to do, what reader needs they will try to

Video modeling helps students learn self-monitoring skills in conversation.

address, and what arguments they will use to address those needs. Hallenbeck (1996) suggested using a “think-sheet” like the one in Figure 14-9 to help students plan these arguments. They can then be assigned to create the ad or speech. Next a role-playing situation might be used in which the student must plan an “attack,” for example, on parents to persuade them to lift their curfew for a special school event. Again, before role-playing the argument, the students should plan their strategy, stating explicitly the parent needs they will address (such as the need to believe the students are safe and chaperoned), what arguments they will use, and how the arguments will be phrased. Only then will they role-play the situation. After the role-play, they can evaluate their performance and list ways it could be improved. Similar “meta” approaches can be used for other aspects of conversational discourse. Again, the goal of a learning-strategies approach is to encourage conscious planning, self-cueing, and self-monitoring to give students tools for improving their own performance. Many of the approaches we will discuss later that are designed for high functioning students with autism will also be useful for other teens who need help with conversational pragmatics.

Other Discourse Genres

Narrative Texts

Most of the narrative texts that students encounter in secondary school will be in literature classes, and perhaps in some work on biography in other subjects. This suggests that English teachers will be ideal collaborative partners for helping students to master these important discourse structures.

Comprehension. Students with LLD typically show poor reading comprehension (Moats, 2004; Roberts et al., 2008), but several studies (Edmonds et al., 2009; Scammacca et al., 2007; Vaughn et al., 2010) have shown that reading comprehension can be significantly improved for struggling readers at the secondary level with targeted interventions.

Vaughn et al. (2010) pointed out that two of the most important interventions for students with LLD are (1) control of the difficulty of the material they must process, so that (2) they persist longer in working on the task. If our students are immature in their narrative abilities, the narratives presented in the typical classroom may be so far “above their heads” that they simply give up. One role the SLP can play is to provide guided practice and feedback in work on narratives with more controlled levels of difficulty, to encourage students to persist so that eventually they can move up toward grade-appropriate material. Another way SLPs can

What do I want to argue for?
Whom do I need to convince?
Where and when will I make my argument?
What are the points I will make? First: Next: Third: Then: Finally:
How will I sum up?

FIGURE 14-9 Graphic “think-sheet” for organizing a persuasive piece. (From Hallenbeck, M. [1996]. The cognitive strategy in writing: Welcome relief for adolescents with learning disabilities. *Learning Disabilities Research and Practice*, 11, 107-119.)

participate in improving narrative comprehension is by providing opportunities for fluency development. That is, Wexler, Vaughn, Edmonds, & Reutebuch (2008) reported that one of the more effective ways of improving fluency for secondary students, in addition to combining it with vocabulary work as we discussed earlier, is to have students read a passage themselves after hearing a skilled reader read it. This suggests that SLPs can use communication sessions to revisit passages covered in class, reading the passages to students, then asking them to reread the passage aloud after hearing it, and following up the reading/rereading with an activity that targets a specific strategy, like the ones we will describe below. This is a great way to support the development of fluency in the context of our efforts to increase comprehension, as well.

Ehren (2007a) summarized findings on intervention for reading comprehension by saying that explicit teaching of comprehension strategies with frequent guided practice is what works. Both Ehren and Roberts et al. (2008) outlined the major strategies that have been shown to be effective for improving reading comprehension in secondary students with LLD. These appear in [Box 14-7](#). Some of the strategies we talked about in Chapter 12, including *directed reading-thinking* (Ambe, 2007), *QART*, and story grammar mapping (Onachukwu, Boon, Fore Iii, & Bender, 2007) may be appropriate for some students at the secondary level, as well. A variety of strategies that make use of the components listed in [Box 14-7](#) have been developed specifically for adolescents with LLD. We'll review a sample of them here.

BOX 14-7 Evidence-Based Strategies for Improving Reading Comprehension in Secondary Students with LLD

The following strategies should be used before, during, and after reading:

- Activating prior knowledge
- Predicting
- Paraphrasing
- Summarizing
- Self-questioning
- Visualizing
- Using graphic organizers
- Comprehension monitoring
- “Think-aloud” strategy modeling by skilled readers

Adapted from Ehren, B. (2009). Looking through an adolescent literacy lens at the narrow view of reading. *Language, Speech, and Hearing Services in Schools*, 40, 192-195; Roberts, G., Torgesen, J.K., Boardman, A., and Scammacca, N. (2008). Evidence-based strategies for reading instruction of older students with learning disabilities. *Learning Disabilities Research & Practice* (Blackwell Publishing Limited), 23(2), 63-69.

Scheffel, Shroyer, and Strongin (2003) reviewed literature suggesting that the use of visual maps and organizers improved students' comprehension of narrative material. Other activities they found to be related to improved narrative comprehension included the use of RT techniques applied to narrative texts and the use

of preparatory sets such as predicting and foregrounding prior knowledge before reading or listening. Finally, they found the “What I Know,” or K-W-H-L, strategy to be effective in improving understanding of stories. This strategy consists of teaching students to use a chart to outline knowledge before and after reading:

- **K** stands for what you already **KNOW** about the subject.
- **W** stands for what you **WANT** to learn.
- **H** stands for figuring out **HOW** you can learn more about the topic.
- **L** stands for what you **LEARN** as you read.

A graphic organizer for this strategy that might be used for the first chapter of Homer’s *Odyssey* is depicted in Table 14-4.

Graves and Montague (1991) suggested a story grammar checklist for this purpose. The students read a story and record events from the story that fill in each aspect of the story grammar. They then check off each aspect as they record it, to indicate that they have identified that element of the story. An example story grammar checklist appears in Table 14-5.

Production. Vallecorsa and deBettencourt (1997) emphasized, though, that story comprehension activities will not necessarily lead to generalized improvements in story production without explicit instruction. It is important, then, to provide students with strategies for both understanding and producing stories. Vallecorsa and deBettencourt suggested using a story map, like the one in Figure 14-10, to help students with narrative production. Students use the map to guide and organize their story production, drawing on the story element structure we have discussed.

Nelson and Van Meter (2002) emphasized the importance of having a real communicative purpose in composing a story, a purpose beyond merely pleasing the clinician or getting a grade. Classroom units on biography and autobiography make ideal contexts for encouraging students to write their own life stories, a topic that cannot help being of vital interest to the author. Again, we can motivate story production by having students write plays for production or video recording, or by having them produce contemporary versions of literature the students read in class for publication (with the student’s permission) in a class literary magazine distributed to friends and family.

Monroe and Troia (2006) suggest teaching students the SPACE mnemonic for writing stories. This device encourages them to remember to include *Setting elements, Problems, Actions, Consequences*, and *Emotions* in their stories. In a similar vein, Montague, Graves, and Leavell (1991) suggested providing students with “story grammar cue cards.” Students can be given a set of index cards, each of which contains a major story grammar element and a set of questions to answer in producing that element in a story. They use the cards as cues as they construct their stories. The cards can be used in the process of writing story summaries for book reports or as a guide to the student’s original story compositions. Box 14-8 provides an example of a set of story grammar cue cards. Nathanson, Crank, Saywitz, and Ruegg (2007) showed that even cue cards as simple as those in Figure 14-11 were effective in improving narrative production in middle school students with LLD, when combined with adult modeling and verbal rehearsal of the meaning of each card. Students

TABLE 14-4 Graphic Organizer for K-W-H-L Strategy for Improving Narrative Comprehension

What Do I Already Know Before Reading?	What Do I Want to Know?	How Can I Learn More?	What Did I Learn After Reading?
Odysseus is a hero.	Why is the book so long?	Web sites on Trojan War.	Odysseus fought in the Trojan War.
The story is from a very long time ago. It has something to do with the Trojan War.	What does Odysseus have to do with an odyssey? What is an odyssey?	Watch the movie “Troy.”	An odyssey is a long trip.
I saw a Simpsons episode that was about this. What happened was . . .	Why didn’t Odysseus just go straight home instead of stopping at all those places?	Review Greek mythology unit from last year’s English class.	Odysseus was in trouble with some of the gods, so they made his trip long and hard.

TABLE 14-5 An Example of a Story Grammar Checklist for Dickens’ *A Christmas Carol*

Story Grammar Element	Event from Story	Check Off
Setting		
When	Christmas, over 100 years ago	✓
Where	England	
Who	Mr. Scrooge	
Problem	It’s Christmas, a time to be generous, and he is very stingy.	✓
Internal response	Hates Christmas	✓
Plan or attempt	Wants to ignore it	✓
Response	Goes to bed early; a ghost visits him to bring him visions of Christmases past, present, and future	✓
Additional plan or attempt	(Additional episodes in the story can be charted)	
Additional response:		
Resolution or consequence	Mr. Scrooge learns the meaning of the holiday and the joy of giving.	✓

Outcome/Resolution _____

FIGURE 14-10 Story map for narrative production. (Adapted from Vallecorsa, A., & deBettencourt, L. [1997]. Using a mapping procedure to teach reading and writing skills to middle grade students with learning disabilities. *Education and Treatment of Children*, 20, 173-188.)

BOX 14-8 An Example of a Set of Story Grammar Cue Cards

Card 1: Setting

Where and when does the story take place? Who are the main characters?

Card 2: Problem

What happens to get the story started? What is the problem the main character must solve?

Card 3: Internal Response

What thoughts or feelings does the main character have about the problem? What makes him or her want to do something about it?

Card 4: Plan

What is the main character's goal? What does he or she plan to do? What are his or her intentions?

Card 5: Attempt

What does the character do to carry out the plan?

Card 6: Consequence

What happens when the character tries to carry out the plan? Is it successful or unsuccessful? How and why? What else happens when the character tries to carry out the plan? Did he or she intend for that to happen?

Card 7: Reaction

How do the characters feel about what happened in the story? What do they think about the problem, the plan, and the result?

FIGURE 14-11 Simple story cue cards. (Adapted from Nathanson, R., Crank, J. N., Saywitz, K. J., & Ruegg, E. (2007). Enhancing the oral narratives of children with learning disabilities. *Reading & Writing Quarterly*, 23(4), 315-331.)

should be encouraged not to answer the questions one by one, but instead to include information that will answer the questions within their story. Students can use the cues to guide their production of oral and written summaries for “book talks” given to peers or younger students and “book review” magazines produced in class. Story grammar cue cards also can help increase students’ comprehension and summarization of stories they read. They can use the cards as study guides in their reading of curricular literature. Being encouraged to ask themselves the questions on the cards can help them to organize their processing of the story and aid in retention. Again, reciprocal teaching approaches, using visual organizers, and highlighting background knowledge in activities such as K-W-H-L are strategies that can improve narrative expression as well as comprehension. Harris, Graham, Mason and Friedlander (2008) suggest the POW mnemonic seen in [Box 14-9](#) for helping students generate stories. Merritt, Culatta, and Trostle (1998) provide additional suggestions for improving narrative discourse skills.

Expository Texts

Most of the texts secondary students encounter outside of literature classes take an expository form. We talked in Chapter 10 about the difficulties inherent in expository texts, especially for our students with LLD. Expository texts include both classroom books and

teachers’ lectures. Students will be expected both to understand information presented in these formats, and to produce expository speech and writing. Larson and McKinley (2003a) argue that success in school relies on expository text competence. The SLP’s role in developing this competence involves helping students acquire strategies for producing and understanding these difficult text structures in both oral and written forms, which should result in improving both reading comprehension and writing across a range of academic subjects. Remember, too, what Snyder (2010) reminds us: understanding expository texts is reliant on having some background knowledge of the text’s topic, so an important preparatory activity for reading these texts is foregrounding and adding to that knowledge by means of oral discussion before reading. Vaughn et al. (2010), in reviewing studies addressing expository skills in students with LLD, found there were several elements common to successful programs. These are summarized in [Box 14-10](#).

Let’s look at how we can incorporate these effective practices in our work.

BOX 14-9 POW! Tips for Writing Stories

Pick an idea:

- Who is the main character?
- When does the story take place? Where?
- What does the main character do or want to do?
- What do the other characters do?
- Then what happens?
- How does the story end?
- How do each of the characters feel?

Organize thoughts and notes:

- Does the story follow a timeline?
- Do events and plans cause outcomes?
- Does it make sense?

Write some more:

- Add more details
- Use more descriptive words
- Include what characters thought and felt

Adapted from Harris, K. R., Graham, S., Mason, L. H., & Friedlander, B. (2008). *Powerful writing strategies for all students*. Baltimore, MD: Paul H. Brookes.

BOX 14-10 Essential Elements in Strategy Instruction

EXPOSITORY TEXT

- Controlling task difficulty by sequencing materials to maintain high levels of success
- Interactive, small group (3 to 10 students) instruction (ideal group size appears to be 6 students)
- Teaching students to generate their own questions as they proceed through material and asking guiding questions that stimulate thinking and invite interactive responses
- Modeling think-alouds to make the process as clear and explicit as possible, and having students think aloud as they complete tasks
- Providing extended practice and feedback from both adults and peers
- Explicit teaching of the steps in comprehending or producing exposition, using “think sheets,” mnemonics, visual organizers, and other strategies
- Explicit teaching of text structures

Adapted from Baker, S., Gersten, R., & Graham, S. (2003). Teaching expressive writing to students with learning disabilities: Research-based applications and examples. *Journal of Learning Disabilities*, 36, 109-123.

Comprehending Expository Text Scott and Balthazar (2010) emphasized that one of the things that make expository texts difficult is that, not only is their structure more complex than other discourse genres, but their syntax is, too. They identified three syntactic structures common to expository texts, but uncommon in other discourse:

1. Extensive premodification and/or postmodification of the head noun of the noun phrase (NP) (e.g., *The oldest known fossil skeleton of a human ancestor, a female specimen nicknamed Eve* has been found, scientists revealed yesterday.)
2. Multiclausal sentences with tightly orchestrated hierarchical structure so that there are several levels of subordination within a single sentence (e.g., The animals adapt by making sure that when there is food available they get and store as much of it as possible by having reservoirs for fat storage, such as the camel's hump.)
3. Information structured within and across sentences. Without intonation to highlight the new information in a sentence, expository texts often reserve the end of the sentence for new information. Adverbial subordinate clauses often precede the main clause they modify to allow for the placement of new information at the end (e.g., *When a camel drinks*, it takes in as much as 50 gallons of water at a time.). Ideas often carry across sentences as well (e.g., Once DNA's structure was known, scientists worked to learn how it provides a library of instructions that control the cells that make up our bodies and those of other creatures. They learned *this structure* is consistent across all living things.).

Scott and Balthazar argue that one technique to help students learn to understand these forms is *priming*. Priming involves modeling sentences with these kinds of forms immediately before asking students to summarize an expository passage. For example, if the SLP models summarizing an expository passage using relative clauses, and students are then asked to provide their own summary, Scott and Balthazar report that the students are likely to increase their rate of production of relative clauses. Priming is a technique that can be useful both in our direct work with struggling readers, and in our consulting with classroom teachers, as a concrete suggestion for improving students' ability both to understand and produce expository texts. Culatta, Blank, and Black (2010) provide additional guidance for using teacher talk to enhance comprehension of expository texts.

Vaughn et al. (2010) showed that, even when students use strategies successfully to support their understanding of narratives, they don't spontaneously carry these strategies over to expository texts. For this reason, it is important to teach strategies for comprehending expository texts explicitly. Katim and Harris (1997) suggested using a paraphrasing strategy. Entitled RAP, the strategy entails having students read one paragraph at a time. After each, the strategy instructs the students to:

Read
Ask questions
Put ideas in their own words

If students have difficulty, they are provided with an organizer like the one in Box 14-11. Katim and Harris demonstrated that the use of this strategy improved reading comprehension significantly for both typical students and those with LLD in an inclusive classroom setting.

BOX 14-11 Steps in the RAP Strategy

Step 1: Read a paragraph.

Step 2: Ask yourself, "What were the main idea and details of this paragraph?"

Places to look, if you're stumped:

Look in the first sentence.

Look for repetitions of the same word or words in the whole paragraph.

Questions to ask yourself, if you're stumped:

What is the paragraph about?

This paragraph is about _____.

What does it tell me about _____?

It tells me _____.

Step 3: Put the main idea and details into your own words.

Adapted from Katim, D., & Harris, S. (1997). Improving the reading comprehension of middle school students in inclusive classrooms. *Journal of Adolescent and Adult Literacy*, 41, 116-123.

