#### Research Topics

## Geometric Network

Weighted undirected graph

$G(V, E)$  s.t.

- $V \subset \mathbb{R}^d$ .
- $\forall e = (u, v) \in E, wt(e) = |uv|$ .

- Driving distance: 143 km. Actual distance: 100 km.
- $\frac{\text{Driving distance}}{\text{Actual distance}} = 1.43.$

## Dilation (stretch factor)

• between a pair of vertices=

$\frac{\text{Distance in the graph}}{\text{Euclidean distance}}$

• of a network= maximum  
dilation between all pairs.

## $t$ -spanner

A network with dilation at  
most  $t$ , or  
 $\forall u, v \in V$ , there is a path  
between  $u$  and  $v$  of length  
 $\leq t \times |uv|$ .

( $t$ -path)

## ORG. GREEDY

**Input:**  $V$  and  $t > 1$

**Output:**  $t$ -spanner  $G(V, E)$

Sort pairs of points by non-decreasing order of distance;

$E := \emptyset$ ;

$G := (V, E)$  ;

**for** each pair  $(u, v)$  of points (in sorted order) **do**

**if** SHORTESTPATH( $G, u, v$ )  $> t \cdot |uv|$  **then**

        Add  $(u, v)$  to  $E$ ;

**end**

**end**

**return**  $G(V, E)$ ;

## ORG. GREEDY

**Input:**  $V$  and  $t > 1$

**Output:**  $t$ -spanner  $G(V, E)$

Sort pairs of points by non-decreasing order of distance;

$E := \emptyset$ ;  $G := (V, E)$  ;

**for each pair**  $(u, v)$  **of points (in sorted order) do**

**if** SHORTESTPATH( $G, u, v$ )  $> t \cdot |uv|$  **then**

        Add  $(u, v)$  to  $E$ ;

**end**

**end**

**return**  $G(V, E)$ ;

Number of shortest path queries:  $\Theta(n^2)$ .

## Observations:

- We only want to know if there is a  $t$ -path between  $u$  and  $v$ .
- The graph is only updated  $\mathcal{O}(n)$  times.

## Conjecture:

The running time of IMP. GREEDY is  $\mathcal{O}(n^2 \log n)$ .

## Bose, Carmi, Farshi, Maheshvari and Smid (2008)

- The conjecture is wrong!
- They presented an algorithm which computes the greedy spanner in  $\mathcal{O}(n^2 \log n)$  time (even for points from some metric spaces).

## $\Theta$ -GRAPH

**Input:**  $V$  and  $t > 1$

**Output:**  $t$ -spanner  $G(V, E)$

Set  $k :=$  the smallest integer such that  $t = \frac{1}{\cos \theta - \sin \theta}$  for  
 $\theta = 2\pi/k$ ;

$E := \emptyset$ ;

**for each point**  $u \in V$  **do**

$C_1, \dots, C_k :=$  non-overlapping cones with angle  $\theta$   
    and with apex at  $u$ ;

**for each cone**  $C_i$  **do**

        | Connect  $u$  to the closest point in  $C_i$ ;

**end**

**end**

**return**  $G(V, E)$ ;

Time Complexity:  $\mathcal{O}(n \log n)$ .

Storage Complexity:  $\mathcal{O}(n)$ .

# Well Separated Pair Decomposition (WSPD)

Geometric  
Spanner Networks

## Well Separated Pair Decomposition:

Let  $V \subset \mathbb{R}^d$  and  $s > 0$ . A WSPD for  $V$  with respect to  $s$  is a set  $\{(A_i, B_i)\}_{i=1}^m$  of pairs of non-empty subsets of  $V$  such that

- $\forall i$ ,  $A_i$  and  $B_i$  are  $s$ -well separated,
- $\forall p, q \in V$ , there is **exactly** one index  $i$  s. t.
  - $p \in A_i$  and  $q \in B_i$  or
  - $q \in A_i$  and  $p \in B_i$ .

$m$  : Size of WSPD.

Callahan & Kosaraju (1995)

For each set of  $n$  points, we can construct a WSPD of size  $\mathcal{O}(s^d \cdot n)$  in  $\mathcal{O}(n \log n)$  time using  $\mathcal{O}(s^d \cdot n)$  space.

## Designing approximation algorithms with spanners

Geometric  
Spanner Networks

### Definition:

If  $G$  is a graph with vertex set  $P$ , then a tour of  $P$  in  $G$  is a (possibly non-simple) cycle in  $G$  that visits each point of  $P$  at least once.

### Observation:

For any  $t$ -spanner  $G$  for  $P$ , there is a tour of  $P$  in  $G$ , whose weight is at most  $t \cdot wt(\text{TSP}(P))$ .

### Theorem (Rao and Smith, 1998)

Given a  $(1 + \varepsilon)$ -spanner of a set of  $n$  points with  $\mathcal{O}(n)$  size and  $\mathcal{O}(wt(\text{MST}))$  weight, we can compute a  $(1 + \varepsilon)$ -approximation of  $\text{TSP}(P)$  in  $\mathcal{O}(n \log n)$  time.

## Metric space searching

### Geometric Spanner Networks

## What is the role of spanners?

- A metric shows the similarity between any two objects.
- But evaluating the distances is expensive.
- One way to speedup is computing the distance between any two objects and save them, but it needs  $O(n^2)$  space (AESA).
- A  $t$ -spanner can be used as a sparse data structure to reduce the space.

Protein Visualization

### Research Topics

# Applications

## Metric space searching

### What is the role of spanners?

- A metric shows the similarity between any two objects.
- But evaluating the distances are expensive.
- One way to speedup is computing the distance between any two objects and save them, but it needs  $O(n^2)$  space (AESA).
- A  $t$ -spanner can be used as a sparse data structure to reduce the space.

## Current and Future Works:

- Dynamic spanners (insert and remove nodes).
- Kinetic spanners (when points move and we want to maintain a spanner all the time).
- Fault-tolerant spanners (vertex/edge fault tolerant or region fault tolerant).
- Spanners among obstacles.
- Optimization problems.
- External memory (I/O efficient) algorithms for generating spanners.
- Experimental works on spanner algorithms.