A learning-strategies approach to exposition includes helping students identify the macrostructures typically used in this genre (Bakken & Whedon, 2002; Ukrainetz, 2007). Englert and Hiebert (1984) reported on a classification system proposed by Meyer (1975) that includes six basic expository text structures. Piccolo (1987) suggested using both verbal and visual organizers to help students identify these common expository structures. Westby (2005) and Ukrainetz (2007) gave some examples of verbal organizers that can be helpful. These appear in Table 14-6. The "comprehension cues" in Table 14-6 can be used as study guides, as students prepare to be tested on material with each type of structure. They are also questions students should be taught to consider to guide their processing of expository material and can serve as self-cues for writing expository texts with each of the structures they are learning. Westby et al. (2010) reported that identification of expository text structures and use of graphic organizers promoted growth in summarization skills, which, in turn, have been found to result in more accurate comprehension (Thiede and Anderson, 2003). Examples of visual organizers, following those suggested by Piccolo (1987) and others appear in Figure 14-12.

Identifying these structures is a useful learning strategy because it gives students a set of organizers they can bring to the task of processing new information in expository text formats. We need to remember, though, that these ideal formats are not followed in all expository writing, and much of what students read is not so easily classified into one macrostructure or another. The point of teaching this strategy is not to get bogged down in meticulous identification of text structure, but simply to give students some organizing tools that can help them make more sense of and retain more information from the large amount of reading they must do to complete the high school curriculum. Analysis of text structure can easily be combined with other learning strategies approaches, such as RT.

Bakken and Whedon (2002) suggest that, after helping students to identify the structure of a text, the clinician provide a note-taking form specific to that structure. Dickson, Simmons, and Kameenui (1995) used comparison/contrast texts as an example to demonstrate the use of notesheets, such as those in Figures 14-13 and 14-14, to aid students in comprehending expository structures. Figure 14-15 presents an example note-taking form that might be given to a selection identified as a Sequence structure. Each

TABLE 14-6 Verbal Organizers for Identifying Expository Text Structures

Text Structure	Function	Key Words	Comprehension Cues
Sequence	To tell what happened or how to do or make something	<i>First, next, then, second, third, following, finally, subsequently, from here to, before, after, eventually</i>	Give the steps . . . When did . . . happen?
Enumerative	To give a list of things related to a topic and describe each	<i>An example, for instance, another, such as, to illustrate</i>	Give examples . . . Describe and give examples of . . . Give a list of . . .
Cause-effect	To explain or give reasons why something happens or exists	<i>Because, since, reasons, then, therefore, for this reason, results or effects, consequently, so, in order to, thus, hence, depends on, influences, affects, is a function of, leads to, produces</i>	Explain . . . Predict . . . Why did . . . happen? How did . . . happen? Give the causes (reasons, effects, results, etc.) of . . .
Descriptive	To tell what something is	<i>Is called, is, can be defined, can be interpreted, is explained, refers to, is someone who, means</i>	Define . . . Describe . . . List . . . What is . . . Who is . . . Describe the problem of . . . What are some proposed solutions to . . . ?

Adapted from Westby, C. (1998a). Communication refinement in school age and adolescence. In W. Haynes & B. Shulman (Eds.), *Communication development: Foundations, processes and clinical applications* (pp. 311-360). Baltimore, MD: Williams and Wilkins and Ukrainetz T. (2007). The many ways of exposition: A focus on discourse structure. In Ukrainetz T. (ed). *Contextualized language intervention*. (pp. 247-288). Greenville, SC: Thinking Publications.

structure is practiced on material that is controlled for difficulty until students can take notes on it effectively, then a new structure is introduced. After several structures have been learned in this way, students are encouraged to identify text structures from several possible alternatives, and choose the correct note-taking form for reading each one. Once students can accomplish this successfully on below-grade-level material, texts closer to grade level are gradually introduced.

DiCecco and Gleason (2002) presented an additional strategy-based approach to improving comprehension of expository text in students with LLD. Their approach, presented in an intensive format (daily 40-minute sessions for 4 weeks), included:

- vocabulary and preparatory set instruction before reading, including foregrounding and adding to background knowledge of the topic (Snyder, 2010)
- oral reading by students with literal and inferential questions asked by the teacher
- presentation of relationships among ideas within the passage using graphic organizers (GOs) like the ones in [Figure 14-16](#) as a postreading activity
- having students write summaries of each text read

Students were taught the following strategy for writing summaries:

- List key points.
- Combine the points that go together.
- Number the points in a logical order.
- Reread the list in order.
- Write each numbered point into a paragraph.

DiCecco and Gleason were able to show that this combined approach resulted in more improvements in understanding of relational information by students with LLD than did approaches without the intensive, GO-supported instruction.

Another learning-strategy approach to improving students' comprehension of expository text material is the multipass or survey, question, read, recite, review (SQ3R) method (Just & Carpenter, 1987; Robinson, 1970; Schumaker et al., 1982), originally developed during World War II to teach GIs to acquire the specialized job skills needed for the war effort. This procedure can be combined with the identification of expository structure to help students get the most out of their reading of expository material. Here we would teach the students the five SQ3R steps outlined in [Box 14-12](#). This approach can readily be combined with reciprocal teaching. To do this, we would first model the SQ3R method on an expository text passage, then give each student a turn to act as facilitator in guiding the rest of the group through the process. The ultimate goal, of course, is to get students to use the method independently on their classroom material.

Englert and Mariage (1991) developed a metacognitive approach to study skills that combines many of the techniques we've been discussing. Labeled the POSSE strategy, it is used to teach students a sequence of steps, similar to SQ3R, that can be used to maximize their acquisition and retention of curricular material. Students are taught to go through each of the following steps in the POSSE program, one for each letter in its acronym title:

Predict. Scan the text for headings, boldface print, pictures, and any other information they can use to invoke a preparatory set, activate background information, and generate prereading questions.

Organize. Brainstorm their prereading questions into a set of categories of information that the passage will contain. They might schematize this, using a semantic map or visual organizer.

Vaughn and Edmonds (2006) advocate collaborative strategic reading (CSR) for older struggling readers. This approach emphasizes the use of cooperative learning groups to assist students in comprehending texts and lectures. The strategies practiced in this approach focus on comprehension monitoring.

How Technology Influenced Life after WWI

FIGURE 14-16 Graphic organizer for relating ideas within a passage. (Adapted from DiCecco & Gleason, 2002.)

BOX 14-12 Five Steps in the SQ3R Learning Strategy

Survey: Skim the table of contents, headings, boldface print, illustrations, summary sections, and so on to glean the passage's main idea and general organization. Get a preparatory set on the material.

Question: Ask a set of preparatory questions based on the survey of the material to review prior knowledge and set up some purposes for reading.

Read: Read one section of the material and try to answer the preparatory questions developed for that section.

Recite: Give answers to the questions, take notes of main points and details associated with each, and give examples of important ideas contained in the text.

Review: Go over the main points, with the help of the notes. List major subpoints and give details for each. Rehearse to try to remember the main points and subpoints.

Adapted from Just, M., & Carpenter, P. (1987). *The psychology of reading and language comprehension*. Boston: Allyn and Bacon; Robinson, F. (1970). *Effective study*. New York: Harper and Row; and Schumaker, J., Deshler, D., Denton, P., Alley, G., Clark, F., & Nolan, M. (1982). Multipass: A learning strategy for improving reading comprehension. *Learning Disability Quarterly*, 5, 295-304.

Students are given explicit instruction in four strategies that comprise CSR:

Preview: recall what you know about the topic of the text; predict what it will be about

Click and clunk: monitor comprehension during reading or listening by recognizing when you are "clicking" along, understanding what you read, and when you come to hard words and ideas (clunk)

Get the gist: restate the most important idea in the paragraph or passage

Wrap-up: summarize what you've learned, and ask questions like ones a teacher may ask on a test

Ask an easy question that can be found in the text answered in one or two words

Ask a harder question that requires putting information from different parts of the text together in 2 to 3 sentences

Ask a really hard question, one that requires getting information from what you read and other things you have learned

Vaughn and Edmonds suggest assigning roles within the cooperative learning group, such as:

Leader: guides others through previewing, assists with wrap-up, identifies "clunks"

Clunk Expert: makes sure students write down their clunks, then helps others resolve them

Gist Expert: helps formulate the main idea, makes sure gist is written down

Note-Taker: makes sure all information is recorded and assignment is completed

Box 14-13 provides a sample "learning log" that students might use to record their responses in a CSR activity. Vaughn and Edmonds stress that graphic organizers can be combined with this, as with the other strategies we've discussed, to help students organize material they need to learn. They suggest that "concept maps" can be helpful in improving students' understanding of difficult new ideas encountered in expository text. An example concept map appears in Figure 14-17.

But Horn (2010) as well as Snyder and Caccamise (2010) warn that it will be important to combine strategy instruction with some degree of explicit teaching in domains of content needed to understand expository material. They advocate supplementing strategy instruction with content-oriented activities such as:

Encouraging active engagement with texts by having students review notes, rewrite content, and teach it to others

Encouraging retrieval practice through summarizing and retelling

Explicitly teaching words from the Academic Word List (AWL), a collection of word families found to occur frequently across different curricular texts (Coxhead, 2000; www.victoria.ac.nz/lals/resources/academicwordlist/default.aspx)

Providing alternative sources of similar content such as newspapers, magazines, movies, videos, podcasts, and other internet resources to strengthen students' knowledge about the topic of the exposition, introducing them before, during, or after reading

Guiding students not only to identify text structures, but to develop their own graphic organizers to summarize and review expository content. Using these self-created organizers as a basis for speaking and writing about the text is especially helpful

BOX 14-13 Learning Log for CSR Groups

And we shouldn't forget the simple things. Hall-Kenyon and Black (2010) remind us of the importance of calling students' attention to formats and visuals within expository texts, including headings, subheadings, boldface type, text boxes and side bars, diagrams, charts, and maps. Horn (2010) suggests guiding students on "walk throughs" of texts before reading, looking for these devices and discussing how they will support understanding the material.

Writing Expository Text. Green (2009) summarized the writing difficulties common to students with LLD. They include struggles with the motor act of writing, writing that is short and sparse, mechanical errors in spelling and punctuation, more limited complex syntax and vocabulary, less cohesion, less sensitivity to audience, less adherence to genre, and lower overall quality. Schumaker and Deshler (2009) reviewed literature showing that teens with LLD were capable of learning and using strategies for complex writing skills, applying these skills to assignments in general education classes, and of being successful in these classes, given adequate opportunities for practice and support. Moreover, Strum and Rankin-Erikson (2002) demonstrated that the use of visual supports and graphic organizers resulted in significant increases in both length and overall quality of expository writing of students with LLD. Graham and Perin (2007) identified a set of interventions that have been shown to be effective in improving writing for adolescents. These are listed in Box 14-14, and we'll

talk in more detail about these interventions in the following sections. It is important to note that both Graham and Perin, as well as Mason and Graham (2008), report that strategy instruction was the most effective method for use with struggling writers, although they needed more instruction and practice than typical students to master it. These findings suggest that SLPs have a large role to play in improving writing for students with LLD by providing explicit instruction and extended, mediated practice in the use of interventions like those in Box 14-14, and giving students scaffolded opportunities to apply the strategies to a range of curriculum-based assignments with controlled levels of difficulty. Again, we as SLPs want to focus on strategy instruction and practice, rather than on tutoring writing for a particular topic or assignment.

Since Graham and Perin identified explicit strategy instruction as the most effective intervention for struggling adolescent writers, let's look first at some strategies aimed at improving the writing process.

Strategies for Planning Writing. We talked earlier about the basic steps in the writing process: planning, composition, and revision. Nelson (2010) and Wong (2000) suggest teaching the POWER strategy: plan, organize, write, edit, revise. For students with LLD the first phase—planning and organizing—is usually a problem. Baker, Gersten, and Graham (2003) point out that a major difficulty for students with LLD is generating ideas for writing. They tend to have a relatively sparse knowledge base to begin with and even then fail to access all their knowledge about a topic when writing. They may forget ideas they do generate because of interference from poorly developed spelling skills and laborious handwriting, and they terminate the planning process too soon, going on to composition before they develop an adequate plan for their writing. The result is written products that are sparse and unelaborated.

As we have said before, Kamhi (2009), Nippold (2010), and Snyder (2010) argue that increasing knowledge is an essential element of improving both reading comprehension and written

BOX 14-14 Interventions Found in Graham and Perin (2007) Meta-Analysis to Be Effective in Improving Writing in Adolescents

- Teach strategies explicitly for planning, composing, revising, and editing.
- During planning, identify purpose, genre, audience, and characteristics (e.g., addresses both sides of an argument for persuasive genre) of written product.
- Use "inquiry" in prewriting: engage students in developing ideas, such as reading topic related material, or comparing and contrasting examples or cases.
- Teach prewriting strategies such as prompting planning before writing, organizing ideas with visual organizers such as semantic webs.
- Provide writers with models of each type of writing, highlighting text structures for narrative or various kinds of expository writing; have students analyze and imitate models.
- Encourage use of word processing as a primary tool for writing.
- Use peer collaborative groups for planning, drafting, and revising.
- Teach complex-sentence production; sentence combining is an especially effective tool.
- Teach summarizing.

From Graham, S., and Perin, D. (2007). A meta-analysis of writing instruction for adolescent students. *Journal of Educational Psychology*, 99, 445-476.

expression. Graham and Perin (2007) advocated using an “inquiry” strategy to address this problem. This involves students’ using the writing planning process to gain information about the topic they are to write about. That is, we teach students that expository writing is not just putting words on paper, but is, in fact, gathering information and *then* organizing it to communicate to others. We can help students identify sources of new information, including library books, internet resources, interviewing knowledgeable people, and making observations to gather facts about the topic. This information can become the content of the other planning activities, such as listing topics and related ideas, as well as making outlines, graphic organizers, semantic webs and text structure diagrams.

Baker et al. (2003) found that teaching steps in the planning process explicitly, with think-alouds and encouragement for students to engage in extended dialogue with the teacher and peers during the planning process was effective in improving the writing of students with LLD. Graham and Harris (1999) propose a three-step planning strategy:

1. *Think*: Who will read this?
Why am I writing it?
What do I know about this topic?
What do I want to say?
2. *Plan* what to say, using brainstorming with teacher and peers and an organizing think-sheet (Fig. 14-17 and 14-18).
3. *Write*, then **say more**.

Figure 14-18 provides a brainstorming and organizing think-sheet students can use to aid in the second of these steps, with the example

of “Snowboarding” as the topic for writing. After students generate the basic ideas for the piece (the ovals surrounding the topic oval), they indicate several supplementary ideas for each basic idea on the lines beside its oval. They then number the ovals in the order in which they will appear in the composition. An alternative approach is simply to list all the ideas that come to mind about a topic, then use highlighters to color code ideas that should go together in the same paragraph (all the ideas about the dangers of snowboarding can be highlighted in blue; those about the different ways to use the board can be highlighted in yellow, etc.). When one of these processes is completed, students try to add additional ideas (e.g., to fill oval number 5). Figure 14-19 provides another example.

Information we gained from our assessment of the writing process (see Chapter 13) can guide in developing this part of the intervention plan. The important point to remember is that encouraging students to make fuller use of the planning phase of writing is a crucial step in producing better written products. And, as Baker et al. (2003) pointed out, the main function of think-sheets is to get students to think out loud, and provide opportunities for extended dialogue and feedback from teachers and peers. In other words, think-sheets and other visual organizers are really there to give students something to talk about with others as they plan their writing. Nelson, Van Meter, Chamberlain, and Bahr (2001) remind us that an essential role the SLP can play is to encourage students to use oral language in the planning phase. We can, in collaborative settings or communication classroom settings, work with groups of students containing those with LLD to get them to talk through

FIGURE 14-18 Sample brainstorming and organization think-sheet. (Adapted from Hallenbeck, M. [1996]. The cognitive strategy in writing: Welcome relief for adolescents with learning disabilities. *Learning Disabilities Research and Practice*, 11, 107-119.)

Name _____

Topic: Women in the Civil War

Who: Who am I writing for? my history teacher and the others in my history class.

Why: Why am I writing? to show that it wasn't only the soldiers who took part in the Civil War.

What: What do I know? It was hard to get clothes and things in the South because all the factories were in the North.

How: How can I group my ideas?

Nursing

Getting food

Making clothes

Writing letters

How will I organize my writing?

_____ Sequence _____ Comparison/contrast _____ Enumerative

_____ Cause/effect _____ Description _____ Problem/solution

FIGURE 14-19 Example planning sheet for expository writing.

their planning activities, modeling and eliciting think-alouds from students before they transfer their thoughts to think-sheets and other visual forms. Mason and Graham (2008) report that teacher modeling of the planning process is one of the most effective techniques for improving student writing.

Kerrigan (1974) developed another structured method for teaching students the planning phase in writing. The six steps in this procedure are given in [Box 14-15](#). The steps can be translated into a think-aloud protocol. In using these protocols for intervention, though, we would give students the script for the protocol, based on the steps in [Box 14-15](#), rather than leaving them on their own to develop it. In this way we would be guiding the students' thinking and providing them with a base from which to expand skills in the writing process. And we also want to remember the importance of initially controlling the difficulty of the task so that students experience success that makes them willing to persist, and of providing guided practice, feedback, and interactive questions throughout the activity.

Wiig (1984) presented an additional strategy for getting students into the composition process. She had students first free-associate to a topic, listing words or drawing a picture. Next, the students generated a list of key words about the topic that describe its interesting, unexpected aspects. These key words were then built into simple sentences. The sentences were sequenced to reflect the structure of the topic (temporal, causal, and so on). The simple sentences were then elaborated with missing details, adverbs, and modifier phrases. They were finally combined into complex sentences. This process can be carried out on paper or using a word processor with a separate printout for each step in the process. Again, once students have been guided through these steps several times, they are encouraged to guide themselves and to use similar strategies in independent writing activities.

Using Text Structures for Planning Writing. An additional strategy on Graham and Perin's list of effective interventions for planning writing is the use of text structures and models. The expository text structures we discussed earlier are good tools for organizing students' production of written reports, research papers, and other content-based writing assignments. After going through each of the text structures, using Piccolo's procedures (outlined later) and practicing with verbal and visual organizers, it might be

useful to have students apply the structures to their own writing. We might take a homework assignment, such as writing a report on a particular country, and write it two different ways: once using, say, an enumerative structure, and once using, perhaps, a descriptive format. Exercises like this can help students develop more flexibility and efficiency in their written communication.

Piccolo suggested starting with sequence structures first, because they are most similar to the time-based organization in narratives, and following the order given in [Table 14-6](#) when introducing expository types to students. She recommended the following a series of steps for teaching students to recognize each of the expository macrostructures and provided detailed lesson plans for accomplishing each of these steps:

1. Define and label the structure.
2. Have students examine model paragraphs, using verbal and visual organizers to find the critical attributes of each.
3. Write a group paragraph modeling the original paragraph using a visual organizer (see [Figure 14-12](#)).
4. Have students compose paragraphs individually, using the visual organizer.
5. Look for the pattern in paragraphs from students' texts.

We can combine the use of text structures with models of good writing, as well. If, for example, we are working with a communication class on writing expository texts, we might have them read the following paragraph taken from Lewis's journal of the Lewis and Clark expedition, to use as a model of a problem/solution text structure:

On June second they arrived at a major fork in the river, in north-central Montana, an estimated 465 river miles upstream from the mouth of the Yellowstone. It shouldn't have been there. No Indian informant had mentioned it. There was not even a hint of it from anybody. Yet it posed the most significant geographical question of the entire Expedition. Which of these rivers was the Missouri? The issue was fraught with danger. They needed to reach the Rockies, find the Shoshoni Indians, get some horses, portage to the head of the Columbia, and reach the Pacific before winter closed in. To choose the wrong route would consume twice the time it would take to correct the mistake and would . . . not only lose them the whole of the present travel season, but "would probably so dishearten the party that it might defeat the expedition altogether."

After reading, we can have students use the paragraph as a model to write about a situation in which they had to make a difficult choice, then apply the same model to writing about a difficult choice faced by a character in a history text from the curriculum.

Of course, following the steps in procedures like these does not lead to the production of great literature. Eventually students have to go beyond these simplistic protocols to produce truly original writing. The advantage of simple systems like these is that they help students take that first step on the long journey toward mature, independent writing. It gets them thinking, planning, and writing, and as Vaughn et al. (2010) note, the best way to improve student writing is to get students to write!

Strategies for Composition. Once students have been guided to plan writing, we can attend to the next phase of writing, composition. Here students must turn their raw ideas into literate statements and organize the ideas into a coherent composition. Wong, Butler, Ficzer, and Kuperis (1996) suggest using "prompt cards" to aid students in turning ideas into sentences. These cards remind

BOX 14-15 Basic Steps in Beginning the Process of Composition

- Step 1:** Write a short, simple sentence that states one idea.
- Step 2:** Write three sentences about the sentence in Step 1. Be sure they relate to the meaning of the entire sentence, not just one part of it. Each of these will be the topic sentence for a new paragraph.
- Step 3:** Write four or five sentences about each of the three topic sentences in Step 2.
- Step 4:** Make the sentences in Step 3 as detailed as possible. Try to say a lot about each idea, instead of talking about a lot of different ideas.
- Step 5:** Start a new paragraph with each topic sentence in Step 2. Follow each of these topic sentences with the detail sentences you wrote in Steps 3 and 4. Make sure that each of the sentences in each paragraph relates to the topic sentence.
- Step 6:** Make sure each sentence in the composition is related to the sentence that comes before it. Be sure each paragraph is clearly related to the paragraph that comes before it.

Adapted from Kerrigan, W. (1974). *Writing to the point: Six basic steps*. New York: Harcourt, Brace, Jovanovich.

students of the verbal organizers used in each type of expository writing. Clinicians and students can work together to design prompt cards for each expository category, using the information in Table 14-6 as a guide. A prompt card for cause/effect writing, adapted from Wong (2000) is presented in Figure 14-20. When a student decides to use the cause/effect structure for sentence generation, the card can be displayed and the student encouraged to use it to help produce sentences appropriate for that form.

Encouraging Word Processing. As Graham and Perin (2007) showed, removing handwriting as an obstacle to composition can improve students' writing. Cochran and Bull (1991) and Nelson et al. (2001) provided ideas for using word processors to enhance the writing process. They suggested that the *Logowriter* software program (Logowriter, 1990) is particularly suited to working with students at advanced language levels. It allows students to create both text and graphics, which can be linked together. These kinds of productions make ideal "newspapers" and "magazines" for publishing student work. Westby and Clauser (1999) suggest *The Amazing Writing Machine* (Broderbund, 1995) and the *Ultimate Writing and Creativity Center* (The Learning Co., 1996), as well. Additional resources include *Secret Writer's Society* (Learning Upgrade LLC, 1999), *Storybook Weaver Deluxe* (The Learning Company, 2004), *Write On! Plus, Author's Toolkit and Literature Series I* (Sunburst, 1997), *Diary Maker* (Tom Snyder Productions, 1994), *The Writer's Companion* (Visions Technology in Education, 2003), and *Composition* (Homeworkhelp.com, 2005). In addition, internet resources allow students to produce materials that combine text, graphics, video, and audio information. These applications can allow students to develop exciting materials that incorporate their writing. Landis (2002), MacArthur (2000), and Strum and Koppenhaver (2000) provide additional suggestions for using assistive computer technology with students with disabilities.

Strategies for Editing and Revising. The final step in a writing intervention program is to focus students' attention on the quality of their written products. This attention takes place in the context of *editing* and *revising*. It's a good policy to keep the processes of generating and editing writing distinct. We want students to feel relatively uninhibited by worries about errors during the planning and process stages of writing, so that ideas can flow

freely. Once the basic composition has been generated, though, it is legitimate and necessary to edit and revise for clarity, organization, and mechanics. A learning-strategies approach to this aspect of writing requires that we get students to monitor and correct their own written products, rather than correcting them ourselves.

Gerber (1993) suggested that we encourage students to start the editing process by reading their composition aloud. This slows down the reading, allowing more time to detect errors and for the student to hear how the product might sound to others. Wiig (1984) suggested that the first passes through the composition in the editing process should focus on mechanics: spelling, punctuation, capitalization, and paragraph segmentation. This gives us opportunities to supply basic-skill instruction in these areas, if needed, and to emphasize to students the importance of editing their own work for these elements. Once basic skills in writing mechanics are adequate, we can focus on strategies, such as computer-assisted spelling and grammar checkers in word processing programs as well as careful proofreading, to maximize the accuracy of error identification. It is useful for most students to develop a strategy of making several passes through the composition, each time looking for just one element: spelling, capitalization, or punctuation. Mason and Graham (2008) report that teaching students with LLD the COPS strategy (*Capitalization, Organization, Punctuation, Spelling*), which is summarized in Box 14-16, was effective in improving editing of written products. They also showed that teaching an InSPECT strategy for editing word processed writing, which also appears in Box 14-16, was effective.

Graham and Harris (1999) cautioned, however, that too many students with LLD think editing means *only* correcting mechanical errors. Students also need to learn that revising is essential in writing. Revising differs from editing in that its aim is to improve the overall quality of the composition rather than just correct mistakes. Graham and Harris (1999) described a strategy for revising that includes a series of self-directed prompts and reported that its use led to a significant increase in meaning-based revisions and overall writing quality in students with LLD. The strategy is summarized in Box 14-17.

BOX 14-16 Effective Strategies for Improving Editing of Written Products for Students with LLD

COPS

- C**-Have I *capitalized* the first word in sentences and all the proper nouns?
- O**-Have I made any errors in *overall* appearance such as margins, messiness, or spacing errors?
- P**-Have I used end *punctuation*, commas, and semicolons correctly?
- S**-Are the words *spelled* right; can I sound them out, or should I use a dictionary?

InSPECT FOR WORD PROCESSING

- In your document,
- S**tart the spell checker.
- P**ick the correct alternative.
- E**liminate unrecognizable words.
- C**orrect additional errors.

BOX 14-17 Self- and Peer Prompts for Revising Compositions of Students with LLD at the Advanced Language Stage**SELF-PROMPTS**

Read your composition.

Find the sentence that gives the main idea. Is it clear?

Add two sentences to make it clearer or stronger.

SCAN each sentence:

- Does it make *Sense*?
- Is it *Connected* to the rest of the composition?
- Can you *Add* more?
- *Note* errors.

Make necessary changes on your computer or on your paper with a red marker.

Reread the composition. Make any final changes.

Recopy or print out revised version.

PEER PROMPTS

(Two peers provide suggestions to each other on how to revise their respective writings.)

Listen as your partner reads the piece out loud and read along.

Tell what your partner's paper is about and what you liked best.

Reread your partner's paper and make notes:

- Is everything clear?
- Can any details be added?

Discuss your suggestions with your partner.

Revise your own paper.

Exchange papers and check for errors:

- Capitalization
- Punctuation
- Spelling

Peer Collaboration. Graham and Perin (2007) emphasized the efficacy of involving peers in collaborative work on writing. Box 14-17 also gives a strategy for peer revision, in which students work in pairs to provide prompts to each other. Westby and Clauser (2005) suggested using a form like the one in Table 14-7 to aid in peer revision activities. The form helps peers provide specific comments, rather than vague generalities, like "This is a good paper," on their fellow students' writing. Baker et al. (2003) suggest an

additional possibility for peer collaboration at the revision stage: cognitive apprenticeship (CA). CA involves pairing the student with a peer who is a more effective writer as a "mentor" and having the mentor think-aloud as she or he goes through the revision process, talking through strategies like those in Box 14-17, discussing and questioning the apprentice and demonstrating the ways in which the writing can be improved by changing words, sentences, and organization. This procedure would follow editing for mechanical errors in order to allow the student to focus on the improvement of tone, meaning, and organization in the writing. But whether students work individually or with peers, those with LLD need to be given practice in focusing on the revision process not only to correct errors but also to make meaning-related changes that enhance the organization and quality of their writing.

Self- and Peer Assessment. We also can encourage students to use some of our assessment instruments for self-assessment, as well as collaborative assessment with peers. Students can be given, for example, the holistic evaluation criteria listed in Table 13-10. The clinician can give guided practice in applying the criteria to work the students are producing for some of their academic classes. They can then be encouraged to use these criteria in revising writing, attempting to make changes that would result in a higher score. They can be encouraged to focus on one criterion at a time, such as providing sufficient information, giving clear cohesion, or using a literate language tone. Again, they can be taught to make several passes through the writing, each time attending to just one of the criteria and making changes that improve that one element. After several passes, they can be asked to use the criteria to reevaluate their writing sample and see how much they have improved it. As Baker et al. (2003) showed, teaching self-monitoring is an important aspect of improving writing for secondary students with LLD.

The goals of a learning-strategies approach to expository writing instruction for students with LLD are twofold. First, we want to help students to get more fluent in the planning process of writing and to learn to devote some time to planning and information gathering before producing the actual product. Second, we want to impress on them the importance of editing and revising and to help them see these steps as essential in the production of a finished writing product. By giving students some self-prompting and cueing strategies for achieving these steps in the writing process, and by providing them with extensive practice at controlled levels of difficulty using models and peer collaboration, we are providing the tools they need to develop into independent, literate writers. And the research done on writing instruction for students with both typical achievement and LLD assures us that these strategies are

TABLE 14-7 Guidelines for Peer Comments on Expository Writing**Guideline: When You Work with a Partner to Revise Your Writing, Ask Yourself, Did I:****Example**

Praise specific aspects of the writing?

Ask questions that guide thinking?

Make comments that link to text?

Offer to think together about how to improve the essay.

You gave a vivid description of rainforests in the first paragraph.

You said the rainforest is endangered. Why? Give three reasons.

You said tigers are disappearing from the rainforest because of hunting.

That surprised me; isn't hunting illegal? Are there other reasons?

I got confused in the second paragraph when you talked about acid rain.

Maybe we can figure out a way to make that clearer. What did you mean?

Adapted from Westby, C., & Clauser, P. (2005.) The right stuff for writing: Assessing and facilitating written language. In H. Catts & A. Kahmi (Eds.) *Language and reading disabilities* (2nd ed.). (pp. 274-340). Boston: Allyn & Bacon.

effective, although students with LLD will need more help and more practice than their typically achieving peers.

Persuasive Text

We talked earlier about the prevalence of persuasive texts in high stakes tests at the secondary level. Once basic skill instruction has been used to familiarize students with the functions and structures of persuasive writing, we can use the same sorts of strategies for helping them learn to evaluate and improve their own persuasive writing as we do for other genres. These strategies include graphic organizers, think-aloud procedures, “think-sheets,” and so on, geared toward persuasive writing. Figure 14-21 provides an example visual organizer for a persuasive essay. Ralph, Andrews-Weckerly, and Lewis (2006) reported that giving students not just a goal for a persuasive text, but an elaborated set of goals—such as stating a viewpoint on the question, stating reasons for the view, elaborating the reasons, stating the alternative view, giving reasons for an alternative, and giving rebuttals—resulted in significant improvements in the persuasive writing of secondary students with LLD. This strategy of providing a set of guidelines for elaborating arguments in persuasive writing is an additional intervention for improving our students’ writing in this high stakes area.

The Metas

Learning-strategy approaches are ideally suited to working on “meta” skills with students at the advanced language level. Since “meta” skills require awareness and conscious attention, they mesh well with learning-strategies approaches that teach students to use planning and self-evaluation. We’ve already talked about a variety of metalinguistic strategies for the areas of semantics, syntax, and pragmatics. Let’s look at the other two areas of “meta” skills we’ve been discussing, self-regulation and metacognition, and examine some learning-strategies approaches for each.

Self-Regulation

Students continually need to evaluate their own performance in order to decide when to invoke the strategies they have. This aspect of metacognition is often called self-regulation, or executive

function. Hughes, Turkstra, and Wulfeck (2009) evaluated executive function in adolescents with LLD and showed that many of them have impairments in executive functions that affect their performance in activities of daily living and academic achievement. Duckworth and Seligman (2005) report that executive function in adolescence predicts academic success better than IQ, so it’s clearly an important skill to cultivate. But here’s the good news: Blakemore and Choudhury (2006) reviewed research on adolescent brain development that suggests adolescence represents a time of significant brain reorganization, particularly in the frontal lobe, where executive processes take place. As a result, the brain may be especially sensitive to instruction and practice in executive function, and metacognition at this point in development. That means that adolescents may be especially “teachable” in executive and metacognitive functions during their secondary school years, so that effort spent on these skills during adolescence can have an especially large “pay-off.”

Self-Regulated Comprehension

One aspect of self-regulation involves students’ ability to *monitor their comprehension* of both written and spoken material. When working on comprehension monitoring, the strategies we teach students address both detection of gaps in their understanding and procedures for doing something to fill in those gaps. Bunce (1991) suggested using a barrier-game format to develop comprehension-monitoring skill for spoken material. Here students take turns being speaker and listener, giving and following a set of directions for, for example, drawing a map from a pattern in the book for a geography assignment. The directions given by each speaker are audiorecorded. After the map has been drawn and the pattern and drawn map compared, students listen together to the audio. They identify areas in the instructions that were unclear or misleading and discuss how the directions could have been given differently to result in a more accurate product. Students can then generate a list of “pointers” for giving clear directions. They can try the exercise again, this time stopping each other at points at which the speaker has failed to follow the “pointers” developed by the partners. Students also can be encouraged to ask specific questions of themselves as they hear each step of the directions. These questions are designed both to detect errors in understanding and to provide a strategy for correcting the problem. Questions such as the following might be used:

- Did I “get” it? What did the instruction tell me to do?
- Can I follow the direction? Do I have everything I need?
- Do I need to ask (student) to repeat the instruction? Part of it?
- Do I need to ask what a word means?
- Do I need to check that I got it right? Shall I repeat what I heard and ask if it’s correct?

After some work of this kind in the barrier-game setting, students can be encouraged to apply their strategies to classroom lectures. Here video- or audiorecorded lectures can be used. Students can be required to listen to a portion of the lecture, take notes, then examine their notes for gaps in their understanding. In the lecture format, unlike in the barrier game, it may not always be acceptable to stop the lecturer to ask for clarification, repetition, or additional background information when a comprehension gap arises. For this reason, students need to learn to give themselves signals in their

Visual organizer for persuasive essay in response to prompt: ‘In some schools, officials have the right to search students’ personal property (lockers, backpacks, purses) without permission. Decide whether you are **for** or **against** officials having this right. Write an essay for the school newspaper to convince other students of your position. Be sure to include supporting details.

Thesis: I think that school officials should/should not have the right to search students’ personal property without their permission.

notes that a problem occurred. A question mark can be placed in the margin, for example, whenever the student detects a gap in comprehension. Students then need to develop strategies to clarify these points. They can be asked to brainstorm with the SLP some ways to fill in the gaps. They might, for example, ask a friend after class, stay after class to ask the teacher, look up an unknown word in a dictionary or internet search engine, check a detail on a map, or reread the relevant passage in the textbook.

The goal of the development of these comprehension-monitoring strategies is to get students to recognize when they fail to understand; to have some options for repairing the difficulty; and to place the responsibility for monitoring comprehension, as well as the ability to do something about it, in their hands.

Strategies for *monitoring reading comprehension* have the same goals. Here we want to encourage students to use a strategy, such as SQ3R, focusing particularly on the development of a preparatory set of questions. Students would use the questions to guide their reading and note any questions they were unable to answer because of difficulties with comprehension. Self-questioning, using queries like the ones we looked at, is also helpful for getting students to recognize gaps in their understanding. Students can be encouraged to place a small “sticky” note in the margin of the text to indicate a passage, word, or phrase that they did not understand. They might write a quick note to themselves on the “sticky” to indicate what else they need to know, or what preparatory question the passage could answer if they were able to decipher it. Again, we can encourage students to brainstorm a list of ways to fill in their comprehension gaps. Asking classmates or parents (during homework time), getting to class a minute early to ask the teacher, and checking a dictionary or the internet might be ways to start this list. In addition, Thiede and Anderson (2003) showed that asking students to summarize what they read resulted in increased accuracy in comprehension monitoring. Having students use a summarization strategy, then, combined with explicit instructions to ask themselves how well they summarized and how they could improve their summaries, can also increase comprehension monitoring.

It is important to note that comprehension monitoring of written material can only take place in the context of understanding most of the material in the text. If students are reading significantly below grade level, they may not be able to monitor reading comprehension adequately because the gaps are too frequent and too extensive. If this is the case, some modification of the material they are required to read may be needed, or accommodations for them to get the information from some source outside classroom texts may be necessary. As we saw, controlling the difficulty of material is crucial to helping students develop effective strategy use.

Self-Regulated Writing

Santangelo, Harris, and Graham (2008) identify self-regulated strategy development (SRSD) for writing as the approach with the strongest empirical track record of efficacy for improving student writing. SRSD focuses on helping motivate students to monitor and regulate their own actions during writing, so that they internalize the strategy being taught. If, for example, we applied SRSD to the SCAN strategy in Box 14-17, we would first have students think and talk about problems they have in writing and why it would be helpful to them to be better at it. We would model the SCAN strategy several times on examples of writing for different purposes. Placing students in cooperative learning groups, we could have them practice using the strategy with peers, first for a simple piece of writing, and then for gradually longer and more

complex assignments. Perhaps the most important step in this process for the development of self-regulation is having students use the strategy independently, evaluate their results, and discuss how using the strategy improved their performance, using a checklist like the one in Figure 14-22. This kind of self-monitoring can help students develop the habit of “double checking” themselves as they complete academic assignments. Wong (2000) presents another example of a prompt-sheet that can be used for teaching self-regulatory strategies in the area of curricular writing. This appears in Figure 14-23.

Metacognition

Metacognition involves, as we’ve seen, awareness and management of our own thought processes, and reflection on our own and others’ thinking as an object of thought, or “thinking about thinking.” Turkstra and Byom (2011) called it *executive function*; Kuhn and Dean (2004) discuss it in terms of *critical thinking*. Hughes, Turksra, and Wulfeck (2008) showed that these skills are significantly impaired in adolescents with LLD. In working on learning strategies in the metacognitive area, we are essentially teaching students tactics for becoming critical readers and thinkers. Kuhn and Dean suggested that one way of supporting metacognitive development is to encourage students to reflect on and evaluate their activities: *Why are we doing this? What was gained from having done it?* Another source of metacognitive development is the internalization that occurs when students learn to ask themselves questions they have been asked often in similar circumstances. If students participate in discourse where they are frequently asked, “How do you know?,” “What evidence do you have for that statement?,” or “What makes you say that?,” they become more likely to pose such questions to themselves.

Smith (2010) suggests that one of the best ways to develop metacognition is through revision in writing. Revising focuses students’ attention on the choice of language and the thoughts

- ☐ I found a quiet place to work.
- ☐ I read or listened to the teacher’s directions carefully.
- ☐ I thought about who would read my paper.
- ☐ I thought about what I know about the subject.
- ☐ I thought about what I wanted my paper to accomplish.
- ☐ I used brainstorming to plan my paper before I wrote.
- ☐ I organized my ideas before I wrote.
- ☐ I got all the information I needed before I wrote.
- ☐ I thought about the reader as I wrote.
- ☐ I thought about what I wanted to accomplish as I wrote.
- ☐ I continued to think and plan as I wrote.
- ☐ I revised the first draft of my paper.
- ☐ I checked to be sure a reader could understand what I meant.
- ☐ I checked to make sure I had accomplished my goals.
- ☐ I checked my paper for spelling, capitalization, and punctuation errors.
- ☐ I reread my paper before turning it in.
- ☐ I asked other students or my parents to read the paper to see what they thought.
- ☐ I rewarded myself when I finished.

FIGURE 14-22 Self-monitoring checklist for student writing. (Adapted from Graham, S. [1992]. Helping students with LD progress as writers. *Intervention in School and Clinic*, 27, 134-144.)

POWER CHECKLIST**Plan**

- ___ Did I complete a think sheet?
- ___ Did I talk it over with my teacher and other students?
- ___ Do I have my think sheet with me?
- ___ Did I put my name, date, and title of the essay on my paper?

Organize

- ___ Have I chosen an organizational structure for my paper?
- ___ Did I use a graphic organizer to lay out my ideas?

Write

- ___ Did I follow my plan?
- ___ Did I include all the ideas in my graphic organizer?
- ___ Does the first paragraph state my opinion and give supporting ideas?
- ___ Do my middle paragraphs elaborate my main idea?
- ___ Does my last paragraph give a summary and reasons for my conclusion?

Edit

- ___ Have I checked for spelling mistakes?
- ___ Have I checked for grammar mistakes?
- ___ Have I checked for punctuation mistakes?
- ___ Have I checked for capitalization mistakes?
- ___ Have I asked a teacher or peer to check over the paper with me?
- ___ Have I made all the corrections?

Revise

- ___ Have I read my paper aloud and conferenced with my partner?
- ___ Have I found ways to make my paper clearer and more mature?

FIGURE 14-23 Checklist for self-regulation in writing a persuasive essay. (Adapted from Wong, B. [2000]. Writing strategies instruction for expository essays for adolescents with and without learning disabilities. *Topics in Language Disorders*, 20[4], 29-44.)

behind it, helping them evaluate the soundness of both their language and thought. In working on the revision processes in writing, modeling the process of assessing the soundness of what is being expressed with *think-alouds* will be helpful in teaching this kind of critical thinking. Vaughn et al. (2010) reviewed literature that suggests that other learning strategies approaches, too, foster metacognition, especially if they contain the following elements:

- Extended practice with feedback from adults and peers
- Use of interactive questions
- Breaking tasks down into component parts
- Using prompts and cues that are gradually faded

CONTEXTS OF INTERVENTION IN THE ADVANCED LANGUAGE STAGE

Agents of Intervention

For students with advanced language, most intervention is delivered by the SLP in collaboration with other special educators and mainstream teachers. One additional agent of intervention at this

level, though, is the normally achieving peer. We've talked already about using peers to help our students improve their functional language and classroom communication skills. Peers also can serve as intervention agents to provide content mastery instruction to students with LLD. In this role, they would work as tutors, perhaps during study halls or homeroom periods, to go over homework, share classroom lecture notes, or answer the curricular questions of a student with LLD. Stenhoff and Lignugaris (2007) showed in a meta-analysis that peer tutoring in secondary settings resulted in improved academic performance of students with mild disabilities and could be classified as a practice with a strong evidence base. Murray-Seegert (1989) described a program in which regular education students, some of whom were at risk for school failure themselves, volunteered to work with students with disabilities to receive course credit for an "Internal Work Experience."

The advantages of using peer tutors to help our clients with content mastery, rather than tutoring them ourselves, are twofold. First, peer tutoring involves the client in direct social interaction with peers, which may blossom into friendship and could provide the student with additional *entree* into the peer circle. Choosing a

popular peer to act as a tutor can help to facilitate such outcomes. Second, using peers as content mastery tutors frees up the SLP's time to do what we do best: developing programs that improve communication, rather than working with individuals on subject matter in which we may be less than expert (Ehren, 2007a). Finally, research (summarized by Anderson, Yilmaz, & Wasburn-Moses, 2004) indicates that, when peer-tutoring is instituted class-wide, all students show increases in test results, and students with LLD show larger increases than typical students. When consulting with classroom teachers who have students on IEPs in their classrooms, suggesting class-wide peer tutoring is one way to accommodate the student with LLD while benefiting all the students in the classroom.

Larson and McKinley (1987) provided guidelines for recruiting and training peer tutors. They suggested first enlisting the enthusiasm of other teachers and administrators in the program. This can be accomplished by discussing it at in-services, sending out brief newsletters, and talking informally with faculty and administrators. They advocated recruiting tutors through school newspapers and teacher recommendations and suggested making the process of choosing tutors a selective one, involving formal applications and interviews. This both helps to ensure suitability of the tutors and makes them feel they have achieved something merely by being selected over others. Additional incentives, such as course credit or recognition for volunteer service at awards assemblies, also are wise additions to the program.

In using peers to provide content mastery instruction, we need to provide some training to the tutor (Stenhoff and Lignugaris, 2007). Here it is important to emphasize that the tutor is not to do the work for the client, but to help guide the student's attention and develop learning strategies. If we do some learning-strategy instruction in collaborative lessons in the regular classroom, we can instruct the tutors to use elements of the methods taught in these sessions, such as SQ3R or POSSE, when addressing the curricular area with which they are helping the client.

Some books about tutoring also can be recommended to peer tutors and might be kept in the school library. These include *Longman Guide to Peer Tutoring—2nd Edition* (Gillespie & Lerner, 2007), *Peer Tutoring: A Teacher's Resource Guide* (Gordon, 2005), *Developing a Successful Tutoring Program* (Koskinen & Wilson, 1982a), *Tutoring: A Guide to Success* (Koskinen & Wilson, 1982b), *A Guide for Student Tutors* (Koskinen & Wilson, 1982c), and *Tutoring Can Be Fun* (Klausmeier, Jetter, & Nelson, 1972).

Nelson (2010) suggested another use of peers as intervention agents. She advocated a "learning buddy system" in which a normally achieving and a disabled student take notes on classroom lectures, then share their notes afterward. The key to this system is to have the client take the notes, but to examine and compare them after the lecture with those of the peer. The peer's notes can be copied by the student with LLD, but not before the pair has examined the two versions and identified any inconsistencies or gaps in the client's notes. This system not only provides the client with better access to the information presented in the lecture, but supplies a way to improve note-taking skills by learning from detailed comparison with those of an academically successful peer.

Finally, we should think about having the student with LLD serve as a tutor for others. Vaughn et al. (2010) suggested that working with a partner for sustained amounts of time, switching roles between tutor and tutee, was a highly effective practice in working with students with LLD. Moreover, they found that when

students with LLD serve in the role of tutor in reading situations, listening to others' accurate oral reading, following along silently, then formulating relevant questions about what the tutee read, positive effects are increased. We may, then, want to think about ways in which we can engage students with LLD in "tutoring" younger successful readers, or in exchanging tutor/tutee roles with peers for reading practice.

Service Delivery Models

Larson and McKinley (2003b), in discussing service delivery options for secondary students with LLD, argued that the pull-out, or clinical, approach has many problems at this level. They observed that students do not want to give up study halls and free periods for therapy and should not be pulled out of regular classes. They also pointed out additional problems, such as the lack of connection to the curriculum, the lack of communication between the SLP and other faculty, and the "patchy" nature of this kind of intervention. They argued that, although a range of service delivery options should be available, the major portion of the intervention program for adolescents with LLD should take place either in special course-for-credit programs designed for these students or in collaborative or consultation formats aimed at helping the student succeed in mainstream classes.

Ehren (2002, 2007b), in discussing ways in which SLPs can contribute to academic success for secondary students with LLD, emphasized that, even when we are not seeing students on a one-to-one basis, the therapeutic aspect of our interactions with them should be paramount. That is, whether we are seeing students in a clinical setting, communication classroom group, or as part of an in-class collaboration, the same elements are critical to making our efforts effective, and our involvement different from what the student gets from the regular teacher. Our intervention should be:

- Individualized and responsive, using ongoing, dynamic assessment and constantly modifying the program to meet the student in his or her current zone of proximal development
- Systematic; that is, organized and sequenced into small segments to control for task difficulty, providing instruction that includes explanation, modeling, and guided practice that is scaffolded by questions, explanations, and conversations
- Intensive, engaging for extended periods of time (more than would be spent in a typical classroom) on guided, interactive activities that are goal-directed and provide opportunities to achieve mastery and generalization, achieved through collaboration with special and general education teachers

Let's look at our four service delivery options and talk about how we can use them to achieve this kind of intervention at the secondary level.

The Clinical Model

Although pull-out instruction will probably make up only a small part of the intervention at this level, at some times and for some clients a pull-out/sit-in program is appropriate. When using pull-out with secondary students, we want to be sensitive to the students' feelings of embarrassment about needing help and find ways to minimize them. Working with students in small groups, perhaps during "club" or homeroom period, may help. We also want to be sure to see groups rather than individual students so that no one feels singled out. We should limit the duration of the pull-out intervention, using it only to lay the basis for collaborative or consultative work in the classroom. Coming into the classroom to do

individual intervention may be just as embarrassing to a student as being pulled out. When we do come into the class, it should be to provide instruction collaboratively to the whole group.

Deshler et al. (2009) advocate a “supported inclusion” model for adolescents with LLD. Pull-out/sit-in instruction can be an effective part of this model, in conjunction with collaborative work on study skills or other metacognitive activities in the mainstream classroom. We can “prep” a small group of clients on the SQ3R method, for example, before going into their English class to teach it to the group. This preparation gives the clients a “leg up” on the other students in mastering the technique and gives them that extra guided practice they probably need to succeed with it.

The Language-Based Course for Credit

Nippold (2010) argues that most direct instruction to students at the advanced language level should take place in a language-based class offered as an “elective” within the curriculum. Larson and McKinley (2003b) discussed some of the factors needed for its success. First, they emphasized that students must receive credit toward graduation for the course. This entails receiving grades, although grading can be done in a variety of ways. Students may contract to do certain tasks, which, if completed, ensure them a certain grade in the course. Alternatively, the course may be graded on a pass-fail basis. Portfolio grading—that is, grading products of participation in the course rather than testing—is popular in the mainstream curriculum and can be used in the language-based course for credit as well.

Larson and McKinley (2003b) suggested scheduling classes to conform to the existing structure of other classes in the building. If some courses are offered in 6- or 8-week modules, these can be ideal scheduling vehicles for language-based classes as well. Semester-long or year-long courses also are options. If other classes in the building last 50 minutes, the language-based course should, too. The classes should be scheduled along with other subject areas in as similar a way as possible.

To get students motivated to take these courses, they need to be held in “real” classrooms, not therapy rooms or other stigmatized settings. Since few SLPs in secondary schools have the luxury of their own classrooms, teaching the class in a mainstream setting may require a nomadic existence, in which the SLP moves each period to whatever classroom is available. Larson and McKinley argued that the benefits of holding the class in regular education areas are worth this inconvenience.

The name of the course also is an important consideration. Larson and McKinley (2003b) and Nippold (2010) suggested avoiding names that might carry a stigma, such as “Remedial Communication,” and opting instead for titles that sound supportive and mainstream. Some suggestions include “Effective Communication,” “Communication Studies,” and “Communication Laboratory.”

To as great an extent possible, we want to group students in a class on the basis of shared needs and similar levels of current functioning, although scheduling considerations also come into play here. When choosing students for the class, Larson, McKinley, and Boley (1993) suggested that class size should be in the 3- to 12-student range and that there should be no more than a two-grade spread among students in the class. They advocated involving students actively in the planning of goals and objectives for the class and in choosing from among a set of appropriate topics and activities. The purpose of the class should be explained, and the clinician should be as open as possible about the fact that the class

is designed to help the students overcome some of the difficulties they have in school.

The content of the communication class is determined to a large extent by the assessment data on individual students. In general, the goal is to focus on cognitive and communicative skills and strategies that enable students to function effectively in school, home, vocational, and leisure settings. Virtually all the activities we discussed in the section on processes of intervention are adaptable to the communication classroom setting. An advantage of this setting, too, is that, in addition to using activities with mainstream curricular content controlled for level of difficulty, the clinician can focus on a few units or themes that are of high interest to the students, and use these as a context for some of the activities we’ve discussed. Sports, ancient mythology, careers, and issues in local or school politics have been used effectively as themes in communication classrooms for adolescent students. Ehren (2002, 2009) suggested a balance of skills and strategy instruction.

Consultation and Collaboration

All the issues involved in collaborative and consultative service delivery models that we discussed in Chapter 12 apply at the advanced language level as well. The success of these models requires scheduled conference time with other faculty and the building of administrative support, for example. Many of the techniques we discussed for achieving these goals in elementary schools can be used effectively in secondary schools as well.

Larson, McKinley, and Boley (1993) pointed out the difficulties of providing consultation and collaboration at the secondary level. These include the fact that teachers are very independent in their development of course material and that they deal with so many students, spending very little time in one-to-one interaction with each. Furthermore, no one teacher has primary responsibility for any student. Larson et al. argued that secondary teachers may need to be “sold” on the idea of the importance of language as a basis for success throughout the curriculum. A yearly in-service presentation on information like that given in Chapter 10 can help get this message across. Ehren (2007b) warned us of the need to take a “low horse” approach. Rather than coming in on a “high horse,” and affecting to know how to solve all the student’s problems, she suggests we make tactful offers to learn from teachers, make suggestions where they are welcomed, and value and respect the competence and experience of educators with different areas of expertise.

Consultation

One of the first obstacles we’ll encounter in providing consultation at the secondary level, as we’ve seen, is finding teachers who will agree to consult with us. It may help to approach several of a student’s teachers and ask whether they would be willing to talk with you periodically about thoughts for helping the student do better in the class. If the consultation is originally focused on the student rather than the teacher, teachers may be less likely to believe the consultation’s object is to “correct” poor teaching. Ehren (2002) suggests asking, “Can you share with me any approaches that especially help Peter?” or “Is there something I can do to help Mike succeed in your class?” rather than telling the teacher what to do. Additionally, when we do get to making suggestions, we can back them up with concrete help such as making visual aids or lecture outlines for the teacher, the consultation is more likely to be well-received. As we discussed before, not every teacher will be willing to enter a consultative relationship. We should try to identify first those who are most interested and receptive, and establish

relations with these. English and Language Arts teachers are most likely to have an interest in working with an SLP. As success is seen, it will be easier to find new recruits. Larson and McKinley (1995) and Marvin (1990) provided additional suggestions for effective consultation.

Anderson et al. (2004) identified six practices that appeared to be the most effective in helping students with LLD succeed in general education classrooms. As part of our consultation with classroom teachers, we can suggest the following procedures:

- *Mnemonic strategy instruction:* We can encourage teachers to present strategies such as Keywords and POSSE, or offer to present them in collaborative teaching sessions.
- *Visual and graphic organizers:* Sharing some of the graphic organizers we use with our student with their classroom teachers can encourage them to use these supports, which are valuable to general as well as special education students.
- *Guided notes:* We can work with teachers to provide prepared handouts that guide a student through a lecture or discussion with visual cues and spaces for the student to write key facts and concepts. Teachers may choose to provide these to all students, or only to those on IEPs.
- *Class-wide peer tutoring:* As we discussed before, this practice helps students take responsibility for their own learning and benefits even top students as well as those with special needs.
- *Linking current knowledge to new information:* Using techniques we've discussed, such as creating anticipatory sets and activating background knowledge, facilitates the ability of all students to assimilate new information.
- *Reciprocal teaching:* Providing students with problems, procedures, and materials, having them brainstorm ways to use what they have been given to solve the problem after modeling and support from the teacher helps students master concepts through their own thinking and experimenting.

In general, consultation with secondary teachers about adolescents with LLD can have two goals: to *modify* the *presentation* of material and to make some *accommodations* for the student in the classroom. That is, we can try to make some changes in how the teacher talks to the students, which will benefit the student with LLD and mainstream students as well. We also can provide guidance and assistance in accommodating the kinds of written assignments,

tests, note-taking, etc., that the student with LLD must do to participate in the mainstream curriculum.

Modifying Presentation of Information

One approach that can be used is to encourage what Nelson (1998) called “mediational teaching” or what Silliman and Wilkinson (1991) called “dialogic mentoring.” We talked earlier about some methods for implementing these approaches, including reciprocal teaching. An additional technique was suggested by Westby (2005). It makes use of Bloom’s (1956) taxonomy for categorizing levels of thought. Teachers using this approach would, when students reply to questions, use the answer to identify students’ current level of thinking ability and then provide a scaffolding question that encourages the student to operate at the next-higher level. Examples of questions at each level are presented in Table 14-8.

When encouraging teachers to use any of these dialogic-mentoring techniques on a consulting basis, it is important to prepare written summaries of the technique and to discuss it with each teacher, giving detailed examples of how it might be used within that teacher’s curricular area. Another helpful approach is to offer to teach one class of the teacher’s collaboratively, using the technique, to give a chance for the teacher to see it in action. It is also important in working with teachers on their questioning techniques to encourage teachers to make answering a positive experience for students with LLD. Lunday (1996) suggested circulating “tip sheets” to teachers like the one in Box 14-18 to remind them of the importance of the way they use questions in their classes.

Lasky (1991) presented some additional guidelines for modifying the teacher’s presentation of information for the benefit of the student with LLD. She suggested, first, that we ask teachers to use a *slow rate of presentation*. This is perhaps one of the simplest modifications teachers can make and can be extremely helpful to students with LLD. Besides just talking more slowly, teachers can be encouraged to insert short (1-second) pauses within long or complex sentences to give students additional processing time. A second suggestion is to ask teachers to provide *redundancy*. Teachers can paraphrase difficult material so that students hear it several different ways. They also can summarize the main points of the material at the end of the presentation. Even verbatim repetition, with modification of the stress and intonation pattern for emphasis, can be an effective rhetorical technique and provides helpful redundancy. Visual and graphic organizers are also very

TABLE 14-8 Sample Questions Based on Bloom’s (1956) Taxonomy

Level	Definition	Example
Knowledge	Remembers and repeats information presented, answers simple questions.	How many electoral college votes does Texas have in presidential elections?
Comprehension	Demonstrates understanding by paraphrasing or restating information in own words.	Explain how the electoral college works.
Application	Uses information, rules, methods, or principles learned in new but similar situations.	How is the electoral college system like a parliamentary system, such as the one we discussed in Israel?
Analysis	Identifies components, gives explanations, identifies problems.	How would an electoral college system work if it were applied to our student government?
Synthesis	Abstracts from previously learned material to generate solutions to new but related problems.	What kinds of problems can arise from an electoral college system of presidential elections?
Evaluation	Compares alternatives, states and justifies opinions, provides evidence for responses.	Discuss how national election policies should be reformed and why.

BOX 14-18 Sample Teacher “Tip Sheet” for Classroom Questions**Asking Questions: Expecting Answers**

Teachers ask questions that they expect students to be able to answer. Questioning students helps the learning process. A teacher’s response to students’ answers can foster this learning process and also protect the student’s self-esteem.

Here are a few basic but powerful behaviors:

Provide wait time: Pausing to allow a student more time to answer instead of moving on to the next student when you don’t get a response

Dignify responses: Give credit for the correct aspects of an incorrect response

Restating the question: Asking the question a second time

Rephrasing the questions: Using different words that might increase the probability of a correct response

Providing guidance: Giving enough hints and clues so that the student will eventually determine the correct answer
These actions may seem insignificant, but they send a powerful message of acceptance to students. Students who feel accepted become active learners!

From Lunday, A. (1996). A collaborative communication skills program for Job Corps centers. *Topics in Language Disorders*, 16, 23-36.

helpful ways of supporting the learning of students with LLD, and we can remind teachers that they will probably be helpful to many students in the class. Lasky also advised us to have teachers *provide contextual cues*. These might include stating the topic to be discussed; using visual aids such as slides, overheads, and charts to reinforce the verbal presentation; putting an outline of the presentation on an overhead or handout; and asking directed questions to focus students’ attention on critical points in the presentation and aid in recall. Another suggestion is to *relate new information to something the students already know*. An easy way to do this is to use names of the students in the class in examples the teacher gives. Choosing examples from areas in which students have experience or interest, such as sports, also aids recall. In consulting with teachers on these techniques, we can present them with a simple list of “suggestions for helping students with disabilities ‘make it’ in your classroom.” The list might look like this:

1. Talk slowly.
2. Pause within long sentences.
3. Repeat important information.
4. Provide visual cues.
5. Relate new information to something students already know.

We might give the list to a willing teacher and ask him or her to see what changes might be made. When the teacher identifies some, we can talk about them in more detail, making concrete suggestions and giving examples from the teacher’s classroom content.

In addition to giving teachers techniques like these, we also can offer some simple tips for helping our students succeed in the classroom. These might include asking teachers to write all their instructions on the board as they say them. This both slows them down, so directions are easier to process, and provides an additional visual version that students can refer to if they didn’t get it the first time or if they forget the instructions. Conversely, we

can ask teachers to read written instructions given on tests and homework assignments aloud, again providing an alternate modality for students who may have trouble processing information from printed material. Asking teachers to pause briefly after they ask a question can give the student with LLD additional time to retrieve an answer. If asking for a list of answers (such as three causes of World War I), teachers can, after a pause, ask the student with LLD for an answer first. This gives him or her the opportunity to provide a correct answer, before all the “good” answers are taken. Mainstream students can provide other aspects of the answer (Lavoie, 1989). Ehren (2002) made some additional suggestions, including:

- Advising teachers to present learning experiences in addition to listening, such as debates or other participatory activities.
- Asking teachers to provide greater guidance and support to students with LLD by breaking assignments down into parts, and giving more opportunities for practice.
- Suggesting teachers take the time to explain to students with LLD privately where they have made errors and how they can correct them.
- Helping teachers use anticipatory sets to marshal and evaluate their students’ background knowledge on curricular topics. If background knowledge gaps are identified, the SLP can help the student find ways to catch up.
- Encouraging teachers to use peer-assisted activities such as cooperative learning groups, peer learning buddies and class-wide peer tutoring to provide students with LLD opportunities to practice social skills being developed in the communication classroom setting.
- Ask teachers to offer choices to students with LLD about how they complete assignments, the topics they write on, etc.

Choices help the student feel more involved.

Accommodations for Students with Disabilities

In addition to providing teachers with suggestions for modifying the presentation of language in the classroom, consultation can be used to plan the accommodations a student may need to succeed in a particular class. Here we may encounter some resistance, even from formerly cooperative consultees. Some teachers may feel it is “not fair” to make accommodations for students with LLD that are not made for others in the class. Why, for example, should only one student get an outline of the lecture or the opportunity to make a detailed map instead of a written report about a country when the others don’t get to do the same? Some of these concerns can be addressed by encouraging the teacher to go ahead and give the aid to *every* student. An outline of a lecture, or flexibility of assignments, will no doubt be of help to all.

Other accommodations, though, such as allowing extra time on tests or reducing the number of questions that must be answered, may not be appropriate for mainstream students. In cases like these, we might want to use an example like that presented by Lavoie (1989). We might ask teachers to imagine that one student in the class suddenly chokes on a piece of gum. Let’s say the teacher knows how to do the Heimlich maneuver, but as the student chokes, the teacher tells him, “Well, I could do a Heimlich, but it wouldn’t be fair if I did one for you and didn’t do it for everyone in the class.” The point is that most students do not need the accommodations, but if someone does, it is eminently “fair” to provide them, since survival in the classroom for *this* student may depend on them.

The two ways we can provide accommodations for students in secondary classrooms are by *modifying curricular materials* and by *modifying the way students are required to demonstrate knowledge*.

Larson and McKinley (1995) provided some suggestions for *adapting materials* for students with LLD. They suggested putting students' textbooks in audio form (student volunteer service organizations, school volunteers, or senior citizens may be recruited for this work). This way, students with difficulty reading can get the information aurally. Students with LLD may be given special permission to write in or highlight textbooks or to make photocopies that can be written in or highlighted. Larson and McKinley also suggested color-coding textbooks for the student. That is, certain textbooks can be highlighted by the clinician and recycled each year for LLD students in the appropriate grade. The clinician can highlight main ideas in yellow, details in blue, and vocabulary to be learned in green, for instance. Students in pull-out/sit-in or language-based courses for credit can work with the clinician to highlight books in study skills units, and these can become part of a clinician's collection of highlighted books available for students in later years. Over time, a clinician can develop an extensive library of color-coded books for the use of students with LLD. Beginning the color coding on older, more worn textbooks may help to enlist administrative support. Simon (1998) suggested some additional ways to adapt classroom materials for students with LLD. These include the following:

- *Marginal glosses:* Key concepts and vocabulary are highlighted, then notes explaining them are written to the student in the margin or on "sticky" notes placed next to the highlighted portions.
- *Cued texts:* Visual cues are used to show relationships among pronouns and their noun referents, or between other elements of text cohesion. For example, the story character's initials can be written above a pronoun referring to that character.
- *Structured overviews:* Mini-outlines, story maps, or semantic webs are placed on "sticky" notes at the beginning of a text section to guide students in reading it.

Again, all these cues can be provided by students working with the clinician within the communication classroom, to be used later by other students for whom the clinician is consulting. Additional ideas for modifying curricular materials for students with LLD can be found in DeMier, Wise, and Marcum (1982), the Oklahoma Project (1982), and Project STILE (1979). There are also helpful Web sites, including www.ldonline.org/article/Accommodations_for_Students_with_LD, the Learning Disabilities Association of American website, www.ldanatl.org/aboutld/teachers/understanding/accommodations.asp, and www.ldat.org/ld_info/accommodations.html

In *modifying the way students are required to demonstrate knowledge*, we are working with teachers to accommodate students' special needs in classroom assignments and tests. We've talked already about providing flexibility in assignments. Students with LLD may not be able to produce written work that is as lengthy or mature as that of their peers, especially if the work must be completed within class time. An SLP can work with receptive teachers to develop rigorous but achievable modifications of class assignments for students with LLD.

We talked earlier, too, about portfolio assessment as an alternative to testing. This method samples student work over a semester or year and allows students to demonstrate their progress by a comparison of work done early in the term with that done later. This system is ideal for students with LLD, who may not perform on grade level but should nevertheless be able to demonstrate significant improvement in their work. Kratcoski (1998), Valencia (1990), and Wolf (1989) discussed methods of portfolio assessment. Fredrick (2009) emphasized the importance of modeling and encouraging use of reflective and metacognitive language during

teacher-student portfolio conferences, and found that students can be taught to be more reflective about their work in this way. Even if teachers are reluctant to use this method of evaluation for mainstream students, it is a reasonable accommodation for students with LLD.

Larson and McKinley (1987) discussed some accommodations that can be made in tests for teachers who are unwilling to use other assessment methods. They suggested administering tests orally to students and allowing students to dictate or audiorecord answers rather than writing them. Wiig and Semel (1984) suggested other modifications of tests, such as having fewer problems or questions per page to avoid overstimulation for distractible students and extending time limits to allow students to demonstrate their knowledge without the pressure of a time constraint. Fagen, Graves, and Tessier-Switlick (1984) provided additional suggestions.

Collaboration

The issues in establishing collaborative relations with teachers at the secondary level are the same as those we face in elementary schools, only more so. Friend and Cook (1990) discussed some critical elements that need to be present for collaboration to succeed. These sources can be useful in laying the necessary groundwork. Again, the number of teachers with whom this can work is limited. Teachers of resource rooms may be good first bets, if students with LLD spend part of their day there. English or Language Arts teachers also are good candidates. You may want to make a general offer at the beginning of each school year to work collaboratively in classes that have students with LLD. You might pique teachers' interest by circulating a list of topics you would like to cover in collaborative sessions. Teachers of many subjects would welcome having someone work with them to teach modules such as "Listening Skills," "Effective Study Strategies," "Remember to Use Mnemonics," "Editing Your Writing," or "Do You Know If You Understand?" for example. We talked earlier about doing collaborative intervention for classroom discourse skills in courses that use cooperative learning groups. These also provide excellent opportunities for moving into the classroom. When we get the go-ahead to teach these collaborative units, they provide a good jumping-off point for some pull-out/sit-in sessions with students who are involved in a clinical intervention model. Some of the commercial sources of lessons that we discussed in Chapter 12 also can be appropriate for use in secondary classrooms. Many of the activities we discussed in the Processes of Intervention at the Advanced Language Stage section make ideal collaborative lessons, particularly those on the "metas," writing, editing, comprehension monitoring, and other high level language skills that will be difficult for many students in addition to the identified client.

In collaborative planning we need to work closely with teachers to ensure that they don't see us as just "taking over" the class, leaving them without responsibility. On the other hand, we want to be sure that they don't expect us to work as an aide with only the identified client. Again, we'll need to lay some groundwork in conference sessions with the teacher to establish roles, deciding who will do what with whom in the lessons, following the suggestions we discussed in Chapter 12. Working with teachers to choose one of the models of collaborative intervention in Figure 12-13 can help set the stage for successful teamwork. Using materials such as the planning forms in Appendix 12-2 can also be helpful with secondary teachers, as well as those in elementary schools. This groundwork is crucial for achieving the potential of collaborative intervention.

Also, in going into the classroom to provide collaborative sessions, you will want to observe all the courtesies we discussed in Chapter 12. You'll want to provide the teacher with a structured lesson plan, like the one in Box 12-19 for example. You should provide a commercial lesson plan in case you are sick the day the lesson is scheduled. Punctuality and sticking to the class's time limit also are important. So are providing visual aids and follow-up materials. Most important, perhaps, is to practice what we preach about mediational teaching, question procedures, and good classroom communication. Remember the guidelines that we talked about giving teachers in consultation sessions to improve presentation of material to students? Reviewing these can be a good reminder to ourselves about appropriate classroom language style.

SPECIAL CONSIDERATIONS FOR HIGH FUNCTIONING STUDENTS WITH ASD

These days more than half the students diagnosed with ASD function within the normal range of cognition and have acquired basic spoken language skills (Tager-Flusberg et al., 2005). These students may show high achievement in some areas, but will almost always have deficits in pragmatic aspects of language, in social skills, and peer interactions (Paul, Landa & Schoen, 2011). Many high functioning students with ASD, as well, have difficulty with executive functioning (Tsatsanis, 2005) and with understanding narratives in which much of the plot is driven by characters' internal states, plans, and goals. As SLPs, it falls within our scope of practice to work on addressing these communication difficulties. Many of the interventions we have discussed for adolescents with LLD are appropriate for those with ASD, as well. Robinson and Westby (2009) suggest work on inferencing in narrative as a way to help develop understanding of internal states. They suggest using inference and internal state charts as visual supports for helping students use evidence in the story to identify characters' feelings and to draw conclusions about intentions underlying actions in stories. Examples can be seen in Figure 14-24. The activities for developing self-regulation, metacognition, learning-strategy acquisition, conversational skills, classroom discourse, and the

functional curriculum are all additional approaches that are relevant for students with ASD. In fact, having students with LLD work in communication classes with students with ASD can be a good mix because the students with ASD may be able to serve as models in academic areas, while those with LLD will be stronger in pragmatic and social skills and can serve as models for these domains.

In terms of developing pragmatic, social, and peer interaction skills, there are a few approaches that seem to be particularly well-suited to students with ASD. We've already discussed script-fading and video modeling in Chapter 12. These methods can be used for adolescent students, as well, so long as we adjust their content to chronologically age-appropriate material. Social skills groups of students with ASD are often used, although the evidence to support their efficacy is sparse (Bellini et al., 2007). Approaches with strong evidence are those that include peer models. One peer modeling approach that fits in well at the secondary level is *peer networking* (Kamps et al., 1997; Thiemann-Bourque, 2010). This approach recruits 4 to 6 different peers whose job it is to interact with the student with ASD at different times in the day. Thiemann-Bourque reports that at the secondary level it is important to have the peers themselves identify the difficult times of the day and the kinds of interactions that need to be mediated; for example, perhaps one peer will join the target student at lunch on two days, another at lunch for three days, one at gym, and one while waiting for buses. Training for peers involves the peers meeting with the clinician to identify times of day and social issues that should be addressed; with the clinician they brainstorm strategies to try to deal with each problem. Thiemann-Bourque suggests giving the peers photographs or written scripts to pass on as cues to the target student. The peers are encouraged to prompt the target student using these visual supports, to coach them to maintain interactions, and praise their efforts. A detailed description of this program can be found in Thiemann-Bourque (2010).

Finally, many students with ASD will attend college. For these students, Retherford and Sterling-Orth (2009) provide information on programs and resources. When working with families of these students on transition planning, this kind of information can be useful to share.

Inference chart for *Shiloh* (Naylor, 1991).

Character	Inference	Evidence (How do you know?)
Marty	He loves animals.	He can't eat a rabbit when he learns his dad shot its head off.

Internal states chart for *Shiloh* (Naylor, 1991).

Character	When	Feeling	Why
Marty	At Sunday dinner	Mild disgust; dismay; Doesn't want to eat rabbit	Doesn't like to think about how it died; it ruins his appetite
Mom	At Sunday dinner	Annoyed	Marty plays with his food and doesn't eat what she cooked.

Social or academic language intervention: You don't have to choose. *Perspectives in Language Learning and Education*, 16, 42-47) and inference chart for *Shiloh* (Naylor, P. [1991]. *Shiloh*. New York: Atheneum).

TRANSITIONAL INTERVENTION PLANNING

The ITP is the vehicle used to identify the goals we target for students 16 to 21 years of age, who must soon leave school and make a transition to another setting. As we said in Chapter 13, the development of the ITP, like that of the IEP, is a collaborative effort among teachers, parents, and the student. The National Joint Committee on Learning Disabilities (1994) listed the responsibilities of school personnel in preparing the ITP. These appear in [Box 14-19](#).

Both the student and the family should have an opportunity to discuss their goals and to think about what the best, realistic post-secondary outcome for each individual student will be. Sturomski (1996) emphasized the importance of starting this process early so

Transition planning includes community referenced skills.

that students can begin participating in community activities outside of school, making contacts and visiting potential post-secondary settings. He reported that students who use community services while still in school are more likely to use them in adult life, as well. ITP guidelines suggest that transition planning begin when a student reaches age 14. Kosine (2007) highlights several elements of successful transitions plans. These are summarized in [Box 14-20](#).

Much of the program for transitioning from school to independent living takes place in the context of the functional strand of the curriculum for students with LLD. Here, as we discussed, the curriculum focuses on developing vocational and daily living skills and on improving social communication abilities. The functional strand of the curriculum in the latter years of secondary school can be closely tied to the educational and vocational programs that students will be involved with when they graduate. If you can establish links with higher education and vocational training or job settings in which your students are likely to participate, these links will facilitate the transition. Perhaps a counselor from the local community college or a personnel officer from a company that has made an effort to provide employment for people with disabilities can be invited to talk to the functional communication class. A “field trip” to one of these sites would also be a way to expose students to the next stage of life. Madaus (2005) discussed some of the issues in helping students with LLD make the transition to higher education. And as we saw, there is now a great deal of information available specifically for high functioning students with ASD about planning for college.

Sturomski (1996), Kosine (2007), and Weidenthal and Kochhar-Bryant (2007) stressed the importance of developing not only basic life skills—such as using money, buying and preparing food, using public transportation, securing health care, and participating in

BOX 14-19 Responsibilities of Secondary School Personnel in Individualized Transition Planning

- Form a transition team consisting of a coordinator, the student, the family, administrators, teachers, and related service personnel.
- Include the student and parents in the entire planning process.
- Demonstrate sensitivity to the culture and values of the student and family.
- Develop an appropriate packet of materials to document the student’s secondary school program and to facilitate service delivery in the postsecondary setting.
- Provide administrative support, resources, and time to foster collaboration among team members.
- Inform the student about laws, rules, and regulation that ensure his or her rights.
- Provide appropriate course selection, counseling, and academic support services.
- Ensure competence in literacy and mathematics.
- Ensure that the student learns effective studying, time-management, test-preparation, and test-taking strategies.
- Help the student use a range of academic accommodations and technological aids.
- Help the student evaluate the need for external supports and adjust the level of assistance when appropriate.
- Help the student develop appropriate social skills and interpersonal communication abilities.
- Help the student to develop self-advocacy skills, including an understanding of his or her disability and how to use this information in communicating with others.
- Foster independence through increased responsibility and opportunity for self-management.
- Encourage the student to develop extra-curricular interests and participate in community activities.
- Inform the student and family about admission procedures for diverse postsecondary settings.
- Inform the student and family about services that postsecondary settings provide, such as disability services, academic counseling, etc.
- Ensure the timely development of documentation and material to meet application deadlines.
- Help the student and family select and apply to postsecondary institutions that will offer both the challenge and the support necessary.
- Develop ongoing communication with postsecondary personnel.

BOX 14-20 Components of Successful Transition Plans

- While student is still in high school, teach and provide coaching and practice in self-determination skills, which can be used in college or employment, including:
 - Asking teachers for clarification of lecture materials
 - Reporting their learning disability to their teacher(s)
 - Making an appointment with a teacher to discuss needs and/or accommodations
 - Asking a teacher for permission to record class lectures
 - Obtaining teacher approval for another student to take notes or to copy another student's notes
 - Seeking assistance from the school librarian and
 - Making an appointment with a resource person, such as a counselor
- Add post-secondary education counselors, disability specialists and/or vocational rehabilitation counselors to the transition teams.
- Give high school students assignments to:
 - Become familiar with their educational rights under Section 504
 - Become knowledgeable about the college selection and application process
 - Meet with a counselor or disability specialist at a local college
- For students headed to vocational settings:
 - Have students explore the values, attitudes, and habits that make a good employee
 - Learn about the knowledge and skills necessary for careers the student is interested in
 - Arrange for the student to spend time in the work environment

Adapted from Kosine, N. R. (2007). Preparing students with learning disabilities for postsecondary education. *Journal of Special Education Leadership*, 20(2), 93-104.

recreational activities—but of developing the self-determination necessary to secure the accommodations to which our students are entitled. In fact, the Council for Exceptional Children (CEC) sees the development of self-determination in students with disabilities as one of the hallmark outcomes of a successful transition process. Michaels and Ferrara (2005) reviewed evidence that suggests students with both mild and moderate disabilities with high levels of self-determination at the time of graduation were significantly more likely to be living independently, have greater financial independence, and be working 3 years after graduation than their peers with low levels of self-determination. Students need guided practice while they are in school in advocating for themselves, evaluating and making choices, talking about their disability, explaining its impact, and asking for what will be needed to enable their participation in the community.

As part of the functional strand of the curriculum, the clinician may want to schedule some family conference time, to get parents together with students to talk about what is going to happen after graduation. For students continuing on to higher-education settings, it is an opportunity to discuss whether the student will live at home, on campus, or in an independent-living arrangement. Talking about the realistic pros and cons of each situation with the family can help them focus on how students will achieve their greatest potential. Issues such as cost, the time students must spend on daily living activities as opposed to studying, peer relations, and student preferences must be discussed and weighed.

For students who will go directly to vocational training programs or to the job market, again, living and financial arrangements need to be discussed with the family. Although graduation from high school has traditionally been the time at which adolescents move away from the parental home, more and more mainstream young people are opting for the monetary and emotional support offered by staying under the parents' roof. Some parents want to see their children with disabilities "leave the nest" at the "normal" time. For these families, counseling and referrals to community agencies that can provide some assistance can be given. Other families may feel differently, though. In some families, neither the parents nor the client feel ready to make this move. We should not feel that because a student with a disability is supposed to be "mainstreamed," he or she should be denied the option available to other young people—that of remaining within the family for a few more years. When the feeling of the family is to put off a transition to independent living for a while, the clinician can be supportive by making the family aware of agencies and resources that will be available when the client is ready to make the move. McPartland's (2004) *Implementing Ongoing Transition Plans for the IEP: A Student-Driven Approach to IDEA Mandates—2nd edition* and Harrington's (2003) *Handbook of Career Planning for Students with Special Needs—3rd edition* are useful resources.

For students with severe disabilities, who will be transitioning to adult community programming, perhaps the most important role for the SLP is to insure a viable means of communication that the student can use in community settings. Cascella and McNamara (2005) argue that communication goals for these students be functional, aimed toward enabling independent behavior, rather than developmental, or pegged to the child's mental age. Goals such as making a sound to indicate where the student is when called may be more appropriate than working on getting him to say his name. Making sure that the communication modality used by the student works effectively with listeners who may not be familiar with the student is also important. For a student who uses speech for the main form of communication, but is unintelligible to people outside his circle, some alternative may need to be introduced to allow for interactions in the community. This can involve taking some "field trips" to try out communication methods in order to find what works best to allow the individual to interact in the community. The main goal of working on communication skills with severely impaired students at the transition level is to maximize the degree of independence and interaction they can achieve, so focusing on functionally effective communication in any modality must be our primary objective. Many of the methods we discussed for students at this developmental level in our earlier chapters can serve as points of reference.

Appendix 14-1 provides an example of an ITP summary.

CONCLUSIONS

Planning programs for secondary students with LLD requires thinking about today and thinking about tomorrow. That is, we need to help students perform up to their potential in the school setting now, as well as develop skills that will contribute to a successful adjustment to independent living later. Let's take Michael as our example and look at the kind of intervention program we might develop to address both these sets of needs for a student like him.

Ms. LaBell was the SLP in Michael's high school. When his parents requested a reevaluation, Ms. LaBell reviewed all his records from throughout his school career. She talked on the phone with the family to discuss their concerns. One of their main ones was that Michael seemed to lack "common sense." Despite his strengths in many areas, he was gullible and easily deceived. They were afraid he would be taken advantage of in some way. He also seemed to have poor judgment, and they were worried about how he could live independently. Ms. LaBell also met with several of his teachers and talked with them about his classroom performance using the interview format in Box 13-5. Finally, she talked to Michael himself, and had him fill out a self-assessment (see Figure 13-1).

Ms. LaBell did some formal testing, but, as expected, Michael's scores on standardized tests (she gave him the *Peabody Picture Vocabulary Test—IV* and *Test of Adolescent Language*) were within normal limits. His teachers confirmed that his semantic skills, including advanced vocabulary and definitional skills, as well as his syntax were excellent; excessively so, in fact. He often used big words or long, formal-sounding sentences that the other students had trouble understanding, and he just sounded too stiff, even in the classroom situation. The English teacher did note problems with multiple meanings and figurative language, though, when Ms. LaBell asked her specifically about these areas. Ms. LaBell was able to document this deficit using the *Test of Language Competence*. Ms. LaBell asked Michael's permission to observe him during a peer conversation and conducted a conversational analysis (see Figure 13-4). There she identified a range of difficulties in conversational interactions. Negotiation skills and register variation were particular problems. She had Michael produce both a spoken and written narrative sample and analyzed them for story grammar, cohesiveness, and use of literate language style. Michael's style in both contained many literate language markers. T-unit length and use of low-frequency structures and connectives were higher than average. But his narratives lacked cohesion and did not contain all the expected story grammar elements. Plans, goals, and internal responses were notably absent. Ms. LaBell looked at his comprehension skills and found he did well with expository texts, like his science book, but had more difficulty with narrative and persuasive or argumentative materials. Informal assessment of "meta" skills and comprehension monitoring showed Michael was aware when he had problems, but had few strategies for correcting them. Analysis of written communication skills showed good performance in writing mechanics and lexical choice, but difficulty with the planning aspect of writing and in providing sufficient information, supplying cohesion, and using appropriate detail. Michael also had a great deal of trouble editing his work. He could identify mechanical errors, but had problems revising other aspects of his writing.

Ms. LaBell had a junior- and senior-level communication class running that year. The academic strand focused on study skills, comprehension monitoring, editing, and vocabulary development. The functional strand concentrated on choice-making, daily living skills, self-determination, and career development. There were already six students in the class, and Ms. LaBell convinced Michael, with some difficulty, to trade his elective music class for the communication course.

Michael's strong vocabulary skills were an asset in the class. He was assigned to develop a vocabulary list for the unit on ancient mythology that the class was studying. Michael had to preview the material they would read, pick out words that might be hard for the other students, and meet with Ms. LaBell to develop lessons to teach the words. She often added words to his list that had multiple meanings and helped him develop games and lessons on these words. She also encouraged him to involve the class in figurative-language activities using the words.

In the study skills and comprehension-monitoring units, Michael had needs similar to those of the other students in the class. The group engaged in reciprocal teaching activities to improve their reading comprehension. Ms. LaBell was careful to let Michael act as the "facilitator" early in the sessions on expository texts, since he had good command of this type of material. For narrative texts, drawn from their ancient mythology unit, she had Michael act as facilitator only after several other students had modeled the RT. The SQ3R method was also addressed in the study skills unit. For additional narrative development, the group put on a play about their favorite myth, writing the dialogue and acting out various characters. Michael was assigned to a character who needed to show various emotions, and Ms. LaBell talked with him about each emotion he was to portray, why the character felt that way, and when and why Michael himself might have felt that way. Comprehension monitoring was addressed with barrier games and by using audio recordings from lectures given by teachers the students had for other classes. Students were encouraged to use SQ3R as a way to monitor comprehension of material they read.

Because of Michael's strong expository comprehension skills, he helped Ms. LaBell highlight texts for the other students, using color coding to point out main ideas, salient details, and difficult vocabulary. He also made audiorecordings of text material that other students who were poorer readers needed to study. To work on negotiation and conversational register skills, Ms. LaBell assigned another student with good conversational skills, Jeffrey, to "tutor" Michael in dyadic conversation. They did role-playing activities, audiorecorded them, then listened to the recordings together. Ms. LaBell coached Jeffrey to first critique his own performance, then give Michael some "tips" about his. They then replayed the exercise, and the next time it was Michael's turn to critique first. After they both felt they had gotten it right, Ms. LaBell listened to the recording with them and made further comments.

Ms. LaBell addressed writing and editing by asking students to bring written assignments from other classes and plan and edit them in class. They started the planning process with Hallenbeck's (1996) think-sheet. After producing a draft, students read their drafts aloud to each other and underlined any errors they detected. Ms. LaBell then led them on several passes through the text to detect and correct errors in spelling, capitalization, punctuation, and grammar. In a final pass, they evaluated their writing using Graham and Harris's (1999) self-questions. After going through this process on a few other writing assignments, Ms. LaBell had the students do the activities using reciprocal teaching rather than under her direct instruction. As a final activity, students completed a writing assignment independently, using a checklist to cue them to go through each planning and editing phase. Ms. LaBell also

encouraged Michael to check out a blog Web site and to begin writing about his life there. He found that others responded and even “met” another young man who had a similar disability through the blog site. In addition to having a new “friend” to write to, Michael’s resistance to writing decreased as it became a more ordinary activity for him.

In the functional strand of the curriculum, students gave oral reports on jobs that interested them and on job-hunting techniques. They role-played interviewing for an apartment. They did a unit on nutrition and making good nutritional choices, in which the health teacher guest-lectured. This was followed by a unit, taught in conjunction with the school counselor, on self-esteem and making choices to avoid substance abuse. Michael’s assignments during this unit involved role-playing situations in which he was invited not only to abuse drugs and alcohol, but to shoplift, and to buy items presented to him at inflated prices. Ms. LaBell emphasized the importance of evaluating options with which students were presented. She used “think-aloud” protocols to get Michael and the others to talk through these choices and arrive at sensible decisions. The class also took a field trip to the local community college and sat in on some classes there. They all talked about what they hoped to do after graduation, and Ms. LaBell encouraged them to consider not only what they wanted but what was realistic for each.

Toward the end of the Michael’s senior year, Ms. LaBell invited Michael and his parents to a conference to develop his ITP and discuss his future. Michael wanted to attend the flagship branch of the state university, about 3 hours away from his home. Ms. LaBell thought, on the strength of his excellent math and science scores on SATs, that this was a realistic option, but his parents had doubts about his ability to get along on his own there. Michael at first thought he would prefer to be away from home, but after some discussion with Ms. LaBell and role-playing in class about what was involved in dorm living, Michael decided it might be best to stay home for a couple of years after graduation and take courses at the community college. His parents were relieved and felt the decision was best for them all for now. Ms. LaBell gave them the name of a counselor at the community college who would be able to work with Michael to make the transition to the 4-year college when he finished his associate’s degree.

STUDY GUIDE

- I. Issues in Intervention at the Advanced Language Stage
 - A. Suppose you are attempting to convince a high school principal of the need for communication intervention for students with LLD in the school. Give your rationale.
 - B. Discuss student-centered intervention at the secondary level.
 - C. How can communication contracts be used with secondary students?
 - D. Describe the role of counseling with secondary students.
- II. Products of Intervention in the Advanced Language Stage
 - A. Discuss purposes of intervention at the secondary level.
 - B. Define *content mastery* and describe the SLP’s role in it at the secondary level.
 - C. What are the criteria for including students in a learning-strategies approach to intervention?
- III. Processes of Intervention in the Advanced Language Stage
 - A. Discuss methods for teaching literate lexicon skills to adolescent students with LLD.
 - B. How can secondary students’ word retrieval be improved?
 - C. Describe methods for addressing figurative language skills.
 - D. Outline some approaches to teaching verbal reasoning.
 - E. Discuss sentence combining and paraphrasing as syntactic intervention methods.
 - F. How can students be exposed to literary language at the secondary level?
 - G. Discuss basic skills approaches to improving classroom discourse skills for secondary students with LLD.
 - H. What resources are available for exposing teens to advanced narrative structures? Discuss activities that can be used to improve narrative skills in adolescent students with LLD.
 - I. Describe activities for increasing appropriate use of cohesive markers.
 - J. Discuss basic skills methods for addressing mechanical problems in the writing of secondary students with LLD.
 - K. Describe approaches to improving conversational skills in adolescent clients. How can learning-strategies approaches be used to address conversational skill deficits?
 - L. What other skills should be addressed in the functional strand of the curriculum?
 - M. Give the steps for teaching a learning strategy.
 - N. Discuss some strategy approaches to improving semantic skills in secondary students with LLD.
 - O. How can syntactic skills be addressed in the editing process?
 - P. Describe some learning-strategy approaches to improving classroom discourse skills.
 - Q. Discuss reciprocal teaching.
 - R. Discuss learning-strategy methods for narrative skills.
 - S. Describe the use of verbal and visual organizers for improving expository text comprehension.
 - T. Discuss additional learning-strategy approaches for expository text material.
 - U. How can learning strategies be used to address the writing process?
 - V. Discuss the use of the editing process in teaching strategies to improve written products.
 - W. Describe methods for teaching comprehension monitoring at the secondary level.
 - X. What is the relation between reading comprehension skills and monitoring of comprehension of written material?
 - Y. Discuss metacognitive or study skill instruction at the secondary level.
- IV. Contexts of Intervention in the Advanced Language Stage
 - A. Discuss peer tutoring as an intervention strategy for students with LLD. How should peers be selected and trained? What should the goal of their tutoring be?
 - B. Discuss the clinical model of intervention at the secondary level. What are its strengths and weaknesses?
 - C. Describe the language-based course for credit in terms of title, scheduling, content, grading, class composition, and similar issues.
 - D. What are some special difficulties in providing consultation and collaboration at the secondary level?

- E. Discuss some consultation strategies for helping teachers modify the presentation of material to secondary students.
 - F. Describe methods of modifying curricular materials for students with LLD.
 - G. What are some ways we can accommodate students with LLD in terms of demonstrating their knowledge on tests and assignments?
 - H. How can SLPs in secondary schools engage in collaborative classroom intervention?
- V. Students with high functioning autism (HFA)
- A. List the most typical strengths and weaknesses of secondary students with HFA.
 - B. What methods that can be used for students with LLD are also useful for students with HFA?
 - C. What approaches are more specialized for students with HFA?
- VI. Transitional Intervention Planning
- A. Discuss the unique needs of high-functioning students with ASD in transition planning.
 - B. Discuss the role of the ITP in intervention planning for students in high school.
 - C. What are the responsibilities of the school personnel in transition planning?
 - D. How can the functional strand of the curriculum be used to address transitional intervention planning?
 - E. How can learning-strategy approaches be used for transition planning for students with LLD?
 - F. Discuss family conferencing as an aspect of transitional intervention planning.
 - G. What is self-determination, and why is it important for young adults with LLD?

Example of an ITP Summary Form**Transition Planning Summary**

Statement of Transition Service Needs for students 14 and older (must be completed at each Annual Review following a student's 13th birthday):

Student Preferences/Interests (Sections 2, 3, and 4 must be completed at each Annual Review following a student's 15th birthday):

Was the student invited to attend his/her Planning and Placement Team meeting?

YES NO

Did the student attend?

YES NO

How were the student's Preferences/Interests, as they relate to planning for Transition Services, determined?

☐ Personal interview

☐ Testing

☐ Vocational assessments

☐ Comments at meeting

☐ Interview with family

☐ Other:

Summarize student Preferences/Interest as they relate to Transitional Services:

Agency Participation:

Were outside agencies involved in the PPT meeting? YES NO

(If no, specify reason):

If yes, did the agency's/agencies' representative attend? YES NO

(If no, specify reason):

Has any participating agency agreed to provide or pay for services/linkages/transition planning?

NO YES (Specify):

Justification for Transition Services not being addressed:

If an annual goal and related objectives were not developed for independent living or community participation, provide a justification:

If activities/training are not provided in both the community and the classroom, provide a justification statement:

At least 1 year prior to reaching age 18, the student must be informed of her or his rights under IDEA, if any, which will transfer to her or him at the age.

A

- AAC. See Augmentative and alternative communication
- A Boy, a Dog, and a Frog* (Mayer), 548
- Abuse, 127-128
- Academic communication, 599-612
- Accelerated Vocabulary*, 600
- Accountability, 91
- Ace Hits the Big Time* (Murphy & Wolkoff), 602
- Acorn's Gold Mine*, 358
- Acquired language disorders, differences between language-learning disabilities and, 118t
- Activities
 - intervention, 80-87
 - for milieu communication training, 76b, 76t
- Adaptive behavior, 101
- Adaptive Behavior Assessment System* (Harrison & Oakland), 102
- Adderall, 125
- Administrative support, building, 524, 639-640
- Adolescent Conversational Analysis* (Larson & McKinley), 552
- Adolescents
 - conversational analysis of, 553f
 - interventions for improving writing in, 629b
 - language development in, 537-539
 - with language-learning disabilities, 539
 - narrative production measures from, 558t
 - probes for eliciting conversational behavior in, 554t
 - prompts for eliciting oral exposition in, 551b
 - rationale for services to, 595-596
 - register variation skills assessment worksheet, 554t
 - sampling context for oral language of, 548
 - secondary-school classroom discourse and, 556-557
 - survival skills and, 614-615
 - t-unit length analyses for, 548t
- Advanced language stage
 - assessment, 537-594
 - behavior observation and criterion-referenced, 543-569
 - functional communication, 570
 - metalinguistics, 567
 - metapragmatics, 567-568
 - pragmatics, 551-566
 - screening, case finding, and establishing eligibility in, 540-543
 - semantics, 543-547
 - syntax and morphology, 547-551
 - categories of cohesive markers for assessment at, 559b
 - checklist for referral at, 542f
 - considerations for high functioning students with ASD, 643
 - curriculum demands at, 539b
 - intervention, 595-649
 - agents of, 637-638
 - basic skills approaches to, 598-615
 - contexts of, 637-643
- Advanced language stage (*Continued*)
 - functional vs. academic curriculum, 598
 - issues in, 595-597
 - learning-strategies approach, 597-598, 615-637
 - metacognition, 636-637
 - narratives, 608-611, 619-623
 - pragmatics, 606-611, 618-635
 - processes of, 598-637
 - role of the SLP in secondary curriculum, 596
 - self-regulation, 635-636
 - semantics, 615-617
 - service delivery models, 638-643
 - student-centered, 596-597
 - syntax, 617-618
 - student self-assessment form, 541f
 - transitional intervention planning, 644-645, 645b

 - on cognitive-referencing, 7
 - definition of language disorders, 1-2
 - guidelines for monolingual SLPs, 164b
 - levels of prevention as defined by, 96t
 - service delivery models and, 520
- Analogies for Thinking and Talking (Nelson & Gillespie), 603-604
- Analogies Tutorial, 603-604
- Analytic rater, 564
- Analyzing the Communication Environment (ACE) (Rowland and Schwegert), 327, 329t
- Anansi and the Moss-Covered Rock (Kimmel), 507
- Animated Alphabet (Stone), 512
- A Northern Light* (Donnelly), 608
- Answers to questions, 45
- Anticipatory sets, developing, 200
- Appropriate interpretation, judgement of, 429
- Appropriate responses
 - in comprehension, 45-46
 - obligating pragmatically, 82-83
- Apraxia of speech, childhood, 130-133
 - assessing motor-speech development, 249-250
 - intervention approaches for children with, 132b
- Arab-American culture, 143
 - language and articulation differences between English and Arabic, 145b
- Argumentative text, 404, 563, 611-612
- Around the World in Eighty Days* (Verne), 558
- Artemis Fowl* (Colfer), 506
- Artic Games & More*, 358
- Articulation I, II, III*, 358
- Articulation tests, 290-292, 293, 294
- Artifact analysis, 451-452, 546
- Asian-American culture, 143-144
- Assessment
 - advanced language stage, 537-594
 - artful storytelling with literate language, 559
 - awareness of classroom pragmatic rules, 569b
 - behavioral observations, 48-50
 - case history, 23-24
 - child and family in process of, 418
 - child behavior and development in high-risk infants, 189
 - child behavior and development in preintentional infants, 197-199
 - of CLD children, 151t, 154b, 155-159
 - cohesion in narrative, 559
 - collateral areas, 288
 - communication in emerging language stage, 242-243
 - communicative intention, 243-246, 435
 - of communicative skills in children with emerging language, 238-243
 - of comprehension, 30
 - comprehension in contextualized settings, 300-301
 - comprehension monitoring, 430, 568-569
 - comprehension strategies, 299-300
 - conversational pragmatics in advanced language stage, 551-566
 - conversational pragmatics in preschool speakers with ASD, 330t
 - criterion-referenced, 292-320
 - criterion-referenced procedures, 44-48, 155-159
 - cultural and linguistic differences, 148-159
 - curriculum-based, 50
 - curriculum-based language, 451-453
 - decision making based on, 254-255
 - developing language stage, 286-346
 - developmental scales, 44
 - diadochokinetic, 34
 - domains of language, 29
 - dynamic, 49, 151t, 452-453, 453t
 - ecological, 455t
 - for emerging language, 234-285
 - of English Language Learners, 152t
 - establishing baseline function, 26-27
 - establishing goals for intervention, 27-28
 - evaluation vs., 22
 - feeding, 193-194

Assessment (*Continued*)

- feeding and oral motor development in
 - high-risk infants, 186-187
- of feeding and oral skills in Prelinguistic stage, 187b
- formative vs. summative, 50
- functional, 49-50
- functional behavior, 482-484
- gesture, 239-240
- hard-to-assess child, 50-51
- hearing, 30
- for high-risk infants, 186-193
- holistic evaluation criteria for written products, 567t
- identifying students for communication, 418-423
- infants at prelinguistic stages of communication, 201-202
- integrating and interpreting, 51-53
- for intervention, 27-28
- interviews and questionnaires, 44
- language for learning stage, 425b
- language or communication sample, 24
- language production, 30
- lexical production, 252-253
- measuring change for, 28-29
- metacognitive skills, 451t
- metalinguistic awareness, 449-451
- methods for, 38-50
- model for English language learners, 152t
- motor skills, 271
- multidisciplinary and transdisciplinary, 238-239
- narrative inferencing, 558
- nonverbal cognition, 35-38
- nonverbal intelligence, 38t
- norm-referenced conversational, 553-554
- oral-motor, 30-35
- parent-child communication in high-risk infants, 190-191
- parent-child communication in preintentional infants, 199-202
- peer, 634
- phonological processing, 295-296
- phonological skills, 250-252
- plan, 24-50
- play, 239-240
- portfolio, 566
- pragmatic, 316-320, 325t
- pragmatics in semi-structured conversation
 - form for, 331t
- for preintentional infants, 193-202
- presuppositional skill, 436-438
- presuppositional skills, 503
- productive syntax and morphology, 301-316
- purpose of, 25-29
- register variation, 436, 554t, 555
- for screening nonverbal cognition, 37t
- self, 634
- semantic-syntactic production, 253-254
- social functioning, 36-38
- of spatial, temporal, and connective terms, 426b
- speech-motor development, 249-250
- speech sound production, 292-296
- spelling, 452b
- standardized tests, 38-44
- story macrostructure, 557
- story microstructure, 557
- structured observations, 24
- student-centered, 539-540
- summarizing skills, 558
- for suspected developmental language disorders, 22-24

Assessment (*Continued*)

- syllable structure level (SSL), 251-252
- syntactic complexity, 548
- for toddlers with ASD, 266-267
- traumatic brain injuries, 115, 116b
- vocabulary, 296-297
- vocal, 194-196
- writing process, 564
- written narratives, 446-447
- written product, 564-565
- Assessment, Evaluation, and Programming
 - System for Infants and Children (Bricker, Capt, & Pretti-Fontczak), 243
- Assessment Instrument for Multicultural Clients (Adler), 159
- Assessment of Language Impaired Children's Conversation (Bishop et al.), 552
- Assessment of Phonological Processes (Hodson), 424
- Assessment of Preterm Infant Behavior (Als, Lester, Tronick, & Brazelton), 189
- Assigning structural stage procedure, 309-311, 312
- Assisted reading, 517
- Attention deficit hyperactivity disorder (ADHD), 123-125
 - children with FXS and, 107
 - classroom strategies for children with, 126b
 - cognition, 123
 - diagnostic criteria for, 124b
 - implications for clinical practice, 125
 - language, 124-125
 - language learning disability and, 406
 - planning intervention with IEP and, 481-482
- Auditory bombardment, 354
- Auditory perceptual deficit model, 15
- Auditory processing disorder (APD), 110, 112-113
- Augmentative and alternative communication (AAC)
 - in autism spectrum disorder, 134
 - for childhood apraxia of speech, 133
 - emergent literacy intervention strategies for children who use, 275b
 - functional communication training and, 377-378
 - intentional communication and, 271-272
 - interactive skills of, 85b
 - as intervention approach, 83-85
 - intervention techniques for children with deaf-blindness, 113b
 - for nonverbal child with ASD, 133-134
 - in older clients at developing language stage, 322-323, 325
 - in older clients with emerging language, 271-273, 274
 - in prelinguistic stage, 208-210
 - for severe speech and physical impairment, 129-130
 - strategies for developing literacy skills in children using, 131t
- Aural habilitation, hearing conservation and for high-risk infants, 189
- in older prelinguistic clients, 207
- in preintentional infants, 197
- Authentic assessments, 50
- Autiometric classification of hearing loss, 109t
- Autism Diagnostic Interview* (Lord, Rutter, & LeCouteur), 267
- Autism Diagnostic Observation Scale* (Lord et al.), 267
- Autism Observation Scale for Infants* (Bryson et al.), 267

Autism spectrum disorder (ASD), 24, 118-123

Milestones of Early Communication Development

Typical Age	Pragmatics	Semantics
0-8 mo	Perlocutionary: caregivers attribute intent to child's actions	
8-12 mo	Illocutionary intents expressed with gestures and vocalizations: • Requesting objects and actions • Refusing • Commenting • Communicative games Frequency of communicative acts: 2.5/min of free play	Understanding of 3-50 words First words used for names of familiar people and objects; communicative games and routines; to talk about appearance, disappearance, recurrence
12-18 mo	Locutionary intents express same functions with words that were expressed before with preverbal means Frequency of communicative acts: 5/min of free play	Average expressive vocabulary size: 50-100 words at 18 mo Semantic roles expressed in one-word speech include the following: • Agent • Action • Object • Location • Possession • Rejection • Disappearance • Nonexistence • Denial Words are understood outside of routine games; still need contextual support for lexical comprehension
18-24 mo	Frequency of word use increases over preverbal communication New intents include the following: • Requesting information • Answering questions • Acknowledging Frequency of communicative acts: 7.5/min of free play	Average expressive vocabulary size: 200-300 words at 24 mo Understand single words for objects out of sight Understand two-word relations similar to those expressed Prevalent relations expressed as follows: • Agent-action • Agent-object • Action-object • Action-location • Entity-location • Possessor-possession • Demonstrative-entity • Attribute-entity
24-30 mo	Frequency of topic continuations increase, mostly through repetition "Please" used for polite requests New intents include the following: • Symbolic play • Talk about absent objects • Misrepresenting reality (lies, teases) Narratives are "heap stories," primarily labels and descriptions	Understanding and use of questions about object (what?), people (who?), basic events [what (x) doing? Where (X) going?]
30-36 mo	Topic continuation nears 50% Topics are continued by adding new information Some requests for clarification provided Use of language in play increases Narratives are "sequences," with theme but no plot	Use and understanding of "why" questions Understanding and use of basic spatial terms (<i>in, on, under</i> , etc.)
36-42 mo	More flexibility in requesting, including the following: • Permission directives (Can you . . .?) • Indirect requests (Would you . . .?) Direct requests decrease in frequency, as indirect requests increase Narratives are "primitive," with theme and some temporal organization	Semantic relations between adjacent and conjoined sentences include the following: • Additive • Temporal • Causal • Contrastive Understanding of basic color words Use and understanding of basic kinship terms
42-48 mo	New functions emerge, including the following: • Reporting on past events • Reasoning • Predicting • Expressing empathy • Creating imaginary roles and props • Maintaining interactions	Use and understanding of "when" and "how" questions Understanding of words for basic shapes (circle, square, triangle) Use and understanding of basic size vocabulary (big, small) Use of conjunctions <i>and, because</i> to conjoin sentences
48-60 mo	Hints that do not mention the intention in the request ("Those smell good!") emerge Ability to address specific requests for clarification increases Narratives are "chains" with some plot, but no high point or resolution	Knowledge of letter names and sounds emerges Knowledge of numbers and counting emerges Use of conjunctions <i>when, so, because, if</i>

Syntax

Phonology

0-2 mo—vegetative sounds
2-4 mo—cooing, laughing
4-6 mo—quasi-resonant nuclei, vocal play
6-10 mo—canonical, reduplicated babbling-CV syllables
Jargon babble with intonation contours of language being learned

First 50 words

- Most often have CV shape
- Use same consonants used in early babbling
- Use of reduplication, syllable deletion, assimilation, and final consonant deletion is common
- Words are selected or avoided for expression based on favored and avoided sounds

Brown's Stage I: Basic Semantic Roles and Relations
Two-word utterances emerge
Word order is consistent
Utterances are "telegraphic" with few grammatical markers

By 24 mo, 9-10 initial and 5-6 final consonants are used
Speech is 50% intelligible
70% of consonants are correct
CVC and two-syllable words emerge

Brown's Stage II: Grammatical Morphemes
Early emerging acquisition: *-ing* in, on, plural */s/*
Use of *no*, *not*, *can't*, *don't* as negation between subject and verb
Questions formed with rising intonation only
Sentences with semi-auxiliaries *gonna*, *wanna*, *gotta*, *hafta* appear

Awareness of rhyme emerges

Brown's Stage III: Modulation of Simple Sentences
Present tense auxiliaries appear (*can*, *will*)
Be verbs used inconsistently
Overgeneralized past-tense forms appear

Speech is 75% intelligible at 36 mo
Ability to produce rhyme emerges

Brown's Stage IV: Emergence of Embedded Sentences
First complex sentence forms appear
Auxiliary verbs are placed correctly in questions and negatives
Irregular past tense, articles (*a*, *the*), possessive ('s) acquired

Use of reduplication, syllable deletion, assimilation, and final consonant deletion is less common
Use of stopping, fronting, cluster reduction, and liquid simplification continues

Brown's Stage Late IV–Early V
Early emerging complex sentence types, including the following:

- Full prepositional clauses
- *Wh*- clauses
- Simple infinitives
- Conjoined

Use of cluster reduction decreases

Brown's Stage V
Later developing morphemes acquired, including the following:

- *Be* verbs
- Regular past
- Third person */s/*

Past-tense auxiliaries used

- Relative clauses (right branching)
- Infinitive clauses with different subjects
- Gerund clauses
- *Wh*- infinitive clauses

Basic sentence forms acquired

Speech is 100% intelligible
Ability to segment words into syllables emerges
Use of most simplification processes stops; errors on */s/*, */r/*, */l/*, *th* may persist

Milestones of Later Communication Development

Typical Age	Pragmatics	Semantics
5-7 yr	Narratives are true "stories" with central focus, high point, and resolution	Reorganization of lexical knowledge from syntagmatic (episodic) to paradigmatic (semantic) networks Average expressive vocabulary size is 3000-5000 words
7-9 yr	Stories contain complete episodes with internal goals, motivations, and reactions of characters; some multiple-episode stories appear Language is used to establish and maintain social status Increased perspective-taking allows for more successful persuasion Provide conversational repairs by defining terms or giving background information Can perform successfully in simple referential communication tasks	School and reading experience introduce new words not encountered in conversation Pronouns used anaphorically to refer to nouns previously named Word definitions include synonyms and categories Some words understood to have multiple meanings Capacity for production of figurative language increases
9-12 yr	Stories include complex, embedded, and interactive episodes Understand jokes and riddles based on lexical ambiguity	Vocabulary used in school texts is more abstract and specific than that used in conversation Students are expected to acquire new information from written texts Can explain relationships between meanings of multiple-meaning words Begin using adverbial conjuncts (4% of utterances contain them) Most common idioms understood
12-14 yr	Expository texts used in school-sponsored writing Most information is presented in expository formats Understand jokes and riddles based on deep structure ambiguity	Abstract, dictionary definitions given for words Use of Adverbial conjuncts increases to 85% of utterances Can explain meaning of proverbs in context
15-18 yr	Language is used to maintain social bounds ("just talking") Persuasive and argumentative skills reach near-adult levels	Average vocabulary of high school graduate is 10,000 words

Data from Chapman, R. (2000). Children's language learning: An interactionist perspective. *Journal of Child Psychology and Psychiatry*, 41, 33-54; Nippold, M. (1998). *Later language development: The school-age and adolescent years*. Austin, TX: Pro-Ed; Westby, C. (1999). Assessing and facilitating text comprehension problems. In H. Catts and A. Kahmi (Eds.), *Language and reading disabilities* (pp. 154-223). Boston, MA: Allyn & Bacon.

Milestones of Literacy Development

Typical Age	Literacy Socialization	Phonological Awareness	Print Knowledge
0-2 yr	Enjoys joint book-reading Learns to hold book right-side up Learns to turn pages Answers questions about pictures, characters	Exposure to rhyme initiates rhyme awareness	Learns to distinguish print from pictures
2-5 yr	Learns the need to turn page to get to next part of story Learns left-right progression of print Learns print is stable; anyone reading a book reads the same words	Can segment sentences into words Can segment words into syllables Can recognize/produce rhymes Can recognize/produce words with same beginning sound Can segment/blend words by onset/rime (s + un = sun)	Learns alphabet song Learns to recognize and name letters Learns letters "have" sounds Learns clusters of letters separated by space form words
5-7 yr	Reads picture books for pleasure, with assistance (e.g., audio-taped book) Reads picture books for pleasure, independently	Can identify (name) first sound in word Can list words that start w/same sound Can count sounds in words Can blend 3-4 sounds to make a word (/h/ + /ʌ/ + /n/ + /d/ = hand) Can segment words into 3-4 phonemes (hand = /h/ + /ʌ/ + /n/ + /d/) Can manipulate sounds in words (What's hop without /p/? [hʌ/])	Learns alphabetic principle: Words are made up of sounds; sounds can be represented by letters Learns all letter names, letter sounds for consonants Learns sounds for vowels Can match letters to sounds
7-9 yr	Reads "chapter books" for pleasure, independently May read non-fiction for pleasure, as well	Can play with sounds in words, as in pig latin and other secret codes	Begins to learn conventions for punctuation, capitalization, other conventions of print
9-12 yr	Reads for information as well as pleasure		Continues improving knowledge of writing conventions Errors in these decrease
12-18 yr	Develops study skills to retain material read		Masters basic rules for punctuation, capitalization, etc.

Data from Kadervek, J., & Justice, L. (2004). Embedded-explicit emergent literacy intervention II: Goal selection and implementation in the early childhood classroom. *Language, Speech, and Hearing Services in Schools*, 35, 212-228; Kamhi, A. & Catts, H. (2005). *Reading development*. In H. Catts & A. Kamhi (Eds.), *Language and Reading Disabilities*. 2nd Ed. (pp. 26-49). Boston: Allyn & Bacon.

Syntax	Phonology/Metalinguistics
Use and understanding of passive sentences emerges Mastery of exceptions to basic grammatical rules begins	Last residual speech errors overcome Ability to segment words into phonemes emerges Understand concept of "Word" separate from its referent
Literate language syntax needed for academic participation develops A few errors in noun phrases ("much bricks") persist	Articulation is mostly error-free Some difficulty with complex words may persist (<i>aluminum</i>) Phonological knowledge is used in spelling Sound manipulation in activities such as pig latin is seen
Syntax used in school texts is more complex than that used in oral language Use of word order variations increases in writing ("Around the house we put a fence?")	Morphophonological knowledge develops and is used in spelling Metacognitive skills emerge
Use of perfect aspect (<i>have/had</i> + [verb]) increases Syntax used in writing is more complex than that used in speech	Knowledge of stress rules (<i>yellowjacket</i> vs. <i>yellow jacket</i>) is acquired
Sentence length and complexity in written language is greater than in spoken Rate of modal auxiliary use increases Full adult range of syntactic constructions reached	Knowledge of morphophonological rules reaches adult level

Reading	Writing
May pretend to read when others are reading	Learns to hold crayon, scribble
Learns to recognize name in print May recognize environmental print (reads "McDonald's" sign)	Begins representational drawing Learns to write name Distinguished drawing from writing Learns to write some letters May use invented spelling to label drawings
Learns to decode by identifying sounds for printed letters and synthesizing sounds across letters to form words Learns some words by sight	Learns conventional spelling for some words Learns to spell by segmenting words into sounds and writing letters for sounds Makes errors based on phonetic correspondences Writing is simpler than speech Writing begins to be more common than drawing
More words recognized by "sight" More phonic patterns are recognized to increase automaticity of decoding (e.g., "silent e rule") As reading becomes more automatic, more attention is focused on comprehension Reading moves toward fluency	Learns spelling patterns (e.g., <i>ight</i> pattern words) Increases vocabulary of known spellings Makes fewer spelling errors Uses writing to send messages Begins school-sponsored writing, such as book reports Writing resembles level of complexity in speech Oral and literate styles are mixed in writing Narrative writing predominates
Reading is fluent Decoding is efficient and automatic Comprehension is focus; reads to learn	Learns morphophonological rules and patterns in spelling (e.g., <i>photograph</i> has two 'o's, you can hear them both in <i>photography</i>) Writing has a more consistently literate style; more subordinate clauses Persuasive and expository writing is introduced in the school curriculum
Begins to develop critical reading/thinking skills Learns to distinguish fact from opinion in writing Can construct knowledge from print sources using reasoning, analysis, synthesis and judgment	Level of complexity in writing begins to be greater than in speech More low frequency syntactic forms appear in writing than in speech Persuasive and expository writing continue to improve beyond high school, given adequate experience and opportunity
